	Write (see page 6704)	Introduces a pure virtual method for writing to the stream.

74.1.3.2 TWebRequestFileStream.Create Constructor

Pascal

```
constructor Create(ABuffer: Pointer; Size: Integer);
```

C++

```
__fastcall TWebRequestFileStream(void * ABuffer, int Size);
```

Description

This is Create, a member of class TWebRequestFileStream.

74.1.3.3 TWebRequestFileStream Methods

The methods of the TWebRequestFileStream class are listed here.

Public Methods

	Name	Description
	Write (see page 6704)	Introduces a pure virtual method for writing to the stream.

74.1.3.3.1 TWebRequestFileStream.Write Method

Introduces a pure virtual method for writing to the stream.

Pascal

```
function Write(const Buffer; Count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  Buffer, Longint Count);
```

Description

Each descendant stream object defines a Write method that writes data to its particular storage medium (such as memory or a disk file). Write attempts to write up to Count bytes from Buffer, and returns the number of bytes actually written.

All the other data-writing methods of a stream (WriteBuffer, WriteComponent) call Write to do their actual writing.

This is namespace ReqMulti.

Topics

Name	Description
Classes (see page 6706)	The following table lists classes in this documentation.

Classes

	Name	Description
	TMultipartContentParser (see page 6706)	TMultipartContentParser extracts named value strings and uploaded files from an HTTP request sent by a multipart form.

75.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TMultipartContentParser (see page 6706)	TMultipartContentParser extracts named value strings and uploaded files from an HTTP request sent by a multipart form.

75.1.1 TMultipartContentParser Class

TMultipartContentParser extracts named value strings and uploaded files from an HTTP request sent by a multipart form.

Class Hierarchy

Pascal

```
TMultipartContentParser = class(TAbstractContentParser);
```

C++

```
class TMultipartContentParser : public TAbstractContentParser;
```

File

ReqMulti

Description

Web request objects use TMultipartContentParser object to parse the content of an HTTP request message from a multipart form when that request may contain uploaded files. The Web request uses this content parser to assign values for its ContentFields and Files properties.

TMultipartContentParser is only used when the current HTTP request object has a content type of 'multipart/form-data'. Multipart forms built using a WebSnap application automatically use this content type.

To allow your WebSnap application to use TMultipartContentParser in Delphi, add the ReqMulti (see page 6705) unit to the end of your project uses clause. In C++, include ReqMulti.hpp in the header of your project source file.

TWebRequest (see page 3358)

TContentParser (see page 3301)

TWebRequest (see page 3358)

75.1.1.1 TMultipartContentParser Members

The following tables list the members exposed by TMultipartContentParser.

Protected Methods

	Name	Description
	BufferContent (see page 6708)	This is BufferContent, a member of class TMultipartContentParser.
	ExtractContentTypeFields (see page 6709)	This is ExtractContentTypeFields, a member of class TMultipartContentParser.
	ExtractMultipartContentFields (see page 6709)	This is ExtractMultipartContentFields, a member of class TMultipartContentParser.
V	GetContentFields (see page 6709)	Returns the named value strings that are included in the content of the current Web request.
V	GetFiles (see page 6709)	Returns a set of uploaded files that the parser extracts from the current Web request.
	ParseMultiPart (see page 6710)	This is ParseMultiPart, a member of class TMultipartContentParser.
	ParseMultiPartContent (see page 6710)	This is ParseMultiPartContent, a member of class TMultipartContentParser.
	ParseMultipartHeaders (see page 6710)	This is ParseMultipartHeaders, a member of class TMultipartContentParser.

Protected Properties

	Name	Description
R	WebRequest (see page 3258)	Indicates the Web request object that uses this parser to parse its content.

Public Methods

	Name	Description
V	CanParse (see page 6708)	Indicates whether a specified request message contains information encoded in a way that this parser understands.
V	Create (see page 3256)	Creates and initializes a new TAbstractContentParser (see page 3255) object.
V	Destroy (see page 6707)	Frees the memory associated with the TMultipartContentParser (see page 6706) object.

75.1.1.2 TMultipartContentParser.Destroy Destructor

Frees the memory associated with the TMultipartContentParser (see page 6706) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TMultipartContentParser();
```

Description

Do not free content parser instances. The Web request object frees the content parser when it no longer needs it.

75.1.1.3 TMultipartContentParser Methods

The methods of the TMultipartContentParser class are listed here.

Protected Methods

	Name	Description
	BufferContent (see page 6708)	This is BufferContent, a member of class TMultipartContentParser.
	ExtractContentTypeFields (see page 6709)	This is ExtractContentTypeFields, a member of class TMultipartContentParser.
	ExtractMultipartContentFields (see page 6709)	This is ExtractMultipartContentFields, a member of class TMultipartContentParser.

	GetContentFields (see page 6709)	Returns the named value strings that are included in the content of the current Web request.
	GetFiles (see page 6709)	Returns a set of uploaded files that the parser extracts from the current Web request.
	ParseMultiPart (see page 6710)	This is ParseMultiPart, a member of class TMultipartContentParser.
	ParseMultiPartContent (see page 6710)	This is ParseMultiPartContent, a member of class TMultipartContentParser.
	ParseMultipartHeaders (see page 6710)	This is ParseMultipartHeaders, a member of class TMultipartContentParser.

Public Methods

	Name	Description
	CanParse (see page 6708)	Indicates whether a specified request message contains information encoded in a way that this parser understands.

75.1.1.3.1 TMultipartContentParser.BufferContent Method

Pascal

```
procedure BufferContent;
```

C++

```
__fastcall BufferContent();
```

Description

This is BufferContent, a member of class TMultipartContentParser.

75.1.1.3.2 TMultipartContentParser.CanParse Method

Indicates whether a specified request message contains information encoded in a way that this parser understands.

Pascal

```
class function CanParse(AWebRequest: TWebRequest): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanParse(TWebRequest AWebRequest);
```

Description

CanParse indicates whether a content parser class can handle parsing a specified request message. CanParse is a class method (Delphi) or static method (C++), which means the Web request does not need an instantiated object to call this method. The Web request object calls the CanParse method of every registered content parser until it finds one that can parse its content.

AWebRequest is the current HTTP request message.

CanParse returns true if this class can parse AWebRequest, false if AWebRequest does not indicate an encoding that this class understands.

In TMultipartContentParser (see page 6706), CanParse returns true if AWebRequest has a content type of 'multipart/form-data'. If the Web request indicates some other content type, the Web request uses a different content parser class such as TContentParser (see page 3301).

See Also

ContentType (see page 3376)

TContentParser (see page 3301)

75.1.1.3.3 TMultipartContentParser.ExtractContentTypeFields Method

Pascal

```
procedure ExtractContentTypeFields(Strings: TStrings);
```

C++

```
__fastcall ExtractContentTypeFields(TStrings Strings);
```

Description

This is ExtractContentTypeFields, a member of class TMultipartContentParser.

75.1.1.3.4 TMultipartContentParser.ExtractMultipartContentFields Method

Pascal

```
procedure ExtractMultipartContentFields;
```

C++

```
__fastcall ExtractMultipartContentFields();
```

Description

This is ExtractMultipartContentFields, a member of class TMultipartContentParser.

75.1.1.3.5 TMultipartContentParser.GetContentFields Method

Returns the named value strings that are included in the content of the current Web request.

Pascal

```
function GetContentFields: TStrings; override;
```

C++

```
virtual __fastcall TStrings GetContentFields();
```

Description

GetContentFields returns a list of strings with the form "Name=Value" that represent any name/value pairs that the parser identifies in the content of the current Web request.

In TAbstractContentParser, GetContentFields is abstract or, in C++ terminology, pure virtual, meaning that this class does not supply an implementation. Descendant classes override this method to extract name/value pairs from the current request and add them to the returned string list.

Note: The content parser owns the string list it returns. The caller should not free the string list.

See Also

ContentFields (see page 3375)

WebRequest (see page 3258)

ExtractContentFields (see page 3363)

75.1.1.3.6 TMultipartContentParser.GetFiles Method

Returns a set of uploaded files that the parser extracts from the current Web request.

Pascal

```
function GetFiles: TAbstractWebRequestFiles; override;
```

C++

```
virtual __fastcall TAbstractWebRequestFiles GetFiles();
```

Description

GetFiles returns a list of Web request file objects, each of which represents an uploaded file from the current Web request. Each Web request file object has properties to describe an uploaded file, including a stream object from which to read the content of the uploaded file.

In TAbstractContentParser, GetFiles is abstract or, in C++ terminology, pure virtual, meaning that this class does not supply an implementation. Descendant classes override this method to extract uploaded files from the current request and add them to the Web request files object.

Note: The content parser owns the list it returns. The caller should not free this list.

TAbstractWebRequestFile (see page 3288)

75.1.1.3.7 TMultipartContentParser.ParseMultiPart Method

Pascal

```
procedure ParseMultiPart(Part: Pointer; Size: Integer);
```

C++

```
__fastcall ParseMultiPart(void * Part, int Size);
```

Description

This is ParseMultiPart, a member of class TMultipartContentParser.

75.1.1.3.8 TMultipartContentParser.ParseMultiPartContent Method

Pascal

```
procedure ParseMultiPartContent;
```

C++

```
__fastcall ParseMultiPartContent();
```

Description

This is ParseMultiPartContent, a member of class TMultipartContentParser.

75.1.1.3.9 TMultipartContentParser.ParseMultipartHeaders Method

Pascal

```
procedure ParseMultipartHeaders(Parser: THTTPParser; AContent: Pointer; AContentLength:
Integer);
```

C++

```
__fastcall ParseMultipartHeaders(THTTPParser Parser, void * AContent, int AContentLength);
```

Description

This is ParseMultipartHeaders, a member of class TMultipartContentParser.

76 Ribbon Namespace

This is namespace Ribbon.

Topics

Name	Description
Classes (see page 6715)	The following table lists classes in this documentation.
Interfaces (see page 6931)	The following table lists interfaces in this documentation.
Structs, Records, Enums (see page 6936)	The following table lists structs, records, enums in this documentation.
Types (see page 6940)	The following table lists types in this documentation.

Classes

	Name	Description
	ERibbonException (see page 6715)	This is class Ribbon.ERibbonException.
	TApplicationMenu (see page 6716)	Contains properties associated with the Application (see page 2612) Menu (see page 6721).
	TCustomActionControlBar (see page 6721)	This is class Ribbon.TCustomActionControlBar.
	TCustomRibbon (see page 6724)	Base class for all ribbon controls.
	TCustomRibbonColorMap (see page 6767)	This is class Ribbon.TCustomRibbonColorMap.
	TCustomRibbonGroup (see page 6771)	Align and display all controls on ribbon.
	TCustomRibbonPage (see page 6790)	Holds groups of controls.
	TCustomRibbonQuickAccessPopupToolbar (see page 6804)	This is class Ribbon.TCustomRibbonQuickAccessPopupToolbar.
	TCustomRibbonQuickAccessToolbar (see page 6807)	Quck Access Toolbar base class.
	TCustomTabData (see page 6819)	Encapsulates all functions and status to manage scrolling of tabs and selected group.
	THelpButton (see page 6825)	Button to activate help.
	TOffice2007Button (see page 6826)	This is class Ribbon.TOffice2007Button.
	TQuickAccessToolbar (see page 6835)	Quick Access Toolbar appearance.
	TQuickAccessToolbarGroupItem (see page 6841)	Display Quick Access Toolbar commands to display entire Ribbon group.
	TQuickAccessToolbarGroups (see page 6843)	This is class Ribbon.TQuickAccessToolbarGroups.
	TRibbon (see page 6845)	Implement ribbon control.
	TRibbonCustomizeDlg (see page 6864)	This is class Ribbon.TRibbonCustomizeDlg.
	TRibbonGroup (see page 6865)	Control used to display the user selectable commands for the ribbon.
	TRibbonGroupCollapsedControl (see page 6871)	Control used to represent a collapsed group on a tab.
	TRibbonGroupDockForm (see page 6884)	Display a collapsed group.
	TRibbonGroupScrollButton (see page 6886)	This is class Ribbon.TRibbonGroupScrollButton.
	TRibbonLunaColorMap (see page 6890)	Color map class for Luna.

	TRibbonObsidianColorMap (see page 6896)	Color map class for Obsidian.
	TRibbonPage (see page 6901)	Tab page for ribbon control.
	TRibbonQuickAccessPopupToolbar (see page 6911)	This is class Ribbon.TRibbonQuickAccessPopupToolbar.
	TRibbonQuickAccessToolbar (see page 6911)	Quck Access Toolbar.
	TRibbonSilverColorMap (see page 6914)	Color map class for Silver.
	TRibbonTabItem (see page 6920)	This is class Ribbon.TRibbonTabItem.
	TRibbonTabs (see page 6925)	Collection of information about ribbon pages.

Interfaces

	Name	Description
	IRibbon (see page 6931)	Interface for ribbon control.
	IRibbonGroup (see page 6933)	Interface for any ribbon-specific group.
	IRibbonQuickAccessToolbar (see page 6934)	This is class Ribbon.IRibbonQuickAccessToolbar.

Structs, Records, Enums

	Name	Description
	TCommandType (see page 6936)	This is record Ribbon.TCommandType.
	TIconSize (see page 6936)	This is record Ribbon.TIconSize.
	TRibbonGroupVariant (see page 6937)	This is record Ribbon.TRibbonGroupVariant.
	TRibbonMetric (see page 6937)	This is record Ribbon.TRibbonMetric.
	TRibbonScrollButton (see page 6938)	This is record Ribbon.TRibbonScrollButton.
	TTabActiveScrollButton (see page 6938)	This is record Ribbon.TTabActiveScrollButton.
	TTabSeparatorState (see page 6939)	Position of Quick Access Toolbar.

Types

Name	Description
TCustomRibbonClass (see page 6940)	This is type Ribbon.TCustomRibbonClass.
TRecentItemClickEvent (see page 6940)	This is type Ribbon.TRecentItemClickEvent.
TRibbonScrollButtons (see page 6941)	This is type Ribbon.TRibbonScrollButtons.

76.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERibbonException (see page 6715)	This is class Ribbon.ERibbonException.
	TApplicationMenu (see page 6716)	Contains properties associated with the Application (see page 2612) Menu (see page 6721).
	TCustomActionControlBar (see page 6721)	This is class Ribbon.TCustomActionControlBar.
	TCustomRibbon (see page 6724)	Base class for all ribbon controls.
	TCustomRibbonColorMap (see page 6767)	This is class Ribbon.TCustomRibbonColorMap.
	TCustomRibbonGroup (see page 6771)	Align and display all controls on ribbon.
	TCustomRibbonPage (see page 6790)	Holds groups of controls.
	TCustomRibbonQuickAccessPopupToolbar (see page 6804)	This is class Ribbon.TCustomRibbonQuickAccessPopupToolbar.
	TCustomRibbonQuickAccessToolbar (see page 6807)	Quck Access Toolbar base class.
	TCustomTabData (see page 6819)	Encapsulates all functions and status to manage scrolling of tabs and selected group.
	THelpButton (see page 6825)	Button to activate help.
	TOffice2007Button (see page 6826)	This is class Ribbon.TOffice2007Button.
	TQuickAccessToolbar (see page 6835)	Quick Access Toolbar appearance.
	TQuickAccessToolbarGroupItem (see page 6841)	Display Quick Access Toolbar commands to display entire Ribbon (see page 6713) group.
	TQuickAccessToolbarGroups (see page 6843)	This is class Ribbon.TQuickAccessToolbarGroups.
	TRibbon (see page 6845)	Implement ribbon control.
	TRibbonCustomizeDlg (see page 6864)	This is class Ribbon.TRibbonCustomizeDlg.
	TRibbonGroup (see page 6865)	Control used to display the user selectable commands for the ribbon.
	TRibbonGroupCollapsedControl (see page 6871)	Control used to represent a collapsed group on a tab.
	TRibbonGroupDockForm (see page 6884)	Display a collapsed group.
	TRibbonGroupScrollButton (see page 6886)	This is class Ribbon.TRibbonGroupScrollButton.
	TRibbonLunaColorMap (see page 6890)	Color map class for Luna.
	TRibbonObsidianColorMap (see page 6896)	Color map class for Obsidian.
	TRibbonPage (see page 6901)	Tab page for ribbon control.
	TRibbonQuickAccessPopupToolbar (see page 6911)	This is class Ribbon.TRibbonQuickAccessPopupToolbar.
	TRibbonQuickAccessToolbar (see page 6911)	Quck Access Toolbar.
	TRibbonSilverColorMap (see page 6914)	Color map class for Silver.
	TRibbonTabItem (see page 6920)	This is class Ribbon.TRibbonTabItem.
	TRibbonTabs (see page 6925)	Collection of information about ribbon pages.

76.1.1 ERibbonException Class

Class Hierarchy

Pascal

```
ERibbonException = class(Exception);
```

C++

```
class ERibbonException : public Exception;
```

File

Ribbon

Description

This is class Ribbon.ERibbonException.

76.1.2 TApplicationMenu Class

Contains properties associated with the Application (see page 2612) Menu (see page 6721).

Class Hierarchy

Pascal

```
TApplicationMenu = class(TPersistent);
```

C++

```
class TApplicationMenu : public TPersistent;
```

File

Ribbon

Description

TApplicationMenu Contains properties associated with the Application (see page 2612) Menu (see page 6721) on a ribbon.

Use the properties to change the appearance and behavior of the Application (see page 2612) Menu (see page 6721) as displayed on the ribbon.

See Also

Caption (see page 6719)

Icon (see page 6720)

KeyTip (see page 6720)

76.1.2.1 TApplicationMenu Members

The following tables list the members exposed by TApplicationMenu.

Protected Methods

	Name	Description
	GetActionClientItem (see page 6718)	This is GetActionClientItem, a member of class TApplicationMenu.
	Initialize (see page 6719)	This is Initialize, a member of class TApplicationMenu.

Public Methods

	Name	Description
	Assign (see page 6718)	Copies the contents of another, similar object.
	Create (see page 6717)	This is Create, a member of class TApplicationMenu.

	Destroy (see page 6717)	Destroys the TPersistent instance and frees its memory.
	Show (see page 6719)	This is Show, a member of class TApplicationMenu.

Published Properties

	Name	Description
	Caption (see page 6719)	Text displayed above Application (see page 2612) Menu (see page 6721).
	CommandType (see page 6720)	This is CommandType, a member of class TApplicationMenu.
	Icon (see page 6720)	Icon to display on the Application (see page 2612) Button.
	IconSize (see page 6720)	This is IconSize, a member of class TApplicationMenu.
	KeyTip (see page 6720)	KeyTip displayed in KeyTip mode.
	Menu (see page 6721)	This is Menu, a member of class TApplicationMenu.
	ScreenTip (see page 6721)	This is ScreenTip, a member of class TApplicationMenu.

76.1.2.2 TApplicationMenu.Create Constructor

Pascal

```
constructor Create(ARibbon: TCustomRibbon); reintroduce;
```

C++

```
__fastcall TApplicationMenu(TCustomRibbon ARibbon);
```

Description

This is Create, a member of class TApplicationMenu.

76.1.2.3 TApplicationMenu.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TApplicationMenu();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

System::TObject::Free

System::TObject::Destroy

76.1.2.4 TApplicationMenu Methods

The methods of the TApplicationMenu class are listed here.

Protected Methods

	Name	Description
	GetActionClientItem (see page 6718)	This is GetActionClientItem, a member of class TApplicationMenu.
	Initialize (see page 6719)	This is Initialize, a member of class TApplicationMenu.

Public Methods

	Name	Description
	Assign (see page 6718)	Copies the contents of another, similar object.
	Show (see page 6719)	This is Show, a member of class TApplicationMenu.

76.1.2.4.1 TApplicationMenu.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

AssignTo

EConvertError

76.1.2.4.2 TApplicationMenu.GetActionClientItem Method

Pascal

```
function GetActionClientItem: TActionClientItem;
```

C++

```
__fastcall TActionClientItem GetActionClientItem();
```

Description

This is GetActionClientItem, a member of class TApplicationMenu.

76.1.2.4.3 TApplicationMenu.Initialize Method

Pascal

```
procedure Initialize(AManager: TCustomScreenTipsManager);
```

C++

```
__fastcall Initialize(TCustomScreenTipsManager AManager);
```

Description

This is Initialize, a member of class TApplicationMenu.

76.1.2.4.4 TApplicationMenu.Show Method

Pascal

```
procedure Show(const Visible: Boolean);
```

C++

```
__fastcall Show(const Boolean Visible);
```

Description

This is Show, a member of class TApplicationMenu.

76.1.2.5 TApplicationMenu Properties

The properties of the TApplicationMenu class are listed here.

Published Properties

	Name	Description
	Caption (see page 6719)	Text displayed above Application (see page 2612) Menu (see page 6721).
	CommandType (see page 6720)	This is CommandType, a member of class TApplicationMenu.
	Icon (see page 6720)	Icon to display on the Application (see page 2612) Button.
	IconSize (see page 6720)	This is IconSize, a member of class TApplicationMenu.
	KeyTip (see page 6720)	KeyTip displayed in KeyTip mode.
	Menu (see page 6721)	This is Menu, a member of class TApplicationMenu.
	ScreenTip (see page 6721)	This is ScreenTip, a member of class TApplicationMenu.

76.1.2.5.1 TApplicationMenu.Caption Property

Text displayed above Application (see page 2612) Menu (see page 6721).

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Caption is the text displayed above the right panel in the Application (see page 2612) Menu (see page 6721).

76.1.2.5.2 TApplicationMenu.CommandType Property

Pascal

```
property CommandType: TCommandType;
```

C++

```
__property TCommandType CommandType;
```

Description

This is CommandType, a member of class TApplicationMenu.

76.1.2.5.3 TApplicationMenu.Icon Property

Icon to display on the Application (see page 2612) Button.

Pascal

```
property Icon: TIcon;
```

C++

```
__property TIcon Icon;
```

Description

Icon is the icon to display on the Application (see page 2612) Button. If no icon is assigned, the default application icon is used. The dimensions of the assigned icon are 24 x 24.

76.1.2.5.4 TApplicationMenu.IconSize Property

Pascal

```
property IconSize: TIconSize;
```

C++

```
__property TIconSize IconSize;
```

Description

This is IconSize, a member of class TApplicationMenu.

76.1.2.5.5 TApplicationMenu.KeyTip Property

KeyTip displayed in KeyTip mode.

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the KeyTip that is displayed when the user has entered KeyTip mode.

76.1.2.5.6 TApplicationMenu.Menu Property

Pascal

```
property Menu: TRibbonApplicationMenuBar;
```

C++

```
__property TRibbonApplicationMenuBar Menu;
```

Description

This is Menu, a member of class TApplicationMenu.

76.1.2.5.7 TApplicationMenu.ScreenTip Property

Pascal

```
property ScreenTip: TScreenTipItem;
```

C++

```
__property TScreenTipItem ScreenTip;
```

Description

This is ScreenTip, a member of class TApplicationMenu.

76.1.3 TCustomActionControlBar Class

Class Hierarchy

Pascal

```
TCustomActionControlBar = class(TCustomActionToolbar);
```

C++

```
class TCustomActionControlBar : public TCustomActionToolbar;
```

File

Ribbon

Description

This is class Ribbon.TCustomActionControlBar.

76.1.3.1 TCustomActionControlBar Members

The following tables list the members exposed by TCustomActionControlBar.

Protected Methods

	Name	Description
	CMControlChange (see page 6722)	This is CMControlChange, a member of class TCustomActionControlBar.
V	CreateControls (see page 6723)	This is CreateControls, a member of class TCustomActionControlBar.
V	GetControlClass (see page 6723)	This is GetControlClass, a member of class TCustomActionControlBar.

Protected Properties

	Name	Description
	CreatingControls (see page 6723)	This is CreatingControls, a member of class TCustomActionControlBar.

Public Methods

	Name	Description
	Create (see page 6722)	This is Create, a member of class TCustomActionControlBar.
	CreateControl (see page 6722)	This is CreateControl, a member of class TCustomActionControlBar.

76.1.3.2 TCustomActionControlBar.Create Constructor

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomActionControlBar(TComponent * AOwner);
```

Description

This is Create, a member of class TCustomActionControlBar.

76.1.3.3 TCustomActionControlBar Methods

The methods of the TCustomActionControlBar class are listed here.

Protected Methods

	Name	Description
	CMControlChange (see page 6722)	This is CMControlChange, a member of class TCustomActionControlBar.
	CreateControls (see page 6723)	This is CreateControls, a member of class TCustomActionControlBar.
	GetControlClass (see page 6723)	This is GetControlClass, a member of class TCustomActionControlBar.

Public Methods

	Name	Description
	CreateControl (see page 6722)	This is CreateControl, a member of class TCustomActionControlBar.

76.1.3.3.1 TCustomActionControlBar.CMControlChange Method

Pascal

```
procedure CMControlChange(var Message: TCMControlChange); message CM_CONTROLCHANGE;
```

C++

```
__fastcall CMControlChange(TCMControlChange Message);
```

Description

This is CMControlChange, a member of class TCustomActionControlBar.

76.1.3.3.2 TCustomActionControlBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomActionControlBar.

76.1.3.3.3 TCustomActionControlBar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomActionControlBar.

76.1.3.3.4 TCustomActionControlBar.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TCustomActionControlBar.

76.1.3.4 TCustomActionControlBar Properties

The properties of the TCustomActionControlBar class are listed here.

Protected Properties

	Name	Description
	CreatingControls (see page 6723)	This is CreatingControls, a member of class TCustomActionControlBar.

76.1.3.4.1 TCustomActionControlBar.CreatingControls Property

Pascal

```
property CreatingControls: Boolean;
```

C++

```
__property Boolean CreatingControls;
```

Description

This is CreatingControls, a member of class TCustomActionControlBar.

76.1.4 TCustomRibbon Class

Base class for all ribbon controls.

Class Hierarchy

Pascal

```
TCustomRibbon = class(TCustomControl);
```

C++

```
class TCustomRibbon : public TCustomControl;
```

File

Ribbon

Description

TCustomRibbon is the base class for all ribbon controls. A ribbon can hold controls, such as application menus, Quick Access Toolbars, and pages holding controls.

The following constants control ribbon appearance:

Value	Meaning
cRibbonHideWidth (see page 6731)	Parent width at which the Ribbon (see page 6713) must automatically hide.
cRibbonHideHeight (see page 6730)	Parent height at which the Ribbon (see page 6713) must automatically hide.
cRibbonQuickAccessToolbarTop (see page 6732)	Top position of the Quick Access Toolbar.
cRibbonQuickAccessToolbarLeft (see page 6732)	Left position of the Quick Access Toolbar.
cRibbonHeight (see page 6730)	Default height of the ribbon.
cRibbonQATHeight (see page 6732)	Height of the bottom aligned Quick Access Toolbar.
cRibbonUnthemedCaptionHeight (see page 6733)	Height of the caption section of the ribbon.
cRibbonFirstTabOffSet (see page 6730)	Position of the first tab that is displayed.
cRibbonTabSpacing (see page 6733)	Amount of spacing between tabs.
cRibbonTabHeight (see page 6732)	Height of the tabs.
cRibbonMinimizedHeight (see page 6731)	Minimized (see page 6763) height of the ribbon.

The following messages are used:

Value	Meaning
UM_DISPLAYKEYTIPS (see page 6733)	Message sent to display the KeyTips.
UM_CHECKSIZE (see page 6733)	Message sent after a `WMWindowPosChanged` (see page 6758) message.

76.1.4.1 TCustomRibbon Members

The following tables list the members exposed by TCustomRibbon.

Protected Events

	Name	Description
	OnLeftTabScrollButtonClick (see page 6766)	This is OnLeftTabScrollButtonClick, a member of class TCustomRibbon.
	OnRightTabScrollButtonClick (see page 6767)	This is OnRightTabScrollButtonClick, a member of class TCustomRibbon.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 6736)	This is CMBidimodechanged, a member of class TCustomRibbon.
	CMDesignHitTest (see page 6737)	This is CMDesignHitTest, a member of class TCustomRibbon.
	CMFontchanged (see page 6737)	This is CMFontchanged, a member of class TCustomRibbon.
	CMMouseenter (see page 6737)	This is CMMouseenter, a member of class TCustomRibbon.
	CMMouseleave (see page 6737)	This is CMMouseleave, a member of class TCustomRibbon.
	CMTextchanged (see page 6738)	This is CMTextchanged, a member of class TCustomRibbon.
	CMThemeChanged (see page 6738)	This is CMThemeChanged, a member of class TCustomRibbon.
	ContextMenuPopupHandler (see page 6738)	This is ContextMenuPopupHandler, a member of class TCustomRibbon.
	CreateContextMenu (see page 6738)	This is CreateContextMenu, a member of class TCustomRibbon.
	CustomFrameWndProc (see page 6739)	This is CustomFrameWndProc, a member of class TCustomRibbon.
	DblClick (see page 6739)	OnDblClick event dispatcher.
	DefineProperties (see page 6739)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DisplayKeyTips (see page 6740)	This is DisplayKeyTips, a member of class TCustomRibbon.
	DoAddToQuickAccessToolbar (see page 6740)	This is DoAddToQuickAccessToolbar, a member of class TCustomRibbon.
	DoChangeQuickAccessToolbarPosition (see page 6740)	This is DoChangeQuickAccessToolbarPosition, a member of class TCustomRibbon.
	DoContextPopup (see page 6741)	OnContextPopup event dispatcher.
	DoCustomizeQuickAccessToolbar (see page 6741)	This is DoCustomizeQuickAccessToolbar, a member of class TCustomRibbon.
	DoGroupStyleChanged (see page 6741)	This is DoGroupStyleChanged, a member of class TCustomRibbon.
	DoHelpButtonClick (see page 6741)	This is DoHelpButtonClick, a member of class TCustomRibbon.
	DoMinimizeRibbon (see page 6742)	This is DoMinimizeRibbon, a member of class TCustomRibbon.
	DoMouseWheelDown (see page 6742)	OnMouseWheelDown event dispatcher.
	DoMouseWheelUp (see page 6743)	OnMouseWheelUp event dispatcher.
	DoRecentItemClick (see page 6743)	This is DoRecentItemClick, a member of class TCustomRibbon.
	DoScrollTabsLeft (see page 6743)	This is DoScrollTabsLeft, a member of class TCustomRibbon.
	DoScrollTabsRight (see page 6743)	This is DoScrollTabsRight, a member of class TCustomRibbon.
	DoTabChange (see page 6744)	This is DoTabChange, a member of class TCustomRibbon.

	DrawCaption (see page 6744)	This is DrawCaption, a member of class TCustomRibbon.
	DrawQuickAccessToolbar (see page 6744)	This is DrawQuickAccessToolbar, a member of class TCustomRibbon.
	DrawSystemButtons (see page 6744)	This is DrawSystemButtons, a member of class TCustomRibbon.
	DrawTab (see page 6745)	This is DrawTab, a member of class TCustomRibbon.
	GetContextMenuOptions (see page 6745)	This is GetContextMenuOptions, a member of class TCustomRibbon.
	GetHelpButtonRect (see page 6745)	This is GetHelpButtonRect, a member of class TCustomRibbon.
	GetRibbonHeight (see page 6746)	This is GetRibbonHeight, a member of class TCustomRibbon.
	GetTabAt (see page 6746)	This is GetTabAt, a member of class TCustomRibbon.
	GetTabRect (see page 6746)	This is GetTabRect, a member of class TCustomRibbon.
	GetTabWidth (see page 6747)	This is GetTabWidth, a member of class TCustomRibbon.
	HasApplicationMenu (see page 6747)	This is HasApplicationMenu, a member of class TCustomRibbon.
	HasQuickAccessToolbar (see page 6747)	This is HasQuickAccessToolbar, a member of class TCustomRibbon.
	Idle (see page 6747)	This is Idle, a member of class TCustomRibbon.
	KeyDown (see page 6749)	Respond to key press events.
	Loaded (see page 6749)	Initializes the control after it is loaded from a stream.
	MouseDown (see page 6750)	OnMouseDown event dispatcher.
	MouseInSystemMenu (see page 6750)	This is MouseInSystemMenu, a member of class TCustomRibbon.
	MouseMove (see page 6750)	Respond to mouse moving over control area..
	MouseUp (see page 6751)	OnMouseUp event dispatcher.
	Notification (see page 6752)	Responds to notifications that components are being created or destroyed.
	Paint (see page 6752)	Renders the image of a custom control.
	RebuildRibbonMetrics (see page 6753)	This is RebuildRibbonMetrics, a member of class TCustomRibbon.
	Resize (see page 6754)	Respond to control resize.
	SetParent (see page 6754)	Sets the parent of the control.
	UMCheckResize (see page 6756)	This is UMCheckResize, a member of class TCustomRibbon.
	UMDisplayKeyTips (see page 6756)	This is UMDisplayKeyTips, a member of class TCustomRibbon.
	UpdateQATPosition (see page 6757)	This is UpdateQATPosition, a member of class TCustomRibbon.
	UpdateSystemMenuInfo (see page 6757)	This is UpdateSystemMenuInfo, a member of class TCustomRibbon.
	ValidTab (see page 6757)	This is ValidTab, a member of class TCustomRibbon.
	WMEraseBkgnd (see page 6757)	This is WMEraseBkgnd, a member of class TCustomRibbon.
	WMGetDlgCode (see page 6758)	This is WMGetDlgCode, a member of class TCustomRibbon.
	WMKillFocus (see page 6758)	This is WMKillFocus, a member of class TCustomRibbon.
	WMSettingChange (see page 6758)	This is WMSettingChange, a member of class TCustomRibbon.
	WMWindowPosChanged (see page 6758)	This is WMWindowPosChanged, a member of class TCustomRibbon.

Protected Properties

	Name	Description
	AllowKeyboardNavigation (see page 6760)	This is AllowKeyboardNavigation, a member of class TCustomRibbon.
	HideRibbon (see page 6761)	This is HideRibbon, a member of class TCustomRibbon.
	HotTabIndex (see page 6762)	This is HotTabIndex, a member of class TCustomRibbon.
	KeyTipsVisible (see page 6762)	This is KeyTipsVisible, a member of class TCustomRibbon.
	Menu (see page 6762)	This is Menu, a member of class TCustomRibbon.
	ScaleFactor (see page 6763)	This is ScaleFactor, a member of class TCustomRibbon.

Public Constants

	Name	Description
	cRibbonFirstTabOffSet (see page 6730)	This is cRibbonFirstTabOffSet, a member of class TCustomRibbon.
	cRibbonGroupCaptionHeight (see page 6730)	This is cRibbonGroupCaptionHeight, a member of class TCustomRibbon.
	cRibbonGroupHeight (see page 6730)	This is cRibbonGroupHeight, a member of class TCustomRibbon.
	cRibbonHeight (see page 6730)	This is cRibbonHeight, a member of class TCustomRibbon.
	cRibbonHideHeight (see page 6730)	This is cRibbonHideHeight, a member of class TCustomRibbon.
	cRibbonHideWidth (see page 6731)	This is cRibbonHideWidth, a member of class TCustomRibbon.
	cRibbonMinimizedHeight (see page 6731)	This is cRibbonMinimizedHeight, a member of class TCustomRibbon.
	cRibbonMinimumCaptionWidth (see page 6731)	This is cRibbonMinimumCaptionWidth, a member of class TCustomRibbon.
	cRibbonPageHeight (see page 6731)	This is cRibbonPageHeight, a member of class TCustomRibbon.

	cRibbonQATHeight (see page 6732)	This is cRibbonQATHeight, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarLeft (see page 6732)	This is cRibbonQuickAccessToolbarLeft, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarTop (see page 6732)	This is cRibbonQuickAccessToolbarTop, a member of class TCustomRibbon.
	cRibbonTabHeight (see page 6732)	This is cRibbonTabHeight, a member of class TCustomRibbon.
	cRibbonTabScrollButtonWidth (see page 6732)	This is cRibbonTabScrollButtonWidth, a member of class TCustomRibbon.
	cRibbonTabSpacing (see page 6733)	This is cRibbonTabSpacing, a member of class TCustomRibbon.
	cRibbonUnthemedCaptionHeight (see page 6733)	This is cRibbonUnthemedCaptionHeight, a member of class TCustomRibbon.
	UM_CHECKSIZE (see page 6733)	This is UM_CHECKSIZE, a member of class TCustomRibbon.
	UM_DISPLAYKEYTIPS (see page 6733)	This is UM_DISPLAYKEYTIPS, a member of class TCustomRibbon.

Public Events

	Name	Description
	OnHelpButtonClick (see page 6766)	This is OnHelpButtonClick, a member of class TCustomRibbon.
	OnRecentItemClick (see page 6766)	This is OnRecentItemClick, a member of class TCustomRibbon.
	OnTabChange (see page 6767)	This is OnTabChange, a member of class TCustomRibbon.

Public Methods

	Name	Description
	AddRecentItem (see page 6735)	Add new entry into Recent Items list.
	AddTab (see page 6736)	This is AddTab, a member of class TCustomRibbon.
	BeginUpdate (see page 6736)	This is BeginUpdate, a member of class TCustomRibbon.
	CheckRibbonSize (see page 6736)	This is CheckRibbonSize, a member of class TCustomRibbon.
	ClearRecentItems (see page 6736)	This is ClearRecentItems, a member of class TCustomRibbon.
V	Create (see page 6728)	Creates an instance of TCustomControl.
	CustomFrameSupported (see page 6738)	This is CustomFrameSupported, a member of class TCustomRibbon.
	DeleteTab (see page 6740)	Delete tab at specified Index.
V	Destroy (see page 6728)	Destroys an instance of TCustomControl.
	DoMouseWheelEx (see page 6742)	This is DoMouseWheelEx, a member of class TCustomRibbon.
	EndUpdate (see page 6745)	This is EndUpdate, a member of class TCustomRibbon.
V	GetIcon (see page 6745)	Return Icon used by Application (see page 2612) Menu (see page 6762) Button.
	GetRibbonMetric (see page 6746)	This is GetRibbonMetric, a member of class TCustomRibbon.
	InvalidateHeaderArea (see page 6747)	Invalidate header section of Ribbon (see page 6713).
	InvalidateScrollButtons (see page 6748)	This is InvalidateScrollButtons, a member of class TCustomRibbon.
	InvalidateSystemMenuArea (see page 6748)	This is InvalidateSystemMenuArea, a member of class TCustomRibbon.
	InvalidateTabArea (see page 6748)	Invalidate area that displays tabs.
	MoveGroup (see page 6751)	Move group to new page.
	RemoveAllTabs (see page 6753)	Remove all Tabs (see page 6764) from Ribbon (see page 6713).
	RemoveRecentItem (see page 6753)	This is RemoveRecentItem, a member of class TCustomRibbon.
	RemoveTab (see page 6753)	Remove tab with specified caption.
V	SetBounds (see page 6754)	Sets the windowed control's boundary properties all at once.
	TabHandledKeyTips (see page 6755)	Validate **KeyTip** input when **KeyTip**s State is **ktsTabs**.
	TabHideKeyTips (see page 6755)	Hide K**eyTip**s.
	TabShowKeyTips (see page 6756)	Display **KeyTip**s for **ktsTabs** State.

Public Nested Types

Name	Description
TTabChangeEvent (see page 6765)	This is nested type Ribbon.TCustomRibbon.TTabChangeEvent.

Public Properties

	Name	Description
	ActionManager (see page 6759)	This is ActionManager, a member of class TCustomRibbon.
	Active (see page 6759)	Indicates if form that ribbon is placed on is active form.
	ActivePage (see page 6760)	Page currently displayed by ribbon control.

	ApplicationMenu (see page 6760)	Change appearance of ribbon's associated TRibbonApplicationMenuBar (see page 7302) control.
	ColorMap (see page 6761)	This is ColorMap, a member of class TCustomRibbon.
	DocumentName (see page 6761)	Text in Ribbon (see page 6713) caption.
	HideTabs (see page 6762)	Shows or hides Tab portion of Ribbon (see page 6713).
	Minimized (see page 6763)	Show Ribbon (see page 6713) in minimized state where tabs can be selected but are not visible.
	QuickAccessToolbar (see page 6763)	Properties associated with TQuickAccessToolbar (see page 6835).
	ScreenTips (see page 6763)	This is ScreenTips, a member of class TCustomRibbon.
	ShowHelpButton (see page 6764)	Determines whether ribbon displays Help Button.
	Style (see page 6764)	This is Style, a member of class TCustomRibbon.
	TabIndex (see page 6764)	Change the active page of ribbon.
	Tabs (see page 6764)	Collection of TRibbonTabs (see page 6925) visible on ribbon.
	UseCustomFrame (see page 6765)	Indicates whether to use a custom frame for ribbon controls.

76.1.4.2 TCustomRibbon.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbon(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Create

Destroy

Canvas

Owner

76.1.4.3 TCustomRibbon.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbon();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

76.1.4.4 TCustomRibbon Constants

The constants of the TCustomRibbon class are listed here.

Public Constants

	Name	Description
	cRibbonFirstTabOffSet (see page 6730)	This is cRibbonFirstTabOffSet, a member of class TCustomRibbon.
	cRibbonGroupCaptionHeight (see page 6730)	This is cRibbonGroupCaptionHeight, a member of class TCustomRibbon.
	cRibbonGroupHeight (see page 6730)	This is cRibbonGroupHeight, a member of class TCustomRibbon.
	cRibbonHeight (see page 6730)	This is cRibbonHeight, a member of class TCustomRibbon.
	cRibbonHideHeight (see page 6730)	This is cRibbonHideHeight, a member of class TCustomRibbon.
	cRibbonHideWidth (see page 6731)	This is cRibbonHideWidth, a member of class TCustomRibbon.
	cRibbonMinimizedHeight (see page 6731)	This is cRibbonMinimizedHeight, a member of class TCustomRibbon.
	cRibbonMinimumCaptionWidth (see page 6731)	This is cRibbonMinimumCaptionWidth, a member of class TCustomRibbon.
	cRibbonPageHeight (see page 6731)	This is cRibbonPageHeight, a member of class TCustomRibbon.
	cRibbonQATHeight (see page 6732)	This is cRibbonQATHeight, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarLeft (see page 6732)	This is cRibbonQuickAccessToolbarLeft, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarTop (see page 6732)	This is cRibbonQuickAccessToolbarTop, a member of class TCustomRibbon.
	cRibbonTabHeight (see page 6732)	This is cRibbonTabHeight, a member of class TCustomRibbon.
	cRibbonTabScrollButtonWidth (see page 6732)	This is cRibbonTabScrollButtonWidth, a member of class TCustomRibbon.
	cRibbonTabSpacing (see page 6733)	This is cRibbonTabSpacing, a member of class TCustomRibbon.
	cRibbonUnthemedCaptionHeight (see page 6733)	This is cRibbonUnthemedCaptionHeight, a member of class TCustomRibbon.
	UM_CHECKSIZE (see page 6733)	This is UM_CHECKSIZE, a member of class TCustomRibbon.
	UM_DISPLAYKEYTIPS (see page 6733)	This is UM_DISPLAYKEYTIPS, a member of class TCustomRibbon.

76.1.4.4.1 TCustomRibbon.cRibbonFirstTabOffSet Constant

Pascal

```
const cRibbonFirstTabOffSet = 47;
```

C++

```
cRibbonFirstTabOffSet = 47;
```

Description

This is cRibbonFirstTabOffSet, a member of class TCustomRibbon.

76.1.4.4.2 TCustomRibbon.cRibbonGroupCaptionHeight Constant

Pascal

```
const cRibbonGroupCaptionHeight = 16;
```

C++

```
cRibbonGroupCaptionHeight = 16;
```

Description

This is cRibbonGroupCaptionHeight, a member of class TCustomRibbon.

76.1.4.4.3 TCustomRibbon.cRibbonGroupHeight Constant

Pascal

```
const cRibbonGroupHeight = 86;
```

C++

```
cRibbonGroupHeight = 86;
```

Description

This is cRibbonGroupHeight, a member of class TCustomRibbon.

76.1.4.4.4 TCustomRibbon.cRibbonHeight Constant

Pascal

```
const cRibbonHeight = 117;
```

C++

```
cRibbonHeight = 117;
```

Description

This is cRibbonHeight, a member of class TCustomRibbon.

76.1.4.4.5 TCustomRibbon.cRibbonHideHeight Constant

Pascal

```
const cRibbonHideHeight = 250;
```

C++

```
cRibbonHideHeight = 250;
```

Description

This is cRibbonHideHeight, a member of class TCustomRibbon.

76.1.4.4.6 TCustomRibbon.cRibbonHideWidth Constant

Pascal

```
const cRibbonHideWidth = 300;
```

C++

```
cRibbonHideWidth = 300;
```

Description

This is cRibbonHideWidth, a member of class TCustomRibbon.

76.1.4.4.7 TCustomRibbon.cRibbonMinimizedHeight Constant

Pascal

```
const cRibbonMinimizedHeight = 27;
```

C++

```
cRibbonMinimizedHeight = 27;
```

Description

This is cRibbonMinimizedHeight, a member of class TCustomRibbon.

76.1.4.4.8 TCustomRibbon.cRibbonMinimumCaptionWidth Constant

Pascal

```
const cRibbonMinimumCaptionWidth = 50;
```

C++

```
cRibbonMinimumCaptionWidth = 50;
```

Description

This is cRibbonMinimumCaptionWidth, a member of class TCustomRibbon.

76.1.4.4.9 TCustomRibbon.cRibbonPageHeight Constant

Pascal

```
const cRibbonPageHeight = 93;
```

C++

```
cRibbonPageHeight = 93;
```

Description

This is cRibbonPageHeight, a member of class TCustomRibbon.

76.1.4.4.10 TCustomRibbon.cRibbonQATHeight Constant

Pascal

```
const cRibbonQATHeight = 26;
```

C++

```
cRibbonQATHeight = 26;
```

Description

This is cRibbonQATHeight, a member of class TCustomRibbon.

76.1.4.4.11 TCustomRibbon.cRibbonQuickAccessToolbarLeft Constant

Pascal

```
const cRibbonQuickAccessToolbarLeft = 34;
```

C++

```
cRibbonQuickAccessToolbarLeft = 34;
```

Description

This is cRibbonQuickAccessToolbarLeft, a member of class TCustomRibbon.

76.1.4.4.12 TCustomRibbon.cRibbonQuickAccessToolbarTop Constant

Pascal

```
const cRibbonQuickAccessToolbarTop = 5;
```

C++

```
cRibbonQuickAccessToolbarTop = 5;
```

Description

This is cRibbonQuickAccessToolbarTop, a member of class TCustomRibbon.

76.1.4.4.13 TCustomRibbon.cRibbonTabHeight Constant

Pascal

```
const cRibbonTabHeight = 23;
```

C++

```
cRibbonTabHeight = 23;
```

Description

This is cRibbonTabHeight, a member of class TCustomRibbon.

76.1.4.4.14 TCustomRibbon.cRibbonTabScrollButtonWidth Constant

Pascal

```
const cRibbonTabScrollButtonWidth = 12;
```

C++

```
cRibbonTabScrollButtonWidth = 12;
```

Description

This is cRibbonTabScrollButtonWidth, a member of class TCustomRibbon.

76.1.4.4.15 TCustomRibbon.cRibbonTabSpacing Constant

Pascal

```
const cRibbonTabSpacing = 6;
```

C++

```
cRibbonTabSpacing = 6;
```

Description

This is cRibbonTabSpacing, a member of class TCustomRibbon.

76.1.4.4.16 TCustomRibbon.cRibbonUnthemedCaptionHeight Constant

Pascal

```
const cRibbonUnthemedCaptionHeight = 30;
```

C++

```
cRibbonUnthemedCaptionHeight = 30;
```

Description

This is cRibbonUnthemedCaptionHeight, a member of class TCustomRibbon.

76.1.4.4.17 TCustomRibbon.UM_CHECKSIZE Constant

Pascal

```
const UM_CHECKSIZE = WM_USER + 2;
```

C++

```
UM_CHECKSIZE = WM_USER + 2;
```

Description

This is UM_CHECKSIZE, a member of class TCustomRibbon.

76.1.4.4.18 TCustomRibbon.UM_DISPLAYKEYTIPS Constant

Pascal

```
const UM_DISPLAYKEYTIPS = WM_USER + 1;
```

C++

```
UM_DISPLAYKEYTIPS = WM_USER + 1;
```

Description

This is UM_DISPLAYKEYTIPS, a member of class TCustomRibbon.

76.1.4.5 TCustomRibbon Methods

The methods of the TCustomRibbon class are listed here.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 6736)	This is CMBidimodechanged, a member of class TCustomRibbon.
	CMDesignHitTest (see page 6737)	This is CMDesignHitTest, a member of class TCustomRibbon.
	CMFontchanged (see page 6737)	This is CMFontchanged, a member of class TCustomRibbon.
	CMMouseenter (see page 6737)	This is CMMouseenter, a member of class TCustomRibbon.
	CMMouseleave (see page 6737)	This is CMMouseleave, a member of class TCustomRibbon.
	CMTextchanged (see page 6738)	This is CMTextchanged, a member of class TCustomRibbon.
	CMThemeChanged (see page 6738)	This is CMThemeChanged, a member of class TCustomRibbon.
V	ContextMenuPopupHandler (see page 6738)	This is ContextMenuPopupHandler, a member of class TCustomRibbon.
V	CreateContextMenu (see page 6738)	This is CreateContextMenu, a member of class TCustomRibbon.
V	CustomFrameWndProc (see page 6739)	This is CustomFrameWndProc, a member of class TCustomRibbon.
V	DblClick (see page 6739)	OnDblClick event dispatcher.
V	DefineProperties (see page 6739)	Provides methods to read and write the IsControl property to a stream such as a form file.
V	DisplayKeyTips (see page 6740)	This is DisplayKeyTips, a member of class TCustomRibbon.
V	DoAddToQuickAccessToolbar (see page 6740)	This is DoAddToQuickAccessToolbar, a member of class TCustomRibbon.
V	DoChangeQuickAccessToolbarPosition (see page 6740)	This is DoChangeQuickAccessToolbarPosition, a member of class TCustomRibbon.
V	DoContextPopup (see page 6741)	OnContextPopup event dispatcher.
V	DoCustomizeQuickAccessToolbar (see page 6741)	This is DoCustomizeQuickAccessToolbar, a member of class TCustomRibbon.
V	DoGroupStyleChanged (see page 6741)	This is DoGroupStyleChanged, a member of class TCustomRibbon.
V	DoHelpButtonClick (see page 6741)	This is DoHelpButtonClick, a member of class TCustomRibbon.
V	DoMinimizeRibbon (see page 6742)	This is DoMinimizeRibbon, a member of class TCustomRibbon.
V	DoMouseWheelDown (see page 6742)	OnMouseWheelDown event dispatcher.
V	DoMouseWheelUp (see page 6743)	OnMouseWheelUp event dispatcher.
V	DoRecentItemClick (see page 6743)	This is DoRecentItemClick, a member of class TCustomRibbon.
V	DoScrollTabsLeft (see page 6743)	This is DoScrollTabsLeft, a member of class TCustomRibbon.
V	DoScrollTabsRight (see page 6743)	This is DoScrollTabsRight, a member of class TCustomRibbon.
V	DoTabChange (see page 6744)	This is DoTabChange, a member of class TCustomRibbon.
V	DrawCaption (see page 6744)	This is DrawCaption, a member of class TCustomRibbon.
V	DrawQuickAccessToolbar (see page 6744)	This is DrawQuickAccessToolbar, a member of class TCustomRibbon.
	DrawSystemButtons (see page 6744)	This is DrawSystemButtons, a member of class TCustomRibbon.
V	DrawTab (see page 6745)	This is DrawTab, a member of class TCustomRibbon.
	GetContextMenuOptions (see page 6745)	This is GetContextMenuOptions, a member of class TCustomRibbon.
V	GetHelpButtonRect (see page 6745)	This is GetHelpButtonRect, a member of class TCustomRibbon.
	GetRibbonHeight (see page 6746)	This is GetRibbonHeight, a member of class TCustomRibbon.
V	GetTabAt (see page 6746)	This is GetTabAt, a member of class TCustomRibbon.
V	GetTabRect (see page 6746)	This is GetTabRect, a member of class TCustomRibbon.
V	GetTabWidth (see page 6747)	This is GetTabWidth, a member of class TCustomRibbon.
	HasApplicationMenu (see page 6747)	This is HasApplicationMenu, a member of class TCustomRibbon.
	HasQuickAccessToolbar (see page 6747)	This is HasQuickAccessToolbar, a member of class TCustomRibbon.
	Idle (see page 6747)	This is Idle, a member of class TCustomRibbon.
V	KeyDown (see page 6749)	Respond to key press events.
V	Loaded (see page 6749)	Initializes the control after it is loaded from a stream.
V	MouseDown (see page 6750)	OnMouseDown event dispatcher.
	MouseInSystemMenu (see page 6750)	This is MouseInSystemMenu, a member of class TCustomRibbon.
V	MouseMove (see page 6750)	Respond to mouse moving over control area..
V	MouseUp (see page 6751)	OnMouseUp event dispatcher.
V	Notification (see page 6752)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 6752)	Renders the image of a custom control.
	RebuildRibbonMetrics (see page 6753)	This is RebuildRibbonMetrics, a member of class TCustomRibbon.
V	Resize (see page 6754)	Respond to control resize.
V	SetParent (see page 6754)	Sets the parent of the control.

	UMCheckResize (see page 6756)	This is UMCheckResize, a member of class TCustomRibbon.
	UMDisplayKeyTips (see page 6756)	This is UMDisplayKeyTips, a member of class TCustomRibbon.
	UpdateQATPosition (see page 6757)	This is UpdateQATPosition, a member of class TCustomRibbon.
	UpdateSystemMenuInfo (see page 6757)	This is UpdateSystemMenuInfo, a member of class TCustomRibbon.
	ValidTab (see page 6757)	This is ValidTab, a member of class TCustomRibbon.
	WMEraseBkgnd (see page 6757)	This is WMEraseBkgnd, a member of class TCustomRibbon.
	WMGetDlgCode (see page 6758)	This is WMGetDlgCode, a member of class TCustomRibbon.
	WMKillFocus (see page 6758)	This is WMKillFocus, a member of class TCustomRibbon.
	WMSettingChange (see page 6758)	This is WMSettingChange, a member of class TCustomRibbon.
	WMWindowPosChanged (see page 6758)	This is WMWindowPosChanged, a member of class TCustomRibbon.

Public Methods

	Name	Description
	AddRecentItem (see page 6735)	Add new entry into Recent Items list.
	AddTab (see page 6736)	This is AddTab, a member of class TCustomRibbon.
	BeginUpdate (see page 6736)	This is BeginUpdate, a member of class TCustomRibbon.
	CheckRibbonSize (see page 6736)	This is CheckRibbonSize, a member of class TCustomRibbon.
	ClearRecentItems (see page 6736)	This is ClearRecentItems, a member of class TCustomRibbon.
	CustomFrameSupported (see page 6738)	This is CustomFrameSupported, a member of class TCustomRibbon.
	DeleteTab (see page 6740)	Delete tab at specified Index.
	DoMouseWheelEx (see page 6742)	This is DoMouseWheelEx, a member of class TCustomRibbon.
	EndUpdate (see page 6745)	This is EndUpdate, a member of class TCustomRibbon.
	GetIcon (see page 6745)	Return Icon used by Application (see page 2612) Menu (see page 6762) Button.
	GetRibbonMetric (see page 6746)	This is GetRibbonMetric, a member of class TCustomRibbon.
	InvalidateHeaderArea (see page 6747)	Invalidate header section of Ribbon (see page 6713).
	InvalidateScrollButtons (see page 6748)	This is InvalidateScrollButtons, a member of class TCustomRibbon.
	InvalidateSystemMenuArea (see page 6748)	This is InvalidateSystemMenuArea, a member of class TCustomRibbon.
	InvalidateTabArea (see page 6748)	Invalidate area that displays tabs.
	MoveGroup (see page 6751)	Move group to new page.
	RemoveAllTabs (see page 6753)	Remove all Tabs (see page 6764) from Ribbon (see page 6713).
	RemoveRecentItem (see page 6753)	This is RemoveRecentItem, a member of class TCustomRibbon.
	RemoveTab (see page 6753)	Remove tab with specified caption.
	SetBounds (see page 6754)	Sets the windowed control's boundary properties all at once.
	TabHandledKeyTips (see page 6755)	Validate **KeyTip** input when **KeyTip**s State is **ktsTabs**.
	TabHideKeyTips (see page 6755)	Hide K**eyTip**s.
	TabShowKeyTips (see page 6756)	Display **KeyTip**s for **ktsTabs** State.

76.1.4.5.1 TCustomRibbon.AddRecentItem Method

Add new entry into Recent Items list.

Pascal

```
function AddRecentItem(const FileName: string): Integer;
```

C++

```
__fastcall int AddRecentItem(const UnicodeString FileName);
```

Description

Call AddRecentItem to add a new entry into the Recent Items list to the right of the Application (see page 2612) Menu (see page 6762). The new entry is automatically added to the top of the Recent items list, and if an entry with the same filename already exists, it is deleted.

This method should only be called when the command type for the application menu is set to **ctRecent**.

76.1.4.5.2 TCustomRibbon.AddTab Method

Pascal

```
function AddTab(const APage: TCustomRibbonPage): TRibbonTabItem;
```

C++

```
__fastcall TRibbonTabItem AddTab(const TCustomRibbonPage APage);
```

Description

This is AddTab, a member of class TCustomRibbon.

76.1.4.5.3 TCustomRibbon.BeginUpdate Method

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

This is BeginUpdate, a member of class TCustomRibbon.

76.1.4.5.4 TCustomRibbon.CheckRibbonSize Method

Pascal

```
procedure CheckRibbonSize;
```

C++

```
__fastcall CheckRibbonSize();
```

Description

This is CheckRibbonSize, a member of class TCustomRibbon.

76.1.4.5.5 TCustomRibbon.ClearRecentItems Method

Pascal

```
procedure ClearRecentItems;
```

C++

```
__fastcall ClearRecentItems();
```

Description

This is ClearRecentItems, a member of class TCustomRibbon.

76.1.4.5.6 TCustomRibbon.CMBidimodechanged Method

Pascal

```
procedure CMBidimodechanged(var Message: TMessage); message CM_BIDIMODECHANGED;
```

C++

```
__fastcall CMBidimodechanged(TMessage Message);
```

Description

This is CMBidimodechanged, a member of class TCustomRibbon.

76.1.4.5.7 TCustomRibbon.CMDesignHitTest Method

Pascal

```
procedure CMDesignHitTest(var Message: TCMDesignHitTest); message CM_DESIGNHITTEST;
```

C++

```
__fastcall CMDesignHitTest(TCMDesignHitTest Message);
```

Description

This is CMDesignHitTest, a member of class TCustomRibbon.

76.1.4.5.8 TCustomRibbon.CMFontchanged Method

Pascal

```
procedure CMFontchanged(var Message: TMessage); message CM_FONTCHANGED;
```

C++

```
__fastcall CMFontchanged(TMessage Message);
```

Description

This is CMFontchanged, a member of class TCustomRibbon.

76.1.4.5.9 TCustomRibbon.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TCustomRibbon.

76.1.4.5.10 TCustomRibbon.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TCustomRibbon.

76.1.4.5.11 TCustomRibbon.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TCustomRibbon.

76.1.4.5.12 TCustomRibbon.CMThemeChanged Method

Pascal

```
procedure CMThemeChanged(var Message: TMessage); message CM_THEMECHANGED;
```

C++

```
__fastcall CMThemeChanged(TMessage Message);
```

Description

This is CMThemeChanged, a member of class TCustomRibbon.

76.1.4.5.13 TCustomRibbon.ContextMenuPopupHandler Method

Pascal

```
procedure ContextMenuPopupHandler(Sender: TObject); virtual;
```

C++

```
virtual __fastcall ContextMenuPopupHandler(TObject * Sender);
```

Description

This is ContextMenuPopupHandler, a member of class TCustomRibbon.

76.1.4.5.14 TCustomRibbon.CreateContextMenu Method

Pascal

```
procedure CreateContextMenu; virtual;
```

C++

```
virtual __fastcall CreateContextMenu();
```

Description

This is CreateContextMenu, a member of class TCustomRibbon.

76.1.4.5.15 TCustomRibbon.CustomFrameSupported Method

Pascal

```
function CustomFrameSupported: Boolean;
```

C++

```
__fastcall Boolean CustomFrameSupported();
```

Description

This is CustomFrameSupported, a member of class TCustomRibbon.

76.1.4.5.16 TCustomRibbon.CustomFrameWndProc Method

Pascal

```
procedure CustomFrameWndProc(var Message: TMessage); virtual;
```

C++

```
virtual __fastcall CustomFrameWndProc(TMessage Message);
```

Description

This is CustomFrameWndProc, a member of class TCustomRibbon.

76.1.4.5.17 TCustomRibbon.DblClick Method

OnDblClick event dispatcher.

Pascal

```
procedure DblClick; override;
```

C++

```
virtual __fastcall DblClick();
```

Description

DblClick calls any event handler attached to the OnDblClick event. Override DblClick to provide other responses in addition to the inherited event-handler call when the user double-clicks the control.

The DblClick method is triggered by left mouse-button double-click message (WM_LBUTTONDBLCLK) from Windows.

See Also

Click

OnDblClick

76.1.4.5.18 TCustomRibbon.DefineProperties Method

Provides methods to read and write the IsControl property to a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

DefineProperties is called automatically by the streaming system that loads and saves VCL components. It allows persistent objects to read and write properties that are not published. Published properties are loaded and stored automatically.

DefineProperties uses the methods of the filer passed as the Filer parameter to assign methods that can load and save the IsControl property.

Override DefineProperties to persist unpublished properties. Call the DefineBinaryProperty or DefineProperty method of the Filer parameter to assign methods that load or save property values.

Note: When overriding this method, call the parent class's DefineProperties method first.

See Also

DefineBinaryProperty

DefineProperty

DefineProperties

IsControl

76.1.4.5.19 TCustomRibbon.DeleteTab Method

Delete tab at specified Index.

Pascal

```
procedure DeleteTab(const Index: Integer);
```

C++

```
__fastcall DeleteTab(const int Index);
```

Description

DeleteTab deletes the tab at the specified Index. The Page and any associated Groups are also deleted

76.1.4.5.20 TCustomRibbon.DisplayKeyTips Method

Pascal

```
procedure DisplayKeyTips(const State: TKeyTipState); virtual;
```

C++

```
virtual __fastcall DisplayKeyTips(const TKeyTipState State);
```

Description

This is DisplayKeyTips, a member of class TCustomRibbon.

76.1.4.5.21 TCustomRibbon.DoAddToQuickAccessToolbar Method

Pascal

```
procedure DoAddToQuickAccessToolbar; virtual;
```

C++

```
virtual __fastcall DoAddToQuickAccessToolbar();
```

Description

This is DoAddToQuickAccessToolbar, a member of class TCustomRibbon.

76.1.4.5.22 TCustomRibbon.DoChangeQuickAccessToolbarPosition Method

Pascal

```
procedure DoChangeQuickAccessToolbarPosition; virtual;
```

C++

```
virtual __fastcall DoChangeQuickAccessToolbarPosition();
```

Description

This is DoChangeQuickAccessToolbarPosition, a member of class TCustomRibbon.

76.1.4.5.23 TCustomRibbon.DoContextPopup Method

OnContextPopup event dispatcher.

Pascal

```
procedure DoContextPopup(MousePos: TPoint; var Handled: Boolean); override;
```

C++

```
virtual __fastcall DoContextPopup(TPoint MousePos, Boolean Handled);
```

Description

OnContextPopup calls any event handler attached to the OnContextPopup event. When creating a component that descends from TControl, override OnContextPopup to provide other responses in addition to the inherited event-handler call when the user invokes the control's context menu.

MousePos indicates the position where the user right-clicked the control. If the user invoked the context menu using the keyboard, MousePos is (-1,-1).

Handled returns a Boolean value indicating whether the control should continue with its default response to the user action.

See Also

OnContextPopup

76.1.4.5.24 TCustomRibbon.DoCustomizeQuickAccessToolbar Method

Pascal

```
procedure DoCustomizeQuickAccessToolbar; virtual;
```

C++

```
virtual __fastcall DoCustomizeQuickAccessToolbar();
```

Description

This is DoCustomizeQuickAccessToolbar, a member of class TCustomRibbon.

76.1.4.5.25 TCustomRibbon.DoGroupStyleChanged Method

Pascal

```
procedure DoGroupStyleChanged; virtual;
```

C++

```
virtual __fastcall DoGroupStyleChanged();
```

Description

This is DoGroupStyleChanged, a member of class TCustomRibbon.

76.1.4.5.26 TCustomRibbon.DoHelpButtonClick Method

Pascal

```
procedure DoHelpButtonClick; virtual;
```

C++

```
virtual __fastcall DoHelpButtonClick();
```

Description

This is DoHelpButtonClick, a member of class TCustomRibbon.

76.1.4.5.27 TCustomRibbon.DoMinimizeRibbon Method

Pascal

```
procedure DoMinimizeRibbon; virtual;
```

C++

```
virtual __fastcall DoMinimizeRibbon();
```

Description

This is DoMinimizeRibbon, a member of class TCustomRibbon.

76.1.4.5.28 TCustomRibbon.DoMouseWheelDown Method

OnMouseWheelDown event dispatcher.

Pascal

```
function DoMouseWheelDown(Shift: TShiftState; MousePos: TPoint): Boolean; override;
```

C++

```
virtual __fastcall Boolean DoMouseWheelDown(TShiftState Shift, TPoint MousePos);
```

Description

The DoMouseWheel method calls DoMouseWheelDown to generate an OnMouseWheelDown event.

The Shift parameter indicates the state of the Shift, Alt, and Ctrl keys.

The MousePos parameter indicates the position of the mouse pointer.

DoMouseWheelDown returns true if an event handler indicates that it handled the message, and false otherwise.

Override DoMouseWheelDown to perform class-specific tasks in addition to calling the event handler when the mouse wheel is rotated downward.

See Also

OnMouseWheelDown

DoMouseWheel

76.1.4.5.29 TCustomRibbon.DoMouseWheelEx Method

Pascal

```
function DoMouseWheelEx(Shift: TShiftState; WheelDelta: Integer; MousePos: TPoint): Boolean;
```

C++

```
__fastcall Boolean DoMouseWheelEx(TShiftState Shift, int WheelDelta, TPoint MousePos);
```

Description

This is DoMouseWheelEx, a member of class TCustomRibbon.

76.1.4.5.30 TCustomRibbon.DoMouseWheelUp Method

OnMouseWheelUp event dispatcher.

Pascal

```
function DoMouseWheelUp(Shift: TShiftState; MousePos: TPoint): Boolean; override;
```

C++

```
virtual __fastcall Boolean DoMouseWheelUp(TShiftState Shift, TPoint MousePos);
```

Description

The DoMouseWheel method calls DoMouseWheelUp to generate an OnMouseWheelUp event.

The Shift parameter indicates the state of the Shift, Alt, and Ctrl keys.

The MousePos parameter indicates the position of the mouse pointer.

DoMouseWheelUp returns true if an event handler indicates that it handled the message, and false otherwise.

Override DoMouseWheelUp to perform class-specific tasks in addition to calling the event handler when the mouse wheel is rotated upward.

See Also

OnMouseWheelUp

DoMouseWheel

76.1.4.5.31 TCustomRibbon.DoRecentItemClick Method

Pascal

```
procedure DoRecentItemClick(const FileName: string; const Index: Integer); virtual;
```

C++

```
virtual __fastcall DoRecentItemClick(const UnicodeString FileName, const int Index);
```

Description

This is DoRecentItemClick, a member of class TCustomRibbon.

76.1.4.5.32 TCustomRibbon.DoScrollTabsLeft Method

Pascal

```
procedure DoScrollTabsLeft; virtual;
```

C++

```
virtual __fastcall DoScrollTabsLeft();
```

Description

This is DoScrollTabsLeft, a member of class TCustomRibbon.

76.1.4.5.33 TCustomRibbon.DoScrollTabsRight Method

Pascal

```
procedure DoScrollTabsRight; virtual;
```

C++

```
virtual __fastcall DoScrollTabsRight();
```

Description

This is DoScrollTabsRight, a member of class TCustomRibbon.

76.1.4.5.34 TCustomRibbon.DoTabChange Method

Pascal

```
procedure DoTabChange(const NewIndex: Integer; const OldIndex: Integer; var AllowChange:
Boolean); virtual;
```

C++

```
virtual __fastcall DoTabChange(const int NewIndex, const int OldIndex, Boolean AllowChange);
```

Description

This is DoTabChange, a member of class TCustomRibbon.

76.1.4.5.35 TCustomRibbon.DrawCaption Method

Pascal

```
procedure DrawCaption; virtual;
```

C++

```
virtual __fastcall DrawCaption();
```

Description

This is DrawCaption, a member of class TCustomRibbon.

76.1.4.5.36 TCustomRibbon.DrawQuickAccessToolbar Method

Pascal

```
procedure DrawQuickAccessToolbar; virtual;
```

C++

```
virtual __fastcall DrawQuickAccessToolbar();
```

Description

This is DrawQuickAccessToolbar, a member of class TCustomRibbon.

76.1.4.5.37 TCustomRibbon.DrawSystemButtons Method

Pascal

```
procedure DrawSystemButtons;
```

C++

```
__fastcall DrawSystemButtons();
```

Description

This is DrawSystemButtons, a member of class TCustomRibbon.

76.1.4.5.38 TCustomRibbon.DrawTab Method

Pascal

```
procedure DrawTab(const Index: Integer); virtual;
```

C++

```
virtual __fastcall DrawTab(const int Index);
```

Description

This is DrawTab, a member of class TCustomRibbon.

76.1.4.5.39 TCustomRibbon.EndUpdate Method

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

This is EndUpdate, a member of class TCustomRibbon.

76.1.4.5.40 TCustomRibbon.GetContextMenuOptions Method

Pascal

```
function GetContextMenuOptions: TContextMenuOptions;
```

C++

```
__fastcall TContextMenuOptions GetContextMenuOptions();
```

Description

This is GetContextMenuOptions, a member of class TCustomRibbon.

76.1.4.5.41 TCustomRibbon.GetHelpButtonRect Method

Pascal

```
function GetHelpButtonRect: TRect; virtual;
```

C++

```
virtual __fastcall TRect GetHelpButtonRect();
```

Description

This is GetHelpButtonRect, a member of class TCustomRibbon.

76.1.4.5.42 TCustomRibbon.GetIcon Method

Return Icon used by Application (see page 2612) Menu (see page 6762) Button.

Pascal

```
function GetIcon(out IconSize: TIconSize): TIcon; virtual;
```

C++

```
virtual __fastcall TIcon GetIcon(TIconSize IconSize);
```

Description

GetIcon returns the Icon used by the Application (see page 2612) Menu (see page 6762) Button. If there is no Icon assigned to the TApplicationMenu.Icon property, the application's icon is used.

See Also

TApplicationMenu (see page 6716)

Icon (see page 6720)

76.1.4.5.43 TCustomRibbon.GetRibbonHeight Method

Pascal

```
function GetRibbonHeight: Integer;
```

C++

```
__fastcall int GetRibbonHeight();
```

Description

This is GetRibbonHeight, a member of class TCustomRibbon.

76.1.4.5.44 TCustomRibbon.GetRibbonMetric Method

Pascal

```
function GetRibbonMetric(const Metric: TRibbonMetric): Integer;
```

C++

```
__fastcall int GetRibbonMetric(const TRibbonMetric Metric);
```

Description

This is GetRibbonMetric, a member of class TCustomRibbon.

76.1.4.5.45 TCustomRibbon.GetTabAt Method

Pascal

```
function GetTabAt(const X: Integer; const Y: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int GetTabAt(const int X, const int Y);
```

Description

This is GetTabAt, a member of class TCustomRibbon.

76.1.4.5.46 TCustomRibbon.GetTabRect Method

Pascal

```
function GetTabRect(const Index: Integer): TRect; virtual;
```

C++

```
virtual __fastcall TRect GetTabRect(const int Index);
```

Description

This is GetTabRect, a member of class TCustomRibbon.

76.1.4.5.47 TCustomRibbon.GetTabWidth Method

Pascal

```
function GetTabWidth(const Index: Integer): Integer; virtual;
```

C++

```
virtual __fastcall int GetTabWidth(const int Index);
```

Description

This is GetTabWidth, a member of class TCustomRibbon.

76.1.4.5.48 TCustomRibbon.HasApplicationMenu Method

Pascal

```
function HasApplicationMenu: Boolean;
```

C++

```
__fastcall Boolean HasApplicationMenu();
```

Description

This is HasApplicationMenu, a member of class TCustomRibbon.

76.1.4.5.49 TCustomRibbon.HasQuickAccessToolbar Method

Pascal

```
function HasQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean HasQuickAccessToolbar();
```

Description

This is HasQuickAccessToolbar, a member of class TCustomRibbon.

76.1.4.5.50 TCustomRibbon.Idle Method

Pascal

```
procedure Idle(const Msg: TMsg);
```

C++

```
__fastcall Idle(const TMsg Msg);
```

Description

This is Idle, a member of class TCustomRibbon.

76.1.4.5.51 TCustomRibbon.InvalidateHeaderArea Method

Invalidate header section of Ribbon (see page 6713).

Pascal

```
procedure InvalidateHeaderArea;
```

C++

```
__fastcall InvalidateHeaderArea();
```

Description

InvalidateHeaderArea invalidates the header section of the Ribbon (see page 6713). Invalidating the header of the ribbon is especially important when using a custom frame. When using a custom frame, the header section of the ribbon needs to react visually to additional non-client specific messages.

See Also

InvalidateTabArea (see page 6748)

76.1.4.5.52 TCustomRibbon.InvalidateScrollButtons Method

Pascal

```
procedure InvalidateScrollButtons;
```

C++

```
__fastcall InvalidateScrollButtons();
```

Description

This is InvalidateScrollButtons, a member of class TCustomRibbon.

76.1.4.5.53 TCustomRibbon.InvalidateSystemMenuArea Method

Pascal

```
procedure InvalidateSystemMenuArea;
```

C++

```
__fastcall InvalidateSystemMenuArea();
```

Description

This is InvalidateSystemMenuArea, a member of class TCustomRibbon.

76.1.4.5.54 TCustomRibbon.InvalidateTabArea Method

Invalidate area that displays tabs.

Pascal

```
procedure InvalidateTabArea;
```

C++

```
__fastcall InvalidateTabArea();
```

Description

InvalidateTabArea invalidates the area that displays the tabs.

See Also

InvalidateHeaderArea (see page 6747)

76.1.4.5.55 TCustomRibbon.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

KeyUp

OnKeyDown

DoKeyDown

DoKeyPress

DoKeyUp

76.1.4.5.56 TCustomRibbon.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded

Action

ActionChange

76.1.4.5.57 TCustomRibbon.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

MouseMove

MouseUp

OnMouseDown

76.1.4.5.58 TCustomRibbon.MouseInSystemMenu Method

Pascal

```
function MouseInSystemMenu(const LPt: TPoint): Boolean;
```

C++

```
__fastcall Boolean MouseInSystemMenu(const TPoint LPt);
```

Description

This is MouseInSystemMenu, a member of class TCustomRibbon.

76.1.4.5.59 TCustomRibbon.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown

MouseUp

OnMouseMove

76.1.4.5.60 TCustomRibbon.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

See Also

MouseDown

MouseMove

OnMouseUp

76.1.4.5.61 TCustomRibbon.MoveGroup Method

Move group to new page.

Pascal

```
procedure MoveGroup(const GroupName: string; const PageName: string);
```

C++

```
__fastcall MoveGroup(const UnicodeString GroupName, const UnicodeString PageName);
```

Description

MoveGroup moves a group to a new page. The group to be moved is specified in the **GroupName** parameter. The destination page is specified in the **PageName** parameter.

76.1.4.5.62 TCustomRibbon.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

76.1.4.5.63 TCustomRibbon.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas

PaintWindow

GetDeviceContext

ClipRect (see page 2718)

76.1.4.5.64 TCustomRibbon.RebuildRibbonMetrics Method

Pascal

```
procedure RebuildRibbonMetrics;
```

C++

```
__fastcall RebuildRibbonMetrics();
```

Description

This is RebuildRibbonMetrics, a member of class TCustomRibbon.

76.1.4.5.65 TCustomRibbon.RemoveAllTabs Method

Remove all Tabs (see page 6764) from Ribbon (see page 6713).

Pascal

```
procedure RemoveAllTabs;
```

C++

```
__fastcall RemoveAllTabs();
```

Description

RemoveAllTabs removes all Tabs (see page 6764) from the Ribbon (see page 6713). All associated pages and groups are deleted.

See Also

RemoveTab (see page 6753)

76.1.4.5.66 TCustomRibbon.RemoveRecentItem Method

Pascal

```
function RemoveRecentItem(const FileName: string): Boolean;
```

C++

```
__fastcall Boolean RemoveRecentItem(const UnicodeString FileName);
```

Description

This is RemoveRecentItem, a member of class TCustomRibbon.

76.1.4.5.67 TCustomRibbon.RemoveTab Method

Remove tab with specified caption.

Pascal

```
procedure RemoveTab(const ACaption: string);
```

C++

```
__fastcall RemoveTab(const UnicodeString ACaption);
```

Description

RemoveTab removes the tab with the specified caption. RemoveTab deletes the associated page and any groups on that page.

See Also

RemoveAllTabs (see page 6753)

76.1.4.5.68 TCustomRibbon.Resize Method

Respond to control resize.

Pascal

```
procedure Resize; override;
```

C++

```
virtual __fastcall Resize();
```

Description

Resize is called automatically immediately after the control's dimensions change. As implemented in TControl, Resize calls the control's OnResize event handler if it is assigned.

See Also

OnResize

76.1.4.5.69 TCustomRibbon.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

See Also

Height

Left

Top

Width

76.1.4.5.70 TCustomRibbon.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

See Also

Destroy

InsertControl

Parent

RemoveControl

76.1.4.5.71 TCustomRibbon.TabHandledKeyTips Method

Validate **KeyTip** input when **KeyTip**s State is **ktsTabs**.

Pascal

```
procedure TabHandledKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall TabHandledKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

TabHandledKeyTips validates **KeyTip** input when the **KeyTip**s State is **ktsTabs**. **KeyTip**s can be in either **ktsTabs** or **ktsControls** state. When the **KeyTip**s state is **ktsTabs**, the user has the option of selecting which Tab to switch to and display the **KeyTip**s for the controls on that tab. When the State **ktsTabs**, the Application (see page 2612) Button and Quick Access Toolbar are also displaying their **KeyTip**s.

The parameters are:

- KeyTip: The **KeyTip** the user has input that needs to be validated against.
- Full: A list of TKeyTipMatchItem (see page 6962) that contain details if any **KeyTip**s were matched.

See Also

TKeyTipMatchItem (see page 6962)

TKeyTipState (see page 7288)

76.1.4.5.72 TCustomRibbon.TabHideKeyTips Method

Hide K**eyTip**s.

Pascal

```
procedure TabHideKeyTips(const KeyTip: string; KeyTips: TKeyTipList);
```

C++

```
__fastcall TabHideKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

TabHideKeyTips hides the **KeyTip**s. If the **KeyTips** parameter is `nil`, all **KeyTip**s are hidden. Otherwise **KeyTips** contains TKeyTipMatchItem (see page 6962) that are not supposed to be hidden at this time. This would occur when there are a number of Partial **KeyTip** matches where the first character of a **KeyTip** matches many **KeyTip**s.

See Also

TKeyTipMatchItem (see page 6962)

TabShowKeyTips (see page 6756)

76.1.4.5.73 TCustomRibbon.TabShowKeyTips Method

Display **KeyTip**s for **ktsTabs** State.

Pascal

```
procedure TabShowKeyTips;
```

C++

```
__fastcall TabShowKeyTips();
```

Description

TabShowKeyTips displays the **KeyTip**s for the **ktsTabs** State. When called, **KeyTip**s are displayed for the Tabs (see page 6764), Application (see page 2612) Button and Quick Access Toolbar.

See Also

TabHideKeyTips (see page 6755)

TKeyTipState (see page 7288)

76.1.4.5.74 TCustomRibbon.UMCheckResize Method

Pascal

```
procedure UMCheckResize(var Message: TMessage); message UM_CHECKSIZE;
```

C++

```
__fastcall UMCheckResize(TMessage Message);
```

Description

This is UMCheckResize, a member of class TCustomRibbon.

76.1.4.5.75 TCustomRibbon.UMDisplayKeyTips Method

Pascal

```
procedure UMDisplayKeyTips(var Message: TMessage); message UM_DISPLAYKEYTIPS;
```

C++

```
__fastcall UMDisplayKeyTips(TMessage Message);
```

Description

This is UMDisplayKeyTips, a member of class TCustomRibbon.

76.1.4.5.76 TCustomRibbon.UpdateQATPosition Method

Pascal

```
procedure UpdateQATPosition;
```

C++

```
__fastcall UpdateQATPosition();
```

Description

This is UpdateQATPosition, a member of class TCustomRibbon.

76.1.4.5.77 TCustomRibbon.UpdateSystemMenuInfo Method

Pascal

```
procedure UpdateSystemMenuInfo;
```

C++

```
__fastcall UpdateSystemMenuInfo();
```

Description

This is UpdateSystemMenuInfo, a member of class TCustomRibbon.

76.1.4.5.78 TCustomRibbon.ValidTab Method

Pascal

```
function ValidTab(const Index: Integer): Boolean;
```

C++

```
__fastcall Boolean ValidTab(const int Index);
```

Description

This is ValidTab, a member of class TCustomRibbon.

76.1.4.5.79 TCustomRibbon.WMEraseBkgnd Method

Pascal

```
procedure WMEraseBkgnd(var Message: TWMEraseBkgnd); message WM_ERASEBKGND;
```

C++

```
__fastcall WMEraseBkgnd(TWMEraseBkgnd Message);
```

Description

This is WMEraseBkgnd, a member of class TCustomRibbon.

76.1.4.5.80 TCustomRibbon.WMGetDlgCode Method

Pascal

```
procedure WMGetDlgCode(var Message: TWMGetDlgCode); message WM_GETDLGCODE;
```

C++

```
__fastcall WMGetDlgCode(TWMGetDlgCode Message);
```

Description

This is WMGetDlgCode, a member of class TCustomRibbon.

76.1.4.5.81 TCustomRibbon.WMKillFocus Method

Pascal

```
procedure WMKillFocus(var Message: TWMKillFocus); message WM_KILLFOCUS;
```

C++

```
__fastcall WMKillFocus(TWMKillFocus Message);
```

Description

This is WMKillFocus, a member of class TCustomRibbon.

76.1.4.5.82 TCustomRibbon.WMSettingChange Method

Pascal

```
procedure WMSettingChange(var Message: TWMSettingChange); message WM_SETTINGCHANGE;
```

C++

```
__fastcall WMSettingChange(TWMSettingChange Message);
```

Description

This is WMSettingChange, a member of class TCustomRibbon.

76.1.4.5.83 TCustomRibbon.WMWindowPosChanged Method

Pascal

```
procedure WMWindowPosChanged(var Message: TWMWindowPosChanged); message WM_WINDOWPOSCHANGED;
```

C++

```
__fastcall WMWindowPosChanged(TWMWindowPosChanged Message);
```

Description

This is WMWindowPosChanged, a member of class TCustomRibbon.

76.1.4.6 TCustomRibbon Properties

The properties of the TCustomRibbon class are listed here.

Protected Properties

	Name	Description
	AllowKeyboardNavigation (see page 6760)	This is AllowKeyboardNavigation, a member of class TCustomRibbon.
	HideRibbon (see page 6761)	This is HideRibbon, a member of class TCustomRibbon.
	HotTabIndex (see page 6762)	This is HotTabIndex, a member of class TCustomRibbon.
	KeyTipsVisible (see page 6762)	This is KeyTipsVisible, a member of class TCustomRibbon.
R	Menu (see page 6762)	This is Menu, a member of class TCustomRibbon.
R	ScaleFactor (see page 6763)	This is ScaleFactor, a member of class TCustomRibbon.

Public Properties

	Name	Description
	ActionManager (see page 6759)	This is ActionManager, a member of class TCustomRibbon.
	Active (see page 6759)	Indicates if form that ribbon is placed on is active form.
	ActivePage (see page 6760)	Page currently displayed by ribbon control.
	ApplicationMenu (see page 6760)	Change appearance of ribbon's associated TRibbonApplicationMenuBar (see page 7302) control.
	ColorMap (see page 6761)	This is ColorMap, a member of class TCustomRibbon.
	DocumentName (see page 6761)	Text in Ribbon (see page 6713) caption.
	HideTabs (see page 6762)	Shows or hides Tab portion of Ribbon (see page 6713).
	Minimized (see page 6763)	Show Ribbon (see page 6713) in minimized state where tabs can be selected but are not visible.
	QuickAccessToolbar (see page 6763)	Properties associated with TQuickAccessToolbar (see page 6835).
	ScreenTips (see page 6763)	This is ScreenTips, a member of class TCustomRibbon.
	ShowHelpButton (see page 6764)	Determines whether ribbon displays Help Button.
	Style (see page 6764)	This is Style, a member of class TCustomRibbon.
	TabIndex (see page 6764)	Change the active page of ribbon.
	Tabs (see page 6764)	Collection of TRibbonTabs (see page 6925) visible on ribbon.
	UseCustomFrame (see page 6765)	Indicates whether to use a custom frame for ribbon controls.

76.1.4.6.1 TCustomRibbon.ActionManager Property

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

This is ActionManager, a member of class TCustomRibbon.

76.1.4.6.2 TCustomRibbon.Active Property

Indicates if form that ribbon is placed on is active form.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Active indicates if the form that the ribbon is placed on is the active form of the desktop.

There should be no need for a user to set the Active property unless they are not using the custom frame functionality of the

ribbon. The appearance of the ribbon changes depending on the value of this property.

If the form that the ribbon is placed on does not descend from TRibbonForm, the user should update the Active property when the form gets activated and deactivated.

See Also

ActivePage (see page 6760)

76.1.4.6.3 TCustomRibbon.ActivePage Property

Page currently displayed by ribbon control.

Pascal

```
property ActivePage: TCustomRibbonPage;
```

C++

```
__property TCustomRibbonPage ActivePage;
```

Description

ActivePage is the page currently displayed by the ribbon control.

Read ActivePage to determine which page is selected by the user. The user selects a page by clicking the mouse on its tab or selects the page's associated keytip. Set ActivePage to bring a page to the foreground. Only one page can be active at a time.

Use TRibbonTabs.SelectNext and TRibbonTabs.SelectPrior to select the next and prior pages in the ribbon. If the active page does not change after a call to SelectNext or SelectPrior, the return value of those functions is False.

To change the active page of the ribbon by Index, set the TabIndex (see page 6764) property to the desired page index.

See Also

TRibbonTabs (see page 6925)

Active (see page 6759)

TabIndex (see page 6764)

SelectNext (see page 6928)

SelectPrior (see page 6928)

76.1.4.6.4 TCustomRibbon.AllowKeyboardNavigation Property

Pascal

```
property AllowKeyboardNavigation: Boolean;
```

C++

```
__property Boolean AllowKeyboardNavigation;
```

Description

This is AllowKeyboardNavigation, a member of class TCustomRibbon.

76.1.4.6.5 TCustomRibbon.ApplicationMenu Property

Change appearance of ribbon's associated TRibbonApplicationMenuBar (see page 7302) control.

Pascal

```
property ApplicationMenu: TApplicationMenu;
```

C++

```
__property TApplicationMenu ApplicationMenu;
```

Description

ApplicationMenu changes the appearance for the ribbon's associated TRibbonApplicationMenuBar (see page 7302) control.

Changing the values of the fields in ApplicationMenu changes the characteristics of the Application (see page 2612) Menu (see page 6762) for the ribbon. The Application (see page 2612) Menu (see page 6762) on the ribbon is represented by the round button in the top left corner.

See Also

TApplicationMenu (see page 6716)

TRibbonApplicationMenuBar (see page 7302)

76.1.4.6.6 TCustomRibbon.ColorMap Property

Pascal

```
property ColorMap: TCustomActionBarColorMap;
```

C++

```
__property TCustomActionBarColorMap ColorMap;
```

Description

This is ColorMap, a member of class TCustomRibbon.

76.1.4.6.7 TCustomRibbon.DocumentName Property

Text in Ribbon (see page 6713) caption.

Pascal

```
property DocumentName: string;
```

C++

```
__property UnicodeString DocumentName;
```

Description

DocumentName appears in the Ribbon (see page 6713) caption.

See Also

CaptionFont

76.1.4.6.8 TCustomRibbon.HideRibbon Property

Pascal

```
property HideRibbon: Boolean;
```

C++

```
__property Boolean HideRibbon;
```

Description

This is HideRibbon, a member of class TCustomRibbon.

76.1.4.6.9 TCustomRibbon.HideTabs Property

Shows or hides Tab portion of Ribbon (see page 6713).

Pascal

```
property HideTabs: Boolean;
```

C++

```
__property Boolean HideTabs;
```

Description

HideTabs shows or hides the Tab portion of the Ribbon (see page 6713). When HideTabs is True, the user cannot access any of the Tabs (see page 6764) on the Ribbon (see page 6713).

76.1.4.6.10 TCustomRibbon.HotTabIndex Property

Pascal

```
property HotTabIndex: Integer;
```

C++

```
__property int HotTabIndex;
```

Description

This is HotTabIndex, a member of class TCustomRibbon.

76.1.4.6.11 TCustomRibbon.KeyTipsVisible Property

Pascal

```
property KeyTipsVisible: Boolean;
```

C++

```
__property Boolean KeyTipsVisible;
```

Description

This is KeyTipsVisible, a member of class TCustomRibbon.

76.1.4.6.12 TCustomRibbon.Menu Property

Pascal

```
property Menu: TRibbonApplicationMenuBar;
```

C++

```
__property TRibbonApplicationMenuBar Menu;
```

Description

This is Menu, a member of class TCustomRibbon.

76.1.4.6.13 TCustomRibbon.Minimized Property

Show Ribbon (see page 6713) in minimized state where tabs can be selected but are not visible.

Pascal

```
property Minimized: Boolean;
```

C++

```
__property Boolean Minimized;
```

Description

Minimized indicates whether to show the Ribbon (see page 6713) in a minimized state where tabs can be selected but are not visible. When Minimized is True, Tabs (see page 6764) still function. You can access the tabs by selecting the desired Tab with the mouse or switching to the tab by using tab allocated `KeyTips`.

76.1.4.6.14 TCustomRibbon.QuickAccessToolbar Property

Properties associated with TQuickAccessToolbar (see page 6835).

Pascal

```
property QuickAccessToolbar: TQuickAccessToolbar;
```

C++

```
__property TQuickAccessToolbar QuickAccessToolbar;
```

Description

QuickAccessToolbar has the properties associated with the TQuickAccessToolbar (see page 6835) on the ribbon. Use these properties to change the appearance of the Quick Access Toolbar as displayed on the ribbon.

See Also

TQuickAccessToolbar (see page 6835)

76.1.4.6.15 TCustomRibbon.ScaleFactor Property

Pascal

```
property ScaleFactor: Single;
```

C++

```
__property Single ScaleFactor;
```

Description

This is ScaleFactor, a member of class TCustomRibbon.

76.1.4.6.16 TCustomRibbon.ScreenTips Property

Pascal

```
property ScreenTips: TCustomScreenTipsManager;
```

C++

```
__property TCustomScreenTipsManager ScreenTips;
```

Description

This is ScreenTips, a member of class TCustomRibbon.

76.1.4.6.17 TCustomRibbon.ShowHelpButton Property

Determines whether ribbon displays Help Button.

Pascal

```
property ShowHelpButton: Boolean;
```

C++

```
__property Boolean ShowHelpButton;
```

Description

ShowHelpButton indicates whether or not the ribbon displays a Help Button in the top right hand corner.

See Also

THelpButton (see page 6825)

76.1.4.6.18 TCustomRibbon.Style Property

Pascal

```
property Style: TRibbonStyleActionBars;
```

C++

```
__property TRibbonStyleActionBars Style;
```

Description

This is Style, a member of class TCustomRibbon.

76.1.4.6.19 TCustomRibbon.TabIndex Property

Change the active page of ribbon.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

TabIndex changes the active page of the ribbon. Set the TabIndex property to the desired page index.

See Also

Tabs (see page 6764)

76.1.4.6.20 TCustomRibbon.Tabs Property

Collection of TRibbonTabs (see page 6925) visible on ribbon.

Pascal

```
property Tabs: TRibbonTabs;
```

C++

```
__property TRibbonTabs Tabs;
```

Description

Tabs contains a collection of TRibbonTabs (see page 6925) visible on the ribbon.

Tabs is a linked list of TRibbonTabs (see page 6925) objects. TRibbonTabs (see page 6925) is a simple data structure that contains the caption for the tab, the keytip for the tab as well as a reference to the Tab object.

See Also

TRibbonTabs (see page 6925)

TabIndex (see page 6764)

76.1.4.6.21 TCustomRibbon.UseCustomFrame Property

Indicates whether to use a custom frame for ribbon controls.

Pascal

```
property UseCustomFrame: Boolean;
```

C++

```
__property Boolean UseCustomFrame;
```

Description

UseCustomFrame indicates whether or not to use a custom frame, such as TRibbonForm, for ribbon controls.

See Also

TRibbonForm

76.1.4.7 TCustomRibbon Nested Types

The nested types of the TCustomRibbon class are listed here.

Public Nested Types

Name	Description
TTabChangeEvent (see page 6765)	This is nested type Ribbon.TCustomRibbon.TTabChangeEvent.

76.1.4.7.1 TCustomRibbon.TTabChangeEvent Nested Type

Pascal

```
TTabChangeEvent = procedure (Sender: TObject; const NewIndex, OldIndex: Integer; var
AllowChange: Boolean) of object;
```

C++

```
(Sender: TObject; const NewIndex, OldIndex: Integer; var AllowChange: Boolean) (
TTabChangeEvent)();
```

Description

This is nested type Ribbon.TCustomRibbon.TTabChangeEvent.

76.1.4.8 TCustomRibbon Events

The events of the TCustomRibbon class are listed here.

Protected Events

	Name	Description
	OnLeftTabScrollButtonClick (see page 6766)	This is OnLeftTabScrollButtonClick, a member of class TCustomRibbon.
	OnRightTabScrollButtonClick (see page 6767)	This is OnRightTabScrollButtonClick, a member of class TCustomRibbon.

Public Events

	Name	Description
	OnHelpButtonClick (see page 6766)	This is OnHelpButtonClick, a member of class TCustomRibbon.
	OnRecentItemClick (see page 6766)	This is OnRecentItemClick, a member of class TCustomRibbon.
	OnTabChange (see page 6767)	This is OnTabChange, a member of class TCustomRibbon.

76.1.4.8.1 TCustomRibbon.OnHelpButtonClick Event

Pascal

```
property OnHelpButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHelpButtonClick;
```

Description

This is OnHelpButtonClick, a member of class TCustomRibbon.

76.1.4.8.2 TCustomRibbon.OnLeftTabScrollButtonClick Event

Pascal

```
property OnLeftTabScrollButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnLeftTabScrollButtonClick;
```

Description

This is OnLeftTabScrollButtonClick, a member of class TCustomRibbon.

76.1.4.8.3 TCustomRibbon.OnRecentItemClick Event

Pascal

```
property OnRecentItemClick: TRecentItemClickEvent;
```

C++

```
__property TRecentItemClickEvent OnRecentItemClick;
```

Description

This is OnRecentItemClick, a member of class TCustomRibbon.

76.1.4.8.4 TCustomRibbon.OnRightTabScrollButtonClick Event

Pascal

```
property OnRightTabScrollButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnRightTabScrollButtonClick;
```

Description

This is OnRightTabScrollButtonClick, a member of class TCustomRibbon.

76.1.4.8.5 TCustomRibbon.OnTabChange Event

Pascal

```
property OnTabChange: TTabChangeEvent;
```

C++

```
__property TTabChangeEvent OnTabChange;
```

Description

This is OnTabChange, a member of class TCustomRibbon.

76.1.5 TCustomRibbonColorMap Class

Class Hierarchy

Pascal

```
TCustomRibbonColorMap = class(TXPColorMap);
```

C++

```
class TCustomRibbonColorMap : public TXPColorMap;
```

File

Ribbon

Description

This is class Ribbon.TCustomRibbonColorMap.

76.1.5.1 TCustomRibbonColorMap Members

The following tables list the members exposed by TCustomRibbonColorMap.

Public Properties

	Name	Description
	ActiveTabFontColor (see page 6768)	This is ActiveTabFontColor, a member of class TCustomRibbonColorMap.
	BevelMinimizedInner (see page 6768)	This is BevelMinimizedInner, a member of class TCustomRibbonColorMap.
	BevelMinimizedOuter (see page 6769)	This is BevelMinimizedOuter, a member of class TCustomRibbonColorMap.

	CaptionFontColor (see page 6769)	This is CaptionFontColor, a member of class TCustomRibbonColorMap.
	ControlColor (see page 6769)	This is ControlColor, a member of class TCustomRibbonColorMap.
	ControlFrameColor (see page 6769)	This is ControlFrameColor, a member of class TCustomRibbonColorMap.
	ControlInactiveColor (see page 6769)	This is ControlInactiveColor, a member of class TCustomRibbonColorMap.
	DocumentFontColor (see page 6770)	This is DocumentFontColor, a member of class TCustomRibbonColorMap.
	GroupFontColor (see page 6770)	This is GroupFontColor, a member of class TCustomRibbonColorMap.
	InactiveTabFontColor (see page 6770)	This is InactiveTabFontColor, a member of class TCustomRibbonColorMap.
	QuickAccessToolbarMoreBorderColor (see page 6770)	This is QuickAccessToolbarMoreBorderColor, a member of class TCustomRibbonColorMap.
	QuickAccessToolbarMoreColor (see page 6771)	This is QuickAccessToolbarMoreColor, a member of class TCustomRibbonColorMap.

76.1.5.2 TCustomRibbonColorMap Properties

The properties of the TCustomRibbonColorMap class are listed here.

Public Properties

	Name	Description
	ActiveTabFontColor (see page 6768)	This is ActiveTabFontColor, a member of class TCustomRibbonColorMap.
	BevelMinimizedInner (see page 6768)	This is BevelMinimizedInner, a member of class TCustomRibbonColorMap.
	BevelMinimizedOuter (see page 6769)	This is BevelMinimizedOuter, a member of class TCustomRibbonColorMap.
	CaptionFontColor (see page 6769)	This is CaptionFontColor, a member of class TCustomRibbonColorMap.
	ControlColor (see page 6769)	This is ControlColor, a member of class TCustomRibbonColorMap.
	ControlFrameColor (see page 6769)	This is ControlFrameColor, a member of class TCustomRibbonColorMap.
	ControlInactiveColor (see page 6769)	This is ControlInactiveColor, a member of class TCustomRibbonColorMap.
	DocumentFontColor (see page 6770)	This is DocumentFontColor, a member of class TCustomRibbonColorMap.
	GroupFontColor (see page 6770)	This is GroupFontColor, a member of class TCustomRibbonColorMap.
	InactiveTabFontColor (see page 6770)	This is InactiveTabFontColor, a member of class TCustomRibbonColorMap.
	QuickAccessToolbarMoreBorderColor (see page 6770)	This is QuickAccessToolbarMoreBorderColor, a member of class TCustomRibbonColorMap.
	QuickAccessToolbarMoreColor (see page 6771)	This is QuickAccessToolbarMoreColor, a member of class TCustomRibbonColorMap.

76.1.5.2.1 TCustomRibbonColorMap.ActiveTabFontColor Property

Pascal

```
property ActiveTabFontColor: TColor;
```

C++

```
__property TColor ActiveTabFontColor;
```

Description

This is ActiveTabFontColor, a member of class TCustomRibbonColorMap.

76.1.5.2.2 TCustomRibbonColorMap.BevelMinimizedInner Property

Pascal

```
property BevelMinimizedInner: TColor;
```

C++

```
__property TColor BevelMinimizedInner;
```

Description

This is BevelMinimizedInner, a member of class TCustomRibbonColorMap.

76.1.5.2.3 TCustomRibbonColorMap.BevelMinimizedOuter Property

Pascal

```
property BevelMinimizedOuter: TColor;
```

C++

```
__property TColor BevelMinimizedOuter;
```

Description

This is BevelMinimizedOuter, a member of class TCustomRibbonColorMap.

76.1.5.2.4 TCustomRibbonColorMap.CaptionFontColor Property

Pascal

```
property CaptionFontColor: TColor;
```

C++

```
__property TColor CaptionFontColor;
```

Description

This is CaptionFontColor, a member of class TCustomRibbonColorMap.

76.1.5.2.5 TCustomRibbonColorMap.ControlColor Property

Pascal

```
property ControlColor: TColor;
```

C++

```
__property TColor ControlColor;
```

Description

This is ControlColor, a member of class TCustomRibbonColorMap.

76.1.5.2.6 TCustomRibbonColorMap.ControlFrameColor Property

Pascal

```
property ControlFrameColor: TColor;
```

C++

```
__property TColor ControlFrameColor;
```

Description

This is ControlFrameColor, a member of class TCustomRibbonColorMap.

76.1.5.2.7 TCustomRibbonColorMap.ControlInactiveColor Property

Pascal

```
property ControlInactiveColor: TColor;
```

C++

```
__property TColor ControlInactiveColor;
```

Description

This is ControlInactiveColor, a member of class TCustomRibbonColorMap.

76.1.5.2.8 TCustomRibbonColorMap.DocumentFontColor Property

Pascal

```
property DocumentFontColor: TColor;
```

C++

```
__property TColor DocumentFontColor;
```

Description

This is DocumentFontColor, a member of class TCustomRibbonColorMap.

76.1.5.2.9 TCustomRibbonColorMap.GroupFontColor Property

Pascal

```
property GroupFontColor: TColor;
```

C++

```
__property TColor GroupFontColor;
```

Description

This is GroupFontColor, a member of class TCustomRibbonColorMap.

76.1.5.2.10 TCustomRibbonColorMap.InactiveTabFontColor Property

Pascal

```
property InactiveTabFontColor: TColor;
```

C++

```
__property TColor InactiveTabFontColor;
```

Description

This is InactiveTabFontColor, a member of class TCustomRibbonColorMap.

76.1.5.2.11 TCustomRibbonColorMap.QuickAccessToolbarMoreBorderColor Property

Pascal

```
property QuickAccessToolbarMoreBorderColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreBorderColor;
```

Description

This is QuickAccessToolbarMoreBorderColor, a member of class TCustomRibbonColorMap.

76.1.5.2.12 TCustomRibbonColorMap.QuickAccessToolbarMoreColor Property

Pascal

```
property QuickAccessToolbarMoreColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreColor;
```

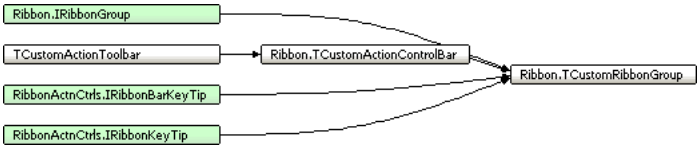
Description

This is QuickAccessToolbarMoreColor, a member of class TCustomRibbonColorMap.

