Pascal

```
function get_entities: IDOMNamedNodeMap; safecall;
```

C++

```
__fastcall IDOMNamedNodeMap get_entities();
```

Description

This is get_entities, a member of class IDOMDocumentType.

83.2.7.2.2 IDOMDocumentType.get_internalSubset Method

Pascal

```
function get_internalSubset: DOMString; safecall;
```

C++

```
__fastcall DOMString get_internalSubset();
```

Description

This is get_internalSubset, a member of class IDOMDocumentType.

83.2.7.2.3 IDOMDocumentType.get_name Method

Pascal

```
function get_name: DOMString; safecall;
```

C++

```
__fastcall DOMString get_name();
```

Description

This is get_name, a member of class IDOMDocumentType.

83.2.7.2.4 IDOMDocumentType.get_notations Method

Pascal

```
function get_notations: IDOMNamedNodeMap; safecall;
```

C++

```
__fastcall IDOMNamedNodeMap get_notations();
```

Description

This is get_notations, a member of class IDOMDocumentType.

83.2.7.2.5 IDOMDocumentType.get_publicId Method

Pascal

```
function get_publicId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_publicId();
```

Description

This is get_publicId, a member of class IDOMDocumentType.

83.2.7.2.6 IDOMDocumentType.get_systemId Method

Pascal

```
function get_systemId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_systemId();
```

Description

This is get_systemId, a member of class IDOMDocumentType.

83.2.7.3 IDOMDocumentType Properties

The properties of the IDOMDocumentType class are listed here.

Public Properties

	Name	Description
	entities (see page 7493)	This is entities, a member of class IDOMDocumentType.
	internalSubset (see page 7493)	This is internalSubset, a member of class IDOMDocumentType.
	name (see page 7494)	This is name, a member of class IDOMDocumentType.
	notations (see page 7494)	This is notations, a member of class IDOMDocumentType.
	publicId (see page 7494)	This is publicId, a member of class IDOMDocumentType.
	systemId (see page 7494)	This is systemId, a member of class IDOMDocumentType.

83.2.7.3.1 IDOMDocumentType.entities Property

Pascal

```
property entities: IDOMNamedNodeMap;
```

C++

```
__property IDOMNamedNodeMap entities;
```

Description

This is entities, a member of class IDOMDocumentType.

83.2.7.3.2 IDOMDocumentType.internalSubset Property

Pascal

```
property internalSubset: DOMString;
```

C++

```
__property DOMString internalSubset;
```

Description

This is internalSubset, a member of class IDOMDocumentType.

83.2.7.3.3 IDOMDocumentType.name Property

Pascal

```
property name: DOMString;
```

C++

```
__property DOMString name;
```

Description

This is name, a member of class IDOMDocumentType.

83.2.7.3.4 IDOMDocumentType.notations Property

Pascal

```
property notations: IDOMNamedNodeMap;
```

C++

```
__property IDOMNamedNodeMap notations;
```

Description

This is notations, a member of class IDOMDocumentType.

83.2.7.3.5 IDOMDocumentType.publicId Property

Pascal

```
property publicId: DOMString;
```

C++

```
__property DOMString publicId;
```

Description

This is publicId, a member of class IDOMDocumentType.

83.2.7.3.6 IDOMDocumentType.systemId Property

Pascal

```
property systemId: DOMString;
```

C++

```
__property DOMString systemId;
```

Description

This is systemId, a member of class IDOMDocumentType.

83.2.8 IDOMElement Interface

Class Hierarchy

Pascal

```
IDOMElement = interface(IDOMNode);
```

C++

```
__interface IDOMElement : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMElement.

83.2.8.1 IDOMElement Members

The following tables list the members exposed by IDOMElement.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	get_tagName (see page 7497)	This is get_tagName, a member of class IDOMElement.
	getAttribute (see page 7497)	This is getAttribute, a member of class IDOMElement.
	getAttributeNode (see page 7497)	This is getAttributeNode, a member of class IDOMElement.
	getAttributeNodeNS (see page 7497)	This is getAttributeNodeNS, a member of class IDOMElement.
	getAttributeNS (see page 7497)	This is getAttributeNS, a member of class IDOMElement.
	getElementsByTagName (see page 7498)	This is getElementsByTagName, a member of class IDOMElement.
	getElementsByTagNameNS (see page 7498)	This is getElementsByTagNameNS, a member of class IDOMElement.
	hasAttribute (see page 7498)	This is hasAttribute, a member of class IDOMElement.
	hasAttributeNS (see page 7498)	This is hasAttributeNS, a member of class IDOMElement.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeAttribute (see page 7499)	This is removeAttribute, a member of class IDOMElement.
	removeAttributeNode (see page 7499)	This is removeAttributeNode, a member of class IDOMElement.
	removeAttributeNS (see page 7499)	This is removeAttributeNS, a member of class IDOMElement.

	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 7519)	Sets the value of the node.
	setAttribute (see page 7499)	This is setAttribute, a member of class IDOMElement.
	setAttributeNode (see page 7499)	This is setAttributeNode, a member of class IDOMElement.
	setAttributeNodeNS (see page 7500)	This is setAttributeNodeNS, a member of class IDOMElement.
	setAttributeNS (see page 7500)	This is setAttributeNS, a member of class IDOMElement.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.
R	tagName (see page 7500)	This is tagName, a member of class IDOMElement.

83.2.8.2 IDOMElement Methods

The methods of the IDOMElement class are listed here.

Public Methods

	Name	Description
	get_tagName (see page 7497)	This is get_tagName, a member of class IDOMElement.
	getAttribute (see page 7497)	This is getAttribute, a member of class IDOMElement.
	getAttributeNode (see page 7497)	This is getAttributeNode, a member of class IDOMElement.
	getAttributeNodeNS (see page 7497)	This is getAttributeNodeNS, a member of class IDOMElement.
	getAttributeNS (see page 7497)	This is getAttributeNS, a member of class IDOMElement.
	getElementsByTagName (see page 7498)	This is getElementsByTagName, a member of class IDOMElement.
	getElementsByTagNameNS (see page 7498)	This is getElementsByTagNameNS, a member of class IDOMElement.
	hasAttribute (see page 7498)	This is hasAttribute, a member of class IDOMElement.
	hasAttributeNS (see page 7498)	This is hasAttributeNS, a member of class IDOMElement.
	removeAttribute (see page 7499)	This is removeAttribute, a member of class IDOMElement.
	removeAttributeNode (see page 7499)	This is removeAttributeNode, a member of class IDOMElement.
	removeAttributeNS (see page 7499)	This is removeAttributeNS, a member of class IDOMElement.
	setAttribute (see page 7499)	This is setAttribute, a member of class IDOMElement.
	setAttributeNode (see page 7499)	This is setAttributeNode, a member of class IDOMElement.
	setAttributeNodeNS (see page 7500)	This is setAttributeNodeNS, a member of class IDOMElement.
	setAttributeNS (see page 7500)	This is setAttributeNS, a member of class IDOMElement.

83.2.8.2.1 IDOMElement.get_tagName Method

Pascal

```
function get_tagName: DOMString; safecall;
```

C++

```
__fastcall DOMString get_tagName();
```

Description

This is get_tagName, a member of class IDOMElement.

83.2.8.2.2 IDOMElement.getAttribute Method

Pascal

```
function getAttribute(const name: DOMString): DOMString; safecall;
```

C++

```
__fastcall DOMString getAttribute(const DOMString name);
```

Description

This is getAttribute, a member of class IDOMElement.

83.2.8.2.3 IDOMElement.getAttributeNode Method

Pascal

```
function getAttributeNode(const name: DOMString): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr getAttributeNode(const DOMString name);
```

Description

This is getAttributeNode, a member of class IDOMElement.

83.2.8.2.4 IDOMElement.getAttributeNodeNS Method

Pascal

```
function getAttributeNodeNS(const namespaceURI: DOMString; const localName: DOMString):
IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr getAttributeNodeNS(const DOMString namespaceURI, const DOMString
localName);
```

Description

This is getAttributeNodeNS, a member of class IDOMElement.

83.2.8.2.5 IDOMElement.getAttributeNS Method

Pascal

```
function getAttributeNS(const namespaceURI: DOMString; const localName: DOMString): DOMString;
safecall;
```

C++

```
__fastcall DOMString getAttributeNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is getAttributeNS, a member of class IDOMElement.

83.2.8.2.6 IDOMElement.getElementsByTagName Method

Pascal

```
function getElementsByTagName(const name: DOMString): IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList getElementsByTagName(const DOMString name);
```

Description

This is getElementsByTagName, a member of class IDOMElement.

83.2.8.2.7 IDOMElement.getElementsByTagNameNS Method

Pascal

```
function getElementsByTagNameNS(const namespaceURI: DOMString; const localName: DOMString):
IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList getElementsByTagNameNS(const DOMString namespaceURI, const DOMString
localName);
```

Description

This is getElementsByTagNameNS, a member of class IDOMElement.

83.2.8.2.8 IDOMElement.hasAttribute Method

Pascal

```
function hasAttribute(const name: DOMString): WordBool; safecall;
```

C++

```
__fastcall WordBool hasAttribute(const DOMString name);
```

Description

This is hasAttribute, a member of class IDOMElement.

83.2.8.2.9 IDOMElement.hasAttributeNS Method

Pascal

```
function hasAttributeNS(const namespaceURI: DOMString; const localName: DOMString): WordBool;
safecall;
```

C++

```
__fastcall WordBool hasAttributeNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is hasAttributeNS, a member of class IDOMElement.

83.2.8.2.10 IDOMElement.removeAttribute Method

Pascal

```
procedure removeAttribute(const name: DOMString); safecall;
```

C++

```
__fastcall removeAttribute(const DOMString name);
```

Description

This is removeAttribute, a member of class IDOMElement.

83.2.8.2.11 IDOMElement.removeAttributeNode Method

Pascal

```
function removeAttributeNode(const oldAttr: IDOMAttr): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr removeAttributeNode(const IDOMAttr oldAttr);
```

Description

This is removeAttributeNode, a member of class IDOMElement.

83.2.8.2.12 IDOMElement.removeAttributeNS Method

Pascal

```
procedure removeAttributeNS(const namespaceURI: DOMString; const localName: DOMString);
safecall;
```

C++

```
__fastcall removeAttributeNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is removeAttributeNS, a member of class IDOMElement.

83.2.8.2.13 IDOMElement.setAttribute Method

Pascal

```
procedure setAttribute(const name: DOMString; const value: DOMString); safecall;
```

C++

```
__fastcall setAttribute(const DOMString name, const DOMString value);
```

Description

This is setAttribute, a member of class IDOMElement.

83.2.8.2.14 IDOMElement.setAttributeNode Method

Pascal

```
function setAttributeNode(const newAttr: IDOMAttr): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr setAttributeNode(const IDOMAttr newAttr);
```

Description

This is setAttributeNode, a member of class IDOMElement.

83.2.8.2.15 IDOMElement.setAttributeNodeNS Method

Pascal

```
function setAttributeNodeNS(const newAttr: IDOMAttr): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr setAttributeNodeNS(const IDOMAttr newAttr);
```

Description

This is setAttributeNodeNS, a member of class IDOMElement.

83.2.8.2.16 IDOMElement.setAttributeNS Method

Pascal

```
procedure setAttributeNS(const namespaceURI: DOMString; const qulifiedName: DOMString; const
value: DOMString); safecall;
```

C++

```
__fastcall setAttributeNS(const DOMString namespaceURI, const DOMString qulifiedName, const
DOMString value);
```

Description

This is setAttributeNS, a member of class IDOMElement.

83.2.8.3 IDOMElement Properties

The properties of the IDOMElement class are listed here.

Public Properties

	Name	Description
	tagName (see page 7500)	This is tagName, a member of class IDOMElement.

83.2.8.3.1 IDOMElement.tagName Property

Pascal

```
property tagName: DOMString;
```

C++

```
__property DOMString tagName;
```

Description

This is tagName, a member of class IDOMElement.

83.2.9 IDOMEntity Interface

Class Hierarchy

Pascal

```
IDOMEntity = interface(IDOMNode);
```

C++

```
__interface IDOMEntity : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMEntity.

83.2.9.1 IDOMEntity Members

The following tables list the members exposed by IDOMEntity.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_notationName (see page 7502)	This is get_notationName, a member of class IDOMEntity.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	get_publicId (see page 7502)	This is get_publicId, a member of class IDOMEntity.
	get_systemId (see page 7503)	This is get_systemId, a member of class IDOMEntity.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.

	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 7519)	Sets the value of the node.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	notationName (see page 7503)	This is notationName, a member of class IDOMEntity.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.
R	publicId (see page 7503)	This is publicId, a member of class IDOMEntity.
R	systemId (see page 7503)	This is systemId, a member of class IDOMEntity.

83.2.9.2 IDOMEntity Methods

The methods of the IDOMEntity class are listed here.

Public Methods

	Name	Description
	get_notationName (see page 7502)	This is get_notationName, a member of class IDOMEntity.
	get_publicId (see page 7502)	This is get_publicId, a member of class IDOMEntity.
	get_systemId (see page 7503)	This is get_systemId, a member of class IDOMEntity.

83.2.9.2.1 IDOMEntity.get_notationName Method

Pascal

```
function get_notationName: DOMString; safecall;
```

C++

```
__fastcall DOMString get_notationName();
```

Description

This is get_notationName, a member of class IDOMEntity.

83.2.9.2.2 IDOMEntity.get_publicId Method

Pascal

```
function get_publicId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_publicId();
```

Description

This is get_publicId, a member of class IDOMEntity.

83.2.9.2.3 IDOMEntity.get_systemId Method

Pascal

```
function get_systemId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_systemId();
```

Description

This is get_systemId, a member of class IDOMEntity.

83.2.9.3 IDOMEntity Properties

The properties of the IDOMEntity class are listed here.

Public Properties

	Name	Description
	notationName (see page 7503)	This is notationName, a member of class IDOMEntity.
	publicId (see page 7503)	This is publicId, a member of class IDOMEntity.
	systemId (see page 7503)	This is systemId, a member of class IDOMEntity.

83.2.9.3.1 IDOMEntity.notationName Property

Pascal

```
property notationName: DOMString;
```

C++

```
__property DOMString notationName;
```

Description

This is notationName, a member of class IDOMEntity.

83.2.9.3.2 IDOMEntity.publicId Property

Pascal

```
property publicId: DOMString;
```

C++

```
__property DOMString publicId;
```

Description

This is publicId, a member of class IDOMEntity.

83.2.9.3.3 IDOMEntity.systemId Property

Pascal

```
property systemId: DOMString;
```

C++

```
__property DOMString systemId;
```

Description

This is systemId, a member of class IDOMEntity.

83.2.10 IDOMEntityReference Interface

Class Hierarchy

Pascal

```
IDOMEntityReference = interface(IDOMNode);
```

C++

```
__interface IDOMEntityReference : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMEntityReference.

83.2.11 IDOMImplementation Interface

Class Hierarchy

Pascal

```
IDOMImplementation = interface;
```

C++

```
__interface IDOMImplementation;
```

File

xmldom

Description

This is class xmldom.IDOMImplementation.

83.2.11.1 IDOMImplementation Members

The following tables list the members exposed by IDOMImplementation.

Public Methods

	Name	Description
	createDocument (see page 7505)	This is createDocument, a member of class IDOMImplementation.
	createDocumentType (see page 7505)	This is createDocumentType, a member of class IDOMImplementation.
	hasFeature (see page 7505)	This is hasFeature, a member of class IDOMImplementation.

83.2.11.2 IDOMImplementation Methods

The methods of the IDOMImplementation class are listed here.

Public Methods

	Name	Description
	createDocument (see page 7505)	This is createDocument, a member of class IDOMImplementation.
	createDocumentType (see page 7505)	This is createDocumentType, a member of class IDOMImplementation.
	hasFeature (see page 7505)	This is hasFeature, a member of class IDOMImplementation.

83.2.11.2.1 IDOMImplementation.createDocument Method

Pascal

```
function createDocument(const namespaceURI: DOMString; const qualifiedName: DOMString;
doctype: IDOMDocumentType): IDOMDocument; safecall;
```

C++

```
__fastcall IDOMDocument createDocument(const DOMString namespaceURI, const DOMString
qualifiedName, IDOMDocumentType doctype);
```

Description

This is createDocument, a member of class IDOMImplementation.

83.2.11.2.2 IDOMImplementation.createDocumentType Method

Pascal

```
function createDocumentType(const qualifiedName: DOMString; const publicId: DOMString; const
systemId: DOMString): IDOMDocumentType; safecall;
```

C++

```
__fastcall IDOMDocumentType createDocumentType(const DOMString qualifiedName, const DOMString
publicId, const DOMString systemId);
```

Description

This is createDocumentType, a member of class IDOMImplementation.

83.2.11.2.3 IDOMImplementation.hasFeature Method

Pascal

```
function hasFeature(const feature: DOMString; const version: DOMString): WordBool;
```

C++

```
__fastcall WordBool hasFeature(const DOMString feature, const DOMString version);
```

Description

This is hasFeature, a member of class IDOMImplementation.

83.2.12 IDOMNamedNodeMap Interface

Class Hierarchy

Pascal

```
IDOMNamedNodeMap = interface;
```

C++

```
__interface IDOMNamedNodeMap;
```

File

xmldom

Description

This is class xmldom.IDOMNamedNodeMap.

83.2.12.1 IDOMNamedNodeMap Members

The following tables list the members exposed by IDOMNamedNodeMap.

Public Methods

	Name	Description
	get_item (see page 7507)	This is get_item, a member of class IDOMNamedNodeMap.
	get_length (see page 7507)	This is get_length, a member of class IDOMNamedNodeMap.
	getNamedItem (see page 7507)	This is getNamedItem, a member of class IDOMNamedNodeMap.
	getNamedItemNS (see page 7507)	This is getNamedItemNS, a member of class IDOMNamedNodeMap.
	removeNamedItem (see page 7508)	This is removeNamedItem, a member of class IDOMNamedNodeMap.
	removeNamedItemNS (see page 7508)	This is removeNamedItemNS, a member of class IDOMNamedNodeMap.
	setNamedItem (see page 7508)	This is setNamedItem, a member of class IDOMNamedNodeMap.
	setNamedItemNS (see page 7508)	This is setNamedItemNS, a member of class IDOMNamedNodeMap.

Public Properties

	Name	Description
R	item (see page 7509)	This is item, a member of class IDOMNamedNodeMap.
R	length (see page 7509)	This is length, a member of class IDOMNamedNodeMap.

83.2.12.2 IDOMNamedNodeMap Methods

The methods of the IDOMNamedNodeMap class are listed here.

Public Methods

	Name	Description
	get_item (see page 7507)	This is get_item, a member of class IDOMNamedNodeMap.
	get_length (see page 7507)	This is get_length, a member of class IDOMNamedNodeMap.
	getNamedItem (see page 7507)	This is getNamedItem, a member of class IDOMNamedNodeMap.
	getNamedItemNS (see page 7507)	This is getNamedItemNS, a member of class IDOMNamedNodeMap.
	removeNamedItem (see page 7508)	This is removeNamedItem, a member of class IDOMNamedNodeMap.
	removeNamedItemNS (see page 7508)	This is removeNamedItemNS, a member of class IDOMNamedNodeMap.

	setNamedItem (see page 7508)	This is setNamedItem, a member of class IDOMNamedNodeMap.
	setNamedItemNS (see page 7508)	This is setNamedItemNS, a member of class IDOMNamedNodeMap.

83.2.12.2.1 IDOMNamedNodeMap.get_item Method

Pascal

```
function get_item(index: Integer): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_item(int index);
```

Description

This is get_item, a member of class IDOMNamedNodeMap.

83.2.12.2.2 IDOMNamedNodeMap.get_length Method

Pascal

```
function get_length: Integer; safecall;
```

C++

```
__fastcall int get_length();
```

Description

This is get_length, a member of class IDOMNamedNodeMap.

83.2.12.2.3 IDOMNamedNodeMap.getNamedItem Method

Pascal

```
function getNamedItem(const name: DOMString): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode getNamedItem(const DOMString name);
```

Description

This is getNamedItem, a member of class IDOMNamedNodeMap.

83.2.12.2.4 IDOMNamedNodeMap.getNamedItemNS Method

Pascal

```
function getNamedItemNS(const namespaceURI: DOMString; const localName: DOMString): IDOMNode;
safecall;
```

C++

```
__fastcall IDOMNode getNamedItemNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is getNamedItemNS, a member of class IDOMNamedNodeMap.

83.2.12.2.5 IDOMNamedNodeMap.removeNamedItem Method

Pascal

```
function removeNamedItem(const name: DOMString): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode removeNamedItem(const DOMString name);
```

Description

This is removeNamedItem, a member of class IDOMNamedNodeMap.

83.2.12.2.6 IDOMNamedNodeMap.removeNamedItemNS Method

Pascal

```
function removeNamedItemNS(const namespaceURI: DOMString; const localName: DOMString):
IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode removeNamedItemNS(const DOMString namespaceURI, const DOMString localName);
```

Description

This is removeNamedItemNS, a member of class IDOMNamedNodeMap.

83.2.12.2.7 IDOMNamedNodeMap.setNamedItem Method

Pascal

```
function setNamedItem(const arg: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode setNamedItem(const IDOMNode arg);
```

Description

This is setNamedItem, a member of class IDOMNamedNodeMap.

83.2.12.2.8 IDOMNamedNodeMap.setNamedItemNS Method

Pascal

```
function setNamedItemNS(const arg: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode setNamedItemNS(const IDOMNode arg);
```

Description

This is setNamedItemNS, a member of class IDOMNamedNodeMap.

83.2.12.3 IDOMNamedNodeMap Properties

The properties of the IDOMNamedNodeMap class are listed here.

Public Properties

	Name	Description
	item (see page 7509)	This is item, a member of class IDOMNamedNodeMap.
	length (see page 7509)	This is length, a member of class IDOMNamedNodeMap.

83.2.12.3.1 IDOMNamedNodeMap.item Property

Pascal

```
property item [index: Integer]: IDOMNode;
```

C++

```
__property IDOMNode item[int index];
```

Description

This is item, a member of class IDOMNamedNodeMap.

83.2.12.3.2 IDOMNamedNodeMap.length Property

Pascal

```
property length: Integer;
```

C++

```
__property int length;
```

Description

This is length, a member of class IDOMNamedNodeMap.

83.2.13 IDOMNode Interface

IDOMNode is the DOM interface for a node in an XML document.

Class Hierarchy

Pascal

```
IDOMNode = interface(IInterface);
```

C++

```
__interface IDOMNode : public IInterface;
```

File

xmldom

Description

IDOMNode is a vendor-neutral version of the DOM interface for a node in an XML document. It conforms to the W3CXML DOM level 2 specification. Use IDOMNode to work with a node in an XML document when you are using standard DOM interfaces rather than the IXMLNode interface. (IXMLNode is the node interface used by TXMLDocument document.)

IDOMNode represents an element in an XML document that has been parsed by a DOM parser. It includes properties and methods for navigating the node hierarchy of an XML document, for accessing the attributes (see page 7520) of a node, and

for drilling down to obtain the node's value.

For more information about IDOMNode and the other standard DOM interfaces, see the DOM specification on the W3 website or the documentation provided by your DOM vendor.

Note: C++ method declarations that use IDOMNode use the _di_IDOMNode type instead. This type is a DelphiInterface (see page 3263) wrapper around the IDOMNode interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IDOMNode >  _di_IDOMNode;
```

See Also

IXMLNode (see page 7615)

TXMLDocument (see page 7299)

CreateDOMNode

83.2.13.1 IDOMNode Members

The following tables list the members exposed by IDOMNode.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 7519)	Sets the value of the node.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.

	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
	localName (see page 7521)	This is localName, a member of class IDOMNode.
	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.

83.2.13.2 IDOMNode Methods

The methods of the IDOMNode class are listed here.

Public Methods

	Name	Description
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 7519)	Sets the value of the node.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

83.2.13.2.1 IDOMNode.appendChild Method

Pascal

```
function appendChild(const newChild: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode appendChild(const IDOMNode newChild);
```

Description

This is appendChild, a member of class IDOMNode.

83.2.13.2.2 IDOMNode.cloneNode Method

Pascal

```
function cloneNode(deep: WordBool): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode cloneNode(WordBool deep);
```

Description

This is cloneNode, a member of class IDOMNode.

83.2.13.2.3 IDOMNode.get_attributes Method

Returns the value of the get_attributes property.

Pascal

```
function get_attributes: IDOMNamedNodeMap; safecall;
```

C++

```
__fastcall IDOMNamedNodeMap get_attributes();
```

Description

get_get_attributes is the read implementation of the get_attributes property.

See Also

get_attributes

83.2.13.2.4 IDOMNode.get_childNodes Method

Returns the value of the get_childNodes property.

Pascal

```
function get_childNodes: IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList get_childNodes();
```

Description

get_get_childNodes is the read implementation of the get_childNodes property.

See Also

get_childNodes

83.2.13.2.5 IDOMNode.get_firstChild Method

Returns the value of the get_firstChild property.

Pascal

```
function get_firstChild: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_firstChild();
```

Description

get_get_firstChild is the read implementation of the get_firstChild property.

See Also

get_firstChild

83.2.13.2.6 IDOMNode.get_lastChild Method

Returns the value of the get_lastChild property.

Pascal

```
function get_lastChild: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_lastChild();
```

Description

get_get_lastChild is the read implementation of the get_lastChild property.

See Also

get_lastChild

83.2.13.2.7 IDOMNode.get_localName Method

Returns the value of the get_localName property.

Pascal

```
function get_localName: DOMString; safecall;
```

C++

```
__fastcall DOMString get_localName();
```

Description

get_get_localName is the read implementation of the get_localName property.

See Also

get_localName

83.2.13.2.8 IDOMNode.get_namespaceURI Method

Returns the value of the get_namespaceURI property.

Pascal

```
function get_namespaceURI: DOMString; safecall;
```

C++

```
__fastcall DOMString get_namespaceURI();
```

Description

get_get_namespaceURI is the read implementation of the get_namespaceURI property.

See Also

get_namespaceURI

83.2.13.2.9 IDOMNode.get_nextSibling Method

Returns the value of the get_nextSibling property.

Pascal

```
function get_nextSibling: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_nextSibling();
```

Description

get_get_nextSibling is the read implementation of the get_nextSibling property.

See Also

get_nextSibling

83.2.13.2.10 IDOMNode.get_nodeName Method

Returns the value of the get_nodeName property.

Pascal

```
function get_nodeName: DOMString; safecall;
```

C++

```
__fastcall DOMString get_nodeName();
```

Description

get_get_nodeName is the read implementation of the get_nodeName property.

See Also

get_nodeName

83.2.13.2.11 IDOMNode.get_nodeType Method

Returns the value of the get_nodeType property.

Pascal

```
function get_nodeType: DOMNodeType; safecall;
```

C++

```
__fastcall DOMNodeType get_nodeType();
```

Description

get_get_nodeType is the read implementation of the get_nodeType property.