76.1.6 TCustomRibbonGroup Class

Align and display all controls on ribbon.

Class Hierarchy



Pascal

```
TCustomRibbonGroup = class(TCustomActionControlBar, IRibbonGroup, IRibbonBarKeyTip,
IRibbonKeyTip);
```

C++

```
class TCustomRibbonGroup : public TCustomActionControlBar, public IRibbonGroup, public
IRibbonBarKeyTip, public IRibbonKeyTip;
```

File

Ribbon

Description

TCustomRibbonGroup aligns and displays all controls available for use on the ribbon. Controls are displayed on a Ribbon (see page 6713) Group.

Creating an Application that Uses Ribbon Controls

Adding Commands to the Ribbon

TGroupAlign

76.1.6.1 TCustomRibbonGroup Members

The following tables list the members exposed by TCustomRibbonGroup.

Enumerations

	Name	Description
	TGroupAlign (see page 6774)	This is record Ribbon.TCustomRibbonGroup.TGroupAlign.

Protected Methods

	Name	Description
	AlignControls (see page 6775)	This is AlignControls, a member of class TCustomRibbonGroup.
	AutoSizingChanged (see page 6776)	This is AutoSizingChanged, a member of class TCustomRibbonGroup.
	CMControlChange (see page 6722)	This is CMControlChange, a member of class TCustomActionControlBar.
	CMFontchanged (see page 6777)	This is CMFontchanged, a member of class TCustomRibbonGroup.
	CMItemDropPoint (see page 6777)	This is CMItemDropPoint, a member of class TCustomRibbonGroup.
	CMMouseenter (see page 6778)	This is CMMouseenter, a member of class TCustomRibbonGroup.
	CMMouseleave (see page 6778)	This is CMMouseleave, a member of class TCustomRibbonGroup.
	CMTextchanged (see page 6778)	This is CMTextchanged, a member of class TCustomRibbonGroup.
	CreateControls (see page 6779)	This is CreateControls, a member of class TCustomRibbonGroup.
	DoDropItem (see page 6779)	This is DoDropItem, a member of class TCustomRibbonGroup.
	DoEndDrag (see page 6779)	This is DoEndDrag, a member of class TCustomRibbonGroup.
	DrawShowDialogButton (see page 6780)	This is DrawShowDialogButton, a member of class TCustomRibbonGroup.
	GetCaptionHeight (see page 6780)	This is GetCaptionHeight, a member of class TCustomRibbonGroup.
	GetControlClass (see page 6723)	This is GetControlClass, a member of class TCustomActionControlBar.
	GetGroupHeight (see page 6780)	This is GetGroupHeight, a member of class TCustomRibbonGroup.
	HideControls (see page 6781)	This is HideControls, a member of class TCustomRibbonGroup.
	MouseDown (see page 6782)	This is MouseDown, a member of class TCustomRibbonGroup.
	MouseMove (see page 6782)	This is MouseMove, a member of class TCustomRibbonGroup.
	MouseUp (see page 6783)	This is MouseUp, a member of class TCustomRibbonGroup.
	Notification (see page 6783)	This is Notification, a member of class TCustomRibbonGroup.
	Paint (see page 6783)	This is Paint, a member of class TCustomRibbonGroup.
	Resize (see page 6783)	This is Resize, a member of class TCustomRibbonGroup.
	SetAutoSizing (see page 6783)	This is SetAutoSizing, a member of class TCustomRibbonGroup.
	SetParent (see page 6784)	This is SetParent, a member of class TCustomRibbonGroup.
	SetupDropDownBtn (see page 6785)	This is SetupDropDownBtn, a member of class TCustomRibbonGroup.
	ShowControls (see page 6785)	This is ShowControls, a member of class TCustomRibbonGroup.

Protected Properties

	Name	Description
	CreatingControls (see page 6723)	This is CreatingControls, a member of class TCustomActionControlBar.

Public Methods

	Name	Description
	AlignGroupControls (see page 6775)	Align controls in Ribbon (see page 6713) Group
	Assign (see page 6775)	This is Assign, a member of class TCustomRibbonGroup.
	BarHandleKeyTips (see page 6776)	Iterate over any visible **KeyTip (see page 6788)**s and perform validation to determine if one of **KeyTip (see page 6788)**s is partial or full match.
	BarHideKeyTips (see page 6776)	Hide any visible KeyTips that commands are displaying.
	BarShowKeyTips (see page 6777)	Show K**eyTip**s for commands.
	Clone (see page 6777)	This is Clone, a member of class TCustomRibbonGroup.
	Create (see page 6773)	This is Create, a member of class TCustomRibbonGroup.
	CreateControl (see page 6778)	Recreate specific control.
	Destroy (see page 6773)	This is Destroy, a member of class TCustomRibbonGroup.
	DockDrop (see page 6779)	This is DockDrop, a member of class TCustomRibbonGroup.
	DragDrop (see page 6779)	This is DragDrop, a member of class TCustomRibbonGroup.
	GetKeyTip (see page 6780)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 6781)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 6781)	Hide **KeyTip** for command.
	KeyTipClick (see page 6782)	Handle clicking a **KeyTip**.
	SetBounds (see page 6784)	This is SetBounds, a member of class TCustomRibbonGroup.
	SetKeyTip (see page 6784)	Sets **KeyTip** for command.
	ShowKeyTip (see page 6785)	Shows **KeyTip** for command in specified position.

V	StyleChanged (see page 6785)	This is StyleChanged, a member of class TCustomRibbonGroup.

Public Nested Types

Name	Description
TRowPosition (see page 6790)	This is nested type Ribbon.TCustomRibbonGroup.TRowPosition.

Public Properties

	Name	Description
R	CanCollapse (see page 6786)	Determine whether group can be displayed collapsed.
R	CollapsedControl (see page 6786)	This is CollapsedControl, a member of class TCustomRibbonGroup.
	DialogAction (see page 6786)	Determines whether dialog button displayed in group.
	GroupAlign (see page 6787)	Determines how controls on group are aligned.
	GroupIndex (see page 6787)	Index of group within current tab.
	GroupVariant (see page 6787)	Current size variant ribbon group is using.
R	GroupWidth (see page 6788)	This is GroupWidth, a member of class TCustomRibbonGroup.
R	HasGallery (see page 6788)	Indicates if group has an in ribbon Gallery.
	Items (see page 6788)	This is Items, a member of class TCustomRibbonGroup.
	KeyTip (see page 6788)	Key tip for Dialog button of group.
R	Page (see page 6789)	Reference to Page group is on.
R	RequiredWidth (see page 6789)	Width required to display group.
	Rows (see page 6789)	Number of Rows in group has for controls.

76.1.6.2 TCustomRibbonGroup.Create Constructor

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonGroup(TComponent * AOwner);
```

Description

This is Create, a member of class TCustomRibbonGroup.

76.1.6.3 TCustomRibbonGroup.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbonGroup();
```

Description

This is Destroy, a member of class TCustomRibbonGroup.

76.1.6.4 TCustomRibbonGroup Enumerations

The enumerations of the TCustomRibbonGroup class are listed here.

Enumerations

	Name	Description
	TGroupAlign (see page 6774)	This is record Ribbon.TCustomRibbonGroup.TGroupAlign.

76.1.6.4.1 Ribbon.TCustomRibbonGroup.TGroupAlign Enumeration

Pascal

```
TGroupAlign = (
  gaHorizontal,
  gaVertical
);
```

C++

```
enum TGroupAlign {
  gaHorizontal,
  gaVertical
};
```

File

Ribbon

Description

This is record Ribbon.TCustomRibbonGroup.TGroupAlign.

76.1.6.5 TCustomRibbonGroup Methods

The methods of the TCustomRibbonGroup class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 6775)	This is AlignControls, a member of class TCustomRibbonGroup.
	AutoSizingChanged (see page 6776)	This is AutoSizingChanged, a member of class TCustomRibbonGroup.
	CMFontchanged (see page 6777)	This is CMFontchanged, a member of class TCustomRibbonGroup.
	CMItemDropPoint (see page 6777)	This is CMItemDropPoint, a member of class TCustomRibbonGroup.
	CMMouseenter (see page 6778)	This is CMMouseenter, a member of class TCustomRibbonGroup.
	CMMouseleave (see page 6778)	This is CMMouseleave, a member of class TCustomRibbonGroup.
	CMTextchanged (see page 6778)	This is CMTextchanged, a member of class TCustomRibbonGroup.
	CreateControls (see page 6779)	This is CreateControls, a member of class TCustomRibbonGroup.
	DoDropItem (see page 6779)	This is DoDropItem, a member of class TCustomRibbonGroup.
	DoEndDrag (see page 6779)	This is DoEndDrag, a member of class TCustomRibbonGroup.
	DrawShowDialogButton (see page 6780)	This is DrawShowDialogButton, a member of class TCustomRibbonGroup.
	GetCaptionHeight (see page 6780)	This is GetCaptionHeight, a member of class TCustomRibbonGroup.
	GetGroupHeight (see page 6780)	This is GetGroupHeight, a member of class TCustomRibbonGroup.
	HideControls (see page 6781)	This is HideControls, a member of class TCustomRibbonGroup.
	MouseDown (see page 6782)	This is MouseDown, a member of class TCustomRibbonGroup.
	MouseMove (see page 6782)	This is MouseMove, a member of class TCustomRibbonGroup.
	MouseUp (see page 6783)	This is MouseUp, a member of class TCustomRibbonGroup.
	Notification (see page 6783)	This is Notification, a member of class TCustomRibbonGroup.
	Paint (see page 6783)	This is Paint, a member of class TCustomRibbonGroup.
	Resize (see page 6783)	This is Resize, a member of class TCustomRibbonGroup.
	SetAutoSizing (see page 6783)	This is SetAutoSizing, a member of class TCustomRibbonGroup.
	SetParent (see page 6784)	This is SetParent, a member of class TCustomRibbonGroup.
	SetupDropDownBtn (see page 6785)	This is SetupDropDownBtn, a member of class TCustomRibbonGroup.
	ShowControls (see page 6785)	This is ShowControls, a member of class TCustomRibbonGroup.

Public Methods

	Name	Description
	AlignGroupControls (see page 6775)	Align controls in Ribbon (see page 6713) Group
	Assign (see page 6775)	This is Assign, a member of class TCustomRibbonGroup.
	BarHandleKeyTips (see page 6776)	Iterate over any visible **KeyTip (see page 6788)**s and perform validation to determine if one of **KeyTip (see page 6788)**s is partial or full match.
	BarHideKeyTips (see page 6776)	Hide any visible KeyTips that commands are displaying.
	BarShowKeyTips (see page 6777)	Show K**eyTip**s for commands.
	Clone (see page 6777)	This is Clone, a member of class TCustomRibbonGroup.
	CreateControl (see page 6778)	Recreate specific control.
	DockDrop (see page 6779)	This is DockDrop, a member of class TCustomRibbonGroup.
	DragDrop (see page 6779)	This is DragDrop, a member of class TCustomRibbonGroup.
	GetKeyTip (see page 6780)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 6781)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 6781)	Hide **KeyTip** for command.
	KeyTipClick (see page 6782)	Handle clicking a **KeyTip**.
	SetBounds (see page 6784)	This is SetBounds, a member of class TCustomRibbonGroup.
	SetKeyTip (see page 6784)	Sets **KeyTip** for command.
	ShowKeyTip (see page 6785)	Shows **KeyTip** for command in specified position.
	StyleChanged (see page 6785)	This is StyleChanged, a member of class TCustomRibbonGroup.

76.1.6.5.1 TCustomRibbonGroup.AlignControls Method

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

This is AlignControls, a member of class TCustomRibbonGroup.

76.1.6.5.2 TCustomRibbonGroup.AlignGroupControls Method

Align controls in Ribbon (see page 6713) Group

Pascal

```
procedure AlignGroupControls; virtual;
```

C++

```
virtual __fastcall AlignGroupControls();
```

Description

AlignGroupControls aligns the controls in the Ribbon (see page 6713) Group.

76.1.6.5.3 TCustomRibbonGroup.Assign Method

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

This is Assign, a member of class TCustomRibbonGroup.

76.1.6.5.4 TCustomRibbonGroup.AutoSizingChanged Method

Pascal

```
procedure AutoSizingChanged; override;
```

C++

```
virtual __fastcall AutoSizingChanged();
```

Description

This is AutoSizingChanged, a member of class TCustomRibbonGroup.

76.1.6.5.5 TCustomRibbonGroup.BarHandleKeyTips Method

Iterate over any visible **KeyTip (see page 6788)**s and perform validation to determine if one of **KeyTip (see page 6788)**s is partial or full match.

Pascal

```
procedure BarHandleKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHandleKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

BarHandleKeyTips iterates over any visible **KeyTip (see page 6788)**s and performs validation to determine if one of the **KeyTip (see page 6788)**s is a partial or full match. **KeyTip (see page 6788)**s that match are returned in the **List** parameter.

See Also

BarHideKeyTips (see page 6776)

BarShowKeyTips (see page 6777)

76.1.6.5.6 TCustomRibbonGroup.BarHideKeyTips Method

Hide any visible KeyTips that commands are displaying.

Pascal

```
procedure BarHideKeyTips(KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHideKeyTips(TKeyTipList KeyTips);
```

Description

BarHideKeyTips hides any visible KeyTips that commands are displaying. The **KeyTips** parameter contains a list of TKeyTipMatchItem (see page 6962) objects that indicate the **KeyTip (see page 6788)** associate with that command should not be close. When the **KeyTips** parameter is `nil`, all **KeyTip (see page 6788)**s are hidden.

See Also

TKeyTipMatchItem (see page 6962)

BarHandleKeyTips (see page 6776)

BarShowKeyTips (see page 6777)

76.1.6.5.7 TCustomRibbonGroup.BarShowKeyTips Method

Show K**eyTip**s for commands.

Pascal

```
procedure BarShowKeyTips;
```

C++

```
__fastcall BarShowKeyTips();
```

Description

BarShowKeyTips shows **KeyTip (see page 6788)**s for the commands.

See Also

BarHandleKeyTips (see page 6776)

BarHideKeyTips (see page 6776)

76.1.6.5.8 TCustomRibbonGroup.Clone Method

Pascal

```
function Clone: TCustomRibbonGroup;
```

C++

```
__fastcall TCustomRibbonGroup Clone();
```

Description

This is Clone, a member of class TCustomRibbonGroup.

76.1.6.5.9 TCustomRibbonGroup.CMFontchanged Method

Pascal

```
procedure CMFontchanged(var Message: TMessage); message CM_FONTCHANGED;
```

C++

```
__fastcall CMFontchanged(TMessage Message);
```

Description

This is CMFontchanged, a member of class TCustomRibbonGroup.

76.1.6.5.10 TCustomRibbonGroup.CMItemDropPoint Method

Pascal

```
procedure CMItemDropPoint(var Message: TCMItemMsg); message CM_ITEMDROPPOINT;
```

C++

```
__fastcall CMItemDropPoint(TCMItemMsg Message);
```

Description

This is CMItemDropPoint, a member of class TCustomRibbonGroup.

76.1.6.5.11 TCustomRibbonGroup.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TCustomRibbonGroup.

76.1.6.5.12 TCustomRibbonGroup.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TCustomRibbonGroup.

76.1.6.5.13 TCustomRibbonGroup.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TCustomRibbonGroup.

76.1.6.5.14 TCustomRibbonGroup.CreateControl Method

Recreate specific control.

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

CreateControl recreates a specific control.

See Also

AlignGroupControls (see page 6934)

76.1.6.5.15 TCustomRibbonGroup.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomRibbonGroup.

76.1.6.5.16 TCustomRibbonGroup.DockDrop Method

Pascal

```
procedure DockDrop(Source: TDragDockObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DockDrop(TDragDockObject Source, int X, int Y);
```

Description

This is DockDrop, a member of class TCustomRibbonGroup.

76.1.6.5.17 TCustomRibbonGroup.DoDropItem Method

Pascal

```
procedure DoDropItem(Source: TActionItemDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropItem(TActionItemDragObject Source, const int X, const int Y);
```

Description

This is DoDropItem, a member of class TCustomRibbonGroup.

76.1.6.5.18 TCustomRibbonGroup.DoEndDrag Method

Pascal

```
procedure DoEndDrag(Target: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DoEndDrag(TObject * Target, int X, int Y);
```

Description

This is DoEndDrag, a member of class TCustomRibbonGroup.

76.1.6.5.19 TCustomRibbonGroup.DragDrop Method

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

This is DragDrop, a member of class TCustomRibbonGroup.

76.1.6.5.20 TCustomRibbonGroup.DrawShowDialogButton Method

Pascal

```
procedure DrawShowDialogButton; virtual;
```

C++

```
virtual __fastcall DrawShowDialogButton();
```

Description

This is DrawShowDialogButton, a member of class TCustomRibbonGroup.

76.1.6.5.21 TCustomRibbonGroup.GetCaptionHeight Method

Pascal

```
function GetCaptionHeight: Integer;
```

C++

```
__fastcall int GetCaptionHeight();
```

Description

This is GetCaptionHeight, a member of class TCustomRibbonGroup.

76.1.6.5.22 TCustomRibbonGroup.GetGroupHeight Method

Pascal

```
function GetGroupHeight: Integer;
```

C++

```
__fastcall int GetGroupHeight();
```

Description

This is GetGroupHeight, a member of class TCustomRibbonGroup.

76.1.6.5.23 TCustomRibbonGroup.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 7282)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

76.1.6.5.24 TCustomRibbonGroup.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

76.1.6.5.25 TCustomRibbonGroup.HideControls Method

Pascal

```
procedure HideControls; virtual;
```

C++

```
virtual __fastcall HideControls();
```

Description

This is HideControls, a member of class TCustomRibbonGroup.

76.1.6.5.26 TCustomRibbonGroup.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

76.1.6.5.27 TCustomRibbonGroup.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

76.1.6.5.28 TCustomRibbonGroup.MouseDown Method

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

This is MouseDown, a member of class TCustomRibbonGroup.

76.1.6.5.29 TCustomRibbonGroup.MouseMove Method

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

This is MouseMove, a member of class TCustomRibbonGroup.

76.1.6.5.30 TCustomRibbonGroup.MouseUp Method

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

This is MouseUp, a member of class TCustomRibbonGroup.

76.1.6.5.31 TCustomRibbonGroup.Notification Method

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

This is Notification, a member of class TCustomRibbonGroup.

76.1.6.5.32 TCustomRibbonGroup.Paint Method

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

This is Paint, a member of class TCustomRibbonGroup.

76.1.6.5.33 TCustomRibbonGroup.Resize Method

Pascal

```
procedure Resize; override;
```

C++

```
virtual __fastcall Resize();
```

Description

This is Resize, a member of class TCustomRibbonGroup.

76.1.6.5.34 TCustomRibbonGroup.SetAutoSizing Method

Pascal

```
procedure SetAutoSizing(const Value: Boolean); override;
```

C++

```
virtual __fastcall SetAutoSizing(const Boolean Value);
```

Description

This is SetAutoSizing, a member of class TCustomRibbonGroup.

76.1.6.5.35 TCustomRibbonGroup.SetBounds Method

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

This is SetBounds, a member of class TCustomRibbonGroup.

76.1.6.5.36 TCustomRibbonGroup.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

ShowKeyTip (see page 7281)

76.1.6.5.37 TCustomRibbonGroup.SetParent Method

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

This is SetParent, a member of class TCustomRibbonGroup.

76.1.6.5.38 TCustomRibbonGroup.SetupDropDownBtn Method

Pascal

```
procedure SetupDropDownBtn; override;
```

C++

```
virtual __fastcall SetupDropDownBtn();
```

Description

This is SetupDropDownBtn, a member of class TCustomRibbonGroup.

76.1.6.5.39 TCustomRibbonGroup.ShowControls Method

Pascal

```
procedure ShowControls; virtual;
```

C++

```
virtual __fastcall ShowControls();
```

Description

This is ShowControls, a member of class TCustomRibbonGroup.

76.1.6.5.40 TCustomRibbonGroup.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

76.1.6.5.41 TCustomRibbonGroup.StyleChanged Method

Pascal

```
procedure StyleChanged(AStyle: TRibbonStyleActionBars); virtual;
```

C++

```
virtual __fastcall StyleChanged(TRibbonStyleActionBars AStyle);
```

Description

This is StyleChanged, a member of class TCustomRibbonGroup.

76.1.6.6 TCustomRibbonGroup Properties

The properties of the TCustomRibbonGroup class are listed here.

Public Properties

	Name	Description
R	CanCollapse (see page 6786)	Determine whether group can be displayed collapsed.
R	CollapsedControl (see page 6786)	This is CollapsedControl, a member of class TCustomRibbonGroup.
	DialogAction (see page 6786)	Determines whether dialog button displayed in group.
	GroupAlign (see page 6787)	Determines how controls on group are aligned.
	GroupIndex (see page 6787)	Index of group within current tab.
	GroupVariant (see page 6787)	Current size variant ribbon group is using.
R	GroupWidth (see page 6788)	This is GroupWidth, a member of class TCustomRibbonGroup.
R	HasGallery (see page 6788)	Indicates if group has an in ribbon Gallery.
	Items (see page 6788)	This is Items, a member of class TCustomRibbonGroup.
	KeyTip (see page 6788)	Key tip for Dialog button of group.
R	Page (see page 6789)	Reference to Page group is on.
R	RequiredWidth (see page 6789)	Width required to display group.
	Rows (see page 6789)	Number of Rows in group has for controls.

76.1.6.6.1 TCustomRibbonGroup.CanCollapse Property

Determine whether group can be displayed collapsed.

Pascal

```
property CanCollapse: Boolean;
```

C++

```
__property Boolean CanCollapse;
```

Description

CanCollapse determines whether the group can be displayed in the collapsed state. If there is only one control on the group, that group cannot be displayed as collapsed.

76.1.6.6.2 TCustomRibbonGroup.CollapsedControl Property

Pascal

```
property CollapsedControl: TRibbonGroupCollapsedControl;
```

C++

```
__property TRibbonGroupCollapsedControl CollapsedControl;
```

Description

This is CollapsedControl, a member of class TCustomRibbonGroup.

76.1.6.6.3 TCustomRibbonGroup.DialogAction Property

Determines whether dialog button displayed in group.

Pascal

```
property DialogAction: TContainedAction;
```

C++

```
__property TContainedAction DialogAction;
```

Description

DialogAction determines whether the dialog button is displayed in the lower right hand corner of the group.

See Also

KeyTip (see page 6788)

76.1.6.6.4 TCustomRibbonGroup.GroupAlign Property

Determines how controls on group are aligned.

Pascal

```
property GroupAlign: TGroupAlign;
```

C++

```
__property TGroupAlign GroupAlign;
```

Description

GroupAlign contains a TGroupAlign (see page 6774) that determines how controls on a group are aligned.

If alignment is **gaHorizontal**, controls are aligned left to right, top to bottom. To make a control start in a new row, set the `NewRow` property to true.

If alignment is **gaVertical**, controls are aligned top to bottom, left to right. Controls are automatically moved to the next column in the group if three controls are already in the column. You can also force a control to a new column by setting the `NewCol` property to true.

See Also

TGroupAlign

76.1.6.6.5 TCustomRibbonGroup.GroupIndex Property

Index of group within current tab.

Pascal

```
property GroupIndex: Integer;
```

C++

```
__property int GroupIndex;
```

Description

GroupIndex is the index of the group within the current tab. Set the GroupIndex property to change the position of the group within the current tab.

76.1.6.6.6 TCustomRibbonGroup.GroupVariant Property

Current size variant ribbon group is using.

Pascal

```
property GroupVariant: TRibbonGroupVariant;
```

C++

```
__property TRibbonGroupVariant GroupVariant;
```

Description

GroupVariant is the current size variant the ribbon group is using.

See Also

RequiredWidth (see page 6789)

76.1.6.6.7 TCustomRibbonGroup.GroupWidth Property

Pascal

```
property GroupWidth: Integer;
```

C++

```
__property int GroupWidth;
```

Description

This is GroupWidth, a member of class TCustomRibbonGroup.

76.1.6.6.8 TCustomRibbonGroup.HasGallery Property

Indicates if group has an in ribbon Gallery.

Pascal

```
property HasGallery: Boolean;
```

C++

```
__property Boolean HasGallery;
```

Description

HasGallery returns True if the group has an in ribbon Gallery to display, false otherwise.

76.1.6.6.9 TCustomRibbonGroup.Items Property

Pascal

```
property Items;
```

C++

```
__property Items;
```

Description

This is Items, a member of class TCustomRibbonGroup.

76.1.6.6.10 TCustomRibbonGroup.KeyTip Property

Key tip for Dialog button of group.

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the key tip for the Dialog button of the group. It is only valid when DialogAction (see page 6786) has been set.

See Also

DialogAction (see page 6786)

76.1.6.6.11 TCustomRibbonGroup.Page Property

Reference to Page group is on.

Pascal

```
property Page: TRibbonPage;
```

C++

```
__property TRibbonPage Page;
```

Description

Page is a reference to the Page that the group is on.

76.1.6.6.12 TCustomRibbonGroup.RequiredWidth Property

Width required to display group.

Pascal

```
property RequiredWidth: Integer;
```

C++

```
__property int RequiredWidth;
```

Description

RequiredWidth is the width required to display the group in its large Variant.

See Also

GroupVariant (see page 6787)

76.1.6.6.13 TCustomRibbonGroup.Rows Property

Number of Rows in group has for controls.

Pascal

```
property Rows: Integer;
```

C++

```
__property int Rows;
```

Description

Rows is the number of Rows the group has for displaying controls. A group must have at least 1 row and a maximum of 3.

76.1.6.7 TCustomRibbonGroup Nested Types

The nested types of the TCustomRibbonGroup class are listed here.

Public Nested Types

Name	Description
TRowPosition (see page 6790)	This is nested type Ribbon.TCustomRibbonGroup.TRowPosition.

76.1.6.7.1 TCustomRibbonGroup.TRowPosition Nested Type

Pascal

```
TRowPosition = array [1..3] of Integer;
```

C++

```
array [1..3] of Integer TRowPosition;
```

Description

This is nested type Ribbon.TCustomRibbonGroup.TRowPosition.

76.1.7 TCustomRibbonPage Class

Holds groups of controls.

Class Hierarchy

Pascal

```
TCustomRibbonPage = class(TCustomControl);
```

C++

```
class TCustomRibbonPage : public TCustomControl;
```

File

Ribbon

Description

TCustomRibbonPage holds the groups of controls that are displayed.

See Also

Creating an Application that Uses Ribbon Controls

Adding Commands to the Ribbon

76.1.7.1 TCustomRibbonPage Members

The following tables list the members exposed by TCustomRibbonPage.

Protected Methods

	Name	Description
	CMControlListChanging (see page 6795)	This is CMControlListChanging, a member of class TCustomRibbonPage.
	CMTextchanged (see page 6795)	This is CMTextchanged, a member of class TCustomRibbonPage.
V	CreateScrollButton (see page 6795)	This is CreateScrollButton, a member of class TCustomRibbonPage.
V	DoScrollButtonClick (see page 6795)	This is DoScrollButtonClick, a member of class TCustomRibbonPage.
	GetPageHeight (see page 6797)	This is GetPageHeight, a member of class TCustomRibbonPage.
	GetPageTop (see page 6797)	This is GetPageTop, a member of class TCustomRibbonPage.
V	Loaded (see page 6798)	Initializes the control after it is loaded from a stream.
V	Notification (see page 6798)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 6799)	Renders the image of a custom control.
V	RequestAlign (see page 6799)	Instructs the parent of a control to reposition the control, enforcing its Align property.
V	Resize (see page 6800)	Respond to control resize.
V	SetParent (see page 6801)	Sets the parent of the control.
	UpdateScrollButtons (see page 6802)	This is UpdateScrollButtons, a member of class TCustomRibbonPage.

Protected Properties

	Name	Description
	GroupOffset (see page 6803)	This is GroupOffset, a member of class TCustomRibbonPage.

Public Constants

	Name	Description
	cRibbonGroupLeftOffset (see page 6793)	This is cRibbonGroupLeftOffset, a member of class TCustomRibbonPage.
	cRibbonGroupSpacing (see page 6793)	This is cRibbonGroupSpacing, a member of class TCustomRibbonPage.

Public Methods

	Name	Description
	AddGroup (see page 6794)	This is AddGroup, a member of class TCustomRibbonPage.
	AlignGroups (see page 6794)	This is AlignGroups, a member of class TCustomRibbonPage.
	CollapseGroup (see page 6795)	This is CollapseGroup, a member of class TCustomRibbonPage.
V	Create (see page 6792)	Creates an instance of TCustomControl.
V	Destroy (see page 6792)	Destroys an instance of TCustomControl.
	FindGroup (see page 6796)	This is FindGroup, a member of class TCustomRibbonPage.
	FindGroupAt (see page 6796)	This is FindGroupAt, a member of class TCustomRibbonPage.
	GetGroupPos (see page 6796)	This is GetGroupPos, a member of class TCustomRibbonPage.
	GetNextVisibleGroup (see page 6796)	This is GetNextVisibleGroup, a member of class TCustomRibbonPage.
	HandleKeyTips (see page 6797)	This is HandleKeyTips, a member of class TCustomRibbonPage.
	HideKeyTips (see page 6797)	This is HideKeyTips, a member of class TCustomRibbonPage.
V	Invalidate (see page 6797)	Schedules a control repaint.
	RibbonStyle (see page 6800)	Return style class to use when drawing specific Ribbon (see page 6804) elements.
V	SetBounds (see page 6800)	Sets the windowed control's boundary properties all at once.
	ShowKeyTips (see page 6802)	This is ShowKeyTips, a member of class TCustomRibbonPage.
	UpdateActionManager (see page 6802)	This is UpdateActionManager, a member of class TCustomRibbonPage.

Public Properties

	Name	Description
R	CollapseGroupCount (see page 6803)	This is CollapseGroupCount, a member of class TCustomRibbonPage.
R	GroupCount (see page 6803)	This is GroupCount, a member of class TCustomRibbonPage.
R	Groups (see page 6803)	This is Groups, a member of class TCustomRibbonPage.
	Index (see page 6803)	This is Index, a member of class TCustomRibbonPage.
	KeyTip (see page 6804)	This is KeyTip, a member of class TCustomRibbonPage.
	Ribbon (see page 6804)	This is Ribbon, a member of class TCustomRibbonPage.

76.1.7.2 TCustomRibbonPage.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonPage(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Create

Destroy

Canvas

Owner

76.1.7.3 TCustomRibbonPage.Destroy Destructor

Destroys an instance of TCustomControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbonPage();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the control is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Destroys the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

76.1.7.4 TCustomRibbonPage Constants

The constants of the TCustomRibbonPage class are listed here.

Public Constants

	Name	Description
	cRibbonGroupLeftOffset (see page 6793)	This is cRibbonGroupLeftOffset, a member of class TCustomRibbonPage.
	cRibbonGroupSpacing (see page 6793)	This is cRibbonGroupSpacing, a member of class TCustomRibbonPage.

76.1.7.4.1 TCustomRibbonPage.cRibbonGroupLeftOffset Constant

Pascal

```
const cRibbonGroupLeftOffset = 4;
```

C++

```
cRibbonGroupLeftOffset = 4;
```

Description

This is cRibbonGroupLeftOffset, a member of class TCustomRibbonPage.

76.1.7.4.2 TCustomRibbonPage.cRibbonGroupSpacing Constant

Pascal

```
const cRibbonGroupSpacing = 2;
```

C++

```
cRibbonGroupSpacing = 2;
```

Description

This is cRibbonGroupSpacing, a member of class TCustomRibbonPage.

76.1.7.5 TCustomRibbonPage Methods

The methods of the TCustomRibbonPage class are listed here.

Protected Methods

	Name	Description
	CMControlListChanging (see page 6795)	This is CMControlListChanging, a member of class TCustomRibbonPage.
	CMTextchanged (see page 6795)	This is CMTextchanged, a member of class TCustomRibbonPage.
	CreateScrollButton (see page 6795)	This is CreateScrollButton, a member of class TCustomRibbonPage.

	DoScrollButtonClick (see page 6795)	This is DoScrollButtonClick, a member of class TCustomRibbonPage.
	GetPageHeight (see page 6797)	This is GetPageHeight, a member of class TCustomRibbonPage.
	GetPageTop (see page 6797)	This is GetPageTop, a member of class TCustomRibbonPage.
	Loaded (see page 6798)	Initializes the control after it is loaded from a stream.
	Notification (see page 6798)	Responds to notifications that components are being created or destroyed.
	Paint (see page 6799)	Renders the image of a custom control.
	RequestAlign (see page 6799)	Instructs the parent of a control to reposition the control, enforcing its Align property.
	Resize (see page 6800)	Respond to control resize.
	SetParent (see page 6801)	Sets the parent of the control.
	UpdateScrollButtons (see page 6802)	This is UpdateScrollButtons, a member of class TCustomRibbonPage.

Public Methods

	Name	Description
	AddGroup (see page 6794)	This is AddGroup, a member of class TCustomRibbonPage.
	AlignGroups (see page 6794)	This is AlignGroups, a member of class TCustomRibbonPage.
	CollapseGroup (see page 6795)	This is CollapseGroup, a member of class TCustomRibbonPage.
	FindGroup (see page 6796)	This is FindGroup, a member of class TCustomRibbonPage.
	FindGroupAt (see page 6796)	This is FindGroupAt, a member of class TCustomRibbonPage.
	GetGroupPos (see page 6796)	This is GetGroupPos, a member of class TCustomRibbonPage.
	GetNextVisibleGroup (see page 6796)	This is GetNextVisibleGroup, a member of class TCustomRibbonPage.
	HandleKeyTips (see page 6797)	This is HandleKeyTips, a member of class TCustomRibbonPage.
	HideKeyTips (see page 6797)	This is HideKeyTips, a member of class TCustomRibbonPage.
	Invalidate (see page 6797)	Schedules a control repaint.
	RibbonStyle (see page 6800)	Return style class to use when drawing specific Ribbon (see page 6804) elements.
	SetBounds (see page 6800)	Sets the windowed control's boundary properties all at once.
	ShowKeyTips (see page 6802)	This is ShowKeyTips, a member of class TCustomRibbonPage.
	UpdateActionManager (see page 6802)	This is UpdateActionManager, a member of class TCustomRibbonPage.

76.1.7.5.1 TCustomRibbonPage.AddGroup Method

Pascal

```
procedure AddGroup(const Group: TCustomRibbonGroup);
```

C++

```
__fastcall AddGroup(const TCustomRibbonGroup Group);
```

Description

This is AddGroup, a member of class TCustomRibbonPage.

76.1.7.5.2 TCustomRibbonPage.AlignGroups Method

Pascal

```
procedure AlignGroups;
```

C++

```
__fastcall AlignGroups();
```

Description

This is AlignGroups, a member of class TCustomRibbonPage.

76.1.7.5.3 TCustomRibbonPage.CMControlListChanging Method

Pascal

```
procedure CMControlListChanging(var Message: TCMControlListChanging); message
CM_CONTROLLISTCHANGING;
```

C++

```
__fastcall CMControlListChanging(TCMControlListChanging Message);
```

Description

This is CMControlListChanging, a member of class TCustomRibbonPage.

76.1.7.5.4 TCustomRibbonPage.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TCustomRibbonPage.

76.1.7.5.5 TCustomRibbonPage.CollapseGroup Method

Pascal

```
procedure CollapseGroup(const Group: TCustomRibbonGroup);
```

C++

```
__fastcall CollapseGroup(const TCustomRibbonGroup Group);
```

Description

This is CollapseGroup, a member of class TCustomRibbonPage.

76.1.7.5.6 TCustomRibbonPage.CreateScrollButton Method

Pascal

```
function CreateScrollButton(const Direction: TScrollDirection): TRibbonGroupScrollButton;
virtual;
```

C++

```
virtual __fastcall TRibbonGroupScrollButton CreateScrollButton(const TScrollDirection
Direction);
```

Description

This is CreateScrollButton, a member of class TCustomRibbonPage.

76.1.7.5.7 TCustomRibbonPage.DoScrollButtonClick Method

Pascal

```
procedure DoScrollButtonClick(const Direction: TScrollDirection); virtual;
```

C++

```
virtual __fastcall DoScrollButtonClick(const TScrollDirection Direction);
```

Description

This is DoScrollButtonClick, a member of class TCustomRibbonPage.

76.1.7.5.8 TCustomRibbonPage.FindGroup Method

Pascal

```
function FindGroup(const GroupCaption: string): TControl;
```

C++

```
__fastcall TControl * FindGroup(const UnicodeString GroupCaption);
```

Description

This is FindGroup, a member of class TCustomRibbonPage.

76.1.7.5.9 TCustomRibbonPage.FindGroupAt Method

Pascal

```
function FindGroupAt(const Pt: TPoint): TCustomRibbonGroup;
```

C++

```
__fastcall TCustomRibbonGroup FindGroupAt(const TPoint Pt);
```

Description

This is FindGroupAt, a member of class TCustomRibbonPage.

76.1.7.5.10 TCustomRibbonPage.GetGroupPos Method

Pascal

```
function GetGroupPos(Ignore: TControl): Integer;
```

C++

```
__fastcall int GetGroupPos(TControl * Ignore);
```

Description

This is GetGroupPos, a member of class TCustomRibbonPage.

76.1.7.5.11 TCustomRibbonPage.GetNextVisibleGroup Method

Pascal

```
function GetNextVisibleGroup: TCustomRibbonGroup;
```

C++

```
__fastcall TCustomRibbonGroup GetNextVisibleGroup();
```

Description

This is GetNextVisibleGroup, a member of class TCustomRibbonPage.

76.1.7.5.12 TCustomRibbonPage.GetPageHeight Method

Pascal

```
function GetPageHeight: Integer;
```

C++

```
__fastcall int GetPageHeight();
```

Description

This is GetPageHeight, a member of class TCustomRibbonPage.

76.1.7.5.13 TCustomRibbonPage.GetPageTop Method

Pascal

```
function GetPageTop: Integer;
```

C++

```
__fastcall int GetPageTop();
```

Description

This is GetPageTop, a member of class TCustomRibbonPage.

76.1.7.5.14 TCustomRibbonPage.HandleKeyTips Method

Pascal

```
procedure HandleKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall HandleKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

This is HandleKeyTips, a member of class TCustomRibbonPage.

76.1.7.5.15 TCustomRibbonPage.HideKeyTips Method

Pascal

```
procedure HideKeyTips(KeyTips: TKeyTipList);
```

C++

```
__fastcall HideKeyTips(TKeyTipList KeyTips);
```

Description

This is HideKeyTips, a member of class TCustomRibbonPage.

76.1.7.5.16 TCustomRibbonPage.Invalidate Method

Schedules a control repaint.

Pascal

```
procedure Invalidate; override;
```

C++

```
virtual __fastcall Invalidate();
```

Description

Invalidate informs a control that its entire surface needs to be repainted. Calling Invalidate can prevent flicker caused by a series of partial repaints. There is no performance penalty for calling Invalidate multiple times before the control is actually repainted.

The actual repaint does not occur until the control is updated. To force an immediate repaint, call Repaint instead.

See Also

Repaint

Update

76.1.7.5.17 TCustomRibbonPage.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded

Action

ActionChange

76.1.7.5.18 TCustomRibbonPage.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other

objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu

Notification

76.1.7.5.19 TCustomRibbonPage.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas

PaintWindow

GetDeviceContext

ClipRect (see page 2718)

76.1.7.5.20 TCustomRibbonPage.RequestAlign Method

Instructs the parent of a control to reposition the control, enforcing its Align property.

Pascal

```
procedure RequestAlign; override;
```

C++

```
virtual __fastcall RequestAlign();
```

Description

Controls call RequestAlign internally when changes are made to the size or position of the control, so that they remain properly aligned within the parent control. Do not call RequestAlign in application code.

See Also

Align

Parent

76.1.7.5.21 TCustomRibbonPage.Resize Method

Respond to control resize.

Pascal

```
procedure Resize; override;
```

C++

```
virtual __fastcall Resize();
```

Description

Resize is called automatically immediately after the control's dimensions change. As implemented in TControl, Resize calls the control's OnResize event handler if it is assigned.

See Also

OnResize

76.1.7.5.22 TCustomRibbonPage.RibbonStyle Method

Return style class to use when drawing specific Ribbon (see page 6804) elements.

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

RibbonStyle returns the style class to use when drawing the specific Ribbon (see page 6804) elements.

VariableName

ConstantName

76.1.7.5.23 TCustomRibbonPage.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
```

```
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

See Also

Height

Left

Top

Width

76.1.7.5.24 TCustomRibbonPage.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

RemoveControl

76.1.7.5.25 TCustomRibbonPage.ShowKeyTips Method

Pascal

```
procedure ShowKeyTips;
```

C++

```
__fastcall ShowKeyTips();
```

Description

This is ShowKeyTips, a member of class TCustomRibbonPage.

76.1.7.5.26 TCustomRibbonPage.UpdateActionManager Method

Pascal

```
procedure UpdateActionManager(Value: TCustomActionManager);
```

C++

```
__fastcall UpdateActionManager(TCustomActionManager Value);
```

Description

This is UpdateActionManager, a member of class TCustomRibbonPage.

76.1.7.5.27 TCustomRibbonPage.UpdateScrollButtons Method

Pascal

```
procedure UpdateScrollButtons;
```

C++

```
__fastcall UpdateScrollButtons();
```

Description

This is UpdateScrollButtons, a member of class TCustomRibbonPage.

76.1.7.6 TCustomRibbonPage Properties

The properties of the TCustomRibbonPage class are listed here.

Protected Properties

	Name	Description
	GroupOffset (see page 6803)	This is GroupOffset, a member of class TCustomRibbonPage.

Public Properties

	Name	Description
R	CollapseGroupCount (see page 6803)	This is CollapseGroupCount, a member of class TCustomRibbonPage.
R	GroupCount (see page 6803)	This is GroupCount, a member of class TCustomRibbonPage.
R	Groups (see page 6803)	This is Groups, a member of class TCustomRibbonPage.
	Index (see page 6803)	This is Index, a member of class TCustomRibbonPage.
	KeyTip (see page 6804)	This is KeyTip, a member of class TCustomRibbonPage.
	Ribbon (see page 6804)	This is Ribbon, a member of class TCustomRibbonPage.

76.1.7.6.1 TCustomRibbonPage.CollapseGroupCount Property

Pascal

```
property CollapseGroupCount: Integer;
```

C++

```
__property int CollapseGroupCount;
```

Description

This is CollapseGroupCount, a member of class TCustomRibbonPage.

76.1.7.6.2 TCustomRibbonPage.GroupCount Property

Pascal

```
property GroupCount: Integer;
```

C++

```
__property int GroupCount;
```

Description

This is GroupCount, a member of class TCustomRibbonPage.

76.1.7.6.3 TCustomRibbonPage.GroupOffset Property

Pascal

```
property GroupOffset: Integer;
```

C++

```
__property int GroupOffset;
```

Description

This is GroupOffset, a member of class TCustomRibbonPage.

76.1.7.6.4 TCustomRibbonPage.Groups Property

Pascal

```
property Groups [Index: Integer]: TCustomRibbonGroup;
```

C++

```
__property TCustomRibbonGroup Groups[int Index];
```

Description

This is Groups, a member of class TCustomRibbonPage.

76.1.7.6.5 TCustomRibbonPage.Index Property

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

This is Index, a member of class TCustomRibbonPage.

76.1.7.6.6 TCustomRibbonPage.KeyTip Property

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

This is KeyTip, a member of class TCustomRibbonPage.

76.1.7.6.7 TCustomRibbonPage.Ribbon Property

Pascal

```
property Ribbon: TCustomRibbon;
```

C++

```
__property TCustomRibbon Ribbon;
```

Description

This is Ribbon, a member of class TCustomRibbonPage.

76.1.8 TCustomRibbonQuickAccessPopupToolbar Class

Class Hierarchy

Pascal

```
TCustomRibbonQuickAccessPopupToolbar = class(TCustomActionPopupMenu);
```

C++

```
class TCustomRibbonQuickAccessPopupToolbar : public TCustomActionPopupMenu;
```

File

Ribbon

Description

This is class Ribbon.TCustomRibbonQuickAccessPopupToolbar.

76.1.8.1 TCustomRibbonQuickAccessPopupToolbar Members

The following tables list the members exposed by TCustomRibbonQuickAccessPopupToolbar.

Protected Methods

	Name	Description
	CreateWnd (see page 6806)	Creates the underlying window.
	DrawBackground (see page 6806)	This is DrawBackground, a member of class TCustomRibbonQuickAccessPopupToolbar.
	GetControlClass (see page 6806)	This is GetControlClass, a member of class TCustomRibbonQuickAccessPopupToolbar.
	NCPaint (see page 6807)	This is NCPaint, a member of class TCustomRibbonQuickAccessPopupToolbar.
	ValidOrientations (see page 6807)	This is ValidOrientations, a member of class TCustomRibbonQuickAccessPopupToolbar.

Public Methods

	Name	Description
	Create (see page 6805)	Creates and initializes a TCustomActionPopupMenu instance.
	CreateControl (see page 6806)	This is CreateControl, a member of class TCustomRibbonQuickAccessPopupToolbar.

76.1.8.2 TCustomRibbonQuickAccessPopupToolbar.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonQuickAccessPopupToolbar(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

76.1.8.3 TCustomRibbonQuickAccessPopupToolbar Methods

The methods of the TCustomRibbonQuickAccessPopupToolbar class are listed here.

Protected Methods

	Name	Description
	CreateWnd (see page 6806)	Creates the underlying window.
	DrawBackground (see page 6806)	This is DrawBackground, a member of class TCustomRibbonQuickAccessPopupToolbar.
	GetControlClass (see page 6806)	This is GetControlClass, a member of class TCustomRibbonQuickAccessPopupToolbar.
	NCPaint (see page 6807)	This is NCPaint, a member of class TCustomRibbonQuickAccessPopupToolbar.
	ValidOrientations (see page 6807)	This is ValidOrientations, a member of class TCustomRibbonQuickAccessPopupToolbar.

Public Methods

	Name	Description
	CreateControl (see page 6806)	This is CreateControl, a member of class TCustomRibbonQuickAccessPopupToolbar.

76.1.8.3.1 TCustomRibbonQuickAccessPopupToolbar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomRibbonQuickAccessPopupToolbar.

76.1.8.3.2 TCustomRibbonQuickAccessPopupToolbar.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

See Also

CreateParams

CreateWindowHandle

Perform

DestroyWnd

76.1.8.3.3 TCustomRibbonQuickAccessPopupToolbar.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TCustomRibbonQuickAccessPopupToolbar.

76.1.8.3.4 TCustomRibbonQuickAccessPopupToolbar.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TCustomRibbonQuickAccessPopupToolbar.

76.1.8.3.5 TCustomRibbonQuickAccessPopupToolbar.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TCustomRibbonQuickAccessPopupToolbar.

76.1.8.3.6 TCustomRibbonQuickAccessPopupToolbar.ValidOrientations Method

Pascal

```
function ValidOrientations: TBarOrientations; override;
```

C++

```
virtual __fastcall TBarOrientations ValidOrientations();
```

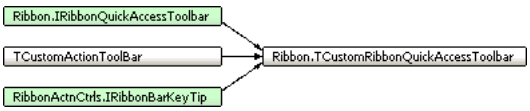
Description

This is ValidOrientations, a member of class TCustomRibbonQuickAccessPopupToolbar.

76.1.9 TCustomRibbonQuickAccessToolbar Class

Quck Access Toolbar base class.

Class Hierarchy



Pascal

```
TCustomRibbonQuickAccessToolbar = class(TCustomActionToolBar, IRibbonQuickAccessToolbar,
IRibbonBarKeyTip);
```

C++

```
class TCustomRibbonQuickAccessToolbar : public TCustomActionToolBar, public
IRibbonQuickAccessToolbar, public IRibbonBarKeyTip;
```

File

Ribbon

Description

TCustomRibbonQuickAccessToolbar is the base class Quck Access Toolbar.

76.1.9.1 TCustomRibbonQuickAccessToolbar Members

The following tables list the members exposed by TCustomRibbonQuickAccessToolbar.

Protected Methods

	Name	Description
	CMFontchanged (see page 6811)	This is CMFontchanged, a member of class TCustomRibbonQuickAccessToolbar.
V	CreateControls (see page 6811)	This is CreateControls, a member of class TCustomRibbonQuickAccessToolbar.
V	DoContextPopup (see page 6812)	OnContextPopup event dispatcher.
V	DoDropActions (see page 6812)	This is DoDropActions, a member of class TCustomRibbonQuickAccessToolbar.
V	DoDropItem (see page 6813)	This is DoDropItem, a member of class TCustomRibbonQuickAccessToolbar.
V	DoMoreCommands (see page 6813)	This is DoMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.
V	DoScrollBtnClick (see page 6813)	This is DoScrollBtnClick, a member of class TCustomRibbonQuickAccessToolbar.
V	DrawBackground (see page 6814)	This is DrawBackground, a member of class TCustomRibbonQuickAccessToolbar.
V	GetBarHeight (see page 6814)	This is GetBarHeight, a member of class TCustomRibbonQuickAccessToolbar.
V	GetBarWidth (see page 6815)	This is GetBarWidth, a member of class TCustomRibbonQuickAccessToolbar.
V	GetScrollBtnClass (see page 6815)	This is GetScrollBtnClass, a member of class TCustomRibbonQuickAccessToolbar.
V	Notification (see page 6815)	Responds to notifications that components are being created or destroyed.
V	RequestAlign (see page 6815)	Instructs the parent of a control to reposition the control, enforcing its Align property.
V	SetParent (see page 6816)	Sets the parent of the control.
V	SetupDropDownBtn (see page 6816)	This is SetupDropDownBtn, a member of class TCustomRibbonQuickAccessToolbar.
V	ShowCustomizeMenu (see page 6817)	This is ShowCustomizeMenu, a member of class TCustomRibbonQuickAccessToolbar.
V	ShowMoreControls (see page 6817)	This is ShowMoreControls, a member of class TCustomRibbonQuickAccessToolbar.
V	UpdateQATWidth (see page 6817)	This is UpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 6810)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 6810)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 6811)	Show **KeyTip**s for any commands that support them.
V	Create (see page 6809)	Creates and initializes a TCustomActionToolBar instance.
V	CreateControl (see page 6811)	This is CreateControl, a member of class TCustomRibbonQuickAccessToolbar.
	Customize (see page 6812)	This is Customize, a member of class TCustomRibbonQuickAccessToolbar.
V	DoDropCategory (see page 6813)	This is DoDropCategory, a member of class TCustomRibbonQuickAccessToolbar.
	DoUpdateQATWidth (see page 6813)	This is DoUpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.
V	DragDrop (see page 6814)	Generates an OnDragDrop event.

Public Nested Types

Name	Description
TMoreCommandsEvent (see page 6819)	This is nested type Ribbon.TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent.

Public Properties

	Name	Description
	Items (see page 6818)	Lists the action clients that correspond to the child controls of this action band.
	OnMoreCommands (see page 6818)	This is OnMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.
R	Ribbon (see page 6818)	This is Ribbon, a member of class TCustomRibbonQuickAccessToolbar.
	ScrollMode (see page 6818)	This is ScrollMode, a member of class TCustomRibbonQuickAccessToolbar.
	ShowBorder (see page 6819)	This is ShowBorder, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.2 TCustomRibbonQuickAccessToolbar.Create Constructor

Creates and initializes a TCustomActionToolBar instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonQuickAccessToolbar(TComponent * AOwner);
```

Description

Create generates a TCustomActionToolBar and initializes its properties.

```
__fastcall virtual TCustomActionToolBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall (HWND ParentWindow) : Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

76.1.9.3 TCustomRibbonQuickAccessToolbar Methods

The methods of the TCustomRibbonQuickAccessToolbar class are listed here.

Protected Methods

	Name	Description
	CMFontchanged (see page 6811)	This is CMFontchanged, a member of class TCustomRibbonQuickAccessToolbar.
V	CreateControls (see page 6811)	This is CreateControls, a member of class TCustomRibbonQuickAccessToolbar.
V	DoContextPopup (see page 6812)	OnContextPopup event dispatcher.
V	DoDropActions (see page 6812)	This is DoDropActions, a member of class TCustomRibbonQuickAccessToolbar.
V	DoDropItem (see page 6813)	This is DoDropItem, a member of class TCustomRibbonQuickAccessToolbar.
V	DoMoreCommands (see page 6813)	This is DoMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.
V	DoScrollBtnClick (see page 6813)	This is DoScrollBtnClick, a member of class TCustomRibbonQuickAccessToolbar.
V	DrawBackground (see page 6814)	This is DrawBackground, a member of class TCustomRibbonQuickAccessToolbar.
V	GetBarHeight (see page 6814)	This is GetBarHeight, a member of class TCustomRibbonQuickAccessToolbar.
V	GetBarWidth (see page 6815)	This is GetBarWidth, a member of class TCustomRibbonQuickAccessToolbar.
V	GetScrollBtnClass (see page 6815)	This is GetScrollBtnClass, a member of class TCustomRibbonQuickAccessToolbar.
V	Notification (see page 6815)	Responds to notifications that components are being created or destroyed.
V	RequestAlign (see page 6815)	Instructs the parent of a control to reposition the control, enforcing its Align property.
V	SetParent (see page 6816)	Sets the parent of the control.

	SetupDropDownBtn (see page 6816)	This is SetupDropDownBtn, a member of class TCustomRibbonQuickAccessToolbar.
	ShowCustomizeMenu (see page 6817)	This is ShowCustomizeMenu, a member of class TCustomRibbonQuickAccessToolbar.
	ShowMoreControls (see page 6817)	This is ShowMoreControls, a member of class TCustomRibbonQuickAccessToolbar.
	UpdateQATWidth (see page 6817)	This is UpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 6810)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 6810)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 6811)	Show **KeyTip**s for any commands that support them.
	CreateControl (see page 6811)	This is CreateControl, a member of class TCustomRibbonQuickAccessToolbar.
	Customize (see page 6812)	This is Customize, a member of class TCustomRibbonQuickAccessToolbar.
	DoDropCategory (see page 6813)	This is DoDropCategory, a member of class TCustomRibbonQuickAccessToolbar.
	DoUpdateQATWidth (see page 6813)	This is DoUpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.
	DragDrop (see page 6814)	Generates an OnDragDrop event.

76.1.9.3.1 TCustomRibbonQuickAccessToolbar.BarHandleKeyTips Method

Check if any commands on Action Bar are partial or full match for **KeyTip**.

Pascal

```
procedure BarHandleKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHandleKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

BarHandleKeyTips checks if any commands on the Action Bar are a partial or full match for the **KeyTip**. Matches are returned as a TKeyTipMatchItem in the `List` parameter. If only one item is a match, that command is executed.

See Also

TKeyTipMatchItem (see page 6962)

BarHideKeyTips (see page 7273)

BarShowKeyTips (see page 7274)

76.1.9.3.2 TCustomRibbonQuickAccessToolbar.BarHideKeyTips Method

Hide any visible **KeyTip** windows.

Pascal

```
procedure BarHideKeyTips(KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHideKeyTips(TKeyTipList KeyTips);
```

Description

BarHideKeyTips hides any visible **KeyTip** windows. `ExceptList` may contain a list of TKeyTipMatchItem objects for commands that should not be hidden. These items are current partial matches and require additional handling.

See Also

TKeyTipMatchItem (see page 6962)

BarHandleKeyTips (see page 7273)

BarShowKeyTips (see page 7274)

76.1.9.3.3 TCustomRibbonQuickAccessToolbar.BarShowKeyTips Method

Show **KeyTip**s for any commands that support them.

Pascal

```
procedure BarShowKeyTips;
```

C++

```
__fastcall BarShowKeyTips();
```

Description

BarShowKeyTips shows **KeyTip**s for any commands that support them.

See Also

BarHandleKeyTips (see page 7273)

BarHideKeyTips (see page 7273)

76.1.9.3.4 TCustomRibbonQuickAccessToolbar.CMFontchanged Method

Pascal

```
procedure CMFontchanged(var Message: TMessage); message CM_FONTCHANGED;
```

C++

```
__fastcall CMFontchanged(TMessage Message);
```

Description

This is CMFontchanged, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.5 TCustomRibbonQuickAccessToolbar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.6 TCustomRibbonQuickAccessToolbar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.7 TCustomRibbonQuickAccessToolbar.Customize Method

Pascal

```
procedure Customize;
```

C++

```
__fastcall Customize();
```

Description

This is Customize, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.8 TCustomRibbonQuickAccessToolbar.DoContextPopup Method

OnContextPopup event dispatcher.

Pascal

```
procedure DoContextPopup(MousePos: TPoint; var Handled: Boolean); override;
```

C++

```
virtual __fastcall DoContextPopup(TPoint MousePos, Boolean Handled);
```

Description

OnContextPopup calls any event handler attached to the OnContextPopup event. When creating a component that descends from TControl, override OnContextPopup to provide other responses in addition to the inherited event-handler call when the user invokes the control's context menu.

MousePos indicates the position where the user right-clicked the control. If the user invoked the context menu using the keyboard, MousePos is (-1,-1).

Handled returns a Boolean value indicating whether the control should continue with its default response to the user action.

OnContextPopup

76.1.9.3.9 TCustomRibbonQuickAccessToolbar.DoDropActions Method

Pascal

```
procedure DoDropActions(Source: TActionDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropActions(TActionDragObject Source, const int X, const int Y);
```

Description

This is DoDropActions, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.10 TCustomRibbonQuickAccessToolbar.DoDropCategory Method

Pascal

```
procedure DoDropCategory(Source: TCategoryDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropCategory(TCategoryDragObject Source, const int X, const int Y);
```

Description

This is DoDropCategory, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.11 TCustomRibbonQuickAccessToolbar.DoDropItem Method

Pascal

```
procedure DoDropItem(Source: TActionItemDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropItem(TActionItemDragObject Source, const int X, const int Y);
```

Description

This is DoDropItem, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.12 TCustomRibbonQuickAccessToolbar.DoMoreCommands Method

Pascal

```
procedure DoMoreCommands; virtual;
```

C++

```
virtual __fastcall DoMoreCommands();
```

Description

This is DoMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.13 TCustomRibbonQuickAccessToolbar.DoScrollBtnClick Method

Pascal

```
procedure DoScrollBtnClick; override;
```

C++

```
virtual __fastcall DoScrollBtnClick();
```

Description

This is DoScrollBtnClick, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.14 TCustomRibbonQuickAccessToolbar.DoUpdateQATWidth Method

Pascal

```
procedure DoUpdateQATWidth;
```

C++

```
__fastcall DoUpdateQATWidth();
```

Description

This is DoUpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.15 TCustomRibbonQuickAccessToolbar.DragDrop Method

Generates an OnDragDrop event.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

DragDrop is called automatically when the user drags and drops a control onto the tool bar. This method generates an OnDragDrop event, and then updates its list of hidden controls to reflect the presence of the new child control.

Source is the dragged control that is dropped onto the tool bar.

X and Y are the mouse coordinates where Source was dropped.

DragCanceled

OnDragDrop

HiddenCount

76.1.9.3.16 TCustomRibbonQuickAccessToolbar.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.17 TCustomRibbonQuickAccessToolbar.GetBarHeight Method

Pascal

```
function GetBarHeight: Integer; override;
```

C++

```
virtual __fastcall int GetBarHeight();
```

Description

This is GetBarHeight, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.18 TCustomRibbonQuickAccessToolbar.GetBarWidth Method

Pascal

```
function GetBarWidth: Integer; override;
```

C++

```
virtual __fastcall int GetBarWidth();
```

Description

This is GetBarWidth, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.19 TCustomRibbonQuickAccessToolbar.GetScrollBtnClass Method

Pascal

```
function GetScrollBtnClass: TCustomToolScrollBtnClass; override;
```

C++

```
virtual __fastcall TCustomToolScrollBtnClass GetScrollBtnClass();
```

Description

This is GetScrollBtnClass, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.20 TCustomRibbonQuickAccessToolbar.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

76.1.9.3.21 TCustomRibbonQuickAccessToolbar.RequestAlign Method

Instructs the parent of a control to reposition the control, enforcing its Align property.

Pascal

```
procedure RequestAlign; override;
```

C++

```
virtual __fastcall RequestAlign();
```

Description

Controls call RequestAlign internally when changes are made to the size or position of the control, so that they remain properly aligned within the parent control. Do not call RequestAlign in application code.

See Also

Align

Parent

76.1.9.3.22 TCustomRibbonQuickAccessToolbar.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

76.1.9.3.23 TCustomRibbonQuickAccessToolbar.SetupDropDownBtn Method

Pascal

```
procedure SetupDropDownBtn; override;
```

C++

```
virtual __fastcall SetupDropDownBtn();
```

Description

This is SetupDropDownBtn, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.24 TCustomRibbonQuickAccessToolbar.ShowCustomizeMenu Method

Pascal

```
procedure ShowCustomizeMenu(AScrollBtn: TRibbonQATScrollButton); virtual;
```

C++

```
virtual __fastcall ShowCustomizeMenu(TRibbonQATScrollButton AScrollBtn);
```

Description

This is ShowCustomizeMenu, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.25 TCustomRibbonQuickAccessToolbar.ShowMoreControls Method

Pascal

```
procedure ShowMoreControls; virtual;
```

C++

```
virtual __fastcall ShowMoreControls();
```

Description

This is ShowMoreControls, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.3.26 TCustomRibbonQuickAccessToolbar.UpdateQATWidth Method

Pascal

```
procedure UpdateQATWidth; virtual;
```

C++

```
virtual __fastcall UpdateQATWidth();
```

Description

This is UpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.4 TCustomRibbonQuickAccessToolbar Properties

The properties of the TCustomRibbonQuickAccessToolbar class are listed here.

Public Properties

	Name	Description
	Items (see page 6818)	Lists the action clients that correspond to the child controls of this action band.
	OnMoreCommands (see page 6818)	This is OnMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.
R	Ribbon (see page 6818)	This is Ribbon, a member of class TCustomRibbonQuickAccessToolbar.
	ScrollMode (see page 6818)	This is ScrollMode, a member of class TCustomRibbonQuickAccessToolbar.
	ShowBorder (see page 6819)	This is ShowBorder, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.4.1 TCustomRibbonQuickAccessToolbar.Items Property

Lists the action clients that correspond to the child controls of this action band.

Pascal

```
property Items;
```

C++

```
__property Items;
```

Description

Items is used internally to access the components that the action manager lists to represent the child controls of this action band. Each action client object in the Items collection corresponds to one of the controls that the ActionControls property lists. The entire collection of items belongs to the action client specified by this action band's ActionClient property.

76.1.9.4.2 TCustomRibbonQuickAccessToolbar.OnMoreCommands Property

Pascal

```
property OnMoreCommands: TMoreCommandsEvent;
```

C++

```
__property TMoreCommandsEvent OnMoreCommands;
```

Description

This is OnMoreCommands, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.4.3 TCustomRibbonQuickAccessToolbar.Ribbon Property

Pascal

```
property Ribbon: TCustomRibbon;
```

C++

```
__property TCustomRibbon Ribbon;
```

Description

This is Ribbon, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.4.4 TCustomRibbonQuickAccessToolbar.ScrollMode Property

Pascal

```
property ScrollMode: TQATScrollMode;
```

C++

```
__property TQATScrollMode ScrollMode;
```

Description

This is ScrollMode, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.4.5 TCustomRibbonQuickAccessToolbar.ShowBorder Property

Pascal

```
property ShowBorder: Boolean;
```

C++

```
__property Boolean ShowBorder;
```

Description

This is ShowBorder, a member of class TCustomRibbonQuickAccessToolbar.

76.1.9.5 TCustomRibbonQuickAccessToolbar Nested Types

The nested types of the TCustomRibbonQuickAccessToolbar class are listed here.

Public Nested Types

Name	Description
TMoreCommandsEvent (see page 6819)	This is nested type Ribbon.TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent.

76.1.9.5.1 TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent Nested Type

Pascal

```
TMoreCommandsEvent = procedure (Sender: TObject; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; var Handled: Boolean) ( TMoreCommandsEvent)();
```

Description

This is nested type Ribbon.TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent.

76.1.10 TCustomTabData Class

Encapsulates all functions and status to manage scrolling of tabs and selected group.

Class Hierarchy

Pascal

```
TCustomTabData = class;
```

C++

```
class TCustomTabData;
```

File

Ribbon

Description

TCustomTabData encapsulates all the functions and status information needed to manage scrolling tabs and the selected group on a ribbon.

76.1.10.1 TCustomTabData Members

The following tables list the members exposed by TCustomTabData.

Public Methods

	Name	Description
	Add (see page 6821)	This is Add, a member of class TCustomTabData.
	CalculateTabWidths (see page 6821)	This is CalculateTabWidths, a member of class TCustomTabData.
	Clear (see page 6821)	This is Clear, a member of class TCustomTabData.
V	Create (see page 6820)	This is Create, a member of class TCustomTabData.
V	Destroy (see page 6821)	This is Destroy, a member of class TCustomTabData.

Public Properties

	Name	Description
R	AvailableSpace (see page 6822)	This is AvailableSpace, a member of class TCustomTabData.
	FirstVisibleTabIndex (see page 6822)	This is FirstVisibleTabIndex, a member of class TCustomTabData.
R	FullWidth (see page 6822)	This is FullWidth, a member of class TCustomTabData.
R	ItemCount (see page 6823)	This is ItemCount, a member of class TCustomTabData.
R	LastVisibleTabIndex (see page 6823)	This is LastVisibleTabIndex, a member of class TCustomTabData.
R	LeftTabScrollButtonRect (see page 6823)	This is LeftTabScrollButtonRect, a member of class TCustomTabData.
R	NewWidth (see page 6823)	This is NewWidth, a member of class TCustomTabData.
R	Owner (see page 6824)	This is Owner, a member of class TCustomTabData.
R	RightTabScrollButtonRect (see page 6824)	This is RightTabScrollButtonRect, a member of class TCustomTabData.
R	ScrollButtons (see page 6824)	This is ScrollButtons, a member of class TCustomTabData.
R	SeparatorOpacity (see page 6824)	This is SeparatorOpacity, a member of class TCustomTabData.
R	TabSeparatorState (see page 6824)	This is TabSeparatorState, a member of class TCustomTabData.
R	TabUpdateRect (see page 6825)	This is TabUpdateRect, a member of class TCustomTabData.

76.1.10.2 TCustomTabData.Create Constructor

Pascal

```
constructor Create(AOwner: TCustomRibbon); virtual; reintroduce;
```

C++

```
virtual __fastcall TCustomTabData(TCustomRibbon AOwner);
```

Description

This is Create, a member of class TCustomTabData.

76.1.10.3 TCustomTabData.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomTabData();
```

Description

This is Destroy, a member of class TCustomTabData.

76.1.10.4 TCustomTabData Methods

The methods of the TCustomTabData class are listed here.

Public Methods

	Name	Description
	Add (see page 6821)	This is Add, a member of class TCustomTabData.
	CalculateTabWidths (see page 6821)	This is CalculateTabWidths, a member of class TCustomTabData.
	Clear (see page 6821)	This is Clear, a member of class TCustomTabData.

76.1.10.4.1 TCustomTabData.Add Method

Pascal

```
procedure Add(ATab: TRibbonTabItem);
```

C++

```
__fastcall Add(TRibbonTabItem ATab);
```

Description

This is Add, a member of class TCustomTabData.

76.1.10.4.2 TCustomTabData.CalculateTabWidths Method

Pascal

```
procedure CalculateTabWidths(AAvailableSpace: Integer; APages: TRibbonTabs);
```

C++

```
__fastcall CalculateTabWidths(int AAvailableSpace, TRibbonTabs APages);
```

Description

This is CalculateTabWidths, a member of class TCustomTabData.

76.1.10.4.3 TCustomTabData.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TCustomTabData.

76.1.10.5 TCustomTabData Properties

The properties of the TCustomTabData class are listed here.

Public Properties

	Name	Description
	AvailableSpace (see page 6822)	This is AvailableSpace, a member of class TCustomTabData.
	FirstVisibleTabIndex (see page 6822)	This is FirstVisibleTabIndex, a member of class TCustomTabData.
	FullWidth (see page 6822)	This is FullWidth, a member of class TCustomTabData.
	ItemCount (see page 6823)	This is ItemCount, a member of class TCustomTabData.
	LastVisibleTabIndex (see page 6823)	This is LastVisibleTabIndex, a member of class TCustomTabData.
	LeftTabScrollButtonRect (see page 6823)	This is LeftTabScrollButtonRect, a member of class TCustomTabData.
	NewWidth (see page 6823)	This is NewWidth, a member of class TCustomTabData.
	Owner (see page 6824)	This is Owner, a member of class TCustomTabData.
	RightTabScrollButtonRect (see page 6824)	This is RightTabScrollButtonRect, a member of class TCustomTabData.
	ScrollButtons (see page 6824)	This is ScrollButtons, a member of class TCustomTabData.
	SeparatorOpacity (see page 6824)	This is SeparatorOpacity, a member of class TCustomTabData.
	TabSeparatorState (see page 6824)	This is TabSeparatorState, a member of class TCustomTabData.
	TabUpdateRect (see page 6825)	This is TabUpdateRect, a member of class TCustomTabData.

76.1.10.5.1 TCustomTabData.AvailableSpace Property

Pascal

```
property AvailableSpace: Integer;
```

C++

```
__property int AvailableSpace;
```

Description

This is AvailableSpace, a member of class TCustomTabData.

76.1.10.5.2 TCustomTabData.FirstVisibleTabIndex Property

Pascal

```
property FirstVisibleTabIndex: Integer;
```

C++

```
__property int FirstVisibleTabIndex;
```

Description

This is FirstVisibleTabIndex, a member of class TCustomTabData.

76.1.10.5.3 TCustomTabData.FullWidth Property

Pascal

```
property FullWidth [Idx: Integer]: Integer;
```

C++

```
__property int FullWidth[int Idx];
```

Description

This is FullWidth, a member of class TCustomTabData.

76.1.10.5.4 TCustomTabData.ItemCount Property

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

This is ItemCount, a member of class TCustomTabData.

76.1.10.5.5 TCustomTabData.LastVisibleTabIndex Property

Pascal

```
property LastVisibleTabIndex: Integer;
```

C++

```
__property int LastVisibleTabIndex;
```

Description

This is LastVisibleTabIndex, a member of class TCustomTabData.

76.1.10.5.6 TCustomTabData.LeftTabScrollButtonRect Property

Pascal

```
property LeftTabScrollButtonRect: TRect;
```

C++

```
__property TRect LeftTabScrollButtonRect;
```

Description

This is LeftTabScrollButtonRect, a member of class TCustomTabData.

76.1.10.5.7 TCustomTabData.NewWidth Property

Pascal

```
property NewWidth [Idx: Integer]: Integer;
```

C++

```
__property int NewWidth[int Idx];
```

Description

This is NewWidth, a member of class TCustomTabData.

76.1.10.5.8 TCustomTabData.Owner Property

Pascal

```
property Owner: TCustomRibbon;
```

C++

```
__property TCustomRibbon Owner;
```

Description

This is Owner, a member of class TCustomTabData.

76.1.10.5.9 TCustomTabData.RightTabScrollButtonRect Property

Pascal

```
property RightTabScrollButtonRect: TRect;
```

C++

```
__property TRect RightTabScrollButtonRect;
```

Description

This is RightTabScrollButtonRect, a member of class TCustomTabData.

76.1.10.5.10 TCustomTabData.ScrollButtons Property

Pascal

```
property ScrollButtons: TRibbonScrollButtons;
```

C++

```
__property TRibbonScrollButtons ScrollButtons;
```

Description

This is ScrollButtons, a member of class TCustomTabData.

76.1.10.5.11 TCustomTabData.SeparatorOpacity Property

Pascal

```
property SeparatorOpacity: Byte;
```

C++

```
__property Byte SeparatorOpacity;
```

Description

This is SeparatorOpacity, a member of class TCustomTabData.

76.1.10.5.12 TCustomTabData.TabSeparatorState Property

Pascal

```
property TabSeparatorState: TTabSeparatorState;
```

C++

```
__property TTabSeparatorState TabSeparatorState;
```

Description

This is TabSeparatorState, a member of class TCustomTabData.

76.1.10.5.13 TCustomTabData.TabUpdateRect Property

Pascal

```
property TabUpdateRect: TRect;
```

C++

```
__property TRect TabUpdateRect;
```

Description

This is TabUpdateRect, a member of class TCustomTabData.

76.1.11 THelpButton Class

Button to activate help.

Class Hierarchy

Pascal

```
THelpButton = class(TOffice2007Button);
```

C++

```
class THelpButton : public TOffice2007Button;
```

File

Ribbon

Description

THelpButton represents the button used for activating help.

See Also

ShowHelpButton (see page 6764)

76.1.11.1 THelpButton Members

The following tables list the members exposed by THelpButton.

Protected Methods

	Name	Description
	CMMouseenter (see page 6829)	This is CMMouseenter, a member of class TOffice2007Button.
	CMMouseleave (see page 6829)	This is CMMouseleave, a member of class TOffice2007Button.
V	DoClick (see page 6829)	This is DoClick, a member of class TOffice2007Button.
V	DrawBackground (see page 6829)	This is DrawBackground, a member of class TOffice2007Button.
V	DrawImage (see page 6826)	This is DrawImage, a member of class THelpButton.
V	MouseDown (see page 6830)	OnMouseDown event dispatcher.
V	MouseMove (see page 6830)	Respond to mouse moving over control area..

	MouseUp (see page 6831)	OnMouseUp event dispatcher.
	Paint (see page 6831)	Render control surface.
	SetParent (see page 6832)	Sets the parent of the control.

Protected Properties

	Name	Description
	MouseInControl (see page 6832)	This is MouseInControl, a member of class TOffice2007Button.
	RibbonStyle (see page 6833)	This is RibbonStyle, a member of class TOffice2007Button.

Public Events

	Name	Description
	OnClick (see page 6833)	Occurs when the user clicks the control.

Public Methods

	Name	Description
	Create (see page 6827)	Creates an instance of TGraphicControl.
	Destroy (see page 6828)	Destroys an instance of TGraphicControl.

76.1.11.2 THelpButton Methods

The methods of the THelpButton class are listed here.

Protected Methods

	Name	Description
	DrawImage (see page 6826)	This is DrawImage, a member of class THelpButton.

76.1.11.2.1 THelpButton.DrawImage Method

Pascal

```
procedure DrawImage; override;
```

C++

```
virtual __fastcall DrawImage();
```

Description

This is DrawImage, a member of class THelpButton.

76.1.12 TOffice2007Button Class

Class Hierarchy

Pascal

```
TOffice2007Button = class(TGraphicControl);
```

C++

```
class TOffice2007Button : public TGraphicControl;
```

File

Ribbon

Description

This is class Ribbon.TOffice2007Button.

76.1.12.1 TOffice2007Button Members

The following tables list the members exposed by TOffice2007Button.

Protected Methods

	Name	Description
	CMMouseenter (see page 6829)	This is CMMouseenter, a member of class TOffice2007Button.
	CMMouseleave (see page 6829)	This is CMMouseleave, a member of class TOffice2007Button.
V	DoClick (see page 6829)	This is DoClick, a member of class TOffice2007Button.
V	DrawBackground (see page 6829)	This is DrawBackground, a member of class TOffice2007Button.
V	DrawImage (see page 6830)	This is DrawImage, a member of class TOffice2007Button.
V	MouseDown (see page 6830)	OnMouseDown event dispatcher.
V	MouseMove (see page 6830)	Respond to mouse moving over control area..
V	MouseUp (see page 6831)	OnMouseUp event dispatcher.
V	Paint (see page 6831)	Render control surface.
V	SetParent (see page 6832)	Sets the parent of the control.

Protected Properties

	Name	Description
	MouseInControl (see page 6832)	This is MouseInControl, a member of class TOffice2007Button.
R	RibbonStyle (see page 6833)	This is RibbonStyle, a member of class TOffice2007Button.

Public Events

	Name	Description
	OnClick (see page 6833)	Occurs when the user clicks the control.

Public Methods

	Name	Description
V	Create (see page 6827)	Creates an instance of TGraphicControl.
V	Destroy (see page 6828)	Destroys an instance of TGraphicControl.

76.1.12.2 TOffice2007Button.Create Constructor

Creates an instance of TGraphicControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TOffice2007Button(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TGraphicControl. However, you should never attempt to instantiate a TGraphicControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component, typically a form, that is responsible for freeing the graphic control. It becomes the value of the Owner property. If you do not explicitly provide an Owner to the constructor (that is, if AOwner is nil (Delphi) or NULL (C++)), your application is responsible for explicitly freeing the graphic control.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

76.1.12.3 TOffice2007Button.Destroy Destructor

Destroys an instance of TGraphicControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TOffice2007Button();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

76.1.12.4 TOffice2007Button Methods

The methods of the TOffice2007Button class are listed here.

Protected Methods

	Name	Description
	CMMouseenter (see page 6829)	This is CMMouseenter, a member of class TOffice2007Button.
	CMMouseleave (see page 6829)	This is CMMouseleave, a member of class TOffice2007Button.
V	DoClick (see page 6829)	This is DoClick, a member of class TOffice2007Button.
V	DrawBackground (see page 6829)	This is DrawBackground, a member of class TOffice2007Button.
V	DrawImage (see page 6830)	This is DrawImage, a member of class TOffice2007Button.
V	MouseDown (see page 6830)	OnMouseDown event dispatcher.
V	MouseMove (see page 6830)	Respond to mouse moving over control area..

	MouseUp (see page 6831)	OnMouseUp event dispatcher.
	Paint (see page 6831)	Render control surface.
	SetParent (see page 6832)	Sets the parent of the control.

76.1.12.4.1 TOffice2007Button.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TOffice2007Button.

76.1.12.4.2 TOffice2007Button.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TOffice2007Button.

76.1.12.4.3 TOffice2007Button.DoClick Method

Pascal

```
procedure DoClick; virtual;
```

C++

```
virtual __fastcall DoClick();
```

Description

This is DoClick, a member of class TOffice2007Button.

76.1.12.4.4 TOffice2007Button.DrawBackground Method

Pascal

```
procedure DrawBackground; virtual;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TOffice2007Button.

76.1.12.4.5 TOffice2007Button.DrawImage Method

Pascal

```
procedure DrawImage; virtual;
```

C++

```
virtual __fastcall DrawImage();
```

Description

This is DrawImage, a member of class TOffice2007Button.

76.1.12.4.6 TOffice2007Button.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

MouseMove

MouseUp

OnMouseDown

76.1.12.4.7 TOffice2007Button.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler

when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

MouseDown

MouseUp

OnMouseMove

76.1.12.4.8 TOffice2007Button.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

MouseMove

OnMouseUp

76.1.12.4.9 TOffice2007Button.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

76.1.12.4.10 TOffice2007Button.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

76.1.12.5 TOffice2007Button Properties

The properties of the TOffice2007Button class are listed here.

Protected Properties

	Name	Description
	MouseInControl (see page 6832)	This is MouseInControl, a member of class TOffice2007Button.
R	RibbonStyle (see page 6833)	This is RibbonStyle, a member of class TOffice2007Button.

76.1.12.5.1 TOffice2007Button.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TOffice2007Button.

76.1.12.5.2 TOffice2007Button.RibbonStyle Property

Pascal

```
property RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__property TRibbonStyleActionBars RibbonStyle;
```

Description

This is RibbonStyle, a member of class TOffice2007Button.

76.1.12.6 TOffice2007Button Events

The events of the TOffice2007Button class are listed here.

Public Events

	Name	Description
	OnClick (see page 6833)	Occurs when the user clicks the control.

76.1.12.6.1 TOffice2007Button.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
```

```
    PageControl1Change(Sender);
end;

76.1.13.1 TQuickAccessToolbar Members

The following tables list the members exposed by TQuickAccessToolbar.

Enumerations

	Name	Description
	TQATPosition (see page 6836)	This is record Ribbon.TQuickAccessToolbar.TQATPosition.

Protected Methods

	Name	Description
	DoChange (see page 6838)	This is DoChange, a member of class TQuickAccessToolbar.

Public Events

	Name	Description
	OnChange (see page 6840)	This is OnChange, a member of class TQuickAccessToolbar.

Public Methods

	Name	Description
	Assign (see page 6837)	Copies the contents of another, similar object.
	Create (see page 6836)	This is Create, a member of class TQuickAccessToolbar.
	Show (see page 6838)	This is Show, a member of class TQuickAccessToolbar.
	TogglePosition (see page 6838)	This is TogglePosition, a member of class TQuickAccessToolbar.

Public Properties

	Name	Description
	BarWidth (see page 6839)	This is BarWidth, a member of class TQuickAccessToolbar.

Published Properties

	Name	Description
	ActionBar (see page 6839)	This is ActionBar, a member of class TQuickAccessToolbar.
	Position (see page 6839)	This is Position, a member of class TQuickAccessToolbar.
	ShowMinimize (see page 6839)	This is ShowMinimize, a member of class TQuickAccessToolbar.
	ShowMoreCommands (see page 6840)	This is ShowMoreCommands, a member of class TQuickAccessToolbar.
	ShowPosition (see page 6840)	This is ShowPosition, a member of class TQuickAccessToolbar.

76.1.13.2 TQuickAccessToolbar.Create Constructor

Pascal

```
constructor Create(ARibbon: TCustomRibbon); reintroduce;
```

C++

```
__fastcall TQuickAccessToolbar(TCustomRibbon ARibbon);
```

Description

This is Create, a member of class TQuickAccessToolbar.

76.1.13.3 TQuickAccessToolbar Enumerations

The enumerations of the TQuickAccessToolbar class are listed here.

Enumerations

	Name	Description
	TQATPosition (see page 6836)	This is record Ribbon.TQuickAccessToolbar.TQATPosition.

76.1.13.3.1 Ribbon.TQuickAccessToolbar.TQATPosition Enumeration

Pascal

```
TQATPosition = (
  qpTop,
  qpBottom
);
```

C++

```
enum TQATPosition {
  qpTop,
  qpBottom
};
```

File

Ribbon

Description

This is record Ribbon.TQuickAccessToolbar.TQATPosition.

76.1.13.4 TQuickAccessToolbar Methods

The methods of the TQuickAccessToolbar class are listed here.

Protected Methods

	Name	Description
	DoChange (see page 6838)	This is DoChange, a member of class TQuickAccessToolbar.

Public Methods

	Name	Description
	Assign (see page 6837)	Copies the contents of another, similar object.
	Show (see page 6838)	This is Show, a member of class TQuickAccessToolbar.
	TogglePosition (see page 6838)	This is TogglePosition, a member of class TQuickAccessToolbar.

76.1.13.4.1 TQuickAccessToolbar.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

EConvertError

76.1.13.4.2 TQuickAccessToolbar.DoChange Method

Pascal

```
procedure DoChange; virtual;
```

C++

```
virtual __fastcall DoChange();
```

Description

This is DoChange, a member of class TQuickAccessToolbar.

76.1.13.4.3 TQuickAccessToolbar.Show Method

Pascal

```
procedure Show(const Visible: Boolean);
```

C++

```
__fastcall Show(const Boolean Visible);
```

Description

This is Show, a member of class TQuickAccessToolbar.

76.1.13.4.4 TQuickAccessToolbar.TogglePosition Method

Pascal

```
procedure TogglePosition;
```

C++

```
__fastcall TogglePosition();
```

Description

This is TogglePosition, a member of class TQuickAccessToolbar.

76.1.13.5 TQuickAccessToolbar Properties

The properties of the TQuickAccessToolbar class are listed here.

Public Properties

	Name	Description
	BarWidth (see page 6839)	This is BarWidth, a member of class TQuickAccessToolbar.

Published Properties

	Name	Description
	ActionBar (see page 6839)	This is ActionBar, a member of class TQuickAccessToolbar.
	Position (see page 6839)	This is Position, a member of class TQuickAccessToolbar.
	ShowMinimize (see page 6839)	This is ShowMinimize, a member of class TQuickAccessToolbar.
	ShowMoreCommands (see page 6840)	This is ShowMoreCommands, a member of class TQuickAccessToolbar.
	ShowPosition (see page 6840)	This is ShowPosition, a member of class TQuickAccessToolbar.

76.1.13.5.1 TQuickAccessToolbar.ActionBar Property

Pascal

```
property ActionBar: TCustomRibbonQuickAccessToolbar;
```

C++

```
__property TCustomRibbonQuickAccessToolbar ActionBar;
```

Description

This is ActionBar, a member of class TQuickAccessToolbar.

76.1.13.5.2 TQuickAccessToolbar.BarWidth Property

Pascal

```
property BarWidth: Integer;
```

C++

```
__property int BarWidth;
```

Description

This is BarWidth, a member of class TQuickAccessToolbar.

76.1.13.5.3 TQuickAccessToolbar.Position Property

Pascal

```
property Position: TQATPosition;
```

C++

```
__property TQATPosition Position;
```

Description

This is Position, a member of class TQuickAccessToolbar.

76.1.13.5.4 TQuickAccessToolbar.ShowMinimize Property

Pascal

```
property ShowMinimize: Boolean;
```

C++

```
__property Boolean ShowMinimize;
```

Description

This is ShowMinimize, a member of class TQuickAccessToolbar.

76.1.13.5.5 TQuickAccessToolbar.ShowMoreCommands Property

Pascal

```
property ShowMoreCommands: Boolean;
```

C++

```
__property Boolean ShowMoreCommands;
```

Description

This is ShowMoreCommands, a member of class TQuickAccessToolbar.

76.1.13.5.6 TQuickAccessToolbar.ShowPosition Property

Pascal

```
property ShowPosition: Boolean;
```

C++

```
__property Boolean ShowPosition;
```

Description

This is ShowPosition, a member of class TQuickAccessToolbar.

76.1.13.6 TQuickAccessToolbar Events

The events of the TQuickAccessToolbar class are listed here.

Public Events

	Name	Description
	OnChange (see page 6840)	This is OnChange, a member of class TQuickAccessToolbar.

76.1.13.6.1 TQuickAccessToolbar.OnChange Event

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

This is OnChange, a member of class TQuickAccessToolbar.

76.1.14 TQuickAccessToolbarGroupItem Class

Display Quick Access Toolbar commands to display entire Ribbon (see page 6713) group.

Class Hierarchy

Pascal

```
TQuickAccessToolbarGroupItem = class;
```

C++

```
class TQuickAccessToolbarGroupItem;
```

File

Ribbon

Description

TQuickAccessToolbarGroupItem is used to display Quick Access Toolbar commands that display an entire Ribbon (see page 6713) group when clicked.

76.1.14.1 TQuickAccessToolbarGroupItem Members

The following tables list the members exposed by TQuickAccessToolbarGroupItem.

Public Methods

	Name	Description
	Create (see page 6841)	This is Create, a member of class TQuickAccessToolbarGroupItem.
V	Destroy (see page 6842)	This is Destroy, a member of class TQuickAccessToolbarGroupItem.

Public Properties

	Name	Description
R	Action (see page 6842)	This is Action, a member of class TQuickAccessToolbarGroupItem.
R	Caption (see page 6842)	This is Caption, a member of class TQuickAccessToolbarGroupItem.
R	Group (see page 6842)	This is Group, a member of class TQuickAccessToolbarGroupItem.

76.1.14.2 TQuickAccessToolbarGroupItem.Create Constructor

Pascal

```
constructor Create(ActionList: TActionList; AGroup: TCustomRibbonGroup); reintroduce;
```

C++

```
__fastcall TQuickAccessToolbarGroupItem(TActionList ActionList, TCustomRibbonGroup AGroup);
```

Description

This is Create, a member of class TQuickAccessToolbarGroupItem.

76.1.14.3 TQuickAccessToolbarGroupItem.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TQuickAccessToolbarGroupItem();
```

Description

This is Destroy, a member of class TQuickAccessToolbarGroupItem.

76.1.14.4 TQuickAccessToolbarGroupItem Properties

The properties of the TQuickAccessToolbarGroupItem class are listed here.

Public Properties

	Name	Description
	Action (see page 6842)	This is Action, a member of class TQuickAccessToolbarGroupItem.
	Caption (see page 6842)	This is Caption, a member of class TQuickAccessToolbarGroupItem.
	Group (see page 6842)	This is Group, a member of class TQuickAccessToolbarGroupItem.

76.1.14.4.1 TQuickAccessToolbarGroupItem.Action Property

Pascal

```
property Action: TAction;
```

C++

```
__property TAction Action;
```

Description

This is Action, a member of class TQuickAccessToolbarGroupItem.

76.1.14.4.2 TQuickAccessToolbarGroupItem.Caption Property

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

This is Caption, a member of class TQuickAccessToolbarGroupItem.

76.1.14.4.3 TQuickAccessToolbarGroupItem.Group Property

Pascal

```
property Group: TCustomRibbonGroup;
```

C++

```
__property TCustomRibbonGroup Group;
```

Description

This is Group, a member of class TQuickAccessToolbarGroupItem.

76.1.15 TQuickAccessToolbarGroups Class

Class Hierarchy

Pascal

```
TQuickAccessToolbarGroups = class;
```

C++

```
class TQuickAccessToolbarGroups;
```

File

Ribbon

Description

This is class Ribbon.TQuickAccessToolbarGroups.

76.1.15.1 TQuickAccessToolbarGroups Members

The following tables list the members exposed by TQuickAccessToolbarGroups.

Public Methods

	Name	Description
	Add (see page 6844)	This is Add, a member of class TQuickAccessToolbarGroups.
	Clean (see page 6844)	This is Clean, a member of class TQuickAccessToolbarGroups.
V	Create (see page 6843)	This is Create, a member of class TQuickAccessToolbarGroups.
V	Destroy (see page 6844)	This is Destroy, a member of class TQuickAccessToolbarGroups.
	Exists (see page 6844)	This is Exists, a member of class TQuickAccessToolbarGroups.
	Group (see page 6845)	This is Group, a member of class TQuickAccessToolbarGroups.
	Remove (see page 6845)	This is Remove, a member of class TQuickAccessToolbarGroups.

76.1.15.2 TQuickAccessToolbarGroups.Create Constructor

Pascal

```
constructor Create(Images: TCustomImageList); virtual;
```

C++

```
virtual __fastcall TQuickAccessToolbarGroups(TCustomImageList Images);
```

Description

This is Create, a member of class TQuickAccessToolbarGroups.

76.1.15.3 TQuickAccessToolbarGroups.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TQuickAccessToolbarGroups();
```

Description

This is Destroy, a member of class TQuickAccessToolbarGroups.

76.1.15.4 TQuickAccessToolbarGroups Methods

The methods of the TQuickAccessToolbarGroups class are listed here.

Public Methods

	Name	Description
	Add (see page 6844)	This is Add, a member of class TQuickAccessToolbarGroups.
	Clean (see page 6844)	This is Clean, a member of class TQuickAccessToolbarGroups.
	Exists (see page 6844)	This is Exists, a member of class TQuickAccessToolbarGroups.
	Group (see page 6845)	This is Group, a member of class TQuickAccessToolbarGroups.
	Remove (see page 6845)	This is Remove, a member of class TQuickAccessToolbarGroups.

76.1.15.4.1 TQuickAccessToolbarGroups.Add Method

Pascal

```
function Add(AGroup: TCustomRibbonGroup): TQuickAccessToolbarGroupItem;
```

C++

```
__fastcall TQuickAccessToolbarGroupItem Add(TCustomRibbonGroup AGroup);
```

Description

This is Add, a member of class TQuickAccessToolbarGroups.

76.1.15.4.2 TQuickAccessToolbarGroups.Clean Method

Pascal

```
procedure Clean;
```

C++

```
__fastcall Clean();
```

Description

This is Clean, a member of class TQuickAccessToolbarGroups.

76.1.15.4.3 TQuickAccessToolbarGroups.Exists Method

Pascal

```
function Exists(const ACaption: string): Boolean;
```

C++

```
__fastcall Boolean Exists(const UnicodeString ACaption);
```

Description

This is Exists, a member of class TQuickAccessToolbarGroups.

76.1.15.4.4 TQuickAccessToolbarGroups.Group Method

Pascal

```
function Group(const ACaption: string): TCustomRibbonGroup;
```

C++

```
__fastcall TCustomRibbonGroup Group(const UnicodeString ACaption);
```

Description

This is Group, a member of class TQuickAccessToolbarGroups.

76.1.15.4.5 TQuickAccessToolbarGroups.Remove Method

Pascal

```
procedure Remove(const ACaption: string);
```

C++

```
__fastcall Remove(const UnicodeString ACaption);
```

Description

This is Remove, a member of class TQuickAccessToolbarGroups.

76.1.16 TRibbon Class

Implement ribbon control.

Class Hierarchy

Pascal

```
TRibbon = class(TCustomRibbon);
```

C++

```
class TRibbon : public TCustomRibbon;
```

File

Ribbon

Description

TRibbon is a TCustomRibbon (see page 6724) that implements the ribbon control. Use TRibbon to create a user interface that looks and performs like the Microsoft Fluent User Interface.

Instead of the tradional user interface where the application has a top level menu, there is no top level menu when using TRibbon. Instead there is an Application (see page 2612) Menu (see page 6762), represented by a large round button in the

top left corner. Commands are displayed in groups in tabs. These groups are more like toolbars and can display a variety of user interface elements.

76.1.16.1 TRibbon Members

The following tables list the members exposed by TRibbon.

Protected Events

	Name	Description
	OnLeftTabScrollButtonClick (see page 6766)	This is OnLeftTabScrollButtonClick, a member of class TCustomRibbon.
	OnRightTabScrollButtonClick (see page 6767)	This is OnRightTabScrollButtonClick, a member of class TCustomRibbon.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 6736)	This is CMBidimodechanged, a member of class TCustomRibbon.
	CMDesignHitTest (see page 6737)	This is CMDesignHitTest, a member of class TCustomRibbon.
	CMFontchanged (see page 6737)	This is CMFontchanged, a member of class TCustomRibbon.
	CMMouseenter (see page 6737)	This is CMMouseenter, a member of class TCustomRibbon.
	CMMouseleave (see page 6737)	This is CMMouseleave, a member of class TCustomRibbon.
	CMTextchanged (see page 6738)	This is CMTextchanged, a member of class TCustomRibbon.
	CMThemeChanged (see page 6738)	This is CMThemeChanged, a member of class TCustomRibbon.
	ContextMenuPopupHandler (see page 6738)	This is ContextMenuPopupHandler, a member of class TCustomRibbon.
	CreateContextMenu (see page 6738)	This is CreateContextMenu, a member of class TCustomRibbon.
	CustomFrameWndProc (see page 6739)	This is CustomFrameWndProc, a member of class TCustomRibbon.
	DblClick (see page 6739)	OnDblClick event dispatcher.
	DefineProperties (see page 6739)	Provides methods to read and write the IsControl property to a stream such as a form file.
	DisplayKeyTips (see page 6740)	This is DisplayKeyTips, a member of class TCustomRibbon.
	DoAddToQuickAccessToolbar (see page 6740)	This is DoAddToQuickAccessToolbar, a member of class TCustomRibbon.
	DoChangeQuickAccessToolbarPosition (see page 6740)	This is DoChangeQuickAccessToolbarPosition, a member of class TCustomRibbon.
	DoContextPopup (see page 6741)	OnContextPopup event dispatcher.
	DoCustomizeQuickAccessToolbar (see page 6741)	This is DoCustomizeQuickAccessToolbar, a member of class TCustomRibbon.
	DoGroupStyleChanged (see page 6741)	This is DoGroupStyleChanged, a member of class TCustomRibbon.
	DoHelpButtonClick (see page 6741)	This is DoHelpButtonClick, a member of class TCustomRibbon.
	DoMinimizeRibbon (see page 6742)	This is DoMinimizeRibbon, a member of class TCustomRibbon.
	DoMouseWheelDown (see page 6742)	OnMouseWheelDown event dispatcher.
	DoMouseWheelUp (see page 6743)	OnMouseWheelUp event dispatcher.
	DoRecentItemClick (see page 6743)	This is DoRecentItemClick, a member of class TCustomRibbon.
	DoScrollTabsLeft (see page 6743)	This is DoScrollTabsLeft, a member of class TCustomRibbon.
	DoScrollTabsRight (see page 6743)	This is DoScrollTabsRight, a member of class TCustomRibbon.
	DoTabChange (see page 6744)	This is DoTabChange, a member of class TCustomRibbon.
	DrawCaption (see page 6744)	This is DrawCaption, a member of class TCustomRibbon.
	DrawQuickAccessToolbar (see page 6744)	This is DrawQuickAccessToolbar, a member of class TCustomRibbon.
	DrawSystemButtons (see page 6744)	This is DrawSystemButtons, a member of class TCustomRibbon.
	DrawTab (see page 6745)	This is DrawTab, a member of class TCustomRibbon.
	GetContextMenuOptions (see page 6745)	This is GetContextMenuOptions, a member of class TCustomRibbon.
	GetHelpButtonRect (see page 6745)	This is GetHelpButtonRect, a member of class TCustomRibbon.

	GetRibbonHeight (see page 6746)	This is GetRibbonHeight, a member of class TCustomRibbon.
V	GetTabAt (see page 6746)	This is GetTabAt, a member of class TCustomRibbon.
V	GetTabRect (see page 6746)	This is GetTabRect, a member of class TCustomRibbon.
V	GetTabWidth (see page 6747)	This is GetTabWidth, a member of class TCustomRibbon.
	HasApplicationMenu (see page 6747)	This is HasApplicationMenu, a member of class TCustomRibbon.
	HasQuickAccessToolbar (see page 6747)	This is HasQuickAccessToolbar, a member of class TCustomRibbon.
	Idle (see page 6747)	This is Idle, a member of class TCustomRibbon.
V	KeyDown (see page 6749)	Respond to key press events.
V	Loaded (see page 6749)	Initializes the control after it is loaded from a stream.
V	MouseDown (see page 6750)	OnMouseDown event dispatcher.
	MouseInSystemMenu (see page 6750)	This is MouseInSystemMenu, a member of class TCustomRibbon.
V	MouseMove (see page 6750)	Respond to mouse moving over control area..
V	MouseUp (see page 6751)	OnMouseUp event dispatcher.
V	Notification (see page 6752)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 6752)	Renders the image of a custom control.
	RebuildRibbonMetrics (see page 6753)	This is RebuildRibbonMetrics, a member of class TCustomRibbon.
V	Resize (see page 6754)	Respond to control resize.
V	SetParent (see page 6754)	Sets the parent of the control.
	UMCheckResize (see page 6756)	This is UMCheckResize, a member of class TCustomRibbon.
	UMDisplayKeyTips (see page 6756)	This is UMDisplayKeyTips, a member of class TCustomRibbon.
	UpdateQATPosition (see page 6757)	This is UpdateQATPosition, a member of class TCustomRibbon.
	UpdateSystemMenuInfo (see page 6757)	This is UpdateSystemMenuInfo, a member of class TCustomRibbon.
	ValidTab (see page 6757)	This is ValidTab, a member of class TCustomRibbon.
	WMEraseBkgnd (see page 6757)	This is WMEraseBkgnd, a member of class TCustomRibbon.
	WMGetDlgCode (see page 6758)	This is WMGetDlgCode, a member of class TCustomRibbon.
	WMKillFocus (see page 6758)	This is WMKillFocus, a member of class TCustomRibbon.
	WMSettingChange (see page 6758)	This is WMSettingChange, a member of class TCustomRibbon.
	WMWindowPosChanged (see page 6758)	This is WMWindowPosChanged, a member of class TCustomRibbon.

Protected Properties

	Name	Description
	AllowKeyboardNavigation (see page 6760)	This is AllowKeyboardNavigation, a member of class TCustomRibbon.
	HideRibbon (see page 6761)	This is HideRibbon, a member of class TCustomRibbon.
	HotTabIndex (see page 6762)	This is HotTabIndex, a member of class TCustomRibbon.
	KeyTipsVisible (see page 6762)	This is KeyTipsVisible, a member of class TCustomRibbon.
R	Menu (see page 6762)	This is Menu, a member of class TCustomRibbon.
R	ScaleFactor (see page 6763)	This is ScaleFactor, a member of class TCustomRibbon.

Public Constants

	Name	Description
	cRibbonFirstTabOffSet (see page 6730)	This is cRibbonFirstTabOffSet, a member of class TCustomRibbon.
	cRibbonGroupCaptionHeight (see page 6730)	This is cRibbonGroupCaptionHeight, a member of class TCustomRibbon.
	cRibbonGroupHeight (see page 6730)	This is cRibbonGroupHeight, a member of class TCustomRibbon.
	cRibbonHeight (see page 6730)	This is cRibbonHeight, a member of class TCustomRibbon.
	cRibbonHideHeight (see page 6730)	This is cRibbonHideHeight, a member of class TCustomRibbon.
	cRibbonHideWidth (see page 6731)	This is cRibbonHideWidth, a member of class TCustomRibbon.
	cRibbonMinimizedHeight (see page 6731)	This is cRibbonMinimizedHeight, a member of class TCustomRibbon.
	cRibbonMinimumCaptionWidth (see page 6731)	This is cRibbonMinimumCaptionWidth, a member of class TCustomRibbon.
	cRibbonPageHeight (see page 6731)	This is cRibbonPageHeight, a member of class TCustomRibbon.
	cRibbonQATHeight (see page 6732)	This is cRibbonQATHeight, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarLeft (see page 6732)	This is cRibbonQuickAccessToolbarLeft, a member of class TCustomRibbon.
	cRibbonQuickAccessToolbarTop (see page 6732)	This is cRibbonQuickAccessToolbarTop, a member of class TCustomRibbon.
	cRibbonTabHeight (see page 6732)	This is cRibbonTabHeight, a member of class TCustomRibbon.
	cRibbonTabScrollButtonWidth (see page 6732)	This is cRibbonTabScrollButtonWidth, a member of class TCustomRibbon.
	cRibbonTabSpacing (see page 6733)	This is cRibbonTabSpacing, a member of class TCustomRibbon.

	cRibbonUnthemedCaptionHeight (see page 6733)	This is cRibbonUnthemedCaptionHeight, a member of class TCustomRibbon.
	UM_CHECKSIZE (see page 6733)	This is UM_CHECKSIZE, a member of class TCustomRibbon.
	UM_DISPLAYKEYTIPS (see page 6733)	This is UM_DISPLAYKEYTIPS, a member of class TCustomRibbon.

Public Methods

	Name	Description
	AddRecentItem (see page 6735)	Add new entry into Recent Items list.
	AddTab (see page 6736)	This is AddTab, a member of class TCustomRibbon.
	BeginUpdate (see page 6736)	This is BeginUpdate, a member of class TCustomRibbon.
	CheckRibbonSize (see page 6736)	This is CheckRibbonSize, a member of class TCustomRibbon.
	ClearRecentItems (see page 6736)	This is ClearRecentItems, a member of class TCustomRibbon.
V	Create (see page 6728)	Creates an instance of TCustomControl.
	CustomFrameSupported (see page 6738)	This is CustomFrameSupported, a member of class TCustomRibbon.
	DeleteTab (see page 6740)	Delete tab at specified Index.
V	Destroy (see page 6728)	Destroys an instance of TCustomControl.
	DoMouseWheelEx (see page 6742)	This is DoMouseWheelEx, a member of class TCustomRibbon.
	EndUpdate (see page 6745)	This is EndUpdate, a member of class TCustomRibbon.
V	GetIcon (see page 6745)	Return Icon used by Application (see page 2612) Menu (see page 6762) Button.
	GetRibbonMetric (see page 6746)	This is GetRibbonMetric, a member of class TCustomRibbon.
	InvalidateHeaderArea (see page 6747)	Invalidate header section of Ribbon (see page 6713).
	InvalidateScrollButtons (see page 6748)	This is InvalidateScrollButtons, a member of class TCustomRibbon.
	InvalidateSystemMenuArea (see page 6748)	This is InvalidateSystemMenuArea, a member of class TCustomRibbon.
	InvalidateTabArea (see page 6748)	Invalidate area that displays tabs.
	MoveGroup (see page 6751)	Move group to new page.
	RemoveAllTabs (see page 6753)	Remove all Tabs (see page 6764) from Ribbon (see page 6713).
	RemoveRecentItem (see page 6753)	This is RemoveRecentItem, a member of class TCustomRibbon.
	RemoveTab (see page 6753)	Remove tab with specified caption.
V	SetBounds (see page 6754)	Sets the windowed control's boundary properties all at once.
	TabHandledKeyTips (see page 6755)	Validate **KeyTip** input when **KeyTip**s State is **ktsTabs**.
	TabHideKeyTips (see page 6755)	Hide K**eyTip**s.
	TabShowKeyTips (see page 6756)	Display **KeyTip**s for **ktsTabs** State.

Public Nested Types

Name	Description
TTabChangeEvent (see page 6765)	This is nested type Ribbon.TCustomRibbon.TTabChangeEvent.

Public Properties

	Name	Description
	Active (see page 6759)	Indicates if form that ribbon is placed on is active form.
	ActivePage (see page 6760)	Page currently displayed by ribbon control.
	ColorMap (see page 6761)	This is ColorMap, a member of class TCustomRibbon.
	Minimized (see page 6763)	Show Ribbon (see page 6713) in minimized state where tabs can be selected but are not visible.

Published Events

	Name	Description
	OnHelpButtonClick (see page 6863)	This is OnHelpButtonClick, a member of class TRibbon.
	OnRecentItemClick (see page 6863)	Recent item clicked.
	OnTabChange (see page 6864)	This is OnTabChange, a member of class TRibbon.

Published Properties

	Name	Description
	ActionManager (see page 6849)	This is ActionManager, a member of class TRibbon.
	Align (see page 6850)	Determines how the control aligns within its container (parent control).

	Anchors (see page 6853)	Specifies how the control is anchored to its parent.
	ApplicationMenu (see page 6854)	Change appearance of ribbon's associated TRibbonApplicationMenuBar control.
	BiDiMode (see page 6854)	Specifies the bi-directional mode for the control.
	Caption (see page 6854)	Specifies a text string that identifies the control to the user.
	DocumentName (see page 6857)	Text in Ribbon caption.
	Enabled (see page 6857)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 6858)	Controls the attributes of text written on or in the control.
	Height (see page 6859)	Specifies the vertical size of the control in pixels.
	HideTabs (see page 6860)	Shows or hides Tab portion of Ribbon.
	ParentBiDiMode (see page 6860)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 6861)	Determines where a control looks for its font information.
	QuickAccessToolbar (see page 6861)	Properties associated with TQuickAccessToolbar.
	ScreenTips (see page 6861)	This is ScreenTips, a member of class TRibbon.
	ShowHelpButton (see page 6862)	Determines whether ribbon displays Help Button.
	Style (see page 6862)	This is Style, a member of class TRibbon.
	TabIndex (see page 6862)	Change the active page of ribbon.
	Tabs (see page 6862)	Collection of TRibbonTabs visible on ribbon.
	UseCustomFrame (see page 6863)	Indicates whether to use a custom frame for ribbon controls.

76.1.16.2 TRibbon Properties

The properties of the TRibbon class are listed here.

Published Properties

	Name	Description
	ActionManager (see page 6849)	This is ActionManager, a member of class TRibbon.
	Align (see page 6850)	Determines how the control aligns within its container (parent control).
	Anchors (see page 6853)	Specifies how the control is anchored to its parent.
	ApplicationMenu (see page 6854)	Change appearance of ribbon's associated TRibbonApplicationMenuBar control.
	BiDiMode (see page 6854)	Specifies the bi-directional mode for the control.
	Caption (see page 6854)	Specifies a text string that identifies the control to the user.
	DocumentName (see page 6857)	Text in Ribbon caption.
	Enabled (see page 6857)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 6858)	Controls the attributes of text written on or in the control.
	Height (see page 6859)	Specifies the vertical size of the control in pixels.
	HideTabs (see page 6860)	Shows or hides Tab portion of Ribbon.
	ParentBiDiMode (see page 6860)	Specifies whether the control uses its parent's BiDiMode.
	ParentFont (see page 6861)	Determines where a control looks for its font information.
	QuickAccessToolbar (see page 6861)	Properties associated with TQuickAccessToolbar.
	ScreenTips (see page 6861)	This is ScreenTips, a member of class TRibbon.
	ShowHelpButton (see page 6862)	Determines whether ribbon displays Help Button.
	Style (see page 6862)	This is Style, a member of class TRibbon.
	TabIndex (see page 6862)	Change the active page of ribbon.
	Tabs (see page 6862)	Collection of TRibbonTabs visible on ribbon.
	UseCustomFrame (see page 6863)	Indicates whether to use a custom frame for ribbon controls.

76.1.16.2.1 TRibbon.ActionManager Property

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

This is ActionManager, a member of class TRibbon.

76.1.16.2.2 TRibbon.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
```

```
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
```

```
  clause of the form's implementation section.
  Note that when creating a splitter dynamically at runtime,
  it is important to set its position to the appropriate side
  of the control it will resize.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  var
    Split: TSplitter;
    Files: TFileListBox;
    Dirs: TDirectoryListBox;
  begin
    { first add a directory list box to the form }
    Dirs := TDirectoryListBox.Create(Form1);
    { line it up on the left of the form }
    Dirs.Parent := Form1;
    Dirs.Align := alLeft;
    Dirs.Width := Form1.ClientWidth div 3;
  { now add the splitter to divide the directory pane from the file pane }
    Split := TSplitter.Create(Form1);
    Split.Parent := Form1;
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane - a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
  end;
  {
  Dynamically create a TProgressBar control and align it to
  the bottom of the form.

Parent

Anchors

76.1.16.2.3 TRibbon.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

Parent

Align

76.1.16.2.4 TRibbon.ApplicationMenu Property

Change appearance of ribbon's associated TRibbonApplicationMenuBar control.

Pascal

```
property ApplicationMenu: TApplicationMenu;
```

C++

```
__property TApplicationMenu ApplicationMenu;
```

Description

ApplicationMenu changes the appearance for the ribbon's associated TRibbonApplicationMenuBar control.

Changing the values of the fields in ApplicationMenu changes the characteristics of the Application Menu for the ribbon. The Application Menu on the ribbon is represented by the round button in the top left corner.

See Also

TApplicationMenu (see page 6716)

TRibbonApplicationMenuBar (see page 7302)

76.1.16.2.5 TRibbon.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

76.1.16.2.6 TRibbon.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
```

```
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
```

```
      begin
        with TToolButton.Create(ToolBar) do
        begin
          Parent := ToolBar;
          Caption := ButtonCaptions[I];
          if (ButtonCaptions[I] = '|') then
            Style := tbsSeparator
          else
            Style := tbsButton;
        end;
      end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ToolBar1 := TToolBar.Create(Self);
    ToolBar1.Parent := Self;
    AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
    ToolBar1.ShowCaptions := True;
    ToolBar1.Height := 40;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I: Integer;
  begin
    for I := ToolBar1.ButtonCount - 1 downto 0 do
      ToolBar1.Buttons[I].Free;
    ToolBar1.Free;
  end;
```

76.1.16.2.7 TRibbon.DocumentName Property

Text in Ribbon caption.

Pascal

```
property DocumentName: string;
```

C++

```
__property UnicodeString DocumentName;
```

Description

DocumentName appears in the Ribbon caption.

See Also

CaptionFont

76.1.16.2.8 TRibbon.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

76.1.16.2.9 TRibbon.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
```

```
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

76.1.16.2.10 TRibbon.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;
```

```
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
    end;
end;

76.1.16.2.11 TRibbon.HideTabs Property

Shows or hides Tab portion of Ribbon.

Pascal

```
property HideTabs: Boolean;
```

C++

```
__property Boolean HideTabs;
```

Description

HideTabs shows or hides the Tab portion of the Ribbon. When HideTabs is True, the user cannot access any of the Tabs on the Ribbon.

76.1.16.2.12 TRibbon.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

See Also

Parent

BiDiMode

76.1.16.2.13 TRibbon.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

76.1.16.2.14 TRibbon.QuickAccessToolbar Property

Properties associated with TQuickAccessToolbar.

Pascal

```
property QuickAccessToolbar: TQuickAccessToolbar;
```

C++

```
__property TQuickAccessToolbar QuickAccessToolbar;
```

Description

QuickAccessToolbar has the properties associated with the TQuickAccessToolbar on the ribbon. Use these properties to change the appearance of the Quick Access Toolbar as displayed on the ribbon.

See Also

TQuickAccessToolbar (see page 6835)

76.1.16.2.15 TRibbon.ScreenTips Property

Pascal

```
property ScreenTips: TCustomScreenTipsManager;
```

C++

```
__property TCustomScreenTipsManager ScreenTips;
```

Description

This is ScreenTips, a member of class TRibbon.

76.1.16.2.16 TRibbon.ShowHelpButton Property

Determines whether ribbon displays Help Button.

Pascal

```
property ShowHelpButton: Boolean;
```

C++

```
__property Boolean ShowHelpButton;
```

Description

ShowHelpButton indicates whether or not the ribbon displays a Help Button in the top right hand corner.

See Also

THelpButton (see page 6825)

76.1.16.2.17 TRibbon.Style Property

Pascal

```
property Style: TRibbonStyleActionBars;
```

C++

```
__property TRibbonStyleActionBars Style;
```

Description

This is Style, a member of class TRibbon.

76.1.16.2.18 TRibbon.TabIndex Property

Change the active page of ribbon.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

TabIndex changes the active page of the ribbon. Set the TabIndex property to the desired page index.

See Also

Tabs (see page 6764)

76.1.16.2.19 TRibbon.Tabs Property

Collection of TRibbonTabs visible on ribbon.

Pascal

```
property Tabs: TRibbonTabs;
```

C++

```
__property TRibbonTabs Tabs;
```

Description

Tabs contains a collection of TRibbonTabs visible on the ribbon.

Tabs is a linked list of TRibbonTabs objects. TRibbonTabs is a simple data structure that contains the caption for the tab, the keytip for the tab as well as a reference to the Tab object.

See Also

76.1.16.2.20 TRibbon.UseCustomFrame Property

Indicates whether to use a custom frame for ribbon controls.

Pascal

```
property UseCustomFrame: Boolean;
```

C++

```
__property Boolean UseCustomFrame;
```

Description

UseCustomFrame indicates whether or not to use a custom frame, such as TRibbonForm, for ribbon controls.

76.1.16.3 TRibbon Events

The events of the TRibbon class are listed here.

Published Events

	Name	Description
	OnHelpButtonClick (see page 6863)	This is OnHelpButtonClick, a member of class TRibbon.
	OnRecentItemClick (see page 6863)	Recent item clicked.
	OnTabChange (see page 6864)	This is OnTabChange, a member of class TRibbon.

76.1.16.3.1 TRibbon.OnHelpButtonClick Event

Pascal

```
property OnHelpButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnHelpButtonClick;
```

Description

This is OnHelpButtonClick, a member of class TRibbon.

76.1.16.3.2 TRibbon.OnRecentItemClick Event

Recent item clicked.

Pascal

```
property OnRecentItemClick: TRecentItemClickEvent;
```

C++

```
__property TRecentItemClickEvent OnRecentItemClick;
```

Description

OnRecentItemClick occurs when a recent item is clicked.

Description

This is class Ribbon.TRibbonCustomizeDlg.

76.1.17.1 TRibbonCustomizeDlg Members

The following tables list the members exposed by TRibbonCustomizeDlg.

Protected Methods

	Name	Description
	SetupDlg (see page 6865)	This is SetupDlg, a member of class TRibbonCustomizeDlg.

76.1.17.2 TRibbonCustomizeDlg Methods

The methods of the TRibbonCustomizeDlg class are listed here.

Protected Methods

	Name	Description
	SetupDlg (see page 6865)	This is SetupDlg, a member of class TRibbonCustomizeDlg.

76.1.17.2.1 TRibbonCustomizeDlg.SetupDlg Method

Pascal

```
procedure SetupDlg; override;
```

C++

```
virtual __fastcall SetupDlg();
```

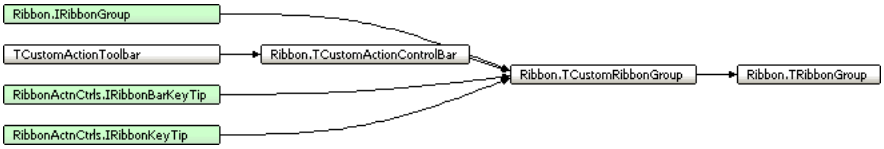
Description

This is SetupDlg, a member of class TRibbonCustomizeDlg.

76.1.18 TRibbonGroup Class

Control used to display the user selectable commands for the ribbon.

Class Hierarchy



Pascal

```
TRibbonGroup = class(TCustomRibbonGroup);
```

C++

```
class TRibbonGroup : public TCustomRibbonGroup;
```

File

Ribbon

Description

TRibbonGroup is a TCustomRibbonGroup (see page 6771) that is used to display the user selectable commands for the ribbon.

When creating a user interface using TRibbon (see page 6845), you add commands to ribbon groups. Ribbon (see page 6713) groups are placed on a ribbon page. You can add new groups to a ribbon by right clicking on the ribbon page and selecting the Add Group component editor item.

The position of the ribbon group is determined by the ribbon page that it was placed on. You cannot freely move the ribbon group around the ribbon page. To change the position of the group within the same page, change the GroupIndex (see page 6869) property.

To move the ribbon group to another ribbon page, use the Move Group command available when right clicking on the ribbon page at design time.

76.1.18.1 TRibbonGroup Members

The following tables list the members exposed by TRibbonGroup.

Enumerations

	Name	Description
	TGroupAlign (see page 6774)	This is record Ribbon.TCustomRibbonGroup.TGroupAlign.

Protected Methods

	Name	Description
V	AlignControls (see page 6775)	This is AlignControls, a member of class TCustomRibbonGroup.
V	AutoSizingChanged (see page 6776)	This is AutoSizingChanged, a member of class TCustomRibbonGroup.
	CMControlChange (see page 6722)	This is CMControlChange, a member of class TCustomActionControlBar.
	CMFontchanged (see page 6777)	This is CMFontchanged, a member of class TCustomRibbonGroup.
	CMItemDropPoint (see page 6777)	This is CMItemDropPoint, a member of class TCustomRibbonGroup.
	CMMouseenter (see page 6778)	This is CMMouseenter, a member of class TCustomRibbonGroup.
	CMMouseleave (see page 6778)	This is CMMouseleave, a member of class TCustomRibbonGroup.
	CMTextchanged (see page 6778)	This is CMTextchanged, a member of class TCustomRibbonGroup.
V	CreateControls (see page 6723)	This is CreateControls, a member of class TCustomActionControlBar.
V	CreateControls (see page 6779)	This is CreateControls, a member of class TCustomRibbonGroup.
V	DoDropItem (see page 6779)	This is DoDropItem, a member of class TCustomRibbonGroup.
V	DoEndDrag (see page 6779)	This is DoEndDrag, a member of class TCustomRibbonGroup.
V	DrawShowDialogButton (see page 6780)	This is DrawShowDialogButton, a member of class TCustomRibbonGroup.
	GetCaptionHeight (see page 6780)	This is GetCaptionHeight, a member of class TCustomRibbonGroup.
V	GetControlClass (see page 6723)	This is GetControlClass, a member of class TCustomActionControlBar.
	GetGroupHeight (see page 6780)	This is GetGroupHeight, a member of class TCustomRibbonGroup.
V	HideControls (see page 6781)	This is HideControls, a member of class TCustomRibbonGroup.
V	MouseDown (see page 6782)	This is MouseDown, a member of class TCustomRibbonGroup.
V	MouseMove (see page 6782)	This is MouseMove, a member of class TCustomRibbonGroup.
V	MouseUp (see page 6783)	This is MouseUp, a member of class TCustomRibbonGroup.
V	Notification (see page 6783)	This is Notification, a member of class TCustomRibbonGroup.
V	Paint (see page 6783)	This is Paint, a member of class TCustomRibbonGroup.
V	Resize (see page 6783)	This is Resize, a member of class TCustomRibbonGroup.
V	SetAutoSizing (see page 6783)	This is SetAutoSizing, a member of class TCustomRibbonGroup.
V	SetParent (see page 6784)	This is SetParent, a member of class TCustomRibbonGroup.
V	SetupDropDownBtn (see page 6785)	This is SetupDropDownBtn, a member of class TCustomRibbonGroup.
V	ShowControls (see page 6785)	This is ShowControls, a member of class TCustomRibbonGroup.

Protected Properties

	Name	Description
R	CreatingControls (see page 6723)	This is CreatingControls, a member of class TCustomActionControlBar.

Public Methods

	Name	Description
	AlignGroupControls (see page 6934)	Realign controls on group.
V	AlignGroupControls (see page 6775)	Align controls in Ribbon (see page 6713) Group
V	Assign (see page 6775)	This is Assign, a member of class TCustomRibbonGroup.
	BarHandleKeyTips (see page 6776)	Iterate over any visible **KeyTip (see page 6788)**s and perform validation to determine if one of **KeyTip (see page 6788)**s is partial or full match.
	BarHandleKeyTips (see page 7273)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 6776)	Hide any visible KeyTips that commands are displaying.
	BarHideKeyTips (see page 7273)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 6777)	Show K**eyTip**s for commands.
	BarShowKeyTips (see page 7274)	Show **KeyTip**s for any commands that support them.
	Clone (see page 6777)	This is Clone, a member of class TCustomRibbonGroup.
V	Create (see page 6722)	This is Create, a member of class TCustomActionControlBar.
V	Create (see page 6773)	This is Create, a member of class TCustomRibbonGroup.
	CreateControl (see page 6934)	Recreate specific control.
V	CreateControl (see page 6722)	This is CreateControl, a member of class TCustomActionControlBar.
V	CreateControl (see page 6778)	Recreate specific control.
V	Destroy (see page 6773)	This is Destroy, a member of class TCustomRibbonGroup.
V	DockDrop (see page 6779)	This is DockDrop, a member of class TCustomRibbonGroup.
V	DragDrop (see page 6779)	This is DragDrop, a member of class TCustomRibbonGroup.
	GetKeyTip (see page 6780)	Returns current **KeyTip** for command.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	HandleKeyTip (see page 6781)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HideKeyTip (see page 6781)	Hide **KeyTip** for command.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	KeyTipClick (see page 6782)	Handle clicking a **KeyTip**.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
V	SetBounds (see page 6784)	This is SetBounds, a member of class TCustomRibbonGroup.
	SetKeyTip (see page 6784)	Sets **KeyTip** for command.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	ShowKeyTip (see page 6785)	Shows **KeyTip** for command in specified position.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	StyleChanged (see page 6934)	This is StyleChanged, a member of class IRibbonGroup.
V	StyleChanged (see page 6785)	This is StyleChanged, a member of class TCustomRibbonGroup.

Public Nested Types

Name	Description
TRowPosition (see page 6790)	This is nested type Ribbon.TCustomRibbonGroup.TRowPosition.

Public Properties

	Name	Description
R	CanCollapse (see page 6786)	Determine whether group can be displayed collapsed.
R	CollapsedControl (see page 6786)	This is CollapsedControl, a member of class TCustomRibbonGroup.
	GroupVariant (see page 6787)	Current size variant ribbon group is using.
R	GroupWidth (see page 6788)	This is GroupWidth, a member of class TCustomRibbonGroup.
R	HasGallery (see page 6788)	Indicates if group has an in ribbon Gallery.
	Items (see page 6788)	This is Items, a member of class TCustomRibbonGroup.
R	Page (see page 6789)	Reference to Page group is on.
R	RequiredWidth (see page 6789)	Width required to display group.

Published Properties

	Name	Description
	ActionManager (see page 6868)	This is ActionManager, a member of class TRibbonGroup.
	BiDiMode (see page 6868)	This is BiDiMode, a member of class TRibbonGroup.
	Caption (see page 6869)	This is Caption, a member of class TRibbonGroup.
	DialogAction (see page 6869)	Determines whether dialog button displayed in group.
	GroupAlign (see page 6869)	Determines how controls on group are aligned.
	GroupIndex (see page 6869)	Index of group within current tab.
	Height (see page 6870)	This is Height, a member of class TRibbonGroup.
	KeyTip (see page 6870)	Key tip for Dialog button of group.
	ParentBiDiMode (see page 6870)	This is ParentBiDiMode, a member of class TRibbonGroup.
	Rows (see page 6870)	Number of Rows in group has for controls.

76.1.18.2 TRibbonGroup Properties

The properties of the TRibbonGroup class are listed here.

Published Properties

	Name	Description
	ActionManager (see page 6868)	This is ActionManager, a member of class TRibbonGroup.
	BiDiMode (see page 6868)	This is BiDiMode, a member of class TRibbonGroup.
	Caption (see page 6869)	This is Caption, a member of class TRibbonGroup.
	DialogAction (see page 6869)	Determines whether dialog button displayed in group.
	GroupAlign (see page 6869)	Determines how controls on group are aligned.
	GroupIndex (see page 6869)	Index of group within current tab.
	Height (see page 6870)	This is Height, a member of class TRibbonGroup.
	KeyTip (see page 6870)	Key tip for Dialog button of group.
	ParentBiDiMode (see page 6870)	This is ParentBiDiMode, a member of class TRibbonGroup.
	Rows (see page 6870)	Number of Rows in group has for controls.

76.1.18.2.1 TRibbonGroup.ActionManager Property

Pascal

```
property ActionManager;
```

C++

```
__property ActionManager;
```

Description

This is ActionManager, a member of class TRibbonGroup.

76.1.18.2.2 TRibbonGroup.BiDiMode Property

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

This is BiDiMode, a member of class TRibbonGroup.

76.1.18.2.3 TRibbonGroup.Caption Property

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

This is Caption, a member of class TRibbonGroup.

76.1.18.2.4 TRibbonGroup.DialogAction Property

Determines whether dialog button displayed in group.

Pascal

```
property DialogAction: TContainedAction;
```

C++

```
__property TContainedAction DialogAction;
```

Description

DialogAction determines whether the dialog button is displayed in the lower right hand corner of the group.

See Also

KeyTip (see page 6788)

76.1.18.2.5 TRibbonGroup.GroupAlign Property

Determines how controls on group are aligned.

Pascal

```
property GroupAlign: TGroupAlign;
```

C++

```
__property TGroupAlign GroupAlign;
```

Description

GroupAlign contains a TGroupAlign that determines how controls on a group are aligned.

If alignment is **gaHorizontal**, controls are aligned left to right, top to bottom. To make a control start in a new row, set the NewRow property to true.

If alignment is **gaVertical**, controls are aligned top to bottom, left to right. Controls are automatically moved to the next column in the group if three controls are already in the column. You can also force a control to a new column by setting the NewCol property to true.

See Also

TGroupAlign

76.1.18.2.6 TRibbonGroup.GroupIndex Property

Index of group within current tab.

Pascal

```
property GroupIndex: Integer;
```

C++

```
__property int GroupIndex;
```

Description

GroupIndex is the index of the group within the current tab. Set the GroupIndex property to change the position of the group within the current tab.

76.1.18.2.7 TRibbonGroup.Height Property

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

This is Height, a member of class TRibbonGroup.

76.1.18.2.8 TRibbonGroup.KeyTip Property

Key tip for Dialog button of group.

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;__property UnicodeString KeyTip;
```

Description

KeyTip is the key tip for the Dialog button of the group. It is only valid when DialogAction has been set.

See Also

DialogAction (see page 6786)

76.1.18.2.9 TRibbonGroup.ParentBiDiMode Property

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

This is ParentBiDiMode, a member of class TRibbonGroup.

76.1.18.2.10 TRibbonGroup.Rows Property

Number of Rows in group has for controls.

Pascal

```
property Rows: Integer;
```

C++

```
__property int Rows;
```

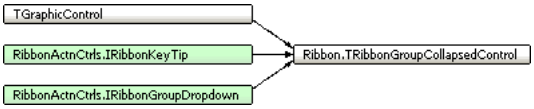
Description

Rows is the number of Rows the group has for displaying controls. A group must have at least 1 row and a maximum of 3.

76.1.19 TRibbonGroupCollapsedControl Class

Control used to represent a collapsed group on a tab.

Class Hierarchy



Pascal

```
TRibbonGroupCollapsedControl = class(TGraphicControl, IRibbonKeyTip, IRibbonGroupDropdown);
```

C++

```
class TRibbonGroupCollapsedControl : public TGraphicControl, public IRibbonKeyTip, public
IRibbonGroupDropdown;
```

File

Ribbon

Description

TRibbonGroupCollapsedControl is a control used to represent a collapsed group on a tab.

This class is used internally by the ribbon group to represent a group in the collapsed state. A group is collapsed when the GroupVariant property of the ribbon group is **rgvCollapsed**. This happens automatically when the ribbon is resized in such a way that the group is no longer completely visible within the current tab.

Note: This class is for internal use only.

GroupVariant (see page 6787)

76.1.19.1 TRibbonGroupCollapsedControl Members

The following tables list the members exposed by TRibbonGroupCollapsedControl.

Protected Methods

	Name	Description
	AdjustBounds (see page 6874)	This is AdjustBounds, a member of class TRibbonGroupCollapsedControl.
	Click (see page 6874)	Respond to user click.
	CMFontchanged (see page 6875)	This is CMFontchanged, a member of class TRibbonGroupCollapsedControl.
	CMMouseenter (see page 6875)	This is CMMouseenter, a member of class TRibbonGroupCollapsedControl.

	CMMouseleave (see page 6875)	This is CMMouseleave, a member of class TRibbonGroupCollapsedControl.
	CMTextchanged (see page 6875)	This is CMTextchanged, a member of class TRibbonGroupCollapsedControl.
V	Notification (see page 6878)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 6878)	Render control surface.
	SetupGroupImage (see page 6879)	This is SetupGroupImage, a member of class TRibbonGroupCollapsedControl.

Protected Properties

	Name	Description
	MouseInControl (see page 6883)	This is MouseInControl, a member of class TRibbonGroupCollapsedControl.

Public Methods

	Name	Description
	CloseUp (see page 6875)	This is CloseUp, a member of class TRibbonGroupCollapsedControl.
V	Create (see page 6872)	Creates an instance of TGraphicControl.
V	Destroy (see page 6873)	Destroys an instance of TGraphicControl.
	GetKeyTip (see page 6876)	Returns current **KeyTip** for command.
	GetParentControl (see page 6876)	This is GetParentControl, a member of class TRibbonGroupCollapsedControl.
	GetTopPosition (see page 6876)	This is GetTopPosition, a member of class TRibbonGroupCollapsedControl.
	HandleKeyTip (see page 6876)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 6877)	Hide **KeyTip** for command.
	KeyTipClick (see page 6877)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 6878)	Sets **KeyTip** for command.
	ShowKeyTip (see page 6879)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	ActionManager (see page 6880)	This is ActionManager, a member of class TRibbonGroupCollapsedControl.
	OldWidth (see page 6883)	This is OldWidth, a member of class TRibbonGroupCollapsedControl.

Published Properties

	Name	Description
	Caption (see page 6880)	Specifies a text string that identifies the control to the user.
	Group (see page 6883)	Group associated with collapsed button.
	KeyTip (see page 6883)	Current **KeyTip** for command

76.1.19.2 TRibbonGroupCollapsedControl.Create Constructor

Creates an instance of TGraphicControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonGroupCollapsedControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TGraphicControl. However, you should never attempt to instantiate a TGraphicControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component, typically a form, that is responsible for freeing the graphic control. It becomes the value of the Owner property. If you do not explicitly provide an Owner to the constructor (that is, if AOwner is nil (Delphi) or NULL (C++)), your application is responsible for explicitly freeing the graphic control.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

76.1.19.3 TRibbonGroupCollapsedControl.Destroy Destructor

Destroys an instance of TGraphicControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonGroupCollapsedControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

76.1.19.4 TRibbonGroupCollapsedControl Methods

The methods of the TRibbonGroupCollapsedControl class are listed here.

Protected Methods

	Name	Description
	AdjustBounds (see page 6874)	This is AdjustBounds, a member of class TRibbonGroupCollapsedControl.
V	Click (see page 6874)	Respond to user click.
	CMFontchanged (see page 6875)	This is CMFontchanged, a member of class TRibbonGroupCollapsedControl.
	CMMouseenter (see page 6875)	This is CMMouseenter, a member of class TRibbonGroupCollapsedControl.
	CMMouseleave (see page 6875)	This is CMMouseleave, a member of class TRibbonGroupCollapsedControl.
	CMTextchanged (see page 6875)	This is CMTextchanged, a member of class TRibbonGroupCollapsedControl.
V	Notification (see page 6878)	Responds to notifications that components are being created or destroyed.

	Paint (see page 6878)	Render control surface.
	SetupGroupImage (see page 6879)	This is SetupGroupImage, a member of class TRibbonGroupCollapsedControl.

Public Methods

	Name	Description
	CloseUp (see page 6875)	This is CloseUp, a member of class TRibbonGroupCollapsedControl.
	GetKeyTip (see page 6876)	Returns current **KeyTip** for command.
	GetParentControl (see page 6876)	This is GetParentControl, a member of class TRibbonGroupCollapsedControl.
	GetTopPosition (see page 6876)	This is GetTopPosition, a member of class TRibbonGroupCollapsedControl.
	HandleKeyTip (see page 6876)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 6877)	Hide **KeyTip** for command.
	KeyTipClick (see page 6877)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 6878)	Sets **KeyTip** for command.
	ShowKeyTip (see page 6879)	Shows **KeyTip** for command in specified position.

76.1.19.4.1 TRibbonGroupCollapsedControl.AdjustBounds Method

Pascal

```
procedure AdjustBounds; dynamic;
```

C++

```
__fastcall AdjustBounds();
```

Description

This is AdjustBounds, a member of class TRibbonGroupCollapsedControl.

76.1.19.4.2 TRibbonGroupCollapsedControl.Click Method

Respond to user click.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

Click is called automatically when the user left-clicks the control. Component or application code can call Click to simulate a user mouse click. This is often done in menu actions and hotkey handlers.

As implemented in TControl, Click queries whether the OnClick event handler exists and is different from the OnExecute handler for the control's Action. If this is true, the OnClick event handler is called. If this is false, and the Action OnExecute event handler exists, the Action's Execute method is called. Override Click to provide additional behavior.

OnClick

76.1.19.4.3 TRibbonGroupCollapsedControl.CloseUp Method

Pascal

```
procedure CloseUp;
```

C++

```
__fastcall CloseUp();
```

Description

This is CloseUp, a member of class TRibbonGroupCollapsedControl.

76.1.19.4.4 TRibbonGroupCollapsedControl.CMFontchanged Method

Pascal

```
procedure CMFontchanged(var Message: TMessage); message CM_FONTCHANGED;
```

C++

```
__fastcall CMFontchanged(TMessage Message);
```

Description

This is CMFontchanged, a member of class TRibbonGroupCollapsedControl.

76.1.19.4.5 TRibbonGroupCollapsedControl.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TRibbonGroupCollapsedControl.

76.1.19.4.6 TRibbonGroupCollapsedControl.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonGroupCollapsedControl.

76.1.19.4.7 TRibbonGroupCollapsedControl.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TRibbonGroupCollapsedControl.

76.1.19.4.8 TRibbonGroupCollapsedControl.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 7282)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

76.1.19.4.9 TRibbonGroupCollapsedControl.GetParentControl Method

Pascal

```
function GetParentControl: TWinControl;
```

C++

```
__fastcall TWinControl * GetParentControl();
```

Description

This is GetParentControl, a member of class TRibbonGroupCollapsedControl.

76.1.19.4.10 TRibbonGroupCollapsedControl.GetTopPosition Method

Pascal

```
function GetTopPosition: Integer;
```

C++

```
__fastcall int GetTopPosition();
```

Description

This is GetTopPosition, a member of class TRibbonGroupCollapsedControl.

76.1.19.4.11 TRibbonGroupCollapsedControl.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

76.1.19.4.12 TRibbonGroupCollapsedControl.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

76.1.19.4.13 TRibbonGroupCollapsedControl.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

76.1.19.4.14 TRibbonGroupCollapsedControl.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

76.1.19.4.15 TRibbonGroupCollapsedControl.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

76.1.19.4.16 TRibbonGroupCollapsedControl.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

76.1.19.4.17 TRibbonGroupCollapsedControl.SetupGroupImage Method

Pascal

```
procedure SetupGroupImage;
```

C++

```
__fastcall SetupGroupImage();
```

Description

This is SetupGroupImage, a member of class TRibbonGroupCollapsedControl.

76.1.19.4.18 TRibbonGroupCollapsedControl.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 7282)

76.1.19.5 TRibbonGroupCollapsedControl Properties

The properties of the TRibbonGroupCollapsedControl class are listed here.

Protected Properties

	Name	Description
	MouseInControl (see page 6883)	This is MouseInControl, a member of class TRibbonGroupCollapsedControl.

Public Properties

	Name	Description
	ActionManager (see page 6880)	This is ActionManager, a member of class TRibbonGroupCollapsedControl.
	OldWidth (see page 6883)	This is OldWidth, a member of class TRibbonGroupCollapsedControl.

Published Properties

	Name	Description
	Caption (see page 6880)	Specifies a text string that identifies the control to the user.
	Group (see page 6883)	Group associated with collapsed button.
	KeyTip (see page 6883)	Current **KeyTip** for command

76.1.19.5.1 TRibbonGroupCollapsedControl.ActionManager Property

Pascal

```
property ActionManager: TCustomActionManager;
```

C++

```
__property TCustomActionManager ActionManager;
```

Description

This is ActionManager, a member of class TRibbonGroupCollapsedControl.

76.1.19.5.2 TRibbonGroupCollapsedControl.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
```

```
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do
    begin
      with TToolButton.Create(ToolBar) do
      begin
        Parent := ToolBar;
        Caption := ButtonCaptions[I];
        if (ButtonCaptions[I] = '|') then
          Style := tbsSeparator
        else
          Style := tbsButton;
      end;
    end;
end;

procedure TForm1.FormCreate(Sender: TObject);
begin
  ToolBar1 := TToolBar.Create(Self);
  ToolBar1.Parent := Self;
  AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
  ToolBar1.ShowCaptions := True;
  ToolBar1.Height := 40;
end;

procedure TForm1.FormDestroy(Sender: TObject);
var
```

```
  I: Integer;
begin
  for I := ToolBar1.ButtonCount - 1 downto 0 do
    ToolBar1.Buttons[I].Free;
  ToolBar1.Free;
end;
```

76.1.19.5.3 TRibbonGroupCollapsedControl.Group Property

Group associated with collapsed button.

Pascal

```
property Group: TCustomRibbonGroup;
```

C++

```
__property TCustomRibbonGroup Group;
```

Description

Group is the group associated with the collapsed button.

76.1.19.5.4 TRibbonGroupCollapsedControl.KeyTip Property

Current **KeyTip** for command

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the current **KeyTip** for the command

See Also

GetKeyTip (see page 7279)

SetKeyTip (see page 7281)

76.1.19.5.5 TRibbonGroupCollapsedControl.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TRibbonGroupCollapsedControl.

76.1.19.5.6 TRibbonGroupCollapsedControl.OldWidth Property

Pascal

```
property OldWidth: Integer;
```

C++

```
__property int OldWidth;
```

Description

This is OldWidth, a member of class TRibbonGroupCollapsedControl.

76.1.20 TRibbonGroupDockForm Class

Display a collapsed group.

Class Hierarchy

Pascal

```
TRibbonGroupDockForm = class(TXToolDockForm);
```

C++

```
class TRibbonGroupDockForm : public TXToolDockForm;
```

File

Ribbon

Description

TRibbonGroupDockForm is used to display a collapsed group.

When the user clicks on a groups collapsed button, the large group variant of the ribbon group is displayed as a child to an instance of this class.

Note: This class is for internal use only.

76.1.20.1 TRibbonGroupDockForm Members

The following tables list the members exposed by TRibbonGroupDockForm.

Protected Methods

	Name	Description
	CreateParams (see page 6885)	Initializes the window-creation parameter record when the form window is created.
	WMActivate (see page 6885)	This is WMActivate, a member of class TRibbonGroupDockForm.

Public Methods

	Name	Description
	Create (see page 6885)	Creates an instance of TToolDockForm.

Public Properties

	Name	Description
	Control (see page 6886)	Reference to invoking control.
	ParentControl (see page 6886)	This is ParentControl, a member of class TRibbonGroupDockForm.

76.1.20.2 TRibbonGroupDockForm.Create Constructor

Creates an instance of TToolDockForm.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonGroupDockForm(TComponent * AOwner);
```

Description

AOwner is the dock form's owner, which is responsible for freeing the tool dock form.

The constructor initializes the BorderWidth property to 1.

BorderWidth

Owner

76.1.20.3 TRibbonGroupDockForm Methods

The methods of the TRibbonGroupDockForm class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 6885)	Initializes the window-creation parameter record when the form window is created.
	WMActivate (see page 6885)	This is WMActivate, a member of class TRibbonGroupDockForm.

76.1.20.3.1 TRibbonGroupDockForm.CreateParams Method

Initializes the window-creation parameter record when the form window is created.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

CreateParams calls the inherited CreateParams method, and then adds WS_POPUP to the Style property.

76.1.20.3.2 TRibbonGroupDockForm.WMActivate Method

Pascal

```
procedure WMActivate(var Message: TWMActivate); message WM_ACTIVATE;
```

C++

```
__fastcall WMActivate(TWMActivate Message);
```

Description

This is WMActivate, a member of class TRibbonGroupDockForm.

76.1.20.4 TRibbonGroupDockForm Properties

The properties of the TRibbonGroupDockForm class are listed here.

Public Properties

	Name	Description
	Control (see page 6886)	Reference to invoking control.
	ParentControl (see page 6886)	This is ParentControl, a member of class TRibbonGroupDockForm.

76.1.20.4.1 TRibbonGroupDockForm.Control Property

Reference to invoking control.

Pascal

```
property Control: TControl;
```

C++

```
__property TControl * Control;
```

Description

Control is a reference to the control that invoked the floating group.

76.1.20.4.2 TRibbonGroupDockForm.ParentControl Property

Pascal

```
property ParentControl: TWinControl;
```

C++

```
__property TWinControl * ParentControl;
```

Description

This is ParentControl, a member of class TRibbonGroupDockForm.

76.1.21 TRibbonGroupScrollButton Class

Class Hierarchy

Pascal

```
TRibbonGroupScrollButton = class(TCustomControl);
```

C++

```
class TRibbonGroupScrollButton : public TCustomControl;
```

File

Ribbon

Description

This is class Ribbon.TRibbonGroupScrollButton.

76.1.21.1 TRibbonGroupScrollButton Members

The following tables list the members exposed by TRibbonGroupScrollButton.

Protected Methods

	Name	Description
	CMDesignHitTest (see page 6888)	This is CMDesignHitTest, a member of class TRibbonGroupScrollButton.
	CMMouseenter (see page 6888)	This is CMMouseenter, a member of class TRibbonGroupScrollButton.
	CMMouseleave (see page 6888)	This is CMMouseleave, a member of class TRibbonGroupScrollButton.
	Paint (see page 6888)	Renders the image of a custom control.

Protected Properties

	Name	Description
	Direction (see page 6889)	This is Direction, a member of class TRibbonGroupScrollButton.
	MouseInControl (see page 6889)	This is MouseInControl, a member of class TRibbonGroupScrollButton.
	RibbonStyle (see page 6890)	This is RibbonStyle, a member of class TRibbonGroupScrollButton.

Public Methods

	Name	Description
	Create (see page 6887)	Creates an instance of TCustomControl.

76.1.21.2 TRibbonGroupScrollButton.Create Constructor

Creates an instance of TCustomControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonGroupScrollButton(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomControl. However, you should never attempt to instantiate a TCustomControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants. Controls placed on forms at design time are created automatically.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes a TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Create

Destroy

Canvas

Owner

76.1.21.3 TRibbonGroupScrollButton Methods

The methods of the TRibbonGroupScrollButton class are listed here.

Protected Methods

	Name	Description
	CMDesignHitTest (see page 6888)	This is CMDesignHitTest, a member of class TRibbonGroupScrollButton.
	CMMouseenter (see page 6888)	This is CMMouseenter, a member of class TRibbonGroupScrollButton.
	CMMouseleave (see page 6888)	This is CMMouseleave, a member of class TRibbonGroupScrollButton.
	Paint (see page 6888)	Renders the image of a custom control.

76.1.21.3.1 TRibbonGroupScrollButton.CMDesignHitTest Method

Pascal

```
procedure CMDesignHitTest(var Message: TCMDesignHitTest); message CM_DESIGNHITTEST;
```

C++

```
__fastcall CMDesignHitTest(TCMDesignHitTest Message);
```

Description

This is CMDesignHitTest, a member of class TRibbonGroupScrollButton.

76.1.21.3.2 TRibbonGroupScrollButton.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TRibbonGroupScrollButton.

76.1.21.3.3 TRibbonGroupScrollButton.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonGroupScrollButton.

76.1.21.3.4 TRibbonGroupScrollButton.Paint Method

Renders the image of a custom control.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method for TCustomControl does nothing other than provide the interface for a method that responds to WM_PAINT messages. Paint is called by the PaintWindow method, after that method has supplied the Canvas with the handle to a device context. When creating a custom control, always override Paint to draw the image of the control.

Tip: To determine which portions of the control's canvas need to be repainted when Paint is called, use the ClipRect property of the canvas.

See Also

Canvas

GetDeviceContext

ClipRect (see page 2718)

76.1.21.4 TRibbonGroupScrollButton Properties

The properties of the TRibbonGroupScrollButton class are listed here.

Protected Properties

	Name	Description
	Direction (see page 6889)	This is Direction, a member of class TRibbonGroupScrollButton.
	MouseInControl (see page 6889)	This is MouseInControl, a member of class TRibbonGroupScrollButton.
	RibbonStyle (see page 6890)	This is RibbonStyle, a member of class TRibbonGroupScrollButton.

76.1.21.4.1 TRibbonGroupScrollButton.Direction Property

Pascal

```
property Direction: TScrollDirection;
```

C++

```
__property TScrollDirection Direction;
```

Description

This is Direction, a member of class TRibbonGroupScrollButton.

76.1.21.4.2 TRibbonGroupScrollButton.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TRibbonGroupScrollButton.

76.1.21.4.3 TRibbonGroupScrollButton.RibbonStyle Property

Pascal

```
property RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__property TRibbonStyleActionBars RibbonStyle;
```

Description

This is RibbonStyle, a member of class TRibbonGroupScrollButton.

76.1.22 TRibbonLunaColorMap Class

Color map class for Luna.

Class Hierarchy

Pascal

```
TRibbonLunaColorMap = class(TCustomRibbonColorMap);
```

C++

```
class TRibbonLunaColorMap : public TCustomRibbonColorMap;
```

File

Ribbon

Description

TRibbonLunaColorMap is the color map class for the Luna ribbon style.

See Also

TRibbonObsidianColorMap (see page 6896)

TRibbonSilverColorMap (see page 6914)

76.1.22.1 TRibbonLunaColorMap Members

The following tables list the members exposed by TRibbonLunaColorMap.

Public Methods

	Name	Description
	UpdateColors (see page 6891)	Updates an action component to reflect the current color property.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 6892)	This is ActiveTabFontColor, a member of class TRibbonLunaColorMap.

	BevelMinimizedInner (see page 6892)	This is BevelMinimizedInner, a member of class TRibbonLunaColorMap.
	BevelMinimizedOuter (see page 6892)	This is BevelMinimizedOuter, a member of class TRibbonLunaColorMap.
	BtnSelectedFont (see page 6892)	Changes the look and feel of your applications.
	CaptionFontColor (see page 6893)	This is CaptionFontColor, a member of class TRibbonLunaColorMap.
	ControlColor (see page 6893)	This is ControlColor, a member of class TRibbonLunaColorMap.
	ControlFrameColor (see page 6893)	This is ControlFrameColor, a member of class TRibbonLunaColorMap.
	ControlInactiveColor (see page 6893)	This is ControlInactiveColor, a member of class TRibbonLunaColorMap.
	DisabledFontColor (see page 6894)	Changes the look and feel of your applications.
	DocumentFontColor (see page 6894)	This is DocumentFontColor, a member of class TRibbonLunaColorMap.
	FontColor (see page 6894)	Changes the look and feel of your applications.
	GroupFontColor (see page 6894)	This is GroupFontColor, a member of class TRibbonLunaColorMap.
	HighlightColor (see page 6895)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 6895)	This is InactiveTabFontColor, a member of class TRibbonLunaColorMap.
	QuickAccessToolbarMoreBorderColor (see page 6895)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonLunaColorMap.
	QuickAccessToolbarMoreColor (see page 6895)	This is QuickAccessToolbarMoreColor, a member of class TRibbonLunaColorMap.

76.1.22.2 TRibbonLunaColorMap Methods

The methods of the TRibbonLunaColorMap class are listed here.

Public Methods

	Name	Description
	UpdateColors (see page 6891)	Updates an action component to reflect the current color property.

76.1.22.2.1 TRibbonLunaColorMap.UpdateColors Method

Updates an action component to reflect the current color property.

Pascal

```
procedure UpdateColors; override;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically to update associated action components.

76.1.22.3 TRibbonLunaColorMap Properties

The properties of the TRibbonLunaColorMap class are listed here.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 6892)	This is ActiveTabFontColor, a member of class TRibbonLunaColorMap.
	BevelMinimizedInner (see page 6892)	This is BevelMinimizedInner, a member of class TRibbonLunaColorMap.
	BevelMinimizedOuter (see page 6892)	This is BevelMinimizedOuter, a member of class TRibbonLunaColorMap.
	BtnSelectedFont (see page 6892)	Changes the look and feel of your applications.
	CaptionFontColor (see page 6893)	This is CaptionFontColor, a member of class TRibbonLunaColorMap.
	ControlColor (see page 6893)	This is ControlColor, a member of class TRibbonLunaColorMap.
	ControlFrameColor (see page 6893)	This is ControlFrameColor, a member of class TRibbonLunaColorMap.

	ControlInactiveColor (see page 6893)	This is ControlInactiveColor, a member of class TRibbonLunaColorMap.
	DisabledFontColor (see page 6894)	Changes the look and feel of your applications.
	DocumentFontColor (see page 6894)	This is DocumentFontColor, a member of class TRibbonLunaColorMap.
	FontColor (see page 6894)	Changes the look and feel of your applications.
	GroupFontColor (see page 6894)	This is GroupFontColor, a member of class TRibbonLunaColorMap.
	HighlightColor (see page 6895)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 6895)	This is InactiveTabFontColor, a member of class TRibbonLunaColorMap.
	QuickAccessToolbarMoreBorderColor (see page 6895)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonLunaColorMap.
	QuickAccessToolbarMoreColor (see page 6895)	This is QuickAccessToolbarMoreColor, a member of class TRibbonLunaColorMap.

76.1.22.3.1 TRibbonLunaColorMap.ActiveTabFontColor Property

Pascal

```
property ActiveTabFontColor: TColor;
```

C++

```
__property TColor ActiveTabFontColor;
```

Description

This is ActiveTabFontColor, a member of class TRibbonLunaColorMap.

76.1.22.3.2 TRibbonLunaColorMap.BevelMinimizedInner Property

Pascal

```
property BevelMinimizedInner: TColor;
```

C++

```
__property TColor BevelMinimizedInner;
```

Description

This is BevelMinimizedInner, a member of class TRibbonLunaColorMap.

76.1.22.3.3 TRibbonLunaColorMap.BevelMinimizedOuter Property

Pascal

```
property BevelMinimizedOuter: TColor;
```

C++

```
__property TColor BevelMinimizedOuter;
```

Description

This is BevelMinimizedOuter, a member of class TRibbonLunaColorMap.

76.1.22.3.4 TRibbonLunaColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont;
```

C++

```
__property BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.22.3.5 TRibbonLunaColorMap.CaptionFontColor Property

Pascal

```
property CaptionFontColor: TColor;
```

C++

```
__property TColor CaptionFontColor;
```

Description

This is CaptionFontColor, a member of class TRibbonLunaColorMap.

76.1.22.3.6 TRibbonLunaColorMap.ControlColor Property

Pascal

```
property ControlColor: TColor;
```

C++

```
__property TColor ControlColor;
```

Description

This is ControlColor, a member of class TRibbonLunaColorMap.

76.1.22.3.7 TRibbonLunaColorMap.ControlFrameColor Property

Pascal

```
property ControlFrameColor: TColor;
```

C++

```
__property TColor ControlFrameColor;
```

Description

This is ControlFrameColor, a member of class TRibbonLunaColorMap.

76.1.22.3.8 TRibbonLunaColorMap.ControlInactiveColor Property

Pascal

```
property ControlInactiveColor: TColor;
```

C++

```
__property TColor ControlInactiveColor;
```

Description

This is ControlInactiveColor, a member of class TRibbonLunaColorMap.

76.1.22.3.9 TRibbonLunaColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor;
```

C++

```
__property DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.22.3.10 TRibbonLunaColorMap.DocumentFontColor Property

Pascal

```
property DocumentFontColor: TColor;
```

C++

```
__property TColor DocumentFontColor;
```

Description

This is DocumentFontColor, a member of class TRibbonLunaColorMap.

76.1.22.3.11 TRibbonLunaColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor;
```

C++

```
__property FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.22.3.12 TRibbonLunaColorMap.GroupFontColor Property

Pascal

```
property GroupFontColor: TColor;
```

C++

```
__property TColor GroupFontColor;
```

Description

This is GroupFontColor, a member of class TRibbonLunaColorMap.

76.1.22.3.13 TRibbonLunaColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor;
```

C++

```
__property HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.22.3.14 TRibbonLunaColorMap.InactiveTabFontColor Property

Pascal

```
property InactiveTabFontColor: TColor;
```

C++

```
__property TColor InactiveTabFontColor;
```

Description

This is InactiveTabFontColor, a member of class TRibbonLunaColorMap.

76.1.22.3.15 TRibbonLunaColorMap.QuickAccessToolbarMoreBorderColor Property

Pascal

```
property QuickAccessToolbarMoreBorderColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreBorderColor;
```

Description

This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonLunaColorMap.

76.1.22.3.16 TRibbonLunaColorMap.QuickAccessToolbarMoreColor Property

Pascal

```
property QuickAccessToolbarMoreColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreColor;
```

Description

This is QuickAccessToolbarMoreColor, a member of class TRibbonLunaColorMap.

76.1.23 TRibbonObsidianColorMap Class

Color map class for Obsidian.

Class Hierarchy

Pascal

```
TRibbonObsidianColorMap = class(TCustomRibbonColorMap);
```

C++

```
class TRibbonObsidianColorMap : public TCustomRibbonColorMap;
```

File

Ribbon

Description

TRibbonObsidianColorMap is the color map class for the Obsidian ribbon style.

See Also

TRibbonLunaColorMap (see page 6890)

TRibbonSilverColorMap (see page 6914)

76.1.23.1 TRibbonObsidianColorMap Members

The following tables list the members exposed by TRibbonObsidianColorMap.

Public Methods

	Name	Description
	UpdateColors (see page 6897)	Updates an action component to reflect the current color property.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 6898)	This is ActiveTabFontColor, a member of class TRibbonObsidianColorMap.
	BevelMinimizedInner (see page 6898)	This is BevelMinimizedInner, a member of class TRibbonObsidianColorMap.
	BevelMinimizedOuter (see page 6898)	This is BevelMinimizedOuter, a member of class TRibbonObsidianColorMap.
	BtnSelectedFont (see page 6898)	Changes the look and feel of your applications.
	CaptionFontColor (see page 6898)	This is CaptionFontColor, a member of class TRibbonObsidianColorMap.
	ControlColor (see page 6899)	This is ControlColor, a member of class TRibbonObsidianColorMap.
	ControlFrameColor (see page 6899)	This is ControlFrameColor, a member of class TRibbonObsidianColorMap.
	ControlInactiveColor (see page 6899)	This is ControlInactiveColor, a member of class TRibbonObsidianColorMap.
	DisabledFontColor (see page 6899)	Changes the look and feel of your applications.
	DocumentFontColor (see page 6900)	This is DocumentFontColor, a member of class TRibbonObsidianColorMap.
	FontColor (see page 6900)	Changes the look and feel of your applications.
	GroupFontColor (see page 6900)	This is GroupFontColor, a member of class TRibbonObsidianColorMap.
	HighlightColor (see page 6900)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 6901)	This is InactiveTabFontColor, a member of class TRibbonObsidianColorMap.
	QuickAccessToolbarMoreBorderColor (see page 6901)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonObsidianColorMap.

	QuickAccessToolbarMoreColor (see page 6901)	This is QuickAccessToolbarMoreColor, a member of class TRibbonObsidianColorMap.

76.1.23.2 TRibbonObsidianColorMap Methods

The methods of the TRibbonObsidianColorMap class are listed here.

Public Methods

	Name	Description
	UpdateColors (see page 6897)	Updates an action component to reflect the current color property.

76.1.23.2.1 TRibbonObsidianColorMap.UpdateColors Method

Updates an action component to reflect the current color property.

Pascal

```
procedure UpdateColors; override;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically to update associated action components.

76.1.23.3 TRibbonObsidianColorMap Properties

The properties of the TRibbonObsidianColorMap class are listed here.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 6898)	This is ActiveTabFontColor, a member of class TRibbonObsidianColorMap.
	BevelMinimizedInner (see page 6898)	This is BevelMinimizedInner, a member of class TRibbonObsidianColorMap.
	BevelMinimizedOuter (see page 6898)	This is BevelMinimizedOuter, a member of class TRibbonObsidianColorMap.
	BtnSelectedFont (see page 6898)	Changes the look and feel of your applications.
	CaptionFontColor (see page 6898)	This is CaptionFontColor, a member of class TRibbonObsidianColorMap.
	ControlColor (see page 6899)	This is ControlColor, a member of class TRibbonObsidianColorMap.
	ControlFrameColor (see page 6899)	This is ControlFrameColor, a member of class TRibbonObsidianColorMap.
	ControlInactiveColor (see page 6899)	This is ControlInactiveColor, a member of class TRibbonObsidianColorMap.
	DisabledFontColor (see page 6899)	Changes the look and feel of your applications.
	DocumentFontColor (see page 6900)	This is DocumentFontColor, a member of class TRibbonObsidianColorMap.
	FontColor (see page 6900)	Changes the look and feel of your applications.
	GroupFontColor (see page 6900)	This is GroupFontColor, a member of class TRibbonObsidianColorMap.
	HighlightColor (see page 6900)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 6901)	This is InactiveTabFontColor, a member of class TRibbonObsidianColorMap.
	QuickAccessToolbarMoreBorderColor (see page 6901)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonObsidianColorMap.
	QuickAccessToolbarMoreColor (see page 6901)	This is QuickAccessToolbarMoreColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.1 TRibbonObsidianColorMap.ActiveTabFontColor Property

Pascal

```
property ActiveTabFontColor: TColor;
```

C++

```
__property TColor ActiveTabFontColor;
```

Description

This is ActiveTabFontColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.2 TRibbonObsidianColorMap.BevelMinimizedInner Property

Pascal

```
property BevelMinimizedInner: TColor;
```

C++

```
__property TColor BevelMinimizedInner;
```

Description

This is BevelMinimizedInner, a member of class TRibbonObsidianColorMap.

76.1.23.3.3 TRibbonObsidianColorMap.BevelMinimizedOuter Property

Pascal

```
property BevelMinimizedOuter: TColor;
```

C++

```
__property TColor BevelMinimizedOuter;
```

Description

This is BevelMinimizedOuter, a member of class TRibbonObsidianColorMap.

76.1.23.3.4 TRibbonObsidianColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont;
```

C++

```
__property BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.23.3.5 TRibbonObsidianColorMap.CaptionFontColor Property

Pascal

```
property CaptionFontColor: TColor;
```

C++

```
__property TColor CaptionFontColor;
```

Description

This is CaptionFontColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.6 TRibbonObsidianColorMap.ControlColor Property

Pascal

```
property ControlColor: TColor;
```

C++

```
__property TColor ControlColor;
```

Description

This is ControlColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.7 TRibbonObsidianColorMap.ControlFrameColor Property

Pascal

```
property ControlFrameColor: TColor;
```

C++

```
__property TColor ControlFrameColor;
```

Description

This is ControlFrameColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.8 TRibbonObsidianColorMap.ControlInactiveColor Property

Pascal

```
property ControlInactiveColor: TColor;
```

C++

```
__property TColor ControlInactiveColor;
```

Description

This is ControlInactiveColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.9 TRibbonObsidianColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor;
```

C++

```
__property DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.23.3.10 TRibbonObsidianColorMap.DocumentFontColor Property

Pascal

```
property DocumentFontColor: TColor;
```

C++

```
__property TColor DocumentFontColor;
```

Description

This is DocumentFontColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.11 TRibbonObsidianColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor;
```

C++

```
__property FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.23.3.12 TRibbonObsidianColorMap.GroupFontColor Property

Pascal

```
property GroupFontColor: TColor;
```

C++

```
__property TColor GroupFontColor;
```

Description

This is GroupFontColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.13 TRibbonObsidianColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor;
```

C++

```
__property HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.23.3.14 TRibbonObsidianColorMap.InactiveTabFontColor Property

Pascal

```
property InactiveTabFontColor: TColor;
```

C++

```
__property TColor InactiveTabFontColor;
```

Description

This is InactiveTabFontColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.15 TRibbonObsidianColorMap.QuickAccessToolbarMoreBorderColor Property

Pascal

```
property QuickAccessToolbarMoreBorderColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreBorderColor;
```

Description

This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonObsidianColorMap.

76.1.23.3.16 TRibbonObsidianColorMap.QuickAccessToolbarMoreColor Property

Pascal

```
property QuickAccessToolbarMoreColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreColor;
```

Description

This is QuickAccessToolbarMoreColor, a member of class TRibbonObsidianColorMap.

76.1.24 TRibbonPage Class

Tab page for ribbon control.

Class Hierarchy

Pascal

```
TRibbonPage = class(TCustomRibbonPage);
```

C++

```
class TRibbonPage : public TCustomRibbonPage;
```

File

Ribbon

Description

TRibbonPage is a TCustomRibbonPage (see page 6790) tab page for the ribbon control that holds the groups of controls displayed.

76.1.24.1 TRibbonPage Members

The following tables list the members exposed by TRibbonPage.

Protected Methods

	Name	Description
	CMControlListChanging (see page 6795)	This is CMControlListChanging, a member of class TCustomRibbonPage.
	CMTextchanged (see page 6795)	This is CMTextchanged, a member of class TCustomRibbonPage.
V	CreateScrollButton (see page 6795)	This is CreateScrollButton, a member of class TCustomRibbonPage.
V	DoScrollButtonClick (see page 6795)	This is DoScrollButtonClick, a member of class TCustomRibbonPage.
	GetPageHeight (see page 6797)	This is GetPageHeight, a member of class TCustomRibbonPage.
	GetPageTop (see page 6797)	This is GetPageTop, a member of class TCustomRibbonPage.
V	Loaded (see page 6798)	Initializes the control after it is loaded from a stream.
V	Notification (see page 6798)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 6799)	Renders the image of a custom control.
V	RequestAlign (see page 6799)	Instructs the parent of a control to reposition the control, enforcing its Align property.
V	Resize (see page 6800)	Respond to control resize.
V	SetParent (see page 6801)	Sets the parent of the control.
	UpdateScrollButtons (see page 6802)	This is UpdateScrollButtons, a member of class TCustomRibbonPage.

Protected Properties

	Name	Description
	GroupOffset (see page 6803)	This is GroupOffset, a member of class TCustomRibbonPage.

Public Constants

	Name	Description
	cRibbonGroupLeftOffset (see page 6793)	This is cRibbonGroupLeftOffset, a member of class TCustomRibbonPage.
	cRibbonGroupSpacing (see page 6793)	This is cRibbonGroupSpacing, a member of class TCustomRibbonPage.

Public Methods

	Name	Description
	AddGroup (see page 6794)	This is AddGroup, a member of class TCustomRibbonPage.
	AlignGroups (see page 6794)	This is AlignGroups, a member of class TCustomRibbonPage.
	CollapseGroup (see page 6795)	This is CollapseGroup, a member of class TCustomRibbonPage.
V	Create (see page 6792)	Creates an instance of TCustomControl.
V	Destroy (see page 6792)	Destroys an instance of TCustomControl.
	FindGroup (see page 6796)	This is FindGroup, a member of class TCustomRibbonPage.
	FindGroupAt (see page 6796)	This is FindGroupAt, a member of class TCustomRibbonPage.

	GetGroupPos (see page 6796)	This is GetGroupPos, a member of class TCustomRibbonPage.
	GetNextVisibleGroup (see page 6796)	This is GetNextVisibleGroup, a member of class TCustomRibbonPage.
	HandleKeyTips (see page 6797)	This is HandleKeyTips, a member of class TCustomRibbonPage.
	HideKeyTips (see page 6797)	This is HideKeyTips, a member of class TCustomRibbonPage.
V	Invalidate (see page 6797)	Schedules a control repaint.
	RibbonStyle (see page 6800)	Return style class to use when drawing specific Ribbon (see page 6804) elements.
V	SetBounds (see page 6800)	Sets the windowed control's boundary properties all at once.
	ShowKeyTips (see page 6802)	This is ShowKeyTips, a member of class TCustomRibbonPage.
	UpdateActionManager (see page 6802)	This is UpdateActionManager, a member of class TCustomRibbonPage.

Public Properties

	Name	Description
R	CollapseGroupCount (see page 6803)	This is CollapseGroupCount, a member of class TCustomRibbonPage.
R	GroupCount (see page 6803)	This is GroupCount, a member of class TCustomRibbonPage.
R	Groups (see page 6803)	This is Groups, a member of class TCustomRibbonPage.
	Ribbon (see page 6804)	This is Ribbon, a member of class TCustomRibbonPage.

Published Properties

	Name	Description
	BiDiMode (see page 6903)	Specifies the bi-directional mode for the control.
	Caption (see page 6904)	Specifies a text string that identifies the control to the user.
	Height (see page 6906)	Specifies the vertical size of the control in pixels.
	Index (see page 6908)	This is Index, a member of class TRibbonPage.
	KeyTip (see page 6908)	This is KeyTip, a member of class TRibbonPage.
	Name (see page 6908)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 6910)	Specifies whether the control uses its parent's BiDiMode.

76.1.24.2 TRibbonPage Properties

The properties of the TRibbonPage class are listed here.

Published Properties

	Name	Description
	BiDiMode (see page 6903)	Specifies the bi-directional mode for the control.
	Caption (see page 6904)	Specifies a text string that identifies the control to the user.
	Height (see page 6906)	Specifies the vertical size of the control in pixels.
	Index (see page 6908)	This is Index, a member of class TRibbonPage.
	KeyTip (see page 6908)	This is KeyTip, a member of class TRibbonPage.
	Name (see page 6908)	Specifies the name of the component as referenced in code.
	ParentBiDiMode (see page 6910)	Specifies whether the control uses its parent's BiDiMode.

76.1.24.2.1 TRibbonPage.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale

that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

76.1.24.2.2 TRibbonPage.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
```

```
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());

  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
```

```
  the TEdit.  These lines of code could also be written:
  PageControl1.ActivePage.Caption := Edit1.Text;
  This would obviate the need for a TTabSheet variable since
  PageControl1.->ActivePage is already of type TTabSheet.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  var
    sheet: TTabSheet;
  begin
    sheet := PageControl1.ActivePage;
    sheet.Caption := Edit1.Text;
  end;
  {
  This example creates a ToolBar and adds ToolButtons to it.
  Include ComCtlrs in the uses clause.
  }
  procedure AddButtons(ToolBar: TToolBar;
    Const ButtonCaptions: array of String);
  var
    I: Integer;
  begin
    for I := 0 to High(ButtonCaptions) do
      begin
        with TToolButton.Create(ToolBar) do
        begin
          Parent := ToolBar;
          Caption := ButtonCaptions[I];
          if (ButtonCaptions[I] = '|') then
            Style := tbsSeparator
          else
            Style := tbsButton;
        end;
      end;
  end;

  procedure TForm1.FormCreate(Sender: TObject);
  begin
    ToolBar1 := TToolBar.Create(Self);
    ToolBar1.Parent := Self;
    AddButtons(ToolBar1, ['New', 'Save', '|', 'Cut', 'Copy', 'Paste']);
    ToolBar1.ShowCaptions := True;
    ToolBar1.Height := 40;
  end;

  procedure TForm1.FormDestroy(Sender: TObject);
  var
    I: Integer;
  begin
    for I := ToolBar1.ButtonCount - 1 downto 0 do
      ToolBar1.Buttons[I].Free;
    ToolBar1.Free;
  end;
```

76.1.24.2.3 TRibbonPage.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
    end;
end;
```

76.1.24.2.4 TRibbonPage.Index Property

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

This is Index, a member of class TRibbonPage.

76.1.24.2.5 TRibbonPage.KeyTip Property

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

This is KeyTip, a member of class TRibbonPage.

76.1.24.2.6 TRibbonPage.Name Property

Specifies the name of the component as referenced in code.

Pascal

```
property Name;
```

C++

```
__property Name;
```

Description

Use Name to change the name of a component to reflect its purpose in the current application. By default, the IDE assigns sequential names based on the type of the component, such as 'Button1', 'Button2', and so on.

Use Name to refer to the component in code.

Warning: Changing Name at runtime causes any references to the old name to become undefined. Any subsequent code that uses the old name will cause an exception.

C++ Examples:

```
/*
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
```

```
on the status bar. Note that because we are using the right-
click, the item need not be selected.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  for (int i = 0; i < ComponentCount; i++)
    ListBox1->Items->InsertObject(0,
                                  Components[i]->Name,
                                  dynamic_cast<TObject *>(Components[i]));
}

void __fastcall TForm1::ListBox1MouseUp(TObject *Sender, TMouseButton Button,
      TShiftState Shift, int X, int Y)
{
  if (Button == mbRight)
  {
    TClass ClassRef;
    int Index = ListBox1->ItemAtPos(Point(X,Y), true);
    // only components that are controls have a position
    // make sure the component is a control
    for (ClassRef = ListBox1->Items->Objects[Index]->ClassType();
         ClassRef != NULL;
         ClassRef = ClassRef->ClassParent())
      if (String(ClassRef->ClassName()) == "TControl")
      {
        TControl *TheObject = dynamic_cast<TControl *>(ListBox1->Items->Objects[Index]);
        StatusBar1->SimpleText =
          TheObject->Name + " is at (" +
          IntToStr(TheObject->Left) + ", " +
          IntToStr(TheObject->Top) + ")";
        break;
      }
    if (ClassRef == NULL) // if it wasn't a control
      MessageBeep(0);
  }
}
```

Delphi Examples:

```
{
For the following example, add a button, a status bar, and a
list box to the form. Set the SimplePanel property of the
status bar to true, using the object inspector. Also, populate
the OnMouseUp event handler for the list box.  The following
code fills a list box with the names of all components on the
form when the user clicks the button. References to the
components themselves are inserted along with the names. The
components are all inserted at the front of the list, so that
the last component added to the form is the first component
in the list.  When the user right-clicks the name of an
object in the list, the component's coordinates are displayed
on the status bar. Note that because we are using the right-
click, the item need not be selected.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to Form1.ComponentCount-1 do
    ListBox1.Items.InsertObject(
      0, Form1.Components[I].Name,
      Form1.Components[I] as TObject);
end;

procedure TForm1.ListBox1MouseUp(
  Sender: TObject; Button: TMouseButton;
  Shift: TShiftState; X,Y: integer);
```

```
var
  APoint: TPoint;
  Index: integer;
  TheObject: TControl;
begin
  if Button = mbRight then
  begin
  APoint.X := X;
  APoint.Y := Y;
  Index := ListBox1.ItemAtPos(APoint, True);
  if (ListBox1.Items.Objects[Index] is TControl) then
  begin
    TheObject :=
      (ListBox1.Items.Objects[Index] as TControl);
    StatusBar1.SimpleText := TheObject.Name + ' is at (' +
                             IntToStr(TheObject.Left) + ', ' +
                             IntToStr(TheObject.Top) + ') ';
  end
  else
    Beep;
  end;

76.1.24.2.7 TRibbonPage.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

V	DoScrollBtnClick (see page 6813)	This is DoScrollBtnClick, a member of class TCustomRibbonQuickAccessToolbar.
V	DrawBackground (see page 6814)	This is DrawBackground, a member of class TCustomRibbonQuickAccessToolbar.
V	GetBarHeight (see page 6814)	This is GetBarHeight, a member of class TCustomRibbonQuickAccessToolbar.
V	GetBarWidth (see page 6815)	This is GetBarWidth, a member of class TCustomRibbonQuickAccessToolbar.
V	GetScrollBtnClass (see page 6815)	This is GetScrollBtnClass, a member of class TCustomRibbonQuickAccessToolbar.
V	Notification (see page 6815)	Responds to notifications that components are being created or destroyed.
V	RequestAlign (see page 6815)	Instructs the parent of a control to reposition the control, enforcing its Align property.
V	SetParent (see page 6816)	Sets the parent of the control.
V	SetupDropDownBtn (see page 6816)	This is SetupDropDownBtn, a member of class TCustomRibbonQuickAccessToolbar.
V	ShowCustomizeMenu (see page 6817)	This is ShowCustomizeMenu, a member of class TCustomRibbonQuickAccessToolbar.
V	ShowMoreControls (see page 6817)	This is ShowMoreControls, a member of class TCustomRibbonQuickAccessToolbar.
V	UpdateQATWidth (see page 6817)	This is UpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 6810)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHandleKeyTips (see page 7273)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 6810)	Hide any visible **KeyTip** windows.
	BarHideKeyTips (see page 7273)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 6811)	Show **KeyTip**s for any commands that support them.
	BarShowKeyTips (see page 7274)	Show **KeyTip**s for any commands that support them.
V	Create (see page 6809)	Creates and initializes a TCustomActionToolBar instance.
V	CreateControl (see page 6811)	This is CreateControl, a member of class TCustomRibbonQuickAccessToolbar.
	Customize (see page 6812)	This is Customize, a member of class TCustomRibbonQuickAccessToolbar.
V	DoDropCategory (see page 6813)	This is DoDropCategory, a member of class TCustomRibbonQuickAccessToolbar.
	DoUpdateQATWidth (see page 6935)	This is DoUpdateQATWidth, a member of class IRibbonQuickAccessToolbar.
	DoUpdateQATWidth (see page 6813)	This is DoUpdateQATWidth, a member of class TCustomRibbonQuickAccessToolbar.
V	DragDrop (see page 6814)	Generates an OnDragDrop event.

Public Nested Types

Name	Description
TMoreCommandsEvent (see page 6819)	This is nested type Ribbon.TCustomRibbonQuickAccessToolbar.TMoreCommandsEvent.

Public Properties

	Name	Description
	Items (see page 6818)	Lists the action clients that correspond to the child controls of this action band.
R	Ribbon (see page 6818)	This is Ribbon, a member of class TCustomRibbonQuickAccessToolbar.
	ScrollMode (see page 6818)	This is ScrollMode, a member of class TCustomRibbonQuickAccessToolbar.
	ShowBorder (see page 6819)	This is ShowBorder, a member of class TCustomRibbonQuickAccessToolbar.

Published Properties

	Name	Description
	ActionManager (see page 6913)	Specifies the action manager component that is associated with the action band.
	OnMoreCommands (see page 6913)	This is OnMoreCommands, a member of class TRibbonQuickAccessToolbar.
	VertMargin (see page 6914)	Specifies the width of the vertical margins in pixels.

76.1.26.2 TRibbonQuickAccessToolbar Properties

The properties of the TRibbonQuickAccessToolbar class are listed here.

Published Properties

	Name	Description
	ActionManager (see page 6913)	Specifies the action manager component that is associated with the action band.
	OnMoreCommands (see page 6913)	This is OnMoreCommands, a member of class TRibbonQuickAccessToolbar.
	VertMargin (see page 6914)	Specifies the width of the vertical margins in pixels.

76.1.26.2.1 TRibbonQuickAccessToolbar.ActionManager Property

Specifies the action manager component that is associated with the action band.

Pascal

```
property ActionManager;
```

C++

```
__property ActionManager;
```

Description

Use ActionManager to access the action manager that uses this action band to render UI elements it manages. Typically, this association is created when you drag actions from the action manager and drop them on the action bar. When an action is dropped on an action band and the ActionManager property is not assigned, the ActionManager property is automatically assigned to the action manager that manages the action that was dropped on the action band.

At runtime, you can perform the equivalent operation to dragging an action onto the action band by setting the ActionBar property of one of the action clients that the action manager's ActionBars property lists so that it specifies this component.

ActionBar

76.1.26.2.2 TRibbonQuickAccessToolbar.OnMoreCommands Property

Pascal

```
property OnMoreCommands: TMoreCommandsEvent;
```

C++

```
__property TMoreCommandsEvent OnMoreCommands;
```

Description

This is OnMoreCommands, a member of class TRibbonQuickAccessToolbar.

76.1.26.2.3 TRibbonQuickAccessToolbar.VertMargin Property

Specifies the width of the vertical margins in pixels.

Pascal

```
property VertMargin;
```

C++

```
__property VertMargin;
```

Description

VertMargin specifies the width of the action band's top and bottom vertical margins in pixels.

HorzMargin

HorzSeparator

76.1.27 TRibbonSilverColorMap Class

Color map class for Silver.

Class Hierarchy

Pascal

```
TRibbonSilverColorMap = class(TCustomRibbonColorMap);
```

C++

```
class TRibbonSilverColorMap : public TCustomRibbonColorMap;
```

File

Ribbon

Description

TRibbonSilverColorMap is the color map class for the Silver ribbon style.

See Also

TRibbonLunaColorMap (see page 6890)

TRibbonObsidianColorMap (see page 6896)

76.1.27.1 TRibbonSilverColorMap Members

The following tables list the members exposed by TRibbonSilverColorMap.

Public Methods

	Name	Description
	UpdateColors (see page 6915)	Updates an action component to reflect the current color property.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 6916)	This is ActiveTabFontColor, a member of class TRibbonSilverColorMap.
	BevelMinimizedInner (see page 6916)	This is BevelMinimizedInner, a member of class TRibbonSilverColorMap.
	BevelMinimizedOuter (see page 6916)	This is BevelMinimizedOuter, a member of class TRibbonSilverColorMap.
	BtnSelectedFont (see page 6917)	Changes the look and feel of your applications.
	CaptionFontColor (see page 6917)	This is CaptionFontColor, a member of class TRibbonSilverColorMap.
	ControlColor (see page 6917)	This is ControlColor, a member of class TRibbonSilverColorMap.
	ControlFrameColor (see page 6917)	This is ControlFrameColor, a member of class TRibbonSilverColorMap.
	ControlInactiveColor (see page 6917)	This is ControlInactiveColor, a member of class TRibbonSilverColorMap.
	DisabledFontColor (see page 6918)	Changes the look and feel of your applications.
	DocumentFontColor (see page 6918)	This is DocumentFontColor, a member of class TRibbonSilverColorMap.
	FontColor (see page 6918)	Changes the look and feel of your applications.
	GroupFontColor (see page 6918)	This is GroupFontColor, a member of class TRibbonSilverColorMap.
	HighlightColor (see page 6919)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 6919)	This is InactiveTabFontColor, a member of class TRibbonSilverColorMap.
	QuickAccessToolbarMoreBorderColor (see page 6919)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonSilverColorMap.
	QuickAccessToolbarMoreColor (see page 6919)	This is QuickAccessToolbarMoreColor, a member of class TRibbonSilverColorMap.

76.1.27.2 TRibbonSilverColorMap Methods

The methods of the TRibbonSilverColorMap class are listed here.

Public Methods

	Name	Description
	UpdateColors (see page 6915)	Updates an action component to reflect the current color property.

76.1.27.2.1 TRibbonSilverColorMap.UpdateColors Method

Updates an action component to reflect the current color property.

Pascal

```
procedure UpdateColors; override;
```

C++

```
virtual __fastcall UpdateColors();
```

Description

UpdateColors is called automatically to update associated action components.

76.1.27.3 TRibbonSilverColorMap Properties

The properties of the TRibbonSilverColorMap class are listed here.

Published Properties

	Name	Description
	ActiveTabFontColor (see page 6916)	This is ActiveTabFontColor, a member of class TRibbonSilverColorMap.
	BevelMinimizedInner (see page 6916)	This is BevelMinimizedInner, a member of class TRibbonSilverColorMap.
	BevelMinimizedOuter (see page 6916)	This is BevelMinimizedOuter, a member of class TRibbonSilverColorMap.
	BtnSelectedFont (see page 6917)	Changes the look and feel of your applications.
	CaptionFontColor (see page 6917)	This is CaptionFontColor, a member of class TRibbonSilverColorMap.
	ControlColor (see page 6917)	This is ControlColor, a member of class TRibbonSilverColorMap.
	ControlFrameColor (see page 6917)	This is ControlFrameColor, a member of class TRibbonSilverColorMap.
	ControlInactiveColor (see page 6917)	This is ControlInactiveColor, a member of class TRibbonSilverColorMap.
	DisabledFontColor (see page 6918)	Changes the look and feel of your applications.
	DocumentFontColor (see page 6918)	This is DocumentFontColor, a member of class TRibbonSilverColorMap.
	FontColor (see page 6918)	Changes the look and feel of your applications.
	GroupFontColor (see page 6918)	This is GroupFontColor, a member of class TRibbonSilverColorMap.
	HighlightColor (see page 6919)	Changes the look and feel of your applications.
	InactiveTabFontColor (see page 6919)	This is InactiveTabFontColor, a member of class TRibbonSilverColorMap.
	QuickAccessToolbarMoreBorderColor (see page 6919)	This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonSilverColorMap.
	QuickAccessToolbarMoreColor (see page 6919)	This is QuickAccessToolbarMoreColor, a member of class TRibbonSilverColorMap.

76.1.27.3.1 TRibbonSilverColorMap.ActiveTabFontColor Property

Pascal

```
property ActiveTabFontColor: TColor;
```

C++

```
__property TColor ActiveTabFontColor;
```

Description

This is ActiveTabFontColor, a member of class TRibbonSilverColorMap.

76.1.27.3.2 TRibbonSilverColorMap.BevelMinimizedInner Property

Pascal

```
property BevelMinimizedInner: TColor;
```

C++

```
__property TColor BevelMinimizedInner;
```

Description

This is BevelMinimizedInner, a member of class TRibbonSilverColorMap.

76.1.27.3.3 TRibbonSilverColorMap.BevelMinimizedOuter Property

Pascal

```
property BevelMinimizedOuter: TColor;
```

C++

```
__property TColor BevelMinimizedOuter;
```

Description

This is BevelMinimizedOuter, a member of class TRibbonSilverColorMap.

76.1.27.3.4 TRibbonSilverColorMap.BtnSelectedFont Property

Changes the look and feel of your applications.

Pascal

```
property BtnSelectedFont;
```

C++

```
__property BtnSelectedFont;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.27.3.5 TRibbonSilverColorMap.CaptionFontColor Property

Pascal

```
property CaptionFontColor: TColor;
```

C++

```
__property TColor CaptionFontColor;
```

Description

This is CaptionFontColor, a member of class TRibbonSilverColorMap.

76.1.27.3.6 TRibbonSilverColorMap.ControlColor Property

Pascal

```
property ControlColor: TColor;
```

C++

```
__property TColor ControlColor;
```

Description

This is ControlColor, a member of class TRibbonSilverColorMap.

76.1.27.3.7 TRibbonSilverColorMap.ControlFrameColor Property

Pascal

```
property ControlFrameColor: TColor;
```

C++

```
__property TColor ControlFrameColor;
```

Description

This is ControlFrameColor, a member of class TRibbonSilverColorMap.

76.1.27.3.8 TRibbonSilverColorMap.ControlInactiveColor Property

Pascal

```
property ControlInactiveColor: TColor;
```

C++

```
__property TColor ControlInactiveColor;
```

Description

This is ControlInactiveColor, a member of class TRibbonSilverColorMap.

76.1.27.3.9 TRibbonSilverColorMap.DisabledFontColor Property

Changes the look and feel of your applications.

Pascal

```
property DisabledFontColor;
```

C++

```
__property DisabledFontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.27.3.10 TRibbonSilverColorMap.DocumentFontColor Property

Pascal

```
property DocumentFontColor: TColor;
```

C++

```
__property TColor DocumentFontColor;
```

Description

This is DocumentFontColor, a member of class TRibbonSilverColorMap.

76.1.27.3.11 TRibbonSilverColorMap.FontColor Property

Changes the look and feel of your applications.

Pascal

```
property FontColor;
```

C++

```
__property FontColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.27.3.12 TRibbonSilverColorMap.GroupFontColor Property

Pascal

```
property GroupFontColor: TColor;
```

C++

```
__property TColor GroupFontColor;
```

Description

This is GroupFontColor, a member of class TRibbonSilverColorMap.

76.1.27.3.13 TRibbonSilverColorMap.HighlightColor Property

Changes the look and feel of your applications.

Pascal

```
property HighlightColor;
```

C++

```
__property HighlightColor;
```

Description

Use Object Inspector for the respective colormaps to change the default settings and customize the look and feel of your applications.

76.1.27.3.14 TRibbonSilverColorMap.InactiveTabFontColor Property

Pascal

```
property InactiveTabFontColor: TColor;
```

C++

```
__property TColor InactiveTabFontColor;
```

Description

This is InactiveTabFontColor, a member of class TRibbonSilverColorMap.

76.1.27.3.15 TRibbonSilverColorMap.QuickAccessToolbarMoreBorderColor Property

Pascal

```
property QuickAccessToolbarMoreBorderColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreBorderColor;
```

Description

This is QuickAccessToolbarMoreBorderColor, a member of class TRibbonSilverColorMap.

76.1.27.3.16 TRibbonSilverColorMap.QuickAccessToolbarMoreColor Property

Pascal

```
property QuickAccessToolbarMoreColor: TColor;
```

C++

```
__property TColor QuickAccessToolbarMoreColor;
```

Description

This is QuickAccessToolbarMoreColor, a member of class TRibbonSilverColorMap.

76.1.28 TRibbonTabItem Class

Class Hierarchy

Pascal

```
TRibbonTabItem = class(TCollectionItem);
```

C++

```
class TRibbonTabItem : public TCollectionItem;
```

File

Ribbon

Description

This is class Ribbon.TRibbonTabItem.

76.1.28.1 TRibbonTabItem Members

The following tables list the members exposed by TRibbonTabItem.

Protected Methods

	Name	Description
	GetDisplayName (see page 6922)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 6921)	Copies the contents of another, similar object.
	Destroy (see page 6920)	Destroys the TCollectionItem instance and frees its memory.

Public Properties

	Name	Description
	BestTabWidth (see page 6923)	This is BestTabWidth, a member of class TRibbonTabItem.
	KeyTipForm (see page 6923)	This is KeyTipForm, a member of class TRibbonTabItem.
	MinTabwidth (see page 6923)	This is MinTabwidth, a member of class TRibbonTabItem.
	MinTruncatedWidth (see page 6924)	This is MinTruncatedWidth, a member of class TRibbonTabItem.
	Modified (see page 6924)	This is Modified, a member of class TRibbonTabItem.
	X (see page 6924)	This is X, a member of class TRibbonTabItem.
	Y (see page 6925)	This is Y, a member of class TRibbonTabItem.

Published Properties

	Name	Description
	Caption (see page 6923)	This is Caption, a member of class TRibbonTabItem.
	KeyTip (see page 6923)	This is KeyTip, a member of class TRibbonTabItem.
	Page (see page 6924)	This is Page, a member of class TRibbonTabItem.

76.1.28.2 TRibbonTabItem.Destroy Destructor

Destroys the TCollectionItem instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonTabItem();
```

Description

Destroy is called indirectly by TCollection's Clear or Delete method.

See Also

Clear

Delete

System::TObject::Free

76.1.28.3 TRibbonTabItem Methods

The methods of the TRibbonTabItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 6922)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 6921)	Copies the contents of another, similar object.

76.1.28.3.1 TRibbonTabItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

AssignTo

EConvertError

76.1.28.3.2 TRibbonTabItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

DisplayName

GetNamePath

76.1.28.4 TRibbonTabItem Properties

The properties of the TRibbonTabItem class are listed here.

Public Properties

	Name	Description
R	BestTabWidth (see page 6923)	This is BestTabWidth, a member of class TRibbonTabItem.
	KeyTipForm (see page 6923)	This is KeyTipForm, a member of class TRibbonTabItem.
R	MinTabwidth (see page 6923)	This is MinTabwidth, a member of class TRibbonTabItem.
R	MinTruncatedWidth (see page 6924)	This is MinTruncatedWidth, a member of class TRibbonTabItem.
	Modified (see page 6924)	This is Modified, a member of class TRibbonTabItem.
	X (see page 6924)	This is X, a member of class TRibbonTabItem.
	Y (see page 6925)	This is Y, a member of class TRibbonTabItem.

Published Properties

	Name	Description
	Caption (see page 6923)	This is Caption, a member of class TRibbonTabItem.
	KeyTip (see page 6923)	This is KeyTip, a member of class TRibbonTabItem.
	Page (see page 6924)	This is Page, a member of class TRibbonTabItem.

76.1.28.4.1 TRibbonTabItem.BestTabWidth Property

Pascal

```
property BestTabWidth: Integer;
```

C++

```
__property int BestTabWidth;
```

Description

This is BestTabWidth, a member of class TRibbonTabItem.

76.1.28.4.2 TRibbonTabItem.Caption Property

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

This is Caption, a member of class TRibbonTabItem.

76.1.28.4.3 TRibbonTabItem.KeyTip Property

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

This is KeyTip, a member of class TRibbonTabItem.

76.1.28.4.4 TRibbonTabItem.KeyTipForm Property

Pascal

```
property KeyTipForm: TCustomControl;
```

C++

```
__property TCustomControl KeyTipForm;
```

Description

This is KeyTipForm, a member of class TRibbonTabItem.

76.1.28.4.5 TRibbonTabItem.MinTabwidth Property

Pascal

```
property MinTabwidth: Integer;
```

C++

```
__property int MinTabwidth;
```

Description

This is MinTabwidth, a member of class TRibbonTabItem.

76.1.28.4.6 TRibbonTabItem.MinTruncatedWidth Property

Pascal

```
property MinTruncatedWidth: Integer;
```

C++

```
__property int MinTruncatedWidth;
```

Description

This is MinTruncatedWidth, a member of class TRibbonTabItem.

76.1.28.4.7 TRibbonTabItem.Modified Property

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

This is Modified, a member of class TRibbonTabItem.

76.1.28.4.8 TRibbonTabItem.Page Property

Pascal

```
property Page: TCustomRibbonPage;
```

C++

```
__property TCustomRibbonPage Page;
```

Description

This is Page, a member of class TRibbonTabItem.

76.1.28.4.9 TRibbonTabItem.X Property

Pascal

```
property X: Integer;
```

C++

```
__property int X;
```

Description

This is X, a member of class TRibbonTabItem.

76.1.28.4.10 TRibbonTabItem.Y Property

Pascal

```
property Y: Integer;
```

C++

```
__property int Y;
```

Description

This is Y, a member of class TRibbonTabItem.

76.1.29 TRibbonTabs Class

Collection of information about ribbon pages.

Class Hierarchy

Pascal

```
TRibbonTabs = class(TOwnedCollection);
```

C++

```
class TRibbonTabs : public TOwnedCollection;
```

File

Ribbon

Description

TRibbonTabs is a collection that maintains information about ribbon pages, their captions and keytip values.

The ribbon control can support many user selectable tabs. The TRibbonTabs object stores all tabs and tab specific values associated with the tab. TRibbonTabs also performs the calculations needed to determine if the tabs can fit in the user displayed area and, if not, performs the resizing of the tabs.

76.1.29.1 TRibbonTabs Members

The following tables list the members exposed by TRibbonTabs.

Protected Methods

	Name	Description
	Notify (see page 6927)	Responds when items are added to or removed from the collection.

Public Methods

	Name	Description
	Add (see page 6926)	Creates a new TCollectionItem instance and adds it to the Items array.
	Create (see page 6926)	Creates and initializes a TOwnedCollection instance.
	FindGroup (see page 6927)	This is FindGroup, a member of class TRibbonTabs.
	GetPageFromPageCaption (see page 6927)	This is GetPageFromPageCaption, a member of class TRibbonTabs.
	IndexOfCaption (see page 6927)	This is IndexOfCaption, a member of class TRibbonTabs.
	SelectNext (see page 6928)	Select next page in ribbon.

	SelectPrior (see page 6928)	Select prior page in ribbon.
	TabExists (see page 6929)	This is TabExists, a member of class TRibbonTabs.

Public Properties

	Name	Description
	DesignerAdd (see page 6929)	This is DesignerAdd, a member of class TRibbonTabs.
	Items (see page 6929)	Lists the items in the collection.
R	Ribbon (see page 6930)	This is Ribbon, a member of class TRibbonTabs.

76.1.29.2 TRibbonTabs.Create Constructor

Creates and initializes a TOwnedCollection instance.

Pascal

```
constructor Create(AOwner: TPersistent; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TRibbonTabs(TPersistent * AOwner, TCollectionItemClass ItemClass);
```

Description

The Create method takes two parameters: the name of an instance object descended from TPersistent and the name of a TCollectionItem descendant class. The first parameter is the owner of the TOwnedCollection instance. The second parameter determines the class of the items created by the Add method.

Add

76.1.29.3 TRibbonTabs Methods

The methods of the TRibbonTabs class are listed here.

Protected Methods

	Name	Description
V	Notify (see page 6927)	Responds when items are added to or removed from the collection.

Public Methods

	Name	Description
	Add (see page 6926)	Creates a new TCollectionItem instance and adds it to the Items array.
	FindGroup (see page 6927)	This is FindGroup, a member of class TRibbonTabs.
	GetPageFromPageCaption (see page 6927)	This is GetPageFromPageCaption, a member of class TRibbonTabs.
	IndexOfCaption (see page 6927)	This is IndexOfCaption, a member of class TRibbonTabs.
	SelectNext (see page 6928)	Select next page in ribbon.
	SelectPrior (see page 6928)	Select prior page in ribbon.
	TabExists (see page 6929)	This is TabExists, a member of class TRibbonTabs.

76.1.29.3.1 TRibbonTabs.Add Method

Creates a new TCollectionItem instance and adds it to the Items array.

Pascal

```
function Add: TRibbonTabItem;
```

C++

```
__fastcall TRibbonTabItem Add();
```

Description

Call Add to create an item in the collection. The new item is placed at the end of the Items array.

Add returns the new collection item.

76.1.29.3.2 TRibbonTabs.FindGroup Method

Pascal

```
function FindGroup(const GroupName: string): TControl;
```

C++

```
__fastcall TControl * FindGroup(const UnicodeString GroupName);
```

Description

This is FindGroup, a member of class TRibbonTabs.

76.1.29.3.3 TRibbonTabs.GetPageFromPageCaption Method

Pascal

```
function GetPageFromPageCaption(const Caption: string): TCustomRibbonPage;
```

C++

```
__fastcall TCustomRibbonPage GetPageFromPageCaption(const UnicodeString Caption);
```

Description

This is GetPageFromPageCaption, a member of class TRibbonTabs.

76.1.29.3.4 TRibbonTabs.IndexOfCaption Method

Pascal

```
function IndexOfCaption(const Caption: string): Integer;
```

C++

```
__fastcall int IndexOfCaption(const UnicodeString Caption);
```

Description

This is IndexOfCaption, a member of class TRibbonTabs.

76.1.29.3.5 TRibbonTabs.Notify Method

Responds when items are added to or removed from the collection.

Pascal

```
procedure Notify(Item: TCollectionItem; Action: TCollectionNotification); override;
```

C++

```
virtual __fastcall Notify(TCollectionItem Item, TCollectionNotification Action);
```

Description

Notify is called automatically when the items in the collection change.

Item is the item that was just added to or that is about to be removed from the collection.

Action indicates whether item was added, is about to be removed, or is about to be deleted:

As implemented in TCollection, Notify calls Added when Action is cnAdded and calls Deleting when Action is cnDeleting. TCollection ignores the cnExtracting action. Descendant classes can override Notify to modify this behavior.

Deleting

76.1.29.3.6 TRibbonTabs.SelectNext Method

Select next page in ribbon.

Pascal

```
function SelectNext: Boolean;
```

C++

```
__fastcall Boolean SelectNext();
```

Description

Use SelectNext to select the next page in the ribbon.

See Also

SelectPrior (see page 6928)

76.1.29.3.7 TRibbonTabs.SelectPrior Method

Select prior page in ribbon.

Pascal

```
function SelectPrior: Boolean;
```

C++

```
__fastcall Boolean SelectPrior();
```

Description

Use SelectPrior to select the prior page in the ribbon.

See Also

SelectNext (see page 6928)

76.1.29.3.8 TRibbonTabs.TabExists Method

Pascal

```
function TabExists(const Caption: string): Boolean;
```

C++

```
__fastcall Boolean TabExists(const UnicodeString Caption);
```

Description

This is TabExists, a member of class TRibbonTabs.

76.1.29.4 TRibbonTabs Properties

The properties of the TRibbonTabs class are listed here.

Public Properties

	Name	Description
	DesignerAdd (see page 6929)	This is DesignerAdd, a member of class TRibbonTabs.
	Items (see page 6929)	Lists the items in the collection.
R	Ribbon (see page 6930)	This is Ribbon, a member of class TRibbonTabs.

76.1.29.4.1 TRibbonTabs.DesignerAdd Property

Pascal

```
property DesignerAdd: Boolean;
```

C++

```
__property Boolean DesignerAdd;
```

Description

This is DesignerAdd, a member of class TRibbonTabs.

76.1.29.4.2 TRibbonTabs.Items Property

Lists the items in the collection.

Pascal

```
property Items [Index: Integer]: TRibbonTabItem;
```

C++

```
__property TRibbonTabItem Items[int Index];
```

Description

Use Items to access individual items in the collection. The value of the Index parameter corresponds to the Index property of TCollectionItem. It represents the position of the item in the collection.

76.1.29.4.3 TRibbonTabs.Ribbon Property

Pascal

```
property Ribbon: TCustomRibbon;
```

C++

```
__property TCustomRibbon Ribbon;
```

Description

This is Ribbon, a member of class TRibbonTabs.

76.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IRibbon (see page 6931)	Interface for ribbon control.
	IRibbonGroup (see page 6933)	Interface for any ribbon-specific group.
	IRibbonQuickAccessToolbar (see page 6934)	This is class Ribbon.IRibbonQuickAccessToolbar.

76.2.1 IRibbon Interface

Interface for ribbon control.

Class Hierarchy

Ribbon.IRibbon

Pascal

```
IRibbon = interface;
```

C++

```
__interface IRibbon;
```

File

Ribbon

Description

Implement the IRibbon interface to acknowledge that the control supports the ribbon control.

Creating an Application that Uses Ribbon Controls

Adding Commands to the Ribbon

IRibbonForm

IRibbonGroup (see page 6933)

76.2.1.1 IRibbon Members

The following tables list the members exposed by IRibbon.

Public Methods

	Name	Description
	GetRibbon (see page 6932)	This is GetRibbon, a member of class IRibbon.
	SetRibbon (see page 6932)	This is SetRibbon, a member of class IRibbon.

Public Properties

	Name	Description
	Ribbon (see page 6932)	This is Ribbon, a member of class IRibbon.

76.2.1.2 IRibbon Methods

The methods of the IRibbon class are listed here.

Public Methods

	Name	Description
	GetRibbon (see page 6932)	This is GetRibbon, a member of class IRibbon.
	SetRibbon (see page 6932)	This is SetRibbon, a member of class IRibbon.

76.2.1.2.1 IRibbon.GetRibbon Method

Pascal

```
function GetRibbon: TCustomRibbon;
```

C++

```
__fastcall TCustomRibbon GetRibbon();
```

Description

This is GetRibbon, a member of class IRibbon.

76.2.1.2.2 IRibbon.SetRibbon Method

Pascal

```
procedure SetRibbon(const Value: TCustomRibbon);
```

C++

```
__fastcall SetRibbon(const TCustomRibbon Value);
```

Description

This is SetRibbon, a member of class IRibbon.

76.2.1.3 IRibbon Properties

The properties of the IRibbon class are listed here.

Public Properties

	Name	Description
	Ribbon (see page 6932)	This is Ribbon, a member of class IRibbon.

76.2.1.3.1 IRibbon.Ribbon Property

Pascal

```
property Ribbon: TCustomRibbon;
```

C++

```
__property TCustomRibbon Ribbon;
```

Description

This is Ribbon, a member of class IRibbon.

76.2.2 IRibbonGroup Interface

Interface for any ribbon-specific group.

Class Hierarchy

Pascal

```
IRibbonGroup = interface;
```

C++

```
__interface IRibbonGroup;
```

File

Ribbon

Description

IRibbonGroup is an interface implemented by any ribbon-specific group.

See Also

IRibbon (see page 6931)

IRibbonForm

76.2.2.1 IRibbonGroup Members

The following tables list the members exposed by IRibbonGroup.

Public Methods

	Name	Description
	AlignGroupControls (see page 6934)	Realign controls on group.
	CreateControl (see page 6934)	Recreate specific control.
	StyleChanged (see page 6934)	This is StyleChanged, a member of class IRibbonGroup.

76.2.2.2 IRibbonGroup Methods

The methods of the IRibbonGroup class are listed here.

Public Methods

	Name	Description
	AlignGroupControls (see page 6934)	Realign controls on group.
	CreateControl (see page 6934)	Recreate specific control.
	StyleChanged (see page 6934)	This is StyleChanged, a member of class IRibbonGroup.

76.2.2.2.1 IRibbonGroup.AlignGroupControls Method

Realign controls on group.

Pascal

```
procedure AlignGroupControls;
```

C++

```
__fastcall AlignGroupControls();
```

Description

AlignGroupControls realigns controls on a group.

See Also

CreateControl (see page 6934)

76.2.2.2.2 IRibbonGroup.CreateControl Method

Recreate specific control.

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl;
```

C++

```
__fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

CreateControl recreates a specific control.

See Also

AlignGroupControls (see page 6934)

76.2.2.2.3 IRibbonGroup.StyleChanged Method

Pascal

```
procedure StyleChanged(AStyle: TRibbonStyleActionBars);
```

C++

```
__fastcall StyleChanged(TRibbonStyleActionBars AStyle);
```

Description

This is StyleChanged, a member of class IRibbonGroup.

76.2.3 IRibbonQuickAccessToolbar Interface

Class Hierarchy

Pascal

```
IRibbonQuickAccessToolbar = interface;
```

C++

```
__interface IRibbonQuickAccessToolbar;
```

File

Ribbon

Description

This is class Ribbon.IRibbonQuickAccessToolbar.

76.2.3.1 IRibbonQuickAccessToolbar Members

The following tables list the members exposed by IRibbonQuickAccessToolbar.

Public Methods

	Name	Description
	DoUpdateQATWidth (see page 6935)	This is DoUpdateQATWidth, a member of class IRibbonQuickAccessToolbar.

76.2.3.2 IRibbonQuickAccessToolbar Methods

The methods of the IRibbonQuickAccessToolbar class are listed here.

Public Methods

	Name	Description
	DoUpdateQATWidth (see page 6935)	This is DoUpdateQATWidth, a member of class IRibbonQuickAccessToolbar.

76.2.3.2.1 IRibbonQuickAccessToolbar.DoUpdateQATWidth Method

Pascal

```
procedure DoUpdateQATWidth;
```

C++

```
__fastcall DoUpdateQATWidth();
```

Description

This is DoUpdateQATWidth, a member of class IRibbonQuickAccessToolbar.

76.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCommandType (see page 6936)	This is record Ribbon.TCommandType.
	TIconSize (see page 6936)	This is record Ribbon.TIconSize.
	TRibbonGroupVariant (see page 6937)	This is record Ribbon.TRibbonGroupVariant.
	TRibbonMetric (see page 6937)	This is record Ribbon.TRibbonMetric.
	TRibbonScrollButton (see page 6938)	This is record Ribbon.TRibbonScrollButton.
	TTabActiveScrollButton (see page 6938)	This is record Ribbon.TTabActiveScrollButton.
	TTabSeparatorState (see page 6939)	Position of Quick Access Toolbar.

76.3.1 Ribbon.TCommandType Enumeration

Pascal

```
TCommandType = (
  ctRecent,
  ctCommands
);
```

C++

```
enum TCommandType {
  ctRecent,
  ctCommands
};
```

File

Ribbon

Description

This is record Ribbon.TCommandType.

76.3.2 Ribbon.TIconSize Enumeration

Pascal

```
TIconSize = (
  isSmall,
  isMedium,
  isLarge
);
```

C++

```
enum TIconSize {
  isSmall,
  isMedium,
```

```
    isLarge
  };
```

File

Ribbon

Description

This is record Ribbon.TIconSize.

76.3.3 Ribbon.TRibbonGroupVariant Enumeration

Pascal

```
  TRibbonGroupVariant = (
    rgvCollapsed,
    rgvSmall,
    rgvMedium,
    rgvLarge
  );
```

C++

```
  enum TRibbonGroupVariant {
    rgvCollapsed,
    rgvSmall,
    rgvMedium,
    rgvLarge
  };
```

File

Ribbon

Description

This is record Ribbon.TRibbonGroupVariant.