See Also

get_nodeType

83.2.13.2.12 IDOMNode.get_nodeValue Method

Returns the value of the get_nodeValue property.

Pascal

```
function get_nodeValue: DOMString; safecall;
```

C++

```
__fastcall DOMString get_nodeValue();
```

Description

get_get_nodeValue is the read implementation of the get_nodeValue property.

See Also

get_nodeValue

83.2.13.2.13 IDOMNode.get_ownerDocument Method

Returns the value of the get_ownerDocument property.

Pascal

```
function get_ownerDocument: IDOMDocument; safecall;
```

C++

```
__fastcall IDOMDocument get_ownerDocument();
```

Description

get_get_ownerDocument is the read implementation of the get_ownerDocument property.

See Also

get_ownerDocument

83.2.13.2.14 IDOMNode.get_parentNode Method

Returns the value of the get_parentNode property.

Pascal

```
function get_parentNode: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_parentNode();
```

Description

get_get_parentNode is the read implementation of the get_parentNode property.

See Also

get_parentNode

83.2.13.2.15 IDOMNode.get_prefix Method

Returns the value of the get_prefix property.

Pascal

```
function get_prefix: DOMString; safecall;
```

C++

```
__fastcall DOMString get_prefix();
```

Description

get_get_prefix is the read implementation of the get_prefix property.

See Also

get_prefix

83.2.13.2.16 IDOMNode.get_previousSibling Method

Returns the value of the get_previousSibling property.

Pascal

```
function get_previousSibling: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_previousSibling();
```

Description

get_get_previousSibling is the read implementation of the get_previousSibling property.

See Also

get_previousSibling

83.2.13.2.17 IDOMNode.hasChildNodes Method

Indicates whether the node has any child nodes.

Pascal

```
function hasChildNodes: WordBool; safecall;
```

C++

```
__fastcall WordBool hasChildNodes();
```

Description

hasChildNodes returns true if this node has any child nodes, false if it has no children.

See Also

ChildNodes (see page 7520)

FirstChild (see page 7520)

LastChild (see page 7520)

83.2.13.2.18 IDOMNode.insertBefore Method

Inserts a new child node before a specified child of the node.

Pascal

```
function insertBefore(const newChild: IDOMNode; const refChild: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode insertBefore(const IDOMNode newChild, const IDOMNode refChild);
```

Description

Use insertBefore to add a child node at a specified position in this node's list of children. If the new node is already in the document's node hierarchy, it is first removed from its parent node. If this node is read-only, refChild is a node that is not in this node's child list, newChild was created using a different document, or if newChild is of a nodeType (see page 7521) that is not permitted as a child of this node, insertBefore raises an exception.

newChild is the child node to add. It can be a node that currently has another parent node, or a new node created using the methods of the document interface. If it is of nodeType (see page 7521) DOCUMENT_FRAGMENT_NODE (see page 7570), the entire contents of the document fragment are moved into this node's childNodes (see page 7520) property list.

refChild is a child of this node before which to insert the new node. If refChild is nil (Delphi) or NULL (C++), the new node is added to the end of this node's child list.

insertBefore returns the interface for the newly added child node.

See Also

AppendChild (see page 7511)

ChildNodes (see page 7520)

replaceChild (see page 7518)

removeChild (see page 7518)

NodeType (see page 7521)

OwnerDocument (see page 7522)

83.2.13.2.19 IDOMNode.normalize Method

Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

Pascal

```
procedure normalize; safecall;
```

C++

```
__fastcall normalize();
```

Description

Call normalize to consolidate adjacent text nodes and remove any empty text nodes in the subtree beneath this node. This method ensures that for all child nodes of this node and of its attributes (see page 7520), only structure nodes (element nodes, comments, processing instructions, CDATA sections, and entity references) separate text nodes and that there are no empty text nodes. This is useful for operations (such as XPointer lookups) that depend on a particular structure in the node hierarchy.

See Also

ChildNodes (see page 7520)

NodeType (see page 7521)

Attributes (see page 7520)

83.2.13.2.20 IDOMNode.removeChild Method

Removes a child node from this node.

Pascal

```
function removeChild(const childNode: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode removeChild(const IDOMNode childNode);
```

Description

removeChild removes a specified child node from this node, and returns its interface. If this node is read-only, or if the specified child node is not a child of this node, removeChild raises an exception.

childNode the node to remove.

See Also

AppendChild (see page 7511)

ChildNodes (see page 7520)

replaceChild (see page 7518)

83.2.13.2.21 IDOMNode.replaceChild Method

Replaces one of this node's children with a specified node.

Pascal

```
function replaceChild(const newChild: IDOMNode; const oldChild: IDOMNode): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode replaceChild(const IDOMNode newChild, const IDOMNode oldChild);
```

Description

Use replaceChild to remove a child of this node and replace it with the node specified by newChild. If the new node is already in the document's node hierarchy, it is first removed from its parent node.

If this node is read-only, refChild is a node that is not in this node's child list, newChild was created using a different document, or if newChild is of a nodeType (see page 7521) that is not permitted as a child of this node, replaceChild raises an exception.

newChild is the child node that replaces oldChild. It can be a node that currently has another parent node, or a new node created using the methods of the document interface. If it is of nodeType (see page 7521) DOCUMENT_FRAGMENT_NODE (see page 7570), the entire contents of the document fragment are moved into this node's childNodes (see page 7520) property list.

refChild is a child that newChild replaces. If refChild is nil (Delphi) or NULL (C++), the new node is added to the end of this node's child list.

replaceChild returns the interface for refChild (the replaced node).

See Also

AppendChild (see page 7511)

ChildNodes (see page 7520)

replaceChild

insertBefore (see page 7516)

83.2.13.2.22 IDOMNode.set_nodeValue Method

Sets the value of the node.

Pascal

```
procedure set_nodeValue(value: DOMString); safecall;
```

C++

```
__fastcall set_nodeValue(DOMString value);
```

Description

set_set_nodeValue is the write implementation of the set_nodeValue property.

value is the new value for the node.

See Also

set_nodeValue

83.2.13.2.23 IDOMNode.supports Method

Indicates whether the node supports a specified feature.

Pascal

```
function supports(const feature: DOMString; const version: DOMString): WordBool;
```

C++

```
__fastcall WordBool supports(const DOMString feature, const DOMString version);
```

Description

supports returns true if the DOM implementation implements the specified feature and this node supports that feature. Otherwise, supports returns false.

feature is the name of the feature in question.

version is the version of the feature. If no version is specified, supports returns true if any version of the feature is supported.

83.2.13.3 IDOMNode Properties

The properties of the IDOMNode class are listed here.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.

R	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.

83.2.13.3.1 IDOMNode.attributes Property

Pascal

```
property attributes: IDOMNamedNodeMap;
```

C++

```
__property IDOMNamedNodeMap attributes;
```

Description

This is attributes, a member of class IDOMNode.

83.2.13.3.2 IDOMNode.childNodes Property

Pascal

```
property childNodes: IDOMNodeList;
```

C++

```
__property IDOMNodeList childNodes;
```

Description

This is childNodes, a member of class IDOMNode.

83.2.13.3.3 IDOMNode.firstChild Property

Pascal

```
property firstChild: IDOMNode;
```

C++

```
__property IDOMNode firstChild;
```

Description

This is firstChild, a member of class IDOMNode.

83.2.13.3.4 IDOMNode.lastChild Property

Pascal

```
property lastChild: IDOMNode;
```

C++

```
__property IDOMNode lastChild;
```

Description

This is lastChild, a member of class IDOMNode.

83.2.13.3.5 IDOMNode.localName Property

Pascal

```
property localName: DOMString;
```

C++

```
__property DOMString localName;
```

Description

This is localName, a member of class IDOMNode.

83.2.13.3.6 IDOMNode.namespaceURI Property

Pascal

```
property namespaceURI: DOMString;
```

C++

```
__property DOMString namespaceURI;
```

Description

This is namespaceURI, a member of class IDOMNode.

83.2.13.3.7 IDOMNode.nextSibling Property

Pascal

```
property nextSibling: IDOMNode;
```

C++

```
__property IDOMNode nextSibling;
```

Description

This is nextSibling, a member of class IDOMNode.

83.2.13.3.8 IDOMNode.nodeName Property

Pascal

```
property nodeName: DOMString;
```

C++

```
__property DOMString nodeName;
```

Description

This is nodeName, a member of class IDOMNode.

83.2.13.3.9 IDOMNode.nodeType Property

Pascal

```
property nodeType: DOMNodeType;
```

C++

```
__property DOMNodeType nodeType;
```

Description

This is nodeType, a member of class IDOMNode.

83.2.13.3.10 IDOMNode.nodeValue Property

Pascal

```
property nodeValue: DOMString;
```

C++

```
__property DOMString nodeValue;
```

Description

This is nodeValue, a member of class IDOMNode.

83.2.13.3.11 IDOMNode.ownerDocument Property

Pascal

```
property ownerDocument: IDOMDocument;
```

C++

```
__property IDOMDocument ownerDocument;
```

Description

This is ownerDocument, a member of class IDOMNode.

83.2.13.3.12 IDOMNode.parentNode Property

Pascal

```
property parentNode: IDOMNode;
```

C++

```
__property IDOMNode parentNode;
```

Description

This is parentNode, a member of class IDOMNode.

83.2.13.3.13 IDOMNode.prefix Property

Pascal

```
property prefix: DOMString;
```

C++

```
__property DOMString prefix;
```

Description

This is prefix, a member of class IDOMNode.

83.2.13.3.14 IDOMNode.previousSibling Property

Pascal

```
property previousSibling: IDOMNode;
```

C++

```
__property IDOMNode previousSibling;
```

Description

This is previousSibling, a member of class IDOMNode.

83.2.14 IDOMNodeEx Interface

Class Hierarchy

Pascal

```
IDOMNodeEx = interface(IDOMNode);
```

C++

```
__interface IDOMNodeEx : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMNodeEx.

83.2.14.1 IDOMNodeEx Members

The following tables list the members exposed by IDOMNodeEx.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.

	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	get_text (see page 7524)	This is get_text, a member of class IDOMNodeEx.
	get_xml (see page 7525)	This is get_xml, a member of class IDOMNodeEx.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 7519)	Sets the value of the node.
	set_text (see page 7525)	This is set_text, a member of class IDOMNodeEx.
	supports (see page 7519)	Indicates whether the node supports a specified feature.
	transformNode (see page 7525)	This is the overview for the transformNode method overload.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.
	text (see page 7526)	This is text, a member of class IDOMNodeEx.
R	xml (see page 7526)	This is xml, a member of class IDOMNodeEx.

83.2.14.2 IDOMNodeEx Methods

The methods of the IDOMNodeEx class are listed here.

Public Methods

	Name	Description
	get_text (see page 7524)	This is get_text, a member of class IDOMNodeEx.
	get_xml (see page 7525)	This is get_xml, a member of class IDOMNodeEx.
	set_text (see page 7525)	This is set_text, a member of class IDOMNodeEx.
	transformNode (see page 7525)	This is the overview for the transformNode method overload.

83.2.14.2.1 IDOMNodeEx.get_text Method

Pascal

```
function get_text: DOMString; safecall;
```

C++

```
__fastcall DOMString get_text();
```

Description

This is get_text, a member of class IDOMNodeEx.

83.2.14.2.2 IDOMNodeEx.get_xml Method

Pascal

```
function get_xml: DOMString; safecall;
```

C++

```
__fastcall DOMString get_xml();
```

Description

This is get_xml, a member of class IDOMNodeEx.

83.2.14.2.3 IDOMNodeEx.set_text Method

Pascal

```
procedure set_text(const Value: DOMString); safecall;
```

C++

```
__fastcall set_text(const DOMString Value);
```

Description

This is set_text, a member of class IDOMNodeEx.

83.2.14.2.4 transformNode Method

This is the overview for the transformNode method overload.

Overload List

	Name	Description
	IDOMNodeEx.transformNode (IDOMNode, IDOMDocument) (see page 7525)	This is transformNode, a member of class IDOMNodeEx.
	IDOMNodeEx.transformNode (IDOMNode, WideString) (see page 7526)	This is transformNode, a member of class IDOMNodeEx.

83.2.14.2.4.1 IDOMNodeEx.transformNode Method (IDOMNode, IDOMDocument)

Pascal

```
procedure transformNode(const stylesheet: IDOMNode; const output: IDOMDocument); safecall;
overload;
```

C++

```
__fastcall transformNode(const IDOMNode stylesheet, const IDOMDocument output);
```

Description

This is transformNode, a member of class IDOMNodeEx.

83.2.14.2.4.2 IDOMNodeEx.transformNode Method (IDOMNode, WideString)

Pascal

```
procedure transformNode(const stylesheet: IDOMNode; var output: WideString); safecall;
overload;
```

C++

```
__fastcall transformNode(const IDOMNode stylesheet, BSTR output);
```

Description

This is transformNode, a member of class IDOMNodeEx.

83.2.14.3 IDOMNodeEx Properties

The properties of the IDOMNodeEx class are listed here.

Public Properties

	Name	Description
	text (see page 7526)	This is text, a member of class IDOMNodeEx.
R	xml (see page 7526)	This is xml, a member of class IDOMNodeEx.

83.2.14.3.1 IDOMNodeEx.text Property

Pascal

```
property text: DOMString;
```

C++

```
__property DOMString text;
```

Description

This is text, a member of class IDOMNodeEx.

83.2.14.3.2 IDOMNodeEx.xml Property

Pascal

```
property xml: DOMString;
```

C++

```
__property DOMString xml;
```

Description

This is xml, a member of class IDOMNodeEx.

83.2.15 IDOMNodeList Interface

Class Hierarchy

Pascal

```
IDOMNodeList = interface;
```

C++

```
__interface IDOMNodeList;
```

File

xmldom

Description

This is class xmldom.IDOMNodeList.

83.2.15.1 IDOMNodeList Members

The following tables list the members exposed by IDOMNodeList.

Public Methods

	Name	Description
	get_item (see page 7527)	This is get_item, a member of class IDOMNodeList.
	get_length (see page 7527)	This is get_length, a member of class IDOMNodeList.

Public Properties

	Name	Description
R	item (see page 7528)	This is item, a member of class IDOMNodeList.
R	length (see page 7528)	This is length, a member of class IDOMNodeList.

83.2.15.2 IDOMNodeList Methods

The methods of the IDOMNodeList class are listed here.

Public Methods

	Name	Description
	get_item (see page 7527)	This is get_item, a member of class IDOMNodeList.
	get_length (see page 7527)	This is get_length, a member of class IDOMNodeList.

83.2.15.2.1 IDOMNodeList.get_item Method

Pascal

```
function get_item(index: Integer): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode get_item(int index);
```

Description

This is get_item, a member of class IDOMNodeList.

83.2.15.2.2 IDOMNodeList.get_length Method

Pascal

```
function get_length: Integer; safecall;
```

C++

```
__fastcall int get_length();
```

Description

This is get_length, a member of class IDOMNodeList.

83.2.15.3 IDOMNodeList Properties

The properties of the IDOMNodeList class are listed here.

Public Properties

	Name	Description
	item (see page 7528)	This is item, a member of class IDOMNodeList.
	length (see page 7528)	This is length, a member of class IDOMNodeList.

83.2.15.3.1 IDOMNodeList.item Property

Pascal

```
property item [index: Integer]: IDOMNode;
```

C++

```
__property IDOMNode item[int index];
```

Description

This is item, a member of class IDOMNodeList.

83.2.15.3.2 IDOMNodeList.length Property

Pascal

```
property length: Integer;
```

C++

```
__property int length;
```

Description

This is length, a member of class IDOMNodeList.

83.2.16 IDOMNodeSelect Interface

Class Hierarchy

Pascal

```
IDOMNodeSelect = interface(IInterface);
```

C++

```
__interface IDOMNodeSelect : public IInterface;
```

File

xmldom

Description

This is class xmldom.IDOMNodeSelect.

83.2.16.1 IDOMNodeSelect Members

The following tables list the members exposed by IDOMNodeSelect.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	selectNode (see page 7529)	This is selectNode, a member of class IDOMNodeSelect.
	selectNodes (see page 7529)	This is selectNodes, a member of class IDOMNodeSelect.

83.2.16.2 IDOMNodeSelect Methods

The methods of the IDOMNodeSelect class are listed here.

Public Methods

	Name	Description
	selectNode (see page 7529)	This is selectNode, a member of class IDOMNodeSelect.
	selectNodes (see page 7529)	This is selectNodes, a member of class IDOMNodeSelect.

83.2.16.2.1 IDOMNodeSelect.selectNode Method

Pascal

```
function selectNode(const nodePath: WideString): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode selectNode(const BSTR nodePath);
```

Description

This is selectNode, a member of class IDOMNodeSelect.

83.2.16.2.2 IDOMNodeSelect.selectNodes Method

Pascal

```
function selectNodes(const nodePath: WideString): IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList selectNodes(const BSTR nodePath);
```

Description

This is selectNodes, a member of class IDOMNodeSelect.

83.2.17 IDOMNotation Interface

Class Hierarchy

Pascal

```
IDOMNotation = interface(IDOMNode);
```

C++

```
__interface IDOMNotation : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMNotation.

83.2.17.1 IDOMNotation Members

The following tables list the members exposed by IDOMNotation.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	get_publicId (see page 7531)	This is get_publicId, a member of class IDOMNotation.
	get_systemId (see page 7531)	This is get_systemId, a member of class IDOMNotation.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.

	set_nodeValue (see page 7519)	Sets the value of the node.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.
R	publicId (see page 7532)	This is publicId, a member of class IDOMNotation.
R	systemId (see page 7532)	This is systemId, a member of class IDOMNotation.

83.2.17.2 IDOMNotation Methods

The methods of the IDOMNotation class are listed here.

Public Methods

	Name	Description
	get_publicId (see page 7531)	This is get_publicId, a member of class IDOMNotation.
	get_systemId (see page 7531)	This is get_systemId, a member of class IDOMNotation.

83.2.17.2.1 IDOMNotation.get_publicId Method

Pascal

```
function get_publicId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_publicId();
```

Description

This is get_publicId, a member of class IDOMNotation.

83.2.17.2.2 IDOMNotation.get_systemId Method

Pascal

```
function get_systemId: DOMString; safecall;
```

C++

```
__fastcall DOMString get_systemId();
```

Description

This is get_systemId, a member of class IDOMNotation.

83.2.17.3 IDOMNotation Properties

The properties of the IDOMNotation class are listed here.

Public Properties

	Name	Description
	publicId (see page 7532)	This is publicId, a member of class IDOMNotation.
	systemId (see page 7532)	This is systemId, a member of class IDOMNotation.

83.2.17.3.1 IDOMNotation.publicId Property

Pascal

```
property publicId: DOMString;
```

C++

```
__property DOMString publicId;
```

Description

This is publicId, a member of class IDOMNotation.

83.2.17.3.2 IDOMNotation.systemId Property

Pascal

```
property systemId: DOMString;
```

C++

```
__property DOMString systemId;
```

Description

This is systemId, a member of class IDOMNotation.

83.2.18 IDOMParseError Interface

Class Hierarchy

Pascal

```
IDOMParseError = interface;
```

C++

```
__interface IDOMParseError;
```

File

xmldom

Description

This is class xmldom.IDOMParseError.

83.2.18.1 IDOMParseError Members

The following tables list the members exposed by IDOMParseError.

Public Methods

	Name	Description
	get_errorCode (see page 7533)	This is get_errorCode, a member of class IDOMParseError.
	get_filepos (see page 7534)	This is get_filepos, a member of class IDOMParseError.
	get_line (see page 7534)	This is get_line, a member of class IDOMParseError.
	get_linepos (see page 7534)	This is get_linepos, a member of class IDOMParseError.
	get_reason (see page 7534)	This is get_reason, a member of class IDOMParseError.
	get_srcText (see page 7534)	This is get_srcText, a member of class IDOMParseError.
	get_url (see page 7535)	This is get_url, a member of class IDOMParseError.

Public Properties

	Name	Description
R	errorCode (see page 7535)	This is errorCode, a member of class IDOMParseError.
R	filePos (see page 7535)	This is filePos, a member of class IDOMParseError.
R	line (see page 7536)	This is line, a member of class IDOMParseError.
R	linePos (see page 7536)	This is linePos, a member of class IDOMParseError.
R	reason (see page 7536)	This is reason, a member of class IDOMParseError.
R	srcText (see page 7536)	This is srcText, a member of class IDOMParseError.
R	url (see page 7536)	This is url, a member of class IDOMParseError.

83.2.18.2 IDOMParseError Methods

The methods of the IDOMParseError class are listed here.

Public Methods

	Name	Description
	get_errorCode (see page 7533)	This is get_errorCode, a member of class IDOMParseError.
	get_filepos (see page 7534)	This is get_filepos, a member of class IDOMParseError.
	get_line (see page 7534)	This is get_line, a member of class IDOMParseError.
	get_linepos (see page 7534)	This is get_linepos, a member of class IDOMParseError.
	get_reason (see page 7534)	This is get_reason, a member of class IDOMParseError.
	get_srcText (see page 7534)	This is get_srcText, a member of class IDOMParseError.
	get_url (see page 7535)	This is get_url, a member of class IDOMParseError.

83.2.18.2.1 IDOMParseError.get_errorCode Method

Pascal

```
function get_errorCode: Integer; safecall;
```

C++

```
__fastcall int get_errorCode();
```

Description

This is get_errorCode, a member of class IDOMParseError.

83.2.18.2.2 IDOMParseError.get_filepos Method

Pascal

```
function get_filepos: Integer; safecall;
```

C++

```
__fastcall int get_filepos();
```

Description

This is get_filepos, a member of class IDOMParseError.

83.2.18.2.3 IDOMParseError.get_line Method

Pascal

```
function get_line: Integer; safecall;
```

C++

```
__fastcall int get_line();
```

Description

This is get_line, a member of class IDOMParseError.

83.2.18.2.4 IDOMParseError.get_linepos Method

Pascal

```
function get_linepos: Integer; safecall;
```

C++

```
__fastcall int get_linepos();
```

Description

This is get_linepos, a member of class IDOMParseError.

83.2.18.2.5 IDOMParseError.get_reason Method

Pascal

```
function get_reason: DOMString; safecall;
```

C++

```
__fastcall DOMString get_reason();
```

Description

This is get_reason, a member of class IDOMParseError.

83.2.18.2.6 IDOMParseError.get_srcText Method

Pascal

```
function get_srcText: DOMString; safecall;
```

C++

```
__fastcall DOMString get_srcText();
```

Description

This is get_srcText, a member of class IDOMParseError.

83.2.18.2.7 IDOMParseError.get_url Method

Pascal

```
function get_url: DOMString; safecall;
```

C++

```
__fastcall DOMString get_url();
```

Description

This is get_url, a member of class IDOMParseError.

83.2.18.3 IDOMParseError Properties

The properties of the IDOMParseError class are listed here.

Public Properties

	Name	Description
	errorCode (see page 7535)	This is errorCode, a member of class IDOMParseError.
	filePos (see page 7535)	This is filePos, a member of class IDOMParseError.
	line (see page 7536)	This is line, a member of class IDOMParseError.
	linePos (see page 7536)	This is linePos, a member of class IDOMParseError.
	reason (see page 7536)	This is reason, a member of class IDOMParseError.
	srcText (see page 7536)	This is srcText, a member of class IDOMParseError.
	url (see page 7536)	This is url, a member of class IDOMParseError.

83.2.18.3.1 IDOMParseError.errorCode Property

Pascal

```
property errorCode: Integer;
```

C++

```
__property int errorCode;
```

Description

This is errorCode, a member of class IDOMParseError.

83.2.18.3.2 IDOMParseError.filePos Property

Pascal

```
property filePos: Integer;
```

C++

```
__property int filePos;
```

Description

This is filePos, a member of class IDOMParseError.

83.2.18.3.3 IDOMParseError.line Property

Pascal

```
property line: Integer;
```

C++

```
__property int line;
```

Description

This is line, a member of class IDOMParseError.

83.2.18.3.4 IDOMParseError.linePos Property

Pascal

```
property linePos: Integer;
```

C++

```
__property int linePos;
```

Description

This is linePos, a member of class IDOMParseError.

83.2.18.3.5 IDOMParseError.reason Property

Pascal

```
property reason: DOMString;
```

C++

```
__property DOMString reason;
```

Description

This is reason, a member of class IDOMParseError.

83.2.18.3.6 IDOMParseError.srcText Property

Pascal

```
property srcText: DOMString;
```

C++

```
__property DOMString srcText;
```

Description

This is srcText, a member of class IDOMParseError.

83.2.18.3.7 IDOMParseError.url Property

Pascal

```
property url: DOMString;
```

C++

```
__property DOMString url;
```

Description

This is url, a member of class IDOMParseError.

83.2.19 IDOMParseOptions Interface

Class Hierarchy

Pascal

```
IDOMParseOptions = interface;
```

C++

```
__interface IDOMParseOptions;
```

File

xmldom

Description

This is class xmldom.IDOMParseOptions.

83.2.19.1 IDOMParseOptions Members

The following tables list the members exposed by IDOMParseOptions.

Public Methods

	Name	Description
	get_async (see page 7538)	This is get_async, a member of class IDOMParseOptions.
	get_preserveWhiteSpace (see page 7538)	This is get_preserveWhiteSpace, a member of class IDOMParseOptions.
	get_resolveExternals (see page 7538)	This is get_resolveExternals, a member of class IDOMParseOptions.
	get_validate (see page 7538)	This is get_validate, a member of class IDOMParseOptions.
	set_async (see page 7539)	This is set_async, a member of class IDOMParseOptions.
	set_preserveWhiteSpace (see page 7539)	This is set_preserveWhiteSpace, a member of class IDOMParseOptions.
	set_resolveExternals (see page 7539)	This is set_resolveExternals, a member of class IDOMParseOptions.
	set_validate (see page 7539)	This is set_validate, a member of class IDOMParseOptions.

Public Properties

	Name	Description
	async (see page 7540)	This is async, a member of class IDOMParseOptions.
	preserveWhiteSpace (see page 7540)	This is preserveWhiteSpace, a member of class IDOMParseOptions.
	resolveExternals (see page 7540)	This is resolveExternals, a member of class IDOMParseOptions.
	validate (see page 7540)	This is validate, a member of class IDOMParseOptions.

83.2.19.2 IDOMParseOptions Methods

The methods of the IDOMParseOptions class are listed here.

Public Methods

	Name	Description
	get_async (see page 7538)	This is get_async, a member of class IDOMParseOptions.
	get_preserveWhiteSpace (see page 7538)	This is get_preserveWhiteSpace, a member of class IDOMParseOptions.
	get_resolveExternals (see page 7538)	This is get_resolveExternals, a member of class IDOMParseOptions.
	get_validate (see page 7538)	This is get_validate, a member of class IDOMParseOptions.
	set_async (see page 7539)	This is set_async, a member of class IDOMParseOptions.
	set_preserveWhiteSpace (see page 7539)	This is set_preserveWhiteSpace, a member of class IDOMParseOptions.
	set_resolveExternals (see page 7539)	This is set_resolveExternals, a member of class IDOMParseOptions.
	set_validate (see page 7539)	This is set_validate, a member of class IDOMParseOptions.