76.3.4 Ribbon.TRibbonMetric Enumeration

Pascal

```
  TRibbonMetric = (
    rmCaption,
    rmHeight,
    rmFullHeight,
    rmMinHeight,
    rmTabTop,
    rmPageHeight,
    rmGroupHeight,
    rmGroupCaptionHeight,
    rmQATWidth,
    rmSystemButtonHeight,
    rmSystemButtonWidth,
    rmTabHeight,
    rmFontSize
  );
```

C++

```
  enum TRibbonMetric {
```

```
    rmCaption,
    rmHeight,
    rmFullHeight,
    rmMinHeight,
    rmTabTop,
    rmPageHeight,
    rmGroupHeight,
    rmGroupCaptionHeight,
    rmQATWidth,
    rmSystemButtonHeight,
    rmSystemButtonWidth,
    rmTabHeight,
    rmFontSize
  };
```

File

Ribbon

Description

This is record Ribbon.TRibbonMetric.

76.3.5 Ribbon.TRibbonScrollButton Enumeration

Pascal

```
  TRibbonScrollButton = (
    tsbTabRight,
    tsbTabLeft,
    tsbGroupLeft,
    tsbGroupRight
  );
```

C++

```
  enum TRibbonScrollButton {
    tsbTabRight,
    tsbTabLeft,
    tsbGroupLeft,
    tsbGroupRight
  };
```

File

Ribbon

Description

This is record Ribbon.TRibbonScrollButton.

76.3.6 Ribbon.TTabActiveScrollButton Enumeration

Pascal

```
  TTabActiveScrollButton = (
    asbNone,
    asbRight,
    asbLeft
  );
```

C++

```
enum TTabActiveScrollButton {
  asbNone,
  asbRight,
  asbLeft
};
```

File

Ribbon

Description

This is record Ribbon.TTabActiveScrollButton.

76.3.7 Ribbon.TTabSeparatorState Enumeration

Position of Quick Access Toolbar.

Pascal

```
TTabSeparatorState = (
  tssHidden,
  tssLight,
  tssMedium,
  tssDark
);
```

C++

```
enum TTabSeparatorState {
  tssHidden,
  tssLight,
  tssMedium,
  tssDark
};
```

File

Ribbon

Description

TTabSeparatorState is the state of the separators that are displayed between tabs when the ribbon is being resized smaller.

Value	Meaning
tssHidden	Hidden
tssLight	Light
tssMedium	Medium
tssDark	Dark

See Also

TApplicationMenu (see page 6716)

76.4 Types

The following table lists types in this documentation.

Types

Name	Description
TCustomRibbonClass (see page 6940)	This is type Ribbon.TCustomRibbonClass.
TRecentItemClickEvent (see page 6940)	This is type Ribbon.TRecentItemClickEvent.
TRibbonScrollButtons (see page 6941)	This is type Ribbon.TRibbonScrollButtons.

76.4.1 Ribbon.TCustomRibbonClass Type

Pascal

```
TCustomRibbonClass = class of TCustomRibbon;
```

C++

```
TCustomRibbon TCustomRibbonClass;
```

File

Ribbon

Description

This is type Ribbon.TCustomRibbonClass.

76.4.2 Ribbon.TRecentItemClickEvent Type

Pascal

```
TRecentItemClickEvent = procedure (Sender: TObject; FileName: string; Index: Integer) of
object;
```

C++

```
(Sender: TObject; FileName: string; Index: Integer) ( TRecentItemClickEvent)();
```

File

Ribbon

Description

This is type Ribbon.TRecentItemClickEvent.

76.4.3 Ribbon.TRibbonScrollButtons Type

Pascal

```
TRibbonScrollButtons = set of TRibbonScrollButton;
```

C++

```
TRibbonScrollButton TRibbonScrollButtons;
```

File

Ribbon

Description

This is type Ribbon.TRibbonScrollButtons.

77 RibbonActnCtrls Namespace

This is namespace RibbonActnCtrls.

Topics

Name	Description
Classes (see page 6946)	The following table lists classes in this documentation.
Interfaces (see page 7272)	The following table lists interfaces in this documentation.
Functions (see page 7284)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 7286)	The following table lists structs, records, enums in this documentation.
Types (see page 7291)	The following table lists types in this documentation.
Constants (see page 7292)	The following table lists constants in this documentation.

Classes

	Name	Description
	TCustomRibbonComboBox (see page 6947)	This is class RibbonActnCtrls.TCustomRibbonComboBox.
	TKeyTipList (see page 6956)	**KeyTip** list.
	TKeyTipListEnumerator (see page 6960)	This is class RibbonActnCtrls.TKeyTipListEnumerator.
	TKeyTipMatchItem (see page 6962)	Details about Full and Partial **KeyTip** matches.
	TKeyTipValidator (see page 6964)	Used to validate **KeyTip**.
	TRibbonAddRemoveItem (see page 6965)	This is class RibbonActnCtrls.TRibbonAddRemoveItem.
	TRibbonApplicationButton (see page 6967)	This is class RibbonActnCtrls.TRibbonApplicationButton.
	TRibbonApplicationMenuButton (see page 6968)	Application (see page 2612) Button when using Ribbon (see page 6713) interface.
	TRibbonApplicationMenuItem (see page 6976)	This is class RibbonActnCtrls.TRibbonApplicationMenuItem.
	TRibbonBaseButtonControl (see page 6980)	Common ancestor for many buttons in groups and Quick Access Toolbar.
	TRibbonCheckBoxControl (see page 6990)	This is class RibbonActnCtrls.TRibbonCheckBoxControl.
	TRibbonComboBox (see page 6992)	This is class RibbonActnCtrls.TRibbonComboBox.
	TRibbonComboBoxItem (see page 7045)	This is class RibbonActnCtrls.TRibbonComboBoxItem.
	TRibbonComboControl (see page 7047)	This is class RibbonActnCtrls.TRibbonComboControl.
	TRibbonCustomControl (see page 7061)	This is class RibbonActnCtrls.TRibbonCustomControl.
	TRibbonCustomizeItem (see page 7073)	This is class RibbonActnCtrls.TRibbonCustomizeItem.
	TRibbonCustomStatusControl (see page 7076)	This is class RibbonActnCtrls.TRibbonCustomStatusControl.
	TRibbonDropDownButton (see page 7078)	This is class RibbonActnCtrls.TRibbonDropDownButton.
	TRibbonGallery (see page 7083)	This is class RibbonActnCtrls.TRibbonGallery.
	TRibbonGalleryControl (see page 7083)	This is class RibbonActnCtrls.TRibbonGalleryControl.
	TRibbonGalleryControlMenuItem (see page 7085)	This is class RibbonActnCtrls.TRibbonGalleryControlMenuItem.

	TRibbonGalleryItem (see page 7091)	This is class RibbonActnCtrls.TRibbonGalleryItem.
	TRibbonGalleryMenuItem (see page 7093)	This is class RibbonActnCtrls.TRibbonGalleryMenuItem.
	TRibbonGallerySplitButton (see page 7096)	This is class RibbonActnCtrls.TRibbonGallerySplitButton.
	TRibbonGripItem (see page 7098)	This is class RibbonActnCtrls.TRibbonGripItem.
	TRibbonGroupDropDown (see page 7101)	Display entire group as dropdown menu in Quick Access Toolbar.
	TRibbonLargeButtonControl (see page 7105)	This is class RibbonActnCtrls.TRibbonLargeButtonControl.
	TRibbonLargeSplitButton (see page 7108)	This is class RibbonActnCtrls.TRibbonLargeSplitButton.
	TRibbonMainMenuItem (see page 7115)	This is class RibbonActnCtrls.TRibbonMainMenuItem.
	TRibbonMainMenuSeparator (see page 7117)	This is class RibbonActnCtrls.TRibbonMainMenuSeparator.
	TRibbonMenuItem (see page 7118)	This is class RibbonActnCtrls.TRibbonMenuItem.
	TRibbonMenuSeparatorItem (see page 7123)	This is class RibbonActnCtrls.TRibbonMenuSeparatorItem.
	TRibbonMenuSmallButtonControl (see page 7125)	This is class RibbonActnCtrls.TRibbonMenuSmallButtonControl.
	TRibbonOptionButtonControl (see page 7128)	This is class RibbonActnCtrls.TRibbonOptionButtonControl.
	TRibbonQATScrollButton (see page 7130)	This is class RibbonActnCtrls.TRibbonQATScrollButton.
	TRibbonRadioButtonControl (see page 7134)	This is class RibbonActnCtrls.TRibbonRadioButtonControl.
	TRibbonRecentButtonControl (see page 7137)	This is class RibbonActnCtrls.TRibbonRecentButtonControl.
	TRibbonRichContentItem (see page 7139)	This is class RibbonActnCtrls.TRibbonRichContentItem.
	TRibbonRichContentMainMenuItem (see page 7143)	This is class RibbonActnCtrls.TRibbonRichContentMainMenuItem.
	TRibbonSeparator (see page 7147)	This is class RibbonActnCtrls.TRibbonSeparator.
	TRibbonSmallButtonControl (see page 7150)	This is class RibbonActnCtrls.TRibbonSmallButtonControl.
	TRibbonSmallSplitButton (see page 7152)	This is class RibbonActnCtrls.TRibbonSmallSplitButton.
	TRibbonSpinButton (see page 7159)	This is class RibbonActnCtrls.TRibbonSpinButton.
	TRibbonSpinEdit (see page 7198)	This is class RibbonActnCtrls.TRibbonSpinEdit.
	TRibbonSplitMenuItem (see page 7257)	This is class RibbonActnCtrls.TRibbonSplitMenuItem.
	TRibbonStyleMenuButton (see page 7262)	Top level menus when using Ribbon (see page 6713) Styles in applications not using Ribbon (see page 6713) interface.
	TRibbonTextControl (see page 7263)	This is class RibbonActnCtrls.TRibbonTextControl.
	TRibbonToolScrollButton (see page 7265)	This is class RibbonActnCtrls.TRibbonToolScrollButton.
	TTimerSpeedButton (see page 7267)	This is class RibbonActnCtrls.TTimerSpeedButton.

Constants

Name	Description
UM_FADECONTROL (see page 7292)	This is constant RibbonActnCtrls.UM_FADECONTROL.

Functions

	Name	Description
	DrawLine (see page 7284)	This is function RibbonActnCtrls.DrawLine.
	IsLeftMouseButtonPressed (see page 7284)	This is function RibbonActnCtrls.IsLeftMouseButtonPressed.
	ShowKeyTip (see page 7284)	Show **KeyTip** for control.
	ShowKeyTip (see page 7284)	Show **KeyTip** for control.

Interfaces

	Name	Description
	IRibbonBarKeyTip (see page 7272)	Action Bars that support KeyTips should implement this interface.
	IRibbonContainedControl (see page 7274)	Interface implemented by controls used as containers for displaying other controls.
	IRibbonControl (see page 7276)	Interface implemented by controls visible in Ribbon (see page 6713) Groups.
	IRibbonGroupDropdown (see page 7277)	This is class RibbonActnCtrls.IRibbonGroupDropdown.
	IRibbonKeyTip (see page 7278)	Commands with a **KeyTip (see page 7282)** should implement this interface.
	IRibbonSplitButton (see page 7282)	Interface implemented by controls that have split button.

Structs, Records, Enums

	Name	Description
	TKeyTipHandled (see page 7286)	Validate if command's **KeyTip** matches current user input.
	TKeyTipMatchType (see page 7287)	Type of match command's **KeyTip** is for current **KeyTip** value.

	TKeyTipPosition (see page 7287)	Position of KeyTips.
	TKeyTipState (see page 7288)	Current state of KeyTips.
	TQATScrollMode (see page 7289)	This is record RibbonActnCtrls.TQATScrollMode.
	TSpinButtonStyle (see page 7290)	This is record RibbonActnCtrls.TSpinButtonStyle.

Types

Name	Description
TNumGlyphs (see page 7291)	This is type RibbonActnCtrls.TNumGlyphs.
TTimeBtnState (see page 7291)	This is type RibbonActnCtrls.TTimeBtnState.

77.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomRibbonComboBox (see page 6947)	This is class RibbonActnCtrls.TCustomRibbonComboBox.
	TKeyTipList (see page 6956)	**KeyTip** list.
	TKeyTipListEnumerator (see page 6960)	This is class RibbonActnCtrls.TKeyTipListEnumerator.
	TKeyTipMatchItem (see page 6962)	Details about Full and Partial **KeyTip** matches.
	TKeyTipValidator (see page 6964)	Used to validate **KeyTip**.
	TRibbonAddRemoveItem (see page 6965)	This is class RibbonActnCtrls.TRibbonAddRemoveItem.
	TRibbonApplicationButton (see page 6967)	This is class RibbonActnCtrls.TRibbonApplicationButton.
	TRibbonApplicationMenuButton (see page 6968)	Application (see page 2612) Button when using Ribbon (see page 6713) interface.
	TRibbonApplicationMenuItem (see page 6976)	This is class RibbonActnCtrls.TRibbonApplicationMenuItem.
	TRibbonBaseButtonControl (see page 6980)	Common ancestor for many buttons in groups and Quick Access Toolbar.
	TRibbonCheckBoxControl (see page 6990)	This is class RibbonActnCtrls.TRibbonCheckBoxControl.
	TRibbonComboBox (see page 6992)	This is class RibbonActnCtrls.TRibbonComboBox.
	TRibbonComboBoxItem (see page 7045)	This is class RibbonActnCtrls.TRibbonComboBoxItem.
	TRibbonComboControl (see page 7047)	This is class RibbonActnCtrls.TRibbonComboControl.
	TRibbonCustomControl (see page 7061)	This is class RibbonActnCtrls.TRibbonCustomControl.
	TRibbonCustomizeItem (see page 7073)	This is class RibbonActnCtrls.TRibbonCustomizeItem.
	TRibbonCustomStatusControl (see page 7076)	This is class RibbonActnCtrls.TRibbonCustomStatusControl.
	TRibbonDropDownButton (see page 7078)	This is class RibbonActnCtrls.TRibbonDropDownButton.
	TRibbonGallery (see page 7083)	This is class RibbonActnCtrls.TRibbonGallery.
	TRibbonGalleryControl (see page 7083)	This is class RibbonActnCtrls.TRibbonGalleryControl.
	TRibbonGalleryControlMenuItem (see page 7085)	This is class RibbonActnCtrls.TRibbonGalleryControlMenuItem.
	TRibbonGalleryItem (see page 7091)	This is class RibbonActnCtrls.TRibbonGalleryItem.
	TRibbonGalleryMenuItem (see page 7093)	This is class RibbonActnCtrls.TRibbonGalleryMenuItem.
	TRibbonGallerySplitButton (see page 7096)	This is class RibbonActnCtrls.TRibbonGallerySplitButton.
	TRibbonGripItem (see page 7098)	This is class RibbonActnCtrls.TRibbonGripItem.
	TRibbonGroupDropDown (see page 7101)	Display entire group as dropdown menu in Quick Access Toolbar.
	TRibbonLargeButtonControl (see page 7105)	This is class RibbonActnCtrls.TRibbonLargeButtonControl.
	TRibbonLargeSplitButton (see page 7108)	This is class RibbonActnCtrls.TRibbonLargeSplitButton.
	TRibbonMainMenuItem (see page 7115)	This is class RibbonActnCtrls.TRibbonMainMenuItem.
	TRibbonMainMenuSeparator (see page 7117)	This is class RibbonActnCtrls.TRibbonMainMenuSeparator.
	TRibbonMenuItem (see page 7118)	This is class RibbonActnCtrls.TRibbonMenuItem.
	TRibbonMenuSeparatorItem (see page 7123)	This is class RibbonActnCtrls.TRibbonMenuSeparatorItem.
	TRibbonMenuSmallButtonControl (see page 7125)	This is class RibbonActnCtrls.TRibbonMenuSmallButtonControl.
	TRibbonOptionButtonControl (see page 7128)	This is class RibbonActnCtrls.TRibbonOptionButtonControl.
	TRibbonQATScrollButton (see page 7130)	This is class RibbonActnCtrls.TRibbonQATScrollButton.
	TRibbonRadioButtonControl (see page 7134)	This is class RibbonActnCtrls.TRibbonRadioButtonControl.
	TRibbonRecentButtonControl (see page 7137)	This is class RibbonActnCtrls.TRibbonRecentButtonControl.
	TRibbonRichContentItem (see page 7139)	This is class RibbonActnCtrls.TRibbonRichContentItem.
	TRibbonRichContentMainMenuItem (see page 7143)	This is class RibbonActnCtrls.TRibbonRichContentMainMenuItem.
	TRibbonSeparator (see page 7147)	This is class RibbonActnCtrls.TRibbonSeparator.
	TRibbonSmallButtonControl (see page 7150)	This is class RibbonActnCtrls.TRibbonSmallButtonControl.
	TRibbonSmallSplitButton (see page 7152)	This is class RibbonActnCtrls.TRibbonSmallSplitButton.
	TRibbonSpinButton (see page 7159)	This is class RibbonActnCtrls.TRibbonSpinButton.
	TRibbonSpinEdit (see page 7198)	This is class RibbonActnCtrls.TRibbonSpinEdit.

	TRibbonSplitMenuItem (see page 7257)	This is class RibbonActnCtrls.TRibbonSplitMenuItem.
	TRibbonStyleMenuButton (see page 7262)	Top level menus when using Ribbon (see page 6713) Styles in applications not using Ribbon (see page 6713) interface.
	TRibbonTextControl (see page 7263)	This is class RibbonActnCtrls.TRibbonTextControl.
	TRibbonToolScrollButton (see page 7265)	This is class RibbonActnCtrls.TRibbonToolScrollButton.
	TTimerSpeedButton (see page 7267)	This is class RibbonActnCtrls.TTimerSpeedButton.

77.1.1 TCustomRibbonComboBox Class

Class Hierarchy

Pascal

```
TCustomRibbonComboBox = class(TCustomEdit);
```

C++

```
class TCustomRibbonComboBox : public TCustomEdit;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TCustomRibbonComboBox.

77.1.1.1 TCustomRibbonComboBox Members

The following tables list the members exposed by TCustomRibbonComboBox.

Protected Methods

	Name	Description
	BeginAutoDrag (see page 6949)	Begin Automatic Drag.
	CMMouseenter (see page 6949)	This is CMMouseenter, a member of class TCustomRibbonComboBox.
	CMMouseleave (see page 6950)	This is CMMouseleave, a member of class TCustomRibbonComboBox.
	DragOver (see page 6950)	OnDragOver event dispatcher.
	KeyDown (see page 6951)	Respond to key press events.
	KeyPress (see page 6951)	Respond to keyboard input.
	MouseMove (see page 6952)	Respond to mouse moving over control area..
	Notification (see page 6952)	Responds to notifications that components are being created or destroyed.
	SetParent (see page 6953)	Sets the parent of the control.
	WMKillFocus (see page 6954)	This is WMKillFocus, a member of class TCustomRibbonComboBox.
	WMSetFocus (see page 6954)	This is WMSetFocus, a member of class TCustomRibbonComboBox.

Public Methods

	Name	Description
	Create (see page 6948)	Creates an instance of TCustomEdit.
	Destroy (see page 6948)	Destroys an instance of TWinControl.
	DragDrop (see page 6950)	OnDragDrop event dispatcher.
	SetBounds (see page 6953)	Sets the windowed control's boundary properties all at once.

Public Properties

	Name	Description
	Color (see page 6955)	Specifies the background color of the control.
	Items (see page 6956)	This is Items, a member of class TCustomRibbonComboBox.
	MouseInControl (see page 6956)	This is MouseInControl, a member of class TCustomRibbonComboBox.

77.1.1.2 TCustomRibbonComboBox.Create Constructor

Creates an instance of TCustomEdit.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonComboBox(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TCustomEdit.

AOwner is another component, typically the form, that is responsible for freeing the edit control. It becomes the value of the Owner property.

Derived objects that override the Create method should call the inherited Create before performing any additional initialization.

See Also

Owner

77.1.1.3 TCustomRibbonComboBox.Destroy Destructor

Destroys an instance of TWinControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbonComboBox();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWinControl reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

Destroy

77.1.1.4 TCustomRibbonComboBox Methods

The methods of the TCustomRibbonComboBox class are listed here.

Protected Methods

	Name	Description
	BeginAutoDrag (see page 6949)	Begin Automatic Drag.
	CMMouseenter (see page 6949)	This is CMMouseenter, a member of class TCustomRibbonComboBox.
	CMMouseleave (see page 6950)	This is CMMouseleave, a member of class TCustomRibbonComboBox.
	DragOver (see page 6950)	OnDragOver event dispatcher.
	KeyDown (see page 6951)	Respond to key press events.
	KeyPress (see page 6951)	Respond to keyboard input.
	MouseMove (see page 6952)	Respond to mouse moving over control area..
	Notification (see page 6952)	Responds to notifications that components are being created or destroyed.
	SetParent (see page 6953)	Sets the parent of the control.
	WMKillFocus (see page 6954)	This is WMKillFocus, a member of class TCustomRibbonComboBox.
	WMSetFocus (see page 6954)	This is WMSetFocus, a member of class TCustomRibbonComboBox.

Public Methods

	Name	Description
	DragDrop (see page 6950)	OnDragDrop event dispatcher.
	SetBounds (see page 6953)	Sets the windowed control's boundary properties all at once.

77.1.1.4.1 TCustomRibbonComboBox.BeginAutoDrag Method

Begin Automatic Drag.

Pascal

```
procedure BeginAutoDrag; override;
```

C++

```
virtual __fastcall BeginAutoDrag();
```

Description

BeginAutoDrag is called automatically when a user drags a control whose DragMode is dmAutomatic. Do not call BeginAutoDrag in application code.

As implemented in TControl, BeginAutoDrag calls BeginDrag, passing in the global Mouse variable's DragImmediate and DragThreshold properties.

See Also

DragKind

DragMode

EndDrag

Mouse

DragImmediate

DragThreshold

Mouse

77.1.1.4.2 TCustomRibbonComboBox.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TCustomRibbonComboBox.

77.1.1.4.3 TCustomRibbonComboBox.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TCustomRibbonComboBox.

77.1.1.4.4 TCustomRibbonComboBox.DragDrop Method

OnDragDrop event dispatcher.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

When creating a component that descends from TControl, override DragDrop to add additional code that executes before the OnDragDrop event handler is called.

The Source parameter is the object that was dropped onto the control. The X and Y parameters are the mouse coordinates where the object was dropped.

See Also

DragCanceled

OnDragDrop

77.1.1.4.5 TCustomRibbonComboBox.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to

false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop

OnDragOver

77.1.1.4.6 TCustomRibbonComboBox.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

See Also

KeyUp

OnKeyDown

DoKeyDown

DoKeyPress

DoKeyUp

77.1.1.4.7 TCustomRibbonComboBox.KeyPress Method

Respond to keyboard input.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

When a windowed control receives a key-press message (WM_CHAR) from Windows, its message handler calls the DoKeyPress method. If DoKeyPress determines that the control should, in fact, process the character, it calls KeyPress, passing the key code in the Key parameter.

KeyPress calls any event handler attached to the OnKeyPress event. Override KeyPress to provide other responses in addition to the event-handler call.

Either KeyPress or the OnKeyPress event handler it calls can suppress further processing of a character by setting the Key parameter to zero.

Note: The Key parameter is the character represented by the key that is pressed, not a Windows virtual key code.

See Also

KeyDown

KeyUp

OnKeyPress

77.1.1.4.8 TCustomRibbonComboBox.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown

MouseUp

OnMouseMove

77.1.1.4.9 TCustomRibbonComboBox.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

See Also

PopupMenu

Notification

77.1.1.4.10 TCustomRibbonComboBox.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

See Also

Height

Left

Top

Width

77.1.1.4.11 TCustomRibbonComboBox.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

Destroy

InsertControl

Parent

RemoveControl

77.1.1.4.12 TCustomRibbonComboBox.WMKillFocus Method

Pascal

```
procedure WMKillFocus(var Message: TWMKillFocus); message WM_KILLFOCUS;
```

C++

```
__fastcall WMKillFocus(TWMKillFocus Message);
```

Description

This is WMKillFocus, a member of class TCustomRibbonComboBox.

77.1.1.4.13 TCustomRibbonComboBox.WMSetFocus Method

Pascal

```
procedure WMSetFocus(var Message: TWMSetFocus); message WM_SETFOCUS;
```

C++

```
__fastcall WMSetFocus(TWMSetFocus Message);
```

Description

This is WMSetFocus, a member of class TCustomRibbonComboBox.

77.1.1.5 TCustomRibbonComboBox Properties

The properties of the TCustomRibbonComboBox class are listed here.

Public Properties

	Name	Description
	Color (see page 6955)	Specifies the background color of the control.
	Items (see page 6956)	This is Items, a member of class TCustomRibbonComboBox.
	MouseInControl (see page 6956)	This is MouseInControl, a member of class TCustomRibbonComboBox.

77.1.1.5.1 TCustomRibbonComboBox.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor

77.1.1.5.2 TCustomRibbonComboBox.Items Property

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

This is Items, a member of class TCustomRibbonComboBox.

77.1.1.5.3 TCustomRibbonComboBox.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TCustomRibbonComboBox.

77.1.2 TKeyTipList Class

KeyTip list.

Class Hierarchy

RibbonActnCtrls.TKeyTipList

Pascal

```
TKeyTipList = class;
```

C++

```
class TKeyTipList;
```

File

RibbonActnCtrls

Description

TKeyTipList is a **KeyTip** list.

77.1.2.1 TKeyTipList Members

The following tables list the members exposed by TKeyTipList.

Public Methods

	Name	Description
	Add (see page 6958)	Add new match to list of KeyTips.
	Clear (see page 6958)	Clear list of KeyTips.

	Create (see page 6957)	Create TKeyTipList (see page 6956) instance.
V	Destroy (see page 6957)	Destroy TKeyTipList (see page 6956) instance.

Public Properties

	Name	Description
R	Count (see page 6958)	Number of valid **KeyTip**s.
	Current (see page 6959)	Current **KeyTip** value so far.
R	Full (see page 6959)	Indicates **KeyTip** has full match in list and no other matches
R	Items (see page 6959)	Indexable list of TKeyTipList (see page 6956).
R	Partial (see page 6960)	**KeyTip** has partial match in list.

77.1.2.2 TKeyTipList.Create Constructor

Create TKeyTipList (see page 6956) instance.

Pascal

```
constructor Create;
```

C++

```
__fastcall TKeyTipList();
```

Description

This method creates a TKeyTipList (see page 6956) instance.

See Also

Destroy (see page 6957)

77.1.2.3 TKeyTipList.Destroy Destructor

Destroy TKeyTipList (see page 6956) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TKeyTipList();
```

Description

This method destroys a TKeyTipList (see page 6956) instance.

See Also

Create (see page 6957)

77.1.2.4 TKeyTipList Methods

The methods of the TKeyTipList class are listed here.

Public Methods

	Name	Description
	Add (see page 6958)	Add new match to list of KeyTips.
	Clear (see page 6958)	Clear list of KeyTips.

77.1.2.4.1 TKeyTipList.Add Method

Add new match to list of KeyTips.

Pascal

```
procedure Add(MatchType: TKeyTipMatchType; Handled: TKeyTipHandled; Control: TControl; Index:
Integer = -1);
```

C++

```
__fastcall Add(TKeyTipMatchType MatchType, TKeyTipHandled Handled, TControl * Control, int
Index = -1);
```

Description

This method adds a new match to the list of KeyTips.

See Also

Clear (see page 6958)

77.1.2.4.2 TKeyTipList.Clear Method

Clear list of KeyTips.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This method clears the list of KeyTips.

See Also

Add (see page 6958)

77.1.2.5 TKeyTipList Properties

The properties of the TKeyTipList class are listed here.

Public Properties

	Name	Description
R	Count (see page 6958)	Number of valid **KeyTip**s.
	Current (see page 6959)	Current **KeyTip** value so far.
R	Full (see page 6959)	Indicates **KeyTip** has full match in list and no other matches
R	Items (see page 6959)	Indexable list of TKeyTipList (see page 6956).
R	Partial (see page 6960)	**KeyTip** has partial match in list.

77.1.2.5.1 TKeyTipList.Count Property

Number of valid **KeyTip**s.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Count contains the number of valid **KeyTip**s.

See Also

Current (see page 6959)

77.1.2.5.2 TKeyTipList.Current Property

Current **KeyTip** value so far.

Pascal

```
property Current: string;
```

C++

```
__property UnicodeString Current;
```

Description

Current is the current **KeyTip** value the user has typed in so far.

See Also

Count (see page 6958)

77.1.2.5.3 TKeyTipList.Full Property

Indicates **KeyTip** has full match in list and no other matches

Pascal

```
property Full: Boolean;
```

C++

```
__property Boolean Full;
```

Description

Full is True if the current **KeyTip** has a full match in the list and there are no other matches, and it is False otherwise.

See Also

Partial (see page 6960)

77.1.2.5.4 TKeyTipList.Items Property

Indexable list of TKeyTipList (see page 6956).

Pascal

```
property Items [Index: Integer]: TKeyTipMatchItem;
```

C++

```
__property TKeyTipMatchItem Items[int Index];
```

Description

Items is an indexable list of TKeyTipList (see page 6956).

77.1.2.5.5 TKeyTipList.Partial Property

KeyTip has partial match in list.

Pascal

```
property Partial: Boolean;
```

C++

```
__property Boolean Partial;
```

Description

Partial is True if the current **KeyTip** has a partial match in the list and false otherwise.

See Also

Full (see page 6959)

77.1.3 TKeyTipListEnumerator Class

Class Hierarchy

Pascal

```
TKeyTipListEnumerator = class;
```

C++

```
class TKeyTipListEnumerator;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TKeyTipListEnumerator.

77.1.3.1 TKeyTipListEnumerator Members

The following tables list the members exposed by TKeyTipListEnumerator.

Public Methods

	Name	Description
	Create (see page 6961)	This is Create, a member of class TKeyTipListEnumerator.
	GetCurrent (see page 6961)	This is GetCurrent, a member of class TKeyTipListEnumerator.
	MoveNext (see page 6961)	This is MoveNext, a member of class TKeyTipListEnumerator.

Public Properties

	Name	Description
	Current (see page 6962)	This is Current, a member of class TKeyTipListEnumerator.

77.1.3.2 TKeyTipListEnumerator.Create Constructor

Pascal

```
constructor Create(AList: TKeyTipList);
```

C++

```
__fastcall TKeyTipListEnumerator(TKeyTipList AList);
```

Description

This is Create, a member of class TKeyTipListEnumerator.

77.1.3.3 TKeyTipListEnumerator Methods

The methods of the TKeyTipListEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 6961)	This is GetCurrent, a member of class TKeyTipListEnumerator.
	MoveNext (see page 6961)	This is MoveNext, a member of class TKeyTipListEnumerator.

77.1.3.3.1 TKeyTipListEnumerator.GetCurrent Method

Pascal

```
function GetCurrent: TKeyTipMatchItem;
```

C++

```
__fastcall TKeyTipMatchItem GetCurrent();
```

Description

This is GetCurrent, a member of class TKeyTipListEnumerator.

77.1.3.3.2 TKeyTipListEnumerator.MoveNext Method

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

This is MoveNext, a member of class TKeyTipListEnumerator.

77.1.3.4 TKeyTipListEnumerator Properties

The properties of the TKeyTipListEnumerator class are listed here.

Public Properties

	Name	Description
	Current (see page 6962)	This is Current, a member of class TKeyTipListEnumerator.

77.1.3.4.1 TKeyTipListEnumerator.Current Property

Pascal

```
property Current: TKeyTipMatchItem;
```

C++

```
__property TKeyTipMatchItem Current;
```

Description

This is Current, a member of class TKeyTipListEnumerator.

77.1.4 TKeyTipMatchItem Class

Details about Full and Partial **KeyTip** matches.

Class Hierarchy

Pascal

```
TKeyTipMatchItem = class;
```

C++

```
class TKeyTipMatchItem;
```

File

RibbonActnCtrls

Description

TKeyTipMatchItem stores details about Full and Partial **KeyTip** matches. It contains a reference to the control that needs to be executed. If the MatchType (see page 6964) is **mtTabs**, then the Index (see page 6964) property is used to determine which Tab to change to.

See Also

Index (see page 6964)

MatchType (see page 6964)

TKeyTipMatchType (see page 7287)

77.1.4.1 TKeyTipMatchItem Members

The following tables list the members exposed by TKeyTipMatchItem.

Public Methods

	Name	Description
	Create (see page 6963)	This is Create, a member of class TKeyTipMatchItem.

Public Properties

	Name	Description
	Control (see page 6963)	This is Control, a member of class TKeyTipMatchItem.

	Handled (see page 6963)	This is Handled, a member of class TKeyTipMatchItem.
	Index (see page 6964)	Determines which Tab to change to.
	MatchType (see page 6964)	**KeyTip** match type.

77.1.4.2 TKeyTipMatchItem.Create Constructor

Pascal

```
constructor Create(AType: TKeyTipMatchType; AHandled: TKeyTipHandled; AControl: TControl;
AIndex: Integer = -1);
```

C++

```
__fastcall TKeyTipMatchItem(TKeyTipMatchType AType, TKeyTipHandled AHandled, TControl *
AControl, int AIndex = -1);
```

Description

This is Create, a member of class TKeyTipMatchItem.

77.1.4.3 TKeyTipMatchItem Properties

The properties of the TKeyTipMatchItem class are listed here.

Public Properties

	Name	Description
	Control (see page 6963)	This is Control, a member of class TKeyTipMatchItem.
	Handled (see page 6963)	This is Handled, a member of class TKeyTipMatchItem.
	Index (see page 6964)	Determines which Tab to change to.
	MatchType (see page 6964)	**KeyTip** match type.

77.1.4.3.1 TKeyTipMatchItem.Control Property

Pascal

```
property Control: TControl;
```

C++

```
__property TControl * Control;
```

Description

This is Control, a member of class TKeyTipMatchItem.

77.1.4.3.2 TKeyTipMatchItem.Handled Property

Pascal

```
property Handled: TKeyTipHandled;
```

C++

```
__property TKeyTipHandled Handled;
```

Description

This is Handled, a member of class TKeyTipMatchItem.

77.1.4.3.3 TKeyTipMatchItem.Index Property

Determines which Tab to change to.

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

If the MatchType (see page 6964) is **mtTabs**, then the Index property is used to determine which Tab to change to.

See Also

MatchType (see page 6964)

TKeyTipMatchType (see page 7287)

77.1.4.3.4 TKeyTipMatchItem.MatchType Property

KeyTip match type.

Pascal

```
property MatchType: TKeyTipMatchType;
```

C++

```
__property TKeyTipMatchType MatchType;
```

Description

MatchType is the **KeyTip** match type.

See Also

Index (see page 6964)

TKeyTipMatchType (see page 7287)

77.1.5 TKeyTipValidator Class

Used to validate **KeyTip**.

Class Hierarchy

Pascal

```
TKeyTipValidator = class;
```

C++

```
class TKeyTipValidator;
```

File

RibbonActnCtrls

Description

TKeyTipValidator is a static class used to validate a **KeyTip**.

77.1.5.1 TKeyTipValidator Members

The following tables list the members exposed by TKeyTipValidator.

Public Methods

	Name	Description
	Validate (see page 6965)	This is Validate, a member of class TKeyTipValidator.

77.1.5.2 TKeyTipValidator Methods

The methods of the TKeyTipValidator class are listed here.

Public Methods

	Name	Description
	Validate (see page 6965)	This is Validate, a member of class TKeyTipValidator.

77.1.5.2.1 TKeyTipValidator.Validate Method

Pascal

```
class procedure Validate(const SrcKeyTip: string; const CmdKeyTip: string; Control: TControl;
var Handled: TKeyTipHandled);
```

C++

```
__fastcall Validate(const UnicodeString SrcKeyTip, const UnicodeString CmdKeyTip, TControl *
Control, TKeyTipHandled Handled);
```

Description

This is Validate, a member of class TKeyTipValidator.

77.1.6 TRibbonAddRemoveItem Class

Class Hierarchy

Pascal

```
TRibbonAddRemoveItem = class(TXPStyleAddRemoveItem);
```

C++

```
class TRibbonAddRemoveItem : public TXPStyleAddRemoveItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonAddRemoveItem.

77.1.6.1 TRibbonAddRemoveItem Members

The following tables list the members exposed by TRibbonAddRemoveItem.

Protected Methods

	Name	Description
	DrawBackground (see page 6966)	Draws a background image on the control.
	DrawGlyph (see page 6966)	Draws a symbol on the control.

77.1.6.2 TRibbonAddRemoveItem Methods

The methods of the TRibbonAddRemoveItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 6966)	Draws a background image on the control.
	DrawGlyph (see page 6966)	Draws a symbol on the control.

77.1.6.2.1 TRibbonAddRemoveItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.6.2.2 TRibbonAddRemoveItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

77.1.7 TRibbonApplicationButton Class

Class Hierarchy

Pascal

```
TRibbonApplicationButton = class(TCustomMenuButton);
```

C++

```
class TRibbonApplicationButton : public TCustomMenuButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonApplicationButton.

77.1.7.1 TRibbonApplicationButton Members

The following tables list the members exposed by TRibbonApplicationButton.

Public Methods

	Name	Description
	CalcBounds (see page 6967)	Calculates the size of the control.

77.1.7.2 TRibbonApplicationButton Methods

The methods of the TRibbonApplicationButton class are listed here.

Public Methods

	Name	Description
	CalcBounds (see page 6967)	Calculates the size of the control.

77.1.7.2.1 TRibbonApplicationButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.8 TRibbonApplicationMenuButton Class

Application (see page 2612) Button when using Ribbon (see page 6713) interface.

Class Hierarchy

Pascal

```
TRibbonApplicationMenuButton = class(TCustomMenuButton, IRibbonKeyTip);
```

C++

```
class TRibbonApplicationMenuButton : public TCustomMenuButton, public IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

TRibbonApplicationMenuButton is used for the Application (see page 2612) Button when using the Ribbon (see page 6713) interface.

77.1.8.1 TRibbonApplicationMenuButton Members

The following tables list the members exposed by TRibbonApplicationMenuButton.

Protected Methods

	Name	Description
	CMMouseEnter (see page 6971)	This is CMMouseEnter, a member of class TRibbonApplicationMenuButton.
	CMMouseLeave (see page 6971)	This is CMMouseLeave, a member of class TRibbonApplicationMenuButton.
	DragOver (see page 6971)	OnDragOver event dispatcher.
	Paint (see page 6973)	Render control surface.
	RibbonStyle (see page 6973)	This is RibbonStyle, a member of class TRibbonApplicationMenuButton.
	SetParent (see page 6974)	Sets the parent of the control.
	UMFadeControl (see page 6975)	This is UMFadeControl, a member of class TRibbonApplicationMenuButton.
	WMLButtonDblClk (see page 6975)	This is WMLButtonDblClk, a member of class TRibbonApplicationMenuButton.

Protected Properties

	Name	Description
	MouseInControl (see page 6976)	This is MouseInControl, a member of class TRibbonApplicationMenuButton.

Public Methods

	Name	Description
	CalcBounds (see page 6970)	Calculates the size of the control.
	Create (see page 6969)	Creates an instance of TCustomMenuButton.
	Destroy (see page 6969)	Destroys an instance of TCustomMenuButton.
	GetKeyTip (see page 6971)	Returns current **KeyTip** for command.

	HandleKeyTip (see page 6972)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 6972)	Hide **KeyTip** for command.
	KeyTipClick (see page 6973)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 6974)	Sets **KeyTip** for command.
	ShowKeyTip (see page 6975)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 6976)	Current **KeyTip** for command

77.1.8.2 TRibbonApplicationMenuButton.Create Constructor

Creates an instance of TCustomMenuButton.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonApplicationMenuButton(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuButton. However, you should never attempt to instantiate a TCustomMenuButton. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the menu button instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

77.1.8.3 TRibbonApplicationMenuButton.Destroy Destructor

Destroys an instance of TCustomMenuButton.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonApplicationMenuButton();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

System::TObject::Free

77.1.8.4 TRibbonApplicationMenuButton Methods

The methods of the TRibbonApplicationMenuButton class are listed here.

Protected Methods

	Name	Description
	CMMouseEnter (see page 6971)	This is CMMouseEnter, a member of class TRibbonApplicationMenuButton.
	CMMouseLeave (see page 6971)	This is CMMouseLeave, a member of class TRibbonApplicationMenuButton.
	DragOver (see page 6971)	OnDragOver event dispatcher.
	Paint (see page 6973)	Render control surface.
	RibbonStyle (see page 6973)	This is RibbonStyle, a member of class TRibbonApplicationMenuButton.
	SetParent (see page 6974)	Sets the parent of the control.
	UMFadeControl (see page 6975)	This is UMFadeControl, a member of class TRibbonApplicationMenuButton.
	WMLButtonDblClk (see page 6975)	This is WMLButtonDblClk, a member of class TRibbonApplicationMenuButton.

Public Methods

	Name	Description
	CalcBounds (see page 6970)	Calculates the size of the control.
	GetKeyTip (see page 6971)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 6972)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 6972)	Hide **KeyTip** for command.
	KeyTipClick (see page 6973)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 6974)	Sets **KeyTip** for command.
	ShowKeyTip (see page 6975)	Shows **KeyTip** for command in specified position.

77.1.8.4.1 TRibbonApplicationMenuButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.8.4.2 TRibbonApplicationMenuButton.CMMouseEnter Method

Pascal

```
procedure CMMouseEnter(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseEnter(TMessage Message);
```

Description

This is CMMouseEnter, a member of class TRibbonApplicationMenuButton.

77.1.8.4.3 TRibbonApplicationMenuButton.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TRibbonApplicationMenuButton.

77.1.8.4.4 TRibbonApplicationMenuButton.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

See Also

DragDrop

OnDragOver

77.1.8.4.5 TRibbonApplicationMenuButton.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 7282)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.8.4.6 TRibbonApplicationMenuButton.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.8.4.7 TRibbonApplicationMenuButton.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.8.4.8 TRibbonApplicationMenuButton.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

77.1.8.4.9 TRibbonApplicationMenuButton.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

77.1.8.4.10 TRibbonApplicationMenuButton.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonApplicationMenuButton.

77.1.8.4.11 TRibbonApplicationMenuButton.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

ShowKeyTip (see page 7281)

77.1.8.4.12 TRibbonApplicationMenuButton.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

Destroy

InsertControl

Parent

RemoveControl

77.1.8.4.13 TRibbonApplicationMenuButton.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

77.1.8.4.14 TRibbonApplicationMenuButton.UMFadeControl Method

Pascal

```
procedure UMFadeControl(var Message: TMessage); message UM_FADECONTROL;
```

C++

```
__fastcall UMFadeControl(TMessage Message);
```

Description

This is UMFadeControl, a member of class TRibbonApplicationMenuButton.

77.1.8.4.15 TRibbonApplicationMenuButton.WMLButtonDblClk Method

Pascal

```
procedure WMLButtonDblClk(var Message: TWMLButtonDblClk); message WM_LBUTTONDBLCLK;
```

C++

```
__fastcall WMLButtonDblClk(TWMLButtonDblClk Message);
```

Description

This is WMLButtonDblClk, a member of class TRibbonApplicationMenuButton.

77.1.8.5 TRibbonApplicationMenuButton Properties

The properties of the TRibbonApplicationMenuButton class are listed here.

Protected Properties

	Name	Description
	MouseInControl (see page 6976)	This is MouseInControl, a member of class TRibbonApplicationMenuButton.

Public Properties

	Name	Description
	KeyTip (see page 6976)	Current **KeyTip** for command

77.1.8.5.1 TRibbonApplicationMenuButton.KeyTip Property

Current **KeyTip** for command

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the current **KeyTip** for the command

See Also

GetKeyTip (see page 7279)

SetKeyTip (see page 7281)

77.1.8.5.2 TRibbonApplicationMenuButton.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TRibbonApplicationMenuButton.

77.1.9 TRibbonApplicationMenuItem Class

Class Hierarchy

Pascal

```
TRibbonApplicationMenuItem = class(TRibbonMenuItem);
```

C++

```
class TRibbonApplicationMenuItem : public TRibbonMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonApplicationMenuItem.

77.1.9.1 TRibbonApplicationMenuItem Members

The following tables list the members exposed by TRibbonApplicationMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 7120)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 7121)	Draws a background image on the control.
	DrawGlyph (see page 6978)	Draws a symbol on the control.
	DrawSelectedBackground (see page 6979)	This is DrawSelectedBackground, a member of class TRibbonApplicationMenuItem.
	DrawSeparator (see page 6979)	This is DrawSeparator, a member of class TRibbonApplicationMenuItem.
	DrawShadowedText (see page 6979)	This is DrawShadowedText, a member of class TRibbonApplicationMenuItem.
	DrawSubMenuGlyph (see page 6979)	This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.
	DrawText (see page 6980)	Draws text on the control.
	GetImageSize (see page 6980)	This is GetImageSize, a member of class TRibbonApplicationMenuItem.
	GetShowShortCut (see page 7122)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 7123)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 7123)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 6978)	Calculates the size of the menu item.
	Click (see page 7120)	Executes the control's function.
	Create (see page 6977)	Creates an instance of TCustomMenuItem.

77.1.9.2 TRibbonApplicationMenuItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonApplicationMenuItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Destroy

77.1.9.3 TRibbonApplicationMenuItem Methods

The methods of the TRibbonApplicationMenuItem class are listed here.

Protected Methods

	Name	Description
	DrawGlyph (see page 6978)	Draws a symbol on the control.
	DrawSelectedBackground (see page 6979)	This is DrawSelectedBackground, a member of class TRibbonApplicationMenuItem.
	DrawSeparator (see page 6979)	This is DrawSeparator, a member of class TRibbonApplicationMenuItem.
	DrawShadowedText (see page 6979)	This is DrawShadowedText, a member of class TRibbonApplicationMenuItem.
	DrawSubMenuGlyph (see page 6979)	This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.
	DrawText (see page 6980)	Draws text on the control.
	GetImageSize (see page 6980)	This is GetImageSize, a member of class TRibbonApplicationMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 6978)	Calculates the size of the menu item.

77.1.9.3.1 TRibbonApplicationMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

77.1.9.3.2 TRibbonApplicationMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

77.1.9.3.3 TRibbonApplicationMenuItem.DrawSelectedBackground Method

Pascal

```
procedure DrawSelectedBackground(ARect: TRect); override;
```

C++

```
virtual __fastcall DrawSelectedBackground(TRect ARect);
```

Description

This is DrawSelectedBackground, a member of class TRibbonApplicationMenuItem.

77.1.9.3.4 TRibbonApplicationMenuItem.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TRibbonApplicationMenuItem.

77.1.9.3.5 TRibbonApplicationMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonApplicationMenuItem.

77.1.9.3.6 TRibbonApplicationMenuItem.DrawSubMenuGlyph Method

Pascal

```
procedure DrawSubMenuGlyph; override;
```

C++

```
virtual __fastcall DrawSubMenuGlyph();
```

Description

This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.

77.1.9.3.7 TRibbonApplicationMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

DrawGlyph

77.1.9.3.8 TRibbonApplicationMenuItem.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

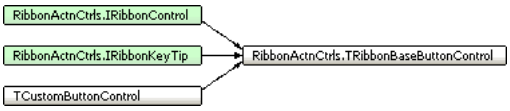
Description

This is GetImageSize, a member of class TRibbonApplicationMenuItem.

77.1.10 TRibbonBaseButtonControl Class

Common ancestor for many buttons in groups and Quick Access Toolbar.

Class Hierarchy



Pascal

```
TRibbonBaseButtonControl = class(TCustomButtonControl, IRibbonControl, IRibbonKeyTip);
```

C++

```
class TRibbonBaseButtonControl : public TCustomButtonControl, public IRibbonControl, public
IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

TRibbonBaseButtonControl is the common ancestor for many buttons that appear in the groups and on the Quick Access Toolbar.

77.1.10.1 TRibbonBaseButtonControl Members

The following tables list the members exposed by TRibbonBaseButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 6985)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 6983)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.10.2 TRibbonBaseButtonControl.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonBaseButtonControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

77.1.10.3 TRibbonBaseButtonControl.Destroy Destructor

Destroys an instance of TCustomActionControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonBaseButtonControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

System::TObject::Free

77.1.10.4 TRibbonBaseButtonControl Methods

The methods of the TRibbonBaseButtonControl class are listed here.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 6985)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 6983)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

77.1.10.4.1 TRibbonBaseButtonControl.AllowHotKeys Method

Pascal

```
function AllowHotKeys: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean AllowHotKeys();
```

Description

This is AllowHotKeys, a member of class TRibbonBaseButtonControl.

77.1.10.4.2 TRibbonBaseButtonControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.10.4.3 TRibbonBaseButtonControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.

77.1.10.4.4 TRibbonBaseButtonControl.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

See Also

Click

Click

UsageCount

77.1.10.4.5 TRibbonBaseButtonControl.DragDrop Method

Performs actions and generates an OnDragDrop event.

Pascal

```
procedure DragDrop(Source: TObject; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall DragDrop(TObject * Source, int X, int Y);
```

Description

This override of the method inherited from TControl executes instructions and generates an OnDragDrop event. The method is

called when a user drags and drops an item (Source) onto the custom action control at coordinates (X,Y).

See Also

DragDrop

77.1.10.4.6 TRibbonBaseButtonControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.10.4.7 TRibbonBaseButtonControl.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

77.1.10.4.8 TRibbonBaseButtonControl.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TRibbonBaseButtonControl.

77.1.10.4.9 TRibbonBaseButtonControl.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonBaseButtonControl.

77.1.10.4.10 TRibbonBaseButtonControl.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

77.1.10.4.11 TRibbonBaseButtonControl.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

Description

This is GetImageSize, a member of class TRibbonBaseButtonControl.

77.1.10.4.12 TRibbonBaseButtonControl.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 7282)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.10.4.13 TRibbonBaseButtonControl.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.10.4.14 TRibbonBaseButtonControl.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.10.4.15 TRibbonBaseButtonControl.IsButton Method

Pascal

```
function IsButton(out ButtonProperties: TButtonProperties): Boolean;
```

C++

```
__fastcall Boolean IsButton(TButtonProperties ButtonProperties);
```

Description

This is IsButton, a member of class TRibbonBaseButtonControl.

77.1.10.4.16 TRibbonBaseButtonControl.IsRibbonAvailable Method

Pascal

```
function IsRibbonAvailable: Boolean;
```

C++

```
__fastcall Boolean IsRibbonAvailable();
```

Description

This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.

77.1.10.4.17 TRibbonBaseButtonControl.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick; virtual;
```

C++

```
virtual __fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

77.1.10.4.18 TRibbonBaseButtonControl.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonBaseButtonControl.

77.1.10.4.19 TRibbonBaseButtonControl.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

ShowKeyTip (see page 7281)

77.1.10.4.20 TRibbonBaseButtonControl.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

77.1.10.5 TRibbonBaseButtonControl Properties

The properties of the TRibbonBaseButtonControl class are listed here.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

77.1.10.5.1 TRibbonBaseButtonControl.DrawDown Property

Pascal

```
property DrawDown: Boolean;
```

C++

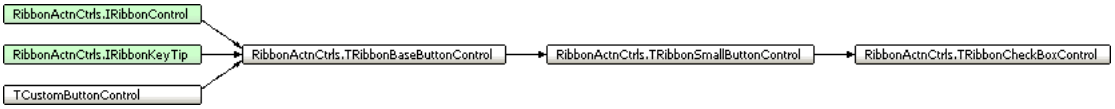
```
__property Boolean DrawDown;
```

Description

This is DrawDown, a member of class TRibbonBaseButtonControl.

77.1.11 TRibbonCheckBoxControl Class

Class Hierarchy



Pascal

```
TRibbonCheckBoxControl = class(TRibbonSmallButtonControl);
```

C++

```
class TRibbonCheckBoxControl : public TRibbonSmallButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonCheckBoxControl.

77.1.11.1 TRibbonCheckBoxControl Members

The following tables list the members exposed by TRibbonCheckBoxControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 6992)	Draws a background image on the control.
	DrawGlyph (see page 6992)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 6991)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.11.2 TRibbonCheckBoxControl Methods

The methods of the TRibbonCheckBoxControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 6992)	Draws a background image on the control.
	DrawGlyph (see page 6992)	Draws a symbol on the control.

Public Methods

	Name	Description
	CalcBounds (see page 6991)	Calculates the size of the control.

77.1.11.2.1 TRibbonCheckBoxControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.11.2.2 TRibbonCheckBoxControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.11.2.3 TRibbonCheckBoxControl.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

77.1.12 TRibbonComboBox Class

Class Hierarchy

Pascal

```
TRibbonComboBox = class(TCustomRibbonComboBox);
```

C++

```
class TRibbonComboBox : public TCustomRibbonComboBox;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonComboBox.

77.1.12.1 TRibbonComboBox Members

The following tables list the members exposed by TRibbonComboBox.

Protected Methods

	Name	Description
	BeginAutoDrag (see page 6949)	Begin Automatic Drag.
	CMMouseenter (see page 6949)	This is CMMouseenter, a member of class TCustomRibbonComboBox.
	CMMouseleave (see page 6950)	This is CMMouseleave, a member of class TCustomRibbonComboBox.
	DragOver (see page 6950)	OnDragOver event dispatcher.
	KeyDown (see page 6951)	Respond to key press events.
	KeyPress (see page 6951)	Respond to keyboard input.
	MouseMove (see page 6952)	Respond to mouse moving over control area..
	Notification (see page 6952)	Responds to notifications that components are being created or destroyed.
	SetParent (see page 6953)	Sets the parent of the control.
	WMKillFocus (see page 6954)	This is WMKillFocus, a member of class TCustomRibbonComboBox.
	WMSetFocus (see page 6954)	This is WMSetFocus, a member of class TCustomRibbonComboBox.

Public Methods

	Name	Description
	Create (see page 6948)	Creates an instance of TCustomEdit.
	Destroy (see page 6948)	Destroys an instance of TWinControl.
	DragDrop (see page 6950)	OnDragDrop event dispatcher.
	SetBounds (see page 6953)	Sets the windowed control's boundary properties all at once.

Public Properties

	Name	Description
	Color (see page 6955)	Specifies the background color of the control.
	MouseInControl (see page 6956)	This is MouseInControl, a member of class TCustomRibbonComboBox.

Published Events

	Name	Description
	OnChange (see page 7012)	Occurs when the text for the edit control may have changed.
	OnClick (see page 7013)	Occurs when the user clicks the control.
	OnContextPopup (see page 7015)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 7015)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 7016)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 7019)	Occurs when the user drags an object over a control.
	OnEndDock (see page 7022)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

	OnEndDrag (see page 7022)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 7023)	Occurs when a control receives the input focus.
	OnExit (see page 7026)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 7029)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 7032)	Occurs when a key is pressed.
	OnKeyUp (see page 7033)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 7035)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 7036)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 7038)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 7038)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 7039)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 7041)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 7043)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 7044)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Alignment (see page 6995)	Determines how the text is aligned within the text edit control.
	AutoSelect (see page 6995)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	CharCase (see page 6996)	Determines the case of the text within the edit control.
	Font (see page 6996)	Controls the attributes of text written on or in the control.
	HideSelection (see page 6997)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 6998)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6998)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	Items (see page 6999)	This is Items, a member of class TRibbonComboBox.
	MaxLength (see page 6999)	Specifies the maximum number of characters the user can enter into the edit control.
	NumbersOnly (see page 7000)	Allows only numbers to be typed into the text edit.
	ParentFont (see page 7000)	Determines where a control looks for its font information.
	PasswordChar (see page 7000)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 7001)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 7006)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 7006)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 7008)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 7008)	Determines if the user can tab to a control.
	Text (see page 7009)	Contains a text string associated with the control.
	TextHint (see page 7010)	A hint or message to be displayed when the Text property is empty.
	Visible (see page 7010)	Determines whether the component appears onscreen.

77.1.12.2 TRibbonComboBox Properties

The properties of the TRibbonComboBox class are listed here.

Published Properties

	Name	Description
	Alignment (see page 6995)	Determines how the text is aligned within the text edit control.

	AutoSelect (see page 6995)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	CharCase (see page 6996)	Determines the case of the text within the edit control.
	Font (see page 6996)	Controls the attributes of text written on or in the control.
	HideSelection (see page 6997)	Determines whether the visual indication of the selected text remains when focus shifts to another control.
	ImeMode (see page 6998)	Determines the behavior of the input method editor (IME).
	ImeName (see page 6998)	Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.
	Items (see page 6999)	This is Items, a member of class TRibbonComboBox.
	MaxLength (see page 6999)	Specifies the maximum number of characters the user can enter into the edit control.
	NumbersOnly (see page 7000)	Allows only numbers to be typed into the text edit.
	ParentFont (see page 7000)	Determines where a control looks for its font information.
	PasswordChar (see page 7000)	Indicates the character, if any, to display in place of the actual characters typed in the control.
	PopupMenu (see page 7001)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 7006)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 7006)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 7008)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 7008)	Determines if the user can tab to a control.
	Text (see page 7009)	Contains a text string associated with the control.
	TextHint (see page 7010)	A hint or message to be displayed when the Text property is empty.
	Visible (see page 7010)	Determines whether the component appears onscreen.

77.1.12.2.1 TRibbonComboBox.Alignment Property

Determines how the text is aligned within the text edit control.

Pascal

```
property Alignment;
```

C++

```
__property Alignment;
```

Description

Use Alignment to change the way the text is formatted in the text edit control. Alignment can take one of the following values:

Value	Meaning
taLeftJustify	Align text to the left side of the control
taCenter	Center text horizontally in the control.
taRightJustify	Align text to the right side of the control.

Displaying and Editing Fields in an Edit Box

77.1.12.2.2 TRibbonComboBox.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect;
```

C++

```
__property AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

SelectAll

SelLength

SelStart

SelText

SetSelTextBuf

77.1.12.2.3 TRibbonComboBox.CharCase Property

Determines the case of the text within the edit control.

Pascal

```
property CharCase;
```

C++

```
__property CharCase;
```

Description

Use CharCase to force the contents of the edit control to assume a particular case.

When CharCase is set to ecLowerCase or ecUpperCase, the case of characters is converted as the user types them into the edit control. Changing the CharCase property to ecLowerCase or ecUpperCase changes the actual contents of the text, not just the appearance. Any case information is lost and can't be recaptured by changing CharCase to ecNormal.

77.1.12.2.4 TRibbonComboBox.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

77.1.12.2.5 TRibbonComboBox.HideSelection Property

Determines whether the visual indication of the selected text remains when focus shifts to another control.

Pascal

```
property HideSelection;
```

C++

```
__property HideSelection;
```

Description

Set HideSelection to false to provide visual feedback of the selected portion of the text even when the edit control does not have

focus. Set HideSelection to true to show the selection only when the edit control has focus. HideSelection does not affect the actual value of the selection, only the visual indication. Always setting HideSelection to false can make forms with many edit controls look too busy.

SetSelTextBuf

77.1.12.2.6 TRibbonComboBox.ImeMode Property

Determines the behavior of the input method editor (IME).

Pascal

```
property ImeMode;
```

C++

```
__property ImeMode;
```

Description

Set ImeMode to configure the way an IME processes user keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeMode allows a control to influence the type of conversion performed by the IME so that it is appropriate for the input expected by the control. For example, a control that only accepts numeric input might specify an ImeMode of imClose, as no conversion is necessary for numeric input.

Note: The value of ImeMode only takes effect when the control receives focus. To change the value of ImeMode when the control already has input focus, call the SetIme method.

ResetIme

ResetImeComposition

SetIme

SetImeCompositionWindow

77.1.12.2.7 TRibbonComboBox.ImeName Property

Specifies the input method editor (IME) to use for converting keyboard input to Asian language characters.

Pascal

```
property ImeName;
```

C++

```
__property ImeName;
```

Description

Set ImeName to specify which IME to use for converting keystrokes. An IME is a front-end input processor for Asian language characters. The IME hooks all keyboard input, converts it to Asian characters in a conversion window, and sends the converted characters or strings on to the application.

ImeName must specify one of the IMEs that has been installed through the Windows control panel. The property inspector provides a drop-down list of all currently installed IMEs on the system. At runtime, applications can obtain a list of currently installed IMEs from the global Screen variable.

If ImeName specifies an unavailable IME, the IME that was active when the application started is used instead. No exception is generated.

Note: The value of ImeName only takes effect when the control receives focus. To change the value of ImeName after the control has input focus, call the SetIme method.

77.1.12.2.8 TRibbonComboBox.Items Property

Pascal

```
property Items: TStrings;
```

C++

```
__property TStrings Items;
```

Description

This is Items, a member of class TRibbonComboBox.

77.1.12.2.9 TRibbonComboBox.MaxLength Property

Specifies the maximum number of characters the user can enter into the edit control.

Pascal

```
property MaxLength;
```

C++

```
__property MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the edit control. A value of 0 indicates that there is no application-defined limit on the length.

Use MaxLength to limit the length of the text in an edit control if that text will be copied into a fixed-length buffer.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered into an edit control.

Note: The unit of MaxLength is characters (not bytes) if the application is using themes.

77.1.12.2.10 TRibbonComboBox.NumbersOnly Property

Allows only numbers to be typed into the text edit.

Pascal

```
property NumbersOnly;
```

C++

```
__property NumbersOnly;
```

Description

Use NumbersOnly to prohibit entry of non-numeric characters in the textfield. Note, however, that a user can paste non-numeric characters in the textfield even when this property is set.

77.1.12.2.11 TRibbonComboBox.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

77.1.12.2.12 TRibbonComboBox.PasswordChar Property

Indicates the character, if any, to display in place of the actual characters typed in the control.

Pascal

```
property PasswordChar;
```

C++

```
__property PasswordChar;
```

Description

Use the PasswordChar property to create an edit control that displays a special character in place of any entered text. If PasswordChar is set to the null character (ANSI character zero), the edit control displays its text normally. If PasswordChar is any other character, the edit control displays PasswordChar in place of each character typed. PasswordChar affects the appearance of the edit control only. The value of the Text property reflects the actual characters that are typed.

77.1.12.2.13 TRibbonComboBox.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
```

```
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
```

```
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
```

```
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

77.1.12.2.14 TRibbonComboBox.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly;
```

C++

```
__property ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then be manipulated by the application, or copied to the Clipboard.

CopyToClipboard

GetSelTextBuf

77.1.12.2.15 TRibbonComboBox.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

77.1.12.2.16 TRibbonComboBox.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

TabStop

77.1.12.2.17 TRibbonComboBox.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

TabOrder

77.1.12.2.18 TRibbonComboBox.Text Property

Contains a text string associated with the control.

Pascal

```
property Text;
```

C++

```
__property Text;
```

Description

Use the Text property to read the Text of the control or specify a new string for the Text value. By default, Text is the control name. For edit controls and memos, the Text appears within the control. For combo boxes, the Text is the content of the edit control portion of the combo box.

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
*/
#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  int Size = Edit1->GetTextLen(); //Get length of string in Edit1
  Size++;                       //Add room for null character
//  Char *Buffer = new Char[Size];  //Creates Buffer dynamic variable
  std::auto_ptr<Char> Buffer(new Char[Size]);
  Edit1->GetTextBuf(Buffer.get(),Size); //Puts Edit1->Text into Buffer
  Edit2->Text = Buffer.get();
}
/*
Note: the same thing could be accomplished more simply as follows:
*/
void __fastcall TForm1::Button2Click(TObject *Sender)
{
  Edit2->Text = Edit1->Text;
}
```

Delphi Examples:

```
{
This example requires two edit boxes and a button.  This example
copies the text in an edit box into a null-terminated string, and
puts this string in another edit box when the user clicks the
button on the form.
}
```

```
procedure TForm1.Button1Click(Sender: TObject);
var
  Buffer: PChar;
  Size: Byte;
begin
  Size := Edit1.GetTextLen;       {Get length of string in Edit1}
  Inc(Size);                      {Add room for null character}
  GetMem(Buffer, Size);           {Creates Buffer dynamic variable}
  Edit1.GetTextBuf(Buffer,Size);  {Puts Edit1.Text into Buffer}
  Edit2.Text := StrPas(Buffer);   {Converts Buffer to a Pascal-style string}
  FreeMem(Buffer, Size);{Frees memory allocated to Buffer}
end;

{
Note: the same thing could be accomplished more simply as follows:
}
procedure TForm1.Button2Click(Sender: TObject);
begin
  Edit2.Text := Edit1.Text;
end;
```

77.1.12.2.19 TRibbonComboBox.TextHint Property

A hint or message to be displayed when the Text property is empty.

Pascal

```
property TextHint;
```

C++

```
__property TextHint;
```

Description

Use TextHint to cue the user on what kind of entry is expected in the text field. Runtime themes must be enabled.

77.1.12.2.20 TRibbonComboBox.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
```

```
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

77.1.12.3 TRibbonComboBox Events

The events of the TRibbonComboBox class are listed here.

Published Events

	Name	Description
	OnChange (see page 7012)	Occurs when the text for the edit control may have changed.
	OnClick (see page 7013)	Occurs when the user clicks the control.
	OnContextPopup (see page 7015)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 7015)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 7016)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 7019)	Occurs when the user drags an object over a control.
	OnEndDock (see page 7022)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 7022)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 7023)	Occurs when a control receives the input focus.
	OnExit (see page 7026)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 7029)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 7032)	Occurs when a key is pressed.
	OnKeyUp (see page 7033)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 7035)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 7036)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 7038)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 7038)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 7039)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 7041)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 7043)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 7044)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

77.1.12.3.1 TRibbonComboBox.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange;
```

C++

```
__property OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified property to see if a change actually occurred. The Text property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

Change

Text

77.1.12.3.2 TRibbonComboBox.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}
```

```
void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

77.1.12.3.3 TRibbonComboBox.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

AutoPopup (see page 4942)

77.1.12.3.4 TRibbonComboBox.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

See Also

OnClick

Responding to User Actions at Runtime

77.1.12.3.5 TRibbonComboBox.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
```

```
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{

77.1.12.3.6 TRibbonComboBox.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

procedure TForm1.FormDragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  TForm1(Source).Left := X;
  TForm1(Source).Top := Y;
end;

procedure TForm1.FormDragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

procedure TForm1.Panel1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := False;
  if (Source is TLabel) and (State = dsDragEnter) then
    (Source as TLabel).EndDrag(False);
end;
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;

77.1.12.3.8 TRibbonComboBox.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
```

```
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;

77.1.12.3.9 TRibbonComboBox.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{

77.1.12.3.10 TRibbonComboBox.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
```

```
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';
  MaskEdit2.EditMask := '!099.099.099.099;1; ';
  MaskEdit3.EditMask := '!099.099.099.099;1; ';

  MaskEdit2.OnExit := MaskEdit2Exit;
end;

procedure TForm1.MaskEdit2Exit(Sender: TObject);
var
  net1, net2, host1, host2,
  netmask1, netmask2, hostmask1, hostmask2,
  sub_net1, sub_net2, sub_host1, sub_host2: Integer;

OnEnter

ActiveControl (see page 2145)

77.1.12.3.11 TRibbonComboBox.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/

OnKeyPress

OnKeyUp

77.1.12.3.12 TRibbonComboBox.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys

that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

77.1.12.3.13 TRibbonComboBox.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp;
```

C++

```
__property OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

```
{
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
}
var
  FormColor: TColor;
procedure TForm1.FormCreate(Sender: TObject);
begin
  KeyPreview := True;
  FormColor := Form1.Color;
end;

procedure TForm1.FormKeyDown(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := clAqua;
    if (ComboBox1.Text = 'KeyDown') then
```

```
      ComboBox1.Text := 'KeyDown2'
    else
      ComboBox1.Text := 'KeyDown';
    WriteLn(ComboBox1.Text);
  end;
end;

procedure TForm1.FormKeyUp(
  Sender: TObject; var Key: Word; Shift: TShiftState);
begin
  if Key = VK_F1 then
  begin
    Form1.Color := FormColor;
    if (ComboBox1.Text = 'KeyUp') then
      ComboBox1.Text := 'KeyUp2'
    else
      ComboBox1.Text := 'KeyUp';
    WriteLn(ComboBox1.Text);
  end;
end;

OnKeyPress

77.1.12.3.14 TRibbonComboBox.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control.

However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

77.1.12.3.15 TRibbonComboBox.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
```

```
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

77.1.12.3.16 TRibbonComboBox.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

77.1.12.3.17 TRibbonComboBox.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

77.1.12.3.18 TRibbonComboBox.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

Responding to a Mouse-up Action

77.1.12.3.20 TRibbonComboBox.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnDockDrop

77.1.12.3.21 TRibbonComboBox.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

This is class RibbonActnCtrls.TRibbonComboBoxItem.

77.1.13.1 TRibbonComboBoxItem Members

The following tables list the members exposed by TRibbonComboBoxItem.

Protected Methods

	Name	Description
	CalcLayout (see page 7120)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 7046)	Draws a background image on the control.
	DrawGlyph (see page 7121)	Draws a symbol on the control.
	DrawSelectedBackground (see page 7121)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 7122)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 7122)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawText (see page 7046)	Draws text on the control.
	GetShowShortCut (see page 7122)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 7123)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 7123)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7046)	Calculates the size of the menu item.
	Click (see page 7120)	Executes the control's function.
	Create (see page 7119)	Creates an instance of TCustomMenuItem.

77.1.13.2 TRibbonComboBoxItem Methods

The methods of the TRibbonComboBoxItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7046)	Draws a background image on the control.
	DrawText (see page 7046)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 7046)	Calculates the size of the menu item.

77.1.13.2.1 TRibbonComboBoxItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

77.1.13.2.2 TRibbonComboBoxItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.13.2.3 TRibbonComboBoxItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

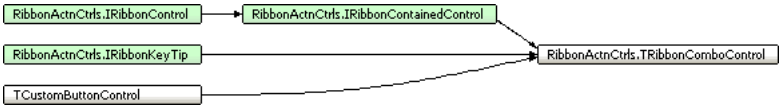
See Also

DrawBackground

DrawGlyph

77.1.14 TRibbonComboControl Class

Class Hierarchy



Pascal

```
TRibbonComboControl = class(TCustomButtonControl, IRibbonContainedControl, IRibbonKeyTip);
```

C++

```
class TRibbonComboControl : public TCustomButtonControl, public IRibbonContainedControl,
public IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonComboControl.

77.1.14.1 TRibbonComboControl Members

The following tables list the members exposed by TRibbonComboControl.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 7051)	This is CMBidimodechanged, a member of class TRibbonComboControl.
	CMMouseenter (see page 7051)	This is CMMouseenter, a member of class TRibbonComboControl.
	CMMouseleave (see page 7051)	This is CMMouseleave, a member of class TRibbonComboControl.
	CMVisiblechanged (see page 7052)	This is CMVisiblechanged, a member of class TRibbonComboControl.
	ComboClick (see page 7052)	This is ComboClick, a member of class TRibbonComboControl.
V	DrawBackground (see page 7052)	Draws a background image on the control.
	DrawFrame (see page 7052)	This is DrawFrame, a member of class TRibbonComboControl.
V	DropDownClick (see page 7053)	This is DropDownClick, a member of class TRibbonComboControl.
	GetCaptionWidth (see page 7053)	This is GetCaptionWidth, a member of class TRibbonComboControl.
	GetGlyphWidth (see page 7053)	This is GetGlyphWidth, a member of class TRibbonComboControl.
	GetLabelWidth (see page 7054)	This is GetLabelWidth, a member of class TRibbonComboControl.
V	MouseDown (see page 7055)	OnMouseDown event dispatcher.
V	Notification (see page 7056)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 7056)	Render control surface.
	RibbonStyle (see page 7057)	This is RibbonStyle, a member of class TRibbonComboControl.

	SetActionClient (see page 7057)	This is SetActionClient, a member of class TRibbonComboControl.
	SetDragMode (see page 7058)	Sets the drag mode for the control.
	SetParent (see page 7058)	Sets the parent of the control.
	ShowComboItems (see page 7059)	This is ShowComboItems, a member of class TRibbonComboControl.

Public Methods

	Name	Description
	CalcBounds (see page 7050)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7050)	This is CanAddToQuickAccessToolbar, a member of class TRibbonComboControl.
	Click (see page 7051)	Executes the control's function.
	Create (see page 7048)	Creates an instance of TCustomButtonControl.
	Destroy (see page 7049)	Destroys an instance of TCustomActionControl.
	GetContainedControl (see page 7053)	This is GetContainedControl, a member of class TRibbonComboControl.
	GetKeyTip (see page 7053)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7054)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7055)	Hide **KeyTip** for command.
	KeyTipClick (see page 7055)	Handle clicking a **KeyTip**.
	SetBounds (see page 7057)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 7057)	This is SetContainedControl, a member of class TRibbonComboControl.
	SetKeyTip (see page 7058)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7059)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	ComboBox (see page 7060)	This is ComboBox, a member of class TRibbonComboControl.
	ContainedControl (see page 7060)	This is ContainedControl, a member of class TRibbonComboControl.
	KeyTip (see page 7282)	Current **KeyTip** for command
	MouseInControl (see page 7060)	This is MouseInControl, a member of class TRibbonComboControl.

77.1.14.2 TRibbonComboControl.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonComboControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

77.1.14.3 TRibbonComboControl.Destroy Destructor

Destroys an instance of TCustomActionControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonComboControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

77.1.14.4 TRibbonComboControl Methods

The methods of the TRibbonComboControl class are listed here.

Protected Methods

	Name	Description
	CMBidimodechanged (see page 7051)	This is CMBidimodechanged, a member of class TRibbonComboControl.
	CMMouseenter (see page 7051)	This is CMMouseenter, a member of class TRibbonComboControl.
	CMMouseleave (see page 7051)	This is CMMouseleave, a member of class TRibbonComboControl.
	CMVisiblechanged (see page 7052)	This is CMVisiblechanged, a member of class TRibbonComboControl.
	ComboClick (see page 7052)	This is ComboClick, a member of class TRibbonComboControl.
V	DrawBackground (see page 7052)	Draws a background image on the control.
	DrawFrame (see page 7052)	This is DrawFrame, a member of class TRibbonComboControl.
V	DropDownClick (see page 7053)	This is DropDownClick, a member of class TRibbonComboControl.
	GetCaptionWidth (see page 7053)	This is GetCaptionWidth, a member of class TRibbonComboControl.
	GetGlyphWidth (see page 7053)	This is GetGlyphWidth, a member of class TRibbonComboControl.
	GetLabelWidth (see page 7054)	This is GetLabelWidth, a member of class TRibbonComboControl.
V	MouseDown (see page 7055)	OnMouseDown event dispatcher.
V	Notification (see page 7056)	Responds to notifications that components are being created or destroyed.

	Paint (see page 7056)	Render control surface.
	RibbonStyle (see page 7057)	This is RibbonStyle, a member of class TRibbonComboControl.
	SetActionClient (see page 7057)	This is SetActionClient, a member of class TRibbonComboControl.
	SetDragMode (see page 7058)	Sets the drag mode for the control.
	SetParent (see page 7058)	Sets the parent of the control.
	ShowComboItems (see page 7059)	This is ShowComboItems, a member of class TRibbonComboControl.

Public Methods

	Name	Description
	CalcBounds (see page 7050)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7050)	This is CanAddToQuickAccessToolbar, a member of class TRibbonComboControl.
	Click (see page 7051)	Executes the control's function.
	GetContainedControl (see page 7053)	This is GetContainedControl, a member of class TRibbonComboControl.
	GetKeyTip (see page 7053)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7054)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7055)	Hide **KeyTip** for command.
	KeyTipClick (see page 7055)	Handle clicking a **KeyTip**.
	SetBounds (see page 7057)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 7057)	This is SetContainedControl, a member of class TRibbonComboControl.
	SetKeyTip (see page 7058)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7059)	Shows **KeyTip** for command in specified position.

77.1.14.4.1 TRibbonComboControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.14.4.2 TRibbonComboControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonComboControl.

77.1.14.4.3 TRibbonComboControl.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

UsageCount

77.1.14.4.4 TRibbonComboControl.CMBidimodechanged Method

Pascal

```
procedure CMBidimodechanged(var Message: TMessage); message CM_BIDIMODECHANGED;
```

C++

```
__fastcall CMBidimodechanged(TMessage Message);
```

Description

This is CMBidimodechanged, a member of class TRibbonComboControl.

77.1.14.4.5 TRibbonComboControl.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TRibbonComboControl.

77.1.14.4.6 TRibbonComboControl.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonComboControl.

77.1.14.4.7 TRibbonComboControl.CMVisiblechanged Method

Pascal

```
procedure CMVisiblechanged(var Message: TMessage); message CM_VISIBLECHANGED;
```

C++

```
__fastcall CMVisiblechanged(TMessage Message);
```

Description

This is CMVisiblechanged, a member of class TRibbonComboControl.

77.1.14.4.8 TRibbonComboControl.ComboClick Method

Pascal

```
procedure ComboClick(Sender: TObject);
```

C++

```
__fastcall ComboClick(TObject * Sender);
```

Description

This is ComboClick, a member of class TRibbonComboControl.

77.1.14.4.9 TRibbonComboControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.14.4.10 TRibbonComboControl.DrawFrame Method

Pascal

```
procedure DrawFrame; reintroduce;
```

C++

```
__fastcall DrawFrame();
```

Description

This is DrawFrame, a member of class TRibbonComboControl.

77.1.14.4.11 TRibbonComboControl.DropDownClick Method

Pascal

```
procedure DropDownClick(const SelectFirst: Boolean); virtual;
```

C++

```
virtual __fastcall DropDownClick(const Boolean SelectFirst);
```

Description

This is DropDownClick, a member of class TRibbonComboControl.

77.1.14.4.12 TRibbonComboControl.GetCaptionWidth Method

Pascal

```
function GetCaptionWidth: Integer;
```

C++

```
__fastcall int GetCaptionWidth();
```

Description

This is GetCaptionWidth, a member of class TRibbonComboControl.

77.1.14.4.13 TRibbonComboControl.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class TRibbonComboControl.

77.1.14.4.14 TRibbonComboControl.GetGlyphWidth Method

Pascal

```
function GetGlyphWidth: Integer;
```

C++

```
__fastcall int GetGlyphWidth();
```

Description

This is GetGlyphWidth, a member of class TRibbonComboControl.

77.1.14.4.15 TRibbonComboControl.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 7282)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.14.4.16 TRibbonComboControl.GetLabelWidth Method

Pascal

```
function GetLabelWidth: Integer;
```

C++

```
__fastcall int GetLabelWidth();
```

Description

This is GetLabelWidth, a member of class TRibbonComboControl.

77.1.14.4.17 TRibbonComboControl.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.14.4.18 TRibbonComboControl.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.14.4.19 TRibbonComboControl.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

77.1.14.4.20 TRibbonComboControl.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of

the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

MouseMove

MouseUp

OnMouseDown

77.1.14.4.21 TRibbonComboControl.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

77.1.14.4.22 TRibbonComboControl.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant

control classes.

See Also

Canvas

77.1.14.4.23 TRibbonComboControl.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonComboControl.

77.1.14.4.24 TRibbonComboControl.SetActionClient Method

Pascal

```
procedure SetActionClient(Value: TActionClientItem); override;
```

C++

```
virtual __fastcall SetActionClient(TActionClientItem Value);
```

Description

This is SetActionClient, a member of class TRibbonComboControl.

77.1.14.4.25 TRibbonComboControl.SetBounds Method

Sets the Left, Top, Width, and Height properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

This override of the method inherited from TControl simultaneously sets all boundary properties at once, and thus avoiding the possibility of a control redraw between the time one value sets and another. In addition, some layout calculations are also performed.

See Also

SetBounds

77.1.14.4.26 TRibbonComboControl.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class TRibbonComboControl.

77.1.14.4.27 TRibbonComboControl.SetDragMode Method

Sets the drag mode for the control.

Pascal

```
procedure SetDragMode(Value: TDragMode); override;
```

C++

```
virtual __fastcall SetDragMode(TDragMode Value);
```

Description

SetDragMode is the protected write implementation for the DragMode property. Override SetDragMode to execute additional code when the value of the DragMode property changes.

See Also

DragMode

77.1.14.4.28 TRibbonComboControl.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

ShowKeyTip (see page 7281)

77.1.14.4.29 TRibbonComboControl.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

77.1.14.4.30 TRibbonComboControl.ShowComboItems Method

Pascal

```
procedure ShowComboItems(const SelectFirst: Boolean); virtual;
```

C++

```
virtual __fastcall ShowComboItems(const Boolean SelectFirst);
```

Description

This is ShowComboItems, a member of class TRibbonComboControl.

77.1.14.4.31 TRibbonComboControl.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

77.1.14.5 TRibbonComboControl Properties

The properties of the TRibbonComboControl class are listed here.

Public Properties

	Name	Description
	ComboBox (see page 7060)	This is ComboBox, a member of class TRibbonComboControl.
	ContainedControl (see page 7060)	This is ContainedControl, a member of class TRibbonComboControl.
	MouseInControl (see page 7060)	This is MouseInControl, a member of class TRibbonComboControl.

77.1.14.5.1 TRibbonComboControl.ComboBox Property

Pascal

```
property ComboBox: TCustomRibbonComboBox;
```

C++

```
__property TCustomRibbonComboBox ComboBox;
```

Description

This is ComboBox, a member of class TRibbonComboControl.

77.1.14.5.2 TRibbonComboControl.ContainedControl Property

Pascal

```
property ContainedControl: TControl;
```

C++

```
__property TControl * ContainedControl;
```

Description

This is ContainedControl, a member of class TRibbonComboControl.

77.1.14.5.3 TRibbonComboControl.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

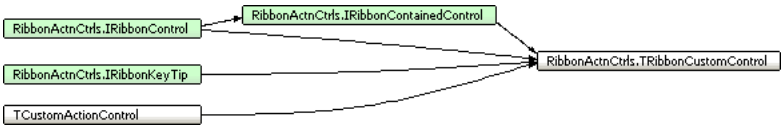
```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TRibbonComboControl.

77.1.15 TRibbonCustomControl Class

Class Hierarchy



Pascal

```
TRibbonCustomControl = class(TCustomActionControl, IRibbonControl, IRibbonContainedControl,
IRibbonKeyTip);
```

C++

```
class TRibbonCustomControl : public TCustomActionControl, public IRibbonControl, public
IRibbonContainedControl, public IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonCustomControl.

77.1.15.1 TRibbonCustomControl Members

The following tables list the members exposed by TRibbonCustomControl.

Protected Methods

	Name	Description
	CMVisiblechanged (see page 7064)	This is CMVisiblechanged, a member of class TRibbonCustomControl.
V	DrawBackground (see page 7065)	Draws a background image on the control.
	GetCaptionWidth (see page 7065)	This is GetCaptionWidth, a member of class TRibbonCustomControl.
	GetGlyphWidth (see page 7065)	This is GetGlyphWidth, a member of class TRibbonCustomControl.
	GetLabelWidth (see page 7066)	This is GetLabelWidth, a member of class TRibbonCustomControl.
V	Notification (see page 7067)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 7068)	Render control surface.
V	SetActionClient (see page 7068)	This is SetActionClient, a member of class TRibbonCustomControl.
V	SetDragMode (see page 7071)	Sets the drag mode for the control.
V	SetParent (see page 7072)	Sets the parent of the control.

Public Methods

	Name	Description
V	CalcBounds (see page 7063)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7064)	This is CanAddToQuickAccessToolbar, a member of class TRibbonCustomControl.
V	Click (see page 7064)	Executes the control's function in response to a mouse click.
V	Create (see page 7062)	Creates an instance of TCustomActionControl.
V	Destroy (see page 7062)	Destroys an instance of TCustomActionControl.
	GetContainedControl (see page 7065)	This is GetContainedControl, a member of class TRibbonCustomControl.
	GetKeyTip (see page 7066)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7066)	Indicates if command's **KeyTip** matches currently input KeyTip.

	HideKeyTip (see page 7067)	Hide **KeyTip** for command.
	KeyTipClick (see page 7067)	Handle clicking a **KeyTip**.
	SetBounds (see page 7068)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 7071)	This is SetContainedControl, a member of class TRibbonCustomControl.
	SetKeyTip (see page 7071)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7072)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	ContainedControl (see page 7073)	This is ContainedControl, a member of class TRibbonCustomControl.
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.15.2 TRibbonCustomControl.Create Constructor

Creates an instance of TCustomActionControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonCustomControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomActionControl. However, you should never attempt to instantiate a TCustomActionControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the TCustomActionControl instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

77.1.15.3 TRibbonCustomControl.Destroy Destructor

Destroys an instance of TCustomActionControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonCustomControl();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the graphic control reference is not nil, and only then calls Destroy.

Applications should only free controls explicitly when the constructor was called without assigning an owner to the control.

As the control is destroyed, it:

Frees the TCanvas object in its Canvas property.

Override Destroy to free any memory or resources allocated in the Create method. When declaring a Destroy method in a descendant control type, always add the override directive to the declaration and call the inherited Destroy as the last statement in the redeclared method.

When a control is created, Delphi automatically provides exception handling around the constructor call. The destructor is called if an exception escapes from the constructor. This means that the destructor code must be prepared to clean up a partially constructed instance. Check all data fields for zero before disposing of their contents.

77.1.15.4 TRibbonCustomControl Methods

The methods of the TRibbonCustomControl class are listed here.

Protected Methods

	Name	Description
	CMVisiblechanged (see page 7064)	This is CMVisiblechanged, a member of class TRibbonCustomControl.
V	DrawBackground (see page 7065)	Draws a background image on the control.
	GetCaptionWidth (see page 7065)	This is GetCaptionWidth, a member of class TRibbonCustomControl.
	GetGlyphWidth (see page 7065)	This is GetGlyphWidth, a member of class TRibbonCustomControl.
	GetLabelWidth (see page 7066)	This is GetLabelWidth, a member of class TRibbonCustomControl.
V	Notification (see page 7067)	Responds to notifications that components are being created or destroyed.
V	Paint (see page 7068)	Render control surface.
V	SetActionClient (see page 7068)	This is SetActionClient, a member of class TRibbonCustomControl.
V	SetDragMode (see page 7071)	Sets the drag mode for the control.
V	SetParent (see page 7072)	Sets the parent of the control.

Public Methods

	Name	Description
V	CalcBounds (see page 7063)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7064)	This is CanAddToQuickAccessToolbar, a member of class TRibbonCustomControl.
V	Click (see page 7064)	Executes the control's function in response to a mouse click.
	GetContainedControl (see page 7065)	This is GetContainedControl, a member of class TRibbonCustomControl.
	GetKeyTip (see page 7066)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7066)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7067)	Hide **KeyTip** for command.
	KeyTipClick (see page 7067)	Handle clicking a **KeyTip**.
V	SetBounds (see page 7068)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 7071)	This is SetContainedControl, a member of class TRibbonCustomControl.
	SetKeyTip (see page 7071)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7072)	Shows **KeyTip** for command in specified position.

77.1.15.4.1 TRibbonCustomControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

77.1.15.4.2 TRibbonCustomControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonCustomControl.

77.1.15.4.3 TRibbonCustomControl.Click Method

Executes the control's function in response to a mouse click.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TControl executes the control's function in response to a user's mouse click. Usage data, which is used to determine whether a control is used frequently enough to be shown by default, is updated as well.

77.1.15.4.4 TRibbonCustomControl.CMVisiblechanged Method

Pascal

```
procedure CMVisiblechanged(var Message: TMessage); message CM_VISIBLECHANGED;
```

C++

```
__fastcall CMVisiblechanged(TMessage Message);
```

Description

This is CMVisiblechanged, a member of class TRibbonCustomControl.

77.1.15.4.5 TRibbonCustomControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.15.4.6 TRibbonCustomControl.GetCaptionWidth Method

Pascal

```
function GetCaptionWidth: Integer;
```

C++

```
__fastcall int GetCaptionWidth();
```

Description

This is GetCaptionWidth, a member of class TRibbonCustomControl.

77.1.15.4.7 TRibbonCustomControl.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class TRibbonCustomControl.

77.1.15.4.8 TRibbonCustomControl.GetGlyphWidth Method

Pascal

```
function GetGlyphWidth: Integer;
```

C++

```
__fastcall int GetGlyphWidth();
```

Description

This is GetGlyphWidth, a member of class TRibbonCustomControl.

77.1.15.4.9 TRibbonCustomControl.GetKeyTip Method

Returns current **KeyTip** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip** for the command

See Also

KeyTip (see page 7282)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.15.4.10 TRibbonCustomControl.GetLabelWidth Method

Pascal

```
function GetLabelWidth: Integer;
```

C++

```
__fastcall int GetLabelWidth();
```

Description

This is GetLabelWidth, a member of class TRibbonCustomControl.

77.1.15.4.11 TRibbonCustomControl.HandleKeyTip Method

Indicates if command's **KeyTip** matches currently input KeyTip.

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip matches the currently input KeyTip by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.15.4.12 TRibbonCustomControl.HideKeyTip Method

Hide **KeyTip** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip**, the **KeyTip** remains visible.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.1.15.4.13 TRibbonCustomControl.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

77.1.15.4.14 TRibbonCustomControl.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

PopupMenu

Notification

77.1.15.4.15 TRibbonCustomControl.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

77.1.15.4.16 TRibbonCustomControl.SetActionClient Method

Pascal

```
procedure SetActionClient(Value: TActionClientItem); override;
```

C++

```
virtual __fastcall SetActionClient(TActionClientItem Value);
```

Description

This is SetActionClient, a member of class TRibbonCustomControl.

77.1.15.4.17 TRibbonCustomControl.SetBounds Method

Sets the Left, Top, Width, and Height properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the component's boundary properties at one time. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately, but SetBounds changes all four properties at once ensuring that the control will not repaint between changes.

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

Calling SetBounds does not necessarily result in the Left, Top, Width, and Height properties changing to the specified values. Before the properties are changed, the AutoSize or Constraints property may limit the changes, and an OnCanResize (or OnConstrainedResize) event handler may change the new values. After the control's Left, Top, Width, and Height properties are changed, SetBounds generates an OnResize event.

Note: Component writers can change the Left, Top, Width, and Height properties while bypassing all resize events and constraint or autosize logic by using the UpdateBoundsRect method instead.

C++ Examples:

```
//
//This example demostrates the usage of Margins and AlignWithMargins
//properties. Note that Margins will only work when AlignWithMargins
//is set to true and Align is not alNone.
//

#define TopPanelMargin 10
#define BottomPanelMargin 20

TPanel *TopPanel, *BottomPanel;

void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Create a new panel and align it to top */
    TopPanel = new TPanel(this);
    TopPanel->Parent = this;
    TopPanel->Align = alTop;
    TopPanel->Height = (ClientHeight / 2);

    /* Create a new panel and align it to the remaining client size */
    BottomPanel = new TPanel(this);
    BottomPanel->Parent = this;
    BottomPanel->Align = alClient;

    /* Set Top panel margins */
    /* Note: Margins will not have an effect if Align is alNone */
    TopPanel->Margins->SetBounds(TopPanelMargin, TopPanelMargin,
                                 TopPanelMargin, TopPanelMargin);
    TopPanel->AlignWithMargins = true;
    TopPanel->Caption = "TopPanel";

    /* Set Top Bottom margins */
    /* Note: Margins will not have an effect if Align is alNone */
    BottomPanel->Margins->SetBounds(BottomPanelMargin, BottomPanelMargin,
                                    BottomPanelMargin, BottomPanelMargin);
    BottomPanel->AlignWithMargins = true;
```

```
    BottomPanel->Caption = "BottomPanel";

    if ((TopPanel->Top != TopPanelMargin) ||
       (TopPanel->Left != TopPanelMargin) ||
       (TopPanel->Width != (ClientWidth - (TopPanelMargin * 2))) ||
       (BottomPanel->Top != (TopPanel->Height + (TopPanelMargin * 2) +
                                                BottomPanelMargin)) ||
       (BottomPanel->Left != BottomPanelMargin) ||
       (BottomPanel->Width != (ClientWidth - (BottomPanelMargin * 2))))
       {
          MessageDlg(AnsiString(
            "This should not happen! Position and size are ")+
            "calculated relative to the margins",
            mtError, TMsgDlgButtons() << mbOK, 0);
       }
}
```

Delphi Examples:

```
{
This example demostrates the usage of Margins and AlignWithMargins
properties. Note that Margins will only work when AlignWithMargins
is set to true and Align is not alNone.
}
const
  TopPanelMargin = 10;
  BottomPanelMargin = 30;

var
  TopPanel, BottomPanel : TPanel;

procedure TForm2.FormCreate(Sender: TObject);
begin
  { Create a new panel and align it to top }
  TopPanel := TPanel.Create(Self);
  TopPanel.Parent := Self;
  TopPanel.Align := alTop;
  TopPanel.Height := (ClientHeight div 2);

  { Create a new panel and align it to the remaining client size }
  BottomPanel := TPanel.Create(Self);
  BottomPanel.Parent := Self;
  BottomPanel.Align := alClient;

  { Set Top panel margins }
  { Note: Margins will not have an effect if Align is alNone }
  TopPanel.Margins.SetBounds(TopPanelMargin, TopPanelMargin,
                             TopPanelMargin, TopPanelMargin);
  TopPanel.AlignWithMargins := true;
  TopPanel.Caption:= 'TopPanel';

  { Set Bottom panel margins }
  { Note: Margins will not have an effect if Align is alNone }
  BottomPanel.Margins.SetBounds(BottomPanelMargin, BottomPanelMargin,
                                BottomPanelMargin, BottomPanelMargin);
  BottomPanel.AlignWithMargins := true;
  BottomPanel.Caption:= 'BottomPanel';

  if (TopPanel.Top <> TopPanelMargin) or
     (TopPanel.Left <> TopPanelMargin) or
     (TopPanel.Width <> (ClientWidth - (TopPanelMargin * 2))) or
     (BottomPanel.Top <> (TopPanel.Height + (TopPanelMargin * 2) +
                                              BottomPanelMargin)) or
     (BottomPanel.Left <> BottomPanelMargin) or
     (BottomPanel.Width <> (ClientWidth - (BottomPanelMargin * 2)))
     then
       MessageDlg('This should not happen! Position and size are ' +
```

```
            'calculated relative to the margins', mtError, [mbOK], 0);

77.1.15.4.18 TRibbonCustomControl.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class TRibbonCustomControl.

77.1.15.4.19 TRibbonCustomControl.SetDragMode Method

Sets the drag mode for the control.

Pascal

```
procedure SetDragMode(Value: TDragMode); override;
```

C++

```
virtual __fastcall SetDragMode(TDragMode Value);
```

Description

SetDragMode is the protected write implementation for the DragMode property. Override SetDragMode to execute additional code when the value of the DragMode property changes.

See Also

DragMode

77.1.15.4.20 TRibbonCustomControl.SetKeyTip Method

Sets **KeyTip** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip** for the command.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

77.1.15.4.21 TRibbonCustomControl.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

77.1.15.4.22 TRibbonCustomControl.ShowKeyTip Method

Shows **KeyTip** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip** for the command in the position specified. Only the Application Button uses a **KeyTip** position.

See Also

KeyTip (see page 7282)

77.1.15.5 TRibbonCustomControl Properties

The properties of the TRibbonCustomControl class are listed here.

Public Properties

	Name	Description
	ContainedControl (see page 7073)	This is ContainedControl, a member of class TRibbonCustomControl.

77.1.15.5.1 TRibbonCustomControl.ContainedControl Property

Pascal

```
property ContainedControl: TControl;
```

C++

```
__property TControl * ContainedControl;
```

Description

This is ContainedControl, a member of class TRibbonCustomControl.

77.1.16 TRibbonCustomizeItem Class

Class Hierarchy

Pascal

```
TRibbonCustomizeItem = class(TCustomAddRemoveItem);

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonCustomizeItem.

77.1.16.1 TRibbonCustomizeItem Members

The following tables list the members exposed by TRibbonCustomizeItem.

Protected Methods

	Name	Description
	DrawBackground (see page 7075)	Draws a background image on the control.
	DrawGlyph (see page 7075)	Draws a symbol on the control.
	RibbonStyle (see page 7075)	This is RibbonStyle, a member of class TRibbonCustomizeItem.

Public Methods

	Name	Description
	CalcBounds (see page 7074)	Calculates the size of the add/remove menu item.

77.1.16.2 TRibbonCustomizeItem Methods

The methods of the TRibbonCustomizeItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7075)	Draws a background image on the control.
	DrawGlyph (see page 7075)	Draws a symbol on the control.
	RibbonStyle (see page 7075)	This is RibbonStyle, a member of class TRibbonCustomizeItem.

Public Methods

	Name	Description
	CalcBounds (see page 7074)	Calculates the size of the add/remove menu item.

77.1.16.2.1 TRibbonCustomizeItem.CalcBounds Method

Calculates the size of the add/remove menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

CalcBounds updates the Height, Width, and TextBounds properties to reflect current conditions (such as the item's caption and the current font).

See Also

Height

Width

TextBounds

77.1.16.2.2 TRibbonCustomizeItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.16.2.3 TRibbonCustomizeItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

Description

This is class RibbonActnCtrls.TRibbonCustomStatusControl.

77.1.17.1 TRibbonCustomStatusControl Members

The following tables list the members exposed by TRibbonCustomStatusControl.

Protected Methods

	Name	Description
	CMVisiblechanged (see page 7064)	This is CMVisiblechanged, a member of class TRibbonCustomControl.
	DrawBackground (see page 7078)	Draws a background image on the control.
	GetCaptionWidth (see page 7065)	This is GetCaptionWidth, a member of class TRibbonCustomControl.
	GetGlyphWidth (see page 7065)	This is GetGlyphWidth, a member of class TRibbonCustomControl.
	GetLabelWidth (see page 7066)	This is GetLabelWidth, a member of class TRibbonCustomControl.
	Notification (see page 7067)	Responds to notifications that components are being created or destroyed.
	Paint (see page 7068)	Render control surface.
	SetActionClient (see page 7068)	This is SetActionClient, a member of class TRibbonCustomControl.
	SetDragMode (see page 7071)	Sets the drag mode for the control.
	SetParent (see page 7072)	Sets the parent of the control.

Public Methods

	Name	Description
	CalcBounds (see page 7077)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 7064)	This is CanAddToQuickAccessToolbar, a member of class TRibbonCustomControl.
	Click (see page 7064)	Executes the control's function in response to a mouse click.
	Create (see page 7062)	Creates an instance of TCustomActionControl.
	Destroy (see page 7062)	Destroys an instance of TCustomActionControl.
	GetContainedControl (see page 7275)	This is GetContainedControl, a member of class IRibbonContainedControl.
	GetContainedControl (see page 7065)	This is GetContainedControl, a member of class TRibbonCustomControl.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 7066)	Returns current **KeyTip** for command.

	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 7066)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 7067)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	KeyTipClick (see page 7067)	Handle clicking a **KeyTip**.
V	SetBounds (see page 7068)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 7275)	This is SetContainedControl, a member of class IRibbonContainedControl.
	SetContainedControl (see page 7071)	This is SetContainedControl, a member of class TRibbonCustomControl.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 7071)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 7072)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	ContainedControl (see page 7275)	This is ContainedControl, a member of class IRibbonContainedControl.
	ContainedControl (see page 7073)	This is ContainedControl, a member of class TRibbonCustomControl.
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.17.2 TRibbonCustomStatusControl Methods

The methods of the TRibbonCustomStatusControl class are listed here.

Protected Methods

	Name	Description
V	DrawBackground (see page 7078)	Draws a background image on the control.

Public Methods

	Name	Description
V	CalcBounds (see page 7077)	Calculates the size of the control.

77.1.17.2.1 TRibbonCustomStatusControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

77.1.17.2.2 TRibbonCustomStatusControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

77.1.18 TRibbonDropDownButton Class

Class Hierarchy

Pascal

```
TRibbonDropDownButton = class(TRibbonBaseButtonControl);
```

C++

```
class TRibbonDropDownButton : public TRibbonBaseButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonDropDownButton.

77.1.18.1 TRibbonDropDownButton Members

The following tables list the members exposed by TRibbonDropDownButton.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 7080)	This is CalcLayout, a member of class TRibbonDropDownButton.
	DoDropDown (see page 7081)	This is DoDropDown, a member of class TRibbonDropDownButton.
	DrawArrow (see page 7081)	This is DrawArrow, a member of class TRibbonDropDownButton.
	DrawBackground (see page 7081)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.

	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 7081)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 7082)	Draws text on the control.
	GetArrowPosition (see page 7082)	This is GetArrowPosition, a member of class TRibbonDropDownButton.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	GetPopupClass (see page 7082)	This is GetPopupClass, a member of class TRibbonDropDownButton.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 7080)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 7080)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7082)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.18.2 TRibbonDropDownButton Methods

The methods of the TRibbonDropDownButton class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 7080)	This is CalcLayout, a member of class TRibbonDropDownButton.
	DoDropDown (see page 7081)	This is DoDropDown, a member of class TRibbonDropDownButton.
	DrawArrow (see page 7081)	This is DrawArrow, a member of class TRibbonDropDownButton.
	DrawBackground (see page 7081)	Draws a background image on the control.
	DrawShadowedText (see page 7081)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 7082)	Draws text on the control.
	GetArrowPosition (see page 7082)	This is GetArrowPosition, a member of class TRibbonDropDownButton.

	GetPopupClass (see page 7082)	This is GetPopupClass, a member of class TRibbonDropDownButton.

Public Methods

	Name	Description
	CalcBounds (see page 7080)	Calculates the size of the control.
	Click (see page 7080)	Executes the control's function.
	KeyTipClick (see page 7082)	Handle clicking a **KeyTip**.

77.1.18.2.1 TRibbonDropDownButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.18.2.2 TRibbonDropDownButton.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonDropDownButton.

77.1.18.2.3 TRibbonDropDownButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

Click

Click

UsageCount

77.1.18.2.4 TRibbonDropDownButton.DoDropDown Method

Pascal

```
procedure DoDropDown(const SelectFirst: Boolean); virtual;
```

C++

```
virtual __fastcall DoDropDown(const Boolean SelectFirst);
```

Description

This is DoDropDown, a member of class TRibbonDropDownButton.

77.1.18.2.5 TRibbonDropDownButton.DrawArrow Method

Pascal

```
procedure DrawArrow(Location: TPoint; Color: TColor; ShadowColor: TColor; Size: Integer);
virtual;
```

C++

```
virtual __fastcall DrawArrow(TPoint Location, TColor Color, TColor ShadowColor, int Size);
```

Description

This is DrawArrow, a member of class TRibbonDropDownButton.

77.1.18.2.6 TRibbonDropDownButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.18.2.7 TRibbonDropDownButton.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonDropDownButton.

77.1.18.2.8 TRibbonDropDownButton.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

77.1.18.2.9 TRibbonDropDownButton.GetArrowPosition Method

Pascal

```
function GetArrowPosition(const ARect: TRect): TPoint; virtual;
```

C++

```
virtual __fastcall TPoint GetArrowPosition(const TRect ARect);
```

Description

This is GetArrowPosition, a member of class TRibbonDropDownButton.

77.1.18.2.10 TRibbonDropDownButton.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomPopupClass; virtual;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TRibbonDropDownButton.

77.1.18.2.11 TRibbonDropDownButton.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick; override;
```

C++

```
virtual __fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

77.1.19 TRibbonGallery Class

Class Hierarchy

Pascal

```
TRibbonGallery = class(TControl);
```

C++

```
class TRibbonGallery : public TControl;
```

File

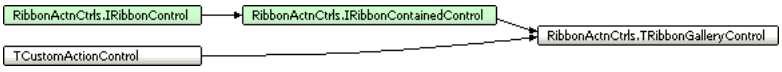
RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGallery.

77.1.20 TRibbonGalleryControl Class

Class Hierarchy



Pascal

```
TRibbonGalleryControl = class(TCustomActionControl, IRibbonContainedControl);
```

C++

```
class TRibbonGalleryControl : public TCustomActionControl, public IRibbonContainedControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGalleryControl.

77.1.20.1 TRibbonGalleryControl Members

The following tables list the members exposed by TRibbonGalleryControl.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 7084)	This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControl.

	GetContainedControl (see page 7084)	This is GetContainedControl, a member of class TRibbonGalleryControl.
	SetContainedControl (see page 7084)	This is SetContainedControl, a member of class TRibbonGalleryControl.

Public Properties

	Name	Description
	ContainedControl (see page 7085)	This is ContainedControl, a member of class TRibbonGalleryControl.
R	Gallery (see page 7085)	This is Gallery, a member of class TRibbonGalleryControl.

77.1.20.2 TRibbonGalleryControl Methods

The methods of the TRibbonGalleryControl class are listed here.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 7084)	This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControl.
	GetContainedControl (see page 7084)	This is GetContainedControl, a member of class TRibbonGalleryControl.
	SetContainedControl (see page 7084)	This is SetContainedControl, a member of class TRibbonGalleryControl.

77.1.20.2.1 TRibbonGalleryControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControl.

77.1.20.2.2 TRibbonGalleryControl.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class TRibbonGalleryControl.

77.1.20.2.3 TRibbonGalleryControl.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class TRibbonGalleryControl.

77.1.20.3 TRibbonGalleryControl Properties

The properties of the TRibbonGalleryControl class are listed here.

Public Properties

	Name	Description
	ContainedControl (see page 7085)	This is ContainedControl, a member of class TRibbonGalleryControl.
	Gallery (see page 7085)	This is Gallery, a member of class TRibbonGalleryControl.

77.1.20.3.1 TRibbonGalleryControl.ContainedControl Property

Pascal

```
property ContainedControl: TControl;
```

C++

```
__property TControl * ContainedControl;
```

Description

This is ContainedControl, a member of class TRibbonGalleryControl.

77.1.20.3.2 TRibbonGalleryControl.Gallery Property

Pascal

```
property Gallery: TRibbonGallery;
```

C++

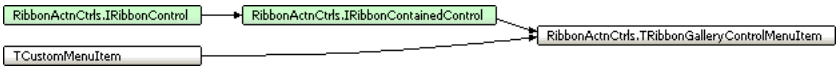
```
__property TRibbonGallery Gallery;
```

Description

This is Gallery, a member of class TRibbonGalleryControl.

77.1.21 TRibbonGalleryControlMenuItem Class

Class Hierarchy



Pascal

```
TRibbonGalleryControlMenuItem = class(TCustomMenuItem, IRibbonContainedControl);
```

C++

```
class TRibbonGalleryControlMenuItem : public TCustomMenuItem, public IRibbonContainedControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGalleryControlMenuItem.

77.1.21.1 TRibbonGalleryControlMenuItem Members

The following tables list the members exposed by TRibbonGalleryControlMenuItem.

Protected Methods

	Name	Description
	Paint (see page 7087)	Render control surface.
	SetParent (see page 7090)	Sets the parent of the control.

Public Methods

	Name	Description
	CalcBounds (see page 7086)	Calculates the size of the menu item.
	CanAddToQuickAccessToolbar (see page 7087)	This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControlMenuItem.
	GetContainedControl (see page 7087)	This is GetContainedControl, a member of class TRibbonGalleryControlMenuItem.
	SetBounds (see page 7088)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 7090)	This is SetContainedControl, a member of class TRibbonGalleryControlMenuItem.

Public Properties

	Name	Description
	ContainedControl (see page 7091)	This is ContainedControl, a member of class TRibbonGalleryControlMenuItem.

77.1.21.2 TRibbonGalleryControlMenuItem Methods

The methods of the TRibbonGalleryControlMenuItem class are listed here.

Protected Methods

	Name	Description
	Paint (see page 7087)	Render control surface.
	SetParent (see page 7090)	Sets the parent of the control.

Public Methods

	Name	Description
	CalcBounds (see page 7086)	Calculates the size of the menu item.
	CanAddToQuickAccessToolbar (see page 7087)	This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControlMenuItem.
	GetContainedControl (see page 7087)	This is GetContainedControl, a member of class TRibbonGalleryControlMenuItem.
	SetBounds (see page 7088)	Sets the Left, Top, Width, and Height properties all at once.
	SetContainedControl (see page 7090)	This is SetContainedControl, a member of class TRibbonGalleryControlMenuItem.

77.1.21.2.1 TRibbonGalleryControlMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

77.1.21.2.2 TRibbonGalleryControlMenuItem.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class TRibbonGalleryControlMenuItem.

77.1.21.2.3 TRibbonGalleryControlMenuItem.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class TRibbonGalleryControlMenuItem.

77.1.21.2.4 TRibbonGalleryControlMenuItem.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

77.1.21.2.5 TRibbonGalleryControlMenuItem.SetBounds Method

Sets the Left, Top, Width, and Height properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the component's boundary properties at one time. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately, but SetBounds changes all four properties at once ensuring that the control will not repaint between changes.

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

Calling SetBounds does not necessarily result in the Left, Top, Width, and Height properties changing to the specified values. Before the properties are changed, the AutoSize or Constraints property may limit the changes, and an OnCanResize (or OnConstrainedResize) event handler may change the new values. After the control's Left, Top, Width, and Height properties are changed, SetBounds generates an OnResize event.

Note: Component writers can change the Left, Top, Width, and Height properties while bypassing all resize events and constraint or autosize logic by using the UpdateBoundsRect method instead.

C++ Examples:

```
//
//This example demostrates the usage of Margins and AlignWithMargins
//properties. Note that Margins will only work when AlignWithMargins
//is set to true and Align is not alNone.
//

#define TopPanelMargin 10
#define BottomPanelMargin 20

TPanel *TopPanel, *BottomPanel;

void __fastcall TForm2::FormCreate(TObject *Sender)
{
    /* Create a new panel and align it to top */
    TopPanel = new TPanel(this);
    TopPanel->Parent = this;
    TopPanel->Align = alTop;
    TopPanel->Height = (ClientHeight / 2);

    /* Create a new panel and align it to the remaining client size */
    BottomPanel = new TPanel(this);
    BottomPanel->Parent = this;
    BottomPanel->Align = alClient;

    /* Set Top panel margins */
    /* Note: Margins will not have an effect if Align is alNone */
    TopPanel->Margins->SetBounds(TopPanelMargin, TopPanelMargin,
                                 TopPanelMargin, TopPanelMargin);
    TopPanel->AlignWithMargins = true;
    TopPanel->Caption = "TopPanel";
```

```
    /* Set Top Bottom margins */
    /* Note: Margins will not have an effect if Align is alNone */
    BottomPanel->Margins->SetBounds(BottomPanelMargin, BottomPanelMargin,
                                    BottomPanelMargin, BottomPanelMargin);
    BottomPanel->AlignWithMargins = true;
    BottomPanel->Caption = "BottomPanel";

    if ((TopPanel->Top != TopPanelMargin) ||
       (TopPanel->Left != TopPanelMargin) ||
       (TopPanel->Width != (ClientWidth - (TopPanelMargin * 2))) ||
       (BottomPanel->Top != (TopPanel->Height + (TopPanelMargin * 2) +
                                               BottomPanelMargin)) ||
       (BottomPanel->Left != BottomPanelMargin) ||
       (BottomPanel->Width != (ClientWidth - (BottomPanelMargin * 2))))
       {
          MessageDlg(AnsiString(
            "This should not happen! Position and size are ")+
            "calculated relative to the margins",
            mtError, TMsgDlgButtons() << mbOK, 0);
       }
}
```

Delphi Examples:

```
{
This example demostrates the usage of Margins and AlignWithMargins
properties. Note that Margins will only work when AlignWithMargins
is set to true and Align is not alNone.
}
const
  TopPanelMargin = 10;
  BottomPanelMargin = 30;

var
  TopPanel, BottomPanel : TPanel;

procedure TForm2.FormCreate(Sender: TObject);
begin
  { Create a new panel and align it to top }
  TopPanel := TPanel.Create(Self);
  TopPanel.Parent := Self;
  TopPanel.Align := alTop;
  TopPanel.Height := (ClientHeight div 2);

  { Create a new panel and align it to the remaining client size }
  BottomPanel := TPanel.Create(Self);
  BottomPanel.Parent := Self;
  BottomPanel.Align := alClient;

  { Set Top panel margins }
  { Note: Margins will not have an effect if Align is alNone }
  TopPanel.Margins.SetBounds(TopPanelMargin, TopPanelMargin,
                             TopPanelMargin, TopPanelMargin);
  TopPanel.AlignWithMargins := true;
  TopPanel.Caption:= 'TopPanel';

  { Set Bottom panel margins }
  { Note: Margins will not have an effect if Align is alNone }
  BottomPanel.Margins.SetBounds(BottomPanelMargin, BottomPanelMargin,
                                BottomPanelMargin, BottomPanelMargin);
  BottomPanel.AlignWithMargins := true;

77.1.21.2.6 TRibbonGalleryControlMenuItem.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class TRibbonGalleryControlMenuItem.

77.1.21.2.7 TRibbonGalleryControlMenuItem.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's

RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

77.1.21.3 TRibbonGalleryControlMenuItem Properties

The properties of the TRibbonGalleryControlMenuItem class are listed here.

Public Properties

	Name	Description
	ContainedControl (see page 7091)	This is ContainedControl, a member of class TRibbonGalleryControlMenuItem.

77.1.21.3.1 TRibbonGalleryControlMenuItem.ContainedControl Property

Pascal

```
property ContainedControl: TControl;
```

C++

```
__property TControl * ContainedControl;
```

Description

This is ContainedControl, a member of class TRibbonGalleryControlMenuItem.

77.1.22 TRibbonGalleryItem Class

Class Hierarchy

Pascal

```
TRibbonGalleryItem = class(TRibbonBaseButtonControl);
```

C++

```
class TRibbonGalleryItem : public TRibbonBaseButtonControl;
```

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGalleryItem.

77.1.22.1 TRibbonGalleryItem Members

The following tables list the members exposed by TRibbonGalleryItem.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 7093)	This is CalcLayout, a member of class TRibbonGalleryItem.
	DrawBackground (see page 6985)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 7093)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.22.2 TRibbonGalleryItem Methods

The methods of the TRibbonGalleryItem class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 7093)	This is CalcLayout, a member of class TRibbonGalleryItem.

Public Methods

	Name	Description
	CalcBounds (see page 7093)	Calculates the size of the control.

77.1.22.2.1 TRibbonGalleryItem.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.22.2.2 TRibbonGalleryItem.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonGalleryItem.

77.1.23 TRibbonGalleryMenuItem Class

Class Hierarchy

Pascal

```
TRibbonGalleryMenuItem = class(TCustomMenuItem);
```

C++

```
class TRibbonGalleryMenuItem : public TCustomMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGalleryMenuItem.

77.1.23.1 TRibbonGalleryMenuItem Members

The following tables list the members exposed by TRibbonGalleryMenuItem.

Protected Methods

	Name	Description
	DrawBackground (see page 7095)	Draws a background image on the control.
	DrawGlyph (see page 7095)	Draws a symbol on the control.
	DrawShadowedText (see page 7095)	This is DrawShadowedText, a member of class TRibbonGalleryMenuItem.
	DrawText (see page 7096)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 7094)	Calculates the size of the menu item.

77.1.23.2 TRibbonGalleryMenuItem Methods

The methods of the TRibbonGalleryMenuItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7095)	Draws a background image on the control.
	DrawGlyph (see page 7095)	Draws a symbol on the control.
	DrawShadowedText (see page 7095)	This is DrawShadowedText, a member of class TRibbonGalleryMenuItem.
	DrawText (see page 7096)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 7094)	Calculates the size of the menu item.

77.1.23.2.1 TRibbonGalleryMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines

to ensure that the values are set properly.

See Also

SetBounds

77.1.23.2.2 TRibbonGalleryMenuItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.23.2.3 TRibbonGalleryMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

77.1.23.2.4 TRibbonGalleryMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonGalleryMenuItem.

77.1.23.2.5 TRibbonGalleryMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

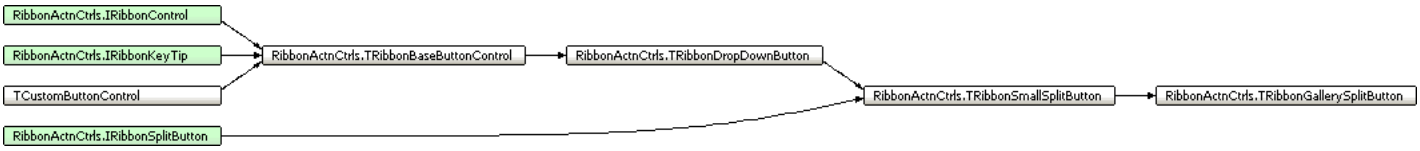
DrawGlyph

77.1.24 TRibbonGallerySplitButton Class

Class Hierarchy



Pascal

```
TRibbonGallerySplitButton = class(TRibbonSmallSplitButton);
```

C++

```
class TRibbonGallerySplitButton : public TRibbonSmallSplitButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGallerySplitButton.

77.1.24.1 TRibbonGallerySplitButton Members

The following tables list the members exposed by TRibbonGallerySplitButton.

Protected Fields

	Name	Description
	FCursorInSplit (see page 7154)	This is FCursorInSplit, a member of class TRibbonSmallSplitButton.
	FSplitRect (see page 7154)	This is FSplitRect, a member of class TRibbonSmallSplitButton.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 7080)	This is CalcLayout, a member of class TRibbonDropDownButton.
	CalcLayout (see page 7155)	This is CalcLayout, a member of class TRibbonSmallSplitButton.
	CMMouseLeave (see page 7156)	This is CMMouseLeave, a member of class TRibbonSmallSplitButton.
	DoDropDown (see page 7081)	This is DoDropDown, a member of class TRibbonDropDownButton.
	DrawArrow (see page 7081)	This is DrawArrow, a member of class TRibbonDropDownButton.
	DrawBackground (see page 6985)	Draws a background image on the control.
	DrawBackground (see page 7081)	Draws a background image on the control.
	DrawBackground (see page 7156)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 7081)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 6986)	Draws text on the control.
	DrawText (see page 7082)	Draws text on the control.
	GetArrowPosition (see page 7082)	This is GetArrowPosition, a member of class TRibbonDropDownButton.
	GetArrowPosition (see page 7157)	This is GetArrowPosition, a member of class TRibbonSmallSplitButton.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	GetPopupClass (see page 7098)	This is GetPopupClass, a member of class TRibbonGallerySplitButton.
	InSplit (see page 7157)	This is InSplit, a member of class TRibbonSmallSplitButton.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseDown (see page 7157)	OnMouseDown event dispatcher.
	MouseMove (see page 7158)	Respond to mouse moving over control area..
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 6983)	Calculates the size of the control.
	CalcBounds (see page 7080)	Calculates the size of the control.
	CalcBounds (see page 7155)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Click (see page 7080)	Executes the control's function.
	Click (see page 7156)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Create (see page 7153)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.

	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
V	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
V	KeyTipClick (see page 7082)	Handle clicking a **KeyTip**.
V	KeyTipClick (see page 7157)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.
	UpdateSplitBounds (see page 7283)	This is UpdateSplitBounds, a member of class IRibbonSplitButton.
V	UpdateSplitBounds (see page 7158)	This is UpdateSplitBounds, a member of class TRibbonSmallSplitButton.

Public Properties

	Name	Description
	CursorInSplit (see page 7159)	This is CursorInSplit, a member of class TRibbonSmallSplitButton.
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.24.2 TRibbonGallerySplitButton Methods

The methods of the TRibbonGallerySplitButton class are listed here.

Protected Methods

	Name	Description
V	GetPopupClass (see page 7098)	This is GetPopupClass, a member of class TRibbonGallerySplitButton.

77.1.24.2.1 TRibbonGallerySplitButton.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomPopupClass; override;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TRibbonGallerySplitButton.

77.1.25 TRibbonGripItem Class

Class Hierarchy

Pascal

```
TRibbonGripItem = class(TMenuResizeActionControl);
```

C++

```
class TRibbonGripItem : public TMenuResizeActionControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonGripItem.

77.1.25.1 TRibbonGripItem Members

The following tables list the members exposed by TRibbonGripItem.

Protected Methods

	Name	Description
	Paint (see page 7100)	Render control surface.
	RibbonStyle (see page 7101)	This is RibbonStyle, a member of class TRibbonGripItem.

Public Methods

	Name	Description
	CalcBounds (see page 7100)	Calculates the size of the control.
	Create (see page 7099)	Creates an instance of TCustomActionControl.

Public Properties

	Name	Description
	GalleryResize (see page 7101)	This is GalleryResize, a member of class TRibbonGripItem.

77.1.25.2 TRibbonGripItem.Create Constructor

Creates an instance of TCustomActionControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonGripItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomActionControl. However, you should never attempt to instantiate a TCustomActionControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the TCustomActionControl instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Owner

Create

Destroy

77.1.25.3 TRibbonGripItem Methods

The methods of the TRibbonGripItem class are listed here.

Protected Methods

	Name	Description
	Paint (see page 7100)	Render control surface.
	RibbonStyle (see page 7101)	This is RibbonStyle, a member of class TRibbonGripItem.

Public Methods

	Name	Description
	CalcBounds (see page 7100)	Calculates the size of the control.

77.1.25.3.1 TRibbonGripItem.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

77.1.25.3.2 TRibbonGripItem.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

Canvas

77.1.25.3.3 TRibbonGripItem.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonGripItem.

77.1.25.4 TRibbonGripItem Properties

The properties of the TRibbonGripItem class are listed here.

Public Properties

	Name	Description
	GalleryResize (see page 7101)	This is GalleryResize, a member of class TRibbonGripItem.

77.1.25.4.1 TRibbonGripItem.GalleryResize Property

Pascal

```
property GalleryResize: TGalleryResize;
```

C++

```
__property TGalleryResize GalleryResize;
```

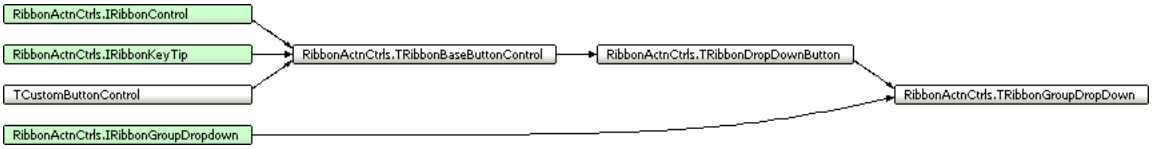
Description

This is GalleryResize, a member of class TRibbonGripItem.

77.1.26 TRibbonGroupDropDown Class

Display entire group as dropdown menu in Quick Access Toolbar.

Class Hierarchy



Pascal

```
TRibbonGroupDropDown = class(TRibbonDropDownButton, IRibbonGroupDropdown);
```

C++

```
class TRibbonGroupDropDown : public TRibbonDropDownButton, public IRibbonGroupDropdown;
```

File

RibbonActnCtrls

Description

TRibbonGroupDropDown is a control used to display an entire group as a dropdown menu in the Quick Access Toolbar.

TRibbonQuickAccessToolbar (see page 6911)

77.1.26.1 TRibbonGroupDropDown Members

The following tables list the members exposed by TRibbonGroupDropDown.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 7080)	This is CalcLayout, a member of class TRibbonDropDownButton.
	DoDropDown (see page 7103)	This is DoDropDown, a member of class TRibbonGroupDropDown.
	DrawArrow (see page 7104)	This is DrawArrow, a member of class TRibbonGroupDropDown.
	DrawBackground (see page 7104)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 7081)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 6986)	Draws text on the control.
	DrawText (see page 7082)	Draws text on the control.
	GetArrowPosition (see page 7082)	This is GetArrowPosition, a member of class TRibbonDropDownButton.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	GetPopupClass (see page 7082)	This is GetPopupClass, a member of class TRibbonDropDownButton.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 6983)	Calculates the size of the control.
	CalcBounds (see page 7080)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Click (see page 7080)	Executes the control's function.
	CloseUp (see page 7103)	This is CloseUp, a member of class TRibbonGroupDropDown.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	GetParentControl (see page 7104)	This is GetParentControl, a member of class TRibbonGroupDropDown.
	GetTopPosition (see page 7104)	This is GetTopPosition, a member of class TRibbonGroupDropDown.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).

	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
V	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
V	KeyTipClick (see page 7082)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	Group (see page 7105)	This is Group, a member of class TRibbonGroupDropDown.
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.26.2 TRibbonGroupDropDown Methods

The methods of the TRibbonGroupDropDown class are listed here.

Protected Methods

	Name	Description
V	DoDropDown (see page 7103)	This is DoDropDown, a member of class TRibbonGroupDropDown.
V	DrawArrow (see page 7104)	This is DrawArrow, a member of class TRibbonGroupDropDown.
V	DrawBackground (see page 7104)	Draws a background image on the control.

Public Methods

	Name	Description
	CloseUp (see page 7103)	This is CloseUp, a member of class TRibbonGroupDropDown.
	GetParentControl (see page 7104)	This is GetParentControl, a member of class TRibbonGroupDropDown.
	GetTopPosition (see page 7104)	This is GetTopPosition, a member of class TRibbonGroupDropDown.

77.1.26.2.1 TRibbonGroupDropDown.CloseUp Method

Pascal

```
procedure CloseUp;
```

C++

```
__fastcall CloseUp();
```

Description

This is CloseUp, a member of class TRibbonGroupDropDown.

77.1.26.2.2 TRibbonGroupDropDown.DoDropDown Method

Pascal

```
procedure DoDropDown(const SelectFirst: Boolean); override;
```

C++

```
virtual __fastcall DoDropDown(const Boolean SelectFirst);
```

Description

This is DoDropDown, a member of class TRibbonGroupDropDown.

77.1.26.2.3 TRibbonGroupDropDown.DrawArrow Method

Pascal

```
procedure DrawArrow(Location: TPoint; Color: TColor; ShadowColor: TColor; Size: Integer);
override;
```

C++

```
virtual __fastcall DrawArrow(TPoint Location, TColor Color, TColor ShadowColor, int Size);
```

Description

This is DrawArrow, a member of class TRibbonGroupDropDown.

77.1.26.2.4 TRibbonGroupDropDown.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.26.2.5 TRibbonGroupDropDown.GetParentControl Method

Pascal

```
function GetParentControl: TWinControl;
```

C++

```
__fastcall TWinControl * GetParentControl();
```

Description

This is GetParentControl, a member of class TRibbonGroupDropDown.

77.1.26.2.6 TRibbonGroupDropDown.GetTopPosition Method

Pascal

```
function GetTopPosition: Integer;
```

C++

```
__fastcall int GetTopPosition();
```

Description

This is GetTopPosition, a member of class TRibbonGroupDropDown.

77.1.26.3 TRibbonGroupDropDown Properties

The properties of the TRibbonGroupDropDown class are listed here.

Public Properties

	Name	Description
	Group (see page 7105)	This is Group, a member of class TRibbonGroupDropDown.

77.1.26.3.1 TRibbonGroupDropDown.Group Property

Pascal

```
property Group: TControl;
```

C++

```
__property TControl * Group;
```

Description

This is Group, a member of class TRibbonGroupDropDown.

77.1.27 TRibbonLargeButtonControl Class

Class Hierarchy

Pascal

```
TRibbonLargeButtonControl = class(TRibbonBaseButtonControl);
```

C++

```
class TRibbonLargeButtonControl : public TRibbonBaseButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonLargeButtonControl.

77.1.27.1 TRibbonLargeButtonControl Members

The following tables list the members exposed by TRibbonLargeButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 7107)	This is CalcLayout, a member of class TRibbonLargeButtonControl.
	DrawBackground (see page 7107)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 7108)	This is DrawShadowedText, a member of class TRibbonLargeButtonControl.
	DrawText (see page 7108)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 7107)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.27.2 TRibbonLargeButtonControl Methods

The methods of the TRibbonLargeButtonControl class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 7107)	This is CalcLayout, a member of class TRibbonLargeButtonControl.

	DrawBackground (see page 7107)	Draws a background image on the control.
	DrawShadowedText (see page 7108)	This is DrawShadowedText, a member of class TRibbonLargeButtonControl.
	DrawText (see page 7108)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 7107)	Calculates the size of the control.

77.1.27.2.1 TRibbonLargeButtonControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.27.2.2 TRibbonLargeButtonControl.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonLargeButtonControl.

77.1.27.2.3 TRibbonLargeButtonControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.27.2.4 TRibbonLargeButtonControl.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonLargeButtonControl.

77.1.27.2.5 TRibbonLargeButtonControl.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

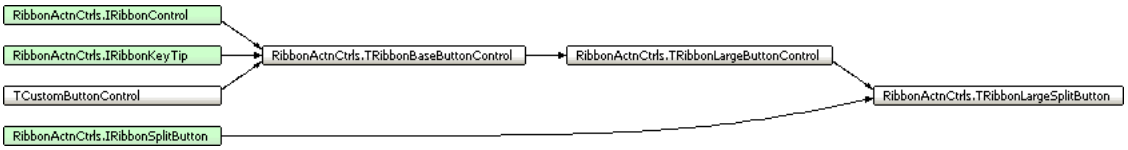
DrawGlyph

77.1.28 TRibbonLargeSplitButton Class

Class Hierarchy



Pascal

```
TRibbonLargeSplitButton = class(TRibbonLargeButtonControl, IRibbonSplitButton);
```

C++

```
class TRibbonLargeSplitButton : public TRibbonLargeButtonControl, public IRibbonSplitButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonLargeSplitButton.

77.1.28.1 TRibbonLargeSplitButton Members

The following tables list the members exposed by TRibbonLargeSplitButton.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 7111)	This is CalcLayout, a member of class TRibbonLargeSplitButton.
	CMMouseleave (see page 7111)	This is CMMouseleave, a member of class TRibbonLargeSplitButton.
	DoSplitButtonClick (see page 7111)	This is DoSplitButtonClick, a member of class TRibbonLargeSplitButton.
	DrawArrow (see page 7112)	This is DrawArrow, a member of class TRibbonLargeSplitButton.
	DrawBackground (see page 7112)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 7108)	This is DrawShadowedText, a member of class TRibbonLargeButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	DrawText (see page 7108)	Draws text on the control.
	GetArrowPosition (see page 7112)	This is GetArrowPosition, a member of class TRibbonLargeSplitButton.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	InSplit (see page 7112)	This is InSplit, a member of class TRibbonLargeSplitButton.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseDown (see page 7113)	OnMouseDown event dispatcher.
	MouseMove (see page 7113)	Respond to mouse moving over control area..
	MouseUp (see page 7114)	OnMouseUp event dispatcher.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 7110)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 7111)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7113)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.

	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.
	UpdateSplitBounds (see page 7114)	This is UpdateSplitBounds, a member of class TRibbonLargeSplitButton.

Public Properties

	Name	Description
	CursorInSplit (see page 7115)	This is CursorInSplit, a member of class TRibbonLargeSplitButton.
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.28.2 TRibbonLargeSplitButton Methods

The methods of the TRibbonLargeSplitButton class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 7111)	This is CalcLayout, a member of class TRibbonLargeSplitButton.
	CMMouseleave (see page 7111)	This is CMMouseleave, a member of class TRibbonLargeSplitButton.
	DoSplitButtonClick (see page 7111)	This is DoSplitButtonClick, a member of class TRibbonLargeSplitButton.
	DrawArrow (see page 7112)	This is DrawArrow, a member of class TRibbonLargeSplitButton.
	DrawBackground (see page 7112)	Draws a background image on the control.
	GetArrowPosition (see page 7112)	This is GetArrowPosition, a member of class TRibbonLargeSplitButton.
	InSplit (see page 7112)	This is InSplit, a member of class TRibbonLargeSplitButton.
	MouseDown (see page 7113)	OnMouseDown event dispatcher.
	MouseMove (see page 7113)	Respond to mouse moving over control area..
	MouseUp (see page 7114)	OnMouseUp event dispatcher.

Public Methods

	Name	Description
	CalcBounds (see page 7110)	Calculates the size of the control.
	Click (see page 7111)	Executes the control's function.
	KeyTipClick (see page 7113)	Handle clicking a **KeyTip**.
	UpdateSplitBounds (see page 7114)	This is UpdateSplitBounds, a member of class TRibbonLargeSplitButton.

77.1.28.2.1 TRibbonLargeSplitButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.28.2.2 TRibbonLargeSplitButton.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonLargeSplitButton.

77.1.28.2.3 TRibbonLargeSplitButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

Click

UsageCount

77.1.28.2.4 TRibbonLargeSplitButton.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonLargeSplitButton.

77.1.28.2.5 TRibbonLargeSplitButton.DoSplitButtonClick Method

Pascal

```
procedure DoSplitButtonClick(const SelectFirst: Boolean); virtual;
```

C++

```
virtual __fastcall DoSplitButtonClick(const Boolean SelectFirst);
```

Description

This is DoSplitButtonClick, a member of class TRibbonLargeSplitButton.

77.1.28.2.6 TRibbonLargeSplitButton.DrawArrow Method

Pascal

```
procedure DrawArrow(Location: TPoint; Color: TColor; ShadowColor: TColor; Size: Integer);
virtual;
```

C++

```
virtual __fastcall DrawArrow(TPoint Location, TColor Color, TColor ShadowColor, int Size);
```

Description

This is DrawArrow, a member of class TRibbonLargeSplitButton.

77.1.28.2.7 TRibbonLargeSplitButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.28.2.8 TRibbonLargeSplitButton.GetArrowPosition Method

Pascal

```
function GetArrowPosition(const ARect: TRect): TPoint; virtual;
```

C++

```
virtual __fastcall TPoint GetArrowPosition(const TRect ARect);
```

Description

This is GetArrowPosition, a member of class TRibbonLargeSplitButton.

77.1.28.2.9 TRibbonLargeSplitButton.InSplit Method

Pascal

```
function InSplit(X: Integer; Y: Integer): Boolean;
```

C++

```
__fastcall Boolean InSplit(int X, int Y);
```

Description

This is InSplit, a member of class TRibbonLargeSplitButton.

77.1.28.2.10 TRibbonLargeSplitButton.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick; override;
```

C++

```
virtual __fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

77.1.28.2.11 TRibbonLargeSplitButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove

MouseUp

OnMouseDown

77.1.28.2.12 TRibbonLargeSplitButton.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

See Also

MouseDown

MouseUp

OnMouseMove

77.1.28.2.13 TRibbonLargeSplitButton.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

77.1.28.2.14 TRibbonLargeSplitButton.UpdateSplitBounds Method

Pascal

```
procedure UpdateSplitBounds; virtual;
```

C++

```
virtual __fastcall UpdateSplitBounds();
```

Description

This is UpdateSplitBounds, a member of class TRibbonLargeSplitButton.

77.1.28.3 TRibbonLargeSplitButton Properties

The properties of the TRibbonLargeSplitButton class are listed here.

Public Properties

	Name	Description
	CursorInSplit (see page 7115)	This is CursorInSplit, a member of class TRibbonLargeSplitButton.

77.1.28.3.1 TRibbonLargeSplitButton.CursorInSplit Property

Pascal

```
property CursorInSplit: Boolean;
```

C++

```
__property Boolean CursorInSplit;
```

Description

This is CursorInSplit, a member of class TRibbonLargeSplitButton.

77.1.29 TRibbonMainMenuItem Class

Class Hierarchy

Pascal

```
TRibbonMainMenuItem = class(TRibbonApplicationMenuItem);
```

C++

```
class TRibbonMainMenuItem : public TRibbonApplicationMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMainMenuItem.

77.1.29.1 TRibbonMainMenuItem Members

The following tables list the members exposed by TRibbonMainMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 7120)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 7121)	Draws a background image on the control.

	DrawGlyph (see page 6978)	Draws a symbol on the control.
	DrawGlyph (see page 7121)	Draws a symbol on the control.
	DrawSelectedBackground (see page 6979)	This is DrawSelectedBackground, a member of class TRibbonApplicationMenuItem.
	DrawSelectedBackground (see page 7121)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 6979)	This is DrawSeparator, a member of class TRibbonApplicationMenuItem.
	DrawSeparator (see page 7122)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 7116)	This is DrawShadowedText, a member of class TRibbonMainMenuItem.
	DrawSubMenuGlyph (see page 6979)	This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.
	DrawText (see page 7116)	Draws text on the control.
	GetImageSize (see page 6980)	This is GetImageSize, a member of class TRibbonApplicationMenuItem.
	GetShowShortCut (see page 7122)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 7123)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 7123)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 6978)	Calculates the size of the menu item.
	CalcBounds (see page 7120)	Calculates the size of the menu item.
	Click (see page 7120)	Executes the control's function.
	Create (see page 6977)	Creates an instance of TCustomMenuItem.
	Create (see page 7119)	Creates an instance of TCustomMenuItem.

77.1.29.2 TRibbonMainMenuItem Methods

The methods of the TRibbonMainMenuItem class are listed here.

Protected Methods

	Name	Description
	DrawShadowedText (see page 7116)	This is DrawShadowedText, a member of class TRibbonMainMenuItem.
	DrawText (see page 7116)	Draws text on the control.

77.1.29.2.1 TRibbonMainMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonMainMenuItem.

77.1.29.2.2 TRibbonMainMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

77.1.30 TRibbonMainMenuSeparator Class

Class Hierarchy

Pascal

```
TRibbonMainMenuSeparator = class(TRibbonSeparator);
```

C++

```
class TRibbonMainMenuSeparator : public TRibbonSeparator;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMainMenuSeparator.

77.1.30.1 TRibbonMainMenuSeparator Members

The following tables list the members exposed by TRibbonMainMenuSeparator.

Protected Methods

	Name	Description
	DrawBackground (see page 7148)	Draws a background image on the control.
	DrawGlyph (see page 7149)	Draws a symbol on the control.
	DrawShadowedText (see page 7149)	This is DrawShadowedText, a member of class TRibbonSeparator.
	DrawText (see page 7149)	Draws text on the control.
	RibbonStyle (see page 7150)	This is RibbonStyle, a member of class TRibbonSeparator.

Public Methods

	Name	Description
	CalcBounds (see page 7118)	Calculates the size of the control.
	Create (see page 7147)	Creates an instance of TCustomActionControl.

77.1.30.2 TRibbonMainMenuSeparator Methods

The methods of the TRibbonMainMenuSeparator class are listed here.

Public Methods

	Name	Description
	CalcBounds (see page 7118)	Calculates the size of the control.

77.1.30.2.1 TRibbonMainMenuSeparator.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMenuItem.

77.1.31.1 TRibbonMenuItem Members

The following tables list the members exposed by TRibbonMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 7120)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 7121)	Draws a background image on the control.
	DrawGlyph (see page 7121)	Draws a symbol on the control.
	DrawSelectedBackground (see page 7121)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 7122)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 7122)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawText (see page 7122)	Draws text on the control.
	GetShowShortCut (see page 7122)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 7123)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 7123)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7120)	Calculates the size of the menu item.
	Click (see page 7120)	Executes the control's function.
	Create (see page 7119)	Creates an instance of TCustomMenuItem.

77.1.31.2 TRibbonMenuItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonMenuItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Destroy

77.1.31.3 TRibbonMenuItem Methods

The methods of the TRibbonMenuItem class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 7120)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 7121)	Draws a background image on the control.
	DrawGlyph (see page 7121)	Draws a symbol on the control.
	DrawSelectedBackground (see page 7121)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 7122)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 7122)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawText (see page 7122)	Draws text on the control.
	GetShowShortCut (see page 7122)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 7123)	This is RibbonStyle, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7120)	Calculates the size of the menu item.
	Click (see page 7120)	Executes the control's function.

77.1.31.3.1 TRibbonMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

SetBounds

77.1.31.3.2 TRibbonMenuItem.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonMenuItem.

77.1.31.3.3 TRibbonMenuItem.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl does little except bring the form containing the item into focus, and prevent the inherited method from being called. The reason for this lack of action is that at runtime, no action should be taken until the primary mouse button is pressed and released, which makes the OnClick event handler responsible for taking action. Click takes place only when the mouse button is first pressed, prior to release.

See Also

OnClick

77.1.31.3.4 TRibbonMenuItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.31.3.5 TRibbonMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

DrawText

77.1.31.3.6 TRibbonMenuItem.DrawSelectedBackground Method

Pascal

```
procedure DrawSelectedBackground(ARect: TRect); virtual;
```

C++

```
virtual __fastcall DrawSelectedBackground(TRect ARect);
```

Description

This is DrawSelectedBackground, a member of class TRibbonMenuItem.

77.1.31.3.7 TRibbonMenuItem.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TRibbonMenuItem.

77.1.31.3.8 TRibbonMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonMenuItem.

77.1.31.3.9 TRibbonMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

77.1.31.3.10 TRibbonMenuItem.GetShowShortCut Method

Pascal

```
function GetShowShortCut: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetShowShortCut();
```

Description

This is GetShowShortCut, a member of class TRibbonMenuItem.

77.1.31.3.11 TRibbonMenuItem.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonMenuItem.

77.1.31.4 TRibbonMenuItem Properties

The properties of the TRibbonMenuItem class are listed here.

Protected Properties

	Name	Description
	DrawBanner (see page 7123)	This is DrawBanner, a member of class TRibbonMenuItem.

77.1.31.4.1 TRibbonMenuItem.DrawBanner Property

Pascal

```
property DrawBanner: Boolean;
```

C++

```
__property Boolean DrawBanner;
```

Description

This is DrawBanner, a member of class TRibbonMenuItem.

77.1.32 TRibbonMenuSeparatorItem Class

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMenuSeparatorItem.

77.1.32.1 TRibbonMenuSeparatorItem Members

The following tables list the members exposed by TRibbonMenuSeparatorItem.

Protected Methods

	Name	Description
	CalcLayout (see page 7120)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 7121)	Draws a background image on the control.
	DrawGlyph (see page 7121)	Draws a symbol on the control.
	DrawSelectedBackground (see page 7121)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 7125)	This is DrawSeparator, a member of class TRibbonMenuSeparatorItem.
	DrawShadowedText (see page 7122)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawText (see page 7122)	Draws text on the control.
	GetShowShortCut (see page 7122)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 7123)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 7123)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7124)	Calculates the size of the menu item.
	Click (see page 7120)	Executes the control's function.
	Create (see page 7119)	Creates an instance of TCustomMenuItem.

77.1.32.2 TRibbonMenuSeparatorItem Methods

The methods of the TRibbonMenuSeparatorItem class are listed here.

Protected Methods

	Name	Description
	DrawSeparator (see page 7125)	This is DrawSeparator, a member of class TRibbonMenuSeparatorItem.

Public Methods

	Name	Description
	CalcBounds (see page 7124)	Calculates the size of the menu item.

77.1.32.2.1 TRibbonMenuSeparatorItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonMenuSmallButtonControl.

77.1.33.1 TRibbonMenuSmallButtonControl Members

The following tables list the members exposed by TRibbonMenuSmallButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.

	DrawBackground (see page 6985)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseUp (see page 7127)	OnMouseUp event dispatcher.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 6983)	Calculates the size of the control.
	CalcBounds (see page 7151)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Create (see page 7126)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.33.2 TRibbonMenuSmallButtonControl.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonMenuSmallButtonControl(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

77.1.33.3 TRibbonMenuSmallButtonControl Methods

The methods of the TRibbonMenuSmallButtonControl class are listed here.

Protected Methods

	Name	Description
	MouseUp (see page 7127)	OnMouseUp event dispatcher.

77.1.33.3.1 TRibbonMenuSmallButtonControl.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

Description

This is class RibbonActnCtrls.TRibbonOptionButtonControl.

77.1.34.1 TRibbonOptionButtonControl Members

The following tables list the members exposed by TRibbonOptionButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 7129)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseUp (see page 7127)	OnMouseUp event dispatcher.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 6983)	Calculates the size of the control.
	CalcBounds (see page 7151)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.

	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Create (see page 7126)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.34.2 TRibbonOptionButtonControl Methods

The methods of the TRibbonOptionButtonControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7129)	Draws a background image on the control.

77.1.34.2.1 TRibbonOptionButtonControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

```
class TRibbonQATScrollButton : public TCustomToolScrollBtn;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonQATScrollButton.

77.1.35.1 TRibbonQATScrollButton Members

The following tables list the members exposed by TRibbonQATScrollButton.

Protected Methods

	Name	Description
	CMMouseEnter (see page 7132)	This is CMMouseEnter, a member of class TRibbonQATScrollButton.
	CMMouseLeave (see page 7132)	This is CMMouseLeave, a member of class TRibbonQATScrollButton.
	DrawArrows (see page 7132)	This is DrawArrows, a member of class TRibbonQATScrollButton.
	DrawBackground (see page 7132)	Draws a background image on the control.
	MouseMove (see page 7133)	Respond to mouse moving over control area..
	RibbonStyle (see page 7133)	This is RibbonStyle, a member of class TRibbonQATScrollButton.

Protected Properties

	Name	Description
	CursorInBtn (see page 7134)	This is CursorInBtn, a member of class TRibbonQATScrollButton.

Public Methods

	Name	Description
	CalcBounds (see page 7131)	Calculates the size of the control.
	Click (see page 7131)	Executes the control's function.

Public Properties

	Name	Description
	DrawDown (see page 7134)	This is DrawDown, a member of class TRibbonQATScrollButton.
	ScrollMode (see page 7134)	This is ScrollMode, a member of class TRibbonQATScrollButton.

77.1.35.2 TRibbonQATScrollButton Methods

The methods of the TRibbonQATScrollButton class are listed here.

Protected Methods

	Name	Description
	CMMouseEnter (see page 7132)	This is CMMouseEnter, a member of class TRibbonQATScrollButton.
	CMMouseLeave (see page 7132)	This is CMMouseLeave, a member of class TRibbonQATScrollButton.
	DrawArrows (see page 7132)	This is DrawArrows, a member of class TRibbonQATScrollButton.
	DrawBackground (see page 7132)	Draws a background image on the control.
	MouseMove (see page 7133)	Respond to mouse moving over control area..
	RibbonStyle (see page 7133)	This is RibbonStyle, a member of class TRibbonQATScrollButton.

Public Methods

	Name	Description
	CalcBounds (see page 7131)	Calculates the size of the control.
	Click (see page 7131)	Executes the control's function.

77.1.35.2.1 TRibbonQATScrollButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.35.2.2 TRibbonQATScrollButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

UsageCount

77.1.35.2.3 TRibbonQATScrollButton.CMMouseEnter Method

Pascal

```
procedure CMMouseEnter(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseEnter(TMessage Message);
```

Description

This is CMMouseEnter, a member of class TRibbonQATScrollButton.

77.1.35.2.4 TRibbonQATScrollButton.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TRibbonQATScrollButton.

77.1.35.2.5 TRibbonQATScrollButton.DrawArrows Method

Pascal

```
procedure DrawArrows; override;
```

C++

```
virtual __fastcall DrawArrows();
```

Description

This is DrawArrows, a member of class TRibbonQATScrollButton.

77.1.35.2.6 TRibbonQATScrollButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.35.2.7 TRibbonQATScrollButton.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

OnMouseMove

77.1.35.2.8 TRibbonQATScrollButton.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonQATScrollButton.

77.1.35.3 TRibbonQATScrollButton Properties

The properties of the TRibbonQATScrollButton class are listed here.

Protected Properties

	Name	Description
	CursorInBtn (see page 7134)	This is CursorInBtn, a member of class TRibbonQATScrollButton.

Public Properties

	Name	Description
	DrawDown (see page 7134)	This is DrawDown, a member of class TRibbonQATScrollButton.
	ScrollMode (see page 7134)	This is ScrollMode, a member of class TRibbonQATScrollButton.

77.1.35.3.1 TRibbonQATScrollButton.CursorInBtn Property

Pascal

```
property CursorInBtn: Boolean;
```

C++

```
__property Boolean CursorInBtn;
```

Description

This is CursorInBtn, a member of class TRibbonQATScrollButton.

77.1.35.3.2 TRibbonQATScrollButton.DrawDown Property

Pascal

```
property DrawDown: Boolean;
```

C++

```
__property Boolean DrawDown;
```

Description

This is DrawDown, a member of class TRibbonQATScrollButton.

77.1.35.3.3 TRibbonQATScrollButton.ScrollMode Property

Pascal

```
property ScrollMode: TQATScrollMode;
```

C++

```
__property TQATScrollMode ScrollMode;
```

Description

This is ScrollMode, a member of class TRibbonQATScrollButton.

77.1.36 TRibbonRadioButtonControl Class

Class Hierarchy

Pascal

```
TRibbonRadioButtonControl = class(TRibbonSmallButtonControl);
```

C++

```
class TRibbonRadioButtonControl : public TRibbonSmallButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonRadioButtonControl.

77.1.36.1 TRibbonRadioButtonControl Members

The following tables list the members exposed by TRibbonRadioButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 7136)	Draws a background image on the control.
	DrawGlyph (see page 7136)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 7136)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.36.2 TRibbonRadioButtonControl Methods

The methods of the TRibbonRadioButtonControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7136)	Draws a background image on the control.
	DrawGlyph (see page 7136)	Draws a symbol on the control.

Public Methods

	Name	Description
	CalcBounds (see page 7136)	Calculates the size of the control.

77.1.36.2.1 TRibbonRadioButtonControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.36.2.2 TRibbonRadioButtonControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.36.2.3 TRibbonRadioButtonControl.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

77.1.37 TRibbonRecentButtonControl Class

Class Hierarchy

Pascal

```
TRibbonRecentButtonControl = class(TRibbonMenuSmallButtonControl);
```

C++

```
class TRibbonRecentButtonControl : public TRibbonMenuSmallButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonRecentButtonControl.

77.1.37.1 TRibbonRecentButtonControl Members

The following tables list the members exposed by TRibbonRecentButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 7138)	This is AllowHotKeys, a member of class TRibbonRecentButtonControl.
	DrawBackground (see page 6985)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseUp (see page 7127)	OnMouseUp event dispatcher.

	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 6983)	Calculates the size of the control.
	CalcBounds (see page 7151)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Create (see page 7126)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.37.2 TRibbonRecentButtonControl Methods

The methods of the TRibbonRecentButtonControl class are listed here.

Protected Methods

	Name	Description
	AllowHotKeys (see page 7138)	This is AllowHotKeys, a member of class TRibbonRecentButtonControl.

77.1.37.2.1 TRibbonRecentButtonControl.AllowHotKeys Method

Pascal

```
function AllowHotKeys: Boolean; override;
```

C++

```
virtual __fastcall Boolean AllowHotKeys();
```

Description

This is AllowHotKeys, a member of class TRibbonRecentButtonControl.

77.1.38 TRibbonRichContentItem Class

Class Hierarchy

Pascal

```
TRibbonRichContentItem = class(TRibbonMenuItem);
```

C++

```
class TRibbonRichContentItem : public TRibbonMenuItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonRichContentItem.

77.1.38.1 TRibbonRichContentItem Members

The following tables list the members exposed by TRibbonRichContentItem.

Protected Methods

	Name	Description
	CalcLayout (see page 7120)	This is CalcLayout, a member of class TRibbonMenuItem.
	CanCalculateHeight (see page 7141)	This is CanCalculateHeight, a member of class TRibbonRichContentItem.
	DrawBackground (see page 7141)	Draws a background image on the control.
	DrawGlyph (see page 7141)	Draws a symbol on the control.
	DrawSelectedBackground (see page 7121)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 7122)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 7142)	This is DrawShadowedText, a member of class TRibbonRichContentItem.
	DrawText (see page 7142)	Draws text on the control.
	GetItemHeight (see page 7142)	This is GetItemHeight, a member of class TRibbonRichContentItem.
	GetItemWidth (see page 7143)	This is GetItemWidth, a member of class TRibbonRichContentItem.
	GetMenuProps (see page 7143)	This is GetMenuProps, a member of class TRibbonRichContentItem.
	GetShowShortCut (see page 7122)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	RibbonStyle (see page 7123)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 7123)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7140)	Calculates the size of the menu item.
	Click (see page 7120)	Executes the control's function.
	Create (see page 7140)	Creates an instance of TCustomMenuItem.

77.1.38.2 TRibbonRichContentItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonRichContentItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Create

Destroy

77.1.38.3 TRibbonRichContentItem Methods

The methods of the TRibbonRichContentItem class are listed here.

Protected Methods

	Name	Description
	CanCalculateHeight (see page 7141)	This is CanCalculateHeight, a member of class TRibbonRichContentItem.
	DrawBackground (see page 7141)	Draws a background image on the control.
	DrawGlyph (see page 7141)	Draws a symbol on the control.
	DrawShadowedText (see page 7142)	This is DrawShadowedText, a member of class TRibbonRichContentItem.
	DrawText (see page 7142)	Draws text on the control.
	GetItemHeight (see page 7142)	This is GetItemHeight, a member of class TRibbonRichContentItem.
	GetItemWidth (see page 7143)	This is GetItemWidth, a member of class TRibbonRichContentItem.
	GetMenuProps (see page 7143)	This is GetMenuProps, a member of class TRibbonRichContentItem.

Public Methods

	Name	Description
	CalcBounds (see page 7140)	Calculates the size of the menu item.

77.1.38.3.1 TRibbonRichContentItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

77.1.38.3.2 TRibbonRichContentItem.CanCalculateHeight Method

Pascal

```
function CanCalculateHeight: Boolean;
```

C++

```
__fastcall Boolean CanCalculateHeight();
```

Description

This is CanCalculateHeight, a member of class TRibbonRichContentItem.

77.1.38.3.3 TRibbonRichContentItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.38.3.4 TRibbonRichContentItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

77.1.38.3.5 TRibbonRichContentItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonRichContentItem.

77.1.38.3.6 TRibbonRichContentItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var Rect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect Rect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

77.1.38.3.7 TRibbonRichContentItem.GetItemHeight Method

Pascal

```
function GetItemHeight: Integer;
```

C++

```
__fastcall int GetItemHeight();
```

Description

This is GetItemHeight, a member of class TRibbonRichContentItem.

77.1.38.3.8 TRibbonRichContentItem.GetItemWidth Method

Pascal

```
function GetItemWidth: Integer;
```

C++

```
__fastcall int GetItemWidth();
```

Description

This is GetItemWidth, a member of class TRibbonRichContentItem.

77.1.38.3.9 TRibbonRichContentItem.GetMenuProps Method

Pascal

```
function GetMenuProps: TMenuProperties;
```

C++

```
__fastcall TMenuProperties GetMenuProps();
```

Description

This is GetMenuProps, a member of class TRibbonRichContentItem.

77.1.39 TRibbonRichContentMainMenuItem Class

Class Hierarchy

Pascal

```
TRibbonRichContentMainMenuItem = class(TRibbonRichContentItem);
```

C++

```
class TRibbonRichContentMainMenuItem : public TRibbonRichContentItem;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonRichContentMainMenuItem.

77.1.39.1 TRibbonRichContentMainMenuItem Members

The following tables list the members exposed by TRibbonRichContentMainMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 7145)	This is CalcLayout, a member of class TRibbonRichContentMainMenuItem.
	CanCalculateHeight (see page 7141)	This is CanCalculateHeight, a member of class TRibbonRichContentItem.
	DrawBackground (see page 7121)	Draws a background image on the control.

	DrawBackground (see page 7141)	Draws a background image on the control.
	DrawGlyph (see page 7145)	Draws a symbol on the control.
	DrawSelectedBackground (see page 7121)	This is DrawSelectedBackground, a member of class TRibbonMenuItem.
	DrawSeparator (see page 7122)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 7122)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 7142)	This is DrawShadowedText, a member of class TRibbonRichContentItem.
	DrawText (see page 7146)	Draws text on the control.
	GetImageSize (see page 7146)	This is GetImageSize, a member of class TRibbonRichContentMainMenuItem.
	GetItemHeight (see page 7142)	This is GetItemHeight, a member of class TRibbonRichContentItem.
	GetItemWidth (see page 7143)	This is GetItemWidth, a member of class TRibbonRichContentItem.
	GetMenuProps (see page 7143)	This is GetMenuProps, a member of class TRibbonRichContentItem.
	GetShowShortCut (see page 7146)	This is GetShowShortCut, a member of class TRibbonRichContentMainMenuItem.
	RibbonStyle (see page 7123)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 7123)	This is DrawBanner, a member of class TRibbonMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7145)	Calculates the size of the menu item.
	Click (see page 7120)	Executes the control's function.
	Create (see page 7144)	Creates an instance of TCustomMenuItem.

77.1.39.2 TRibbonRichContentMainMenuItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonRichContentMainMenuItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

77.1.39.3 TRibbonRichContentMainMenuItem Methods

The methods of the TRibbonRichContentMainMenuItem class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 7145)	This is CalcLayout, a member of class TRibbonRichContentMainMenuItem.
	DrawGlyph (see page 7145)	Draws a symbol on the control.
	DrawText (see page 7146)	Draws text on the control.
	GetImageSize (see page 7146)	This is GetImageSize, a member of class TRibbonRichContentMainMenuItem.
	GetShowShortCut (see page 7146)	This is GetShowShortCut, a member of class TRibbonRichContentMainMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7145)	Calculates the size of the menu item.

77.1.39.3.1 TRibbonRichContentMainMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

SetBounds

77.1.39.3.2 TRibbonRichContentMainMenuItem.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonRichContentMainMenuItem.

77.1.39.3.3 TRibbonRichContentMainMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

77.1.39.3.4 TRibbonRichContentMainMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

77.1.39.3.5 TRibbonRichContentMainMenuItem.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

Description

This is GetImageSize, a member of class TRibbonRichContentMainMenuItem.

77.1.39.3.6 TRibbonRichContentMainMenuItem.GetShowShortCut Method

Pascal

```
function GetShowShortCut: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetShowShortCut();
```

Description

This is GetShowShortCut, a member of class TRibbonRichContentMainMenuItem.

77.1.40 TRibbonSeparator Class

Class Hierarchy

Pascal

```
TRibbonSeparator = class(TCustomActionControl);
```

C++

```
class TRibbonSeparator : public TCustomActionControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSeparator.

77.1.40.1 TRibbonSeparator Members

The following tables list the members exposed by TRibbonSeparator.

Protected Methods

	Name	Description
	DrawBackground (see page 7148)	Draws a background image on the control.
	DrawGlyph (see page 7149)	Draws a symbol on the control.
	DrawShadowedText (see page 7149)	This is DrawShadowedText, a member of class TRibbonSeparator.
	DrawText (see page 7149)	Draws text on the control.
	RibbonStyle (see page 7150)	This is RibbonStyle, a member of class TRibbonSeparator.

Public Methods

	Name	Description
	CalcBounds (see page 7148)	Calculates the size of the control.
	Create (see page 7147)	Creates an instance of TCustomActionControl.

77.1.40.2 TRibbonSeparator.Create Constructor

Creates an instance of TCustomActionControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSeparator(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomActionControl. However, you should never attempt to instantiate a TCustomActionControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the TCustomActionControl instance. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

77.1.40.3 TRibbonSeparator Methods

The methods of the TRibbonSeparator class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7148)	Draws a background image on the control.
	DrawGlyph (see page 7149)	Draws a symbol on the control.
	DrawShadowedText (see page 7149)	This is DrawShadowedText, a member of class TRibbonSeparator.
	DrawText (see page 7149)	Draws text on the control.
	RibbonStyle (see page 7150)	This is RibbonStyle, a member of class TRibbonSeparator.

Public Methods

	Name	Description
	CalcBounds (see page 7148)	Calculates the size of the control.

77.1.40.3.1 TRibbonSeparator.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

77.1.40.3.2 TRibbonSeparator.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.40.3.3 TRibbonSeparator.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

77.1.40.3.4 TRibbonSeparator.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TRibbonSeparator.

77.1.40.3.5 TRibbonSeparator.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

DrawBackground

DrawGlyph

77.1.40.3.6 TRibbonSeparator.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonSeparator.

77.1.41 TRibbonSmallButtonControl Class

Class Hierarchy

Pascal

```
TRibbonSmallButtonControl = class(TRibbonBaseButtonControl);
```

C++

```
class TRibbonSmallButtonControl : public TRibbonBaseButtonControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSmallButtonControl.

77.1.41.1 TRibbonSmallButtonControl Members

The following tables list the members exposed by TRibbonSmallButtonControl.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	DrawBackground (see page 6985)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.
	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.

	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawText (see page 6986)	Draws text on the control.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 7151)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 6984)	Executes the control's function.
	Create (see page 6981)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	KeyTipClick (see page 6988)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.41.2 TRibbonSmallButtonControl Methods

The methods of the TRibbonSmallButtonControl class are listed here.

Public Methods

	Name	Description
	CalcBounds (see page 7151)	Calculates the size of the control.

77.1.41.2.1 TRibbonSmallButtonControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

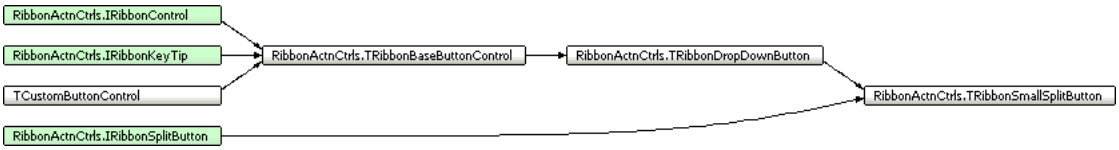
77.1.42 TRibbonSmallSplitButton Class

Class Hierarchy



Pascal

```
TRibbonSmallSplitButton = class(TRibbonDropDownButton, IRibbonSplitButton);
```

C++

```
class TRibbonSmallSplitButton : public TRibbonDropDownButton, public IRibbonSplitButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSmallSplitButton.

77.1.42.1 TRibbonSmallSplitButton Members

The following tables list the members exposed by TRibbonSmallSplitButton.

Protected Fields

	Name	Description
	FCursorInSplit (see page 7154)	This is FCursorInSplit, a member of class TRibbonSmallSplitButton.
	FSplitRect (see page 7154)	This is FSplitRect, a member of class TRibbonSmallSplitButton.

Protected Methods

	Name	Description
	AllowHotKeys (see page 6983)	This is AllowHotKeys, a member of class TRibbonBaseButtonControl.
	CalcLayout (see page 7155)	This is CalcLayout, a member of class TRibbonSmallSplitButton.
	CMMouseLeave (see page 7156)	This is CMMouseLeave, a member of class TRibbonSmallSplitButton.
	DoDropDown (see page 7081)	This is DoDropDown, a member of class TRibbonDropDownButton.
	DrawArrow (see page 7081)	This is DrawArrow, a member of class TRibbonDropDownButton.
	DrawBackground (see page 7156)	Draws a background image on the control.
	DrawGlyph (see page 6985)	Draws a symbol on the control.

	DrawSeparator (see page 6985)	This is DrawSeparator, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 6986)	This is DrawShadowedText, a member of class TRibbonBaseButtonControl.
	DrawShadowedText (see page 7081)	This is DrawShadowedText, a member of class TRibbonDropDownButton.
	DrawText (see page 6986)	Draws text on the control.
	DrawText (see page 7082)	Draws text on the control.
	GetArrowPosition (see page 7157)	This is GetArrowPosition, a member of class TRibbonSmallSplitButton.
	GetImageSize (see page 6986)	This is GetImageSize, a member of class TRibbonBaseButtonControl.
	GetPopupClass (see page 7082)	This is GetPopupClass, a member of class TRibbonDropDownButton.
	InSplit (see page 7157)	This is InSplit, a member of class TRibbonSmallSplitButton.
	IsButton (see page 6988)	This is IsButton, a member of class TRibbonBaseButtonControl.
	IsRibbonAvailable (see page 6988)	This is IsRibbonAvailable, a member of class TRibbonBaseButtonControl.
	MouseDown (see page 7157)	OnMouseDown event dispatcher.
	MouseMove (see page 7158)	Respond to mouse moving over control area..
	RibbonStyle (see page 6988)	This is RibbonStyle, a member of class TRibbonBaseButtonControl.

Protected Properties

	Name	Description
	DrawDown (see page 6990)	This is DrawDown, a member of class TRibbonBaseButtonControl.

Public Methods

	Name	Description
	CalcBounds (see page 7155)	Calculates the size of the control.
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	CanAddToQuickAccessToolbar (see page 6984)	This is CanAddToQuickAccessToolbar, a member of class TRibbonBaseButtonControl.
	Click (see page 7156)	Executes the control's function.
	Create (see page 7153)	Creates an instance of TCustomButtonControl.
	Destroy (see page 6982)	Destroys an instance of TCustomActionControl.
	DragDrop (see page 6984)	Performs actions and generates an OnDragDrop event.
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	GetKeyTip (see page 6986)	Returns current **KeyTip** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HandleKeyTip (see page 6987)	Indicates if command's **KeyTip** matches currently input KeyTip.
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	HideKeyTip (see page 6987)	Hide **KeyTip** for command.
	KeyTipClick (see page 7157)	Handle clicking a **KeyTip**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	SetKeyTip (see page 6989)	Sets **KeyTip** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.
	ShowKeyTip (see page 6989)	Shows **KeyTip** for command in specified position.
	UpdateSplitBounds (see page 7158)	This is UpdateSplitBounds, a member of class TRibbonSmallSplitButton.

Public Properties

	Name	Description
	CursorInSplit (see page 7159)	This is CursorInSplit, a member of class TRibbonSmallSplitButton.
	KeyTip (see page 7282)	Current **KeyTip** for command

77.1.42.2 TRibbonSmallSplitButton.Create Constructor

Creates an instance of TCustomButtonControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSmallSplitButton(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomButtonControl. However, you should never attempt to instantiate a TCustomButtonControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component that is responsible for freeing the button control. It becomes the value of the Owner property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

77.1.42.3 TRibbonSmallSplitButton Fields

The fields of the TRibbonSmallSplitButton class are listed here.

Protected Fields

	Name	Description
	FCursorInSplit (see page 7154)	This is FCursorInSplit, a member of class TRibbonSmallSplitButton.
	FSplitRect (see page 7154)	This is FSplitRect, a member of class TRibbonSmallSplitButton.

77.1.42.3.1 TRibbonSmallSplitButton.FCursorInSplit Field

Pascal

```
FCursorInSplit: Boolean;
```

C++

```
Boolean FCursorInSplit;
```

Description

This is FCursorInSplit, a member of class TRibbonSmallSplitButton.

77.1.42.3.2 TRibbonSmallSplitButton.FSplitRect Field

Pascal

```
FSplitRect: TRect;
```

C++

```
TRect FSplitRect;
```

Description

This is FSplitRect, a member of class TRibbonSmallSplitButton.

77.1.42.4 TRibbonSmallSplitButton Methods

The methods of the TRibbonSmallSplitButton class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 7155)	This is CalcLayout, a member of class TRibbonSmallSplitButton.
	CMMouseLeave (see page 7156)	This is CMMouseLeave, a member of class TRibbonSmallSplitButton.
	DrawBackground (see page 7156)	Draws a background image on the control.
	GetArrowPosition (see page 7157)	This is GetArrowPosition, a member of class TRibbonSmallSplitButton.
	InSplit (see page 7157)	This is InSplit, a member of class TRibbonSmallSplitButton.
	MouseDown (see page 7157)	OnMouseDown event dispatcher.
	MouseMove (see page 7158)	Respond to mouse moving over control area..

Public Methods

	Name	Description
	CalcBounds (see page 7155)	Calculates the size of the control.
	Click (see page 7156)	Executes the control's function.
	KeyTipClick (see page 7157)	Handle clicking a **KeyTip**.
	UpdateSplitBounds (see page 7158)	This is UpdateSplitBounds, a member of class TRibbonSmallSplitButton.

77.1.42.4.1 TRibbonSmallSplitButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

77.1.42.4.2 TRibbonSmallSplitButton.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TRibbonSmallSplitButton.

77.1.42.4.3 TRibbonSmallSplitButton.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl is almost identical to the inherited method. The only difference is that if the button control is being manipulated at design time, extra actions are taken to ensure that the control is properly selected.

Click

UsageCount

77.1.42.4.4 TRibbonSmallSplitButton.CMMouseLeave Method

Pascal

```
procedure CMMouseLeave(var Message: TMessage); override;
```

C++

```
virtual __fastcall CMMouseLeave(TMessage Message);
```

Description

This is CMMouseLeave, a member of class TRibbonSmallSplitButton.

77.1.42.4.5 TRibbonSmallSplitButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.42.4.6 TRibbonSmallSplitButton.GetArrowPosition Method

Pascal

```
function GetArrowPosition(const ARect: TRect): TPoint; override;
```

C++

```
virtual __fastcall TPoint GetArrowPosition(const TRect ARect);
```

Description

This is GetArrowPosition, a member of class TRibbonSmallSplitButton.

77.1.42.4.7 TRibbonSmallSplitButton.InSplit Method

Pascal

```
function InSplit(X: Integer; Y: Integer): Boolean;
```

C++

```
__fastcall Boolean InSplit(int X, int Y);
```

Description

This is InSplit, a member of class TRibbonSmallSplitButton.

77.1.42.4.8 TRibbonSmallSplitButton.KeyTipClick Method

Handle clicking a **KeyTip**.

Pascal

```
procedure KeyTipClick; override;
```

C++

```
virtual __fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip**. Some requires need to be handled differently when clicked by a **KeyTip**.

77.1.42.4.9 TRibbonSmallSplitButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove

MouseUp

OnMouseDown

77.1.42.4.10 TRibbonSmallSplitButton.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

77.1.42.4.11 TRibbonSmallSplitButton.UpdateSplitBounds Method

Pascal

```
procedure UpdateSplitBounds; virtual;
```

C++

```
virtual __fastcall UpdateSplitBounds();
```

Description

This is UpdateSplitBounds, a member of class TRibbonSmallSplitButton.

77.1.42.5 TRibbonSmallSplitButton Properties

The properties of the TRibbonSmallSplitButton class are listed here.

Public Properties

	Name	Description
	CursorInSplit (see page 7159)	This is CursorInSplit, a member of class TRibbonSmallSplitButton.

77.1.42.5.1 TRibbonSmallSplitButton.CursorInSplit Property

Pascal

```
property CursorInSplit: Boolean;
```

C++

```
__property Boolean CursorInSplit;
```

Description

This is CursorInSplit, a member of class TRibbonSmallSplitButton.

77.1.43 TRibbonSpinButton Class

Class Hierarchy

Pascal

```
TRibbonSpinButton = class(TWinControl);
```

C++

```
class TRibbonSpinButton : public TWinControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSpinButton.

77.1.43.1 TRibbonSpinButton Members

The following tables list the members exposed by TRibbonSpinButton.

Protected Methods

	Name	Description
	Control (see page 7161)	This is Control, a member of class TRibbonSpinButton.
	KeyDown (see page 7161)	Respond to key press events.
	Loaded (see page 7162)	Initializes the control after it is loaded from a stream.
	Notification (see page 7162)	Responds to notifications that components are being created or destroyed.

Public Methods

	Name	Description
	Create (see page 7160)	Creates an instance of TWinControl.
	SetBounds (see page 7163)	Sets the windowed control's boundary properties all at once.

Published Events

	Name	Description
	OnDownClick (see page 7183)	This is OnDownClick, a member of class TRibbonSpinButton.
	OnDragDrop (see page 7183)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 7186)	Occurs when the user drags an object over a control.
	OnEndDock (see page 7190)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 7190)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 7191)	Occurs when a control receives the input focus.
	OnExit (see page 7194)	Occurs when the input focus shifts away from one control to another.
	OnStartDock (see page 7196)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 7197)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUpClick (see page 7198)	This is OnUpClick, a member of class TRibbonSpinButton.

Published Properties

	Name	Description
	Align (see page 7164)	Determines how the control aligns within its container (parent control).
	Anchors (see page 7167)	Specifies how the control is anchored to its parent.
	Constraints (see page 7168)	Specifies the size constraints for the control.
	Ctl3D (see page 7169)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DownGlyph (see page 7169)	This is DownGlyph, a member of class TRibbonSpinButton.
	DownNumGlyphs (see page 7169)	This is DownNumGlyphs, a member of class TRibbonSpinButton.
	DragCursor (see page 7170)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 7170)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 7170)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 7172)	Controls whether the control responds to mouse, keyboard, and timer events.
	FocusControl (see page 7172)	This is FocusControl, a member of class TRibbonSpinButton.
	ParentCtl3D (see page 7173)	Determines where a component looks to determine if it should appear three dimensional.
	ParentShowHint (see page 7173)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 7173)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 7178)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 7180)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 7181)	Determines if the user can tab to a control.
	UpGlyph (see page 7181)	This is UpGlyph, a member of class TRibbonSpinButton.
	UpNumGlyphs (see page 7181)	This is UpNumGlyphs, a member of class TRibbonSpinButton.
	Visible (see page 7181)	Determines whether the component appears onscreen.

77.1.43.2 TRibbonSpinButton.Create Constructor

Creates an instance of TWinControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSpinButton(TComponent * AOwner);
```

Description

Call Create to construct and initialize a new control and insert the newly-constructed control into its owner, as specified by the

AOwner parameter. Create inserts the control in the owner by calling the owner's InsertComponent method.

Most controls override Create to initialize their unique properties. Objects that override the Create method must always call the inherited Create method first, and then proceed with the component-specific initialization. Specify the override directive when overriding the Create method.

If a component's Create method allocates resources or memory, override the Destroy method to free those resources.

77.1.43.3 TRibbonSpinButton Methods

The methods of the TRibbonSpinButton class are listed here.

Protected Methods

	Name	Description
	Control (see page 7161)	This is Control, a member of class TRibbonSpinButton.
V	KeyDown (see page 7161)	Respond to key press events.
V	Loaded (see page 7162)	Initializes the control after it is loaded from a stream.
V	Notification (see page 7162)	Responds to notifications that components are being created or destroyed.

Public Methods

	Name	Description
V	SetBounds (see page 7163)	Sets the windowed control's boundary properties all at once.

77.1.43.3.1 TRibbonSpinButton.Control Method

Pascal

```
function Control: TRibbonSpinEdit;
```

C++

```
__fastcall TRibbonSpinEdit Control();
```

Description

This is Control, a member of class TRibbonSpinButton.

77.1.43.3.2 TRibbonSpinButton.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

OnKeyDown

DoKeyDown

DoKeyPress

DoKeyUp

77.1.43.3.3 TRibbonSpinButton.Loaded Method

Initializes the control after it is loaded from a stream.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call Loaded. The VCL streaming system calls Loaded automatically after the control's form is loaded into memory so that the control can complete any initializations that depend on other objects in the form.

Loaded overrides the inherited method in order to initialize the control from its associated Action. To change the properties the control copies from its action, override the ActionChange method.

See Also

Loaded

Action

ActionChange

77.1.43.3.4 TRibbonSpinButton.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

Notification

77.1.43.3.5 TRibbonSpinButton.SetBounds Method

Sets the windowed control's boundary properties all at once.

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

Use SetBounds to change all of the control's boundary properties at once. The same effect can be achieved by setting the Left, Top, Width, and Height properties separately. By setting all four properties at once, SetBounds ensures that the control will not repaint between changes

Specify the values for the Left, Top, Width, and Height properties as the value of the ALeft, ATop, AWidth, and AHeight parameters, respectively.

77.1.43.4 TRibbonSpinButton Properties

The properties of the TRibbonSpinButton class are listed here.

Published Properties

	Name	Description
	Align (see page 7164)	Determines how the control aligns within its container (parent control).
	Anchors (see page 7167)	Specifies how the control is anchored to its parent.
	Constraints (see page 7168)	Specifies the size constraints for the control.
	Ctl3D (see page 7169)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DownGlyph (see page 7169)	This is DownGlyph, a member of class TRibbonSpinButton.
	DownNumGlyphs (see page 7169)	This is DownNumGlyphs, a member of class TRibbonSpinButton.
	DragCursor (see page 7170)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 7170)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 7170)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	Enabled (see page 7172)	Controls whether the control responds to mouse, keyboard, and timer events.
	FocusControl (see page 7172)	This is FocusControl, a member of class TRibbonSpinButton.
	ParentCtl3D (see page 7173)	Determines where a component looks to determine if it should appear three dimensional.
	ParentShowHint (see page 7173)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 7173)	Identifies the pop-up menu associated with the control.
	ShowHint (see page 7178)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 7180)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 7181)	Determines if the user can tab to a control.
	UpGlyph (see page 7181)	This is UpGlyph, a member of class TRibbonSpinButton.
	UpNumGlyphs (see page 7181)	This is UpNumGlyphs, a member of class TRibbonSpinButton.
	Visible (see page 7181)	Determines whether the component appears onscreen.

77.1.43.4.1 TRibbonSpinButton.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of

the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
```

```
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

Parent

Anchors

77.1.43.4.2 TRibbonSpinButton.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent

Align

77.1.43.4.3 TRibbonSpinButton.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

77.1.43.4.4 TRibbonSpinButton.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

77.1.43.4.5 TRibbonSpinButton.DownGlyph Property

Pascal

```
property DownGlyph: TBitmap;
```

C++

```
__property TBitmap DownGlyph;
```

Description

This is DownGlyph, a member of class TRibbonSpinButton.

77.1.43.4.6 TRibbonSpinButton.DownNumGlyphs Property

Pascal

```
property DownNumGlyphs: TNumGlyphs;
```

C++

```
__property TNumGlyphs DownNumGlyphs;
```

Description

This is DownNumGlyphs, a member of class TRibbonSpinButton.

77.1.43.4.7 TRibbonSpinButton.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

77.1.43.4.8 TRibbonSpinButton.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

77.1.43.4.9 TRibbonSpinButton.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

77.1.43.4.10 TRibbonSpinButton.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

Enabling Mouse

77.1.43.4.11 TRibbonSpinButton.FocusControl Property

Pascal

```
property FocusControl: TWinControl;
```

C++

```
__property TWinControl * FocusControl;
```

Description

This is FocusControl, a member of class TRibbonSpinButton.

77.1.43.4.12 TRibbonSpinButton.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

77.1.43.4.13 TRibbonSpinButton.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

77.1.43.4.14 TRibbonSpinButton.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();

                break;
            }
        }
    }
}
```

```
/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;
```

```
procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
}

OnContextPopup

77.1.43.4.15 TRibbonSpinButton.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
```

```
    Edit1.Hint := 'Enter your name';
    Edit1.ShowHint := True;
    with ListBox1 do
    begin
      for I := 1 to 10 do
        Items.Add('Item ' + IntToStr(I));
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }

Displaying Fly-over Help

77.1.43.4.16 TRibbonSpinButton.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl

TabStop

77.1.43.4.17 TRibbonSpinButton.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

TabOrder

77.1.43.4.18 TRibbonSpinButton.UpGlyph Property

Pascal

```
property UpGlyph: TBitmap;
```

C++

```
__property TBitmap UpGlyph;
```

Description

This is UpGlyph, a member of class TRibbonSpinButton.

77.1.43.4.19 TRibbonSpinButton.UpNumGlyphs Property

Pascal

```
property UpNumGlyphs: TNumGlyphs;
```

C++

```
__property TNumGlyphs UpNumGlyphs;
```

Description

This is UpNumGlyphs, a member of class TRibbonSpinButton.

77.1.43.4.20 TRibbonSpinButton.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/

{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
```

```
      begin
        PageControl := PageControl1;
        Caption := 'TabSheet' + IntToStr(i);
        with TEdit.Create(Self) do
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;

77.1.43.5 TRibbonSpinButton Events

The events of the TRibbonSpinButton class are listed here.

Published Events

	Name	Description
	OnDownClick (see page 7183)	This is OnDownClick, a member of class TRibbonSpinButton.
	OnDragDrop (see page 7183)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 7186)	Occurs when the user drags an object over a control.
	OnEndDock (see page 7190)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 7190)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 7191)	Occurs when a control receives the input focus.
	OnExit (see page 7194)	Occurs when the input focus shifts away from one control to another.
	OnStartDock (see page 7196)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 7197)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnUpClick (see page 7198)	This is OnUpClick, a member of class TRibbonSpinButton.

77.1.43.5.1 TRibbonSpinButton.OnDownClick Event

Pascal

```
property OnDownClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDownClick;
```

Description

This is OnDownClick, a member of class TRibbonSpinButton.

77.1.43.5.2 TRibbonSpinButton.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
```

```
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");

TDragObject

77.1.43.5.3 TRibbonSpinButton.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/

77.1.43.5.6 TRibbonSpinButton.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/

Using a Single Navigator for Multiple Datasets

77.1.43.5.7 TRibbonSpinButton.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';
  MaskEdit2.EditMask := '!099.099.099.099;1; ';
  MaskEdit3.EditMask := '!099.099.099.099;1; ';

  MaskEdit2.OnExit := MaskEdit2Exit;
end;

procedure TForm1.MaskEdit2Exit(Sender: TObject);
var
  net1, net2, host1, host2,
  netmask1, netmask2, hostmask1, hostmask2,
  sub_net1, sub_net2, sub_host1, sub_host2: Integer;

  IP, mask: String;

OnEnter

ActiveControl (see page 2145)

77.1.43.5.8 TRibbonSpinButton.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

77.1.43.5.9 TRibbonSpinButton.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSpinEdit.

77.1.44.1 TRibbonSpinEdit Members

The following tables list the members exposed by TRibbonSpinEdit.

Protected Methods

	Name	Description
	CMMouseenter (see page 7201)	This is CMMouseenter, a member of class TRibbonSpinEdit.
	CMMouseleave (see page 7201)	This is CMMouseleave, a member of class TRibbonSpinEdit.
V	CreateParams (see page 7201)	Initializes a window-creation parameter record passed in the Params parameter.
V	CreateWnd (see page 7202)	Creates a Windows control corresponding to the edit control.
V	DownClick (see page 7202)	This is DownClick, a member of class TRibbonSpinEdit.
V	IsValidChar (see page 7203)	This is IsValidChar, a member of class TRibbonSpinEdit.
V	KeyDown (see page 7203)	Respond to key press events.
V	KeyPress (see page 7204)	Respond to keyboard input.
V	SetEnabled (see page 7204)	Sets the value of the Enabled property.
V	SetParent (see page 7205)	Sets the parent of the control.

	UpClick (see page 7206)	This is UpClick, a member of class TRibbonSpinEdit.
	WMKillFocus (see page 7206)	This is WMKillFocus, a member of class TRibbonSpinEdit.

Public Methods

	Name	Description
	Create (see page 7200)	Creates an instance of TCustomEdit.
	Destroy (see page 7200)	Destroys an instance of TWinControl.
	GetChildren (see page 7203)	Calls a specified method for each child of the control.

Public Properties

	Name	Description
	Button (see page 7209)	This is Button, a member of class TRibbonSpinEdit.

Published Events

	Name	Description
	OnChange (see page 7228)	Occurs when the text for the edit control may have changed.
	OnClick (see page 7228)	Occurs when the user clicks the control.
	OnDblClick (see page 7230)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 7230)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 7233)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 7237)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 7238)	Occurs when a control receives the input focus.
	OnExit (see page 7240)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 7243)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 7246)	Occurs when a key is pressed.
	OnKeyUp (see page 7248)	Occurs when the user releases a key that has been pressed.
	OnMouseDown (see page 7249)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 7252)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 7254)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDrag (see page 7256)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Published Properties

	Name	Description
	Anchors (see page 7207)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 7207)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 7208)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	Color (see page 7209)	Specifies the background color of the control.
	Constraints (see page 7210)	Specifies the size constraints for the control.
	Ctl3D (see page 7210)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 7211)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 7211)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditorEnabled (see page 7213)	This is EditorEnabled, a member of class TRibbonSpinEdit.
	Enabled (see page 7213)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 7214)	Controls the attributes of text written on or in the control.
	Increment (see page 7215)	This is Increment, a member of class TRibbonSpinEdit.
	MaxLength (see page 7215)	Specifies the maximum number of characters the user can enter into the edit control.
	MaxValue (see page 7215)	This is MaxValue, a member of class TRibbonSpinEdit.

	MinValue (see page 7216)	This is MinValue, a member of class TRibbonSpinEdit.
	ParentColor (see page 7216)	Determines where a control looks for its color information.
	ParentCtl3D (see page 7216)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 7217)	Determines where a control looks for its font information.
	ParentShowHint (see page 7217)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 7218)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 7223)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 7223)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 7224)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 7225)	Determines if the user can tab to a control.
	Value (see page 7226)	This is Value, a member of class TRibbonSpinEdit.
	Visible (see page 7226)	Determines whether the component appears onscreen.

77.1.44.2 TRibbonSpinEdit.Create Constructor

Creates an instance of TCustomEdit.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSpinEdit(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TCustomEdit.

AOwner is another component, typically the form, that is responsible for freeing the edit control. It becomes the value of the Owner property.

Derived objects that override the Create method should call the inherited Create before performing any additional initialization.

See Also

Owner

77.1.44.3 TRibbonSpinEdit.Destroy Destructor

Destroys an instance of TWinControl.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonSpinEdit();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWinControl reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

Destroy

77.1.44.4 TRibbonSpinEdit Methods

The methods of the TRibbonSpinEdit class are listed here.

Protected Methods

	Name	Description
	CMMouseenter (see page 7201)	This is CMMouseenter, a member of class TRibbonSpinEdit.
	CMMouseleave (see page 7201)	This is CMMouseleave, a member of class TRibbonSpinEdit.
V	CreateParams (see page 7201)	Initializes a window-creation parameter record passed in the Params parameter.
V	CreateWnd (see page 7202)	Creates a Windows control corresponding to the edit control.
V	DownClick (see page 7202)	This is DownClick, a member of class TRibbonSpinEdit.
V	IsValidChar (see page 7203)	This is IsValidChar, a member of class TRibbonSpinEdit.
V	KeyDown (see page 7203)	Respond to key press events.
V	KeyPress (see page 7204)	Respond to keyboard input.
V	SetEnabled (see page 7204)	Sets the value of the Enabled property.
V	SetParent (see page 7205)	Sets the parent of the control.
V	UpClick (see page 7206)	This is UpClick, a member of class TRibbonSpinEdit.
	WMKillFocus (see page 7206)	This is WMKillFocus, a member of class TRibbonSpinEdit.

Public Methods

	Name	Description
V	GetChildren (see page 7203)	Calls a specified method for each child of the control.

77.1.44.4.1 TRibbonSpinEdit.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TRibbonSpinEdit.

77.1.44.4.2 TRibbonSpinEdit.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TRibbonSpinEdit.

77.1.44.4.3 TRibbonSpinEdit.CreateParams Method

Initializes a window-creation parameter record passed in the Params parameter.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. TCustomEdit overrides the inherited method to specify a scrollable single-line edit control that reflects the current values of the BorderStyle, HideSelection, PasswordChar, and ReadOnly properties.

See Also

BorderStyle

CreateWindowHandle

CreateWnd

HideSelection

PasswordChar

ReadOnly

77.1.44.4.4 TRibbonSpinEdit.CreateWnd Method

Creates a Windows control corresponding to the edit control.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called when the edit control is created, and whenever a change to the edit control requires the window to be recreated. After calling the inherited method, CreateWnd sends the newly created window messages to enforce the MaxLength and PasswordChar properties.

See Also

CreateParams

CreateWindowHandle

DestroyWnd

MaxLength

PasswordChar

77.1.44.4.5 TRibbonSpinEdit.DownClick Method

Pascal

```
procedure DownClick(Sender: TObject); virtual;
```

C++

```
virtual __fastcall DownClick(TObject * Sender);
```

Description

This is DownClick, a member of class TRibbonSpinEdit.

77.1.44.4.6 TRibbonSpinEdit.GetChildren Method

Calls a specified method for each child of the control.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren is called by the streaming system that loads and saves components. Applications seldom need to call this routine.

GetChildren executes the callback specified by the Proc parameter for every child control listed by the Controls property that lists the Root parameter as its Owner.

Override GetChildren to limit or augment which child controls are saved with the control. When overriding GetChildren, call the procedure passed as the Proc parameter for every child control that should be saved. The Root parameter indicates the component (usually a form) that owns the control.

See Also

Controls

Owner

77.1.44.4.7 TRibbonSpinEdit.IsValidChar Method

Pascal

```
function IsValidChar(Key: Char): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsValidChar(Char Key);
```

Description

This is IsValidChar, a member of class TRibbonSpinEdit.

77.1.44.4.8 TRibbonSpinEdit.KeyDown Method

Respond to key press events.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

When a windowed control receives a key-down message (WM_KEYDOWN) from Windows, its message handler calls the DoKeyDown method. If DoKeyDown determines that the control should, in fact, process the character, it calls KeyDown, passing the key code and shift-key state in the Key and Shift parameters, respectively.

KeyDown calls any event handler attached to the OnKeyDown event. Override KeyDown to provide other responses in addition to the event-handler call.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use WinAPI virtual key codes to determine the key pressed. For more information, search for virtual key codes in the Win32 Developer's Reference (WIN32.HLP).

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

Either KeyDown or the OnKeyDown event handler it calls can suppress further processing of a key by setting the Key parameter to zero.

See Also

KeyUp

OnKeyDown

DoKeyDown

DoKeyPress

DoKeyUp

77.1.44.4.9 TRibbonSpinEdit.KeyPress Method

Respond to keyboard input.

Pascal

```
procedure KeyPress(var Key: Char); override;
```

C++

```
virtual __fastcall KeyPress(Char Key);
```

Description

When a windowed control receives a key-press message (WM_CHAR) from Windows, its message handler calls the DoKeyPress method. If DoKeyPress determines that the control should, in fact, process the character, it calls KeyPress, passing the key code in the Key parameter.

KeyPress calls any event handler attached to the OnKeyPress event. Override KeyPress to provide other responses in addition to the event-handler call.

Either KeyPress or the OnKeyPress event handler it calls can suppress further processing of a character by setting the Key parameter to zero.

Note: The Key parameter is the character represented by the key that is pressed, not a Windows virtual key code.

KeyDown

KeyUp

OnKeyPress

77.1.44.4.10 TRibbonSpinEdit.SetEnabled Method

Sets the value of the Enabled property.

Pascal

```
procedure SetEnabled(Value: Boolean); override;
```

C++

```
virtual __fastcall SetEnabled(Boolean Value);
```

Description

SetEnabled is the protected write implementation of the Enabled property. After changing the internal representation of the Enabled property, SetEnabled sends a Windows message back to the control so that it can respond to the change. When TControl receives this message, it invalidates the control so that its appearance reflects the change (for example, so that it appears grayed). Some descendants respond to this message in other ways (for example, windowed controls ensure that a disabled control does not have focus).

Override GetEnabled and SetEnabled to change the implementation of the Enabled property. For example, A descendant of TControl might change the way the Enabled property interacts with an associated action. When overriding SetEnabled, be sure to call the inherited method.

See Also

GetEnabled

Enabled

Invalidate

77.1.44.4.11 TRibbonSpinEdit.SetParent Method

Sets the parent of the control.

Pascal

```
procedure SetParent(AParent: TWinControl); override;
```

C++

```
virtual __fastcall SetParent(TWinControl * AParent);
```

Description

SetParent is the protected implementation of the Parent property. Override SetParent to execute additional code when the value of the Parent property changes.

The AParent parameter specifies the new parent of the control.

If the control already has a parent, SetParent removes the control from that parent's list of controls by calling the parent's RemoveControl method. If AParent is not nil (Delphi) or NULL (C++), SetParent calls its InsertControl method to add the control to its list of controls.

The TControl destructor calls SetParent(nil (Delphi) or NULL (C++)) to remove the control from its parent's control list before destroying the component.

77.1.44.4.12 TRibbonSpinEdit.UpClick Method

Pascal

```
procedure UpClick(Sender: TObject); virtual;
```

C++

```
virtual __fastcall UpClick(TObject * Sender);
```

Description

This is UpClick, a member of class TRibbonSpinEdit.

77.1.44.4.13 TRibbonSpinEdit.WMKillFocus Method

Pascal

```
procedure WMKillFocus(var Message: TWMKillFocus); message WM_KILLFOCUS;
```

C++

```
__fastcall WMKillFocus(TWMKillFocus Message);
```

Description

This is WMKillFocus, a member of class TRibbonSpinEdit.

77.1.44.5 TRibbonSpinEdit Properties

The properties of the TRibbonSpinEdit class are listed here.

Public Properties

	Name	Description
R	Button (see page 7209)	This is Button, a member of class TRibbonSpinEdit.

Published Properties

	Name	Description
	Anchors (see page 7207)	Specifies how the control is anchored to its parent.
	AutoSelect (see page 7207)	Determines whether all the text in the edit control is automatically selected when the control gets focus.
	AutoSize (see page 7208)	Determines whether the height of the edit control automatically resizes to accommodate the text.
	Color (see page 7209)	Specifies the background color of the control.
	Constraints (see page 7210)	Specifies the size constraints for the control.
	Ctl3D (see page 7210)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DragCursor (see page 7211)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragMode (see page 7211)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	EditorEnabled (see page 7213)	This is EditorEnabled, a member of class TRibbonSpinEdit.
	Enabled (see page 7213)	Controls whether the control responds to mouse, keyboard, and timer events.
	Font (see page 7214)	Controls the attributes of text written on or in the control.
	Increment (see page 7215)	This is Increment, a member of class TRibbonSpinEdit.
	MaxLength (see page 7215)	Specifies the maximum number of characters the user can enter into the edit control.
	MaxValue (see page 7215)	This is MaxValue, a member of class TRibbonSpinEdit.
	MinValue (see page 7216)	This is MinValue, a member of class TRibbonSpinEdit.
	ParentColor (see page 7216)	Determines where a control looks for its color information.

	ParentCtl3D (see page 7216)	Determines where a component looks to determine if it should appear three dimensional.
	ParentFont (see page 7217)	Determines where a control looks for its font information.
	ParentShowHint (see page 7217)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 7218)	Identifies the pop-up menu associated with the control.
	ReadOnly (see page 7223)	Determines whether the user can change the text of the edit control.
	ShowHint (see page 7223)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	TabOrder (see page 7224)	Indicates the position of the control in its parent's tab order.
	TabStop (see page 7225)	Determines if the user can tab to a control.
	Value (see page 7226)	This is Value, a member of class TRibbonSpinEdit.
	Visible (see page 7226)	Determines whether the component appears onscreen.

77.1.44.5.1 TRibbonSpinEdit.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent

Align

77.1.44.5.2 TRibbonSpinEdit.AutoSelect Property

Determines whether all the text in the edit control is automatically selected when the control gets focus.

Pascal

```
property AutoSelect;
```

C++

```
__property AutoSelect;
```

Description

Set AutoSelect to select all the text when the edit control gets focus. AutoSelect only applies to single-line edit controls.

Use AutoSelect when the user is more likely to replace the text in the edit control than to append to it.

See Also

SelectAll

SelLength

SelStart

SelText

SetSelTextBuf

77.1.44.5.3 TRibbonSpinEdit.AutoSize Property

Determines whether the height of the edit control automatically resizes to accommodate the text.

Pascal

```
property AutoSize;
```

C++

```
__property AutoSize;
```

Description

Use AutoSize to make the edit control adjust its size automatically so the client area accommodates the height of the text. When AutoSize is false, the edit control has a fixed height. When AutoSize is true, the size of the control is readjusted whenever a change occurs that could affect the height of the control, such as a change to the font or border style.

Note: AutoSize only adjusts the height of the edit control. Even with AutoSize set to true, text in the edit control may appear truncated if it extends beyond the width of the control.

C++ Examples:

```
/*
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Edit1->AutoSize = true;
  Edit1->Font->Size = 20;
  Edit1->Text = "The edit box is taller now";
}
```

Delphi Examples:

```
{
{
This example uses an edit box and a button on a form. When
the user clicks the button, the font in the edit box
enlarges, and the edit box enlarges also to accommodate the
larger font size.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Edit1.AutoSize := True;
  Edit1.Font.Size := 20;
  Edit1.Text := 'The edit box is taller now';
end;
```

77.1.44.5.4 TRibbonSpinEdit.Button Property

Pascal

```
property Button: TRibbonSpinButton;
```

C++

```
__property TRibbonSpinButton Button;
```

Description

This is Button, a member of class TRibbonSpinEdit.

77.1.44.5.5 TRibbonSpinEdit.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
```

```
  user to select a color with the dialog box. When a color
  value is selected with the dialog box, it is assigned to
  the shape control.
  }
  procedure TForm1.Button1Click(Sender: TObject);
  begin
    if ColorDialog1.Execute then
      Shape1.Brush.Color := ColorDialog1.Color;
  end;
```

See Also

ParentColor

77.1.44.5.6 TRibbonSpinEdit.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

AutoSize

Align

Anchors

OnConstrainedResize

OnCanResize

77.1.44.5.7 TRibbonSpinEdit.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

77.1.44.5.8 TRibbonSpinEdit.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

77.1.44.5.9 TRibbonSpinEdit.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
```

```
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
  HT: THitTests;
begin
  if TreeView1.Selected = nil then Exit;
  HT := TreeView1.GetHitTestInfoAt(X, Y);
  AnItem := TreeView1.GetNodeAt(X, Y);
  if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
  begin
    if (htOnItem in HT) or (htOnIcon in HT) then
      AttachMode := naAddChild
    else if htNowhere in HT then AttachMode := naAdd
    else if htOnIndent in HT then AttachMode := naInsert;
    TreeView1.Selected.MoveTo(AnItem, AttachMode);
  end;
end;

77.1.44.5.10 TRibbonSpinEdit.EditorEnabled Property

Pascal

```
property EditorEnabled: Boolean;
```

C++

```
__property Boolean EditorEnabled;
```

Description

This is EditorEnabled, a member of class TRibbonSpinEdit.

77.1.44.5.11 TRibbonSpinEdit.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

77.1.44.5.12 TRibbonSpinEdit.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);

```
__property LongInt Increment;
```

Description

This is Increment, a member of class TRibbonSpinEdit.

77.1.44.5.14 TRibbonSpinEdit.MaxLength Property

Specifies the maximum number of characters the user can enter into the edit control.

Pascal

```
property MaxLength;
```

C++

```
__property MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the edit control. A value of 0 indicates that there is no application-defined limit on the length.

Use MaxLength to limit the length of the text in an edit control if that text will be copied into a fixed-length buffer.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered into an edit control.

Note: The unit of MaxLength is characters (not bytes) if the application is using themes.

77.1.44.5.15 TRibbonSpinEdit.MaxValue Property

Pascal

```
property MaxValue: LongInt;
```

C++

```
__property LongInt MaxValue;
```

Description

This is MaxValue, a member of class TRibbonSpinEdit.

77.1.44.5.16 TRibbonSpinEdit.MinValue Property

Pascal

```
property MinValue: LongInt;
```

C++

```
__property LongInt MinValue;
```

Description

This is MinValue, a member of class TRibbonSpinEdit.

77.1.44.5.17 TRibbonSpinEdit.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

77.1.44.5.18 TRibbonSpinEdit.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

77.1.44.5.19 TRibbonSpinEdit.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

ParentShowHint

77.1.44.5.20 TRibbonSpinEdit.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

77.1.44.5.21 TRibbonSpinEdit.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
```

```
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
```

```
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
```

```
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.

OnContextPopup

77.1.44.5.22 TRibbonSpinEdit.ReadOnly Property

Determines whether the user can change the text of the edit control.

Pascal

```
property ReadOnly;
```

C++

```
__property ReadOnly;
```

Description

To restrict the edit control to display only, set the ReadOnly property to true. Set ReadOnly to false to allow the contents of the edit control to be edited.

Setting ReadOnly to true ensures that the text is not altered, while still allowing the user to select text. The selected text can then be manipulated by the application, or copied to the Clipboard.

CopyToClipboard

GetSelTextBuf

77.1.44.5.23 TRibbonSpinEdit.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

ShowHint (see page 1986)

Displaying Fly-over Help

77.1.44.5.24 TRibbonSpinEdit.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

See Also

FindNextControl

TabStop

77.1.44.5.25 TRibbonSpinEdit.TabStop Property

Determines if the user can tab to a control.

Pascal

```
property TabStop;
```

C++

```
__property TabStop;
```

Description

Use the TabStop to allow or disallow access to the control using the Tab key.

If TabStop is true, the control is in the tab order. If TabStop is false, the control is not in the tab order and the user can't press the Tab key to move to the control.

Note: TabStop is not meaningful for a form unless the form assigns another form to be its parent.

TabOrder

77.1.44.5.26 TRibbonSpinEdit.Value Property

Pascal

```
property Value: LongInt;
```

C++

```
__property LongInt Value;
```

Description

This is Value, a member of class TRibbonSpinEdit.

77.1.44.5.27 TRibbonSpinEdit.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;

77.1.44.6 TRibbonSpinEdit Events

The events of the TRibbonSpinEdit class are listed here.

Published Events

	Name	Description
	OnChange (see page 7228)	Occurs when the text for the edit control may have changed.
	OnClick (see page 7228)	Occurs when the user clicks the control.
	OnDblClick (see page 7230)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 7230)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 7233)	Occurs when the user drags an object over a control.
	OnEndDrag (see page 7237)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 7238)	Occurs when a control receives the input focus.

	OnExit (see page 7240)	Occurs when the input focus shifts away from one control to another.
	OnKeyDown (see page 7243)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 7246)	Occurs when a key is pressed.
	OnKeyUp (see page 7248)	Occurs when the user releases a key that has been pressed.
	OnMouseDown (see page 7249)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseMove (see page 7252)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 7254)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDrag (see page 7256)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

77.1.44.6.1 TRibbonSpinEdit.OnChange Event

Occurs when the text for the edit control may have changed.

Pascal

```
property OnChange;
```

C++

```
__property OnChange;
```

Description

Write an OnChange event handler to take specific action whenever the text for the edit control may have changed. Use the Modified property to see if a change actually occurred. The Text property of the edit control will already be updated to reflect any changes. This event provides the first opportunity to respond to modifications that the user types into the edit control.

See Also

Change

Text

77.1.44.6.2 TRibbonSpinEdit.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).

- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
```

```
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

77.1.44.6.4 TRibbonSpinEdit.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*

TDragObject

77.1.44.6.5 TRibbonSpinEdit.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
  property OnDragOver;
```

C++

```
  __property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/

77.1.44.6.6 TRibbonSpinEdit.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;

OnDragDrop

OnDragOver

OnStartDrag

DragKind

77.1.44.6.7 TRibbonSpinEdit.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.

Using a Single Navigator for Multiple Datasets

77.1.44.6.8 TRibbonSpinEdit.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';

OnEnter

ActiveControl (see page 2145)

77.1.44.6.9 TRibbonSpinEdit.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
```

```
  Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
  event to FormKeyUp.  Set the KeyPreview on the form to True.
  Behavior is dependent on keyboard driver(USB, serial, etc).
  */
  void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,

OnKeyPress

OnKeyUp

77.1.44.6.10 TRibbonSpinEdit.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/

void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;

OnKeyDown

OnKeyPress

77.1.44.6.12 TRibbonSpinEdit.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,

OnClick

OnMouseMove

OnMouseUp

MouseCapture

77.1.44.6.13 TRibbonSpinEdit.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
      end;
    if X > StartX then
      begin
```

```
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

OnMouseUp

MouseCapture

77.1.44.6.14 TRibbonSpinEdit.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp;
```

C++

```
__property OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
```

```
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);

OnMouseDown

OnMouseMove

Responding to a Mouse-up Action

77.1.44.6.15 TRibbonSpinEdit.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

77.1.45 TRibbonSplitMenuItem Class

Class Hierarchy

Pascal

```
TRibbonSplitMenuItem = class(TRibbonApplicationMenuItem, IRibbonSplitButton);
```

C++

```
class TRibbonSplitMenuItem : public TRibbonApplicationMenuItem, public IRibbonSplitButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonSplitMenuItem.

77.1.45.1 TRibbonSplitMenuItem Members

The following tables list the members exposed by TRibbonSplitMenuItem.

Protected Fields

	Name	Description
	FMouseInSplit (see page 7259)	This is FMouseInSplit, a member of class TRibbonSplitMenuItem.
	FSplitRect (see page 7259)	This is FSplitRect, a member of class TRibbonSplitMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 7120)	This is CalcLayout, a member of class TRibbonMenuItem.
	DrawBackground (see page 7260)	Draws a background image on the control.
	DrawGlyph (see page 6978)	Draws a symbol on the control.
	DrawGlyph (see page 7121)	Draws a symbol on the control.
	DrawSelectedBackground (see page 7260)	This is DrawSelectedBackground, a member of class TRibbonSplitMenuItem.
	DrawSeparator (see page 6979)	This is DrawSeparator, a member of class TRibbonApplicationMenuItem.
	DrawSeparator (see page 7122)	This is DrawSeparator, a member of class TRibbonMenuItem.
	DrawShadowedText (see page 6979)	This is DrawShadowedText, a member of class TRibbonApplicationMenuItem.
	DrawShadowedText (see page 7122)	This is DrawShadowedText, a member of class TRibbonMenuItem.
	DrawSubMenuGlyph (see page 6979)	This is DrawSubMenuGlyph, a member of class TRibbonApplicationMenuItem.
	DrawText (see page 6980)	Draws text on the control.

	DrawText (see page 7122)	Draws text on the control.
	GetImageSize (see page 6980)	This is GetImageSize, a member of class TRibbonApplicationMenuItem.
	GetShowShortCut (see page 7122)	This is GetShowShortCut, a member of class TRibbonMenuItem.
	IsInSplit (see page 7261)	This is IsInSplit, a member of class TRibbonSplitMenuItem.
	MouseMove (see page 7261)	Respond to mouse moving over control area..
	RibbonStyle (see page 7123)	This is RibbonStyle, a member of class TRibbonMenuItem.

Protected Properties

	Name	Description
	DrawBanner (see page 7123)	This is DrawBanner, a member of class TRibbonMenuItem.
	MouseInSplit (see page 7262)	This is MouseInSplit, a member of class TRibbonSplitMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7259)	Calculates the size of the menu item.
	Click (see page 7260)	Executes the control's function.
	Create (see page 7258)	Creates an instance of TCustomMenuItem.
	UpdateSplitBounds (see page 7261)	This is UpdateSplitBounds, a member of class TRibbonSplitMenuItem.

77.1.45.2 TRibbonSplitMenuItem.Create Constructor

Creates an instance of TCustomMenuItem.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonSplitMenuItem(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TCustomMenuItem. However, you should never attempt to instantiate a TCustomMenuItem. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

After calling the inherited constructor, Create initializes the control, including the following property settings:

Initializes the TCanvas object for its Canvas property.

When overriding Create, always call the inherited Create method first, then proceed with the control's initialization. Remember to specify the override directive when overriding the Create method.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

Destroy

77.1.45.3 TRibbonSplitMenuItem Fields

The fields of the TRibbonSplitMenuItem class are listed here.

Protected Fields

	Name	Description
	FMouseInSplit (see page 7259)	This is FMouseInSplit, a member of class TRibbonSplitMenuItem.
	FSplitRect (see page 7259)	This is FSplitRect, a member of class TRibbonSplitMenuItem.

77.1.45.3.1 TRibbonSplitMenuItem.FMouseInSplit Field

Pascal

```
FMouseInSplit: Boolean;
```

C++

```
Boolean FMouseInSplit;
```

Description

This is FMouseInSplit, a member of class TRibbonSplitMenuItem.

77.1.45.3.2 TRibbonSplitMenuItem.FSplitRect Field

Pascal

```
FSplitRect: TRect;
```

C++

```
TRect FSplitRect;
```

Description

This is FSplitRect, a member of class TRibbonSplitMenuItem.

77.1.45.4 TRibbonSplitMenuItem Methods

The methods of the TRibbonSplitMenuItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7260)	Draws a background image on the control.
	DrawSelectedBackground (see page 7260)	This is DrawSelectedBackground, a member of class TRibbonSplitMenuItem.
	IsInSplit (see page 7261)	This is IsInSplit, a member of class TRibbonSplitMenuItem.
	MouseMove (see page 7261)	Respond to mouse moving over control area..

Public Methods

	Name	Description
	CalcBounds (see page 7259)	Calculates the size of the menu item.
	Click (see page 7260)	Executes the control's function.
	UpdateSplitBounds (see page 7261)	This is UpdateSplitBounds, a member of class TRibbonSplitMenuItem.

77.1.45.4.1 TRibbonSplitMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

77.1.45.4.2 TRibbonSplitMenuItem.Click Method

Executes the control's function.

Pascal

```
procedure Click; override;
```

C++

```
virtual __fastcall Click();
```

Description

This override of the method inherited from TCustomActionControl does little except bring the form containing the item into focus, and prevent the inherited method from being called. The reason for this lack of action is that at runtime, no action should be taken until the primary mouse button is pressed and released, which makes the OnClick event handler responsible for taking action. Click takes place only when the mouse button is first pressed, prior to release.

See Also

OnClick

77.1.45.4.3 TRibbonSplitMenuItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

77.1.45.4.4 TRibbonSplitMenuItem.DrawSelectedBackground Method

Pascal

```
procedure DrawSelectedBackground(ARect: TRect); override;
```

C++

```
virtual __fastcall DrawSelectedBackground(TRect ARect);
```

Description

This is DrawSelectedBackground, a member of class TRibbonSplitMenuItem.

77.1.45.4.5 TRibbonSplitMenuItem.IsInSplit Method

Pascal

```
function IsInSplit(const Pt: TPoint): Boolean;
```

C++

```
__fastcall Boolean IsInSplit(const TPoint Pt);
```

Description

This is IsInSplit, a member of class TRibbonSplitMenuItem.

77.1.45.4.6 TRibbonSplitMenuItem.MouseMove Method

Respond to mouse moving over control area..

Pascal

```
procedure MouseMove(Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseMove(TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseMove method to provide other responses in addition to calling the OnMouseMove event handler when the user moves the mouse.