83.2.19.2.1 IDOMParseOptions.get_async Method

Pascal

```
function get_async: Boolean; safecall;
```

C++

```
__fastcall Boolean get_async();
```

Description

This is get_async, a member of class IDOMParseOptions.

83.2.19.2.2 IDOMParseOptions.get_preserveWhiteSpace Method

Pascal

```
function get_preserveWhiteSpace: Boolean; safecall;
```

C++

```
__fastcall Boolean get_preserveWhiteSpace();
```

Description

This is get_preserveWhiteSpace, a member of class IDOMParseOptions.

83.2.19.2.3 IDOMParseOptions.get_resolveExternals Method

Pascal

```
function get_resolveExternals: Boolean; safecall;
```

C++

```
__fastcall Boolean get_resolveExternals();
```

Description

This is get_resolveExternals, a member of class IDOMParseOptions.

83.2.19.2.4 IDOMParseOptions.get_validate Method

Pascal

```
function get_validate: Boolean; safecall;
```

C++

```
__fastcall Boolean get_validate();
```

Description

This is get_validate, a member of class IDOMParseOptions.

83.2.19.2.5 IDOMParseOptions.set_async Method

Pascal

```
procedure set_async(Value: Boolean); safecall;
```

C++

```
__fastcall set_async(Boolean Value);
```

Description

This is set_async, a member of class IDOMParseOptions.

83.2.19.2.6 IDOMParseOptions.set_preserveWhiteSpace Method

Pascal

```
procedure set_preserveWhiteSpace(Value: Boolean); safecall;
```

C++

```
__fastcall set_preserveWhiteSpace(Boolean Value);
```

Description

This is set_preserveWhiteSpace, a member of class IDOMParseOptions.

83.2.19.2.7 IDOMParseOptions.set_resolveExternals Method

Pascal

```
procedure set_resolveExternals(Value: Boolean); safecall;
```

C++

```
__fastcall set_resolveExternals(Boolean Value);
```

Description

This is set_resolveExternals, a member of class IDOMParseOptions.

83.2.19.2.8 IDOMParseOptions.set_validate Method

Pascal

```
procedure set_validate(Value: Boolean); safecall;
```

C++

```
__fastcall set_validate(Boolean Value);
```

Description

This is set_validate, a member of class IDOMParseOptions.

83.2.19.3 IDOMParseOptions Properties

The properties of the IDOMParseOptions class are listed here.

Public Properties

	Name	Description
	async (see page 7540)	This is async, a member of class IDOMParseOptions.
	preserveWhiteSpace (see page 7540)	This is preserveWhiteSpace, a member of class IDOMParseOptions.
	resolveExternals (see page 7540)	This is resolveExternals, a member of class IDOMParseOptions.
	validate (see page 7540)	This is validate, a member of class IDOMParseOptions.

83.2.19.3.1 IDOMParseOptions.async Property

Pascal

```
property async: Boolean;
```

C++

```
__property Boolean async;
```

Description

This is async, a member of class IDOMParseOptions.

83.2.19.3.2 IDOMParseOptions.preserveWhiteSpace Property

Pascal

```
property preserveWhiteSpace: Boolean;
```

C++

```
__property Boolean preserveWhiteSpace;
```

Description

This is preserveWhiteSpace, a member of class IDOMParseOptions.

83.2.19.3.3 IDOMParseOptions.resolveExternals Property

Pascal

```
property resolveExternals: Boolean;
```

C++

```
__property Boolean resolveExternals;
```

Description

This is resolveExternals, a member of class IDOMParseOptions.

83.2.19.3.4 IDOMParseOptions.validate Property

Pascal

```
property validate: Boolean;
```

C++

```
__property Boolean validate;
```

Description

This is validate, a member of class IDOMParseOptions.

83.2.20 IDOMPersist Interface

Class Hierarchy

Pascal

```
IDOMPersist = interface;
```

C++

```
__interface IDOMPersist;
```

File

xmldom

Description

This is class xmldom.IDOMPersist.

83.2.20.1 IDOMPersist Members

The following tables list the members exposed by IDOMPersist.

Public Methods

	Name	Description
	asyncLoadState (see page 7542)	This is asyncLoadState, a member of class IDOMPersist.
	get_xml (see page 7542)	This is get_xml, a member of class IDOMPersist.
	load (see page 7542)	This is load, a member of class IDOMPersist.
	loadFromStream (see page 7542)	This is the overview for the loadFromStream method overload.
	loadxml (see page 7543)	This is loadxml, a member of class IDOMPersist.
	save (see page 7543)	This is save, a member of class IDOMPersist.
	saveToStream (see page 7543)	This is the overview for the saveToStream method overload.
	set_OnAsyncLoad (see page 7544)	This is set_OnAsyncLoad, a member of class IDOMPersist.

Public Properties

	Name	Description
	xml (see page 7544)	This is xml, a member of class IDOMPersist.

83.2.20.2 IDOMPersist Methods

The methods of the IDOMPersist class are listed here.

Public Methods

	Name	Description
	asyncLoadState (see page 7542)	This is asyncLoadState, a member of class IDOMPersist.
	get_xml (see page 7542)	This is get_xml, a member of class IDOMPersist.
	load (see page 7542)	This is load, a member of class IDOMPersist.
	loadFromStream (see page 7542)	This is the overview for the loadFromStream method overload.
	loadxml (see page 7543)	This is loadxml, a member of class IDOMPersist.
	save (see page 7543)	This is save, a member of class IDOMPersist.
	saveToStream (see page 7543)	This is the overview for the saveToStream method overload.

	set_OnAsyncLoad (see page 7544)	This is set_OnAsyncLoad, a member of class IDOMPersist.

83.2.20.2.1 IDOMPersist.asyncLoadState Method

Pascal

```
function asyncLoadState: Integer; safecall;
```

C++

```
__fastcall int asyncLoadState();
```

Description

This is asyncLoadState, a member of class IDOMPersist.

83.2.20.2.2 IDOMPersist.get_xml Method

Pascal

```
function get_xml: DOMString; safecall;
```

C++

```
__fastcall DOMString get_xml();
```

Description

This is get_xml, a member of class IDOMPersist.

83.2.20.2.3 IDOMPersist.load Method

Pascal

```
function load(source: OleVariant): WordBool; safecall;
```

C++

```
__fastcall WordBool load(OleVariant source);
```

Description

This is load, a member of class IDOMPersist.

83.2.20.2.4 loadFromStream Method

This is the overview for the loadFromStream method overload.

Overload List

	Name	Description
	IDOMPersist.loadFromStream (IStream) (see page 7542)	This is loadFromStream, a member of class IDOMPersist.
	IDOMPersist.loadFromStream (TStream) (see page 7543)	This is loadFromStream, a member of class IDOMPersist.

83.2.20.2.4.1 IDOMPersist.loadFromStream Method (IStream)

Pascal

```
function loadFromStream(const stream: IStream): WordBool; safecall; overload;
```

C++

```
__fastcall WordBool loadFromStream(const IStream stream);
```

Description

This is loadFromStream, a member of class IDOMPersist.

83.2.20.2.4.2 IDOMPersist.loadFromStream Method (TStream)

Pascal

```
function loadFromStream(const stream: TStream): WordBool; safecall; overload;
```

C++

```
__fastcall WordBool loadFromStream(const TStream stream);
```

Description

This is loadFromStream, a member of class IDOMPersist.

83.2.20.2.5 IDOMPersist.loadxml Method

Pascal

```
function loadxml(const Value: DOMString): WordBool; safecall;
```

C++

```
__fastcall WordBool loadxml(const DOMString Value);
```

Description

This is loadxml, a member of class IDOMPersist.

83.2.20.2.6 IDOMPersist.save Method

Pascal

```
procedure save(destination: OleVariant); safecall;
```

C++

```
__fastcall save(OleVariant destination);
```

Description

This is save, a member of class IDOMPersist.

83.2.20.2.7 saveToStream Method

This is the overview for the saveToStream method overload.

Overload List

	Name	Description
	IDOMPersist.saveToStream (IStream) (see page 7544)	This is saveToStream, a member of class IDOMPersist.
	IDOMPersist.saveToStream (TStream) (see page 7544)	This is saveToStream, a member of class IDOMPersist.

83.2.20.2.7.1 IDOMPersist.saveToStream Method (IStream)

Pascal

```
procedure saveToStream(const stream: IStream); safecall; overload;
```

C++

```
__fastcall saveToStream(const IStream stream);
```

Description

This is saveToStream, a member of class IDOMPersist.

83.2.20.2.7.2 IDOMPersist.saveToStream Method (TStream)

Pascal

```
procedure saveToStream(const stream: TStream); safecall; overload;
```

C++

```
__fastcall saveToStream(const TStream stream);
```

Description

This is saveToStream, a member of class IDOMPersist.

83.2.20.2.8 IDOMPersist.set_OnAsyncLoad Method

Pascal

```
procedure set_OnAsyncLoad(const Sender: TObject; EventHandler: TAsyncEventHandler); safecall;
```

C++

```
__fastcall set_OnAsyncLoad(const TObject * Sender, TAsyncEventHandler EventHandler);
```

Description

This is set_OnAsyncLoad, a member of class IDOMPersist.

83.2.20.3 IDOMPersist Properties

The properties of the IDOMPersist class are listed here.

Public Properties

	Name	Description
	xml (see page 7544)	This is xml, a member of class IDOMPersist.

83.2.20.3.1 IDOMPersist.xml Property

Pascal

```
property xml: DOMString;
```

C++

```
__property DOMString xml;
```

Description

This is xml, a member of class IDOMPersist.

83.2.21 IDOMProcessingInstruction Interface

Class Hierarchy

Pascal

```
IDOMProcessingInstruction = interface(IDOMNode);
```

C++

```
__interface IDOMProcessingInstruction : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMProcessingInstruction.

83.2.21.1 IDOMProcessingInstruction Members

The following tables list the members exposed by IDOMProcessingInstruction.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_data (see page 7546)	This is get_data, a member of class IDOMProcessingInstruction.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	get_target (see page 7546)	This is get_target, a member of class IDOMProcessingInstruction.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.

	set_data (see page 7547)	This is set_data, a member of class IDOMProcessingInstruction.
	set_nodeValue (see page 7519)	Sets the value of the node.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
	data (see page 7547)	This is data, a member of class IDOMProcessingInstruction.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.
R	target (see page 7547)	This is target, a member of class IDOMProcessingInstruction.

83.2.21.2 IDOMProcessingInstruction Methods

The methods of the IDOMProcessingInstruction class are listed here.

Public Methods

	Name	Description
	get_data (see page 7546)	This is get_data, a member of class IDOMProcessingInstruction.
	get_target (see page 7546)	This is get_target, a member of class IDOMProcessingInstruction.
	set_data (see page 7547)	This is set_data, a member of class IDOMProcessingInstruction.

83.2.21.2.1 IDOMProcessingInstruction.get_data Method

Pascal

```
function get_data: DOMString; safecall;
```

C++

```
__fastcall DOMString get_data();
```

Description

This is get_data, a member of class IDOMProcessingInstruction.

83.2.21.2.2 IDOMProcessingInstruction.get_target Method

Pascal

```
function get_target: DOMString; safecall;
```

C++

```
__fastcall DOMString get_target();
```

Description

This is get_target, a member of class IDOMProcessingInstruction.

83.2.21.2.3 IDOMProcessingInstruction.set_data Method

Pascal

```
procedure set_data(const value: DOMString); safecall;
```

C++

```
__fastcall set_data(const DOMString value);
```

Description

This is set_data, a member of class IDOMProcessingInstruction.

83.2.21.3 IDOMProcessingInstruction Properties

The properties of the IDOMProcessingInstruction class are listed here.

Public Properties

	Name	Description
	data (see page 7547)	This is data, a member of class IDOMProcessingInstruction.
R	target (see page 7547)	This is target, a member of class IDOMProcessingInstruction.

83.2.21.3.1 IDOMProcessingInstruction.data Property

Pascal

```
property data: DOMString;
```

C++

```
__property DOMString data;
```

Description

This is data, a member of class IDOMProcessingInstruction.

83.2.21.3.2 IDOMProcessingInstruction.target Property

Pascal

```
property target: DOMString;
```

C++

```
__property DOMString target;
```

Description

This is target, a member of class IDOMProcessingInstruction.

83.2.22 IDOMText Interface

Class Hierarchy

Pascal

```
IDOMText = interface(IDOMCharacterData);
```

C++

```
__interface IDOMText : public IDOMCharacterData;
```

File

xmldom

Description

This is class xmldom.IDOMText.

83.2.22.1 IDOMText Members

The following tables list the members exposed by IDOMText.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	appendData (see page 7479)	This is appendData, a member of class IDOMCharacterData.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	deleteData (see page 7480)	This is deleteData, a member of class IDOMCharacterData.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_data (see page 7480)	This is get_data, a member of class IDOMCharacterData.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_length (see page 7480)	This is get_length, a member of class IDOMCharacterData.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	insertData (see page 7480)	This is insertData, a member of class IDOMCharacterData.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	replaceData (see page 7480)	This is replaceData, a member of class IDOMCharacterData.
	set_data (see page 7481)	This is set_data, a member of class IDOMCharacterData.
	set_nodeValue (see page 7519)	Sets the value of the node.
	splitText (see page 7549)	This is splitText, a member of class IDOMText.
	substringData (see page 7481)	This is substringData, a member of class IDOMCharacterData.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
	data (see page 7481)	This is data, a member of class IDOMCharacterData.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	length (see page 7481)	This is length, a member of class IDOMCharacterData.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.

83.2.22.2 IDOMText Methods

The methods of the IDOMText class are listed here.

Public Methods

	Name	Description
	splitText (see page 7549)	This is splitText, a member of class IDOMText.

83.2.22.2.1 IDOMText.splitText Method

Pascal