A control calls MouseMove in response to any of the Windows mouse-move messages (WM_MOUSEMOVE), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively.

As the mouse cursor moves across a control, this method is called repeatedly. Each time it is called, it is with the new coordinates that reflect the continuous path of the mouse cursor across the screen real estate covered by the control's visual representation.

77.1.45.4.7 TRibbonSplitMenuItem.UpdateSplitBounds Method

Pascal

```
procedure UpdateSplitBounds; virtual;
```

C++

```
virtual __fastcall UpdateSplitBounds();
```

Description

This is UpdateSplitBounds, a member of class TRibbonSplitMenuItem.

77.1.45.5 TRibbonSplitMenuItem Properties

The properties of the TRibbonSplitMenuItem class are listed here.

Protected Properties

	Name	Description
	MouseInSplit (see page 7262)	This is MouseInSplit, a member of class TRibbonSplitMenuItem.

77.1.45.5.1 TRibbonSplitMenuItem.MouseInSplit Property

Pascal

```
property MouseInSplit: Boolean;
```

C++

```
__property Boolean MouseInSplit;
```

Description

This is MouseInSplit, a member of class TRibbonSplitMenuItem.

77.1.46 TRibbonStyleMenuButton Class

Top level menus when using Ribbon (see page 6713) Styles in applications not using Ribbon (see page 6713) interface.

Class Hierarchy

Pascal

```
TRibbonStyleMenuButton = class(TCustomMenuButton);
```

C++

```
class TRibbonStyleMenuButton : public TCustomMenuButton;
```

File

RibbonActnCtrls

Description

TRibbonStyleMenuButton is used for the top level menus when using one of the Ribbon (see page 6713) Styles in an application that doesn't use the Ribbon (see page 6713) interface.

77.1.46.1 TRibbonStyleMenuButton Members

The following tables list the members exposed by TRibbonStyleMenuButton.

Protected Methods

	Name	Description
	DrawBackground (see page 7263)	Draws a background image on the control.
	RibbonStyle (see page 7263)	This is RibbonStyle, a member of class TRibbonStyleMenuButton.

77.1.46.2 TRibbonStyleMenuButton Methods

The methods of the TRibbonStyleMenuButton class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7263)	Draws a background image on the control.
	RibbonStyle (see page 7263)	This is RibbonStyle, a member of class TRibbonStyleMenuButton.

77.1.46.2.1 TRibbonStyleMenuButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

```

Description

This is RibbonStyle, a member of class TRibbonStyleMenuButton.

77.1.47 TRibbonTextControl Class

Class Hierarchy

Pascal

```
TRibbonTextControl = class(TCustomActionControl);
```

C++

```
class TRibbonTextControl : public TCustomActionControl;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonTextControl.

77.1.47.1 TRibbonTextControl Members

The following tables list the members exposed by TRibbonTextControl.

Protected Methods

	Name	Description
	DrawBackground (see page 7265)	Draws a background image on the control.
	DrawText (see page 7265)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 7264)	Calculates the size of the control.

77.1.47.2 TRibbonTextControl Methods

The methods of the TRibbonTextControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7265)	Draws a background image on the control.
	DrawText (see page 7265)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 7264)	Calculates the size of the control.

77.1.47.2.1 TRibbonTextControl.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as the presence of an icon, caption, and shortcuts. CalcBounds computes the boundaries of the control considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

class TRibbonToolScrollButton : public TCustomToolScrollBtn;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TRibbonToolScrollButton.

77.1.48.1 TRibbonToolScrollButton Members

The following tables list the members exposed by TRibbonToolScrollButton.

Protected Methods

	Name	Description
	DrawArrows (see page 7266)	This is DrawArrows, a member of class TRibbonToolScrollButton.
	DrawBackground (see page 7266)	Draws a background image on the control.

77.1.48.2 TRibbonToolScrollButton Methods

The methods of the TRibbonToolScrollButton class are listed here.

Protected Methods

	Name	Description
	DrawArrows (see page 7266)	This is DrawArrows, a member of class TRibbonToolScrollButton.
	DrawBackground (see page 7266)	Draws a background image on the control.

77.1.48.2.1 TRibbonToolScrollButton.DrawArrows Method

Pascal

```
procedure DrawArrows; override;
```

C++

```
virtual __fastcall DrawArrows();
```

Description

This is DrawArrows, a member of class TRibbonToolScrollButton.

77.1.48.2.2 TRibbonToolScrollButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

```

C++

```
class TTimerSpeedButton : public TSpeedButton;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.TTimerSpeedButton.

77.1.49.1 TTimerSpeedButton Members

The following tables list the members exposed by TTimerSpeedButton.

Protected Methods

	Name	Description
	CMMouseenter (see page 7268)	This is CMMouseenter, a member of class TTimerSpeedButton.
	CMMouseleave (see page 7269)	This is CMMouseleave, a member of class TTimerSpeedButton.
	MouseDown (see page 7269)	OnMouseDown event dispatcher.
	MouseUp (see page 7269)	OnMouseUp event dispatcher.
	Paint (see page 7270)	Render control surface.

Protected Properties

	Name	Description
	MouseInControl (see page 7271)	This is MouseInControl, a member of class TTimerSpeedButton.

Public Methods

	Name	Description
	Create (see page 7267)	Creates and initializes an instance of TSpeedButton.
	Destroy (see page 7268)	Destroys an instance of TSpeedButton.

Public Properties

	Name	Description
	ButtonStyle (see page 7270)	This is ButtonStyle, a member of class TTimerSpeedButton.
	TimeBtnState (see page 7271)	This is TimeBtnState, a member of class TTimerSpeedButton.

77.1.49.2 TTimerSpeedButton.Create Constructor

Creates and initializes an instance of TSpeedButton.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TTimerSpeedButton(TComponent * AOwner);
```

Description

Call Create to create a speed button at runtime. Speed buttons placed on forms at design time are created automatically.

AOwner is the component, typically a form, that is responsible for freeing the speed button.

See Also

Owner

77.1.49.3 TTimerSpeedButton.Destroy Destructor

Destroys an instance of TSpeedButton.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TTimerSpeedButton();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the speed button is not nil, and only then calls Destroy.

See Also

System::TObject::Free

77.1.49.4 TTimerSpeedButton Methods

The methods of the TTimerSpeedButton class are listed here.

Protected Methods

	Name	Description
	CMMouseenter (see page 7268)	This is CMMouseenter, a member of class TTimerSpeedButton.
	CMMouseleave (see page 7269)	This is CMMouseleave, a member of class TTimerSpeedButton.
V	MouseDown (see page 7269)	OnMouseDown event dispatcher.
V	MouseUp (see page 7269)	OnMouseUp event dispatcher.
V	Paint (see page 7270)	Render control surface.

77.1.49.4.1 TTimerSpeedButton.CMMouseenter Method

Pascal

```
procedure CMMouseenter(var Message: TMessage); message CM_MOUSEENTER;
```

C++

```
__fastcall CMMouseenter(TMessage Message);
```

Description

This is CMMouseenter, a member of class TTimerSpeedButton.

77.1.49.4.2 TTimerSpeedButton.CMMouseleave Method

Pascal

```
procedure CMMouseleave(var Message: TMessage); message CM_MOUSELEAVE;
```

C++

```
__fastcall CMMouseleave(TMessage Message);
```

Description

This is CMMouseleave, a member of class TTimerSpeedButton.

77.1.49.4.3 TTimerSpeedButton.MouseDown Method

OnMouseDown event dispatcher.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user presses the mouse button down while the cursor's hotspot is over the control.

The Button parameter determines which mouse button the user pressed. Shift indicates which shift keys (Shift, Ctrl, or Alt) were down when the user pressed the mouse button. X and Y are the pixel coordinates of the mouse pointer within the client area of the control.

A control calls MouseDown in response to any of the Windows mouse-down messages (WM_LBUTTONDOWN, WM_MBUTTONDOWN, WM_RBUTTONDOWN), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was pressed down: left, right, or middle.

See Also

MouseMove

MouseUp

OnMouseDown

77.1.49.4.4 TTimerSpeedButton.MouseUp Method

OnMouseUp event dispatcher.

Pascal

```
procedure MouseUp(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer); override;
```

C++

```
virtual __fastcall MouseUp(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

Override the protected MouseDown method to provide other responses in addition to calling the OnMouseDown event handler when the user releases a previously pressed mouse button while the cursor's hotspot is over the control.

A control calls MouseUp in response to any of the Windows mouse-up messages (WM_LBUTTONUP, WM_MBUTTONUP, WM_RBUTTONUP), decoding the message parameters into the shift-key state and position, which it passes in the Shift, X, and Y parameters, respectively. The value of the Button parameter indicates which mouse button was released: left, right, or middle

MouseDown

MouseMove

OnMouseUp

77.1.49.4.5 TTimerSpeedButton.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

77.1.49.5 TTimerSpeedButton Properties

The properties of the TTimerSpeedButton class are listed here.

Protected Properties

	Name	Description
	MouseInControl (see page 7271)	This is MouseInControl, a member of class TTimerSpeedButton.

Public Properties

	Name	Description
	ButtonStyle (see page 7270)	This is ButtonStyle, a member of class TTimerSpeedButton.
	TimeBtnState (see page 7271)	This is TimeBtnState, a member of class TTimerSpeedButton.

77.1.49.5.1 TTimerSpeedButton.ButtonStyle Property

Pascal

```
property ButtonStyle: TSpinButtonStyle;
```

C++

```
__property TSpinButtonStyle ButtonStyle;
```

Description

This is ButtonStyle, a member of class TTimerSpeedButton.

77.1.49.5.2 TTimerSpeedButton.MouseInControl Property

Pascal

```
property MouseInControl: Boolean;
```

C++

```
__property Boolean MouseInControl;
```

Description

This is MouseInControl, a member of class TTimerSpeedButton.

77.1.49.5.3 TTimerSpeedButton.TimeBtnState Property

Pascal

```
property TimeBtnState: TTimeBtnState;
```

C++

```
__property TTimeBtnState TimeBtnState;
```

Description

This is TimeBtnState, a member of class TTimerSpeedButton.

77.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IRibbonBarKeyTip (see page 7272)	Action Bars that support KeyTips should implement this interface.
	IRibbonContainedControl (see page 7274)	Interface implemented by controls used as containers for displaying other controls.
	IRibbonControl (see page 7276)	Interface implemented by controls visible in Ribbon (see page 6713) Groups.
	IRibbonGroupDropdown (see page 7277)	This is class RibbonActnCtrls.IRibbonGroupDropdown.
	IRibbonKeyTip (see page 7278)	Commands with a **KeyTip (see page 7282)** should implement this interface.
	IRibbonSplitButton (see page 7282)	Interface implemented by controls that have split button.

77.2.1 IRibbonBarKeyTip Interface

Action Bars that support KeyTips should implement this interface.

Class Hierarchy

RibbonActnCtrls.IRibbonBarKeyTip

Pascal

```
IRibbonBarKeyTip = interface;
```

C++

```
__interface IRibbonBarKeyTip;
```

File

RibbonActnCtrls

Description

Action Bars that support KeyTips should implement IRibbonBarKeyTip. The TRibbonQuickAccessToolbar and TRibbonGroup classes implement this interface.

See Also

TRibbonGroup (see page 6865)

TRibbonQuickAccessToolbar (see page 6911)

77.2.1.1 IRibbonBarKeyTip Members

The following tables list the members exposed by IRibbonBarKeyTip.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 7273)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 7273)	Hide any visible **KeyTip** windows.

	BarShowKeyTips (see page 7274)	Show **KeyTip**s for any commands that support them.

77.2.1.2 IRibbonBarKeyTip Methods

The methods of the IRibbonBarKeyTip class are listed here.

Public Methods

	Name	Description
	BarHandleKeyTips (see page 7273)	Check if any commands on Action Bar are partial or full match for **KeyTip**.
	BarHideKeyTips (see page 7273)	Hide any visible **KeyTip** windows.
	BarShowKeyTips (see page 7274)	Show **KeyTip**s for any commands that support them.

77.2.1.2.1 IRibbonBarKeyTip.BarHandleKeyTips Method

Check if any commands on Action Bar are partial or full match for **KeyTip**.

Pascal

```
procedure BarHandleKeyTips(const KeyTip: string; var KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHandleKeyTips(const UnicodeString KeyTip, TKeyTipList KeyTips);
```

Description

BarHandleKeyTips checks if any commands on the Action Bar are a partial or full match for the **KeyTip**. Matches are returned as a TKeyTipMatchItem (see page 6962) in the `List` parameter. If only one item is a match, that command is executed.

See Also

TKeyTipMatchItem (see page 6962)

BarHideKeyTips (see page 7273)

BarShowKeyTips (see page 7274)

77.2.1.2.2 IRibbonBarKeyTip.BarHideKeyTips Method

Hide any visible **KeyTip** windows.

Pascal

```
procedure BarHideKeyTips(KeyTips: TKeyTipList);
```

C++

```
__fastcall BarHideKeyTips(TKeyTipList KeyTips);
```

Description

BarHideKeyTips hides any visible **KeyTip** windows. `ExceptList` may contain a list of TKeyTipMatchItem (see page 6962) objects for commands that should not be hidden. These items are current partial matches and require additional handling.

See Also

TKeyTipMatchItem (see page 6962)

BarHandleKeyTips (see page 7273)

BarShowKeyTips (see page 7274)

77.2.1.2.3 IRibbonBarKeyTip.BarShowKeyTips Method

Show **KeyTip**s for any commands that support them.

Pascal

```
procedure BarShowKeyTips;
```

C++

```
__fastcall BarShowKeyTips();
```

Description

BarShowKeyTips shows **KeyTip**s for any commands that support them.

See Also

BarHandleKeyTips (see page 7273)

BarHideKeyTips (see page 7273)

77.2.2 IRibbonContainedControl Interface

Interface implemented by controls used as containers for displaying other controls.

Class Hierarchy

Pascal

```
IRibbonContainedControl = interface(IRibbonControl);
```

C++

```
__interface IRibbonContainedControl : public IRibbonControl;
```

File

RibbonActnCtrls

Description

IRibbonContainedControl is an interface implemented by a control that is used as a container for displaying other controls.

See Also

IRibbonControl (see page 7276)

IRibbonSplitButton (see page 7282)

77.2.2.1 IRibbonContainedControl Members

The following tables list the members exposed by IRibbonContainedControl.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.
	GetContainedControl (see page 7275)	This is GetContainedControl, a member of class IRibbonContainedControl.
	SetContainedControl (see page 7275)	This is SetContainedControl, a member of class IRibbonContainedControl.

Public Properties

	Name	Description
	ContainedControl (see page 7275)	This is ContainedControl, a member of class IRibbonContainedControl.

77.2.2.2 IRibbonContainedControl Methods

The methods of the IRibbonContainedControl class are listed here.

Public Methods

	Name	Description
	GetContainedControl (see page 7275)	This is GetContainedControl, a member of class IRibbonContainedControl.
	SetContainedControl (see page 7275)	This is SetContainedControl, a member of class IRibbonContainedControl.

77.2.2.2.1 IRibbonContainedControl.GetContainedControl Method

Pascal

```
function GetContainedControl: TControl;
```

C++

```
__fastcall TControl * GetContainedControl();
```

Description

This is GetContainedControl, a member of class IRibbonContainedControl.

77.2.2.2.2 IRibbonContainedControl.SetContainedControl Method

Pascal

```
procedure SetContainedControl(const Value: TControl);
```

C++

```
__fastcall SetContainedControl(const TControl * Value);
```

Description

This is SetContainedControl, a member of class IRibbonContainedControl.

77.2.2.3 IRibbonContainedControl Properties

The properties of the IRibbonContainedControl class are listed here.

Public Properties

	Name	Description
	ContainedControl (see page 7275)	This is ContainedControl, a member of class IRibbonContainedControl.

77.2.2.3.1 IRibbonContainedControl.ContainedControl Property

Pascal

```
property ContainedControl: TControl;
```

C++

```
__property TControl * ContainedControl;
```

Description

This is ContainedControl, a member of class IRibbonContainedControl.

77.2.3 IRibbonControl Interface

Interface implemented by controls visible in Ribbon (see page 6713) Groups.

Class Hierarchy

Pascal

```
IRibbonControl = interface;
```

C++

```
__interface IRibbonControl;
```

File

RibbonActnCtrls

Description

IRibbonControl is an interface implemented by a control that is visible in Ribbon (see page 6713) Groups.

See Also

IRibbonContainedControl (see page 7274)

IRibbonSplitButton (see page 7282)

77.2.3.1 IRibbonControl Members

The following tables list the members exposed by IRibbonControl.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.

77.2.3.2 IRibbonControl Methods

The methods of the IRibbonControl class are listed here.

Public Methods

	Name	Description
	CanAddToQuickAccessToolbar (see page 7276)	This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.

77.2.3.2.1 IRibbonControl.CanAddToQuickAccessToolbar Method

Pascal

```
function CanAddToQuickAccessToolbar: Boolean;
```

C++

```
__fastcall Boolean CanAddToQuickAccessToolbar();
```

Description

This is CanAddToQuickAccessToolbar, a member of class IRibbonControl.

77.2.4 IRibbonGroupDropdown Interface

Class Hierarchy

RibbonActnCtrls.IRibbonGroupDropdown

Pascal

```
IRibbonGroupDropdown = interface;
```

C++

```
__interface IRibbonGroupDropdown;
```

File

RibbonActnCtrls

Description

This is class RibbonActnCtrls.IRibbonGroupDropdown.

77.2.4.1 IRibbonGroupDropdown Members

The following tables list the members exposed by IRibbonGroupDropdown.

Public Methods

	Name	Description
	CloseUp (see page 7277)	This is CloseUp, a member of class IRibbonGroupDropdown.
	GetParentControl (see page 7278)	This is GetParentControl, a member of class IRibbonGroupDropdown.
	GetTopPosition (see page 7278)	This is GetTopPosition, a member of class IRibbonGroupDropdown.

77.2.4.2 IRibbonGroupDropdown Methods

The methods of the IRibbonGroupDropdown class are listed here.

Public Methods

	Name	Description
	CloseUp (see page 7277)	This is CloseUp, a member of class IRibbonGroupDropdown.
	GetParentControl (see page 7278)	This is GetParentControl, a member of class IRibbonGroupDropdown.
	GetTopPosition (see page 7278)	This is GetTopPosition, a member of class IRibbonGroupDropdown.

77.2.4.2.1 IRibbonGroupDropdown.CloseUp Method

Pascal

```
procedure CloseUp;
```

C++

```
__fastcall CloseUp();
```

Description

This is CloseUp, a member of class IRibbonGroupDropdown.

77.2.4.2.2 IRibbonGroupDropdown.GetParentControl Method

Pascal

```
function GetParentControl: TWinControl;
```

C++

```
__fastcall TWinControl * GetParentControl();
```

Description

This is GetParentControl, a member of class IRibbonGroupDropdown.

77.2.4.2.3 IRibbonGroupDropdown.GetTopPosition Method

Pascal

```
function GetTopPosition: Integer;
```

C++

```
__fastcall int GetTopPosition();
```

Description

This is GetTopPosition, a member of class IRibbonGroupDropdown.

77.2.5 IRibbonKeyTip Interface

Commands with a **KeyTip (see page 7282)** should implement this interface.

Class Hierarchy

Pascal

```
IRibbonKeyTip = interface;
```

C++

```
__interface IRibbonKeyTip;
```

File

RibbonActnCtrls

Description

Commands that have a **KeyTip (see page 7282)** should implement IRibbonKeyTip.

MethodName

EventName

RoutineName

TypeName

VariableName

ConstantName

77.2.5.1 IRibbonKeyTip Members

The following tables list the members exposed by IRibbonKeyTip.

Public Methods

	Name	Description
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.2.5.2 IRibbonKeyTip Methods

The methods of the IRibbonKeyTip class are listed here.

Public Methods

	Name	Description
	GetKeyTip (see page 7279)	Returns current **KeyTip (see page 7282)** for command.
	HandleKeyTip (see page 7280)	Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).
	HideKeyTip (see page 7280)	Hide **KeyTip (see page 7282)** for command.
	KeyTipClick (see page 7281)	Handle clicking a **KeyTip (see page 7282)**.
	SetKeyTip (see page 7281)	Sets **KeyTip (see page 7282)** for command.
	ShowKeyTip (see page 7281)	Shows **KeyTip (see page 7282)** for command in specified position.

77.2.5.2.1 IRibbonKeyTip.GetKeyTip Method

Returns current **KeyTip (see page 7282)** for command.

Pascal

```
function GetKeyTip: string;
```

C++

```
__fastcall UnicodeString GetKeyTip();
```

Description

GetKeyTip returns the current **KeyTip (see page 7282)** for the command

See Also

KeyTip (see page 7282)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.2.5.2.2 IRibbonKeyTip.HandleKeyTip Method

Indicates if command's **KeyTip (see page 7282)** matches currently input KeyTip (see page 7282).

Pascal

```
procedure HandleKeyTip(const KeyTip: string; var Handled: TKeyTipHandled);
```

C++

```
__fastcall HandleKeyTip(const UnicodeString KeyTip, TKeyTipHandled Handled);
```

Description

HandleKeyTip indicates whether this command's

KeyTip (see page 7282) matches the currently input KeyTip (see page 7282) by the user. Full and partial matches are taken into consideration.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.2.5.2.3 IRibbonKeyTip.HideKeyTip Method

Hide **KeyTip (see page 7282)** for command.

Pascal

```
procedure HideKeyTip(const Match: string);
```

C++

```
__fastcall HideKeyTip(const UnicodeString Match);
```

Description

This method hides the **KeyTip (see page 7282)** for this command. If the **Match** parameter matches (full or partial) the command's **KeyTip (see page 7282)**, the **KeyTip (see page 7282)** remains visible.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

SetKeyTip (see page 7281)

ShowKeyTip (see page 7281)

77.2.5.2.4 IRibbonKeyTip.KeyTipClick Method

Handle clicking a **KeyTip (see page 7282)**.

Pascal

```
procedure KeyTipClick;
```

C++

```
__fastcall KeyTipClick();
```

Description

KeyTipClick Handle clicking a **KeyTip (see page 7282)**. Some requires need to be handled differently when clicked by a **KeyTip (see page 7282)**.

77.2.5.2.5 IRibbonKeyTip.SetKeyTip Method

Sets **KeyTip (see page 7282)** for command.

Pascal

```
procedure SetKeyTip(const Value: string);
```

C++

```
__fastcall SetKeyTip(const UnicodeString Value);
```

Description

This method sets the **KeyTip (see page 7282)** for the command.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

ShowKeyTip (see page 7281)

77.2.5.2.6 IRibbonKeyTip.ShowKeyTip Method

Shows **KeyTip (see page 7282)** for command in specified position.

Pascal

```
procedure ShowKeyTip(const Position: TKeyTipPosition);
```

C++

```
__fastcall ShowKeyTip(const TKeyTipPosition Position);
```

Description

This method shows the **KeyTip (see page 7282)** for the command in the position specified. Only the Application (see page 2612) Button uses a **KeyTip (see page 7282)** position.

See Also

KeyTip (see page 7282)

GetKeyTip (see page 7279)

HandleKeyTip (see page 7280)

HideKeyTip (see page 7280)

SetKeyTip (see page 7281)

77.2.5.3 IRibbonKeyTip Properties

The properties of the IRibbonKeyTip class are listed here.

Public Properties

	Name	Description
	KeyTip (see page 7282)	Current **KeyTip** for command

77.2.5.3.1 IRibbonKeyTip.KeyTip Property

Current **KeyTip** for command

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

KeyTip is the current **KeyTip** for the command

See Also

GetKeyTip (see page 7279)

SetKeyTip (see page 7281)

77.2.6 IRibbonSplitButton Interface

Interface implemented by controls that have split button.

Class Hierarchy

Pascal

```
IRibbonSplitButton = interface;
```

C++

```
__interface IRibbonSplitButton;
```

File

RibbonActnCtrls

Description

IRibbonSplitButton is an interface implemented by controls that have a split button.

See Also

IRibbonContainedControl (see page 7274)

IRibbonControl (see page 7276)

77.2.6.1 IRibbonSplitButton Members

The following tables list the members exposed by IRibbonSplitButton.

Public Methods

	Name	Description
	UpdateSplitBounds (see page 7283)	This is UpdateSplitBounds, a member of class IRibbonSplitButton.

77.2.6.2 IRibbonSplitButton Methods

The methods of the IRibbonSplitButton class are listed here.

Public Methods

	Name	Description
	UpdateSplitBounds (see page 7283)	This is UpdateSplitBounds, a member of class IRibbonSplitButton.

77.2.6.2.1 IRibbonSplitButton.UpdateSplitBounds Method

Pascal

```
procedure UpdateSplitBounds;
```

C++

```
__fastcall UpdateSplitBounds();
```

Description

This is UpdateSplitBounds, a member of class IRibbonSplitButton.

77.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DrawLine (see page 7284)	This is function RibbonActnCtrls.DrawLine.
	IsLeftMouseButtonPressed (see page 7284)	This is function RibbonActnCtrls.IsLeftMouseButtonPressed.
	ShowKeyTip (see page 7284)	Show **KeyTip** for control.
	ShowKeyTip (see page 7284)	Show **KeyTip** for control.

77.3.1 RibbonActnCtrls.DrawLine Function

Pascal

```
procedure DrawLine(ACanvas: TCanvas; const AFromPt: TPoint; const AToPt: TPoint);
```

C++

```
DrawLine(TCanvas ACanvas, const TPoint AFromPt, const TPoint AToPt);
```

File

RibbonActnCtrls

Description

This is function RibbonActnCtrls.DrawLine.

77.3.2 RibbonActnCtrls.IsLeftMouseButtonPressed Function

Pascal

```
function IsLeftMouseButtonPressed(Control: TControl): Boolean;
```

C++

```
Boolean IsLeftMouseButtonPressed(TControl * Control);
```

File

RibbonActnCtrls

Description

This is function RibbonActnCtrls.IsLeftMouseButtonPressed.

77.3.3 RibbonActnCtrls.ShowKeyTip Function

Show **KeyTip** for control.

Pascal

```
function ShowKeyTip(const KeyTip: string; const Enabled: Boolean; const Control: TControl;
const Position: TKeyTipPosition): TCustomControl; overload;
function ShowKeyTip(const KeyTip: string; const Enabled: Boolean; const Center: Boolean; const
Rect: TRect; const Position: TKeyTipPosition): TCustomControl; overload;
```

C++

```
TCustomControl ShowKeyTip(const UnicodeString KeyTip, const Boolean Enabled, const TControl *
Control, const TKeyTipPosition Position);
TCustomControl ShowKeyTip(const UnicodeString KeyTip, const Boolean Enabled, const Boolean
Center, const TRect Rect, const TKeyTipPosition Position);
```

File

RibbonActnCtrls

Description

ShowKeyTip shows the **KeyTip** for control.

The parameters are:

- **KeyTip**: The **KeyTip** to display
- **Enabled**: If the **KeyTip** should have an enabled appearance
- **Control**: The control that the **KeyTip** is for. The **KeyTip** displays close to the control
- **Position** - The position of the **KeyTip**. The position of the **KeyTip** can be either **ktpCenter** or **ktpBottom**. Most **KeyTip**s are displayed with the bottom third of the control covered with the **KeyTip**.

77.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TKeyTipHandled (see page 7286)	Validate if command's **KeyTip** matches current user input.
	TKeyTipMatchType (see page 7287)	Type of match command's **KeyTip** is for current **KeyTip** value.
	TKeyTipPosition (see page 7287)	Position of KeyTips.
	TKeyTipState (see page 7288)	Current state of KeyTips.
	TQATScrollMode (see page 7289)	This is record RibbonActnCtrls.TQATScrollMode.
	TSpinButtonStyle (see page 7290)	This is record RibbonActnCtrls.TSpinButtonStyle.

77.4.1 RibbonActnCtrls.TKeyTipHandled Enumeration

Validate if command's **KeyTip** matches current user input.

Pascal

```
TKeyTipHandled = (
  ktNone,
  ktPartial,
  ktFull
);
```

C++

```
enum TKeyTipHandled {
  ktNone,
  ktPartial,
  ktFull
};
```

File

RibbonActnCtrls

Description

Use TKeyTipHandled to validate if a command's **KeyTip** matches the current user input. It can have one of the following values:

Value	Meaning
ktNone	Current KeyTip didn't match the command's **KeyTip**.
ktPartial	Current **KeyTip** matches the first character of the commands **KeyTip**.
ktFull	Current **KeyTip** is a full match for the command. The source **KeyTip** could be either one character or two characters.

See Also

TKeyTipMatchType (see page 7287)

TKeyTipPosition (see page 7287)

TKeyTipState (see page 7288)

77.4.2 RibbonActnCtrls.TKeyTipMatchType Enumeration

Type of match command's **KeyTip** is for current **KeyTip** value.

Pascal

```
TKeyTipMatchType = (
  mtApplicationMenu,
  mtTabs,
  mtControl,
  mtGroup,
  mtCollapsed,
  mtDialogButton
);
```

C++

```
enum TKeyTipMatchType {
  mtApplicationMenu,
  mtTabs,
  mtControl,
  mtGroup,
  mtCollapsed,
  mtDialogButton
};
```

File

RibbonActnCtrls

Description

TKeyTipMatchType is the type of match the command's **KeyTip** is for the current **KeyTip** value. It can have one of the following values:

Value	Meaning
mtApplicationMenu	For ApplicationMenu.
mtTabs	For Tabs.
mtControl	For a Control.
mtGroup	For a Group.
mtCollapsed	For a Collapsed item.
mtDialogButton	For a Dialog Button.

See Also

TKeyTipHandled (see page 7286)

TKeyTipPosition (see page 7287)

TKeyTipState (see page 7288)

77.4.3 RibbonActnCtrls.TKeyTipPosition Enumeration

Position of KeyTips.

Pascal

```
TKeyTipPosition = (
  ktpApplicationButton,
  ktpQuickAccessToolbar,
  ktpTabs,
  ktpGroupA,
  ktpGroupB,
  ktpGroupC,
  ktpGroupD
);
```

C++

```
enum TKeyTipPosition {
  ktpApplicationButton,
  ktpQuickAccessToolbar,
  ktpTabs,
  ktpGroupA,
  ktpGroupB,
  ktpGroupC,
  ktpGroupD
};
```

File

RibbonActnCtrls

Description

TKeyTipPosition is the position of KeyTips. It can have one of the following values:

Value	Meaning
ktpApplicationButton	On Application (see page 2612) Button.
ktpQuickAccessToolbar	On Quick Access Toolbar.
ktpTabs	On tabs.
ktpGroupA	On Group A
ktpGroupB	On Group B
ktpGroupC	On Group C
ktpGroupD	On Group D

See Also

TKeyTipHandled (see page 7286)

TKeyTipMatchType (see page 7287)

TKeyTipState (see page 7288)

77.4.4 RibbonActnCtrls.TKeyTipState Enumeration

Current state of KeyTips.

Pascal

```
TKeyTipState = (
  ktsTabs,
  ktsControls,
```

```
    ktsCollapsedGroup
  );
```

C++

```
  enum TKeyTipState {
    ktsTabs,
    ktsControls,
    ktsCollapsedGroup
  };
```

File

RibbonActnCtrls

Description

TKeyTipState is the current state KeyTips are in. It can have one of the following values:

Value	Meaning
ktsTabs	Initial state where the user hasn't yet selected a Tab to display the `KeyTips` for. In this state, `KeyTips` are displayed for the Application (see page 2612) Button, Quick Access Toolbar and the Tabs.
ktsControls	`KeyTips` are displayed for all commands on the Active Tab. `KeyTips` are also displayed for Groups dialog buttons and collapsed group buttons.
ktsCollapsedGroup	KeyTips are being displayed for commands that are on a collapsed group.

See Also

TKeyTipHandled (see page 7286)

TKeyTipMatchType (see page 7287)

TKeyTipPosition (see page 7287)

77.4.5 RibbonActnCtrls.TQATScrollMode Enumeration

Pascal

```
  TQATScrollMode = (
    qsCustomize,
    qsMoreControls
  );
```

C++

```
  enum TQATScrollMode {
    qsCustomize,
    qsMoreControls
  };
```

File

RibbonActnCtrls

Description

This is record RibbonActnCtrls.TQATScrollMode.

77.4.6 RibbonActnCtrls.TSpinButtonStyle Enumeration

Pascal

```
TSpinButtonStyle = (
  sbsUp,
  sbsDown
);
```

C++

```
enum TSpinButtonStyle {
  sbsUp,
  sbsDown
};
```

File

RibbonActnCtrls

Description

This is record RibbonActnCtrls.TSpinButtonStyle.

77.5 Types

The following table lists types in this documentation.

Types

Name	Description
TNumGlyphs (see page 7291)	This is type RibbonActnCtrls.TNumGlyphs.
TTimeBtnState (see page 7291)	This is type RibbonActnCtrls.TTimeBtnState.

77.5.1 RibbonActnCtrls.TNumGlyphs Type

Pascal

```
TNumGlyphs = Buttons.TNumGlyphs;
```

C++

```
Buttons.TNumGlyphs TNumGlyphs;
```

File

RibbonActnCtrls

Description

This is type RibbonActnCtrls.TNumGlyphs.

77.5.2 RibbonActnCtrls.TTimeBtnState Type

Pascal

```
TTimeBtnState = set of (tbFocusRect, tbAllowTimer);
```

C++

```
(tbFocusRect, tbAllowTimer) TTimeBtnState;
```

File

RibbonActnCtrls

Description

This is type RibbonActnCtrls.TTimeBtnState.

77.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
UM_FADECONTROL (see page 7292)	This is constant RibbonActnCtrls.UM_FADECONTROL.

77.6.1 RibbonActnCtrls.UM_FADECONTROL Constant

Pascal

```
UM_FADECONTROL = WM_USER + 100;
```

C++

```
UM_FADECONTROL = WM_USER + 100;
```

File

RibbonActnCtrls

Description

This is constant RibbonActnCtrls.UM_FADECONTROL.

78 RibbonActnMenus Namespace

This is namespace RibbonActnMenus.

Topics

Name	Description
Classes (see page 7294)	The following table lists classes in this documentation.

Classes

	Name	Description
	TOptionItem (see page 7294)	Item added to OptionItems collection for TRibbonApplicationMenuBar (see page 7302).
	TOptionItems (see page 7298)	Stores additional option items appearing in border of Application Menu.
	TRibbonActionPopupMenu (see page 7300)	Display top level menus when using Ribbon (see page 6713) Style without Ribbon (see page 6713) interface.
	TRibbonApplicationMenuBar (see page 7302)	Display Application Menu for Ribbon (see page 6713).
	TRibbonApplicationPopupMenu (see page 7321)	Ddisplay popup menu when Application Button clicked.
	TRibbonQATCustomizeMenu (see page 7328)	This is class RibbonActnMenus.TRibbonQATCustomizeMenu.
	TRibbonRecentDocuments (see page 7330)	This is class RibbonActnMenus.TRibbonRecentDocuments.
	TRibbonStyleMainPopupMenu (see page 7335)	This is class RibbonActnMenus.TRibbonStyleMainPopupMenu.
	TRibbonStylePopupMenu (see page 7336)	This is class RibbonActnMenus.TRibbonStylePopupMenu.

78.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TOptionItem (see page 7294)	Item added to OptionItems collection for TRibbonApplicationMenuBar (see page 7302).
	TOptionItems (see page 7298)	Stores additional option items appearing in border of Application Menu.
	TRibbonActionPopupMenu (see page 7300)	Display top level menus when using Ribbon (see page 6713) Style without Ribbon (see page 6713) interface.
	TRibbonApplicationMenuBar (see page 7302)	Display Application Menu for Ribbon (see page 6713).
	TRibbonApplicationPopupMenu (see page 7321)	Ddisplay popup menu when Application Button clicked.
	TRibbonQATCustomizeMenu (see page 7328)	This is class RibbonActnMenus.TRibbonQATCustomizeMenu.
	TRibbonRecentDocuments (see page 7330)	This is class RibbonActnMenus.TRibbonRecentDocuments.
	TRibbonStyleMainPopupMenu (see page 7335)	This is class RibbonActnMenus.TRibbonStyleMainPopupMenu.
	TRibbonStylePopupMenu (see page 7336)	This is class RibbonActnMenus.TRibbonStylePopupMenu.

78.1.1 TOptionItem Class

Item added to OptionItems collection for TRibbonApplicationMenuBar (see page 7302).

Class Hierarchy

Pascal

```
TOptionItem = class(TCollectionItem);
```

C++

```
class TOptionItem : public TCollectionItem;
```

File

RibbonActnMenus

Description

TOptionItem is an item added to the OptionItems collection for the TRibbonApplicationMenuBar (see page 7302) component. This class represents the action to use for the command as well as the **KeyTip (see page 7297)** to use.

See Also

TRibbonApplicationMenuBar (see page 7302)

OptionItems (see page 7316)

78.1.1.1 TOptionItem Members

The following tables list the members exposed by TOptionItem.

Protected Methods

	Name	Description
	GetDisplayName (see page 7296)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 7295)	Copies the contents of another, similar object.

Published Properties

	Name	Description
	Action (see page 7296)	This is Action, a member of class TOptionItem.
	Caption (see page 7297)	This is Caption, a member of class TOptionItem.
	Hint (see page 7297)	This is Hint, a member of class TOptionItem.
	KeyTip (see page 7297)	This is KeyTip, a member of class TOptionItem.
	Tag (see page 7297)	This is Tag, a member of class TOptionItem.

78.1.1.2 TOptionItem Methods

The methods of the TOptionItem class are listed here.

Protected Methods

	Name	Description
	GetDisplayName (see page 7296)	Returns the name of the collection item as it appears in the collection editor.

Public Methods

	Name	Description
	Assign (see page 7295)	Copies the contents of another, similar object.

78.1.1.2.1 TOptionItem.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
```

```
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

See Also

AssignTo

EConvertError

78.1.1.2.2 TOptionItem.GetDisplayName Method

Returns the name of the collection item as it appears in the collection editor.

Pascal

```
function GetDisplayName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName is the protected read implementation of the DisplayName property.

See Also

DisplayName

GetNamePath

78.1.1.3 TOptionItem Properties

The properties of the TOptionItem class are listed here.

Published Properties

	Name	Description
	Action (see page 7296)	This is Action, a member of class TOptionItem.
	Caption (see page 7297)	This is Caption, a member of class TOptionItem.
	Hint (see page 7297)	This is Hint, a member of class TOptionItem.
	KeyTip (see page 7297)	This is KeyTip, a member of class TOptionItem.
	Tag (see page 7297)	This is Tag, a member of class TOptionItem.

78.1.1.3.1 TOptionItem.Action Property

Pascal

```
property Action: TContainedAction;
```

C++

```
__property TContainedAction Action;
```

Description

This is Action, a member of class TOptionItem.

78.1.1.3.2 TOptionItem.Caption Property

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

This is Caption, a member of class TOptionItem.

78.1.1.3.3 TOptionItem.Hint Property

Pascal

```
property Hint: string;
```

C++

```
__property UnicodeString Hint;
```

Description

This is Hint, a member of class TOptionItem.

78.1.1.3.4 TOptionItem.KeyTip Property

Pascal

```
property KeyTip: string;
```

C++

```
__property UnicodeString KeyTip;
```

Description

This is KeyTip, a member of class TOptionItem.

78.1.1.3.5 TOptionItem.Tag Property

Pascal

```
property Tag: Integer;
```

C++

```
__property int Tag;
```

Description

This is Tag, a member of class TOptionItem.

78.1.2 TOptionItems Class

Stores additional option items appearing in border of Application Menu.

Class Hierarchy

Pascal

```
TOptionItems = class(TOwnedCollection);
```

C++

```
class TOptionItems : public TOwnedCollection;
```

File

RibbonActnMenus

Description

TOptionItems stores the additional option items that appear in the border of the Application Menu.

See Also

TRibbonApplicationMenuBar (see page 7302)

78.1.2.1 TOptionItems Members

The following tables list the members exposed by TOptionItems.

Public Methods

	Name	Description
	Add (see page 7298)	Creates a new TCollectionItem instance and adds it to the Items array.
	Insert (see page 7299)	Creates a new TCollectionItem instance and adds it to the Items array.

Public Properties

	Name	Description
R	ApplicationMenu (see page 7299)	This is ApplicationMenu, a member of class TOptionItems.
	Items (see page 7300)	Lists the items in the collection.

78.1.2.2 TOptionItems Methods

The methods of the TOptionItems class are listed here.

Public Methods

	Name	Description
	Add (see page 7298)	Creates a new TCollectionItem instance and adds it to the Items array.
	Insert (see page 7299)	Creates a new TCollectionItem instance and adds it to the Items array.

78.1.2.2.1 TOptionItems.Add Method

Creates a new TCollectionItem instance and adds it to the Items array.

Pascal

```
function Add: TOptionItem;
```

C++

```
__fastcall TOptionItem Add();
```

Description

Call Add to create an item in the collection. The new item is placed at the end of the Items array.

Add returns the new collection item.

See Also

Items

Insert

Create

Delete

78.1.2.2.2 TOptionItems.Insert Method

Creates a new TCollectionItem instance and adds it to the Items array.

Pascal

```
function Insert(Index: Integer): TOptionItem;
```

C++

```
__fastcall TOptionItem Insert(int Index);
```

Description

Call Insert to add a new item at a specified position in the collection. Existing items (starting from the specified position) are moved up in the Items array.

Insert returns the new collection item.

See Also

Add

Items

78.1.2.3 TOptionItems Properties

The properties of the TOptionItems class are listed here.

Public Properties

	Name	Description
	ApplicationMenu (see page 7299)	This is ApplicationMenu, a member of class TOptionItems.
	Items (see page 7300)	Lists the items in the collection.

78.1.2.3.1 TOptionItems.ApplicationMenu Property

Pascal

```
property ApplicationMenu: TRibbonApplicationMenuBar;
```

C++

```
__property TRibbonApplicationMenuBar ApplicationMenu;
```

Description

This is ApplicationMenu, a member of class TOptionItems.

78.1.2.3.2 TOptionItems.Items Property

Lists the items in the collection.

Pascal

```
property Items [Index: Integer]: TOptionItem;
```

C++

```
__property TOptionItem Items[int Index];
```

Description

Use Items to access individual items in the collection. The value of the Index parameter corresponds to the Index property of TCollectionItem. It represents the position of the item in the collection.

Count

ItemClass

Index

Add

Insert

78.1.3 TRibbonActionPopupMenu Class

Display top level menus when using Ribbon (see page 6713) Style without Ribbon (see page 6713) interface.

Class Hierarchy

Pascal

```
TRibbonActionPopupMenu = class(TXPStylePopupMenu);
```

C++

```
class TRibbonActionPopupMenu : public TXPStylePopupMenu;
```

File

RibbonActnMenus

Description

TRibbonActionPopupMenu displays top level menus when using the Ribbon (see page 6713) Style without the Ribbon (see page 6713) interface.

78.1.3.1 TRibbonActionPopupMenu Members

The following tables list the members exposed by TRibbonActionPopupMenu.

Protected Methods

	Name	Description
	NCPaint (see page 7301)	This is NCPaint, a member of class TRibbonActionPopupMenu.

Public Methods

	Name	Description
	CreateControl (see page 7301)	This is CreateControl, a member of class TRibbonActionPopupMenu.
	TrackMenu (see page 7302)	Executes the action associated with the menu item.

Public Properties

	Name	Description
	SelectFirstItem (see page 7302)	This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

78.1.3.2 TRibbonActionPopupMenu Methods

The methods of the TRibbonActionPopupMenu class are listed here.

Protected Methods

	Name	Description
	NCPaint (see page 7301)	This is NCPaint, a member of class TRibbonActionPopupMenu.

Public Methods

	Name	Description
	CreateControl (see page 7301)	This is CreateControl, a member of class TRibbonActionPopupMenu.
	TrackMenu (see page 7302)	Executes the action associated with the menu item.

78.1.3.2.1 TRibbonActionPopupMenu.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TRibbonActionPopupMenu.

78.1.3.2.2 TRibbonActionPopupMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TRibbonActionPopupMenu.

78.1.3.2.3 TRibbonActionPopupMenu.TrackMenu Method

Executes the action associated with the menu item.

Pascal

```
procedure TrackMenu; override;
```

C++

```
virtual __fastcall TrackMenu();
```

Description

TrackMenu is called internally to execute the action associated with the selected menu item..

78.1.3.3 TRibbonActionPopupMenu Properties

The properties of the TRibbonActionPopupMenu class are listed here.

Public Properties

	Name	Description
	SelectFirstItem (see page 7302)	This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

78.1.3.3.1 TRibbonActionPopupMenu.SelectFirstItem Property

Pascal

```
property SelectFirstItem: Boolean;
```

C++

```
__property Boolean SelectFirstItem;
```

Description

This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

78.1.4 TRibbonApplicationMenuBar Class

Display Application Menu for Ribbon (see page 6713).

Class Hierarchy

Pascal

```
TRibbonApplicationMenuBar = class(TCustomActionMainMenuBar);
```

C++

```
class TRibbonApplicationMenuBar : public TCustomActionMainMenuBar;
```

File

RibbonActnMenus

Description

TRibbonApplicationMenuBar is used to display the Application Menu for the Ribbon (see page 6713).

The TRibbonApplicationMenuBar component is not available on the component palette and should not be created dynamically. To add an Application Menu to your Ribbon (see page 6713), select the Add Application Menu command in the Ribbon (see page 6713) component editor.

The Application Menu consists of two vertical panes. On the left is a list of Menu items. You can modify the menu items at design time.

On the right is a place to display Recent items. This area is mostly intended for use as a recently used file list. To use this as a Recent Items pane, use the TRibbon.AddRecentItem method to add items. There are a number of Recent Item functions to help you setup the list of items. You can also use the right pane to add more commands. Do this by setting the TApplicationMenu.CommandType to **ctCommand**. See the CommandType property for more details.

The bottom section of the Application button can also display commands. Usually this section is set aside for the Application Exit command and Application Options command. Set your commands in the OptionItems (see page 7316) collection.

To modify the contents of the Application Menu, you can drag actions from the customize dialog and drop them in the menu on the left of the application menu.

See Also

TApplicationMenu (see page 6716)

TRibbon (see page 6845)

CommandType (see page 6720)

AddRecentItem (see page 6735)

78.1.4.1 TRibbonApplicationMenuBar Members

The following tables list the members exposed by TRibbonApplicationMenuBar.

Protected Methods

	Name	Description
	CreateControls (see page 7306)	This is CreateControls, a member of class TRibbonApplicationMenuBar.
	DragOver (see page 7306)	OnDragOver event dispatcher.
	DrawBackground (see page 7306)	This is DrawBackground, a member of class TRibbonApplicationMenuBar.
	GetControlClass (see page 7306)	This is GetControlClass, a member of class TRibbonApplicationMenuBar.
	NewPopup (see page 7307)	This is NewPopup, a member of class TRibbonApplicationMenuBar.
	Notification (see page 7307)	Responds to notifications that components are being created or destroyed.
	Paint (see page 7308)	This is Paint, a member of class TRibbonApplicationMenuBar.
	RibbonStyle (see page 7308)	This is RibbonStyle, a member of class TRibbonApplicationMenuBar.
	ShowKeyTips (see page 7309)	This is ShowKeyTips, a member of class TRibbonApplicationMenuBar.
	WMSysCommand (see page 7309)	This is WMSysCommand, a member of class TRibbonApplicationMenuBar.

Public Methods

	Name	Description
	CloseMenu (see page 7305)	Closes the menu currently being displayed.
	Create (see page 7304)	Creates and initializes a TCustomActionMainMenuBar instance.
	CreateControl (see page 7305)	This is CreateControl, a member of class TRibbonApplicationMenuBar.
	Destroy (see page 7304)	Destroys an instance of TCustomActionMainMenuBar.
	GetRibbon (see page 7307)	This is GetRibbon, a member of class TRibbonApplicationMenuBar.
	SelectApplicationButton (see page 7308)	This is SelectApplicationButton, a member of class TRibbonApplicationMenuBar.
	SetBounds (see page 7308)	Sets the bounds based on whether the popup is expanded or not
	SetRibbon (see page 7309)	This is SetRibbon, a member of class TRibbonApplicationMenuBar.

Public Properties

	Name	Description
	Align (see page 7310)	Determines how the control aligns within its container (parent control).
	HorzMargin (see page 7315)	Specifies the width of the horizontal margins in pixels.
	Spacing (see page 7316)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	VertMargin (see page 7318)	Specifies the width of the vertical margins in pixels.
R	VisibleMenu (see page 7319)	This is VisibleMenu, a member of class TRibbonApplicationMenuBar.
R	VisibleMenuCount (see page 7319)	This is VisibleMenuCount, a member of class TRibbonApplicationMenuBar.

Published Properties

	Name	Description
	ActionManager (see page 7310)	Specifies the action manager component that is associated with the action band.
	Height (see page 7314)	Specifies the vertical size of the control in pixels.
	Left (see page 7315)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	OptionItems (see page 7316)	Commands displayed at bottom of Application Menu.
	RecentItems (see page 7316)	Recent items displayed in right pane of Application.
	Top (see page 7317)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 7319)	Specifies the horizontal size of the control or form in pixels.

78.1.4.2 TRibbonApplicationMenuBar.Create Constructor

Creates and initializes a TCustomActionMainMenuBar instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonApplicationMenuBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionMainMenuBar and initializes its properties.

```
__fastcall virtual TCustomActionMainMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMainMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

78.1.4.3 TRibbonApplicationMenuBar.Destroy Destructor

Destroys an instance of TCustomActionMainMenuBar.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonApplicationMenuBar();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMainMenuBar reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free

Destroy

78.1.4.4 TRibbonApplicationMenuBar Methods

The methods of the TRibbonApplicationMenuBar class are listed here.

Protected Methods

	Name	Description
	CreateControls (see page 7306)	This is CreateControls, a member of class TRibbonApplicationMenuBar.
	DragOver (see page 7306)	OnDragOver event dispatcher.
	DrawBackground (see page 7306)	This is DrawBackground, a member of class TRibbonApplicationMenuBar.
	GetControlClass (see page 7306)	This is GetControlClass, a member of class TRibbonApplicationMenuBar.
	NewPopup (see page 7307)	This is NewPopup, a member of class TRibbonApplicationMenuBar.
	Notification (see page 7307)	Responds to notifications that components are being created or destroyed.
	Paint (see page 7308)	This is Paint, a member of class TRibbonApplicationMenuBar.
	RibbonStyle (see page 7308)	This is RibbonStyle, a member of class TRibbonApplicationMenuBar.
	ShowKeyTips (see page 7309)	This is ShowKeyTips, a member of class TRibbonApplicationMenuBar.
	WMSysCommand (see page 7309)	This is WMSysCommand, a member of class TRibbonApplicationMenuBar.

Public Methods

	Name	Description
	CloseMenu (see page 7305)	Closes the menu currently being displayed.
	CreateControl (see page 7305)	This is CreateControl, a member of class TRibbonApplicationMenuBar.
	GetRibbon (see page 7307)	This is GetRibbon, a member of class TRibbonApplicationMenuBar.
	SelectApplicationButton (see page 7308)	This is SelectApplicationButton, a member of class TRibbonApplicationMenuBar.
	SetBounds (see page 7308)	Sets the bounds based on whether the popup is expanded or not
	SetRibbon (see page 7309)	This is SetRibbon, a member of class TRibbonApplicationMenuBar.

78.1.4.4.1 TRibbonApplicationMenuBar.CloseMenu Method

Closes the menu currently being displayed.

Pascal

```
procedure CloseMenu; override;
```

C++

```
virtual __fastcall CloseMenu();
```

Description

CloseMenu is called to close the menu currently being displayed, including any submenus that may be open.

78.1.4.4.2 TRibbonApplicationMenuBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TRibbonApplicationMenuBar.

78.1.4.4.3 TRibbonApplicationMenuBar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TRibbonApplicationMenuBar.

78.1.4.4.4 TRibbonApplicationMenuBar.DragOver Method

OnDragOver event dispatcher.

Pascal

```
procedure DragOver(Source: TObject; X: Integer; Y: Integer; State: TDragState; var Accept:
Boolean); override;
```

C++

```
virtual __fastcall DragOver(TObject * Source, int X, int Y, TDragState State, Boolean Accept);
```

Description

Override DragOver to add additional code that executes before the OnDragOver event handler is called.

DragOver sets the Accept parameter to true to indicate that the user can drop the dragged object on the control. It sets Accept to false to indicate that the user cannot drop the dragged object on the control.

The Source parameter is the object being dragged. The State parameter indicates how the dragged object is moving in relation to the control. X and Y indicate the current position of the mouse.

DragDrop

OnDragOver

78.1.4.4.5 TRibbonApplicationMenuBar.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TRibbonApplicationMenuBar.

78.1.4.4.6 TRibbonApplicationMenuBar.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TRibbonApplicationMenuBar.

78.1.4.4.7 TRibbonApplicationMenuBar.GetRibbon Method

Pascal

```
function GetRibbon: TWinControl;
```

C++

```
__fastcall TWinControl * GetRibbon();
```

Description

This is GetRibbon, a member of class TRibbonApplicationMenuBar.

78.1.4.4.8 TRibbonApplicationMenuBar.NewPopup Method

Pascal

```
function NewPopup: TCustomActionPopupMenu; override;
```

C++

```
virtual __fastcall TCustomActionPopupMenu NewPopup();
```

Description

This is NewPopup, a member of class TRibbonApplicationMenuBar.

78.1.4.4.9 TRibbonApplicationMenuBar.Notification Method

Responds to notifications that components are being created or destroyed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification allows TControl to update its PopupMenu property when the pop-up menu it refers to is destroyed.

Override the Notification method to respond to notifications that other components are about to be destroyed or have just been created. Use the Notification method to update controls that rely on other objects. Remove references to objects that are going away so that the control does not refer to objects that have been destroyed. For example, data-aware objects override the Notification method to update themselves when their data source is removed. Some objects respond to notifications that other objects of a specific type are being created. For example, the session component sets the Session property of new data-aware controls to itself when the AutoSessionName property is true.

By default, components pass along the notification to their owned components, if any.

Notification

78.1.4.4.10 TRibbonApplicationMenuBar.Paint Method

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

This is Paint, a member of class TRibbonApplicationMenuBar.

78.1.4.4.11 TRibbonApplicationMenuBar.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonApplicationMenuBar.

78.1.4.4.12 TRibbonApplicationMenuBar.SelectApplicationButton Method

Pascal

```
procedure SelectApplicationButton;
```

C++

```
__fastcall SelectApplicationButton();
```

Description

This is SelectApplicationButton, a member of class TRibbonApplicationMenuBar.

78.1.4.4.13 TRibbonApplicationMenuBar.SetBounds Method

Sets the bounds based on whether the popup is expanded or not

Pascal

```
procedure SetBounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer);
override;
```

C++

```
virtual __fastcall SetBounds(int ALeft, int ATop, int AWidth, int AHeight);
```

Description

SetBounds calls the inherited method after altering the AWidth and AHeight parameters (if necessary) to include the width and height of the expanded popup menu. For more information about SetBounds, see the documentation for the inherited method.

SetBounds

78.1.4.4.14 TRibbonApplicationMenuBar.SetRibbon Method

Pascal

```
procedure SetRibbon(const Value: TWinControl);
```

C++

```
__fastcall SetRibbon(const TWinControl * Value);
```

Description

This is SetRibbon, a member of class TRibbonApplicationMenuBar.

78.1.4.4.15 TRibbonApplicationMenuBar.ShowKeyTips Method

Pascal

```
procedure ShowKeyTips;
```

C++

```
__fastcall ShowKeyTips();
```

Description

This is ShowKeyTips, a member of class TRibbonApplicationMenuBar.

78.1.4.4.16 TRibbonApplicationMenuBar.WMSysCommand Method

Pascal

```
procedure WMSysCommand(var Message: TWMSysCommand); message WM_SYSCOMMAND;
```

C++

```
__fastcall WMSysCommand(TWMSysCommand Message);
```

Description

This is WMSysCommand, a member of class TRibbonApplicationMenuBar.

78.1.4.5 TRibbonApplicationMenuBar Properties

The properties of the TRibbonApplicationMenuBar class are listed here.

Public Properties

	Name	Description
	Align (see page 7310)	Determines how the control aligns within its container (parent control).
	HorzMargin (see page 7315)	Specifies the width of the horizontal margins in pixels.
	Spacing (see page 7316)	Determines where the image and text appear on an action band's rendered control that represents the action client.
	VertMargin (see page 7318)	Specifies the width of the vertical margins in pixels.
R	VisibleMenu (see page 7319)	This is VisibleMenu, a member of class TRibbonApplicationMenuBar.
R	VisibleMenuCount (see page 7319)	This is VisibleMenuCount, a member of class TRibbonApplicationMenuBar.

Published Properties

	Name	Description
	ActionManager (see page 7310)	Specifies the action manager component that is associated with the action band.
	Height (see page 7314)	Specifies the vertical size of the control in pixels.

	Left (see page 7315)	Specifies the horizontal coordinate of the left edge of a component relative to its parent.
	OptionItems (see page 7316)	Commands displayed at bottom of Application Menu.
	RecentItems (see page 7316)	Recent items displayed in right pane of Application.
	Top (see page 7317)	Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.
	Width (see page 7319)	Specifies the horizontal size of the control or form in pixels.

78.1.4.5.1 TRibbonApplicationMenuBar.ActionManager Property

Specifies the action manager component that is associated with the action band.

Pascal

```
property ActionManager;
```

C++

```
__property ActionManager;
```

Description

Use ActionManager to access the action manager that uses this action band to render UI elements it manages. Typically, this association is created when you drag actions from the action manager and drop them on the action bar. When an action is dropped on an action band and the ActionManager property is not assigned, the ActionManager property is automatically assigned to the action manager that manages the action that was dropped on the action band.

At runtime, you can perform the equivalent operation to dragging an action onto the action band by setting the ActionBar property of one of the action clients that the action manager's ActionBars property lists so that it specifies this component.

ActionBars

ActionClient

ActionBar

78.1.4.5.2 TRibbonApplicationMenuBar.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
```

```
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane - a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
```

```
  the bottom of the form.
  }

  var
    I: Integer;

Anchors

78.1.4.5.3 TRibbonApplicationMenuBar.Height Property

Specifies the vertical size of the control in pixels.

Pascal

```
property Height;
```

C++

```
__property Height;
```

Description

Use the Height property to read or change the height of the control.

C++ Examples:

```
/*
This example needs only a blank form.  Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
*/
#include <ComCtrls.hpp>

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int I = 0; I <= 2; I++)
  {
    TRichEdit *pRich = new TRichEdit(this);
    pRich->Parent = this;
    pRich->Top = pRich->Height * I;
    pRich->Text = "This text will take the focus.";
    pRich->SelStart = 0;
    pRich->SelLength = pRich->Text.Length();
    if (I == 1)
      pRich->HideSelection = false;
  }
}
```

Delphi Examples:

```
{
This example needs only a blank form. Three Rich Edit
controls are placed vertically on the form, each contain a
line of text, and the second form has HideSelection set to
false.  Try tabbing between the three Rich Edit controls and
observe the effect on the selected text.
}
uses ComCtrls;

procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  for I := 0 to 2 do
    with TRichEdit.Create(Self) do
    begin
      Parent := Self;
      Top := Height * I;
      Text := 'This text will take the focus.';
      SelStart := 0;
      SelLength := Length(Text);
      if (I = 1) then
        HideSelection := False;
```

```
    end;
end;
```

ClientHeight

Width

Using TDBListBox and TDBComboBox

78.1.4.5.4 TRibbonApplicationMenuBar.HorzMargin Property

Specifies the width of the horizontal margins in pixels.

Pascal

```
property HorzMargin;
```

C++

```
__property HorzMargin;
```

Description

HorzMargin specifies the width of the action band's left and right horizontal margins in pixels.

See Also

VertMargin

VertSeparator

78.1.4.5.5 TRibbonApplicationMenuBar.Left Property

Specifies the horizontal coordinate of the left edge of a component relative to its parent.

Pascal

```
property Left;
```

C++

```
__property Left;
```

Description

Use the Left property to determine where the left side of the control begins or to reposition the left side of the control.

If the control is contained in another control, the Left and Top properties are relative to the parent control. If the control is contained directly by the form, the property values are relative to the form. For forms, the value of the Left property is relative to the screen in pixels.

C++ Examples:

```
/*
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
*/
void __fastcall TForm1::Timer1Timer(TObject *Sender)
{
  Timer1->Interval = 100;
  if (ActiveControl)
    ActiveControl->Left = ActiveControl->Left + 1;
```

```
}
```

Delphi Examples:

```
{
Place a TTimer object in the form and enter Timer1Timer in
the OnTimer event.  Place other controls in the form and
change the active control at runtime.  The following event
handler responds to timer events by moving the active control
one pixel to the right every 100 miliseconds:
}
procedure TForm1.Timer1Timer(Sender: TObject);
begin
  Timer1.Interval := 100;
  if ActiveControl <> nil then
    ActiveControl.Left := ActiveControl.Left + 1;
end;
```

78.1.4.5.6 TRibbonApplicationMenuBar.OptionItems Property

Commands displayed at bottom of Application Menu.

Pascal

```
property OptionItems: TOptionItems;
```

C++

```
__property TOptionItems OptionItems;
```

Description

OptionItems are displayed at the bottom of the Application Menu. Usually this section of commands has Application Exit and Application Options commands.

78.1.4.5.7 TRibbonApplicationMenuBar.RecentItems Property

Recent items displayed in right pane of Application.

Pascal

```
property RecentItems: TOptionItems;
```

C++

```
__property TOptionItems RecentItems;
```

Description

RecentItems are displayed in the right pane of the Application Menu. RecentItems can be added dynamically using one of the RecentItems helper methods. To handle the user clicking on a Recent Item, use the OnRecentItemClick event.

See Also

OnRecentItemClick (see page 6863)

78.1.4.5.8 TRibbonApplicationMenuBar.Spacing Property

Determines where the image and text appear on an action band's rendered control that represents the action client.

Pascal

```
property Spacing;
```

C++

```
__property Spacing;
```

Description

Spacing is used internally to set the number of pixels that should appear between the image specified in an action client's ImageIndex and the text specified in its Caption property.

See Also

Caption

ImageIndex

78.1.4.5.9 TRibbonApplicationMenuBar.Top Property

Specifies the Y coordinate of the top left corner of a control, relative to its parent or containing control in pixels.

Pascal

```
property Top;
```

C++

```
__property Top;
```

Description

Use Top to locate the top of the control or reposition the control to a different Y coordinate. The Top property, like the Left property, is the position of the control relative to its container. Thus, if a control is contained in a TPanel, the Left and Top properties are relative to the panel. If the control is contained directly by the form, it is relative to the form. For forms, the value of the Top property is relative to the screen in pixels.

C++ Examples:

```
/*
This example uses an updown control and a group box on a
form, with several controls contained within the group box.
When the updown control or is clicked, the controls within
the group box are moved in the appropriate direction.
*/
void __fastcall TForm1::UpDown1Click(TObject *Sender, TUDBtnType Button)
{
  int I;
  TControl *ChildControl;

  for (I = 0; I < GroupBox1->ControlCount; I++)
  {
    ChildControl = GroupBox1->Controls[I];
    if (Button == btNext)
      ChildControl->Top = ChildControl->Top + 15;
    else
      ChildControl->Top = ChildControl->Top - 15;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  const TColor colorarray[5] = {clYellow, clGreen, clBlue, clLime, clFuchsia};
  GroupBox1->Brush->Color = clRed;
  for (int i = 0; i < GroupBox1->ControlCount; i++)
    dynamic_cast<TWinControl *>(GroupBox1->Controls[i])->Brush->Color = colorarray[i];
```

```
}
```

Delphi Examples:

```
{
This example uses an updown control and a group box on a
form, with several controls contained within the group box.
When the updown control is clicked, the controls within
the group box are moved in the appropriate direction.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
const
  colorarray : Array[0..4] of TColor = (clYellow, clGreen, clBlue, clLime, clFuchsia);
begin
   GroupBox1.Brush.Color := clRed;
  for I:= 0 to GroupBox1.ControlCount -1 do
  begin
    TWinControl(GroupBox1.Controls[I]).Brush.Color := colorarray[I];
  end;
end;

procedure TForm1.UpDown1Click(Sender: TObject; Button: TUDBtnType);
var
  I: Integer;
  ChildControl: TControl;
begin
  for I:= 0 to GroupBox1.ControlCount -1 do
  begin
    ChildControl := GroupBox1.Controls[I];
    if Button = btNext then
      ChildControl.Top := ChildControl.Top + 15
    else
      ChildControl.Top := ChildControl.Top - 15;
  end;
end;
```

HorzMargin

HorzSeparator

78.1.4.5.11 TRibbonApplicationMenuBar.VisibleMenu Property

Pascal

```
property VisibleMenu: TCustomActionMenuBar;
```

C++

```
__property TCustomActionMenuBar VisibleMenu;
```

Description

This is VisibleMenu, a member of class TRibbonApplicationMenuBar.

78.1.4.5.12 TRibbonApplicationMenuBar.VisibleMenuCount Property

Pascal

```
property VisibleMenuCount: Integer;
```

C++

```
__property int VisibleMenuCount;
```

Description

This is VisibleMenuCount, a member of class TRibbonApplicationMenuBar.

78.1.4.5.13 TRibbonApplicationMenuBar.Width Property

Specifies the horizontal size of the control or form in pixels.

Pascal

```
property Width;
```

C++

```
__property Width;
```

Description

Use the Width property to read or change the width of the control.

Note: For tab sheet controls, changing this property at runtime has no effect.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
```

```
  objects.
    TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

    // Line up the directory list box on the left of the form.
    pdlb->Parent = Form1;
    pdlb->Align = alLeft;
    pdlb->Width = Form1->ClientWidth/3;

    // Now use the splitter to divide the directory pane from the file pane.
    ps->Parent = Form1;
    ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
    ps->Align = pdlb->Align; // Give same alignment as directory list.

    // Each pane must be at least one quarter of the form's width.
    ps->MinSize = Form1->ClientWidth/4;

    // Finally, create the last pane - a file list box.
    pflb->Parent = Form1;
    pflb->Align = alClient;
    pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
  { each pane must be at least one quarter of the form's width }
  Split.MinSize := Form1.ClientWidth div 4;
  { Finally, create the last pane – a file list box }
  Files := TFileListBox.Create(Form1);
  Files.Parent := Form1;
  Files.Align := alClient;
  Dirs.FileList := Files; { link the file list box to the directory list box }
end;

78.1.5 TRibbonApplicationPopupMenu Class

Ddisplay popup menu when Application Button clicked.

Class Hierarchy

Pascal

```
TRibbonApplicationPopupMenu = class(TCustomActionPopupMenu);
```

C++

```
class TRibbonApplicationPopupMenu : public TCustomActionPopupMenu;
```

File

RibbonActnMenus

Description

TRibbonApplicationPopupMenu is used to display the popup menu when the Application Button has been clicked. The Application Popup Menu is a two paned menu that shows a normal list of commands on the left pane, as well as a specialized list of commands on the right pane. Additional commands can also be displayed in the bottom border of the menu.

78.1.5.1 TRibbonApplicationPopupMenu Members

The following tables list the members exposed by TRibbonApplicationPopupMenu.

Protected Methods

	Name	Description
	AlignControls (see page 7323)	Aligns any controls for which the control is the parent within a specified area of the control.
	CMTextchanged (see page 7323)	This is CMTextchanged, a member of class TRibbonApplicationPopupMenu.
	CreateControls (see page 7323)	This is CreateControls, a member of class TRibbonApplicationPopupMenu.
	CreateOptionsItems (see page 7324)	This is CreateOptionsItems, a member of class TRibbonApplicationPopupMenu.
	CreateRecentDocuments (see page 7324)	This is CreateRecentDocuments, a member of class TRibbonApplicationPopupMenu.
	CreateWnd (see page 7324)	Creates the underlying window.
	CustomAlignPosition (see page 7325)	Returns aligned position of custom-aligned child control.
	DoDropActions (see page 7325)	This is DoDropActions, a member of class TRibbonApplicationPopupMenu.
	DoDropItem (see page 7326)	This is DoDropItem, a member of class TRibbonApplicationPopupMenu.
	DrawBackground (see page 7326)	This is DrawBackground, a member of class TRibbonApplicationPopupMenu.
	GetBorderHeight (see page 7326)	This is GetBorderHeight, a member of class TRibbonApplicationPopupMenu.
	NCPaint (see page 7327)	This is NCPaint, a member of class TRibbonApplicationPopupMenu.
	PositionPopup (see page 7327)	This is PositionPopup, a member of class TRibbonApplicationPopupMenu.
	RibbonStyle (see page 7327)	This is RibbonStyle, a member of class TRibbonApplicationPopupMenu.
	SetColorMap (see page 7327)	This is SetColorMap, a member of class TRibbonApplicationPopupMenu.

Public Methods

	Name	Description
	Create (see page 7322)	Creates and initializes a TCustomActionPopupMenu instance.
	Destroy (see page 7322)	Destroys an instance of TCustomActionMenuBar.

	DoDropCategory (see page 7326)	This is DoDropCategory, a member of class TRibbonApplicationPopupMenu.
	GetRibbon (see page 7326)	This is GetRibbon, a member of class TRibbonApplicationPopupMenu.
	SetRibbon (see page 7328)	This is SetRibbon, a member of class TRibbonApplicationPopupMenu.

78.1.5.2 TRibbonApplicationPopupMenu.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonApplicationPopupMenu(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

78.1.5.3 TRibbonApplicationPopupMenu.Destroy Destructor

Destroys an instance of TCustomActionMenuBar.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonApplicationPopupMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMenuBar reference is not nil, and only then calls Destroy.

System::TObject::Free

Destroy

78.1.5.4 TRibbonApplicationPopupMenu Methods

The methods of the TRibbonApplicationPopupMenu class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 7323)	Aligns any controls for which the control is the parent within a specified area of the control.
	CMTextchanged (see page 7323)	This is CMTextchanged, a member of class TRibbonApplicationPopupMenu.
	CreateControls (see page 7323)	This is CreateControls, a member of class TRibbonApplicationPopupMenu.
	CreateOptionsItems (see page 7324)	This is CreateOptionsItems, a member of class TRibbonApplicationPopupMenu.
	CreateRecentDocuments (see page 7324)	This is CreateRecentDocuments, a member of class TRibbonApplicationPopupMenu.
	CreateWnd (see page 7324)	Creates the underlying window.

	CustomAlignPosition (see page 7325)	Returns aligned position of custom-aligned child control.
	DoDropActions (see page 7325)	This is DoDropActions, a member of class TRibbonApplicationPopupMenu.
	DoDropItem (see page 7326)	This is DoDropItem, a member of class TRibbonApplicationPopupMenu.
	DrawBackground (see page 7326)	This is DrawBackground, a member of class TRibbonApplicationPopupMenu.
	GetBorderHeight (see page 7326)	This is GetBorderHeight, a member of class TRibbonApplicationPopupMenu.
	NCPaint (see page 7327)	This is NCPaint, a member of class TRibbonApplicationPopupMenu.
	PositionPopup (see page 7327)	This is PositionPopup, a member of class TRibbonApplicationPopupMenu.
	RibbonStyle (see page 7327)	This is RibbonStyle, a member of class TRibbonApplicationPopupMenu.
	SetColorMap (see page 7327)	This is SetColorMap, a member of class TRibbonApplicationPopupMenu.

Public Methods

	Name	Description
	DoDropCategory (see page 7326)	This is DoDropCategory, a member of class TRibbonApplicationPopupMenu.
	GetRibbon (see page 7326)	This is GetRibbon, a member of class TRibbonApplicationPopupMenu.
	SetRibbon (see page 7328)	This is SetRibbon, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.1 TRibbonApplicationPopupMenu.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

See Also

Align

78.1.5.4.2 TRibbonApplicationPopupMenu.CMTextchanged Method

Pascal

```
procedure CMTextchanged(var Message: TMessage); message CM_TEXTCHANGED;
```

C++

```
__fastcall CMTextchanged(TMessage Message);
```

Description

This is CMTextchanged, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.3 TRibbonApplicationPopupMenu.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.4 TRibbonApplicationPopupMenu.CreateOptionsItems Method

Pascal

```
procedure CreateOptionsItems; virtual;
```

C++

```
virtual __fastcall CreateOptionsItems();
```

Description

This is CreateOptionsItems, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.5 TRibbonApplicationPopupMenu.CreateRecentDocuments Method

Pascal

```
procedure CreateRecentDocuments; virtual;
```

C++

```
virtual __fastcall CreateRecentDocuments();
```

Description

This is CreateRecentDocuments, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.6 TRibbonApplicationPopupMenu.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

CreateParams

CreateWindowHandle

Perform

DestroyWnd

78.1.5.4.7 TRibbonApplicationPopupMenu.CustomAlignPosition Method

Returns aligned position of custom-aligned child control.

Pascal

```
procedure CustomAlignPosition(Control: TControl; var NewLeft: Integer; var NewTop: Integer;
var NewWidth: Integer; var NewHeight: Integer; var AlignRect: TRect; AlignInfo: TAlignInfo);
override;
```

C++

```
virtual __fastcall CustomAlignPosition(TControl * Control, int NewLeft, int NewTop, int
NewWidth, int NewHeight, TRect AlignRect, TAlignInfo AlignInfo);
```

Description

CustomAlignPosition determines the specific position of custom-aligned child controls. CustomAlignPosition is called once for each child control with an Align property of **alCustom**, in an order previously determined by calls to CustomAlignInsertBefore.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition.

These are the parameters:

Control	The child control being placed.
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. CustomAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. CustomAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, CustomAlignPosition does nothing.

78.1.5.4.8 TRibbonApplicationPopupMenu.DoDropActions Method

Pascal

```
procedure DoDropActions(Source: TActionDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropActions(TActionDragObject Source, const int X, const int Y);
```

Description

This is DoDropActions, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.9 TRibbonApplicationPopupMenu.DoDropCategory Method

Pascal

```
procedure DoDropCategory(Source: TCategoryDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropCategory(TCategoryDragObject Source, const int X, const int Y);
```

Description

This is DoDropCategory, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.10 TRibbonApplicationPopupMenu.DoDropItem Method

Pascal

```
procedure DoDropItem(Source: TActionItemDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropItem(TActionItemDragObject Source, const int X, const int Y);
```

Description

This is DoDropItem, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.11 TRibbonApplicationPopupMenu.DrawBackground Method

Pascal

```
procedure DrawBackground; override;
```

C++

```
virtual __fastcall DrawBackground();
```

Description

This is DrawBackground, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.12 TRibbonApplicationPopupMenu.GetBorderHeight Method

Pascal

```
function GetBorderHeight: Integer; virtual;
```

C++

```
virtual __fastcall int GetBorderHeight();
```

Description

This is GetBorderHeight, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.13 TRibbonApplicationPopupMenu.GetRibbon Method

Pascal

```
function GetRibbon: TWinControl;
```

C++

```
__fastcall TWinControl * GetRibbon();
```

Description

This is GetRibbon, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.14 TRibbonApplicationPopupMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.15 TRibbonApplicationPopupMenu.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.16 TRibbonApplicationPopupMenu.RibbonStyle Method

Pascal

```
function RibbonStyle: TRibbonStyleActionBars;
```

C++

```
__fastcall TRibbonStyleActionBars RibbonStyle();
```

Description

This is RibbonStyle, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.17 TRibbonApplicationPopupMenu.SetColorMap Method

Pascal

```
procedure SetColorMap(const Value: TCustomActionBarColorMap); override;
```

C++

```
virtual __fastcall SetColorMap(const TCustomActionBarColorMap Value);
```

Description

This is SetColorMap, a member of class TRibbonApplicationPopupMenu.

78.1.5.4.18 TRibbonApplicationPopupMenu.SetRibbon Method

Pascal

```
procedure SetRibbon(const Value: TWinControl);
```

C++

```
__fastcall SetRibbon(const TWinControl * Value);
```

Description

This is SetRibbon, a member of class TRibbonApplicationPopupMenu.

78.1.6 TRibbonQATCustomizeMenu Class

Class Hierarchy

Pascal

```
TRibbonQATCustomizeMenu = class(TCustomizeActionToolBar);
```

C++

```
class TRibbonQATCustomizeMenu : public TCustomizeActionToolBar;
```

File

RibbonActnMenus

Description

This is class RibbonActnMenus.TRibbonQATCustomizeMenu.

78.1.6.1 TRibbonQATCustomizeMenu Members

The following tables list the members exposed by TRibbonQATCustomizeMenu.

Protected Methods

	Name	Description
	DisplayShadow (see page 7329)	This is DisplayShadow, a member of class TRibbonQATCustomizeMenu.
	DoAddCustomizeItems (see page 7329)	This is DoAddCustomizeItems, a member of class TRibbonQATCustomizeMenu.
	GetControlClass (see page 7329)	This is GetControlClass, a member of class TRibbonQATCustomizeMenu.
	HideShadow (see page 7329)	This is HideShadow, a member of class TRibbonQATCustomizeMenu.
	NCPaint (see page 7330)	This is NCPaint, a member of class TRibbonQATCustomizeMenu.
	PositionPopup (see page 7330)	This is PositionPopup, a member of class TRibbonQATCustomizeMenu.
	VisibleChanging (see page 7330)	Provides the interface for a method that responds to changes in the control's visibility.

78.1.6.2 TRibbonQATCustomizeMenu Methods

The methods of the TRibbonQATCustomizeMenu class are listed here.

Protected Methods

	Name	Description
	DisplayShadow (see page 7329)	This is DisplayShadow, a member of class TRibbonQATCustomizeMenu.
	DoAddCustomizeItems (see page 7329)	This is DoAddCustomizeItems, a member of class TRibbonQATCustomizeMenu.
	GetControlClass (see page 7329)	This is GetControlClass, a member of class TRibbonQATCustomizeMenu.
	HideShadow (see page 7329)	This is HideShadow, a member of class TRibbonQATCustomizeMenu.
	NCPaint (see page 7330)	This is NCPaint, a member of class TRibbonQATCustomizeMenu.
	PositionPopup (see page 7330)	This is PositionPopup, a member of class TRibbonQATCustomizeMenu.
	VisibleChanging (see page 7330)	Provides the interface for a method that responds to changes in the control's visibility.

78.1.6.2.1 TRibbonQATCustomizeMenu.DisplayShadow Method

Pascal

```
procedure DisplayShadow; override;
```

C++

```
virtual __fastcall DisplayShadow();
```

Description

This is DisplayShadow, a member of class TRibbonQATCustomizeMenu.

78.1.6.2.2 TRibbonQATCustomizeMenu.DoAddCustomizeItems Method

Pascal

```
procedure DoAddCustomizeItems(const ActionClient: TActionClient); override;
```

C++

```
virtual __fastcall DoAddCustomizeItems(const TActionClient ActionClient);
```

Description

This is DoAddCustomizeItems, a member of class TRibbonQATCustomizeMenu.

78.1.6.2.3 TRibbonQATCustomizeMenu.GetControlClass Method

Pascal

```
function GetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TActionClientItem AnItem);
```

Description

This is GetControlClass, a member of class TRibbonQATCustomizeMenu.

78.1.6.2.4 TRibbonQATCustomizeMenu.HideShadow Method

Pascal

```
procedure HideShadow; override;
```

C++

```
virtual __fastcall HideShadow();
```

Description

This is HideShadow, a member of class TRibbonQATCustomizeMenu.

78.1.6.2.5 TRibbonQATCustomizeMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TRibbonQATCustomizeMenu.

78.1.6.2.6 TRibbonQATCustomizeMenu.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TRibbonQATCustomizeMenu.

78.1.6.2.7 TRibbonQATCustomizeMenu.VisibleChanging Method

Provides the interface for a method that responds to changes in the control's visibility.

Pascal

```
procedure VisibleChanging; override;
```

C++

```
virtual __fastcall VisibleChanging();
```

Description

VisibleChanging is called before the value of a control's Visible property changes. As implemented in TControl, it does nothing. Override VisibleChanging to respond to changes in the control's visibility. For example, if a control should not change its visibility, override VisibleChanging to raise an exception when an attempt is made to alter the control's visibility.

Visible

78.1.7 TRibbonRecentDocuments Class

Class Hierarchy

Pascal

```
TRibbonRecentDocuments = class(TGraphicControl);
```

C++

```
class TRibbonRecentDocuments : public TGraphicControl;
```

File

RibbonActnMenus

Description

This is class RibbonActnMenus.TRibbonRecentDocuments.

78.1.7.1 TRibbonRecentDocuments Members

The following tables list the members exposed by TRibbonRecentDocuments.

Protected Methods

	Name	Description
	Paint (see page 7332)	Render control surface.

Public Methods

	Name	Description
	Create (see page 7331)	Creates an instance of TGraphicControl.

Published Properties

	Name	Description
	Caption (see page 7332)	Specifies a text string that identifies the control to the user.

78.1.7.2 TRibbonRecentDocuments.Create Constructor

Creates an instance of TGraphicControl.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonRecentDocuments(TComponent * AOwner);
```

Description

Calling Create constructs and initializes an instance of TGraphicControl. However, you should never attempt to instantiate a TGraphicControl. This class is intended solely as a base class from which other control classes descend and you should only call Create to instantiate one of these descendants.

AOwner is the component, typically a form, that is responsible for freeing the graphic control. It becomes the value of the Owner property. If you do not explicitly provide an Owner to the constructor (that is, if AOwner is nil (Delphi) or NULL (C++)), your application is responsible for explicitly freeing the graphic control.

Note: If a component's constructor allocates resources or memory, also override the destructor to free those resources.

See Also

Owner

Create

Destroy

78.1.7.3 TRibbonRecentDocuments Methods

The methods of the TRibbonRecentDocuments class are listed here.

Protected Methods

	Name	Description
	Paint (see page 7332)	Render control surface.

78.1.7.3.1 TRibbonRecentDocuments.Paint Method

Render control surface.

Pascal

```
procedure Paint; override;
```

C++

```
virtual __fastcall Paint();
```

Description

The Paint method is called automatically when a lightweight control needs update its display area. Code in the Paint method uses the Canvas property to render the control surface.

As implemented in TGraphicControl, Paint does nothing. Specific rendering logic is provided by Paint methods in descendant control classes.

See Also

Canvas

78.1.7.4 TRibbonRecentDocuments Properties

The properties of the TRibbonRecentDocuments class are listed here.

Published Properties

	Name	Description
	Caption (see page 7332)	Specifies a text string that identifies the control to the user.

78.1.7.4.1 TRibbonRecentDocuments.Caption Property

Specifies a text string that identifies the control to the user.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text string that labels the control.

To underline a character in a Caption that labels a component, include an ampersand (&) before the character. This type of character is called an accelerator character. The user can then select the component by pressing Alt while typing the underlined

character. To display an ampersand character in the caption, use two ampersands (&&).

Note: Controls that display text use either the Caption property or the Text property to specify the text value. Which property is used depends on the type of control. In general, Caption is used for text that appears as a window title or label, while Text is used for text that appears as the content of a control.

C++ Examples:

```
/*
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  Label1->AutoSize = false;
  Label1->Caption = "This string is too long to be the caption of this label";
}
/*
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would make a TTabSheet variable unnecessary since
PageControl1.->ActivePage is already of type TTabSheet.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TTabSheet *sheet = PageControl1->ActivePage;
  sheet->Caption = Edit1->Text;
}
/*
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
*/
#include <comctrls.hpp>
#include <memory>

void AddButtons(TToolBar *toolBar, TStringList *captions)
{
  for (int i = 0; i < captions->Count; i++)
  {
    TToolButton *button = new TToolButton(toolBar);  // The owner (toolBar) will clean this up.
    button->Parent = toolBar;
    button->Caption = captions->Strings[i];
    if (button->Caption == "|")
      button->Style = tbsSeparator;
    else
      button->Style = tbsButton;
  }
}

TToolBar *myToolBar;

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  myToolBar = new TToolBar(this); // The owner (this) will clean this up.
  myToolBar->Parent = this;
//  TStringList *captions = new TStringList();
  std::auto_ptr<TStringList> captions(new TStringList());
```

```
  captions->Add("New");
  captions->Add("Save");
  captions->Add("|");
  captions->Add("Cut");
  captions->Add("Copy");
  captions->Add("Paste");
  AddButtons(myToolBar, captions.get());
//  delete captions;
  myToolBar->ShowCaptions = True;
  myToolBar->Height = 40;
}
```

Delphi Examples:

```
{
The following code keeps the size of the label control
constant, even though the length of the label's caption
changes. As a result, the caption of the label is probably
too long to display in the label when the user clicks the
button:
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  Label1.AutoSize := False;
  Label1.Caption :=
    'This string is too long to be the caption of this label';
end;
{
This example requires a TPageControl populated by several
TabSheets, a TEdit and a TButton. When the button is
clicked, the caption of the active tab changes to that of
the TEdit.  These lines of code could also be written:
PageControl1.ActivePage.Caption := Edit1.Text;
This would obviate the need for a TTabSheet variable since
PageControl1.->ActivePage is already of type TTabSheet.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  sheet: TTabSheet;
begin
  sheet := PageControl1.ActivePage;
  sheet.Caption := Edit1.Text;
end;
{
This example creates a ToolBar and adds ToolButtons to it.
Include ComCtlrs in the uses clause.
}
procedure AddButtons(ToolBar: TToolBar;
  Const ButtonCaptions: array of String);
var
  I: Integer;
begin
  for I := 0 to High(ButtonCaptions) do

78.1.8 TRibbonStyleMainPopupMenu Class

Class Hierarchy

Pascal

```
TRibbonStyleMainPopupMenu = class(TCustomActionPopupMenu);
```

C++

```
class TRibbonStyleMainPopupMenu : public TCustomActionPopupMenu;
```

File

RibbonActnMenus

Description

This is class RibbonActnMenus.TRibbonStyleMainPopupMenu.

78.1.8.1 TRibbonStyleMainPopupMenu Members

The following tables list the members exposed by TRibbonStyleMainPopupMenu.

Protected Methods

	Name	Description
	NCPaint (see page 7336)	This is NCPaint, a member of class TRibbonStyleMainPopupMenu.
	PositionPopup (see page 7336)	This is PositionPopup, a member of class TRibbonStyleMainPopupMenu.

Public Methods

	Name	Description
	Create (see page 7335)	Creates and initializes a TCustomActionPopupMenu instance.

78.1.8.2 TRibbonStyleMainPopupMenu.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonStyleMainPopupMenu(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

78.1.8.3 TRibbonStyleMainPopupMenu Methods

The methods of the TRibbonStyleMainPopupMenu class are listed here.

Protected Methods

	Name	Description
	NCPaint (see page 7336)	This is NCPaint, a member of class TRibbonStyleMainPopupMenu.
	PositionPopup (see page 7336)	This is PositionPopup, a member of class TRibbonStyleMainPopupMenu.

78.1.8.3.1 TRibbonStyleMainPopupMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TRibbonStyleMainPopupMenu.

78.1.8.3.2 TRibbonStyleMainPopupMenu.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TRibbonStyleMainPopupMenu.

78.1.9 TRibbonStylePopupMenu Class

Class Hierarchy

Pascal

```
TRibbonStylePopupMenu = class(TRibbonActionPopupMenu);
```

C++

```
class TRibbonStylePopupMenu : public TRibbonActionPopupMenu;
```

File

RibbonActnMenus

Description

This is class RibbonActnMenus.TRibbonStylePopupMenu.

78.1.9.1 TRibbonStylePopupMenu Members

The following tables list the members exposed by TRibbonStylePopupMenu.

Protected Methods

	Name	Description
	AlignControls (see page 7338)	Aligns any controls for which the control is the parent within a specified area of the control.
	CanAutoSize (see page 7339)	Indicates how the control can be resized.
	NCPaint (see page 7301)	This is NCPaint, a member of class TRibbonActionPopupMenu.
	WMExitsizemove (see page 7339)	This is WMExitsizemove, a member of class TRibbonStylePopupMenu.
	WMNCHitTest (see page 7340)	This is WMNCHitTest, a member of class TRibbonStylePopupMenu.

Public Methods

	Name	Description
	Create (see page 7337)	Creates and initializes a TCustomActionPopupMenu instance.
	CreateControl (see page 7339)	This is CreateControl, a member of class TRibbonStylePopupMenu.
	Destroy (see page 7338)	Destroys an instance of TCustomActionMenuBar.
	TrackMenu (see page 7302)	Executes the action associated with the menu item.

Public Properties

	Name	Description
	GalleryResize (see page 7340)	This is GalleryResize, a member of class TRibbonStylePopupMenu.
	SelectFirstItem (see page 7302)	This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

78.1.9.2 TRibbonStylePopupMenu.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRibbonStylePopupMenu(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

78.1.9.3 TRibbonStylePopupMenu.Destroy Destructor

Destroys an instance of TCustomActionMenuBar.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonStylePopupMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMenuBar reference is not nil, and only then calls Destroy.

System::TObject::Free

Destroy

78.1.9.4 TRibbonStylePopupMenu Methods

The methods of the TRibbonStylePopupMenu class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 7338)	Aligns any controls for which the control is the parent within a specified area of the control.
	CanAutoSize (see page 7339)	Indicates how the control can be resized.
	WMExitsizemove (see page 7339)	This is WMExitsizemove, a member of class TRibbonStylePopupMenu.
	WMNCHitTest (see page 7340)	This is WMNCHitTest, a member of class TRibbonStylePopupMenu.

Public Methods

	Name	Description
	CreateControl (see page 7339)	This is CreateControl, a member of class TRibbonStylePopupMenu.

78.1.9.4.1 TRibbonStylePopupMenu.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

See Also

Align

78.1.9.4.2 TRibbonStylePopupMenu.CanAutoSize Method

Indicates how the control can be resized.

Pascal

```
function CanAutoSize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanAutoSize(int NewWidth, int NewHeight);
```

Description

CanAutoSize is called automatically when the AutoSize property is true and an attempt is made to resize the control. It allows controls to implement the AutoSize property before the resize sequence that begins with the OnCanResize and OnConstrainedResize events and ends with the OnResize event.

When CanAutoSize is called, the NewWidth and NewHeight parameters indicate the proposed new dimensions of the control. CanAutoSize adjusts these values so that the control's size adjusts to its contents. If the adjustment results in values of NewWidth and NewHeight that differ from the control's current width and height, CanAutoSize returns true, indicating that the resize sequence should proceed. If, after adjustment, NewWidth and NewHeight equal Width and Height, CanAutoSize returns false, and the resize sequence is aborted.

As implemented in TWinControl, CanAutoSize returns true, adjusting NewWidth and NewHeight so that all the control's children fit.

Constraints

ConstrainedResize

AdjustSize

78.1.9.4.3 TRibbonStylePopupMenu.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TRibbonStylePopupMenu.

78.1.9.4.4 TRibbonStylePopupMenu.WMExitsizemove Method

Pascal

```
procedure WMExitsizemove(var Message: TMessage); message WM_EXITSIZEMOVE;
```

C++

```
__fastcall WMExitsizemove(TMessage Message);
```

Description

This is WMExitsizemove, a member of class TRibbonStylePopupMenu.

78.1.9.4.5 TRibbonStylePopupMenu.WMNCHitTest Method

Pascal

```
procedure WMNCHitTest(var Message: TWMNCHitTest); message WM_NCHITTEST;
```

C++

```
__fastcall WMNCHitTest(TWMNCHitTest Message);
```

Description

This is WMNCHitTest, a member of class TRibbonStylePopupMenu.

78.1.9.5 TRibbonStylePopupMenu Properties

The properties of the TRibbonStylePopupMenu class are listed here.

Public Properties

	Name	Description
	GalleryResize (see page 7340)	This is GalleryResize, a member of class TRibbonStylePopupMenu.

78.1.9.5.1 TRibbonStylePopupMenu.GalleryResize Property

Pascal

```
property GalleryResize: TGalleryResize;
```

C++

```
__property TGalleryResize GalleryResize;
```

Description

This is GalleryResize, a member of class TRibbonStylePopupMenu.

79 RibbonConsts Namespace

This is namespace RibbonConsts.

Topics

Name	Description
Constants (see page 7342)	The following table lists constants in this documentation.

Constants

Name	Description
SAddToQuickAccessToolbar (see page 7342)	This is constant RibbonConsts.SAddToQuickAccessToolbar.
SCommandIsDisabled (see page 7343)	This is constant RibbonConsts.SCommandIsDisabled.
SCustomizeQuickAccessToolbar (see page 7343)	This is constant RibbonConsts.SCustomizeQuickAccessToolbar.
SDefaultFooterText (see page 7343)	This is constant RibbonConsts.SDefaultFooterText.
SDuplicateRibbonComponentsNotAllowed (see page 7344)	This is constant RibbonConsts.SDuplicateRibbonComponentsNotAllowed.
SGenerateScreenTipsError (see page 7344)	This is constant RibbonConsts.SGenerateScreenTipsError.
SInvalidRibbonGroupParent (see page 7344)	This is constant RibbonConsts.SInvalidRibbonGroupParent.
SInvalidRibbonPageChild (see page 7345)	This is constant RibbonConsts.SInvalidRibbonPageChild.

SShowQuickAccessToolbarBelow (see page 7350)	This is constant RibbonConsts.SShowQuickAccessToolbarBelow.
SUseTheGlyphProperty (see page 7350)	This is constant RibbonConsts.SUseTheGlyphProperty.

79.1 Constants

The following table lists constants in this documentation.

Constants

Name	Description
SAddToQuickAccessToolbar (see page 7342)	This is constant RibbonConsts.SAddToQuickAccessToolbar.
SCommandIsDisabled (see page 7343)	This is constant RibbonConsts.SCommandIsDisabled.
SCustomizeQuickAccessToolbar (see page 7343)	This is constant RibbonConsts.SCustomizeQuickAccessToolbar.
SDefaultFooterText (see page 7343)	This is constant RibbonConsts.SDefaultFooterText.
SDuplicateRibbonComponentsNotAllowed (see page 7344)	This is constant RibbonConsts.SDuplicateRibbonComponentsNotAllowed.
SGenerateScreenTipsError (see page 7344)	This is constant RibbonConsts.SGenerateScreenTipsError.
SInvalidRibbonGroupParent (see page 7344)	This is constant RibbonConsts.SInvalidRibbonGroupParent.
SInvalidRibbonPageChild (see page 7345)	This is constant RibbonConsts.SInvalidRibbonPageChild.
SInvalidRibbonPageParent (see page 7345)	This is constant RibbonConsts.SInvalidRibbonPageParent.
SInvalidScreenTipItemAssign (see page 7345)	This is constant RibbonConsts.SInvalidScreenTipItemAssign.
SMinimizeTheRibbon (see page 7346)	This is constant RibbonConsts.SMinimizeTheRibbon.
SMoreCommands (see page 7346)	This is constant RibbonConsts.SMoreCommands.
SMoreControls (see page 7346)	This is constant RibbonConsts.SMoreControls.
SPageCaptionExists (see page 7347)	This is constant RibbonConsts.SPageCaptionExists.
SQATShowAboveTheRibbon (see page 7347)	This is constant RibbonConsts.SQATShowAboveTheRibbon.
SQATShowBelowTheRibbon (see page 7347)	This is constant RibbonConsts.SQATShowBelowTheRibbon.
SQuickAccessToolbarGlyphRequired (see page 7348)	This is constant RibbonConsts.SQuickAccessToolbarGlyphRequired.
SRecentDocuments (see page 7348)	This is constant RibbonConsts.SRecentDocuments.
SRemoveFromQuickAccessToolbar (see page 7348)	This is constant RibbonConsts.SRemoveFromQuickAccessToolbar.
SRibbonControlInvalidParent (see page 7349)	This is constant RibbonConsts.SRibbonControlInvalidParent.
SRibbonTabIndexInvalid (see page 7349)	This is constant RibbonConsts.SRibbonTabIndexInvalid.
SShowQuickAccessToolbarAbove (see page 7349)	This is constant RibbonConsts.SShowQuickAccessToolbarAbove.
SShowQuickAccessToolbarBelow (see page 7350)	This is constant RibbonConsts.SShowQuickAccessToolbarBelow.
SUseTheGlyphProperty (see page 7350)	This is constant RibbonConsts.SUseTheGlyphProperty.

79.1.1 RibbonConsts.SAddToQuickAccessToolbar Constant

Pascal

```
SAddToQuickAccessToolbar = 'Add to Quick Access Toolbar';
```

C++

```
SAddToQuickAccessToolbar = 'Add to Quick Access Toolbar';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SAddToQuickAccessToolbar.

79.1.2 RibbonConsts.SCommandIsDisabled Constant

Pascal

```
SCommandIsDisabled = 'This command is disabled.';
```

C++

```
SCommandIsDisabled = 'This command is disabled.';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SCommandIsDisabled.

79.1.3 RibbonConsts.SCustomizeQuickAccessToolbar Constant

Pascal

```
SCustomizeQuickAccessToolbar = 'Customize Quick Access Toolbar...';
```

C++

```
SCustomizeQuickAccessToolbar = 'Customize Quick Access Toolbar...';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SCustomizeQuickAccessToolbar.

79.1.4 RibbonConsts.SDefaultFooterText Constant

Pascal

```
SDefaultFooterText = 'Press F1 for more help.';
```

C++

```
SDefaultFooterText = 'Press F1 for more help.';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SDefaultFooterText.

79.1.5 RibbonConsts.SDuplicateRibbonComponentsNotAllowed Constant

Pascal

```
SDuplicateRibbonComponentsNotAllowed = 'Only one Ribbon control on a Form is allowed';
```

C++

```
SDuplicateRibbonComponentsNotAllowed = 'Only one Ribbon control on a Form is allowed';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SDuplicateRibbonComponentsNotAllowed.

79.1.6 RibbonConsts.SGenerateScreenTipsError Constant

Pascal

```
SGenerateScreenTipsError = 'Unable to generate Screen Tips because there are no linked Action
Lists.';
```

C++

```
SGenerateScreenTipsError = 'Unable to generate Screen Tips because there are no linked Action
Lists.';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SGenerateScreenTipsError.

79.1.7 RibbonConsts.SInvalidRibbonGroupParent Constant

Pascal

```
SInvalidRibbonGroupParent = 'Ribbon Group must have a Ribbon Page as its parent';
```

C++

```
SInvalidRibbonGroupParent = 'Ribbon Group must have a Ribbon Page as its parent';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SInvalidRibbonGroupParent.

79.1.8 RibbonConsts.SInvalidRibbonPageChild Constant

Pascal

```
SInvalidRibbonPageChild = 'Only Ribbon Groups can be inserted into a Ribbon Page';
```

C++

```
SInvalidRibbonPageChild = 'Only Ribbon Groups can be inserted into a Ribbon Page';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SInvalidRibbonPageChild.

79.1.9 RibbonConsts.SInvalidRibbonPageParent Constant

Pascal

```
SInvalidRibbonPageParent = 'A Ribbon Pages parent must be TCustomRibbon';
```

C++

```
SInvalidRibbonPageParent = 'A Ribbon Pages parent must be TCustomRibbon';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SInvalidRibbonPageParent.

79.1.10 RibbonConsts.SInvalidScreenTipItemAssign Constant

Pascal

```
SInvalidScreenTipItemAssign = 'Cannot assign a non-ScreenTipItem to a ScreenTipItem';
```

C++

```
SInvalidScreenTipItemAssign = 'Cannot assign a non-ScreenTipItem to a ScreenTipItem';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SInvalidScreenTipItemAssign.

79.1.11 RibbonConsts.SMinimizeTheRibbon Constant

Pascal

```
SMinimizeTheRibbon = 'Minimize the Ribbon';
```

C++

```
SMinimizeTheRibbon = 'Minimize the Ribbon';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SMinimizeTheRibbon.

79.1.12 RibbonConsts.SMoreCommands Constant

Pascal

```
SMoreCommands = 'More Commands...';
```

C++

```
SMoreCommands = 'More Commands...';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SMoreCommands.