```
function splitText(offset: Integer): IDOMText; safecall;
```

C++

```
__fastcall IDOMText splitText(int offset);
```

Description

This is splitText, a member of class IDOMText.

83.2.23 IDOMXMLProlog Interface

Class Hierarchy

Pascal

```
IDOMXMLProlog = interface;
```

C++

```
__interface IDOMXMLProlog;
```

File

xmldom

Description

This is class xmldom.IDOMXMLProlog.

83.2.23.1 IDOMXMLProlog Members

The following tables list the members exposed by IDOMXMLProlog.

Public Methods

	Name	Description
	get_Encoding (see page 7551)	This is get_Encoding, a member of class IDOMXMLProlog.
	get_Standalone (see page 7551)	This is get_Standalone, a member of class IDOMXMLProlog.
	get_Version (see page 7551)	This is get_Version, a member of class IDOMXMLProlog.
	set_Encoding (see page 7551)	This is set_Encoding, a member of class IDOMXMLProlog.
	set_Standalone (see page 7551)	This is set_Standalone, a member of class IDOMXMLProlog.
	set_Version (see page 7552)	This is set_Version, a member of class IDOMXMLProlog.

Public Properties

	Name	Description
	Encoding (see page 7552)	This is Encoding, a member of class IDOMXMLProlog.
	Standalone (see page 7552)	This is Standalone, a member of class IDOMXMLProlog.
	Version (see page 7552)	This is Version, a member of class IDOMXMLProlog.

83.2.23.2 IDOMXMLProlog Methods

The methods of the IDOMXMLProlog class are listed here.

Public Methods

	Name	Description
	get_Encoding (see page 7551)	This is get_Encoding, a member of class IDOMXMLProlog.
	get_Standalone (see page 7551)	This is get_Standalone, a member of class IDOMXMLProlog.
	get_Version (see page 7551)	This is get_Version, a member of class IDOMXMLProlog.
	set_Encoding (see page 7551)	This is set_Encoding, a member of class IDOMXMLProlog.
	set_Standalone (see page 7551)	This is set_Standalone, a member of class IDOMXMLProlog.
	set_Version (see page 7552)	This is set_Version, a member of class IDOMXMLProlog.

83.2.23.2.1 IDOMXMLProlog.get_Encoding Method

Pascal

```
function get_Encoding: DOMString; safecall;
```

C++

```
__fastcall DOMString get_Encoding();
```

Description

This is get_Encoding, a member of class IDOMXMLProlog.

83.2.23.2.2 IDOMXMLProlog.get_Standalone Method

Pascal

```
function get_Standalone: DOMString; safecall;
```

C++

```
__fastcall DOMString get_Standalone();
```

Description

This is get_Standalone, a member of class IDOMXMLProlog.

83.2.23.2.3 IDOMXMLProlog.get_Version Method

Pascal

```
function get_Version: DOMString; safecall;
```

C++

```
__fastcall DOMString get_Version();
```

Description

This is get_Version, a member of class IDOMXMLProlog.

83.2.23.2.4 IDOMXMLProlog.set_Encoding Method

Pascal

```
procedure set_Encoding(const Value: DOMString); safecall;
```

C++

```
__fastcall set_Encoding(const DOMString Value);
```

Description

This is set_Encoding, a member of class IDOMXMLProlog.

83.2.23.2.5 IDOMXMLProlog.set_Standalone Method

Pascal

```
procedure set_Standalone(const Value: DOMString); safecall;
```

C++

```
__fastcall set_Standalone(const DOMString Value);
```

Description

This is set_Standalone, a member of class IDOMXMLProlog.

83.2.23.2.6 IDOMXMLProlog.set_Version Method

Pascal

```
procedure set_Version(const Value: DOMString); safecall;
```

C++

```
__fastcall set_Version(const DOMString Value);
```

Description

This is set_Version, a member of class IDOMXMLProlog.

83.2.23.3 IDOMXMLProlog Properties

The properties of the IDOMXMLProlog class are listed here.

Public Properties

	Name	Description
	Encoding (see page 7552)	This is Encoding, a member of class IDOMXMLProlog.
	Standalone (see page 7552)	This is Standalone, a member of class IDOMXMLProlog.
	Version (see page 7552)	This is Version, a member of class IDOMXMLProlog.

83.2.23.3.1 IDOMXMLProlog.Encoding Property

Pascal

```
property Encoding: DOMString;
```

C++

```
__property DOMString Encoding;
```

Description

This is Encoding, a member of class IDOMXMLProlog.

83.2.23.3.2 IDOMXMLProlog.Standalone Property

Pascal

```
property Standalone: DOMString;
```

C++

```
__property DOMString Standalone;
```

Description

This is Standalone, a member of class IDOMXMLProlog.

83.2.23.3.3 IDOMXMLProlog.Version Property

Pascal

```
property Version: DOMString;
```

C++

```
__property DOMString Version;
```

Description

This is Version, a member of class IDOMXMLProlog.

83.2.24 IDOMXSLProcessor Interface

Class Hierarchy

Pascal

```
IDOMXSLProcessor = interface(IInterface);
```

C++

```
__interface IDOMXSLProcessor : public IInterface;
```

File

xmldom

Description

This is class xmldom.IDOMXSLProcessor.

83.2.24.1 IDOMXSLProcessor Members

The following tables list the members exposed by IDOMXSLProcessor.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	Get_input (see page 7554)	This is Get_input, a member of class IDOMXSLProcessor.
	Get_output (see page 7554)	This is Get_output, a member of class IDOMXSLProcessor.
	Get_stylesheet (see page 7554)	This is Get_stylesheet, a member of class IDOMXSLProcessor.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	reset (see page 7555)	This is reset, a member of class IDOMXSLProcessor.
	Set_input (see page 7555)	This is Set_input, a member of class IDOMXSLProcessor.
	Set_output (see page 7555)	This is Set_output, a member of class IDOMXSLProcessor.
	setParameter (see page 7555)	This is setParameter, a member of class IDOMXSLProcessor.
	transform (see page 7555)	This is transform, a member of class IDOMXSLProcessor.

Public Properties

	Name	Description
	input (see page 7556)	This is input, a member of class IDOMXSLProcessor.
	output (see page 7556)	This is output, a member of class IDOMXSLProcessor.
R	stylesheet (see page 7556)	This is stylesheet, a member of class IDOMXSLProcessor.

83.2.24.2 IDOMXSLProcessor Methods

The methods of the IDOMXSLProcessor class are listed here.

Public Methods

	Name	Description
	Get_input (see page 7554)	This is Get_input, a member of class IDOMXSLProcessor.
	Get_output (see page 7554)	This is Get_output, a member of class IDOMXSLProcessor.
	Get_stylesheet (see page 7554)	This is Get_stylesheet, a member of class IDOMXSLProcessor.
	reset (see page 7555)	This is reset, a member of class IDOMXSLProcessor.
	Set_input (see page 7555)	This is Set_input, a member of class IDOMXSLProcessor.
	Set_output (see page 7555)	This is Set_output, a member of class IDOMXSLProcessor.
	setParameter (see page 7555)	This is setParameter, a member of class IDOMXSLProcessor.
	transform (see page 7555)	This is transform, a member of class IDOMXSLProcessor.

83.2.24.2.1 IDOMXSLProcessor.Get_input Method

Pascal

```
function Get_input: OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_input();
```

Description

This is Get_input, a member of class IDOMXSLProcessor.

83.2.24.2.2 IDOMXSLProcessor.Get_output Method

Pascal

```
function Get_output: OleVariant; safecall;
```

C++

```
__fastcall OleVariant Get_output();
```

Description

This is Get_output, a member of class IDOMXSLProcessor.

83.2.24.2.3 IDOMXSLProcessor.Get_stylesheet Method

Pascal

```
function Get_stylesheet: IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode Get_stylesheet();
```

Description

This is Get_stylesheet, a member of class IDOMXSLProcessor.

83.2.24.2.4 IDOMXSLProcessor.reset Method

Pascal

```
procedure reset; safecall;
```

C++

```
__fastcall reset();
```

Description

This is reset, a member of class IDOMXSLProcessor.

83.2.24.2.5 IDOMXSLProcessor.Set_input Method

Pascal

```
procedure Set_input(const value: OleVariant); safecall;
```

C++

```
__fastcall Set_input(const OleVariant value);
```

Description

This is Set_input, a member of class IDOMXSLProcessor.

83.2.24.2.6 IDOMXSLProcessor.Set_output Method

Pascal

```
procedure Set_output(const value: OleVariant); safecall;
```

C++

```
__fastcall Set_output(const OleVariant value);
```

Description

This is Set_output, a member of class IDOMXSLProcessor.

83.2.24.2.7 IDOMXSLProcessor.setParameter Method

Pascal

```
procedure setParameter(const Name: DOMString; Value: OleVariant; const namespaceURI:
DOMString); safecall;
```

C++

```
__fastcall setParameter(const DOMString Name, OleVariant Value, const DOMString namespaceURI);
```

Description

This is setParameter, a member of class IDOMXSLProcessor.

83.2.24.2.8 IDOMXSLProcessor.transform Method

Pascal

```
function transform: WordBool; safecall;
```

C++

```
__fastcall WordBool transform();
```

Description

This is transform, a member of class IDOMXSLProcessor.

83.2.24.3 IDOMXSLProcessor Properties

The properties of the IDOMXSLProcessor class are listed here.

Public Properties

	Name	Description
	input (see page 7556)	This is input, a member of class IDOMXSLProcessor.
	output (see page 7556)	This is output, a member of class IDOMXSLProcessor.
R	stylesheet (see page 7556)	This is stylesheet, a member of class IDOMXSLProcessor.

83.2.24.3.1 IDOMXSLProcessor.input Property

Pascal

```
property input: OleVariant;
```

C++

```
__property OleVariant input;
```

Description

This is input, a member of class IDOMXSLProcessor.

83.2.24.3.2 IDOMXSLProcessor.output Property

Pascal

```
property output: OleVariant;
```

C++

```
__property OleVariant output;
```

Description

This is output, a member of class IDOMXSLProcessor.

83.2.24.3.3 IDOMXSLProcessor.stylesheet Property

Pascal

```
property stylesheet: IDOMNode;
```

C++

```
__property IDOMNode stylesheet;
```

Description

This is stylesheet, a member of class IDOMXSLProcessor.

83.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DOMVendorNotSupported (see page 7557)	This is function xmldom.DOMVendorNotSupported.
	ExtractLocalName (see page 7557)	Strips the namespace prefix, if present, from the tag name of an XML node.
	ExtractPrefix (see page 7558)	Returns the namespace prefix of an XML node's tag name.
	GetDOM (see page 7559)	Returns the top-level DOM interface for a registered DOM implementation.
	GetDOMNodeEx (see page 7559)	This is function xmldom.GetDOMNodeEx.
	GetDOMVendor (see page 7560)	Returns the TDOMVendor (see page 7466) object for a specified DOM vendor.
	IsPrefixed (see page 7560)	Indicates whether an XML tag name includes a namespace prefix.
	MakeNodeName (see page 7561)	Assembles a full tag name from a local name and namespace prefix.
	NodeMatches (see page 7561)	Indicates whether a specified node matches a given namespace and tag name.
	RegisterDOMVendor (see page 7562)	Registers an implementation of the DOM interfaces so that it is available to the TXMLDocument class.
	SameNamespace (see page 7562)	Indicates whether a specified node is defined within a specified namespace.
	SameNamespace (see page 7562)	Indicates whether a specified node is defined within a specified namespace.
	UnRegisterDOMVendor (see page 7563)	Unregisters a DOM implementation that was registered using RegisterDOMVendor (see page 7562) .

83.3.1 xmldom.DOMVendorNotSupported Function

Pascal

```
procedure DOMVendorNotSupported(const PropOrMethod: string; const VendorName: string);
```

C++

```
DOMVendorNotSupported(const UnicodeString PropOrMethod, const UnicodeString VendorName);
```

File

xmldom

Description

This is function xmldom.DOMVendorNotSupported.

83.3.2 xmldom.ExtractLocalName Function

Strips the namespace prefix, if present, from the tag name of an XML node.

Pascal

```
function ExtractLocalName(const AName: DOMString): DOMString;
```

C++

```
DOMString ExtractLocalName(const DOMString AName);
```

File

xmldom

Description

Call ExtractLocalName to convert a full tag name for an XML node into the corresponding local name.

AName is the tag name to be converted.

ExtractLocalName returns the value of AName with any namespace prefix stripped away.

See Also

ExtractPrefix (see page 7558)

IsPrefixed (see page 7560)

NodeMatches (see page 7561)

IXMLNode

SameNamespace (see page 7562)

83.3.3 xmldom.ExtractPrefix Function

Returns the namespace prefix of an XML node's tag name.

Pascal

```
function ExtractPrefix(const AName: DOMString): DOMString;
```

C++

```
DOMString ExtractPrefix(const DOMString AName);
```

File

xmldom

Description

Call ExtractPrefix to determine the namespace prefix, if any, of a full tag name for an XML node.

AName is the tag name of the XML node.

ExtractPrefix returns the namespace prefix, not including the colon (:) that separates the namespace from the local name of the XML node. If the tag name does not include a namespace prefix, ExtractPrefix returns an empty string.

See Also

ExtractLocalName (see page 7557)

IsPrefixed (see page 7560)

SameNamespace (see page 7562)

NodeMatches (see page 7561)

83.3.4 xmldom.GetDOM Function

Returns the top-level DOM interface for a registered DOM implementation.

Pascal