79.1.13 RibbonConsts.SMoreControls Constant

Pascal

```
SMoreControls = 'More controls';
```

C++

```
SMoreControls = 'More controls';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SMoreControls.

79.1.14 RibbonConsts.SPageCaptionExists Constant

Pascal

```
SPageCaptionExists = 'A page with the caption "%s" already exists';
```

C++

```
SPageCaptionExists = 'A page with the caption "%s" already exists';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SPageCaptionExists.

79.1.15 RibbonConsts.SQATShowAboveTheRibbon Constant

Pascal

```
SQATShowAboveTheRibbon = 'Show Above the Ribbon';
```

C++

```
SQATShowAboveTheRibbon = 'Show Above the Ribbon';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SQATShowAboveTheRibbon.

79.1.16 RibbonConsts.SQATShowBelowTheRibbon Constant

Pascal

```
SQATShowBelowTheRibbon = 'Show Below the Ribbon';
```

C++

```
SQATShowBelowTheRibbon = 'Show Below the Ribbon';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SQATShowBelowTheRibbon.

79.1.17 RibbonConsts.SQuickAccessToolbarGlyphRequired Constant

Pascal

```
SQuickAccessToolbarGlyphRequired = 'Cannot place an item on the Quick Access Toolbar that does not have a glyph';
```

C++

```
SQuickAccessToolbarGlyphRequired = 'Cannot place an item on the Quick Access Toolbar that does not have a glyph';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SQuickAccessToolbarGlyphRequired.

79.1.18 RibbonConsts.SRecentDocuments Constant

Pascal

```
SRecentDocuments = 'Recent Documents';
```

C++

```
SRecentDocuments = 'Recent Documents';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SRecentDocuments.

79.1.19 RibbonConsts.SRemoveFromQuickAccessToolbar Constant

Pascal

```
SRemoveFromQuickAccessToolbar = 'Remove from Quick Access Toolbar';
```

C++

```
SRemoveFromQuickAccessToolbar = 'Remove from Quick Access Toolbar';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SRemoveFromQuickAccessToolbar.

79.1.20 RibbonConsts.SRibbonControlInvalidParent Constant

Pascal

```
SRibbonControlInvalidParent = 'A %s can only be placed on a Ribbon Group with an ActionManager assigned';
```

C++

```
SRibbonControlInvalidParent = 'A %s can only be placed on a Ribbon Group with an ActionManager assigned';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SRibbonControlInvalidParent.

79.1.21 RibbonConsts.SRibbonTabIndexInvalid Constant

Pascal

```
SRibbonTabIndexInvalid = 'Specified TabIndex is invalid';
```

C++

```
SRibbonTabIndexInvalid = 'Specified TabIndex is invalid';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SRibbonTabIndexInvalid.

79.1.22 RibbonConsts.SShowQuickAccessToolbarAbove Constant

Pascal

```
SShowQuickAccessToolbarAbove = 'Show Quick Access Toolbar Above the Ribbon';
```

C++

```
SShowQuickAccessToolbarAbove = 'Show Quick Access Toolbar Above the Ribbon';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SShowQuickAccessToolbarAbove.

79.1.23 RibbonConsts.SShowQuickAccessToolbarBelow Constant

Pascal

```
SShowQuickAccessToolbarBelow = 'Show Quick Access Toolbar Below the Ribbon';
```

C++

```
SShowQuickAccessToolbarBelow = 'Show Quick Access Toolbar Below the Ribbon';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SShowQuickAccessToolbarBelow.

79.1.24 RibbonConsts.SUseTheGlyphProperty Constant

Pascal

```
SUseTheGlyphProperty = 'Use the glyph property to set an image';
```

C++

```
SUseTheGlyphProperty = 'Use the glyph property to set an image';
```

File

RibbonConsts

Description

This is constant RibbonConsts.SUseTheGlyphProperty.

80 RibbonGalleryBar Namespace

This is namespace RibbonGalleryBar.

Topics

Name	Description
Classes (see page 7352)	The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomRibbonGalleryBar (see page 7352)	This is class RibbonGalleryBar.TCustomRibbonGalleryBar.
	TCustomRibbonGalleryPopupBar (see page 7358)	This is class RibbonGalleryBar.TCustomRibbonGalleryPopupBar.
	TRibbonGalleryBar (see page 7360)	This is class RibbonGalleryBar.TRibbonGalleryBar.
	TRibbonGalleryPopupBar (see page 7362)	This is class RibbonGalleryBar.TRibbonGalleryPopupBar.
	TRibbonPopupGalleryBar (see page 7362)	This is class RibbonGalleryBar.TRibbonPopupGalleryBar.

80.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TCustomRibbonGalleryBar (see page 7352)	This is class RibbonGalleryBar.TCustomRibbonGalleryBar.
	TCustomRibbonGalleryPopupBar (see page 7358)	This is class RibbonGalleryBar.TCustomRibbonGalleryPopupBar.
	TRibbonGalleryBar (see page 7360)	This is class RibbonGalleryBar.TRibbonGalleryBar.
	TRibbonGalleryPopupBar (see page 7362)	This is class RibbonGalleryBar.TRibbonGalleryPopupBar.
	TRibbonPopupGalleryBar (see page 7362)	This is class RibbonGalleryBar.TRibbonPopupGalleryBar.

80.1.1 TCustomRibbonGalleryBar Class

Class Hierarchy

Pascal

```
TCustomRibbonGalleryBar = class(TActionToolBar);
```

C++

```
class TCustomRibbonGalleryBar : public TActionToolBar;
```

File

RibbonGalleryBar

Description

This is class RibbonGalleryBar.TCustomRibbonGalleryBar.

80.1.1.1 TCustomRibbonGalleryBar Members

The following tables list the members exposed by TCustomRibbonGalleryBar.

Protected Methods

	Name	Description
	AlignControls (see page 7353)	Aligns any controls for which the control is the parent within a specified area of the control.

Public Methods

	Name	Description
	Create (see page 7353)	Creates and initializes a TCustomActionToolBar instance.
	CreateControl (see page 7354)	This is CreateControl, a member of class TCustomRibbonGalleryBar.
	DoDropCategory (see page 7354)	This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

Public Properties

	Name	Description
	ItemsPerRow (see page 7358)	This is ItemsPerRow, a member of class TCustomRibbonGalleryBar.

	ShowItemCaptions (see page 7358)	This is ShowItemCaptions, a member of class TCustomRibbonGalleryBar.

Published Properties

	Name	Description
	Align (see page 7354)	Determines how the control aligns within its container (parent control).

80.1.1.2 TCustomRibbonGalleryBar.Create Constructor

Creates and initializes a TCustomActionToolBar instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomRibbonGalleryBar(TComponent * AOwner);
```

Description

Create generates a TCustomActionToolBar and initializes its properties.

```
__fastcall virtual TCustomActionToolBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall (HWND ParentWindow) : Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

80.1.1.3 TCustomRibbonGalleryBar Methods

The methods of the TCustomRibbonGalleryBar class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 7353)	Aligns any controls for which the control is the parent within a specified area of the control.

Public Methods

	Name	Description
	CreateControl (see page 7354)	This is CreateControl, a member of class TCustomRibbonGalleryBar.
	DoDropCategory (see page 7354)	This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

80.1.1.3.1 TCustomRibbonGalleryBar.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

Align

80.1.1.3.2 TCustomRibbonGalleryBar.CreateControl Method

Pascal

```
function CreateControl(AnItem: TActionClientItem): TCustomActionControl; override;
```

C++

```
virtual __fastcall TCustomActionControl CreateControl(TActionClientItem AnItem);
```

Description

This is CreateControl, a member of class TCustomRibbonGalleryBar.

80.1.1.3.3 TCustomRibbonGalleryBar.DoDropCategory Method

Pascal

```
procedure DoDropCategory(Source: TCategoryDragObject; const X: Integer; const Y: Integer);
override;
```

C++

```
virtual __fastcall DoDropCategory(TCategoryDragObject Source, const int X, const int Y);
```

Description

This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

80.1.1.4 TCustomRibbonGalleryBar Properties

The properties of the TCustomRibbonGalleryBar class are listed here.

Public Properties

	Name	Description
	ItemsPerRow (see page 7358)	This is ItemsPerRow, a member of class TCustomRibbonGalleryBar.
	ShowItemCaptions (see page 7358)	This is ShowItemCaptions, a member of class TCustomRibbonGalleryBar.

Published Properties

	Name	Description
	Align (see page 7354)	Determines how the control aligns within its container (parent control).

80.1.1.4.1 TCustomRibbonGalleryBar.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form,

panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/
```

```
#include <ComCtrls.hpp>
#include <Controls.hpp>

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
```

```
    { make sure the splitter is to the right of the directory list box! }
    Split.Left := Dirs.Left + Dirs.Width + 1;
    Split.Align := Dirs.Align; { give it the same alignment as the directory }
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane - a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

RibbonGalleryBar

Description

This is class RibbonGalleryBar.TCustomRibbonGalleryPopupBar.

80.1.2.1 TCustomRibbonGalleryPopupBar Members

The following tables list the members exposed by TCustomRibbonGalleryPopupBar.

Protected Methods

	Name	Description
	AlignControls (see page 7359)	Aligns any controls for which the control is the parent within a specified area of the control.
	CreateControls (see page 7360)	This is CreateControls, a member of class TCustomRibbonGalleryPopupBar.
	DoGetControlClass (see page 7360)	This is DoGetControlClass, a member of class TCustomRibbonGalleryPopupBar.
	NCPaint (see page 7301)	This is NCPaint, a member of class TRibbonActionPopupMenu.
	SetColorMap (see page 7360)	This is SetColorMap, a member of class TCustomRibbonGalleryPopupBar.

Public Methods

	Name	Description
	CreateControl (see page 7301)	This is CreateControl, a member of class TRibbonActionPopupMenu.
	TrackMenu (see page 7302)	Executes the action associated with the menu item.

Public Properties

	Name	Description
	SelectFirstItem (see page 7302)	This is SelectFirstItem, a member of class TRibbonActionPopupMenu.

80.1.2.2 TCustomRibbonGalleryPopupBar Methods

The methods of the TCustomRibbonGalleryPopupBar class are listed here.

Protected Methods

	Name	Description
	AlignControls (see page 7359)	Aligns any controls for which the control is the parent within a specified area of the control.
	CreateControls (see page 7360)	This is CreateControls, a member of class TCustomRibbonGalleryPopupBar.
	DoGetControlClass (see page 7360)	This is DoGetControlClass, a member of class TCustomRibbonGalleryPopupBar.
	SetColorMap (see page 7360)	This is SetColorMap, a member of class TCustomRibbonGalleryPopupBar.

80.1.2.2.1 TCustomRibbonGalleryPopupBar.AlignControls Method

Aligns any controls for which the control is the parent within a specified area of the control.

Pascal

```
procedure AlignControls(AControl: TControl; var Rect: TRect); override;
```

C++

```
virtual __fastcall AlignControls(TControl * AControl, TRect Rect);
```

Description

Use AlignControls to align all controls within an area of a form, panel, group box, scroll box, or any container control. Specify the area in which to align the controls as the value of the Rect parameter.

AlignControls uses the Align property value for each child control to determine how to align it. The AControl parameter can be nil (Delphi) or NULL (C++). If you specify a control in AControl, that control takes precedence in alignment over other, similarly-aligned controls.

80.1.2.2.2 TCustomRibbonGalleryPopupBar.CreateControls Method

Pascal

```
procedure CreateControls; override;
```

C++

```
virtual __fastcall CreateControls();
```

Description

This is CreateControls, a member of class TCustomRibbonGalleryPopupBar.

80.1.2.2.3 TCustomRibbonGalleryPopupBar.DoGetControlClass Method

Pascal

```
function DoGetControlClass(AnItem: TActionClientItem): TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass DoGetControlClass(TActionClientItem AnItem);
```

Description

This is DoGetControlClass, a member of class TCustomRibbonGalleryPopupBar.

80.1.2.2.4 TCustomRibbonGalleryPopupBar.SetColorMap Method

Pascal

```
procedure SetColorMap(const Value: TCustomActionBarColorMap); override;
```

C++

```
virtual __fastcall SetColorMap(const TCustomActionBarColorMap Value);
```

Description

This is SetColorMap, a member of class TCustomRibbonGalleryPopupBar.

80.1.3 TRibbonGalleryBar Class

```
class TRibbonGalleryBar : public TCustomRibbonGalleryBar;
```

File

RibbonGalleryBar

Description

This is class RibbonGalleryBar.TRibbonGalleryBar.

80.1.3.1 TRibbonGalleryBar Members

The following tables list the members exposed by TRibbonGalleryBar.

Protected Methods

	Name	Description
	AlignControls (see page 7353)	Aligns any controls for which the control is the parent within a specified area of the control.

Public Methods

	Name	Description
	Create (see page 7353)	Creates and initializes a TCustomActionToolBar instance.
	CreateControl (see page 7354)	This is CreateControl, a member of class TCustomRibbonGalleryBar.
	DoDropCategory (see page 7354)	This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

Published Properties

	Name	Description
	Align (see page 7354)	Determines how the control aligns within its container (parent control).
	Items (see page 7361)	Lists the action clients that correspond to the child controls of this action band.
	ItemsPerRow (see page 7362)	This is ItemsPerRow, a member of class TRibbonGalleryBar.
	ShowItemCaptions (see page 7362)	This is ShowItemCaptions, a member of class TRibbonGalleryBar.

80.1.3.2 TRibbonGalleryBar Properties

The properties of the TRibbonGalleryBar class are listed here.

Published Properties

	Name	Description
	Items (see page 7361)	Lists the action clients that correspond to the child controls of this action band.
	ItemsPerRow (see page 7362)	This is ItemsPerRow, a member of class TRibbonGalleryBar.
	ShowItemCaptions (see page 7362)	This is ShowItemCaptions, a member of class TRibbonGalleryBar.

80.1.3.2.1 TRibbonGalleryBar.Items Property

Lists the action clients that correspond to the child controls of this action band.

Pascal

```
property Items;
```

C++

```
__property Items;
```

Description

Items is used internally to access the components that the action manager lists to represent the child controls of this action band. Each action client object in the Items collection corresponds to one of the controls that the ActionControls property lists. The entire collection of items belongs to the action client specified by this action band's ActionClient property.

This is class RibbonGalleryBar.TRibbonPopupGalleryBar.

80.1.5.1 TRibbonPopupGalleryBar Members

The following tables list the members exposed by TRibbonPopupGalleryBar.

Protected Methods

	Name	Description
	AlignControls (see page 7353)	Aligns any controls for which the control is the parent within a specified area of the control.
	CreateParams (see page 7364)	Initializes a window-creation parameter data structure.

Public Methods

	Name	Description
	Assign (see page 7364)	Copies the contents of another, similar object.
	Create (see page 7353)	Creates and initializes a TCustomActionToolBar instance.
	CreateControl (see page 7354)	This is CreateControl, a member of class TCustomRibbonGalleryBar.
	DisplayGallery (see page 7365)	This is DisplayGallery, a member of class TRibbonPopupGalleryBar.
	DoDropCategory (see page 7354)	This is DoDropCategory, a member of class TCustomRibbonGalleryBar.

Public Properties

	Name	Description
	ItemsPerRow (see page 7358)	This is ItemsPerRow, a member of class TCustomRibbonGalleryBar.
	ShowItemCaptions (see page 7358)	This is ShowItemCaptions, a member of class TCustomRibbonGalleryBar.

Published Properties

	Name	Description
	Align (see page 7354)	Determines how the control aligns within its container (parent control).
	Items (see page 7361)	Lists the action clients that correspond to the child controls of this action band.
	ItemsPerRow (see page 7362)	This is ItemsPerRow, a member of class TRibbonGalleryBar.
	ShowItemCaptions (see page 7362)	This is ShowItemCaptions, a member of class TRibbonGalleryBar.

80.1.5.2 TRibbonPopupGalleryBar Methods

The methods of the TRibbonPopupGalleryBar class are listed here.

Protected Methods

	Name	Description
	CreateParams (see page 7364)	Initializes a window-creation parameter data structure.

Public Methods

	Name	Description
	Assign (see page 7364)	Copies the contents of another, similar object.
	DisplayGallery (see page 7365)	This is DisplayGallery, a member of class TRibbonPopupGalleryBar.

80.1.5.2.1 TRibbonPopupGalleryBar.Assign Method

Copies the contents of another, similar object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy the properties or other attributes of one object from another. The standard form of a call to Assign is

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

which tells the Destination object to copy the contents of the Source object to itself.

Most objects override Assign to handle the assignment of properties from similar objects. When overriding Assign, call the inherited method if the destination object can't handle the assignment of properties from the class of the Source parameter.

If no overridden Assign method can handle the assignment of properties from Source, the method implemented in TPersistent calls the source object's AssignTo method. This allows the source object to handle the assignment. If the Source object is nil (Delphi) or NULL (C++), Assign raises an EConvertError exception.

In general, the statement

```
Destination := Source; {Delphi}
Destination = Source; // C++
```

is not the same as the statement

```
Destination.Assign(Source); {Delphi}
Destination->Assign(Source); // C++
```

The assignment operator makes Destination reference the same object as Source, whereas the Assign method copies the contents of the object referenced by Source into the object referenced by Destination.

Note: The types of some properties are also objects. If these properties have write methods that use Assign to set the value of the property, then in these cases the assignment operator does the same thing as the Assign method.

AssignTo

EConvertError

80.1.5.2.2 TRibbonPopupGalleryBar.CreateParams Method

Initializes a window-creation parameter data structure.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

The CreateWnd method calls CreateParams to initialize the parameters it passes to CreateWindowHandle. Override CreateParams to customize the way a control creates its Windows representation. When overriding CreateParams, always call the inherited method first to set the default values, then make any desired adjustments.

CreateParams fills in the parameter that is passed as the value of the Params parameter. This data structure holds information needed when telling Windows to create a window handle. The fields of a TCreateParams record become the parameters to a call to the CreateWindowEx API function.

TWinControl implements CreateParams by setting all the fields of Params to generic base values. A number of the standard controls override CreateParams to change one or more of the default values in Params.

80.1.5.2.3 TRibbonPopupGalleryBar.DisplayGallery Method

Pascal

```
procedure DisplayGallery(AX: Integer; AY: Integer);
```

C++

```
__fastcall DisplayGallery(int AX, int AY);
```

Description

This is DisplayGallery, a member of class TRibbonPopupGalleryBar.

81 RibbonStyleActnCtrls Namespace

This is namespace RibbonStyleActnCtrls.

81.1.1.1 TAlphaBitmap Members

The following tables list the members exposed by TAlphaBitmap.

Protected Methods

	Name	Description
	Changed (see page 2635)	This is Changed, a member of class TBitmap.
	Changed (see page 2751)	This is Changed, a member of class TGraphic.
	DefineProperties (see page 2751)	Provides an interface for a method that reads and writes otherwise unpublished data.

	Draw (see page 2636)	This is Draw, a member of class TBitmap.
	Draw (see page 2752)	This is Draw, a member of class TGraphic.
	DrawTransparent (see page 2637)	This is DrawTransparent, a member of class TBitmap.
	DrawTransparent (see page 2752)	This is DrawTransparent, a member of class TGraphic.
	Equals (see page 2752)	This is the overview for the Equals method overload.
	GetEmpty (see page 2638)	This is GetEmpty, a member of class TBitmap.
	GetEmpty (see page 2753)	This is GetEmpty, a member of class TGraphic.
	GetHeight (see page 2638)	This is GetHeight, a member of class TBitmap.
	GetHeight (see page 2753)	This is GetHeight, a member of class TGraphic.
	GetPalette (see page 2639)	This is GetPalette, a member of class TBitmap.
	GetPalette (see page 2754)	This is GetPalette, a member of class TGraphic.
	GetSupportsPartialTransparency (see page 2639)	This is GetSupportsPartialTransparency, a member of class TBitmap.
	GetSupportsPartialTransparency (see page 2754)	This is GetSupportsPartialTransparency, a member of class TGraphic.
	GetTransparent (see page 2754)	This is GetTransparent, a member of class TGraphic.
	GetWidth (see page 2639)	This is GetWidth, a member of class TBitmap.
	GetWidth (see page 2754)	This is GetWidth, a member of class TGraphic.
	HandleNeeded (see page 2640)	This is HandleNeeded, a member of class TBitmap.
	MaskHandleNeeded (see page 2644)	This is MaskHandleNeeded, a member of class TBitmap.
	PaletteNeeded (see page 2645)	This is PaletteNeeded, a member of class TBitmap.
	Progress (see page 2756)	This is Progress, a member of class TGraphic.
	ReadData (see page 2645)	This is ReadData, a member of class TBitmap.
	ReadData (see page 2757)	This is ReadData, a member of class TGraphic.
	SetHeight (see page 2649)	This is SetHeight, a member of class TBitmap.
	SetHeight (see page 2758)	This is SetHeight, a member of class TGraphic.
	SetPalette (see page 2649)	This is SetPalette, a member of class TBitmap.
	SetPalette (see page 2759)	This is SetPalette, a member of class TGraphic.
	SetTransparent (see page 2759)	This is SetTransparent, a member of class TGraphic.
	SetWidth (see page 2650)	This is SetWidth, a member of class TBitmap.
	SetWidth (see page 2759)	This is SetWidth, a member of class TGraphic.
	WriteData (see page 2650)	This is WriteData, a member of class TBitmap.
	WriteData (see page 2760)	This is WriteData, a member of class TGraphic.

Public Events

	Name	Description
	OnChange (see page 2763)	Occurs whenever a graphical image changes.
	OnProgress (see page 2764)	Occurs when a graphical image is in the process of changing.

Public Methods

	Name	Description
	Assign (see page 2633)	Copies a new bitmap image to the bitmap object.
	Create (see page 7371)	Create TAlphaBitmap (see page 7369) instance.
	Destroy (see page 2632)	Disposes of the instance of the bitmap object.
	Dormant (see page 2635)	Creates a memory bitmap image in order to release the bitmap handle, forcing the image into DIB format to save resources.
	FreeImage (see page 2637)	Frees the cached file image stored in memory by the bitmap.
	HandleAllocated (see page 2639)	Indicates whether the TBitmap (see page 2628) object has acquired a handle to the underlying GDI object.
	LoadFromClipboardFormat (see page 2640)	Loads a bitmap from the Clipboard into the bitmap object.
	LoadFromClipboardFormat (see page 2754)	Introduces an abstract method that loads the image from a variable in Clipboard format.
	LoadFromFile (see page 2755)	Loads a graphic image stored in a file.
	LoadFromResourceID (see page 2642)	Loads a bitmap from a resource into the bitmap object.
	LoadFromResourceName (see page 2642)	Loads a bitmap resource into the bitmap object.
	LoadFromStream (see page 2643)	Loads the bitmap from a stream into the bitmap object.
	LoadFromStream (see page 2756)	Introduces an abstract method that loads the image from a stream.

	Mask (see page 2644)	Converts the current bitmap image into a monochrome mask, replacing TransparentColor (see page 2660) with white and every other color with black.
	ReleaseHandle (see page 2645)	Returns the handle to the bitmap so that the TBitmap (see page 2628) object no longer knows about the handle.
	ReleaseMaskHandle (see page 2646)	Returns the handle to the bitmap's mask so that the TBitmap (see page 2628) object no longer knows about the mask handle.
	ReleasePalette (see page 2647)	Returns the handle to the bitmap's palette and disassociates the palette from the TBitmap (see page 2628) object.
V	SaveToClipboardFormat (see page 2647)	Creates a local copy of the bitmap in Clipboard format.
A	SaveToClipboardFormat (see page 2757)	Introduces an abstract method that assigns the graphic to a variable in clipboard format.
V	SaveToFile (see page 2757)	Saves a graphics image to a file.
V	SaveToStream (see page 2649)	Saves the bitmap to a stream.
A	SaveToStream (see page 2758)	Introduces an abstract method that saves the graphic image to a stream.
V	SetSize (see page 2650)	Specifies the size of the bitmap.
V	SetSize (see page 2759)	Specifies the size of the graphic.

Public Properties

	Name	Description
	AlphaFormat (see page 2651)	This is AlphaFormat, a member of class TBitmap.
R	Canvas (see page 2651)	Provides access to a drawing surface that represents the bitmap.
R	Empty (see page 2760)	Indicates whether the graphics object contains a graphic.
	Handle (see page 2652)	Provides access to the Windows GDI bitmap handle for accessing the GDI bitmap object.
	HandleType (see page 2653)	Indicates whether the bitmap is a device-dependent bitmap, or a device-independent bitmap.
	Height (see page 2760)	Specifies the vertical size of the graphic in pixels.
	IgnorePalette (see page 2654)	Determines whether the bitmap realizes its palette when drawing its image.
	MaskHandle (see page 2654)	Provides access to the Windows GDI bitmap handle for accessing the GDI bitmap object.
	Modified (see page 2761)	Indicates whether the graphics object has been changed or edited.
	Monochrome (see page 2654)	Determines whether the bitmap displays its image in monochrome.
	Palette (see page 2761)	Indicates the color palette of the graphical image.
	PaletteModified (see page 2761)	Indicates whether the palette has changed.
	PixelFormat (see page 2656)	Indicates the bit format of the bitmap image, specifying how the image is displayed and how the pixels of the bitmap image are stored in memory.
R	ScanLine (see page 2658)	Provides indexed access to each line of pixels.
R	SupportsPartialTransparency (see page 2762)	This is SupportsPartialTransparency, a member of class TGraphic.
	Transparent (see page 2762)	Indicates whether the image covers its rectangular area.
	TransparentColor (see page 2660)	Determines which color of the bitmap is to be transparent when the bitmap is drawn.
	TransparentMode (see page 2661)	Determines whether the TransparentColor (see page 2660) property's value is automatically calculated or stored with the bitmap object.
	Width (see page 2763)	Determines the maximum width of the graphics object in pixels.

81.1.1.2 TAlphaBitmap.Create Constructor

Create TAlphaBitmap (see page 7369) instance.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TAlphaBitmap();
```

Description

This method creates an TAlphaBitmap (see page 7369) instance.

81.1.2 TCustomRibbonSkin Class

Load resources from file or application.

Class Hierarchy

Pascal

```
TCustomRibbonSkin = class;
```

C++

```
class TCustomRibbonSkin;
```

File

RibbonStyleActnCtrls

Description

TCustomRibbonSkin is responsible for loading the resources from a file or application. It also loads the common elements in each skin. Each descendant then modifies the resource or file to be loaded.

See Also

TRibbonSkinLoadType

81.1.2.1 TCustomRibbonSkin Members

The following tables list the members exposed by TCustomRibbonSkin.

Enumerations

	Name	Description
	TRibbonSkinLoadType (see page 7373)	This is record RibbonStyleActnCtrls.TCustomRibbonSkin.TRibbonSkinLoadType.

Protected Methods

	Name	Description
	DoLoadByFile (see page 7374)	This is DoLoadByFile, a member of class TCustomRibbonSkin.
	DoLoadByResource (see page 7374)	This is DoLoadByResource, a member of class TCustomRibbonSkin.

Public Methods

	Name	Description
	Create (see page 7373)	Create TCustomRibbonSkin (see page 7372) instance.
	Destroy (see page 7373)	Destroy TCustomRibbonSkin (see page 7372) instance.
	GetLoadType (see page 7375)	Set method for loading skins.
	GetLoadTypeValue (see page 7375)	This is GetLoadTypeValue, a member of class TCustomRibbonSkin.
	GetResourceHandle (see page 7375)	Override `GetResourceHandle` to supply skins in separate DLL.
	LoadSkin (see page 7375)	This is LoadSkin, a member of class TCustomRibbonSkin.

Public Properties

	Name	Description
	Bitmap (see page 7376)	This is Bitmap, a member of class TCustomRibbonSkin.

81.1.2.2 TCustomRibbonSkin.Create Constructor

Create TCustomRibbonSkin (see page 7372) instance.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TCustomRibbonSkin();
```

Description

This method creates a TCustomRibbonSkin (see page 7372) instance.

See Also

Destroy (see page 7373)

81.1.2.3 TCustomRibbonSkin.Destroy Destructor

Destroy TCustomRibbonSkin (see page 7372) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomRibbonSkin();
```

Description

This method destroys a TCustomRibbonSkin (see page 7372) instance.

See Also

Create (see page 7373)

81.1.2.4 TCustomRibbonSkin Enumerations

The enumerations of the TCustomRibbonSkin class are listed here.

Enumerations

	Name	Description
	TRibbonSkinLoadType (see page 7373)	This is record RibbonStyleActnCtrls.TCustomRibbonSkin.TRibbonSkinLoadType.

81.1.2.4.1 RibbonStyleActnCtrls.TCustomRibbonSkin.TRibbonSkinLoadType Enumeration

Pascal

```
TRibbonSkinLoadType = (
  ltResource,
  ltFile
);
```

C++

```
enum TRibbonSkinLoadType {
  ltResource,
  ltFile
};
```

File

RibbonStyleActnCtrls

Description

This is record RibbonStyleActnCtrls.TCustomRibbonSkin.TRibbonSkinLoadType.

81.1.2.5 TCustomRibbonSkin Methods

The methods of the TCustomRibbonSkin class are listed here.

Protected Methods

	Name	Description
	DoLoadByFile (see page 7374)	This is DoLoadByFile, a member of class TCustomRibbonSkin.
	DoLoadByResource (see page 7374)	This is DoLoadByResource, a member of class TCustomRibbonSkin.

Public Methods

	Name	Description
	GetLoadType (see page 7375)	Set method for loading skins.
	GetLoadTypeValue (see page 7375)	This is GetLoadTypeValue, a member of class TCustomRibbonSkin.
	GetResourceHandle (see page 7375)	Override `GetResourceHandle` to supply skins in separate DLL.
	LoadSkin (see page 7375)	This is LoadSkin, a member of class TCustomRibbonSkin.

81.1.2.5.1 TCustomRibbonSkin.DoLoadByFile Method

Pascal

```
procedure DoLoadByFile; virtual;
```

C++

```
virtual __fastcall DoLoadByFile();
```

Description

This is DoLoadByFile, a member of class TCustomRibbonSkin.

81.1.2.5.2 TCustomRibbonSkin.DoLoadByResource Method

Pascal

```
procedure DoLoadByResource; virtual;
```

C++

```
virtual __fastcall DoLoadByResource();
```

Description

This is DoLoadByResource, a member of class TCustomRibbonSkin.

81.1.2.5.3 TCustomRibbonSkin.GetLoadType Method

Set method for loading skins.

Pascal

```
function GetLoadType: TRibbonSkinLoadType; virtual;
```

C++

```
virtual __fastcall TRibbonSkinLoadType GetLoadType();
```

Description

GetLoadType sets the method for loading the skins for use by the application.

81.1.2.5.4 TCustomRibbonSkin.GetLoadTypeValue Method

Pascal

```
function GetLoadTypeValue: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetLoadTypeValue();
```

Description

This is GetLoadTypeValue, a member of class TCustomRibbonSkin.

81.1.2.5.5 TCustomRibbonSkin.GetResourceHandle Method

Override `GetResourceHandle` to supply skins in separate DLL.

Pascal

```
function GetResourceHandle: THandle; virtual;
```

C++

```
virtual __fastcall THandle GetResourceHandle();
```

Description

This method overrides `GetResourceHandle` to supply skins in a separate DLL file.

81.1.2.5.6 TCustomRibbonSkin.LoadSkin Method

Pascal

```
procedure LoadSkin; virtual;
```

C++

```
virtual __fastcall LoadSkin();
```

Description

This is LoadSkin, a member of class TCustomRibbonSkin.

81.1.2.6 TCustomRibbonSkin Properties

The properties of the TCustomRibbonSkin class are listed here.

Public Properties

	Name	Description
	Bitmap (see page 7376)	This is Bitmap, a member of class TCustomRibbonSkin.

81.1.2.6.1 TCustomRibbonSkin.Bitmap Property

Pascal

```
property Bitmap: TAlphaBitmap;
```

C++

```
__property TAlphaBitmap Bitmap;
```

Description

This is Bitmap, a member of class TCustomRibbonSkin.

81.1.3 TRibbonStyleActionBars Class

Action bar style.

Class Hierarchy

Pascal

```
TRibbonStyleActionBars = class(TXPStyleActionBars);
```

C++

```
class TRibbonStyleActionBars : public TXPStyleActionBars;
```

File

RibbonStyleActnCtrls

Description

TRibbonStyleActionBars is an action bar style.

81.1.3.1 TRibbonStyleActionBars Members

The following tables list the members exposed by TRibbonStyleActionBars.

Public Methods

	Name	Description
	Create (see page 7377)	Create TRibbonStyleActionBars (see page 7376) instance.
	Destroy (see page 7377)	Destroy TRibbonStyleActionBars (see page 7376) instance.
	DrawElement (see page 7378)	This is the overview for the DrawElement method overload.
	GetAddRemoveItemClass (see page 7380)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 7380)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 7380)	Returns the control class type on an action bar item.
	GetPopupClass (see page 7380)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 7381)	This is GetScrollBtnClass, a member of class TRibbonStyleActionBars.
	GetSkinClass (see page 7381)	This is GetSkinClass, a member of class TRibbonStyleActionBars.

Public Properties

	Name	Description
	RibbonSkin (see page 7381)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.

81.1.3.2 TRibbonStyleActionBars.Create Constructor

Create TRibbonStyleActionBars (see page 7376) instance.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TRibbonStyleActionBars();
```

Description

This method creates a TRibbonStyleActionBars (see page 7376) instance.

See Also

Destroy (see page 7377)

81.1.3.3 TRibbonStyleActionBars.Destroy Destructor

Destroy TRibbonStyleActionBars (see page 7376) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRibbonStyleActionBars();
```

Description

This method destroys a TRibbonStyleActionBars (see page 7376) instance.

See Also

Create (see page 7377)

81.1.3.4 TRibbonStyleActionBars Methods

The methods of the TRibbonStyleActionBars class are listed here.

Public Methods

	Name	Description
	DrawElement (see page 7378)	This is the overview for the DrawElement method overload.
	GetAddRemoveItemClass (see page 7380)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 7380)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 7380)	Returns the control class type on an action bar item.
	GetPopupClass (see page 7380)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 7381)	This is GetScrollBtnClass, a member of class TRibbonStyleActionBars.
	GetSkinClass (see page 7381)	This is GetSkinClass, a member of class TRibbonStyleActionBars.

81.1.3.4.1 DrawElement Method

This is the overview for the DrawElement method overload.

Overload List

	Name	Description
	TRibbonStyleActionBars.DrawElement (TSkinApplicationMenu, TCanvas, Integer, Integer, Byte) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinApplicationMenu, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinButton, TCanvas, TRect, Byte) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinCheckBox, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinComboBox, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinForm, TCanvas, TRect, Integer) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinGallery, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinMenu, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinQuickAccessToolbar, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinRadioButton, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinRibbon, TCanvas, TRect, Integer) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinRibbonGroup, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinScrollBar, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinSpinEdit, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.
	TRibbonStyleActionBars.DrawElement (TSkinStatusBar, TCanvas, TRect) (see page 7379)	Methods to draw ribbon skin element.

	TRibbonStyleActionBars.DrawElement (TSkinTab, TCanvas, TRect, Byte) (see page 7379)	Methods to draw ribbon skin element.

81.1.3.4.1.1 TRibbonStyleActionBars.DrawElement Method (TSkinApplicationMenu, TCanvas, Integer, Integer, Byte)

Methods to draw ribbon skin element.

Pascal

```
procedure DrawElement(Element: TSkinRibbon; Canvas: TCanvas; Rect: TRect; Height: Integer);
overload;
procedure DrawElement(Element: TSkinForm; Canvas: TCanvas; Rect: TRect; Height: Integer);
overload;
procedure DrawElement(Element: TSkinApplicationMenu; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinApplicationMenu; Canvas: TCanvas; const X: Integer; const
Y: Integer; const Opacity: Byte); overload;
procedure DrawElement(Element: TSkinTab; Canvas: TCanvas; Rect: TRect; Opacity: Byte = 255);
overload;
procedure DrawElement(Element: TSkinRibbonGroup; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinMenu; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinButton; Canvas: TCanvas; Rect: TRect; Opacity: Byte =
255); overload;
procedure DrawElement(Element: TSkinComboBox; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinSpinEdit; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinGallery; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinQuickAccessToolbar; Canvas: TCanvas; Rect: TRect);
overload;
procedure DrawElement(Element: TSkinScrollBar; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinStatusBar; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinCheckBox; Canvas: TCanvas; Rect: TRect); overload;
procedure DrawElement(Element: TSkinRadioButton; Canvas: TCanvas; Rect: TRect); overload;
```

C++

```
__fastcall DrawElement(TSkinRibbon Element, TCanvas Canvas, TRect Rect, int Height);
__fastcall DrawElement(TSkinForm Element, TCanvas Canvas, TRect Rect, int Height);
__fastcall DrawElement(TSkinApplicationMenu Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinApplicationMenu Element, TCanvas Canvas, const int X, const int Y,
const Byte Opacity);
__fastcall DrawElement(TSkinTab Element, TCanvas Canvas, TRect Rect, Byte Opacity = 255);
__fastcall DrawElement(TSkinRibbonGroup Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinMenu Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinButton Element, TCanvas Canvas, TRect Rect, Byte Opacity = 255);
__fastcall DrawElement(TSkinComboBox Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinSpinEdit Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinGallery Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinQuickAccessToolbar Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinScrollBar Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinStatusBar Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinCheckBox Element, TCanvas Canvas, TRect Rect);
__fastcall DrawElement(TSkinRadioButton Element, TCanvas Canvas, TRect Rect);
```

Description

DrawElement are methods to draw a particular ribbon skin element.

The parameters are:

- **Element**: The item to draw from the Element group.
- **Canvas**: Where the element is to be drawn.
- **Rect**: The rectangle for drawing the element.

- **Center**: Set to True to center the element within the given Rectangle.

81.1.3.4.2 TRibbonStyleActionBars.GetAddRemoveItemClass Method

Returns the base class for ActionBand menus for customizing action bands.

Pascal

```
function GetAddRemoveItemClass(ActionBar: TCustomActionBar): TCustomAddRemoveItemClass;
override;
```

C++

```
virtual __fastcall TCustomAddRemoveItemClass GetAddRemoveItemClass(TCustomActionBar ActionBar);
```

Description

Call GetAddRemoveItemClass to customize action bands.

See Also

TCustomAddRemoveItem

81.1.3.4.3 TRibbonStyleActionBars.GetColorMapClass Method

Returns the class type of the colormap for an action bar.

Pascal

```
function GetColorMapClass(ActionBar: TCustomActionBar): TCustomColorMapClass; override;
```

C++

```
virtual __fastcall TCustomColorMapClass GetColorMapClass(TCustomActionBar ActionBar);
```

Description

Returns the class type TCustomActionBarColorMap, which is a colormap associated with an action bar. Override this method to customize the appearance of your applications.

81.1.3.4.4 TRibbonStyleActionBars.GetControlClass Method

Returns the control class type on an action bar item.

Pascal

```
function GetControlClass(ActionBar: TCustomActionBar; AnItem: TActionClientItem):
TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TCustomActionBar ActionBar,
TActionClientItem AnItem);
```

Description

Returns the control class type on an item in the action bar, such as a button or menu item.

81.1.3.4.5 TRibbonStyleActionBars.GetPopupClass Method

Returns the popup class added to a menu action band.

Pascal

```
function GetPopupClass(ActionBar: TCustomActionBar): TCustomPopupClass; override;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass(TCustomActionBar ActionBar);
```

Description

Call GetPopupClass to find the popup menu associated with a menu action band. Override GetPopupClass to change which popup class is associated with a menu action band depending on the state of the control.

See Also

TCustomActionPopupMenu

81.1.3.4.6 TRibbonStyleActionBars.GetScrollBtnClass Method

Pascal

```
function GetScrollBtnClass: TCustomToolScrollBtnClass; override;
```

C++

```
virtual __fastcall TCustomToolScrollBtnClass GetScrollBtnClass();
```

Description

This is GetScrollBtnClass, a member of class TRibbonStyleActionBars.

81.1.3.4.7 TRibbonStyleActionBars.GetSkinClass Method

Pascal

```
function GetSkinClass: TCustomRibbonSkinClass; virtual; abstract;
```

C++

```
virtual __fastcall TCustomRibbonSkinClass GetSkinClass() = 0;
```

Description

This is GetSkinClass, a member of class TRibbonStyleActionBars.

81.1.3.5 TRibbonStyleActionBars Properties

The properties of the TRibbonStyleActionBars class are listed here.

Public Properties

	Name	Description
	RibbonSkin (see page 7381)	Enter a short sentence, starting with a verb, that states the basic purpose of the property.

81.1.3.5.1 TRibbonStyleActionBars.RibbonSkin Property

Enter a short sentence, starting with a verb, that states the basic purpose of the property.

Pascal

```
property RibbonSkin: TCustomRibbonSkin;
```

C++

```
__property TCustomRibbonSkin RibbonSkin;
```

Description

The long description elaborates on the short description, containing no more than a paragraph or two.

81.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TRibbonElement (see page 7383)	Elements of Ribbon (see page 6713) that need to be skinned.
	TSkinApplicationMenu (see page 7384)	Individual skinned items of Application Menu.
	TSkinButton (see page 7386)	Individual skinned items of Button.
	TSkinCheckBox (see page 7390)	This is record RibbonStyleActnCtrls.TSkinCheckBox.
	TSkinComboBox (see page 7391)	This is record RibbonStyleActnCtrls.TSkinComboBox.
	TSkinForm (see page 7391)	Individual skinned items of Form.
	TSkinGallery (see page 7394)	Individual skinned items of Gallery.
	TSkinMenu (see page 7395)	Individual skinned items of Menu.
	TSkinQuickAccessToolbar (see page 7397)	Individual skinned items of Quick Access Toolbar.
	TSkinRadioButton (see page 7398)	This is record RibbonStyleActnCtrls.TSkinRadioButton.
	TSkinRibbon (see page 7399)	Individual skinned items of Ribbon (see page 6713).
	TSkinRibbonGroup (see page 7400)	Individual skinned items of Group.
	TSkinScrollBar (see page 7402)	Individual skinned items of ScrollBar.
	TSkinSpinEdit (see page 7403)	This is record RibbonStyleActnCtrls.TSkinSpinEdit.
	TSkinStatusBar (see page 7403)	Individual skinned items of Status Bar.
	TSkinTab (see page 7404)	Individual skinned items of Tab.

81.2.1 RibbonStyleActnCtrls.TRibbonElement Enumeration

Elements of Ribbon (see page 6713) that need to be skinned.

Pascal

```
TRibbonElement = (
  reRibbon,
  reForm,
  reApplicationMenu,
  reTab,
  reGroup,
  reMenu,
  reButton,
  reCombo,
  reSpinner,
  reGallery,
  reQuickAccessToolbar,
  reScrollBar,
  reStatusBar,
  reCheckBox,
  reRadioButton
);
```

C++

```
enum TRibbonElement {
  reRibbon,
  reForm,
  reApplicationMenu,
  reTab,
```

```
    reGroup,
    reMenu,
    reButton,
    reCombo,
    reSpinner,
    reGallery,
    reQuickAccessToolbar,
    reScrollBar,
    reStatusBar,
    reCheckBox,
    reRadioButton
  };
```

File

RibbonStyleActnCtrls

Description

TRibbonElement enumerates the available elements of the Ribbon (see page 6713) that need to be skinned.

Value	Meaning
reRibbon	Ribbon (see page 6713)
reForm	Form
reApplicationMenu	Application Menu
reTab	Tab
reGroup	Group
reMenu	Menu
reButton	Button
reCombo	Combo
reSpinner	Spinner
reGallery	Gallery
reQuickAccessToolbar	Quick Access Toolbar
reScrollBar	Scroll Bar
reStatusBar	Status Bar

81.2.2 RibbonStyleActnCtrls.TSkinApplicationMenu Enumeration

Individual skinned items of Application Menu.

Pascal

```
  TSkinApplicationMenu = (
    samButton,
    samButtonHover,
    samButtonPressed,
    samButtonShadow,
    samBorder,
    samMenuNormal,
    samMenuDisabled,
    samMenuHover,
```

```
    samMenuPressed,
    samMenuSplitNormal,
    samMenuSplitHover,
    samMenuSplitPressed,
    samMenuSubMenu
  );
```

C++

```
  enum TSkinApplicationMenu {
    samButton,
    samButtonHover,
    samButtonPressed,
    samButtonShadow,
    samBorder,
    samMenuNormal,
    samMenuDisabled,
    samMenuHover,
    samMenuPressed,
    samMenuSplitNormal,
    samMenuSplitHover,
    samMenuSplitPressed,
    samMenuSubMenu
  };
```

File

RibbonStyleActnCtrls

Description

TSkinApplicationMenu enumerates the individual skinned items of the Application Menu.

Value	Meaning
samButton	Button
samButtonHover	Button hover
samButtonPressed	Button pressed
samButtonShadow	Button shadow
samBorder	Border
samMenuNormal	Normal menu
samMenuDisabled	Disabled menu
samMenuHover	Menu hover
samMenuPressed	Pressed split menu
samMenuSplitNormal	Normal split menu
samMenuSplitHover	Split menu hover
samMenuSplitPressed	Pressed split menu
samMenuSubMenu	Submenu menu
samBorderTopStart	Top border start
samBorderTop	Top border
samBorderTopEnd	Top border end
samBorderBottomStart	Bottom border start
samBorderBottom	Bottom border
samBorderBottomEnd	Bottom border end

File

RibbonStyleActnCtrls

Description

TSkinButton enumerates the individual skinned items of a Button.

Value	Meaning
sbSmall	Small
sbSmallDisabled	Disabled small
sbSmallHover	Small hover
sbSmallPressed	Pressed small
sbSmallSelected	Selected small
sbSmallHoverSelected	Selected small hover
sbSmallGroup	Small group
sbSmallGroupHover	Small group hover
sbSmallGroupPressed	Pressed small group
sbSmallGroupSelected	Selected small group
sbSmallGroupHoverSelected	Selected small group hover
sbLarge	Large
sbLargeDisabled	Disabled Large
sbLargeSplitActive	Active large split
sbLargeHover	Large hover
sbLargePressed	Pressed Large
sbLargeSelected	Selected Large
sbLargeHoverSelected	Selected Large hover
sbSmallSplit	Small split
sbSmallSplitDisabled	Disabled small split
sbSmallSplitHover	Small split hover
sbSmallSplitPressed	Pressed small split
sbSmallSplitSelected	Selected small split
sbSmallSplitHoverSelected	Selected small split hover
sbSmallSplitHoverSplit	Split small split hover
sbSmallSplitPressedSplit	Pressed split small split
sbLargeSplit	Large split
sbLargeSplitDisabled	Disabled large split
sbLargeSplitHover	Large split hover
sbLargeSplitPressed	Pressed large split
sbLargeSplitSelected	Selected large split
sbLargeSplitHoverSelected	Selected large split hover

sbLargeSplitHoverSplit	Split large split hover
sbLargeSplitPressedSplit	Pressed split large split
sbGroup	Group
sbGroupStart	Group start
sbGroupStartHover	Group start hover
sbGroupStartPressed	Pressed group start
sbGroupStartSelected	Selected group start
sbGroupStartHoverSelected	Selected group start hover
sbGroupStartInactive	Inactive group start
sbGroupMiddle	Group middle
sbGroupMiddleHover	Group middle hover
sbGroupMiddlePressed	Pressed group middle
sbGroupMiddleSelected	Selected group middle
sbGroupMiddleHoverSelected	Selected group middle hover
sbGroupMiddleInactive	Inactive group middle
sbGroupEnd	Group end
sbGroupEndHover	Group end hover
sbGroupEndPressed	Pressed group end
sbGroupEndSelected	Selected group end
sbGroupEndHoverSelected	Selected group end hover
sbGroupEndInactive	Inactive group end
sbGroupSingle	Single group
sbGroupSingleHover	Single group hover
sbGroupSinglePressed	Pressed single group
sbGroupSingleSelected	Selected single group
sbGroupSingleHoverSelected	Selected single group hover
sbGroupSingleInactive	Inactive single group

    sfHelpDisabled
  };
```

File

RibbonStyleActnCtrls

Description

TSkinForm enumerates the individual skinned items of the Form.

Value	Meaning
sfLeftFrame	Left frame
sfLeftFrameTop	Left frame top
sfLeftFrameTopDisabled	Disabled left frame top
sfRightFrame	Right frame
sfRightFrameTop	Right frame top
sfRightFrameTopDisabled	Disabled right frame top
sfBottomFrame	Bottom frame
sfButton	Button
sfButtonHover	Button hover
sfButtonPressed	Button pressed
sfMinimize	Minimize
sfMinimizeHover	Minimize hover
sfMinimizePressed	Minimize pressed
sfMinimizeDisabled	Minimize disabled
sfMaximize	Maximize
sfMaximizeHover	Maximize hover
sfMaximizePressed	Maximize pressed
sfMaximizeDisabled	Maximize disabled
sfRestore	Restore
sfRestoreHover	Restore hover
sfRestorePressed	Restore pressed
sfRestoreDisabled	Restore disabled
sfClose	Close
sfCloseHover	Close hover
sfClosePressed	Close pressed
sfCloseDisabled	Close disabled

  sgDownButtonPressed,
  sgDownButtonDisabled,
  sgMoreButton,
  sgMoreButtonHover,
  sgMoreButtonHoverDisabled
};
```

File

RibbonStyleActnCtrls

Description

TSkinGallery enumerates the individual skinned items of a Gallery.

Value	Meaning
sgBackground	Background
sgUpButton	Up button
sgUpButtonHover	Up button hover
sgUpButtonPressed	Pressed up button
sgupButtonDisabled	Disabled up button
sgDownButton	Down button
sgDownButtonHover	Down button hover
sgDownButtonPressed	Pressed down button
sgDownButtonDisabled	Disabled down button

sgMoreButton	More button
sgMoreButtonHover	More button hover
sgUpIcon	Up icon
sgDownIcon	Down icon
sgMoreIcon	More icon

    smOptionButtonHover,
    smOptionButtonDisabled
  };
```

File

RibbonStyleActnCtrls

Description

TSkinMenu enumerates the individual skinned items of a Menu.

Value	Meaning
smBackground	Background
smBanner	Banner
smNormal	Normal
smSelected	Selected
smSelectedStart	Selected start
smSelectedEnd	Selected end
smHover	Hover
smHoverStart	Hover start
smHoverEnd	Hover end
smHoverSelected	Selected hover
smDisabled	Disabled
smCheck	Check
smCheckDisabled	Disabled check
smCheckIcon	Check icon
smCheckDisabledIcon	Disabled check icon
smRadio	Radio
smRadioDisabled	Disabled radio
smSeparator	Separator
smArrowLeftIcon	Left arrow icon
smArrowRightIcon	Right arrow icon

smResize	Resize
smResizeVertical	Vertical resize
smResizeBoth	Resize both
smRichContentHover	Rich content hover
smRichContentDisabled	Disabled rich content
smScrollButton	Scroll button
smScrollButtonHover	Scroll button hover
smScrollButtonUpIcon	Up scroll button icon
smScrollButtonDownIcon	Down scroll button icon
smOptionButton	Option button
smOptionButtonHover	Option button hover
smOptionButtonDisabled	Disabled option button

RibbonStyleActnCtrls

Description

This is record RibbonStyleActnCtrls.TSkinSpinEdit.

81.2.15 RibbonStyleActnCtrls.TSkinStatusBar Enumeration

Individual skinned items of Status Bar.

Pascal

```
TSkinStatusBar = (
  ssbrBackground,
  ssbrNotification,
  ssbrControl,
  ssbrGripper
);
```

C++

```
enum TSkinStatusBar {
  ssbrBackground,
  ssbrNotification,
```

```
    ssbrControl,
    ssbrGripper
  };
```

File

RibbonStyleActnCtrls

Description

TSkinStatusBar enumerates the individual skinned items of a Status Bar.

Value	Meaning
ssbrBackground	Background
ssbrNotification	Notification
ssbrControl	Control
ssbrGripper	Gripper

See Also

TRibbonElement (see page 7383)

81.2.16 RibbonStyleActnCtrls.TSkinTab Enumeration

Individual skinned items of Tab.

Pascal

```
  TSkinTab = (
    stBackground,
    stNormal,
    stHover,
    stHoverUnselected,
    stHoverSelected,
    stKeyTipsActive,
    stScrollLeft,
    stScrollLeftHover,
    stScrollLeftPressed,
    stScrollRight,
    stScrollRightHover,
    stScrollRightPressed,
    stSeparator,
    stScrollGroupLeft,
    stScrollGroupLeftHover,
    stScrollGroupRight,
    stScrollGroupRightHover
  );
```

C++

```
  enum TSkinTab {
    stBackground,
    stNormal,
    stHover,
    stHoverUnselected,
    stHoverSelected,
    stKeyTipsActive,
    stScrollLeft,
    stScrollLeftHover,
    stScrollLeftPressed,
    stScrollRight,
```

```
    stScrollRightHover,
    stScrollRightPressed,
    stSeparator,
    stScrollGroupLeft,
    stScrollGroupLeftHover,
    stScrollGroupRight,
    stScrollGroupRightHover
  };
```

File

RibbonStyleActnCtrls

Description

TSkinTab enumerates the individual skinned items of a Tab.

Value	Meaning
stBackground	Background
stHoverUnselected	Unselected hover
stHoverUnselectedStart	Unselected start hover
stHoverUnselectedEnd	Unselected end hover
stHover	Hover
stHoverStart	Start hover
stHoverEnd	End hover
stNormal	Normal
stNormalStart	Start normal
stNormalEnd	End normal
stHoverSelected	Selected hover
stScrollLeft	Left scroll
stScrollLeftPressed	Pressed Left scroll
stScrollLeftHover	Left scroll hover
stScrollRight	Right scroll
stScrollRightPressed	Pressed right scroll
stScrollRightHover	Right scroll hover
stKeyTipsActive	KeyTips active
stKeyTipsActiveStart	KeyTips active start
stKeyTipsActiveEnd	KeyTips active end
stSeparator	Separator

TAfterExecuteEvent (see page 7422)	This is type Rio.TAfterExecuteEvent.
TBeforeExecuteEvent (see page 7422)	This is type Rio.TBeforeExecuteEvent.

82.1 Classes

The following table lists classes in this documentation.

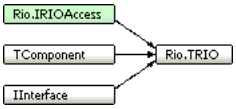
Classes

	Name	Description
	TRIO (see page 7408)	TRIO is the base class for components that generate calls to remote interfaced objects.

82.1.1 TRIO Class

TRIO is the base class for components that generate calls to remote interfaced objects.

Class Hierarchy



Pascal

```
TRIO = class(TComponent, IInterface, IRIOAccess);
```

C++

```
class TRIO : public TComponent, public IInterface, public IRIOAccess;
```

File

Rio

Description

Use TRIO as a base class for components that generate statically-linked calls to invokable interfaces. When an application casts a TRIO descendant to a registered invokable interface, it dynamically generates an in-memory method table, providing an implementation to that invokable interface. TRIO uses two helper objects when generating this implementation. These helper objects implement the IOPConvert (see page 6152) and IWebNode interfaces. IOPConvert (see page 6152) handles the marshaling and unmarshaling of calls to methods on the generated method table, and IWebNode receives the marshaled message call, executes it (typically by sending it to a remote server application), and returns the results of executing the call. These interfaces do not assume any particular encoding or transport protocol. Each TRIO descendant uses its own protocol-specific helper objects to implement these interfaces.

Before TRIO can generate a method table for an invokable interface, the interface must be registered with the invocation registry. To register an invokable interface, use the global InvRegistry (see page 4471) function to obtain access to the registry, and call its RegisterInterface method.

Do not create instances of TRIO. To add a component that generates calls to a registered invokable interface, use a TRIO descendant such as THTTPRIO.

THTTPRio

InvRegistry

TInvokableClassRegistry (see page 4379)

IWebNode

IOPConvert (see page 6152)

IRIOAccess (see page 7420)

82.1.1.1 TRIO Members

The following tables list the members exposed by TRIO.

Protected Fields

	Name	Description
	FConverter (see page 7411)	This is FConverter, a member of class TRIO.
	FIID (see page 7411)	This is FIID, a member of class TRIO.
	FWebNode (see page 7411)	This is FWebNode, a member of class TRIO.
	IntfMD (see page 7411)	This is IntfMD, a member of class TRIO.

Protected Methods

	Name	Description
V	DoAfterExecute (see page 7413)	Generates an OnAfterExecute (see page 7417) event.
V	DoBeforeExecute (see page 7413)	Generates an OnBeforeExecute (see page 7418) event.
V	GetResponseStream (see page 7414)	Returns a newly created stream that receives the results of executing a method call.
V	QueryInterface (see page 7415)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
V	AfterConstruction (see page 7412)	Updates the reference count after the last constructor has executed.
V	BeforeDestruction (see page 7412)	Prevents the destruction of a TRIO (see page 7408) instance if the reference count is greater than zero.
V	Create (see page 7410)	Creates an instance of TRIO (see page 7408).
V	Destroy (see page 7410)	Destroys the instance of a TRIO (see page 7408) object.
	GetRIO (see page 7421)	Returns the value of the RIO (see page 7421) property.
V	NewInstance (see page 7414)	Allocates memory for each instance of a remote interfaced object.

Public Properties

	Name	Description
	Converter (see page 7415)	Handles the marshaling and unmarshaling of calls to an invokable interface.
R	RefCount (see page 7416)	Maintains a reference count on the use of the TRIO (see page 7408) object's interface.
R	RIO (see page 7421)	Provides access to the remote interfaced object that implements this interface.
R	SOAPHeaders (see page 7416)	Provides access to the headers of SOAP messages that the remote interface object sends or receives.
	WebNode (see page 7417)	Handles the execution of method calls on the invokable interface.

Published Events

	Name	Description
	OnAfterExecute (see page 7417)	Occurs when TRIO (see page 7408) receives the results from executing a method of the invokable interface.
	OnBeforeExecute (see page 7418)	Occurs before TRIO (see page 7408) sends an encoded method call for execution.
	OnGetAttachment (see page 7419)	Occurs when TRIO (see page 7408) reads each attachment included in the results from executing a method of the invokable interface.
	OnSendAttachment (see page 7419)	Occurs when TRIO (see page 7408) sends each attachment that is the value of an argument of the method call on the invokable interface.

82.1.1.2 TRIO.Create Constructor

Creates an instance of TRIO (see page 7408).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TRIO(TComponent * AOwner);
```

Description

Call Create to instantiate a TRIO (see page 7408) descendant at runtime. TRIO (see page 7408) descendants added to forms or data modules at design time are created automatically.

The AOwner parameter specifies another component (usually a form or data module) that is responsible for freeing the TRIO (see page 7408) instance. It becomes the value of the Owner property. If the TRIO (see page 7408) instance is created with AOwner set to nil (Delphi) or NULL (C++), then it is automatically freed when its reference count drops to zero.

See Also

RefCount (see page 7416)

Owner

82.1.1.3 TRIO.Destroy Destructor

Destroys the instance of a TRIO (see page 7408) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TRIO();
```

Description

There is no need to explicitly free a TRIO (see page 7408) instance.

If the TRIO (see page 7408) object is created with an Owner, then that Owner handles the freeing of the TRIO (see page 7408) instance. If the TRIO (see page 7408) object is created without an Owner, then it is automatically freed when the reference count on its interface drops to zero.

See Also

Create (see page 7410)

Owner

RefCount (see page 7416)

82.1.1.4 TRIO Fields

The fields of the TRIO class are listed here.

Protected Fields

	Name	Description
	FConverter (see page 7411)	This is FConverter, a member of class TRIO.
	FIID (see page 7411)	This is FIID, a member of class TRIO.
	FWebNode (see page 7411)	This is FWebNode, a member of class TRIO.
	IntfMD (see page 7411)	This is IntfMD, a member of class TRIO.

82.1.1.4.1 TRIO.FConverter Field

Pascal

```
FConverter: IOPConvert;
```

C++

```
IOPConvert FConverter;
```

Description

This is FConverter, a member of class TRIO.

82.1.1.4.2 TRIO.FIID Field

Pascal

```
FIID: TGUID;
```

C++

```
TGUID FIID;
```

Description

This is FIID, a member of class TRIO.

82.1.1.4.3 TRIO.FWebNode Field

Pascal

```
FWebNode: IWebNode;
```

C++

```
IWebNode FWebNode;
```

Description

This is FWebNode, a member of class TRIO.

82.1.1.4.4 TRIO.IntfMD Field

Pascal

```
IntfMD: TIntfMetaData;
```

C++

```
TIntfMetaData IntfMD;
```

Description

This is IntfMD, a member of class TRIO.

82.1.1.5 TRIO Methods

The methods of the TRIO class are listed here.

Protected Methods

	Name	Description
	DoAfterExecute (see page 7413)	Generates an OnAfterExecute (see page 7417) event.
	DoBeforeExecute (see page 7413)	Generates an OnBeforeExecute (see page 7418) event.
	GetResponseStream (see page 7414)	Returns a newly created stream that receives the results of executing a method call.
	QueryInterface (see page 7415)	Implements the IInterface QueryInterface method.

Public Methods

	Name	Description
	AfterConstruction (see page 7412)	Updates the reference count after the last constructor has executed.
	BeforeDestruction (see page 7412)	Prevents the destruction of a TRIO (see page 7408) instance if the reference count is greater than zero.
	NewInstance (see page 7414)	Allocates memory for each instance of a remote interfaced object.

82.1.1.5.1 TRIO.AfterConstruction Method

Updates the reference count after the last constructor has executed.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the TRIO (see page 7408) object's last constructor has executed. Do not call it explicitly in your applications.

TRIO (see page 7408) overrides the AfterConstruction method to update the RefCount (see page 7416) property. TRIO (see page 7408) artificially increments the reference count when it is first created to prevent changes to the reference count from causing the TRIO (see page 7408) instance to be freed before it is fully instantiated. AfterConstruction returns the reference count back to an appropriate level, now that the constructor is finished.

See Also

RefCount (see page 7416)

Create (see page 7410)

NewInstance (see page 7414)

82.1.1.5.2 TRIO.BeforeDestruction Method

Prevents the destruction of a TRIO (see page 7408) instance if the reference count is greater than zero.

Pascal

```
procedure BeforeDestruction; override;
```

C++

```
virtual __fastcall BeforeDestruction();
```

Description

BeforeDestruction is called automatically before the TRIO (see page 7408) object's first destructor executes. Do not call it explicitly in your applications.

TRIO (see page 7408) overrides the BeforeDestruction method to check the RefCount (see page 7416) property. If RefCount (see page 7416) is greater than zero, then there is still an outstanding reference to the TRIO (see page 7408) object's interface,. and BeforeDestruction raises an exception to prevent the destruction of this object.

See Also

RefCount (see page 7416)

82.1.1.5.3 TRIO.DoAfterExecute Method

Generates an OnAfterExecute (see page 7417) event.

Pascal

```
procedure DoAfterExecute(const MethodName: string; Response: TStream); virtual;
```

C++

```
virtual __fastcall DoAfterExecute(const UnicodeString MethodName, TStream Response);
```

Description

TRIO (see page 7408) calls DoAfterExecute internally after it receives the results of a method call but before it unmarshals those results. This method simply generates an OnAfterExecute (see page 7417) event, passing the MethodName and Response parameters to the event handler. Override this method to perform class-specific actions before or after the OnAfterExecute (see page 7417) event.

MethodName is the name of the method that was just executed on the server.

Response is a stream from that contains the results that the server returned after executing the specified method.

See Also

OnAfterExecute (see page 7417)

82.1.1.5.4 TRIO.DoBeforeExecute Method

Generates an OnBeforeExecute (see page 7418) event.

Pascal

```
procedure DoBeforeExecute(const MethodName: string; Request: TStream); virtual;
```

C++

```
virtual __fastcall DoBeforeExecute(const UnicodeString MethodName, TStream Request);
```

Description

TRIO (see page 7408) calls DoBeforeExecute internally before it sends a SOAP packet to the server for execution. This method simply generates an OnBeforeExecute (see page 7418) event, passing the MethodName parameter and the string in the Request parameter to the event handler. Override this method to perform class-specific actions before or after the OnBeforeExecute (see page 7418) event.

MethodName is the name of the method that the encoded SOAP request calls.

Request is a stream from which the encoded SOAP request packet can be read.

See Also

OnBeforeExecute (see page 7418)

82.1.1.5.5 TRIO.GetResponseStream Method

Returns a newly created stream that receives the results of executing a method call.

Pascal

```
function GetResponseStream(BindingType: TWebServiceBindingType): TStream; virtual;
```

C++

```
virtual __fastcall TStream GetResponseStream(TWebServiceBindingType BindingType);
```

Description

TRIO (see page 7408) calls GetResponseStream internally when it executes a method call. It passes the returned stream as the Response parameter of the Execute method on the interface that the WebNode (see page 7417) property specifies. After this stream receives the encoded response of a method call, the RIO (see page 7421) component decodes the response and frees the stream.

BindingType indicates the expected coding of the response that the stream will hold. GetResponseStream can use this information to determine what type of stream to create.

See Also

Execute

WebNode (see page 7417)

82.1.1.5.6 TRIO.NewInstance Method

Allocates memory for each instance of a remote interfaced object.

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

All constructors call NewInstance automatically. NewInstance calls InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call NewInstance directly.

TRIO (see page 7408) overrides NewInstance to increment the reference count when a new instance is created. This prevents any constructor from accidentally deleting the instance due to a RefCount (see page 7416) of zero. The AfterConstruction (see page 7412) method decrements the value of RefCount (see page 7416) after all constructors have executed.

See Also

System::TObject::InstanceSize

System::TObject::NewInstance

AfterConstruction (see page 7412)

82.1.1.5.7 TRIO.QueryInterface Method

Implements the IInterface QueryInterface method.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface is called through the IInterface interface to obtain an interface pointer for the interface identified by the IID parameter. In Delphi, this call is generated when an application casts TRIO (see page 7408) to an invokable interface using the as operator.

TRIO (see page 7408) can only return a single type of interface pointer. The first time an application calls QueryInterface, TRIO (see page 7408) generates an in-memory method table to support calls to the methods on the requested interface.

IID specifies the invokable interface that the application wants to call using this TRIO (see page 7408) instance. If the TRIO (see page 7408) object has already been typecast to an interface, then IID must identify that interface. If the TRIO (see page 7408) instance has not yet been typecast to an interface, then IID must be a registered invokable interface.

Obj returns an interface pointer for the specified interface, unless TRIO (see page 7408) was already implementing a different interface or IID identified an interface that was not registered.

QueryInterface returns 0 (S_OK) if Obj successfully returns an interface pointer. It returns E_NOINTERFACE otherwise.

If QueryInterface successfully returns an interface pointer, it automatically increments the reference count.

See Also

InvRegistry (see page 4471)

RegisterInterface (see page 4404)

RefCount (see page 7416)

82.1.1.6 TRIO Properties

The properties of the TRIO class are listed here.

Public Properties

	Name	Description
	Converter (see page 7415)	Handles the marshaling and unmarshaling of calls to an invokable interface.
R	RefCount (see page 7416)	Maintains a reference count on the use of the TRIO (see page 7408) object's interface.
R	SOAPHeaders (see page 7416)	Provides access to the headers of SOAP messages that the remote interface object sends or receives.
	WebNode (see page 7417)	Handles the execution of method calls on the invokable interface.

82.1.1.6.1 TRIO.Converter Property

Handles the marshaling and unmarshaling of calls to an invokable interface.

Pascal

```
property Converter: IOPConvert;
```

C++

```
__property IOPConvert Converter;
```

Description

TRIO (see page 7408) uses Converter internally to marshal and unmarshal calls to an invokable interface. That is, when the TRIO (see page 7408) object has been typecast to an invokable interface, it implements each method call by using Converter to marshal the call into an encoding protocol, and to unmarshal any return values after that call is executed.

Each TRIO (see page 7408) descendant uses its own protocol-specific helper object as the value of the Converter property.

See Also

WebNode (see page 7417)

TOPToSoapDomConvert (see page 6167)

82.1.1.6.2 TRIO.RefCount Property

Maintains a reference count on the use of the TRIO (see page 7408) object's interface.

Pascal

```
property RefCount: Integer;
```

C++

```
__property int RefCount;
```

Description

RefCount keeps track of the usage on the TRIO (see page 7408) object's interface. RefCount is incremented by the interface's _AddRef method (Delphi) or AddRef method (C++) and decremented by its _Release method (Delphi) or Release method (C++).

If the TRIO (see page 7408) object is created without an Owner, then when RefCount drops to zero, the TRIO (see page 7408) instance is automatically freed.

See Also

QueryInterface (see page 7415)

Create (see page 7410)

_AddRef

_Release

82.1.1.6.3 TRIO.SOAPHeaders Property

Provides access to the headers of SOAP messages that the remote interface object sends or receives.

Pascal

```
property SOAPHeaders: TSOAPHeaders;
```

C++

```
__property TSOAPHeaders SOAPHeaders;
```

Description

SOAPHeaders is a helper object that lets TRIO (see page 7408) support the ISOAPHeaders (see page 4464) interface. It has methods to add headers to an outgoing request message and to retrieve the headers from the resulting response message. You can use the SOAPHeaders property directly, or access it through an ISOAPHeaders (see page 4464) interface, which is

obtained from the invokable interface using the as operator (Delphi) or the Supports method (C++).

Note: Although TRIO (see page 7408) uses the SOAPHeaders property to implement an ISOAPHeaders (see page 4464) interface, you can't obtain an ISOAPHeaders (see page 4464) interface directly from TRIO (see page 7408). Rather, you must obtain this interface from an invokable interface.

See Also

ISOAPHeaders (see page 4464)

82.1.1.6.4 TRIO.WebNode Property

Handles the execution of method calls on the invokable interface.

Pascal

```
property WebNode: IWebNode;
```

C++

```
__property IWebNode WebNode;
```

Description

TRIO (see page 7408) uses WebNode internally to execute method calls after they have been marshaled by Converter (see page 7415). That is, when the TRIO (see page 7408) object has been typecast to an invokable interface, it implements each method call by using Converter (see page 7415) to marshal the call into an encoding protocol, and then uses WebNode to execute the encoded call.

Each TRIO (see page 7408) descendant uses its own protocol-specific helper object as the value of the WebNode property.

See Also

Converter (see page 7415)

THTTPReqResp

OnAfterExecute (see page 7417)

OnBeforeExecute (see page 7418)

82.1.1.7 TRIO Events

The events of the TRIO class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 7417)	Occurs when TRIO (see page 7408) receives the results from executing a method of the invokable interface.
	OnBeforeExecute (see page 7418)	Occurs before TRIO (see page 7408) sends an encoded method call for execution.
	OnGetAttachment (see page 7419)	Occurs when TRIO (see page 7408) reads each attachment included in the results from executing a method of the invokable interface.
	OnSendAttachment (see page 7419)	Occurs when TRIO (see page 7408) sends each attachment that is the value of an argument of the method call on the invokable interface.

82.1.1.7.1 TRIO.OnAfterExecute Event

Occurs when TRIO (see page 7408) receives the results from executing a method of the invokable interface.

Pascal

```
property OnAfterExecute: TAfterExecuteEvent;
```

C++

```
__property TAfterExecuteEvent OnAfterExecute;
```

Description

Write an OnAfterExecute event handler to examine or alter the encoded results from executing a method call. OnAfterExecute occurs after TRIO (see page 7408) calls the Execute method of the interface that the WebNode (see page 7417) property specifies, but before the interface that the Converter (see page 7415) property specifies unmarshals those results.

You can use the SOAPResponse stream of the event handler to alter the encoded results from the server before they are unmarshaled. This lets you compensate for known idiosyncrasies of a server or of the Converter (see page 7415) that is the value of the Converter (see page 7415) property. For example, if the Web Service provider publishes interoperability information, you can use this event to adjust SOAP packets to compensate for differences that the Web Service provider reports.

See Also

OnBeforeExecute (see page 7418)

Execute

WebNode (see page 7417)

Converter (see page 7415)

OnGetAttachment (see page 7419)

82.1.1.7.2 TRIO.OnBeforeExecute Event

Occurs before TRIO (see page 7408) sends an encoded method call for execution.

Pascal

```
property OnBeforeExecute: TBeforeExecuteEvent;
```

C++

```
__property TBeforeExecuteEvent OnBeforeExecute;
```

Description

Write an OnBeforeExecute event handler to examine or alter an encoded method call before it is sent to the server. OnBeforeExecute occurs after the interface that the Converter (see page 7415) property specifies marshals a method call into a SOAP request packet, but before TRIO (see page 7408) calls the Execute method of the interface that the WebNode (see page 7417) property specifies.

You can use the SoapRequest parameter to read or alter the SOAP request before it is passed to the server. For example, if the Web Service provider publishes interoperability information, you can use this parameter to adjust SOAP packets to compensate for differences that the Web Service provider reports.

See Also

OnAfterExecute (see page 7417)

Execute

WebNode (see page 7417)

Converter (see page 7415)

OnSendAttachment (see page 7419)

82.1.1.7.3 TRIO.OnGetAttachment Event

Occurs when TRIO (see page 7408) reads each attachment included in the results from executing a method of the invokable interface.

Pascal

```
property OnGetAttachment: TOnGetAttachmentEvent;
```

C++

```
__property TOnGetAttachmentEvent OnGetAttachment;
```

Description

Write an OnGetAttachment event handler to examine the encoded attachments included in the results from executing a method call or to redirect them so that they are saved to a specific file. OnGetAttachment occurs once for each attachment received in the results from a call to the Execute method of the interface that the WebNode (see page 7417) property specifies. All OnGetAttachment events occur before the OnAfterExecute (see page 7417) event.

See Also

OnAfterExecute (see page 7417)

Execute

WebNode (see page 7417)

82.1.1.7.4 TRIO.OnSendAttachment Event

Occurs when TRIO (see page 7408) sends each attachment that is the value of an argument of the method call on the invokable interface.

Pascal

```
property OnSendAttachment: TOnSendAttachmentEvent;
```

C++

```
__property TOnSendAttachmentEvent OnSendAttachment;
```

Description

Write an OnSendAttachment event handler to examine or alter the attachments that are to be included in a request message that represents a method call. OnSendAttachment occurs once for each attachment sent with the request message to the Web Service provider. All OnSendAttachment events occur after the OnBeforeExecute (see page 7418) event.

See Also

OnBeforeExecute (see page 7418)

Execute

WebNode (see page 7417)

82.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IRIOAccess (see page 7420)	IRIOAccess is the interface for accessing a remote interfaced object from its invokable interface.

82.2.1 IRIOAccess Interface

IRIOAccess is the interface for accessing a remote interfaced object from its invokable interface.

Class Hierarchy

Pascal

```
IRIOAccess = interface;
```

C++

```
__interface IRIOAccess;
```

File

Rio

Description

Remote interfaced objects (TRIO (see page 7408) and its descendants) implement IRIOAccess so that you can access the TRIO (see page 7408) instance given an invokable interface that it implements. This interface defines a single property, RIO (see page 7421), which returns the TRIO (see page 7408) instance that implements it.

Note: C++ method declarations that use IRIOAccess use the _di_IRIOAccess type instead. This type is a DelphiInterface wrapper around the IRIOAccess interface:

Note: typedef System::DelphiInterface< IRIOAccess > _di_IRIOAccess;

See Also

TRIO (see page 7408)

82.2.1.1 IRIOAccess Members

The following tables list the members exposed by IRIOAccess.

Public Methods

	Name	Description
	GetRIO (see page 7421)	Returns the value of the RIO (see page 7421) property.

Public Properties

	Name	Description
	RIO (see page 7421)	Provides access to the remote interfaced object that implements this interface.

82.2.1.2 IRIOAccess Methods

The methods of the IRIOAccess class are listed here.

Public Methods

	Name	Description
	GetRIO (see page 7421)	Returns the value of the RIO (see page 7421) property.

82.2.1.2.1 IRIOAccess.GetRIO Method

Returns the value of the RIO (see page 7421) property.

Pascal

```
function GetRIO: TRIO;
```

C++

```
__fastcall TRIO GetRIO();
```

Description

GetRIO is the read implementation for the RIO (see page 7421) property.

See Also

RIO (see page 7421)

82.2.1.3 IRIOAccess Properties

The properties of the IRIOAccess class are listed here.

Public Properties

	Name	Description
	RIO (see page 7421)	Provides access to the remote interfaced object that implements this interface.

82.2.1.3.1 IRIOAccess.RIO Property

Provides access to the remote interfaced object that implements this interface.

Pascal

```
property RIO: TRIO;
```

C++

```
__property TRIO RIO;
```

Description

Call GetRIO (see page 7421) to access the underlying remote interfaced object. This method is useful when the client of a Web Service uses the automatically-generated function to obtain an invokable interface rather than explicitly creating a TRIO (see page 7408) instance.

82.3 Types

The following table lists types in this documentation.

Types

Name	Description
TAfterExecuteEvent (see page 7422)	This is type Rio.TAfterExecuteEvent.
TBeforeExecuteEvent (see page 7422)	This is type Rio.TBeforeExecuteEvent.

82.3.1 Rio.TAfterExecuteEvent Type

Pascal

```
TAfterExecuteEvent = procedure (const MethodName: string; SOAPResponse: TStream) of object;
```

C++

```
(const MethodName: string; SOAPResponse: TStream) ( TAfterExecuteEvent)();
```

File

Rio

Description

This is type Rio.TAfterExecuteEvent.

82.3.2 Rio.TBeforeExecuteEvent Type

Pascal

```
TBeforeExecuteEvent = procedure (const MethodName: string; SOAPRequest: TStream) of object;
```

C++

```
(const MethodName: string; SOAPRequest: TStream) ( TBeforeExecuteEvent)();
```

File

Rio

Description

This is type Rio.TBeforeExecuteEvent.

82.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
StubSize (see page 7423)	This is constant Rio.StubSize.

82.4.1 Rio.StubSize Constant

Pascal