```
function GetDOM(const VendorDesc: string = ''): IDOMImplementation;
```

C++

```
IDOMImplementation GetDOM(const UnicodeString VendorDesc = '');
```

File

xmldom

Description

Call GetDOM to obtain an IDOMImplementation (see page 7504) interface that you can use for parsing and editing XML documents. The IDOMImplementation (see page 7504) interface is the top-level DOM interface, which you can use to check for the presence of a specific feature or to obtain an interface for working with a DOM document.

VendorDesc is a short descriptive name that identifies the DOM implementation. This name is returned by the Description method of the DOM implementation factory that is used to register the implementation.

Note: The DOM implementation must be registered before you can access it using GetDOM. To register a DOM implementation, use the RegisterDOMVendor (see page 7562) procedure.

See Also

RegisterDOMVendor (see page 7562)

DOMVendors (see page 7568)

GetDOMVendor (see page 7560)

TXMLDocument

Using the Document Object Model

83.3.5 xmldom.GetDOMNodeEx Function

Pascal

```
function GetDOMNodeEx(const Node: IDOMNode): IDOMNodeEx;
```

C++

```
IDOMNodeEx GetDOMNodeEx(const IDOMNode Node);
```

File

xmldom

Description

This is function xmldom.GetDOMNodeEx.

83.3.6 xmldom.GetDOMVendor Function

Returns the TDOMVendor (see page 7466) object for a specified DOM vendor.

Pascal

```
function GetDOMVendor(VendorDesc: string): TDOMVendor;
```

C++

```
TDOMVendor GetDOMVendor(UnicodeString VendorDesc);
```

File

xmldom

Description

Call GetDOMVendor to obtain the TDOMVendor (see page 7466) object that represents a registered DOM implementation. You can then assign this return value as the DOMVendor property of TXMLDocument, or call this object's DOMImplementation method to access the IDOMImplementation (see page 7504) interface for the DOM implementation.

VendorDesc is the descriptive string that identifies the particular DOM implementation that is desired. This is the value returned by the TDOMVendor (see page 7466) object's Description method.

See Also

RegisterDOMVendor (see page 7562)

DOMVendors (see page 7568)

TXMLDocument

83.3.7 xmldom.IsPrefixed Function

Indicates whether an XML tag name includes a namespace prefix.

Pascal

```
function IsPrefixed(const AName: DOMString): Boolean;
```

C++

```
Boolean IsPrefixed(const DOMString AName);
```

File

xmldom

Description

Call IsPrefixed to determine whether a tag name includes a namespace prefix.

AName is the tag name of the XML node.

IsPrefixed returns true if AName includes a namespace prefix followed by the colon (:) separator character, false otherwise.

See Also

ExtractLocalName (see page 7557)

ExtractPrefix (see page 7558)

IXMLNode

83.3.8 xmldom.MakeNodeName Function

Assembles a full tag name from a local name and namespace prefix.

Pascal

```
function MakeNodeName(const Prefix: DOMString; const LocalName: DOMString): DOMString;
```

C++

```
DOMString MakeNodeName(const DOMString Prefix, const DOMString LocalName);
```

File

xmldom

Description

Call MakeNodeName to create a tag name from a namespace prefix and a local tag name.

Prefix is the namespace prefix.

LocalName is the local name for the node.

MakeNodeName returns the full tag name that consists of the namespace prefix, followed by a colon and then the local name.

See Also

ExtractPrefix (see page 7558)

ExtractLocalName (see page 7557)

83.3.9 xmldom.NodeMatches Function

Indicates whether a specified node matches a given namespace and tag name.

Pascal

```
function NodeMatches(const Node: IDOMNode; const TagName: DOMString; const NamespaceURI:
DOMString): Boolean; overload;
```

C++

```
Boolean NodeMatches(const IDOMNode Node, const DOMString TagName, const DOMString
NamespaceURI);
```

File

xmldom

Description

Call NodeMatches to determine whether the node with the interface specified by Node refers to the same node as is described by the TagName and NamespaceURI parameters.

NodeMatches returns true if

The value of Node's NamespaceURI property is the same as the NamespaceURI parameter.

The local name or tag name of Node is the same as the TagName parameter.

Tip: Given an IXMLNode interface, you can obtain the IDOMNode (see page 7509) interface required for the Node parameter by reading its DOMNode property.

See Also

ExtractLocalName (see page 7557)

ExtractPrefix (see page 7558)

IXMLNode

SameNamespace (see page 7562)

IXMLNode

83.3.10 xmldom.RegisterDOMVendor Function

Registers an implementation of the DOM interfaces so that it is available to the TXMLDocument class.

Pascal

```
procedure RegisterDOMVendor(const Vendor: TDOMVendor);
```

C++

```
RegisterDOMVendor(const TDOMVendor Vendor);
```

File

xmldom

Description

Call RegisterDOMVendor to register a DOM implementation that you want to use for parsing XML documents. A DOM (Document Object Model) implementation is a set of objects that implement the standard DOM interfaces.

If you are using another DOM implementation, you must create a TDOMVendor (see page 7466) descendant that can supply the IDOMImplementation (see page 7504) interface and description string for the DOM implementation. Pass an instance of this object as the Vendor parameter to RegisterDOMVendor.

See Also

UnRegisterDOMVendor (see page 7563)

TXMLDocument

TXMLDocument

DOMVendors (see page 7568)

Using the Document Object Model

83.3.11 xmldom.SameNamespace Function

Indicates whether a specified node is defined within a specified namespace.

Pascal

```
function SameNamespace(const Node: IDOMNode; const namespaceURI: WideString): Boolean;
overload;
```

```
function SameNamespace(const URI1: WideString; const URI2: WideString): Boolean; overload;
```

C++

```
Boolean SameNamespace(const IDOMNode Node, const BSTR namespaceURI);
Boolean SameNamespace(const BSTR URI1, const BSTR URI2);
```

File

xmldom

Description

Call SameNamespace to determine whether the two parameters identify the same namespace.

Using the first syntax, the Node parameter identifies a node and the NamespaceURI parameter a namespace. SameNamespace checks whether the node is defined in the specified namespace.

Using the second syntax, both parameters are namespace URI values. SameNamespace checks whether they both identify the same namespace.

Tip: Given an IXMLNode interface, you can obtain the IDOMNode (see page 7509) interface required for the Node parameter by reading its DOMNode property.

See Also

ExtractLocalName (see page 7557)

ExtractPrefix (see page 7558)

IXMLNode

SameNamespace

IXMLNode

IXMLNode

83.3.12 xmldom.UnRegisterDOMVendor Function

Unregisters a DOM implementation that was registered using RegisterDOMVendor (see page 7562) .

Pascal

```
procedure UnRegisterDOMVendor(const Vendor: TDOMVendor);
```

C++

```
UnRegisterDOMVendor(const TDOMVendor Vendor);
```

File

xmldom

Description

Call UnRegisterDOMVendor to unregister a DOM implementation when it is no longer available. After unregistering a DOM implementation, it can't be used by TXMLDocument for parsing XML documents.

Vendor is the TDOMVendor (see page 7466) descendant the represents the DOM implementation that is to be unregistered. It must be the same object used when registering the DOM implementation when you called RegisterDOMVendor (see page 7562).

See Also

RegisterDOMVendor (see page 7562)

TXMLDocument

TXMLDocument

DOMVendors (see page 7568)

Using the Document Object Model

83.4 Types

The following table lists types in this documentation.

Types

Name	Description
DOMNodeType (see page 7565)	DOMNodeType indicates the type of a node in an XML document, as parsed by a DOM parser.
DOMString (see page 7565)	DOMString is the type for strings that are used by a DOM parser.
DOMTimeStamp (see page 7566)	This is type xmldom.DOMTimeStamp.
TAsyncEventHandler (see page 7566)	TAsyncEventHandler is the type of event handlers that respond when the AsyncLoadState of an XML document changes.
TDOMVendorArray (see page 7567)	This is type xmldom.TDOMVendorArray.

83.4.1 xmldom.DOMNodeType Type

DOMNodeType indicates the type of a node in an XML document, as parsed by a DOM parser.

Pascal

```
DOMNodeType = Word;
```

C++

```
Word DOMNodeType;
```

File

xmldom

Description

DOMNodeType is the type of the nodeType property on the IDOMNode (see page 7509) interface. It is a flag, defined by W3C, that indicates the role played by a node in the parsed version of an XML document.

See Also

IDOMNode

83.4.2 xmldom.DOMString Type

DOMString is the type for strings that are used by a DOM parser.

Pascal

```
DOMString = UnicodeString;
```

C++

```
UnicodeString DOMString;
```

File

xmldom

Description

DOM implementations work with wide characters. The strings that are used, therefore, when working with DOM interfaces, are of type DOMString, which simply maps to the WideString (see page 3476) type.

83.4.3 xmldom.DOMTimeStamp Type

Pascal

```
DOMTimeStamp = Int64;
```

C++

```
Int64 DOMTimeStamp;
```

File

xmldom

Description

This is type xmldom.DOMTimeStamp.

83.4.4 xmldom.TAsyncEventHandler Type

TAsyncEventHandler is the type of event handlers that respond when the AsyncLoadState of an XML document changes.

Pascal

```
TAsyncEventHandler = procedure (Sender: TObject; AsyncLoadState: Integer) of object;
```

C++

```
(Sender: TObject; AsyncLoadState: Integer) ( TAsyncEventHandler)();
```

File

xmldom

Description

TAsyncEventHandler is the type for event handlers that respond at various stages during the asynchronous parsing of an XML document.

Sender is the TXMLDocument object that receives the event.

AsyncLoadState is an integer that indicates the current stage of the parsing process. Its value is vendor-specific, and corresponds to the document's AsyncLoadState property.

See Also

TXMLDocument

IXMLDocument

AsyncLoadState

83.4.5 xmldom.TDOMVendorArray Type

Pascal

```
TDOMVendorArray = array of TDOMVendor;
```

C++

```
array of TDOMVendor TDOMVendorArray;
```

File

xmldom

Description

This is type xmldom.TDOMVendorArray.

83.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
DefaultDOMVendor (see page 7568)	This is variable xmldom.DefaultDOMVendor.
DOMVendors (see page 7568)	This is variable xmldom.DOMVendors.

83.5.1 xmldom.DefaultDOMVendor Variable

Pascal

```
DefaultDOMVendor: string;
```

C++

```
UnicodeString DefaultDOMVendor;
```

File

xmldom

Description

This is variable xmldom.DefaultDOMVendor.

83.5.2 xmldom.DOMVendors Variable

Pascal

```
DOMVendors: TDOMVendorList;
```

C++

```
TDOMVendorList DOMVendors;
```

File

xmldom

Description

This is variable xmldom.DOMVendors.

83.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
ATTRIBUTE_NODE (see page 7569)	This is constant xmldom.ATTRIBUTE_NODE.
CDATA_SECTION_NODE (see page 7570)	This is constant xmldom.CDATA_SECTION_NODE.
COMMENT_NODE (see page 7570)	This is constant xmldom.COMMENT_NODE.
DOCUMENT_FRAGMENT_NODE (see page 7570)	This is constant xmldom.DOCUMENT_FRAGMENT_NODE.
DOCUMENT_NODE (see page 7571)	This is constant xmldom.DOCUMENT_NODE.
DOCUMENT_TYPE_NODE (see page 7571)	This is constant xmldom.DOCUMENT_TYPE_NODE.
DOMSTRING_SIZE_ERR (see page 7571)	This is constant xmldom.DOMSTRING_SIZE_ERR.
DOMWrapperVersion (see page 7572)	This is constant xmldom.DOMWrapperVersion.
ELEMENT_NODE (see page 7572)	This is constant xmldom.ELEMENT_NODE.
ENTITY_NODE (see page 7572)	This is constant xmldom.ENTITY_NODE.
ENTITY_REFERENCE_NODE (see page 7573)	This is constant xmldom.ENTITY_REFERENCE_NODE.
HIERARCHY_REQUEST_ERR (see page 7573)	This is constant xmldom.HIERARCHY_REQUEST_ERR.
INDEX_SIZE_ERR (see page 7573)	This is constant xmldom.INDEX_SIZE_ERR.
INUSE_ATTRIBUTE_ERR (see page 7574)	This is constant xmldom.INUSE_ATTRIBUTE_ERR.
INVALID_ACCESS_ERR (see page 7574)	This is constant xmldom.INVALID_ACCESS_ERR.
INVALID_CHARACTER_ERR (see page 7574)	This is constant xmldom.INVALID_CHARACTER_ERR.
INVALID_MODIFICATION_ERR (see page 7575)	This is constant xmldom.INVALID_MODIFICATION_ERR.
INVALID_STATE_ERR (see page 7575)	This is constant xmldom.INVALID_STATE_ERR.
NAMESPACE_ERR (see page 7575)	This is constant xmldom.NAMESPACE_ERR.
NO_DATA_ALLOWED_ERR (see page 7576)	This is constant xmldom.NO_DATA_ALLOWED_ERR.
NO_MODIFICATION_ALLOWED_ERR (see page 7576)	This is constant xmldom.NO_MODIFICATION_ALLOWED_ERR.
NOT_FOUND_ERR (see page 7576)	This is constant xmldom.NOT_FOUND_ERR.
NOT_SUPPORTED_ERR (see page 7577)	This is constant xmldom.NOT_SUPPORTED_ERR.
NOTATION_NODE (see page 7577)	This is constant xmldom.NOTATION_NODE.
NSDelim (see page 7577)	This is constant xmldom.NSDelim.
PROCESSING_INSTRUCTION_NODE (see page 7578)	This is constant xmldom.PROCESSING_INSTRUCTION_NODE.
SEncoding (see page 7578)	This is constant xmldom.SEncoding.
SHttp (see page 7578)	This is constant xmldom.SHttp.
SStandalone (see page 7579)	This is constant xmldom.SStandalone.
SVersion (see page 7579)	This is constant xmldom.SVersion.
SXML (see page 7579)	This is constant xmldom.SXML.
SXMLNamespaceURI (see page 7580)	This is constant xmldom.SXMLNamespaceURI.
SXMLNS (see page 7580)	This is constant xmldom.SXMLNS.
SXMLPrefixNamespaceURI (see page 7580)	This is constant xmldom.SXMLPrefixNamespaceURI.
SYNTAX_ERR (see page 7581)	This is constant xmldom.SYNTAX_ERR.
TEXT_NODE (see page 7581)	This is constant xmldom.TEXT_NODE.
WRONG_DOCUMENT_ERR (see page 7581)	This is constant xmldom.WRONG_DOCUMENT_ERR.

83.6.1 xmldom.ATTRIBUTE_NODE Constant

Pascal