```
StubSize = 19;
```

C++

```
StubSize = 19;
```

File

Rio

Description

This is constant Rio.StubSize.

83 RTLConsts Namespace

This is namespace RTLConsts.

Topics

Name	Description
Constants (see page 7431)	The following table lists constants in this documentation.

Constants

Name	Description
hNoContext (see page 7436)	This is constant RTLConsts.hNoContext.
hNoContextFound (see page 7436)	This is constant RTLConsts.hNoContextFound.
hNoFilterViewer (see page 7436)	This is constant RTLConsts.hNoFilterViewer.
hNoSystem (see page 7437)	This is constant RTLConsts.hNoSystem.
hNoTableOfContents (see page 7437)	This is constant RTLConsts.hNoTableOfContents.
hNothingFound (see page 7437)	This is constant RTLConsts.hNothingFound.
hNoTopics (see page 7438)	This is constant RTLConsts.hNoTopics.
SAcreFeetDescription (see page 7438)	This is constant RTLConsts.SAcreFeetDescription.
SAcreInchesDescription (see page 7438)	This is constant RTLConsts.SAcreInchesDescription.
SAcresDescription (see page 7439)	This is constant RTLConsts.SAcresDescription.
SAncestorNotFound (see page 7439)	This is constant RTLConsts.SAncestorNotFound.
SAngstromsDescription (see page 7439)	This is constant RTLConsts.SAngstromsDescription.
SAnsiUTF8Expected (see page 7440)	This is constant RTLConsts.SAnsiUTF8Expected.
SAreaDescription (see page 7440)	This is constant RTLConsts.SAreaDescription.
SAresDescription (see page 7440)	This is constant RTLConsts.SAresDescription.
sArgument_InvalidHighSurrogate (see page 7441)	This is constant RTLConsts.sArgument_InvalidHighSurrogate.
sArgument_InvalidLowSurrogate (see page 7441)	This is constant RTLConsts.sArgument_InvalidLowSurrogate.
sArgumentOutOfRange_Index (see page 7441)	This is constant RTLConsts.sArgumentOutOfRange_Index.
sArgumentOutOfRange_InvalidHighSurrogate (see page 7442)	This is constant RTLConsts.sArgumentOutOfRange_InvalidHighSurrogate.
sArgumentOutOfRange_InvalidLowSurrogate (see page 7442)	This is constant RTLConsts.sArgumentOutOfRange_InvalidLowSurrogate.
sArgumentOutOfRange_InvalidUTF32 (see page 7443)	This is constant RTLConsts.sArgumentOutOfRange_InvalidUTF32.
sArgumentOutOfRange_StringIndex (see page 7443)	This is constant RTLConsts.sArgumentOutOfRange_StringIndex.
SAssignError (see page 7443)	This is constant RTLConsts.SAssignError.
SAstronomicalUnitsDescription (see page 7444)	This is constant RTLConsts.SAstronomicalUnitsDescription.
sAsyncSocketError (see page 7444)	This is constant RTLConsts.sAsyncSocketError.
SBitsIndexError (see page 7444)	This is constant RTLConsts.SBitsIndexError.
SBucketListLocked (see page 7445)	This is constant RTLConsts.SBucketListLocked.

sCannotCallAcquireOnConditionVar (see page 7445)	This is constant RTLConsts.sCannotCallAcquireOnConditionVar.
sCannotCreateSocket (see page 7445)	This is constant RTLConsts.sCannotCreateSocket.
sCannotListenOnOpen (see page 7446)	This is constant RTLConsts.sCannotListenOnOpen.
sCantChangeWhileActive (see page 7446)	This is constant RTLConsts.sCantChangeWhileActive.
SCantWriteResourceStreamError (see page 7446)	This is constant RTLConsts.SCantWriteResourceStreamError.
SCelsiusDescription (see page 7447)	This is constant RTLConsts.SCelsiusDescription.
SCentaresDescription (see page 7447)	This is constant RTLConsts.SCentaresDescription.
SCentigramsDescription (see page 7447)	This is constant RTLConsts.SCentigramsDescription.
SCentiLitersDescription (see page 7448)	This is constant RTLConsts.SCentiLitersDescription.
SCentimetersDescription (see page 7448)	This is constant RTLConsts.SCentimetersDescription.
SCenturiesDescription (see page 7448)	This is constant RTLConsts.SCenturiesDescription.
SChainsDescription (see page 7449)	This is constant RTLConsts.SChainsDescription.
SCharExpected (see page 7449)	This is constant RTLConsts.SCharExpected.
SCheckSynchronizeError (see page 7449)	This is constant RTLConsts.SCheckSynchronizeError.
SClassNotFound (see page 7450)	This is constant RTLConsts.SClassNotFound.
SCmplxCouldNotParseImaginary (see page 7450)	This is constant RTLConsts.SCmplxCouldNotParseImaginary.
SCmplxCouldNotParsePlus (see page 7450)	This is constant RTLConsts.SCmplxCouldNotParsePlus.
SCmplxCouldNotParseReal (see page 7451)	This is constant RTLConsts.SCmplxCouldNotParseReal.
SCmplxCouldNotParseSymbol (see page 7451)	This is constant RTLConsts.SCmplxCouldNotParseSymbol.
SCmplxErrorSuffix (see page 7451)	This is constant RTLConsts.SCmplxErrorSuffix.
SCmplxUnexpectedChars (see page 7452)	This is constant RTLConsts.SCmplxUnexpectedChars.
SCmplxUnexpectedEOS (see page 7452)	This is constant RTLConsts.SCmplxUnexpectedEOS.
SComponentNameTooLong (see page 7452)	This is constant RTLConsts.SComponentNameTooLong.
SConvDuplicateFamily (see page 7453)	This is constant RTLConsts.SConvDuplicateFamily.
SConvDuplicateType (see page 7453)	This is constant RTLConsts.SConvDuplicateType.
SConvFactorZero (see page 7453)	This is constant RTLConsts.SConvFactorZero.
SConvIllegalFamily (see page 7454)	This is constant RTLConsts.SConvIllegalFamily.
SConvIllegalType (see page 7454)	This is constant RTLConsts.SConvIllegalType.
SConvIncompatibleTypes2 (see page 7454)	This is constant RTLConsts.SConvIncompatibleTypes2.
SConvIncompatibleTypes3 (see page 7455)	This is constant RTLConsts.SConvIncompatibleTypes3.
SConvIncompatibleTypes4 (see page 7455)	This is constant RTLConsts.SConvIncompatibleTypes4.
SConvStrParseError (see page 7455)	This is constant RTLConsts.SConvStrParseError.
SConvUnknownDescription (see page 7456)	This is constant RTLConsts.SConvUnknownDescription.
SConvUnknownDescriptionWithPrefix (see page 7456)	This is constant RTLConsts.SConvUnknownDescriptionWithPrefix.
SConvUnknownFamily (see page 7456)	This is constant RTLConsts.SConvUnknownFamily.
SConvUnknownType (see page 7457)	This is constant RTLConsts.SConvUnknownType.
SCordFeetDescription (see page 7457)	This is constant RTLConsts.SCordFeetDescription.
SCordsDescription (see page 7457)	This is constant RTLConsts.SCordsDescription.
SCubicCentimetersDescription (see page 7458)	This is constant RTLConsts.SCubicCentimetersDescription.
SCubicDecametersDescription (see page 7458)	This is constant RTLConsts.SCubicDecametersDescription.
SCubicDecimetersDescription (see page 7458)	This is constant RTLConsts.SCubicDecimetersDescription.
SCubicFeetDescription (see page 7459)	This is constant RTLConsts.SCubicFeetDescription.
SCubicHectometersDescription (see page 7459)	This is constant RTLConsts.SCubicHectometersDescription.
SCubicInchesDescription (see page 7459)	This is constant RTLConsts.SCubicInchesDescription.
SCubicKilometersDescription (see page 7460)	This is constant RTLConsts.SCubicKilometersDescription.
SCubicMetersDescription (see page 7460)	This is constant RTLConsts.SCubicMetersDescription.
SCubicMilesDescription (see page 7460)	This is constant RTLConsts.SCubicMilesDescription.
SCubicMillimetersDescription (see page 7461)	This is constant RTLConsts.SCubicMillimetersDescription.
SCubicYardsDescription (see page 7461)	This is constant RTLConsts.SCubicYardsDescription.
SCubitsDescription (see page 7461)	This is constant RTLConsts.SCubitsDescription.
SDateTimeDescription (see page 7462)	This is constant RTLConsts.SDateTimeDescription.
SDaysDescription (see page 7462)	This is constant RTLConsts.SDaysDescription.
SDecadesDescription (see page 7462)	This is constant RTLConsts.SDecadesDescription.
SDecagramsDescription (see page 7463)	This is constant RTLConsts.SDecagramsDescription.

SDecaLitersDescription (see page 7463)	This is constant RTLConsts.SDecaLitersDescription.
SDecametersDescription (see page 7463)	This is constant RTLConsts.SDecametersDescription.
SDecasteresDescription (see page 7464)	This is constant RTLConsts.SDecasteresDescription.
SDecigramsDescription (see page 7464)	This is constant RTLConsts.SDecigramsDescription.
SDeciLitersDescription (see page 7464)	This is constant RTLConsts.SDeciLitersDescription.
SDecimetersDescription (see page 7465)	This is constant RTLConsts.SDecimetersDescription.
SDecisteresDescription (see page 7465)	This is constant RTLConsts.SDecisteresDescription.
SDelimiterQuoteCharError (see page 7465)	This is constant RTLConsts.SDelimiterQuoteCharError.
SDistanceDescription (see page 7466)	This is constant RTLConsts.SDistanceDescription.
SDramsDescription (see page 7466)	This is constant RTLConsts.SDramsDescription.
SDryBucketsDescription (see page 7466)	This is constant RTLConsts.SDryBucketsDescription.
SDryBushelsDescription (see page 7467)	This is constant RTLConsts.SDryBushelsDescription.
SDryGallonsDescription (see page 7467)	This is constant RTLConsts.SDryGallonsDescription.
SDryPecksDescription (see page 7467)	This is constant RTLConsts.SDryPecksDescription.
SDryPintsDescription (see page 7468)	This is constant RTLConsts.SDryPintsDescription.
SDryQuartsDescription (see page 7468)	This is constant RTLConsts.SDryQuartsDescription.
SDuplicateClass (see page 7468)	This is constant RTLConsts.SDuplicateClass.
SDuplicateItem (see page 7469)	This is constant RTLConsts.SDuplicateItem.
SDuplicateName (see page 7469)	This is constant RTLConsts.SDuplicateName.
SDuplicateString (see page 7469)	This is constant RTLConsts.SDuplicateString.
SFahrenheitDescription (see page 7470)	This is constant RTLConsts.SFahrenheitDescription.
SFailedToCallConstructor (see page 7470)	This is constant RTLConsts.SFailedToCallConstructor.
SFathomsDescription (see page 7470)	This is constant RTLConsts.SFathomsDescription.
SFCreateError (see page 7471)	This is constant RTLConsts.SFCreateError.
SFCreateErrorEx (see page 7471)	This is constant RTLConsts.SFCreateErrorEx.
SFeetDescription (see page 7471)	This is constant RTLConsts.SFeetDescription.
SFixedColTooBig (see page 7472)	This is constant RTLConsts.SFixedColTooBig.
SFixedRowTooBig (see page 7472)	This is constant RTLConsts.SFixedRowTooBig.
SFluidCupsDescription (see page 7472)	This is constant RTLConsts.SFluidCupsDescription.
SFluidGallonsDescription (see page 7473)	This is constant RTLConsts.SFluidGallonsDescription.
SFluidGillsDescription (see page 7473)	This is constant RTLConsts.SFluidGillsDescription.
SFluidOuncesDescription (see page 7473)	This is constant RTLConsts.SFluidOuncesDescription.
SFluidPintsDescription (see page 7474)	This is constant RTLConsts.SFluidPintsDescription.
SFluidQuartsDescription (see page 7474)	This is constant RTLConsts.SFluidQuartsDescription.
SFluidTablespoonsDescription (see page 7474)	This is constant RTLConsts.SFluidTablespoonsDescription.
SFluidTeaspoonsDescription (see page 7475)	This is constant RTLConsts.SFluidTeaspoonsDescription.
SFOpenError (see page 7475)	This is constant RTLConsts.SFOpenError.
SFOpenErrorEx (see page 7475)	This is constant RTLConsts.SFOpenErrorEx.
SFortnightsDescription (see page 7476)	This is constant RTLConsts.SFortnightsDescription.
SFurlongsDescription (see page 7476)	This is constant RTLConsts.SFurlongsDescription.
SGigametersDescription (see page 7476)	This is constant RTLConsts.SGigametersDescription.
SGrainsDescription (see page 7477)	This is constant RTLConsts.SGrainsDescription.
SGramsDescription (see page 7477)	This is constant RTLConsts.SGramsDescription.
SGridTooLarge (see page 7477)	This is constant RTLConsts.SGridTooLarge.
SHandsDescription (see page 7478)	This is constant RTLConsts.SHandsDescription.
SHectaresDescription (see page 7478)	This is constant RTLConsts.SHectaresDescription.
SHectogramsDescription (see page 7478)	This is constant RTLConsts.SHectogramsDescription.
SHectoLitersDescription (see page 7479)	This is constant RTLConsts.SHectoLitersDescription.
SHectometersDescription (see page 7479)	This is constant RTLConsts.SHectometersDescription.
SHoursDescription (see page 7479)	This is constant RTLConsts.SHoursDescription.
SIdentifierExpected (see page 7480)	This is constant RTLConsts.SIdentifierExpected.
SInchesDescription (see page 7480)	This is constant RTLConsts.SInchesDescription.
SIndexOutOfRange (see page 7480)	This is constant RTLConsts.SIndexOutOfRange.
SIniFileWriteError (see page 7481)	This is constant RTLConsts.SIniFileWriteError.

SInvalidActionCreation (see page 7481)	This is constant RTLConsts.SInvalidActionCreation.
SInvalidActionEnumeration (see page 7481)	This is constant RTLConsts.SInvalidActionEnumeration.
SInvalidActionRegistration (see page 7482)	This is constant RTLConsts.SInvalidActionRegistration.
SInvalidActionUnregistration (see page 7482)	This is constant RTLConsts.SInvalidActionUnregistration.
SInvalidBinary (see page 7482)	This is constant RTLConsts.SInvalidBinary.
SInvalidDate (see page 7483)	This is constant RTLConsts.SInvalidDate.
SInvalidDateDay (see page 7483)	This is constant RTLConsts.SInvalidDateDay.
SInvalidDateMonthWeek (see page 7483)	This is constant RTLConsts.SInvalidDateMonthWeek.
SInvalidDateTime (see page 7484)	This is constant RTLConsts.SInvalidDateTime.
SInvalidDateWeek (see page 7484)	This is constant RTLConsts.SInvalidDateWeek.
SInvalidDayOfWeekInMonth (see page 7484)	This is constant RTLConsts.SInvalidDayOfWeekInMonth.
SInvalidFileName (see page 7485)	This is constant RTLConsts.SInvalidFileName.
SInvalidImage (see page 7485)	This is constant RTLConsts.SInvalidImage.
SInvalidInteger (see page 7485)	This is constant RTLConsts.SInvalidInteger.
SInvalidJulianDate (see page 7486)	This is constant RTLConsts.SInvalidJulianDate.
SInvalidMask (see page 7486)	This is constant RTLConsts.SInvalidMask.
SInvalidName (see page 7486)	This is constant RTLConsts.SInvalidName.
SInvalidProperty (see page 7487)	This is constant RTLConsts.SInvalidProperty.
SInvalidPropertyElement (see page 7487)	This is constant RTLConsts.SInvalidPropertyElement.
SInvalidPropertyPath (see page 7487)	This is constant RTLConsts.SInvalidPropertyPath.
SInvalidPropertyType (see page 7488)	This is constant RTLConsts.SInvalidPropertyType.
SInvalidPropertyValue (see page 7488)	This is constant RTLConsts.SInvalidPropertyValue.
SInvalidRegType (see page 7488)	This is constant RTLConsts.SInvalidRegType.
SInvalidString (see page 7489)	This is constant RTLConsts.SInvalidString.
SInvalidStringGridOp (see page 7489)	This is constant RTLConsts.SInvalidStringGridOp.
SInvalidTime (see page 7489)	This is constant RTLConsts.SInvalidTime.
SItemNotFound (see page 7490)	This is constant RTLConsts.SItemNotFound.
SJulianDateDescription (see page 7490)	This is constant RTLConsts.SJulianDateDescription.
SKelvinDescription (see page 7490)	This is constant RTLConsts.SKelvinDescription.
SKilogramsDescription (see page 7491)	This is constant RTLConsts.SKilogramsDescription.
SKiloLitersDescription (see page 7491)	This is constant RTLConsts.SKiloLitersDescription.
SKilometersDescription (see page 7491)	This is constant RTLConsts.SKilometersDescription.
SLightYearsDescription (see page 7492)	This is constant RTLConsts.SLightYearsDescription.
SLineTooLong (see page 7492)	This is constant RTLConsts.SLineTooLong.
SLinksDescription (see page 7492)	This is constant RTLConsts.SLinksDescription.
SListCapacityError (see page 7493)	This is constant RTLConsts.SListCapacityError.
SListCountError (see page 7493)	This is constant RTLConsts.SListCountError.
SListIndexError (see page 7493)	This is constant RTLConsts.SListIndexError.
SLitersDescription (see page 7494)	This is constant RTLConsts.SLitersDescription.
SLongTonsDescription (see page 7494)	This is constant RTLConsts.SLongTonsDescription.
SMaskEditErr (see page 7494)	This is constant RTLConsts.SMaskEditErr.
SMaskErr (see page 7495)	This is constant RTLConsts.SMaskErr.
SMassDescription (see page 7495)	This is constant RTLConsts.SMassDescription.
SMegametersDescription (see page 7495)	This is constant RTLConsts.SMegametersDescription.
SMemoryStreamError (see page 7496)	This is constant RTLConsts.SMemoryStreamError.
SMetersDescription (see page 7496)	This is constant RTLConsts.SMetersDescription.
SMetricTonsDescription (see page 7496)	This is constant RTLConsts.SMetricTonsDescription.
SMicrogramsDescription (see page 7497)	This is constant RTLConsts.SMicrogramsDescription.
SMicromicronsDescription (see page 7497)	This is constant RTLConsts.SMicromicronsDescription.
SMicronsDescription (see page 7497)	This is constant RTLConsts.SMicronsDescription.
SMilesDescription (see page 7498)	This is constant RTLConsts.SMilesDescription.
SMillenniaDescription (see page 7498)	This is constant RTLConsts.SMillenniaDescription.
SMilligramsDescription (see page 7498)	This is constant RTLConsts.SMilligramsDescription.
SMilliLitersDescription (see page 7499)	This is constant RTLConsts.SMilliLitersDescription.

SMillimetersDescription (see page 7499)	This is constant RTLConsts.SMillimetersDescription.
SMillimicronsDescription (see page 7499)	This is constant RTLConsts.SMillimicronsDescription.
SMilliSecondsDescription (see page 7500)	This is constant RTLConsts.SMilliSecondsDescription.
SMinutesDescription (see page 7500)	This is constant RTLConsts.SMinutesDescription.
SMissingDateTimeField (see page 7500)	This is constant RTLConsts.SMissingDateTimeField.
SModifiedJulianDateDescription (see page 7501)	This is constant RTLConsts.SModifiedJulianDateDescription.
SMonthsDescription (see page 7501)	This is constant RTLConsts.SMonthsDescription.
SNanogramsDescription (see page 7501)	This is constant RTLConsts.SNanogramsDescription.
SNauticalMilesDescription (see page 7502)	This is constant RTLConsts.SNauticalMilesDescription.
sNoAddress (see page 7502)	This is constant RTLConsts.sNoAddress.
SNoComSupport (see page 7502)	This is constant RTLConsts.SNoComSupport.
sNoConstruct (see page 7503)	This is constant RTLConsts.sNoConstruct.
SNotPrinting (see page 7503)	This is constant RTLConsts.SNotPrinting.
SNumberExpected (see page 7503)	This is constant RTLConsts.SNumberExpected.
SOuncesDescription (see page 7504)	This is constant RTLConsts.SOuncesDescription.
SPacesDescription (see page 7504)	This is constant RTLConsts.SPacesDescription.
SParsecsDescription (see page 7504)	This is constant RTLConsts.SParsecsDescription.
SParseError (see page 7505)	This is constant RTLConsts.SParseError.
SPicasDescription (see page 7505)	This is constant RTLConsts.SPicasDescription.
SPointsDescription (see page 7505)	This is constant RTLConsts.SPointsDescription.
SPoundsDescription (see page 7506)	This is constant RTLConsts.SPoundsDescription.
SPrinting (see page 7506)	This is constant RTLConsts.SPrinting.
SPropertyException (see page 7506)	This is constant RTLConsts.SPropertyException.
SRankineDescription (see page 7507)	This is constant RTLConsts.SRankineDescription.
SReadError (see page 7507)	This is constant RTLConsts.SReadError.
SReadOnlyProperty (see page 7507)	This is constant RTLConsts.SReadOnlyProperty.
SReaumurDescription (see page 7508)	This is constant RTLConsts.SReaumurDescription.
SRegCreateFailed (see page 7508)	This is constant RTLConsts.SRegCreateFailed.
SRegGetDataFailed (see page 7508)	This is constant RTLConsts.SRegGetDataFailed.
SRegisterError (see page 7509)	This is constant RTLConsts.SRegisterError.
SRegSetDataFailed (see page 7509)	This is constant RTLConsts.SRegSetDataFailed.
SResNotFound (see page 7509)	This is constant RTLConsts.SResNotFound.
SRodsDescription (see page 7510)	This is constant RTLConsts.SRodsDescription.
SSecondsDescription (see page 7510)	This is constant RTLConsts.SSecondsDescription.
SSeekNotImplemented (see page 7510)	This is constant RTLConsts.SSeekNotImplemented.
sSocketAlreadyOpen (see page 7511)	This is constant RTLConsts.sSocketAlreadyOpen.
sSocketIOError (see page 7511)	This is constant RTLConsts.sSocketIOError.
sSocketMustBeBlocking (see page 7511)	This is constant RTLConsts.sSocketMustBeBlocking.
sSocketRead (see page 7512)	This is constant RTLConsts.sSocketRead.
sSocketWrite (see page 7512)	This is constant RTLConsts.sSocketWrite.
SSortedListError (see page 7512)	This is constant RTLConsts.SSortedListError.
SSquareCentimetersDescription (see page 7513)	This is constant RTLConsts.SSquareCentimetersDescription.
SSquareDecametersDescription (see page 7513)	This is constant RTLConsts.SSquareDecametersDescription.
SSquareDecimetersDescription (see page 7513)	This is constant RTLConsts.SSquareDecimetersDescription.
SSquareFeetDescription (see page 7514)	This is constant RTLConsts.SSquareFeetDescription.
SSquareHectometersDescription (see page 7514)	This is constant RTLConsts.SSquareHectometersDescription.
SSquareInchesDescription (see page 7514)	This is constant RTLConsts.SSquareInchesDescription.
SSquareKilometersDescription (see page 7515)	This is constant RTLConsts.SSquareKilometersDescription.
SSquareMetersDescription (see page 7515)	This is constant RTLConsts.SSquareMetersDescription.
SSquareMilesDescription (see page 7515)	This is constant RTLConsts.SSquareMilesDescription.
SSquareMillimetersDescription (see page 7516)	This is constant RTLConsts.SSquareMillimetersDescription.
SSquareRodsDescription (see page 7516)	This is constant RTLConsts.SSquareRodsDescription.
SSquareYardsDescription (see page 7516)	This is constant RTLConsts.SSquareYardsDescription.
SSteresDescription (see page 7517)	This is constant RTLConsts.SSteresDescription.

SStonesDescription (see page 7517)	This is constant RTLConsts.SStonesDescription.
SStreamSetSize (see page 7517)	This is constant RTLConsts.SStreamSetSize.
SStringExpected (see page 7518)	This is constant RTLConsts.SStringExpected.
SSymbolExpected (see page 7518)	This is constant RTLConsts.SSymbolExpected.
STemperatureDescription (see page 7518)	This is constant RTLConsts.STemperatureDescription.
SThreadCreateError (see page 7519)	This is constant RTLConsts.SThreadCreateError.
SThreadError (see page 7519)	This is constant RTLConsts.SThreadError.
SThreadExternalTerminate (see page 7519)	This is constant RTLConsts.SThreadExternalTerminate.
SThreadExternalWait (see page 7520)	This is constant RTLConsts.SThreadExternalWait.
STimeDescription (see page 7520)	This is constant RTLConsts.STimeDescription.
STimeEncodeError (see page 7520)	This is constant RTLConsts.STimeEncodeError.
STonsDescription (see page 7521)	This is constant RTLConsts.STonsDescription.
STooManyDeleted (see page 7521)	This is constant RTLConsts.STooManyDeleted.
SUKBucketsDescription (see page 7521)	This is constant RTLConsts.SUKBucketsDescription.
SUKBushelsDescription (see page 7522)	This is constant RTLConsts.SUKBushelsDescription.
SUKGallonsDescription (see page 7522)	This is constant RTLConsts.SUKGallonsDescription.
SUKGillsDescription (see page 7522)	This is constant RTLConsts.SUKGillsDescription.
SUKOuncesDescription (see page 7523)	This is constant RTLConsts.SUKOuncesDescription.
SUKPecksDescription (see page 7523)	This is constant RTLConsts.SUKPecksDescription.
SUKPintsDescription (see page 7523)	This is constant RTLConsts.SUKPintsDescription.
SUKPottlesDescription (see page 7524)	This is constant RTLConsts.SUKPottlesDescription.
SUKQuartsDescription (see page 7524)	This is constant RTLConsts.SUKQuartsDescription.
SUnknownGroup (see page 7524)	This is constant RTLConsts.SUnknownGroup.
SUnknownProperty (see page 7525)	This is constant RTLConsts.SUnknownProperty.
SVolumeDescription (see page 7525)	This is constant RTLConsts.SVolumeDescription.
SWeeksDescription (see page 7525)	This is constant RTLConsts.SWeeksDescription.
sWindowsSocketError (see page 7526)	This is constant RTLConsts.sWindowsSocketError.
SWriteError (see page 7526)	This is constant RTLConsts.SWriteError.
SYardsDescription (see page 7526)	This is constant RTLConsts.SYardsDescription.
SYearsDescription (see page 7527)	This is constant RTLConsts.SYearsDescription.

83.1 Constants

The following table lists constants in this documentation.

Constants

Name	Description
hNoContext (see page 7436)	This is constant RTLConsts.hNoContext.
hNoContextFound (see page 7436)	This is constant RTLConsts.hNoContextFound.
hNoFilterViewer (see page 7436)	This is constant RTLConsts.hNoFilterViewer.
hNoSystem (see page 7437)	This is constant RTLConsts.hNoSystem.
hNoTableOfContents (see page 7437)	This is constant RTLConsts.hNoTableOfContents.
hNothingFound (see page 7437)	This is constant RTLConsts.hNothingFound.
hNoTopics (see page 7438)	This is constant RTLConsts.hNoTopics.
SAcreFeetDescription (see page 7438)	This is constant RTLConsts.SAcreFeetDescription.
SAcreInchesDescription (see page 7438)	This is constant RTLConsts.SAcreInchesDescription.
SAcresDescription (see page 7439)	This is constant RTLConsts.SAcresDescription.
SAncestorNotFound (see page 7439)	This is constant RTLConsts.SAncestorNotFound.
SAngstromsDescription (see page 7439)	This is constant RTLConsts.SAngstromsDescription.
SAnsiUTF8Expected (see page 7440)	This is constant RTLConsts.SAnsiUTF8Expected.
SAreaDescription (see page 7440)	This is constant RTLConsts.SAreaDescription.
SAresDescription (see page 7440)	This is constant RTLConsts.SAresDescription.
sArgument_InvalidHighSurrogate (see page 7441)	This is constant RTLConsts.sArgument_InvalidHighSurrogate.
sArgument_InvalidLowSurrogate (see page 7441)	This is constant RTLConsts.sArgument_InvalidLowSurrogate.
sArgumentOutOfRange_Index (see page 7441)	This is constant RTLConsts.sArgumentOutOfRange_Index.
sArgumentOutOfRange_InvalidHighSurrogate (see page 7442)	This is constant RTLConsts.sArgumentOutOfRange_InvalidHighSurrogate.
sArgumentOutOfRange_InvalidLowSurrogate (see page 7442)	This is constant RTLConsts.sArgumentOutOfRange_InvalidLowSurrogate.
sArgumentOutOfRange_InvalidUTF32 (see page 7443)	This is constant RTLConsts.sArgumentOutOfRange_InvalidUTF32.
sArgumentOutOfRange_StringIndex (see page 7443)	This is constant RTLConsts.sArgumentOutOfRange_StringIndex.
SAssignError (see page 7443)	This is constant RTLConsts.SAssignError.
SAstronomicalUnitsDescription (see page 7444)	This is constant RTLConsts.SAstronomicalUnitsDescription.
sAsyncSocketError (see page 7444)	This is constant RTLConsts.sAsyncSocketError.
SBitsIndexError (see page 7444)	This is constant RTLConsts.SBitsIndexError.
SBucketListLocked (see page 7445)	This is constant RTLConsts.SBucketListLocked.
sCannotCallAcquireOnConditionVar (see page 7445)	This is constant RTLConsts.sCannotCallAcquireOnConditionVar.
sCannotCreateSocket (see page 7445)	This is constant RTLConsts.sCannotCreateSocket.
sCannotListenOnOpen (see page 7446)	This is constant RTLConsts.sCannotListenOnOpen.
sCantChangeWhileActive (see page 7446)	This is constant RTLConsts.sCantChangeWhileActive.
SCantWriteResourceStreamError (see page 7446)	This is constant RTLConsts.SCantWriteResourceStreamError.
SCelsiusDescription (see page 7447)	This is constant RTLConsts.SCelsiusDescription.
SCentaresDescription (see page 7447)	This is constant RTLConsts.SCentaresDescription.
SCentigramsDescription (see page 7447)	This is constant RTLConsts.SCentigramsDescription.
SCentiLitersDescription (see page 7448)	This is constant RTLConsts.SCentiLitersDescription.
SCentimetersDescription (see page 7448)	This is constant RTLConsts.SCentimetersDescription.
SCenturiesDescription (see page 7448)	This is constant RTLConsts.SCenturiesDescription.
SChainsDescription (see page 7449)	This is constant RTLConsts.SChainsDescription.
SCharExpected (see page 7449)	This is constant RTLConsts.SCharExpected.
SCheckSynchronizeError (see page 7449)	This is constant RTLConsts.SCheckSynchronizeError.
SClassNotFound (see page 7450)	This is constant RTLConsts.SClassNotFound.
SCmplxCouldNotParseImaginary (see page 7450)	This is constant RTLConsts.SCmplxCouldNotParseImaginary.
SCmplxCouldNotParsePlus (see page 7450)	This is constant RTLConsts.SCmplxCouldNotParsePlus.

SCmplxCouldNotParseReal (see page 7451)	This is constant RTLConsts.SCmplxCouldNotParseReal.
SCmplxCouldNotParseSymbol (see page 7451)	This is constant RTLConsts.SCmplxCouldNotParseSymbol.
SCmplxErrorSuffix (see page 7451)	This is constant RTLConsts.SCmplxErrorSuffix.
SCmplxUnexpectedChars (see page 7452)	This is constant RTLConsts.SCmplxUnexpectedChars.
SCmplxUnexpectedEOS (see page 7452)	This is constant RTLConsts.SCmplxUnexpectedEOS.
SComponentNameTooLong (see page 7452)	This is constant RTLConsts.SComponentNameTooLong.
SConvDuplicateFamily (see page 7453)	This is constant RTLConsts.SConvDuplicateFamily.
SConvDuplicateType (see page 7453)	This is constant RTLConsts.SConvDuplicateType.
SConvFactorZero (see page 7453)	This is constant RTLConsts.SConvFactorZero.
SConvIllegalFamily (see page 7454)	This is constant RTLConsts.SConvIllegalFamily.
SConvIllegalType (see page 7454)	This is constant RTLConsts.SConvIllegalType.
SConvIncompatibleTypes2 (see page 7454)	This is constant RTLConsts.SConvIncompatibleTypes2.
SConvIncompatibleTypes3 (see page 7455)	This is constant RTLConsts.SConvIncompatibleTypes3.
SConvIncompatibleTypes4 (see page 7455)	This is constant RTLConsts.SConvIncompatibleTypes4.
SConvStrParseError (see page 7455)	This is constant RTLConsts.SConvStrParseError.
SConvUnknownDescription (see page 7456)	This is constant RTLConsts.SConvUnknownDescription.
SConvUnknownDescriptionWithPrefix (see page 7456)	This is constant RTLConsts.SConvUnknownDescriptionWithPrefix.
SConvUnknownFamily (see page 7456)	This is constant RTLConsts.SConvUnknownFamily.
SConvUnknownType (see page 7457)	This is constant RTLConsts.SConvUnknownType.
SCordFeetDescription (see page 7457)	This is constant RTLConsts.SCordFeetDescription.
SCordsDescription (see page 7457)	This is constant RTLConsts.SCordsDescription.
SCubicCentimetersDescription (see page 7458)	This is constant RTLConsts.SCubicCentimetersDescription.
SCubicDecametersDescription (see page 7458)	This is constant RTLConsts.SCubicDecametersDescription.
SCubicDecimetersDescription (see page 7458)	This is constant RTLConsts.SCubicDecimetersDescription.
SCubicFeetDescription (see page 7459)	This is constant RTLConsts.SCubicFeetDescription.
SCubicHectometersDescription (see page 7459)	This is constant RTLConsts.SCubicHectometersDescription.
SCubicInchesDescription (see page 7459)	This is constant RTLConsts.SCubicInchesDescription.
SCubicKilometersDescription (see page 7460)	This is constant RTLConsts.SCubicKilometersDescription.
SCubicMetersDescription (see page 7460)	This is constant RTLConsts.SCubicMetersDescription.
SCubicMilesDescription (see page 7460)	This is constant RTLConsts.SCubicMilesDescription.
SCubicMillimetersDescription (see page 7461)	This is constant RTLConsts.SCubicMillimetersDescription.
SCubicYardsDescription (see page 7461)	This is constant RTLConsts.SCubicYardsDescription.
SCubitsDescription (see page 7461)	This is constant RTLConsts.SCubitsDescription.
SDateTimeDescription (see page 7462)	This is constant RTLConsts.SDateTimeDescription.
SDaysDescription (see page 7462)	This is constant RTLConsts.SDaysDescription.
SDecadesDescription (see page 7462)	This is constant RTLConsts.SDecadesDescription.
SDecagramsDescription (see page 7463)	This is constant RTLConsts.SDecagramsDescription.
SDecaLitersDescription (see page 7463)	This is constant RTLConsts.SDecaLitersDescription.
SDecametersDescription (see page 7463)	This is constant RTLConsts.SDecametersDescription.
SDecasteresDescription (see page 7464)	This is constant RTLConsts.SDecasteresDescription.
SDecigramsDescription (see page 7464)	This is constant RTLConsts.SDecigramsDescription.
SDeciLitersDescription (see page 7464)	This is constant RTLConsts.SDeciLitersDescription.
SDecimetersDescription (see page 7465)	This is constant RTLConsts.SDecimetersDescription.
SDecisteresDescription (see page 7465)	This is constant RTLConsts.SDecisteresDescription.
SDelimiterQuoteCharError (see page 7465)	This is constant RTLConsts.SDelimiterQuoteCharError.
SDistanceDescription (see page 7466)	This is constant RTLConsts.SDistanceDescription.
SDramsDescription (see page 7466)	This is constant RTLConsts.SDramsDescription.
SDryBucketsDescription (see page 7466)	This is constant RTLConsts.SDryBucketsDescription.
SDryBushelsDescription (see page 7467)	This is constant RTLConsts.SDryBushelsDescription.
SDryGallonsDescription (see page 7467)	This is constant RTLConsts.SDryGallonsDescription.
SDryPecksDescription (see page 7467)	This is constant RTLConsts.SDryPecksDescription.
SDryPintsDescription (see page 7468)	This is constant RTLConsts.SDryPintsDescription.
SDryQuartsDescription (see page 7468)	This is constant RTLConsts.SDryQuartsDescription.
SDuplicateClass (see page 7468)	This is constant RTLConsts.SDuplicateClass.

SDuplicateItem (see page 7469)	This is constant RTLConsts.SDuplicateItem.
SDuplicateName (see page 7469)	This is constant RTLConsts.SDuplicateName.
SDuplicateString (see page 7469)	This is constant RTLConsts.SDuplicateString.
SFahrenheitDescription (see page 7470)	This is constant RTLConsts.SFahrenheitDescription.
SFailedToCallConstructor (see page 7470)	This is constant RTLConsts.SFailedToCallConstructor.
SFathomsDescription (see page 7470)	This is constant RTLConsts.SFathomsDescription.
SFCreateError (see page 7471)	This is constant RTLConsts.SFCreateError.
SFCreateErrorEx (see page 7471)	This is constant RTLConsts.SFCreateErrorEx.
SFeetDescription (see page 7471)	This is constant RTLConsts.SFeetDescription.
SFixedColTooBig (see page 7472)	This is constant RTLConsts.SFixedColTooBig.
SFixedRowTooBig (see page 7472)	This is constant RTLConsts.SFixedRowTooBig.
SFluidCupsDescription (see page 7472)	This is constant RTLConsts.SFluidCupsDescription.
SFluidGallonsDescription (see page 7473)	This is constant RTLConsts.SFluidGallonsDescription.
SFluidGillsDescription (see page 7473)	This is constant RTLConsts.SFluidGillsDescription.
SFluidOuncesDescription (see page 7473)	This is constant RTLConsts.SFluidOuncesDescription.
SFluidPintsDescription (see page 7474)	This is constant RTLConsts.SFluidPintsDescription.
SFluidQuartsDescription (see page 7474)	This is constant RTLConsts.SFluidQuartsDescription.
SFluidTablespoonsDescription (see page 7474)	This is constant RTLConsts.SFluidTablespoonsDescription.
SFluidTeaspoonsDescription (see page 7475)	This is constant RTLConsts.SFluidTeaspoonsDescription.
SFOpenError (see page 7475)	This is constant RTLConsts.SFOpenError.
SFOpenErrorEx (see page 7475)	This is constant RTLConsts.SFOpenErrorEx.
SFortnightsDescription (see page 7476)	This is constant RTLConsts.SFortnightsDescription.
SFurlongsDescription (see page 7476)	This is constant RTLConsts.SFurlongsDescription.
SGigametersDescription (see page 7476)	This is constant RTLConsts.SGigametersDescription.
SGrainsDescription (see page 7477)	This is constant RTLConsts.SGrainsDescription.
SGramsDescription (see page 7477)	This is constant RTLConsts.SGramsDescription.
SGridTooLarge (see page 7477)	This is constant RTLConsts.SGridTooLarge.
SHandsDescription (see page 7478)	This is constant RTLConsts.SHandsDescription.
SHectaresDescription (see page 7478)	This is constant RTLConsts.SHectaresDescription.
SHectogramsDescription (see page 7478)	This is constant RTLConsts.SHectogramsDescription.
SHectoLitersDescription (see page 7479)	This is constant RTLConsts.SHectoLitersDescription.
SHectometersDescription (see page 7479)	This is constant RTLConsts.SHectometersDescription.
SHoursDescription (see page 7479)	This is constant RTLConsts.SHoursDescription.
SIdentifierExpected (see page 7480)	This is constant RTLConsts.SIdentifierExpected.
SInchesDescription (see page 7480)	This is constant RTLConsts.SInchesDescription.
SIndexOutOfRange (see page 7480)	This is constant RTLConsts.SIndexOutOfRange.
SIniFileWriteError (see page 7481)	This is constant RTLConsts.SIniFileWriteError.
SInvalidActionCreation (see page 7481)	This is constant RTLConsts.SInvalidActionCreation.
SInvalidActionEnumeration (see page 7481)	This is constant RTLConsts.SInvalidActionEnumeration.
SInvalidActionRegistration (see page 7482)	This is constant RTLConsts.SInvalidActionRegistration.
SInvalidActionUnregistration (see page 7482)	This is constant RTLConsts.SInvalidActionUnregistration.
SInvalidBinary (see page 7482)	This is constant RTLConsts.SInvalidBinary.
SInvalidDate (see page 7483)	This is constant RTLConsts.SInvalidDate.
SInvalidDateDay (see page 7483)	This is constant RTLConsts.SInvalidDateDay.
SInvalidDateMonthWeek (see page 7483)	This is constant RTLConsts.SInvalidDateMonthWeek.
SInvalidDateTime (see page 7484)	This is constant RTLConsts.SInvalidDateTime.
SInvalidDateWeek (see page 7484)	This is constant RTLConsts.SInvalidDateWeek.
SInvalidDayOfWeekInMonth (see page 7484)	This is constant RTLConsts.SInvalidDayOfWeekInMonth.
SInvalidFileName (see page 7485)	This is constant RTLConsts.SInvalidFileName.
SInvalidImage (see page 7485)	This is constant RTLConsts.SInvalidImage.
SInvalidInteger (see page 7485)	This is constant RTLConsts.SInvalidInteger.
SInvalidJulianDate (see page 7486)	This is constant RTLConsts.SInvalidJulianDate.
SInvalidMask (see page 7486)	This is constant RTLConsts.SInvalidMask.
SInvalidName (see page 7486)	This is constant RTLConsts.SInvalidName.

SInvalidProperty (see page 7487)	This is constant RTLConsts.SInvalidProperty.
SInvalidPropertyElement (see page 7487)	This is constant RTLConsts.SInvalidPropertyElement.
SInvalidPropertyPath (see page 7487)	This is constant RTLConsts.SInvalidPropertyPath.
SInvalidPropertyType (see page 7488)	This is constant RTLConsts.SInvalidPropertyType.
SInvalidPropertyValue (see page 7488)	This is constant RTLConsts.SInvalidPropertyValue.
SInvalidRegType (see page 7488)	This is constant RTLConsts.SInvalidRegType.
SInvalidString (see page 7489)	This is constant RTLConsts.SInvalidString.
SInvalidStringGridOp (see page 7489)	This is constant RTLConsts.SInvalidStringGridOp.
SInvalidTime (see page 7489)	This is constant RTLConsts.SInvalidTime.
SItemNotFound (see page 7490)	This is constant RTLConsts.SItemNotFound.
SJulianDateDescription (see page 7490)	This is constant RTLConsts.SJulianDateDescription.
SKelvinDescription (see page 7490)	This is constant RTLConsts.SKelvinDescription.
SKilogramsDescription (see page 7491)	This is constant RTLConsts.SKilogramsDescription.
SKiloLitersDescription (see page 7491)	This is constant RTLConsts.SKiloLitersDescription.
SKilometersDescription (see page 7491)	This is constant RTLConsts.SKilometersDescription.
SLightYearsDescription (see page 7492)	This is constant RTLConsts.SLightYearsDescription.
SLineTooLong (see page 7492)	This is constant RTLConsts.SLineTooLong.
SLinksDescription (see page 7492)	This is constant RTLConsts.SLinksDescription.
SListCapacityError (see page 7493)	This is constant RTLConsts.SListCapacityError.
SListCountError (see page 7493)	This is constant RTLConsts.SListCountError.
SListIndexError (see page 7493)	This is constant RTLConsts.SListIndexError.
SLitersDescription (see page 7494)	This is constant RTLConsts.SLitersDescription.
SLongTonsDescription (see page 7494)	This is constant RTLConsts.SLongTonsDescription.
SMaskEditErr (see page 7494)	This is constant RTLConsts.SMaskEditErr.
SMaskErr (see page 7495)	This is constant RTLConsts.SMaskErr.
SMassDescription (see page 7495)	This is constant RTLConsts.SMassDescription.
SMegametersDescription (see page 7495)	This is constant RTLConsts.SMegametersDescription.
SMemoryStreamError (see page 7496)	This is constant RTLConsts.SMemoryStreamError.
SMetersDescription (see page 7496)	This is constant RTLConsts.SMetersDescription.
SMetricTonsDescription (see page 7496)	This is constant RTLConsts.SMetricTonsDescription.
SMicrogramsDescription (see page 7497)	This is constant RTLConsts.SMicrogramsDescription.
SMicromicronsDescription (see page 7497)	This is constant RTLConsts.SMicromicronsDescription.
SMicronsDescription (see page 7497)	This is constant RTLConsts.SMicronsDescription.
SMilesDescription (see page 7498)	This is constant RTLConsts.SMilesDescription.
SMillenniaDescription (see page 7498)	This is constant RTLConsts.SMillenniaDescription.
SMilligramsDescription (see page 7498)	This is constant RTLConsts.SMilligramsDescription.
SMilliLitersDescription (see page 7499)	This is constant RTLConsts.SMilliLitersDescription.
SMillimetersDescription (see page 7499)	This is constant RTLConsts.SMillimetersDescription.
SMillimicronsDescription (see page 7499)	This is constant RTLConsts.SMillimicronsDescription.
SMilliSecondsDescription (see page 7500)	This is constant RTLConsts.SMilliSecondsDescription.
SMinutesDescription (see page 7500)	This is constant RTLConsts.SMinutesDescription.
SMissingDateTimeField (see page 7500)	This is constant RTLConsts.SMissingDateTimeField.
SModifiedJulianDateDescription (see page 7501)	This is constant RTLConsts.SModifiedJulianDateDescription.
SMonthsDescription (see page 7501)	This is constant RTLConsts.SMonthsDescription.
SNanogramsDescription (see page 7501)	This is constant RTLConsts.SNanogramsDescription.
SNauticalMilesDescription (see page 7502)	This is constant RTLConsts.SNauticalMilesDescription.
sNoAddress (see page 7502)	This is constant RTLConsts.sNoAddress.
SNoComSupport (see page 7502)	This is constant RTLConsts.SNoComSupport.
sNoConstruct (see page 7503)	This is constant RTLConsts.sNoConstruct.
SNotPrinting (see page 7503)	This is constant RTLConsts.SNotPrinting.
SNumberExpected (see page 7503)	This is constant RTLConsts.SNumberExpected.
SOuncesDescription (see page 7504)	This is constant RTLConsts.SOuncesDescription.
SPacesDescription (see page 7504)	This is constant RTLConsts.SPacesDescription.
SParsecsDescription (see page 7504)	This is constant RTLConsts.SParsecsDescription.

SParseError (see page 7505)	This is constant RTLConsts.SParseError.
SPicasDescription (see page 7505)	This is constant RTLConsts.SPicasDescription.
SPointsDescription (see page 7505)	This is constant RTLConsts.SPointsDescription.
SPoundsDescription (see page 7506)	This is constant RTLConsts.SPoundsDescription.
SPrinting (see page 7506)	This is constant RTLConsts.SPrinting.
SPropertyException (see page 7506)	This is constant RTLConsts.SPropertyException.
SRankineDescription (see page 7507)	This is constant RTLConsts.SRankineDescription.
SReadError (see page 7507)	This is constant RTLConsts.SReadError.
SReadOnlyProperty (see page 7507)	This is constant RTLConsts.SReadOnlyProperty.
SReaumurDescription (see page 7508)	This is constant RTLConsts.SReaumurDescription.
SRegCreateFailed (see page 7508)	This is constant RTLConsts.SRegCreateFailed.
SRegGetDataFailed (see page 7508)	This is constant RTLConsts.SRegGetDataFailed.
SRegisterError (see page 7509)	This is constant RTLConsts.SRegisterError.
SRegSetDataFailed (see page 7509)	This is constant RTLConsts.SRegSetDataFailed.
SResNotFound (see page 7509)	This is constant RTLConsts.SResNotFound.
SRodsDescription (see page 7510)	This is constant RTLConsts.SRodsDescription.
SSecondsDescription (see page 7510)	This is constant RTLConsts.SSecondsDescription.
SSeekNotImplemented (see page 7510)	This is constant RTLConsts.SSeekNotImplemented.
sSocketAlreadyOpen (see page 7511)	This is constant RTLConsts.sSocketAlreadyOpen.
sSocketIOError (see page 7511)	This is constant RTLConsts.sSocketIOError.
sSocketMustBeBlocking (see page 7511)	This is constant RTLConsts.sSocketMustBeBlocking.
sSocketRead (see page 7512)	This is constant RTLConsts.sSocketRead.
sSocketWrite (see page 7512)	This is constant RTLConsts.sSocketWrite.
SSortedListError (see page 7512)	This is constant RTLConsts.SSortedListError.
SSquareCentimetersDescription (see page 7513)	This is constant RTLConsts.SSquareCentimetersDescription.
SSquareDecametersDescription (see page 7513)	This is constant RTLConsts.SSquareDecametersDescription.
SSquareDecimetersDescription (see page 7513)	This is constant RTLConsts.SSquareDecimetersDescription.
SSquareFeetDescription (see page 7514)	This is constant RTLConsts.SSquareFeetDescription.
SSquareHectometersDescription (see page 7514)	This is constant RTLConsts.SSquareHectometersDescription.
SSquareInchesDescription (see page 7514)	This is constant RTLConsts.SSquareInchesDescription.
SSquareKilometersDescription (see page 7515)	This is constant RTLConsts.SSquareKilometersDescription.
SSquareMetersDescription (see page 7515)	This is constant RTLConsts.SSquareMetersDescription.
SSquareMilesDescription (see page 7515)	This is constant RTLConsts.SSquareMilesDescription.
SSquareMillimetersDescription (see page 7516)	This is constant RTLConsts.SSquareMillimetersDescription.
SSquareRodsDescription (see page 7516)	This is constant RTLConsts.SSquareRodsDescription.
SSquareYardsDescription (see page 7516)	This is constant RTLConsts.SSquareYardsDescription.
SSteresDescription (see page 7517)	This is constant RTLConsts.SSteresDescription.
SStonesDescription (see page 7517)	This is constant RTLConsts.SStonesDescription.
SStreamSetSize (see page 7517)	This is constant RTLConsts.SStreamSetSize.
SStringExpected (see page 7518)	This is constant RTLConsts.SStringExpected.
SSymbolExpected (see page 7518)	This is constant RTLConsts.SSymbolExpected.
STemperatureDescription (see page 7518)	This is constant RTLConsts.STemperatureDescription.
SThreadCreateError (see page 7519)	This is constant RTLConsts.SThreadCreateError.
SThreadError (see page 7519)	This is constant RTLConsts.SThreadError.
SThreadExternalTerminate (see page 7519)	This is constant RTLConsts.SThreadExternalTerminate.
SThreadExternalWait (see page 7520)	This is constant RTLConsts.SThreadExternalWait.
STimeDescription (see page 7520)	This is constant RTLConsts.STimeDescription.
STimeEncodeError (see page 7520)	This is constant RTLConsts.STimeEncodeError.
STonsDescription (see page 7521)	This is constant RTLConsts.STonsDescription.
STooManyDeleted (see page 7521)	This is constant RTLConsts.STooManyDeleted.
SUKBucketsDescription (see page 7521)	This is constant RTLConsts.SUKBucketsDescription.
SUKBushelsDescription (see page 7522)	This is constant RTLConsts.SUKBushelsDescription.
SUKGallonsDescription (see page 7522)	This is constant RTLConsts.SUKGallonsDescription.
SUKGillsDescription (see page 7522)	This is constant RTLConsts.SUKGillsDescription.

SUKOuncesDescription (see page 7523)	This is constant RTLConsts.SUKOuncesDescription.
SUKPecksDescription (see page 7523)	This is constant RTLConsts.SUKPecksDescription.
SUKPintsDescription (see page 7523)	This is constant RTLConsts.SUKPintsDescription.
SUKPottlesDescription (see page 7524)	This is constant RTLConsts.SUKPottlesDescription.
SUKQuartsDescription (see page 7524)	This is constant RTLConsts.SUKQuartsDescription.
SUnknownGroup (see page 7524)	This is constant RTLConsts.SUnknownGroup.
SUnknownProperty (see page 7525)	This is constant RTLConsts.SUnknownProperty.
SVolumeDescription (see page 7525)	This is constant RTLConsts.SVolumeDescription.
SWeeksDescription (see page 7525)	This is constant RTLConsts.SWeeksDescription.
sWindowsSocketError (see page 7526)	This is constant RTLConsts.sWindowsSocketError.
SWriteError (see page 7526)	This is constant RTLConsts.SWriteError.
SYardsDescription (see page 7526)	This is constant RTLConsts.SYardsDescription.
SYearsDescription (see page 7527)	This is constant RTLConsts.SYearsDescription.

83.1.1 RTLConsts.hNoContext Constant

Pascal

```
hNoContext = 'No context-sensitive help installed.';
```

C++

```
hNoContext = 'No context-sensitive help installed.';
```

File

RTLConsts

Description

This is constant RTLConsts.hNoContext.

83.1.2 RTLConsts.hNoContextFound Constant

Pascal

```
hNoContextFound = 'No help found for context %d.';
```

C++

```
hNoContextFound = 'No help found for context %d.';
```

File

RTLConsts

Description

This is constant RTLConsts.hNoContextFound.

83.1.3 RTLConsts.hNoFilterViewer Constant

Pascal

```
hNoFilterViewer = 'No help viewer that supports filters';
```

C++

```
hNoFilterViewer = 'No help viewer that supports filters';
```

File

RTLConsts

Description

This is constant RTLConsts.hNoFilterViewer.

83.1.4 RTLConsts.hNoSystem Constant

Pascal

```
hNoSystem = 'No Help Manager installed.';
```

C++

```
hNoSystem = 'No Help Manager installed.';
```

File

RTLConsts

Description

This is constant RTLConsts.hNoSystem.

83.1.5 RTLConsts.hNoTableOfContents Constant

Pascal

```
hNoTableOfContents = 'No Table of Contents found.';
```

C++

```
hNoTableOfContents = 'No Table of Contents found.';
```

File

RTLConsts

Description

This is constant RTLConsts.hNoTableOfContents.

83.1.6 RTLConsts.hNothingFound Constant

Pascal

```
hNothingFound = 'No help found for "%s"';
```

C++

```
hNothingFound = 'No help found for "%s"';
```

File

RTLConsts

Description

This is constant RTLConsts.hNothingFound.

83.1.7 RTLConsts.hNoTopics Constant

Pascal

```
hNoTopics = 'No topic-based help installed.';
```

C++

```
hNoTopics = 'No topic-based help installed.';
```

File

RTLConsts

Description

This is constant RTLConsts.hNoTopics.

83.1.8 RTLConsts.SAcreFeetDescription Constant

Pascal

```
SAcreFeetDescription = 'AcreFeet';
```

C++

```
SAcreFeetDescription = 'AcreFeet';
```

File

RTLConsts

Description

This is constant RTLConsts.SAcreFeetDescription.

83.1.9 RTLConsts.SAcreInchesDescription Constant

Pascal

```
SAcreInchesDescription = 'AcreInches';
```

C++

```
SAcreInchesDescription = 'AcreInches';
```

File

RTLConsts

Description

This is constant RTLConsts.SAcreInchesDescription.

83.1.10 RTLConsts.SAcresDescription Constant

Pascal

```
SAcresDescription = 'Acres';
```

C++

```
SAcresDescription = 'Acres';
```

File

RTLConsts

Description

This is constant RTLConsts.SAcresDescription.

83.1.11 RTLConsts.SAncestorNotFound Constant

Pascal

```
SAncestorNotFound = 'Ancestor for ''%s'' not found';
```

C++

```
SAncestorNotFound = 'Ancestor for ''%s'' not found';
```

File

RTLConsts

Description

This is constant RTLConsts.SAncestorNotFound.

83.1.12 RTLConsts.SAngstromsDescription Constant

Pascal

```
SAngstromsDescription = 'Angstroms';
```

C++

```
SAngstromsDescription = 'Angstroms';
```

File

RTLConsts

Description

This is constant RTLConsts.SAngstromsDescription.

83.1.13 RTLConsts.SAnsiUTF8Expected Constant

Pascal

```
SAnsiUTF8Expected = 'ANSI or UTF8 encoding expected';
```

C++

```
SAnsiUTF8Expected = 'ANSI or UTF8 encoding expected';
```

File

RTLConsts

Description

This is constant RTLConsts.SAnsiUTF8Expected.

83.1.14 RTLConsts.SAreaDescription Constant

Pascal

```
SAreaDescription = 'Area';
```

C++

```
SAreaDescription = 'Area';
```

File

RTLConsts

Description

This is constant RTLConsts.SAreaDescription.

83.1.15 RTLConsts.SAresDescription Constant

Pascal

```
SAresDescription = 'Ares';
```

C++

```
SAresDescription = 'Ares';
```

File

RTLConsts

Description

This is constant RTLConsts.SAresDescription.

83.1.16 RTLConsts.sArgument_InvalidHighSurrogate Constant

Pascal

```
sArgument_InvalidHighSurrogate = 'High surrogate char without a following low surrogate char
at index: %d. Check that the string is encoded properly';
```

C++

```
sArgument_InvalidHighSurrogate = 'High surrogate char without a following low surrogate char
at index: %d. Check that the string is encoded properly';
```

File

RTLConsts

Description

This is constant RTLConsts.sArgument_InvalidHighSurrogate.

83.1.17 RTLConsts.sArgument_InvalidLowSurrogate Constant

Pascal

```
sArgument_InvalidLowSurrogate = 'Low surrogate char without a preceding high surrogate char at
index: %d. Check that the string is encoded properly';
```

C++

```
sArgument_InvalidLowSurrogate = 'Low surrogate char without a preceding high surrogate char at
index: %d. Check that the string is encoded properly';
```

File

RTLConsts

Description

This is constant RTLConsts.sArgument_InvalidLowSurrogate.

83.1.18 RTLConsts.sArgumentOutOfRange_Index Constant

Pascal

```
sArgumentOutOfRange_Index = 'Index out of range (%d).  Must be >= 0 and < %d';
```

C++

```
sArgumentOutOfRange_Index = 'Index out of range (%d).  Must be >= 0 and < %d';
```

File

RTLConsts

Description

This is constant RTLConsts.sArgumentOutOfRange_Index.

83.1.19 RTLConsts.sArgumentOutOfRange_InvalidHighSurrogate Constant

Pascal

```
sArgumentOutOfRange_InvalidHighSurrogate = 'A valid high surrogate character is >= $D800 and
<= $DBFF';
```

C++

```
sArgumentOutOfRange_InvalidHighSurrogate = 'A valid high surrogate character is >= $D800 and
<= $DBFF';
```

File

RTLConsts

Description

This is constant RTLConsts.sArgumentOutOfRange_InvalidHighSurrogate.

83.1.20 RTLConsts.sArgumentOutOfRange_InvalidLowSurrogate Constant

Pascal

```
sArgumentOutOfRange_InvalidLowSurrogate = 'A valid low surrogate character is >= $DC00 and <=
$DFFF';
```

C++

```
sArgumentOutOfRange_InvalidLowSurrogate = 'A valid low surrogate character is >= $DC00 and <=
$DFFF';
```

File

RTLConsts

Description

This is constant RTLConsts.sArgumentOutOfRange_InvalidLowSurrogate.

83.1.21 RTLConsts.sArgumentOutOfRange_InvalidUTF32 Constant

Pascal

```
sArgumentOutOfRange_InvalidUTF32 = 'Invalid UTF32 character value.  Must be >= 0 and <=
$10FFF, excluding surrogate pair ranges';
```

C++

```
sArgumentOutOfRange_InvalidUTF32 = 'Invalid UTF32 character value.  Must be >= 0 and <=
$10FFF, excluding surrogate pair ranges';
```

File

RTLConsts

Description

This is constant RTLConsts.sArgumentOutOfRange_InvalidUTF32.

83.1.22 RTLConsts.sArgumentOutOfRange_StringIndex Constant

Pascal

```
sArgumentOutOfRange_StringIndex = 'String index out of range (%d).  Must be >= 1 and <= %d';
```

C++

```
sArgumentOutOfRange_StringIndex = 'String index out of range (%d).  Must be >= 1 and <= %d';
```

File

RTLConsts

Description

This is constant RTLConsts.sArgumentOutOfRange_StringIndex.

83.1.23 RTLConsts.SAssignError Constant

Pascal

```
SAssignError = 'Cannot assign a %s to a %s';
```

C++

```
SAssignError = 'Cannot assign a %s to a %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SAssignError.

83.1.24 RTLConsts.SAstronomicalUnitsDescription Constant

Pascal

```
SAstronomicalUnitsDescription = 'AstronomicalUnits';
```

C++

```
SAstronomicalUnitsDescription = 'AstronomicalUnits';
```

File

RTLConsts

Description

This is constant RTLConsts.SAstronomicalUnitsDescription.

83.1.25 RTLConsts.sAsyncSocketError Constant

Pascal

```
sAsyncSocketError = 'Asynchronous socket error %d';
```

C++

```
sAsyncSocketError = 'Asynchronous socket error %d';
```

File

RTLConsts

Description

This is constant RTLConsts.sAsyncSocketError.

83.1.26 RTLConsts.SBitsIndexError Constant

Pascal

```
SBitsIndexError = 'Bits index out of range';
```

C++

```
SBitsIndexError = 'Bits index out of range';
```

File

RTLConsts

Description

This is constant RTLConsts.SBitsIndexError.

83.1.27 RTLConsts.SBucketListLocked Constant

Pascal

```
SBucketListLocked = 'List is locked during an active ForEach';
```

C++

```
SBucketListLocked = 'List is locked during an active ForEach';
```

File

RTLConsts

Description

This is constant RTLConsts.SBucketListLocked.

83.1.28 RTLConsts.sCannotCallAcquireOnConditionVar Constant

Pascal

```
sCannotCallAcquireOnConditionVar = 'Cannot call Acquire on TConditionVariable.  Must call
WaitFor with an external TMutex';
```

C++

```
sCannotCallAcquireOnConditionVar = 'Cannot call Acquire on TConditionVariable.  Must call
WaitFor with an external TMutex';
```

File

RTLConsts

Description

This is constant RTLConsts.sCannotCallAcquireOnConditionVar.

83.1.29 RTLConsts.sCannotCreateSocket Constant

Pascal

```
sCannotCreateSocket = 'Can''t create new socket';
```

C++

```
sCannotCreateSocket = 'Can''t create new socket';
```

File

RTLConsts

Description

This is constant RTLConsts.sCannotCreateSocket.

83.1.30 RTLConsts.sCannotListenOnOpen Constant

Pascal

```
sCannotListenOnOpen = 'Can''t listen on an open socket';
```

C++

```
sCannotListenOnOpen = 'Can''t listen on an open socket';
```

File

RTLConsts

Description

This is constant RTLConsts.sCannotListenOnOpen.

83.1.31 RTLConsts.sCantChangeWhileActive Constant

Pascal

```
sCantChangeWhileActive = 'Can''t change value while socket is active';
```

C++

```
sCantChangeWhileActive = 'Can''t change value while socket is active';
```

File

RTLConsts

Description

This is constant RTLConsts.sCantChangeWhileActive.

83.1.32 RTLConsts.SCantWriteResourceStreamError Constant

Pascal

```
SCantWriteResourceStreamError = 'Can''t write to a read-only resource stream';
```

C++

```
SCantWriteResourceStreamError = 'Can''t write to a read-only resource stream';
```

File

RTLConsts

Description

This is constant RTLConsts.SCantWriteResourceStreamError.

83.1.33 RTLConsts.SCelsiusDescription Constant

Pascal

```
SCelsiusDescription = 'Celsius';
```

C++

```
SCelsiusDescription = 'Celsius';
```

File

RTLConsts

Description

This is constant RTLConsts.SCelsiusDescription.

83.1.34 RTLConsts.SCentaresDescription Constant

Pascal

```
SCentaresDescription = 'Centares';
```

C++

```
SCentaresDescription = 'Centares';
```

File

RTLConsts

Description

This is constant RTLConsts.SCentaresDescription.

83.1.35 RTLConsts.SCentigramsDescription Constant

Pascal

```
SCentigramsDescription = 'Centigrams';
```

C++

```
SCentigramsDescription = 'Centigrams';
```

File

RTLConsts

Description

This is constant RTLConsts.SCentigramsDescription.

83.1.36 RTLConsts.SCentiLitersDescription Constant

Pascal

```
SCentiLitersDescription = 'CentiLiters';
```

C++

```
SCentiLitersDescription = 'CentiLiters';
```

File

RTLConsts

Description

This is constant RTLConsts.SCentiLitersDescription.

83.1.37 RTLConsts.SCentimetersDescription Constant

Pascal

```
SCentimetersDescription = 'Centimeters';
```

C++

```
SCentimetersDescription = 'Centimeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SCentimetersDescription.

83.1.38 RTLConsts.SCenturiesDescription Constant

Pascal

```
SCenturiesDescription = 'Centuries';
```

C++

```
SCenturiesDescription = 'Centuries';
```

File

RTLConsts

Description

This is constant RTLConsts.SCenturiesDescription.

83.1.39 RTLConsts.SChainsDescription Constant

Pascal

```
SChainsDescription = 'Chains';
```

C++

```
SChainsDescription = 'Chains';
```

File

RTLConsts

Description

This is constant RTLConsts.SChainsDescription.

83.1.40 RTLConsts.SCharExpected Constant

Pascal

```
SCharExpected = '''''%s'''' expected';
```

C++

```
SCharExpected = '''''%s'''' expected';
```

File

RTLConsts

Description

This is constant RTLConsts.SCharExpected.

83.1.41 RTLConsts.SCheckSynchronizeError Constant

Pascal

```
SCheckSynchronizeError = 'CheckSynchronize called from thread $%x, which is NOT the main
thread';
```

C++

```
SCheckSynchronizeError = 'CheckSynchronize called from thread $%x, which is NOT the main
thread';
```

File

RTLConsts

Description

This is constant RTLConsts.SCheckSynchronizeError.

83.1.42 RTLConsts.SClassNotFound Constant

Pascal

```
SClassNotFound = 'Class %s not found';
```

C++

```
SClassNotFound = 'Class %s not found';
```

File

RTLConsts

Description

This is constant RTLConsts.SClassNotFound.

83.1.43 RTLConsts.SCmplxCouldNotParseImaginary Constant

Pascal

```
SCmplxCouldNotParseImaginary = 'Could not parse imaginary portion';
```

C++

```
SCmplxCouldNotParseImaginary = 'Could not parse imaginary portion';
```

File

RTLConsts

Description

This is constant RTLConsts.SCmplxCouldNotParseImaginary.

83.1.44 RTLConsts.SCmplxCouldNotParsePlus Constant

Pascal

```
SCmplxCouldNotParsePlus = 'Could not parse required ''+'' (or ''-'') symbol';
```

C++

```
SCmplxCouldNotParsePlus = 'Could not parse required ''+'' (or ''-'') symbol';
```

File

RTLConsts

Description

This is constant RTLConsts.SCmplxCouldNotParsePlus.

83.1.45 RTLConsts.SCmplxCouldNotParseReal Constant

Pascal

```
SCmplxCouldNotParseReal = 'Could not parse real portion';
```

C++

```
SCmplxCouldNotParseReal = 'Could not parse real portion';
```

File

RTLConsts

Description

This is constant RTLConsts.SCmplxCouldNotParseReal.

83.1.46 RTLConsts.SCmplxCouldNotParseSymbol Constant

Pascal

```
SCmplxCouldNotParseSymbol = 'Could not parse required ''%s'' symbol';
```

C++

```
SCmplxCouldNotParseSymbol = 'Could not parse required ''%s'' symbol';
```

File

RTLConsts

Description

This is constant RTLConsts.SCmplxCouldNotParseSymbol.

83.1.47 RTLConsts.SCmplxErrorSuffix Constant

Pascal

```
SCmplxErrorSuffix = '%s [%s<?>%s]';
```

C++

```
SCmplxErrorSuffix = '%s [%s<?>%s]';
```

File

RTLConsts

Description

This is constant RTLConsts.SCmplxErrorSuffix.

83.1.48 RTLConsts.SCmplxUnexpectedChars Constant

Pascal

```
SCmplxUnexpectedChars = 'Unexpected characters';
```

C++

```
SCmplxUnexpectedChars = 'Unexpected characters';
```

File

RTLConsts

Description

This is constant RTLConsts.SCmplxUnexpectedChars.

83.1.49 RTLConsts.SCmplxUnexpectedEOS Constant

Pascal

```
SCmplxUnexpectedEOS = 'Unexpected end of string [%s]';
```

C++

```
SCmplxUnexpectedEOS = 'Unexpected end of string [%s]';
```

File

RTLConsts

Description

This is constant RTLConsts.SCmplxUnexpectedEOS.

83.1.50 RTLConsts.SComponentNameTooLong Constant

Pascal

```
SComponentNameTooLong = 'Component name ''%s'' exceeds 64 character limit';
```

C++

```
SComponentNameTooLong = 'Component name ''%s'' exceeds 64 character limit';
```

File

RTLConsts

Description

This is constant RTLConsts.SComponentNameTooLong.

83.1.51 RTLConsts.SConvDuplicateFamily Constant

Pascal

```
SConvDuplicateFamily = 'Conversion family (%s) already registered';
```

C++

```
SConvDuplicateFamily = 'Conversion family (%s) already registered';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvDuplicateFamily.

83.1.52 RTLConsts.SConvDuplicateType Constant

Pascal

```
SConvDuplicateType = 'Conversion type (%s) already registered in %s';
```

C++

```
SConvDuplicateType = 'Conversion type (%s) already registered in %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvDuplicateType.

83.1.53 RTLConsts.SConvFactorZero Constant

Pascal

```
SConvFactorZero = '%s has a factor of zero';
```

C++

```
SConvFactorZero = '%s has a factor of zero';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvFactorZero.

83.1.54 RTLConsts.SConvIllegalFamily Constant

Pascal

```
SConvIllegalFamily = 'Illegal family';
```

C++

```
SConvIllegalFamily = 'Illegal family';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvIllegalFamily.

83.1.55 RTLConsts.SConvIllegalType Constant

Pascal

```
SConvIllegalType = 'Illegal type';
```

C++

```
SConvIllegalType = 'Illegal type';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvIllegalType.

83.1.56 RTLConsts.SConvIncompatibleTypes2 Constant

Pascal

```
SConvIncompatibleTypes2 = 'Incompatible conversion types [%s, %s]';
```

C++

```
SConvIncompatibleTypes2 = 'Incompatible conversion types [%s, %s]';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvIncompatibleTypes2.

83.1.57 RTLConsts.SConvIncompatibleTypes3 Constant

Pascal

```
SConvIncompatibleTypes3 = 'Incompatible conversion types [%s, %s, %s]';
```

C++

```
SConvIncompatibleTypes3 = 'Incompatible conversion types [%s, %s, %s]';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvIncompatibleTypes3.

83.1.58 RTLConsts.SConvIncompatibleTypes4 Constant

Pascal

```
SConvIncompatibleTypes4 = 'Incompatible conversion types [%s - %s, %s - %s]';
```

C++

```
SConvIncompatibleTypes4 = 'Incompatible conversion types [%s - %s, %s - %s]';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvIncompatibleTypes4.

83.1.59 RTLConsts.SConvStrParseError Constant

Pascal

```
SConvStrParseError = 'Could not parse %s';
```

C++

```
SConvStrParseError = 'Could not parse %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvStrParseError.

83.1.60 RTLConsts.SConvUnknownDescription Constant

Pascal

```
SConvUnknownDescription = '[$%.8x]' deprecated;
```

C++

```
SConvUnknownDescription = '[$%.8x]' deprecated;
```

File

RTLConsts

Description

This is constant RTLConsts.SConvUnknownDescription.

83.1.61 RTLConsts.SConvUnknownDescriptionWithPrefix Constant

Pascal

```
SConvUnknownDescriptionWithPrefix = '[%s%.8x]';
```

C++

```
SConvUnknownDescriptionWithPrefix = '[%s%.8x]';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvUnknownDescriptionWithPrefix.

83.1.62 RTLConsts.SConvUnknownFamily Constant

Pascal

```
SConvUnknownFamily = 'Unknown conversion family %s';
```

C++

```
SConvUnknownFamily = 'Unknown conversion family %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvUnknownFamily.

83.1.63 RTLConsts.SConvUnknownType Constant

Pascal

```
SConvUnknownType = 'Unknown conversion type %s';
```

C++

```
SConvUnknownType = 'Unknown conversion type %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SConvUnknownType.

83.1.64 RTLConsts.SCordFeetDescription Constant

Pascal

```
SCordFeetDescription = 'CordFeet';
```

C++

```
SCordFeetDescription = 'CordFeet';
```

File

RTLConsts

Description

This is constant RTLConsts.SCordFeetDescription.

83.1.65 RTLConsts.SCordsDescription Constant

Pascal

```
SCordsDescription = 'Cords';
```

C++

```
SCordsDescription = 'Cords';
```

File

RTLConsts

Description

This is constant RTLConsts.SCordsDescription.

83.1.66 RTLConsts.SCubicCentimetersDescription Constant

Pascal

```
SCubicCentimetersDescription = 'CubicCentimeters';
```

C++

```
SCubicCentimetersDescription = 'CubicCentimeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicCentimetersDescription.

83.1.67 RTLConsts.SCubicDecametersDescription Constant

Pascal

```
SCubicDecametersDescription = 'CubicDecameters';
```

C++

```
SCubicDecametersDescription = 'CubicDecameters';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicDecametersDescription.

83.1.68 RTLConsts.SCubicDecimetersDescription Constant

Pascal

```
SCubicDecimetersDescription = 'CubicDecimeters';
```

C++

```
SCubicDecimetersDescription = 'CubicDecimeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicDecimetersDescription.

83.1.69 RTLConsts.SCubicFeetDescription Constant

Pascal

```
SCubicFeetDescription = 'CubicFeet';
```

C++

```
SCubicFeetDescription = 'CubicFeet';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicFeetDescription.

83.1.70 RTLConsts.SCubicHectometersDescription Constant

Pascal

```
SCubicHectometersDescription = 'CubicHectometers';
```

C++

```
SCubicHectometersDescription = 'CubicHectometers';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicHectometersDescription.

83.1.71 RTLConsts.SCubicInchesDescription Constant

Pascal

```
SCubicInchesDescription = 'CubicInches';
```

C++

```
SCubicInchesDescription = 'CubicInches';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicInchesDescription.

83.1.72 RTLConsts.SCubicKilometersDescription Constant

Pascal

```
SCubicKilometersDescription = 'CubicKilometers';
```

C++

```
SCubicKilometersDescription = 'CubicKilometers';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicKilometersDescription.

83.1.73 RTLConsts.SCubicMetersDescription Constant

Pascal

```
SCubicMetersDescription = 'CubicMeters';
```

C++

```
SCubicMetersDescription = 'CubicMeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicMetersDescription.

83.1.74 RTLConsts.SCubicMilesDescription Constant

Pascal

```
SCubicMilesDescription = 'CubicMiles';
```

C++

```
SCubicMilesDescription = 'CubicMiles';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicMilesDescription.

83.1.75 RTLConsts.SCubicMillimetersDescription Constant

Pascal

```
SCubicMillimetersDescription = 'CubicMillimeters';
```

C++

```
SCubicMillimetersDescription = 'CubicMillimeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicMillimetersDescription.

83.1.76 RTLConsts.SCubicYardsDescription Constant

Pascal

```
SCubicYardsDescription = 'CubicYards';
```

C++

```
SCubicYardsDescription = 'CubicYards';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubicYardsDescription.

83.1.77 RTLConsts.SCubitsDescription Constant

Pascal

```
SCubitsDescription = 'Cubits';
```

C++

```
SCubitsDescription = 'Cubits';
```

File

RTLConsts

Description

This is constant RTLConsts.SCubitsDescription.

83.1.78 RTLConsts.SDateTimeDescription Constant

Pascal

```
SDateTimeDescription = 'DateTime';
```

C++

```
SDateTimeDescription = 'DateTime';
```

File

RTLConsts

Description

This is constant RTLConsts.SDateTimeDescription.

83.1.79 RTLConsts.SDaysDescription Constant

Pascal

```
SDaysDescription = 'Days';
```

C++

```
SDaysDescription = 'Days';
```

File

RTLConsts

Description

This is constant RTLConsts.SDaysDescription.

83.1.80 RTLConsts.SDecadesDescription Constant

Pascal

```
SDecadesDescription = 'Decades';
```

C++

```
SDecadesDescription = 'Decades';
```

File

RTLConsts

Description

This is constant RTLConsts.SDecadesDescription.

83.1.81 RTLConsts.SDecagramsDescription Constant

Pascal

```
SDecagramsDescription = 'Decagrams';
```

C++

```
SDecagramsDescription = 'Decagrams';
```

File

RTLConsts

Description

This is constant RTLConsts.SDecagramsDescription.

83.1.82 RTLConsts.SDecaLitersDescription Constant

Pascal

```
SDecaLitersDescription = 'DecaLiters';
```

C++

```
SDecaLitersDescription = 'DecaLiters';
```

File

RTLConsts

Description

This is constant RTLConsts.SDecaLitersDescription.

83.1.83 RTLConsts.SDecametersDescription Constant

Pascal

```
SDecametersDescription = 'Decameters';
```

C++

```
SDecametersDescription = 'Decameters';
```

File

RTLConsts

Description

This is constant RTLConsts.SDecametersDescription.

83.1.84 RTLConsts.SDecasteresDescription Constant

Pascal

```
SDecasteresDescription = 'Decasteres';
```

C++

```
SDecasteresDescription = 'Decasteres';
```

File

RTLConsts

Description

This is constant RTLConsts.SDecasteresDescription.

83.1.85 RTLConsts.SDecigramsDescription Constant

Pascal

```
SDecigramsDescription = 'Decigrams';
```

C++

```
SDecigramsDescription = 'Decigrams';
```

File

RTLConsts

Description

This is constant RTLConsts.SDecigramsDescription.

83.1.86 RTLConsts.SDeciLitersDescription Constant

Pascal

```
SDeciLitersDescription = 'DeciLiters';
```

C++

```
SDeciLitersDescription = 'DeciLiters';
```

File

RTLConsts

Description

This is constant RTLConsts.SDeciLitersDescription.

83.1.87 RTLConsts.SDecimetersDescription Constant

Pascal

```
SDecimetersDescription = 'Decimeters';
```

C++

```
SDecimetersDescription = 'Decimeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SDecimetersDescription.

83.1.88 RTLConsts.SDecisteresDescription Constant

Pascal

```
SDecisteresDescription = 'Decisteres';
```

C++

```
SDecisteresDescription = 'Decisteres';
```

File

RTLConsts

Description

This is constant RTLConsts.SDecisteresDescription.

83.1.89 RTLConsts.SDelimiterQuoteCharError Constant

Pascal

```
SDelimiterQuoteCharError = 'Delimiter and QuoteChar properties cannot have the same value';
```

C++

```
SDelimiterQuoteCharError = 'Delimiter and QuoteChar properties cannot have the same value';
```

File

RTLConsts

Description

This is constant RTLConsts.SDelimiterQuoteCharError.

83.1.90 RTLConsts.SDistanceDescription Constant

Pascal

```
SDistanceDescription = 'Distance';
```

C++

```
SDistanceDescription = 'Distance';
```

File

RTLConsts

Description

This is constant RTLConsts.SDistanceDescription.

83.1.91 RTLConsts.SDramsDescription Constant

Pascal

```
SDramsDescription = 'Drams';
```

C++

```
SDramsDescription = 'Drams';
```

File

RTLConsts

Description

This is constant RTLConsts.SDramsDescription.

83.1.92 RTLConsts.SDryBucketsDescription Constant

Pascal

```
SDryBucketsDescription = 'DryBuckets';
```

C++

```
SDryBucketsDescription = 'DryBuckets';
```

File

RTLConsts

Description

This is constant RTLConsts.SDryBucketsDescription.

83.1.93 RTLConsts.SDryBushelsDescription Constant

Pascal

```
SDryBushelsDescription = 'DryBushels';
```

C++

```
SDryBushelsDescription = 'DryBushels';
```

File

RTLConsts

Description

This is constant RTLConsts.SDryBushelsDescription.

83.1.94 RTLConsts.SDryGallonsDescription Constant

Pascal

```
SDryGallonsDescription = 'DryGallons';
```

C++

```
SDryGallonsDescription = 'DryGallons';
```

File

RTLConsts

Description

This is constant RTLConsts.SDryGallonsDescription.

83.1.95 RTLConsts.SDryPecksDescription Constant

Pascal

```
SDryPecksDescription = 'DryPecks';
```

C++

```
SDryPecksDescription = 'DryPecks';
```

File

RTLConsts

Description

This is constant RTLConsts.SDryPecksDescription.

83.1.96 RTLConsts.SDryPintsDescription Constant

Pascal

```
SDryPintsDescription = 'DryPints';
```

C++

```
SDryPintsDescription = 'DryPints';
```

File

RTLConsts

Description

This is constant RTLConsts.SDryPintsDescription.

83.1.97 RTLConsts.SDryQuartsDescription Constant

Pascal

```
SDryQuartsDescription = 'DryQuarts';
```

C++

```
SDryQuartsDescription = 'DryQuarts';
```

File

RTLConsts

Description

This is constant RTLConsts.SDryQuartsDescription.

83.1.98 RTLConsts.SDuplicateClass Constant

Pascal

```
SDuplicateClass = 'A class named %s already exists';
```

C++

```
SDuplicateClass = 'A class named %s already exists';
```

File

RTLConsts

Description

This is constant RTLConsts.SDuplicateClass.

83.1.99 RTLConsts.SDuplicateItem Constant

Pascal

```
SDuplicateItem = 'List does not allow duplicates ($0%x)';
```

C++

```
SDuplicateItem = 'List does not allow duplicates ($0%x)';
```

File

RTLConsts

Description

This is constant RTLConsts.SDuplicateItem.

83.1.100 RTLConsts.SDuplicateName Constant

Pascal

```
SDuplicateName = 'A component named %s already exists';
```

C++

```
SDuplicateName = 'A component named %s already exists';
```

File

RTLConsts

Description

This is constant RTLConsts.SDuplicateName.

83.1.101 RTLConsts.SDuplicateString Constant

Pascal

```
SDuplicateString = 'String list does not allow duplicates';
```

C++

```
SDuplicateString = 'String list does not allow duplicates';
```

File

RTLConsts

Description

This is constant RTLConsts.SDuplicateString.

83.1.102 RTLConsts.SFahrenheitDescription Constant

Pascal

```
SFahrenheitDescription = 'Fahrenheit';
```

C++

```
SFahrenheitDescription = 'Fahrenheit';
```

File

RTLConsts

Description

This is constant RTLConsts.SFahrenheitDescription.

83.1.103 RTLConsts.SFailedToCallConstructor Constant

Pascal

```
SFailedToCallConstructor = 'TStrings descendant %s failed to call inherited constructor';
```

C++

```
SFailedToCallConstructor = 'TStrings descendant %s failed to call inherited constructor';
```

File

RTLConsts

Description

This is constant RTLConsts.SFailedToCallConstructor.

83.1.104 RTLConsts.SFathomsDescription Constant

Pascal

```
SFathomsDescription = 'Fathoms';
```

C++

```
SFathomsDescription = 'Fathoms';
```

File

RTLConsts

Description

This is constant RTLConsts.SFathomsDescription.

83.1.105 RTLConsts.SFCreateError Constant

Pascal

```
SFCreateError = 'Cannot create file %s';
```

C++

```
SFCreateError = 'Cannot create file %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SFCreateError.

83.1.106 RTLConsts.SFCreateErrorEx Constant

Pascal

```
SFCreateErrorEx = 'Cannot create file "%s". %s';
```

C++

```
SFCreateErrorEx = 'Cannot create file "%s". %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SFCreateErrorEx.

83.1.107 RTLConsts.SFeetDescription Constant

Pascal

```
SFeetDescription = 'Feet';
```

C++

```
SFeetDescription = 'Feet';
```

File

RTLConsts

Description

This is constant RTLConsts.SFeetDescription.

83.1.108 RTLConsts.SFixedColTooBig Constant

Pascal

```
SFixedColTooBig = 'Fixed column count must be less than column count';
```

C++

```
SFixedColTooBig = 'Fixed column count must be less than column count';
```

File

RTLConsts

Description

This is constant RTLConsts.SFixedColTooBig.

83.1.109 RTLConsts.SFixedRowTooBig Constant

Pascal

```
SFixedRowTooBig = 'Fixed row count must be less than row count';
```

C++

```
SFixedRowTooBig = 'Fixed row count must be less than row count';
```

File

RTLConsts

Description

This is constant RTLConsts.SFixedRowTooBig.

83.1.110 RTLConsts.SFluidCupsDescription Constant

Pascal

```
SFluidCupsDescription = 'FluidCups';
```

C++

```
SFluidCupsDescription = 'FluidCups';
```

File

RTLConsts

Description

This is constant RTLConsts.SFluidCupsDescription.

83.1.111 RTLConsts.SFluidGallonsDescription Constant

Pascal

```
SFluidGallonsDescription = 'FluidGallons';
```

C++

```
SFluidGallonsDescription = 'FluidGallons';
```

File

RTLConsts

Description

This is constant RTLConsts.SFluidGallonsDescription.

83.1.112 RTLConsts.SFluidGillsDescription Constant

Pascal

```
SFluidGillsDescription = 'FluidGills';
```

C++

```
SFluidGillsDescription = 'FluidGills';
```

File

RTLConsts

Description

This is constant RTLConsts.SFluidGillsDescription.

83.1.113 RTLConsts.SFluidOuncesDescription Constant

Pascal

```
SFluidOuncesDescription = 'FluidOunces';
```

C++

```
SFluidOuncesDescription = 'FluidOunces';
```

File

RTLConsts

Description

This is constant RTLConsts.SFluidOuncesDescription.

83.1.114 RTLConsts.SFluidPintsDescription Constant

Pascal

```
SFluidPintsDescription = 'FluidPints';
```

C++

```
SFluidPintsDescription = 'FluidPints';
```

File

RTLConsts

Description

This is constant RTLConsts.SFluidPintsDescription.

83.1.115 RTLConsts.SFluidQuartsDescription Constant

Pascal

```
SFluidQuartsDescription = 'FluidQuarts';
```

C++

```
SFluidQuartsDescription = 'FluidQuarts';
```

File

RTLConsts

Description

This is constant RTLConsts.SFluidQuartsDescription.

83.1.116 RTLConsts.SFluidTablespoonsDescription Constant

Pascal

```
SFluidTablespoonsDescription = 'FluidTablespoons';
```

C++

```
SFluidTablespoonsDescription = 'FluidTablespoons';
```

File

RTLConsts

Description

This is constant RTLConsts.SFluidTablespoonsDescription.

83.1.117 RTLConsts.SFluidTeaspoonsDescription Constant

Pascal

```
SFluidTeaspoonsDescription = 'FluidTeaspoons';
```

C++

```
SFluidTeaspoonsDescription = 'FluidTeaspoons';
```

File

RTLConsts

Description

This is constant RTLConsts.SFluidTeaspoonsDescription.

83.1.118 RTLConsts.SFOpenError Constant

Pascal

```
SFOpenError = 'Cannot open file %s';
```

C++

```
SFOpenError = 'Cannot open file %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SFOpenError.

83.1.119 RTLConsts.SFOpenErrorEx Constant

Pascal

```
SFOpenErrorEx = 'Cannot open file "%s". %s';
```

C++

```
SFOpenErrorEx = 'Cannot open file "%s". %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SFOpenErrorEx.

83.1.120 RTLConsts.SFortnightsDescription Constant

Pascal

```
SFortnightsDescription = 'Fortnights';
```

C++

```
SFortnightsDescription = 'Fortnights';
```

File

RTLConsts

Description

This is constant RTLConsts.SFortnightsDescription.

83.1.121 RTLConsts.SFurlongsDescription Constant

Pascal

```
SFurlongsDescription = 'Furlongs';
```

C++

```
SFurlongsDescription = 'Furlongs';
```

File

RTLConsts

Description

This is constant RTLConsts.SFurlongsDescription.

83.1.122 RTLConsts.SGigametersDescription Constant

Pascal

```
SGigametersDescription = 'Gigameters';
```

C++

```
SGigametersDescription = 'Gigameters';
```

File

RTLConsts

Description

This is constant RTLConsts.SGigametersDescription.

83.1.123 RTLConsts.SGrainsDescription Constant

Pascal

```
SGrainsDescription = 'Grains';
```

C++

```
SGrainsDescription = 'Grains';
```

File

RTLConsts

Description

This is constant RTLConsts.SGrainsDescription.

83.1.124 RTLConsts.SGramsDescription Constant

Pascal

```
SGramsDescription = 'Grams';
```

C++

```
SGramsDescription = 'Grams';
```

File

RTLConsts

Description

This is constant RTLConsts.SGramsDescription.

83.1.125 RTLConsts.SGridTooLarge Constant

Pascal

```
SGridTooLarge = 'Grid too large for operation';
```

C++

```
SGridTooLarge = 'Grid too large for operation';
```

File

RTLConsts

Description

This is constant RTLConsts.SGridTooLarge.

83.1.126 RTLConsts.SHandsDescription Constant

Pascal

```
SHandsDescription = 'Hands';
```

C++

```
SHandsDescription = 'Hands';
```

File

RTLConsts

Description

This is constant RTLConsts.SHandsDescription.

83.1.127 RTLConsts.SHectaresDescription Constant

Pascal

```
SHectaresDescription = 'Hectares';
```

C++

```
SHectaresDescription = 'Hectares';
```

File

RTLConsts

Description

This is constant RTLConsts.SHectaresDescription.

83.1.128 RTLConsts.SHectogramsDescription Constant

Pascal

```
SHectogramsDescription = 'Hectograms';
```

C++

```
SHectogramsDescription = 'Hectograms';
```

File

RTLConsts

Description

This is constant RTLConsts.SHectogramsDescription.

83.1.129 RTLConsts.SHectoLitersDescription Constant

Pascal

```
SHectoLitersDescription = 'HectoLiters';
```

C++

```
SHectoLitersDescription = 'HectoLiters';
```

File

RTLConsts

Description

This is constant RTLConsts.SHectoLitersDescription.

83.1.130 RTLConsts.SHectometersDescription Constant

Pascal

```
SHectometersDescription = 'Hectometers';
```

C++

```
SHectometersDescription = 'Hectometers';
```

File

RTLConsts

Description

This is constant RTLConsts.SHectometersDescription.

83.1.131 RTLConsts.SHoursDescription Constant

Pascal

```
SHoursDescription = 'Hours';
```

C++

```
SHoursDescription = 'Hours';
```

File

RTLConsts

Description

This is constant RTLConsts.SHoursDescription.

83.1.132 RTLConsts.SIdentifierExpected Constant

Pascal

```
SIdentifierExpected = 'Identifier expected';
```

C++

```
SIdentifierExpected = 'Identifier expected';
```

File

RTLConsts

Description

This is constant RTLConsts.SIdentifierExpected.

83.1.133 RTLConsts.SInchesDescription Constant

Pascal

```
SInchesDescription = 'Inches';
```

C++

```
SInchesDescription = 'Inches';
```

File

RTLConsts

Description

This is constant RTLConsts.SInchesDescription.

83.1.134 RTLConsts.SIndexOutOfRange Constant

Pascal

```
SIndexOutOfRange = 'Grid index out of range';
```

C++

```
SIndexOutOfRange = 'Grid index out of range';
```

File

RTLConsts

Description

This is constant RTLConsts.SIndexOutOfRange.

83.1.135 RTLConsts.SIniFileWriteError Constant

Pascal

```
SIniFileWriteError = 'Unable to write to %s';
```

C++

```
SIniFileWriteError = 'Unable to write to %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SIniFileWriteError.

83.1.136 RTLConsts.SInvalidActionCreation Constant

Pascal

```
SInvalidActionCreation = 'Invalid action creation';
```

C++

```
SInvalidActionCreation = 'Invalid action creation';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidActionCreation.

83.1.137 RTLConsts.SInvalidActionEnumeration Constant

Pascal

```
SInvalidActionEnumeration = 'Invalid action enumeration';
```

C++

```
SInvalidActionEnumeration = 'Invalid action enumeration';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidActionEnumeration.

83.1.138 RTLConsts.SInvalidActionRegistration Constant

Pascal

```
SInvalidActionRegistration = 'Invalid action registration';
```

C++

```
SInvalidActionRegistration = 'Invalid action registration';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidActionRegistration.

83.1.139 RTLConsts.SInvalidActionUnregistration Constant

Pascal

```
SInvalidActionUnregistration = 'Invalid action unregistration';
```

C++

```
SInvalidActionUnregistration = 'Invalid action unregistration';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidActionUnregistration.

83.1.140 RTLConsts.SInvalidBinary Constant

Pascal

```
SInvalidBinary = 'Invalid binary value';
```

C++

```
SInvalidBinary = 'Invalid binary value';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidBinary.

83.1.141 RTLConsts.SInvalidDate Constant

Pascal

```
SInvalidDate = '''''%s'''' is not a valid date' deprecated 'Use SysConsts.SInvalidDate';
```

C++

```
SInvalidDate = '''''%s'''' is not a valid date' deprecated 'Use SysConsts.SInvalidDate';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidDate.

83.1.142 RTLConsts.SInvalidDateDay Constant

Pascal

```
SInvalidDateDay = '(%d, %d) is not a valid DateDay pair';
```

C++

```
SInvalidDateDay = '(%d, %d) is not a valid DateDay pair';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidDateDay.

83.1.143 RTLConsts.SInvalidDateMonthWeek Constant

Pascal

```
SInvalidDateMonthWeek = '(%d, %d, %d, %d) is not a valid DateMonthWeek quad';
```

C++

```
SInvalidDateMonthWeek = '(%d, %d, %d, %d) is not a valid DateMonthWeek quad';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidDateMonthWeek.

83.1.144 RTLConsts.SInvalidDateTime Constant

Pascal

```
SInvalidDateTime = '''''%s'''' is not a valid date and time' deprecated 'Use
SysConsts.SInvalidDateTime';
```

C++

```
SInvalidDateTime = '''''%s'''' is not a valid date and time' deprecated 'Use
SysConsts.SInvalidDateTime';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidDateTime.

83.1.145 RTLConsts.SInvalidDateWeek Constant

Pascal

```
SInvalidDateWeek = '(%d, %d, %d) is not a valid DateWeek triplet';
```

C++

```
SInvalidDateWeek = '(%d, %d, %d) is not a valid DateWeek triplet';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidDateWeek.

83.1.146 RTLConsts.SInvalidDayOfWeekInMonth Constant

Pascal

```
SInvalidDayOfWeekInMonth = '(%d, %d, %d, %d) is not a valid DayOfWeekInMonth quad';
```

C++

```
SInvalidDayOfWeekInMonth = '(%d, %d, %d, %d) is not a valid DayOfWeekInMonth quad';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidDayOfWeekInMonth.

83.1.147 RTLConsts.SInvalidFileName Constant

Pascal

```
SInvalidFileName = 'Invalid file name - %s';
```

C++

```
SInvalidFileName = 'Invalid file name - %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidFileName.

83.1.148 RTLConsts.SInvalidImage Constant

Pascal

```
SInvalidImage = 'Invalid stream format';
```

C++

```
SInvalidImage = 'Invalid stream format';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidImage.

83.1.149 RTLConsts.SInvalidInteger Constant

Pascal

```
SInvalidInteger = '''''%s'''' is not a valid integer value' deprecated 'Use
SysConsts.SInvalidInteger';
```

C++

```
SInvalidInteger = '''''%s'''' is not a valid integer value' deprecated 'Use
SysConsts.SInvalidInteger';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidInteger.

83.1.150 RTLConsts.SInvalidJulianDate Constant

Pascal

```
SInvalidJulianDate = '%f Julian cannot be represented as a DateTime';
```

C++

```
SInvalidJulianDate = '%f Julian cannot be represented as a DateTime';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidJulianDate.

83.1.151 RTLConsts.SInvalidMask Constant

Pascal

```
SInvalidMask = '''%s'' is an invalid mask at (%d)';
```

C++

```
SInvalidMask = '''%s'' is an invalid mask at (%d)';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidMask.

83.1.152 RTLConsts.SInvalidName Constant

Pascal

```
SInvalidName = '''''%s'''' is not a valid component name';
```

C++

```
SInvalidName = '''''%s'''' is not a valid component name';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidName.

83.1.153 RTLConsts.SInvalidProperty Constant

Pascal

```
SInvalidProperty = 'Invalid property value';
```

C++

```
SInvalidProperty = 'Invalid property value';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidProperty.

83.1.154 RTLConsts.SInvalidPropertyElement Constant

Pascal

```
SInvalidPropertyElement = 'Invalid property element: %s';
```

C++

```
SInvalidPropertyElement = 'Invalid property element: %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidPropertyElement.

83.1.155 RTLConsts.SInvalidPropertyPath Constant

Pascal

```
SInvalidPropertyPath = 'Invalid property path';
```

C++

```
SInvalidPropertyPath = 'Invalid property path';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidPropertyPath.

83.1.156 RTLConsts.SInvalidPropertyType Constant

Pascal

```
SInvalidPropertyType = 'Invalid property type: %s';
```

C++

```
SInvalidPropertyType = 'Invalid property type: %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidPropertyType.

83.1.157 RTLConsts.SInvalidPropertyValue Constant

Pascal

```
SInvalidPropertyValue = 'Invalid property value';
```

C++

```
SInvalidPropertyValue = 'Invalid property value';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidPropertyValue.

83.1.158 RTLConsts.SInvalidRegType Constant

Pascal

```
SInvalidRegType = 'Invalid data type for ''%s''';
```

C++

```
SInvalidRegType = 'Invalid data type for ''%s''';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidRegType.

83.1.159 RTLConsts.SInvalidString Constant

Pascal

```
SInvalidString = 'Invalid string constant';
```

C++

```
SInvalidString = 'Invalid string constant';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidString.

83.1.160 RTLConsts.SInvalidStringGridOp Constant

Pascal

```
SInvalidStringGridOp = 'Cannot insert or delete rows from grid';
```

C++

```
SInvalidStringGridOp = 'Cannot insert or delete rows from grid';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidStringGridOp.

83.1.161 RTLConsts.SInvalidTime Constant

Pascal

```
SInvalidTime = '''''%s'''' is not a valid time' deprecated 'Use SysConsts.SInvalidTime';
```

C++

```
SInvalidTime = '''''%s'''' is not a valid time' deprecated 'Use SysConsts.SInvalidTime';
```

File

RTLConsts

Description

This is constant RTLConsts.SInvalidTime.

83.1.162 RTLConsts.SItemNotFound Constant

Pascal

```
SItemNotFound = 'Item not found ($0%x)';
```

C++

```
SItemNotFound = 'Item not found ($0%x)';
```

File

RTLConsts

Description

This is constant RTLConsts.SItemNotFound.

83.1.163 RTLConsts.SJulianDateDescription Constant

Pascal

```
SJulianDateDescription = 'JulianDate';
```

C++

```
SJulianDateDescription = 'JulianDate';
```

File

RTLConsts

Description

This is constant RTLConsts.SJulianDateDescription.

83.1.164 RTLConsts.SKelvinDescription Constant

Pascal

```
SKelvinDescription = 'Kelvin';
```

C++

```
SKelvinDescription = 'Kelvin';
```

File

RTLConsts

Description

This is constant RTLConsts.SKelvinDescription.

83.1.165 RTLConsts.SKilogramsDescription Constant

Pascal

```
SKilogramsDescription = 'Kilograms';
```

C++

```
SKilogramsDescription = 'Kilograms';
```

File

RTLConsts

Description

This is constant RTLConsts.SKilogramsDescription.

83.1.166 RTLConsts.SKiloLitersDescription Constant

Pascal

```
SKiloLitersDescription = 'KiloLiters';
```

C++

```
SKiloLitersDescription = 'KiloLiters';
```

File

RTLConsts

Description

This is constant RTLConsts.SKiloLitersDescription.

83.1.167 RTLConsts.SKilometersDescription Constant

Pascal

```
SKilometersDescription = 'Kilometers';
```

C++

```
SKilometersDescription = 'Kilometers';
```

File

RTLConsts

Description

This is constant RTLConsts.SKilometersDescription.

83.1.168 RTLConsts.SLightYearsDescription Constant

Pascal

```
SLightYearsDescription = 'LightYears';
```

C++

```
SLightYearsDescription = 'LightYears';
```

File

RTLConsts

Description

This is constant RTLConsts.SLightYearsDescription.

83.1.169 RTLConsts.SLineTooLong Constant

Pascal

```
SLineTooLong = 'Line too long';
```

C++

```
SLineTooLong = 'Line too long';
```

File

RTLConsts

Description

This is constant RTLConsts.SLineTooLong.

83.1.170 RTLConsts.SLinksDescription Constant

Pascal

```
SLinksDescription = 'Links';
```

C++

```
SLinksDescription = 'Links';
```

File

RTLConsts

Description

This is constant RTLConsts.SLinksDescription.

83.1.171 RTLConsts.SListCapacityError Constant

Pascal

```
SListCapacityError = 'List capacity out of bounds (%d)';
```

C++

```
SListCapacityError = 'List capacity out of bounds (%d)';
```

File

RTLConsts

Description

This is constant RTLConsts.SListCapacityError.

83.1.172 RTLConsts.SListCountError Constant

Pascal

```
SListCountError = 'List count out of bounds (%d)';
```

C++

```
SListCountError = 'List count out of bounds (%d)';
```

File

RTLConsts

Description

This is constant RTLConsts.SListCountError.

83.1.173 RTLConsts.SListIndexError Constant

Pascal

```
SListIndexError = 'List index out of bounds (%d)';
```

C++

```
SListIndexError = 'List index out of bounds (%d)';
```

File

RTLConsts

Description

This is constant RTLConsts.SListIndexError.

83.1.174 RTLConsts.SLitersDescription Constant

Pascal

```
SLitersDescription = 'Liters';
```

C++

```
SLitersDescription = 'Liters';
```

File

RTLConsts

Description

This is constant RTLConsts.SLitersDescription.

83.1.175 RTLConsts.SLongTonsDescription Constant

Pascal

```
SLongTonsDescription = 'LongTons';
```

C++

```
SLongTonsDescription = 'LongTons';
```

File

RTLConsts

Description

This is constant RTLConsts.SLongTonsDescription.

83.1.176 RTLConsts.SMaskEditErr Constant

Pascal

```
SMaskEditErr = 'Invalid input value.  Use escape key to abandon changes';
```

C++

```
SMaskEditErr = 'Invalid input value.  Use escape key to abandon changes';
```

File

RTLConsts

Description

This is constant RTLConsts.SMaskEditErr.

83.1.177 RTLConsts.SMaskErr Constant

Pascal

```
SMaskErr = 'Invalid input value';
```

C++

```
SMaskErr = 'Invalid input value';
```

File

RTLConsts

Description

This is constant RTLConsts.SMaskErr.

83.1.178 RTLConsts.SMassDescription Constant

Pascal

```
SMassDescription = 'Mass';
```

C++

```
SMassDescription = 'Mass';
```

File

RTLConsts

Description

This is constant RTLConsts.SMassDescription.

83.1.179 RTLConsts.SMegametersDescription Constant

Pascal

```
SMegametersDescription = 'Megameters';
```

C++

```
SMegametersDescription = 'Megameters';
```

File

RTLConsts

Description

This is constant RTLConsts.SMegametersDescription.

83.1.180 RTLConsts.SMemoryStreamError Constant

Pascal

```
SMemoryStreamError = 'Out of memory while expanding memory stream';
```

C++

```
SMemoryStreamError = 'Out of memory while expanding memory stream';
```

File

RTLConsts

Description

This is constant RTLConsts.SMemoryStreamError.

83.1.181 RTLConsts.SMetersDescription Constant

Pascal

```
SMetersDescription = 'Meters';
```

C++

```
SMetersDescription = 'Meters';
```

File

RTLConsts

Description

This is constant RTLConsts.SMetersDescription.

83.1.182 RTLConsts.SMetricTonsDescription Constant

Pascal

```
SMetricTonsDescription = 'MetricTons';
```

C++

```
SMetricTonsDescription = 'MetricTons';
```

File

RTLConsts

Description

This is constant RTLConsts.SMetricTonsDescription.

83.1.183 RTLConsts.SMicrogramsDescription Constant

Pascal

```
SMicrogramsDescription = 'Micrograms';
```

C++

```
SMicrogramsDescription = 'Micrograms';
```

File

RTLConsts

Description

This is constant RTLConsts.SMicrogramsDescription.

83.1.184 RTLConsts.SMicromicronsDescription Constant

Pascal

```
SMicromicronsDescription = 'Micromicrons';
```

C++

```
SMicromicronsDescription = 'Micromicrons';
```

File

RTLConsts

Description

This is constant RTLConsts.SMicromicronsDescription.

83.1.185 RTLConsts.SMicronsDescription Constant

Pascal

```
SMicronsDescription = 'Microns';
```

C++

```
SMicronsDescription = 'Microns';
```

File

RTLConsts

Description

This is constant RTLConsts.SMicronsDescription.

83.1.186 RTLConsts.SMilesDescription Constant

Pascal

```
SMilesDescription = 'Miles';
```

C++

```
SMilesDescription = 'Miles';
```

File

RTLConsts

Description

This is constant RTLConsts.SMilesDescription.

83.1.187 RTLConsts.SMillenniaDescription Constant

Pascal

```
SMillenniaDescription = 'Millennia';
```

C++

```
SMillenniaDescription = 'Millennia';
```

File

RTLConsts

Description

This is constant RTLConsts.SMillenniaDescription.

83.1.188 RTLConsts.SMilligramsDescription Constant

Pascal

```
SMilligramsDescription = 'Milligrams';
```

C++

```
SMilligramsDescription = 'Milligrams';
```

File

RTLConsts

Description

This is constant RTLConsts.SMilligramsDescription.

83.1.189 RTLConsts.SMilliLitersDescription Constant

Pascal

```
SMilliLitersDescription = 'MilliLiters';
```

C++

```
SMilliLitersDescription = 'MilliLiters';
```

File

RTLConsts

Description

This is constant RTLConsts.SMilliLitersDescription.

83.1.190 RTLConsts.SMillimetersDescription Constant

Pascal

```
SMillimetersDescription = 'Millimeters';
```

C++

```
SMillimetersDescription = 'Millimeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SMillimetersDescription.

83.1.191 RTLConsts.SMillimicronsDescription Constant

Pascal

```
SMillimicronsDescription = 'Millimicrons';
```

C++

```
SMillimicronsDescription = 'Millimicrons';
```

File

RTLConsts

Description

This is constant RTLConsts.SMillimicronsDescription.

83.1.192 RTLConsts.SMilliSecondsDescription Constant

Pascal

```
SMilliSecondsDescription = 'MilliSeconds';
```

C++

```
SMilliSecondsDescription = 'MilliSeconds';
```

File

RTLConsts

Description

This is constant RTLConsts.SMilliSecondsDescription.

83.1.193 RTLConsts.SMinutesDescription Constant

Pascal

```
SMinutesDescription = 'Minutes';
```

C++

```
SMinutesDescription = 'Minutes';
```

File

RTLConsts

Description

This is constant RTLConsts.SMinutesDescription.

83.1.194 RTLConsts.SMissingDateTimeField Constant

Pascal

```
SMissingDateTimeField = '?';
```

C++

```
SMissingDateTimeField = '?';
```

File

RTLConsts

Description

This is constant RTLConsts.SMissingDateTimeField.

83.1.195 RTLConsts.SModifiedJulianDateDescription Constant

Pascal

```
SModifiedJulianDateDescription = 'ModifiedJulianDate';
```

C++

```
SModifiedJulianDateDescription = 'ModifiedJulianDate';
```

File

RTLConsts

Description

This is constant RTLConsts.SModifiedJulianDateDescription.

83.1.196 RTLConsts.SMonthsDescription Constant

Pascal

```
SMonthsDescription = 'Months';
```

C++

```
SMonthsDescription = 'Months';
```

File

RTLConsts

Description

This is constant RTLConsts.SMonthsDescription.

83.1.197 RTLConsts.SNanogramsDescription Constant

Pascal

```
SNanogramsDescription = 'Nanograms';
```

C++

```
SNanogramsDescription = 'Nanograms';
```

File

RTLConsts

Description

This is constant RTLConsts.SNanogramsDescription.

83.1.198 RTLConsts.SNauticalMilesDescription Constant

Pascal

```
SNauticalMilesDescription = 'NauticalMiles';
```

C++

```
SNauticalMilesDescription = 'NauticalMiles';
```

File

RTLConsts

Description

This is constant RTLConsts.SNauticalMilesDescription.

83.1.199 RTLConsts.sNoAddress Constant

Pascal

```
sNoAddress = 'No address specified';
```

C++

```
sNoAddress = 'No address specified';
```

File

RTLConsts

Description

This is constant RTLConsts.sNoAddress.

83.1.200 RTLConsts.SNoComSupport Constant

Pascal

```
SNoComSupport = '%s has not been registered as a COM class';
```

C++

```
SNoComSupport = '%s has not been registered as a COM class';
```

File

RTLConsts

Description

This is constant RTLConsts.SNoComSupport.

83.1.201 RTLConsts.sNoConstruct Constant

Pascal

```
sNoConstruct = 'Class %s is not intended to be constructed';
```

C++

```
sNoConstruct = 'Class %s is not intended to be constructed';
```

File

RTLConsts

Description

This is constant RTLConsts.sNoConstruct.

83.1.202 RTLConsts.SNotPrinting Constant

Pascal

```
SNotPrinting = 'Printer is not currently printing';
```

C++

```
SNotPrinting = 'Printer is not currently printing';
```

File

RTLConsts

Description

This is constant RTLConsts.SNotPrinting.

83.1.203 RTLConsts.SNumberExpected Constant

Pascal

```
SNumberExpected = 'Number expected';
```

C++

```
SNumberExpected = 'Number expected';
```

File

RTLConsts

Description

This is constant RTLConsts.SNumberExpected.

83.1.204 RTLConsts.SOuncesDescription Constant

Pascal

```
SOuncesDescription = 'Ounces';
```

C++

```
SOuncesDescription = 'Ounces';
```

File

RTLConsts

Description

This is constant RTLConsts.SOuncesDescription.

83.1.205 RTLConsts.SPacesDescription Constant

Pascal

```
SPacesDescription = 'Paces';
```

C++

```
SPacesDescription = 'Paces';
```

File

RTLConsts

Description

This is constant RTLConsts.SPacesDescription.

83.1.206 RTLConsts.SParsecsDescription Constant

Pascal

```
SParsecsDescription = 'Parsecs';
```

C++

```
SParsecsDescription = 'Parsecs';
```

File

RTLConsts

Description

This is constant RTLConsts.SParsecsDescription.

83.1.207 RTLConsts.SParseError Constant

Pascal

```
SParseError = '%s on line %d';
```

C++

```
SParseError = '%s on line %d';
```

File

RTLConsts

Description

This is constant RTLConsts.SParseError.

83.1.208 RTLConsts.SPicasDescription Constant

Pascal

```
SPicasDescription = 'Picas';
```

C++

```
SPicasDescription = 'Picas';
```

File

RTLConsts

Description

This is constant RTLConsts.SPicasDescription.

83.1.209 RTLConsts.SPointsDescription Constant

Pascal

```
SPointsDescription = 'Points';
```

C++

```
SPointsDescription = 'Points';
```

File

RTLConsts

Description

This is constant RTLConsts.SPointsDescription.

83.1.210 RTLConsts.SPoundsDescription Constant

Pascal

```
SPoundsDescription = 'Pounds';
```

C++

```
SPoundsDescription = 'Pounds';
```

File

RTLConsts

Description

This is constant RTLConsts.SPoundsDescription.

83.1.211 RTLConsts.SPrinting Constant

Pascal

```
SPrinting = 'Printing in progress';
```

C++

```
SPrinting = 'Printing in progress';
```

File

RTLConsts

Description

This is constant RTLConsts.SPrinting.

83.1.212 RTLConsts.SPropertyException Constant

Pascal

```
SPropertyException = 'Error reading %s%s%s: %s';
```

C++

```
SPropertyException = 'Error reading %s%s%s: %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SPropertyException.

83.1.213 RTLConsts.SRankineDescription Constant

Pascal

```
SRankineDescription = 'Rankine';
```

C++

```
SRankineDescription = 'Rankine';
```

File

RTLConsts

Description

This is constant RTLConsts.SRankineDescription.

83.1.214 RTLConsts.SReadError Constant

Pascal

```
SReadError = 'Stream read error';
```

C++

```
SReadError = 'Stream read error';
```

File

RTLConsts

Description

This is constant RTLConsts.SReadError.

83.1.215 RTLConsts.SReadOnlyProperty Constant

Pascal

```
SReadOnlyProperty = 'Property is read-only';
```

C++

```
SReadOnlyProperty = 'Property is read-only';
```

File

RTLConsts

Description

This is constant RTLConsts.SReadOnlyProperty.

83.1.216 RTLConsts.SReaumurDescription Constant

Pascal

```
SReaumurDescription = 'Reaumur';
```

C++

```
SReaumurDescription = 'Reaumur';
```

File

RTLConsts

Description

This is constant RTLConsts.SReaumurDescription.

83.1.217 RTLConsts.SRegCreateFailed Constant

Pascal

```
SRegCreateFailed = 'Failed to create key %s';
```

C++

```
SRegCreateFailed = 'Failed to create key %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SRegCreateFailed.

83.1.218 RTLConsts.SRegGetDataFailed Constant

Pascal

```
SRegGetDataFailed = 'Failed to get data for ''%s''';
```

C++

```
SRegGetDataFailed = 'Failed to get data for ''%s''';
```

File

RTLConsts

Description

This is constant RTLConsts.SRegGetDataFailed.

83.1.219 RTLConsts.SRegisterError Constant

Pascal

```
SRegisterError = 'Invalid component registration';
```

C++

```
SRegisterError = 'Invalid component registration';
```

File

RTLConsts

Description

This is constant RTLConsts.SRegisterError.

83.1.220 RTLConsts.SRegSetDataFailed Constant

Pascal

```
SRegSetDataFailed = 'Failed to set data for ''%s''';
```

C++

```
SRegSetDataFailed = 'Failed to set data for ''%s''';
```

File

RTLConsts

Description

This is constant RTLConsts.SRegSetDataFailed.

83.1.221 RTLConsts.SResNotFound Constant

Pascal

```
SResNotFound = 'Resource %s not found';
```

C++

```
SResNotFound = 'Resource %s not found';
```

File

RTLConsts

Description

This is constant RTLConsts.SResNotFound.

83.1.222 RTLConsts.SRodsDescription Constant

Pascal

```
SRodsDescription = 'Rods';
```

C++

```
SRodsDescription = 'Rods';
```

File

RTLConsts

Description

This is constant RTLConsts.SRodsDescription.

83.1.223 RTLConsts.SSecondsDescription Constant

Pascal

```
SSecondsDescription = 'Seconds';
```

C++

```
SSecondsDescription = 'Seconds';
```

File

RTLConsts

Description

This is constant RTLConsts.SSecondsDescription.

83.1.224 RTLConsts.SSeekNotImplemented Constant

Pascal

```
SSeekNotImplemented = '%s.Seek not implemented';
```

C++

```
SSeekNotImplemented = '%s.Seek not implemented';
```

File

RTLConsts

Description

This is constant RTLConsts.SSeekNotImplemented.

83.1.225 RTLConsts.sSocketAlreadyOpen Constant

Pascal

```
sSocketAlreadyOpen = 'Socket already open';
```

C++

```
sSocketAlreadyOpen = 'Socket already open';
```

File

RTLConsts

Description

This is constant RTLConsts.sSocketAlreadyOpen.

83.1.226 RTLConsts.sSocketIOError Constant

Pascal

```
sSocketIOError = '%s error %d, %s';
```

C++

```
sSocketIOError = '%s error %d, %s';
```

File

RTLConsts

Description

This is constant RTLConsts.sSocketIOError.

83.1.227 RTLConsts.sSocketMustBeBlocking Constant

Pascal

```
sSocketMustBeBlocking = 'Socket must be in blocking mode';
```

C++

```
sSocketMustBeBlocking = 'Socket must be in blocking mode';
```

File

RTLConsts

Description

This is constant RTLConsts.sSocketMustBeBlocking.

83.1.228 RTLConsts.sSocketRead Constant

Pascal

```
sSocketRead = 'Read';
```

C++

```
sSocketRead = 'Read';
```

File

RTLConsts

Description

This is constant RTLConsts.sSocketRead.

83.1.229 RTLConsts.sSocketWrite Constant

Pascal

```
sSocketWrite = 'Write';
```

C++

```
sSocketWrite = 'Write';
```

File

RTLConsts

Description

This is constant RTLConsts.sSocketWrite.

83.1.230 RTLConsts.SSortedListError Constant

Pascal

```
SSortedListError = 'Operation not allowed on sorted list';
```

C++

```
SSortedListError = 'Operation not allowed on sorted list';
```

File

RTLConsts

Description

This is constant RTLConsts.SSortedListError.

83.1.231 RTLConsts.SSquareCentimetersDescription Constant

Pascal

```
SSquareCentimetersDescription = 'SquareCentimeters';
```

C++

```
SSquareCentimetersDescription = 'SquareCentimeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareCentimetersDescription.

83.1.232 RTLConsts.SSquareDecametersDescription Constant

Pascal

```
SSquareDecametersDescription = 'SquareDecameters';
```

C++

```
SSquareDecametersDescription = 'SquareDecameters';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareDecametersDescription.

83.1.233 RTLConsts.SSquareDecimetersDescription Constant

Pascal

```
SSquareDecimetersDescription = 'SquareDecimeters';
```

C++

```
SSquareDecimetersDescription = 'SquareDecimeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareDecimetersDescription.

83.1.234 RTLConsts.SSquareFeetDescription Constant

Pascal

```
SSquareFeetDescription = 'SquareFeet';
```

C++

```
SSquareFeetDescription = 'SquareFeet';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareFeetDescription.

83.1.235 RTLConsts.SSquareHectometersDescription Constant

Pascal

```
SSquareHectometersDescription = 'SquareHectometers';
```

C++

```
SSquareHectometersDescription = 'SquareHectometers';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareHectometersDescription.

83.1.236 RTLConsts.SSquareInchesDescription Constant

Pascal

```
SSquareInchesDescription = 'SquareInches';
```

C++

```
SSquareInchesDescription = 'SquareInches';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareInchesDescription.

83.1.237 RTLConsts.SSquareKilometersDescription Constant

Pascal

```
SSquareKilometersDescription = 'SquareKilometers';
```

C++

```
SSquareKilometersDescription = 'SquareKilometers';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareKilometersDescription.

83.1.238 RTLConsts.SSquareMetersDescription Constant

Pascal

```
SSquareMetersDescription = 'SquareMeters';
```

C++

```
SSquareMetersDescription = 'SquareMeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareMetersDescription.

83.1.239 RTLConsts.SSquareMilesDescription Constant

Pascal

```
SSquareMilesDescription = 'SquareMiles';
```

C++

```
SSquareMilesDescription = 'SquareMiles';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareMilesDescription.

83.1.240 RTLConsts.SSquareMillimetersDescription Constant

Pascal

```
SSquareMillimetersDescription = 'SquareMillimeters';
```

C++

```
SSquareMillimetersDescription = 'SquareMillimeters';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareMillimetersDescription.

83.1.241 RTLConsts.SSquareRodsDescription Constant

Pascal

```
SSquareRodsDescription = 'SquareRods';
```

C++

```
SSquareRodsDescription = 'SquareRods';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareRodsDescription.

83.1.242 RTLConsts.SSquareYardsDescription Constant

Pascal

```
SSquareYardsDescription = 'SquareYards';
```

C++

```
SSquareYardsDescription = 'SquareYards';
```

File

RTLConsts

Description

This is constant RTLConsts.SSquareYardsDescription.

83.1.243 RTLConsts.SSteresDescription Constant

Pascal

```
SSteresDescription = 'Steres';
```

C++

```
SSteresDescription = 'Steres';
```

File

RTLConsts

Description

This is constant RTLConsts.SSteresDescription.

83.1.244 RTLConsts.SStonesDescription Constant

Pascal

```
SStonesDescription = 'Stones';
```

C++

```
SStonesDescription = 'Stones';
```

File

RTLConsts

Description

This is constant RTLConsts.SStonesDescription.

83.1.245 RTLConsts.SStreamSetSize Constant

Pascal

```
SStreamSetSize = 'Error setting stream size';
```

C++

```
SStreamSetSize = 'Error setting stream size';
```

File

RTLConsts

Description

This is constant RTLConsts.SStreamSetSize.

83.1.246 RTLConsts.SStringExpected Constant

Pascal

```
SStringExpected = 'String expected';
```

C++

```
SStringExpected = 'String expected';
```

File

RTLConsts

Description

This is constant RTLConsts.SStringExpected.

83.1.247 RTLConsts.SSymbolExpected Constant

Pascal

```
SSymbolExpected = '%s expected';
```

C++

```
SSymbolExpected = '%s expected';
```

File

RTLConsts

Description

This is constant RTLConsts.SSymbolExpected.

83.1.248 RTLConsts.STemperatureDescription Constant

Pascal

```
STemperatureDescription = 'Temperature';
```

C++

```
STemperatureDescription = 'Temperature';
```

File

RTLConsts

Description

This is constant RTLConsts.STemperatureDescription.

83.1.249 RTLConsts.SThreadCreateError Constant

Pascal

```
SThreadCreateError = 'Thread creation error: %s';
```

C++

```
SThreadCreateError = 'Thread creation error: %s';
```

File

RTLConsts

Description

This is constant RTLConsts.SThreadCreateError.

83.1.250 RTLConsts.SThreadError Constant

Pascal

```
SThreadError = 'Thread Error: %s (%d)';
```

C++

```
SThreadError = 'Thread Error: %s (%d)';
```

File

RTLConsts

Description

This is constant RTLConsts.SThreadError.

83.1.251 RTLConsts.SThreadExternalTerminate Constant

Pascal

```
SThreadExternalTerminate = 'Cannot terminate an externally created thread';
```

C++

```
SThreadExternalTerminate = 'Cannot terminate an externally created thread';
```

File

RTLConsts

Description

This is constant RTLConsts.SThreadExternalTerminate.

83.1.252 RTLConsts.SThreadExternalWait Constant

Pascal

```
SThreadExternalWait = 'Cannot wait for an externally created thread';
```

C++

```
SThreadExternalWait = 'Cannot wait for an externally created thread';
```

File

RTLConsts

Description

This is constant RTLConsts.SThreadExternalWait.

83.1.253 RTLConsts.STimeDescription Constant

Pascal

```
STimeDescription = 'Time';
```

C++

```
STimeDescription = 'Time';
```

File

RTLConsts

Description

This is constant RTLConsts.STimeDescription.

83.1.254 RTLConsts.STimeEncodeError Constant

Pascal

```
STimeEncodeError = 'Invalid argument to time encode' deprecated 'Use
SysConsts.STimeEncodeError';
```

C++

```
STimeEncodeError = 'Invalid argument to time encode' deprecated 'Use
SysConsts.STimeEncodeError';
```

File

RTLConsts

Description

This is constant RTLConsts.STimeEncodeError.

83.1.255 RTLConsts.STonsDescription Constant

Pascal

```
STonsDescription = 'Tons';
```

C++

```
STonsDescription = 'Tons';
```

File

RTLConsts

Description

This is constant RTLConsts.STonsDescription.

83.1.256 RTLConsts.STooManyDeleted Constant

Pascal

```
STooManyDeleted = 'Too many rows or columns deleted';
```

C++

```
STooManyDeleted = 'Too many rows or columns deleted';
```

File

RTLConsts

Description

This is constant RTLConsts.STooManyDeleted.

83.1.257 RTLConsts.SUKBucketsDescription Constant

Pascal

```
SUKBucketsDescription = 'UKBuckets';
```

C++

```
SUKBucketsDescription = 'UKBuckets';
```

File

RTLConsts

Description

This is constant RTLConsts.SUKBucketsDescription.

83.1.258 RTLConsts.SUKBushelsDescription Constant

Pascal

```
SUKBushelsDescription = 'UKBushels';
```

C++

```
SUKBushelsDescription = 'UKBushels';
```

File

RTLConsts

Description

This is constant RTLConsts.SUKBushelsDescription.

83.1.259 RTLConsts.SUKGallonsDescription Constant

Pascal

```
SUKGallonsDescription = 'UKGallons';
```

C++

```
SUKGallonsDescription = 'UKGallons';
```

File

RTLConsts

Description

This is constant RTLConsts.SUKGallonsDescription.

83.1.260 RTLConsts.SUKGillsDescription Constant

Pascal

```
SUKGillsDescription = 'UKGill';
```

C++

```
SUKGillsDescription = 'UKGill';
```

File

RTLConsts

Description

This is constant RTLConsts.SUKGillsDescription.

83.1.261 RTLConsts.SUKOuncesDescription Constant

Pascal

```
SUKOuncesDescription = 'UKOunces';
```

C++

```
SUKOuncesDescription = 'UKOunces';
```

File

RTLConsts

Description

This is constant RTLConsts.SUKOuncesDescription.

83.1.262 RTLConsts.SUKPecksDescription Constant

Pascal

```
SUKPecksDescription = 'UKPecks';
```

C++

```
SUKPecksDescription = 'UKPecks';
```

File

RTLConsts

Description

This is constant RTLConsts.SUKPecksDescription.

83.1.263 RTLConsts.SUKPintsDescription Constant

Pascal

```
SUKPintsDescription = 'UKPints';
```

C++

```
SUKPintsDescription = 'UKPints';
```

File

RTLConsts

Description

This is constant RTLConsts.SUKPintsDescription.

83.1.264 RTLConsts.SUKPottlesDescription Constant

Pascal

```
SUKPottlesDescription = 'UKPottle';
```

C++

```
SUKPottlesDescription = 'UKPottle';
```

File

RTLConsts

Description

This is constant RTLConsts.SUKPottlesDescription.

83.1.265 RTLConsts.SUKQuartsDescription Constant

Pascal

```
SUKQuartsDescription = 'UKQuarts';
```

C++

```
SUKQuartsDescription = 'UKQuarts';
```

File

RTLConsts

Description

This is constant RTLConsts.SUKQuartsDescription.

83.1.266 RTLConsts.SUnknownGroup Constant

Pascal

```
SUnknownGroup = '%s not in a class registration group';
```

C++

```
SUnknownGroup = '%s not in a class registration group';
```

File

RTLConsts

Description

This is constant RTLConsts.SUnknownGroup.

83.1.267 RTLConsts.SUnknownProperty Constant

Pascal

```
SUnknownProperty = 'Property %s does not exist';
```

C++

```
SUnknownProperty = 'Property %s does not exist';
```

File

RTLConsts

Description

This is constant RTLConsts.SUnknownProperty.

83.1.268 RTLConsts.SVolumeDescription Constant

Pascal

```
SVolumeDescription = 'Volume';
```

C++

```
SVolumeDescription = 'Volume';
```

File

RTLConsts

Description

This is constant RTLConsts.SVolumeDescription.

83.1.269 RTLConsts.SWeeksDescription Constant

Pascal

```
SWeeksDescription = 'Weeks';
```

C++

```
SWeeksDescription = 'Weeks';
```

File

RTLConsts

Description

This is constant RTLConsts.SWeeksDescription.

83.1.270 RTLConsts.sWindowsSocketError Constant

Pascal

```
sWindowsSocketError = 'Windows socket error: %s (%d), on API ''%s''';
```

C++

```
sWindowsSocketError = 'Windows socket error: %s (%d), on API ''%s''';
```

File

RTLConsts

Description

This is constant RTLConsts.sWindowsSocketError.

83.1.271 RTLConsts.SWriteError Constant

Pascal

```
SWriteError = 'Stream write error';
```

C++

```
SWriteError = 'Stream write error';
```

File

RTLConsts

Description

This is constant RTLConsts.SWriteError.

83.1.272 RTLConsts.SYardsDescription Constant

Pascal

```
SYardsDescription = 'Yards';
```

C++

```
SYardsDescription = 'Yards';
```

File

RTLConsts

Description

This is constant RTLConsts.SYardsDescription.

83.1.273 RTLConsts.SYearsDescription Constant