```
ATTRIBUTE_NODE = 2;
```

C++

```
ATTRIBUTE_NODE = 2;
```

File

xmldom

Description

This is constant xmldom.ATTRIBUTE_NODE.

83.6.2 xmldom.CDATA_SECTION_NODE Constant

Pascal

```
CDATA_SECTION_NODE = 4;
```

C++

```
CDATA_SECTION_NODE = 4;
```

File

xmldom

Description

This is constant xmldom.CDATA_SECTION_NODE.

83.6.3 xmldom.COMMENT_NODE Constant

Pascal

```
COMMENT_NODE = 8;
```

C++

```
COMMENT_NODE = 8;
```

File

xmldom

Description

This is constant xmldom.COMMENT_NODE.

83.6.4 xmldom.DOCUMENT_FRAGMENT_NODE Constant

Pascal

```
DOCUMENT_FRAGMENT_NODE = 11;
```

C++

```
DOCUMENT_FRAGMENT_NODE = 11;
```

File

xmldom

Description

This is constant xmldom.DOCUMENT_FRAGMENT_NODE.

83.6.5 xmldom.DOCUMENT_NODE Constant

Pascal

```
DOCUMENT_NODE = 9;
```

C++

```
DOCUMENT_NODE = 9;
```

File

xmldom

Description

This is constant xmldom.DOCUMENT_NODE.

83.6.6 xmldom.DOCUMENT_TYPE_NODE Constant

Pascal

```
DOCUMENT_TYPE_NODE = 10;
```

C++

```
DOCUMENT_TYPE_NODE = 10;
```

File

xmldom

Description

This is constant xmldom.DOCUMENT_TYPE_NODE.

83.6.7 xmldom.DOMSTRING_SIZE_ERR Constant

Pascal

```
DOMSTRING_SIZE_ERR = 2;
```

C++

```
DOMSTRING_SIZE_ERR = 2;
```

File

xmldom

Description

This is constant xmldom.DOMSTRING_SIZE_ERR.

83.6.8 xmldom.DOMWrapperVersion Constant

Pascal

```
DOMWrapperVersion = 1.3;
```

C++

```
DOMWrapperVersion = 1.3;
```

File

xmldom

Description

This is constant xmldom.DOMWrapperVersion.

83.6.9 xmldom.ELEMENT_NODE Constant

Pascal

```
ELEMENT_NODE = 1;
```

C++

```
ELEMENT_NODE = 1;
```

File

xmldom

Description

This is constant xmldom.ELEMENT_NODE.

83.6.10 xmldom.ENTITY_NODE Constant

Pascal

```
ENTITY_NODE = 6;
```

C++

```
ENTITY_NODE = 6;
```

File

xmldom

Description

This is constant xmldom.ENTITY_NODE.

83.6.11 xmldom.ENTITY_REFERENCE_NODE Constant

Pascal

```
ENTITY_REFERENCE_NODE = 5;
```

C++

```
ENTITY_REFERENCE_NODE = 5;
```

File

xmldom

Description

This is constant xmldom.ENTITY_REFERENCE_NODE.

83.6.12 xmldom.HIERARCHY_REQUEST_ERR Constant

Pascal

```
HIERARCHY_REQUEST_ERR = 3;
```

C++

```
HIERARCHY_REQUEST_ERR = 3;
```

File

xmldom

Description

This is constant xmldom.HIERARCHY_REQUEST_ERR.

83.6.13 xmldom.INDEX_SIZE_ERR Constant

Pascal

```
INDEX_SIZE_ERR = 1;
```

C++

```
INDEX_SIZE_ERR = 1;
```

File

xmldom

Description

This is constant xmldom.INDEX_SIZE_ERR.

83.6.14 xmldom.INUSE_ATTRIBUTE_ERR Constant

Pascal

```
INUSE_ATTRIBUTE_ERR = 10;
```

C++

```
INUSE_ATTRIBUTE_ERR = 10;
```

File

xmldom

Description

This is constant xmldom.INUSE_ATTRIBUTE_ERR.

83.6.15 xmldom.INVALID_ACCESS_ERR Constant

Pascal

```
INVALID_ACCESS_ERR = 15;
```

C++

```
INVALID_ACCESS_ERR = 15;
```

File

xmldom

Description

This is constant xmldom.INVALID_ACCESS_ERR.

83.6.16 xmldom.INVALID_CHARACTER_ERR Constant

Pascal

```
INVALID_CHARACTER_ERR = 5;
```

C++

```
INVALID_CHARACTER_ERR = 5;
```

File

xmldom

Description

This is constant xmldom.INVALID_CHARACTER_ERR.

83.6.17 xmldom.INVALID_MODIFICATION_ERR Constant

Pascal

```
INVALID_MODIFICATION_ERR = 13;
```

C++

```
INVALID_MODIFICATION_ERR = 13;
```

File

xmldom

Description

This is constant xmldom.INVALID_MODIFICATION_ERR.

83.6.18 xmldom.INVALID_STATE_ERR Constant

Pascal

```
INVALID_STATE_ERR = 11;
```

C++

```
INVALID_STATE_ERR = 11;
```

File

xmldom

Description

This is constant xmldom.INVALID_STATE_ERR.

83.6.19 xmldom.NAMESPACE_ERR Constant

Pascal

```
NAMESPACE_ERR = 14;
```

C++

```
NAMESPACE_ERR = 14;
```

File

xmldom

Description

This is constant xmldom.NAMESPACE_ERR.

83.6.20 xmldom.NO_DATA_ALLOWED_ERR Constant

Pascal

```
NO_DATA_ALLOWED_ERR = 6;
```

C++

```
NO_DATA_ALLOWED_ERR = 6;
```

File

xmldom

Description

This is constant xmldom.NO_DATA_ALLOWED_ERR.

83.6.21 xmldom.NO_MODIFICATION_ALLOWED_ERR Constant

Pascal

```
NO_MODIFICATION_ALLOWED_ERR = 7;
```

C++

```
NO_MODIFICATION_ALLOWED_ERR = 7;
```

File

xmldom

Description

This is constant xmldom.NO_MODIFICATION_ALLOWED_ERR.

83.6.22 xmldom.NOT_FOUND_ERR Constant

Pascal

```
NOT_FOUND_ERR = 8;
```

C++

```
NOT_FOUND_ERR = 8;
```

File

xmldom

Description

This is constant xmldom.NOT_FOUND_ERR.

83.6.23 xmldom.NOT_SUPPORTED_ERR Constant

Pascal

```
NOT_SUPPORTED_ERR = 9;
```

C++

```
NOT_SUPPORTED_ERR = 9;
```

File

xmldom

Description

This is constant xmldom.NOT_SUPPORTED_ERR.

83.6.24 xmldom.NOTATION_NODE Constant

Pascal

```
NOTATION_NODE = 12;
```

C++

```
NOTATION_NODE = 12;
```

File

xmldom

Description

This is constant xmldom.NOTATION_NODE.

83.6.25 xmldom.NSDelim Constant

Pascal

```
NSDelim = ':';
```

C++

```
NSDelim = ':';
```

File

xmldom

Description

This is constant xmldom.NSDelim.

83.6.26 xmldom.PROCESSING_INSTRUCTION_NODE Constant

Pascal

```
PROCESSING_INSTRUCTION_NODE = 7;
```

C++

```
PROCESSING_INSTRUCTION_NODE = 7;
```

File

xmldom

Description

This is constant xmldom.PROCESSING_INSTRUCTION_NODE.

83.6.27 xmldom.SEncoding Constant

Pascal

```
SEncoding = 'encoding';
```

C++

```
SEncoding = 'encoding';
```

File

xmldom

Description

This is constant xmldom.SEncoding.

83.6.28 xmldom.SHttp Constant

Pascal

```
SHttp = 'http:/';
```

C++

```
SHttp = 'http:/';
```

File

xmldom

Description

This is constant xmldom.SHttp.

83.6.29 xmldom.SStandalone Constant

Pascal

```
SStandalone = 'standalone';
```

C++

```
SStandalone = 'standalone';
```

File

xmldom

Description

This is constant xmldom.SStandalone.

83.6.30 xmldom.SVersion Constant

Pascal

```
SVersion = 'version';
```

C++

```
SVersion = 'version';
```

File

xmldom

Description

This is constant xmldom.SVersion.

83.6.31 xmldom.SXML Constant

Pascal

```
SXML = 'xml';
```

C++

```
SXML = 'xml';
```

File

xmldom

Description

This is constant xmldom.SXML.

83.6.32 xmldom.SXMLNamespaceURI Constant

Pascal

```
SXMLNamespaceURI = SHttp+'/www.w3.org/2000/xmlns/';
```

C++

```
SXMLNamespaceURI = SHttp+'/www.w3.org/2000/xmlns/';
```

File

xmldom

Description

This is constant xmldom.SXMLNamespaceURI.

83.6.33 xmldom.SXMLNS Constant

Pascal

```
SXMLNS = 'xmlns';
```

C++

```
SXMLNS = 'xmlns';
```

File

xmldom

Description

This is constant xmldom.SXMLNS.

83.6.34 xmldom.SXMLPrefixNamespaceURI Constant

Pascal

```
SXMLPrefixNamespaceURI = SHttp+'/www.w3.org/XML/1998/namespace';
```

C++

```
SXMLPrefixNamespaceURI = SHttp+'/www.w3.org/XML/1998/namespace';
```

File

xmldom

Description

This is constant xmldom.SXMLPrefixNamespaceURI.

83.6.35 xmldom.SYNTAX_ERR Constant

Pascal

```
SYNTAX_ERR = 12;
```

C++

```
SYNTAX_ERR = 12;
```

File

xmldom

Description

This is constant xmldom.SYNTAX_ERR.

83.6.36 xmldom.TEXT_NODE Constant

Pascal

```
TEXT_NODE = 3;
```

C++

```
TEXT_NODE = 3;
```

File

xmldom

Description

This is constant xmldom.TEXT_NODE.

83.6.37 xmldom.WRONG_DOCUMENT_ERR Constant

Pascal

```
WRONG_DOCUMENT_ERR = 4;
```

C++

```
WRONG_DOCUMENT_ERR = 4;
```

File

xmldom

Description

This is constant xmldom.WRONG_DOCUMENT_ERR.

84 XMLIntf Namespace

This is namespace XMLIntf.

Topics

Name	Description
Classes (see page 7585)	The following table lists classes in this documentation.
Interfaces (see page 7586)	The following table lists interfaces in this documentation.
Structs, Records, Enums (see page 7662)	The following table lists structs, records, enums in this documentation.
Types (see page 7667)	The following table lists types in this documentation.
Constants (see page 7668)	The following table lists constants in this documentation.

Classes

	Name	Description
	EXMLDocError (see page 7585)	EXMLDocError is the exception class for errors editing or parsing an XML document.

Constants

Name	Description
NodeTypeNames (see page 7668)	This is constant XMLIntf.NodeTypeNames.

Interfaces

	Name	Description
	IXMLDocument (see page 7586)	IXMLDocument represents an XML (see page 7614) document.
	IXMLNode (see page 7615)	IXMLNode is the interface for a node in an XML (see page 7643) document.
	IXMLNodeCollection (see page 7644)	IXMLNodeCollection is the interface for a set of child nodes that are all the same type.
	IXMLNodeList (see page 7649)	IXMLNodeList represents a set of nodes in an XML document.

Structs, Records, Enums

	Name	Description
	TNodeType (see page 7662)	TNodeType identifies the type of a node in an XML document.
	TParseOption (see page 7664)	TParseOption and TParseOptions (see page 7667) represent implementation-specific options that are followed when parsing the XML document.
	TXMLDocOption (see page 7664)	TXMLDocOption and TXMLDocOptions (see page 7667) indicate types of information that an XML document automatically supplies.
	TXMLEncodingType (see page 7665)	TXMLEncodingType indicates the character set used to encode characters in an XML document.

Types

Name	Description
TParseOptions (see page 7667)	This is type XMLIntf.TParseOptions.
TXMLDocOptions (see page 7667)	This is type XMLIntf.TXMLDocOptions.

84.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EXMLDocError (see page 7585)	EXMLDocError is the exception class for errors editing or parsing an XML document.

84.1.1 EXMLDocError Class

EXMLDocError is the exception class for errors editing or parsing an XML document.

Class Hierarchy

Pascal

```
EXMLDocError = class(Exception);
```

C++

```
class EXMLDocError : public Exception;
```

File

XMLIntf

Description

EXMLDocError is raised by TXMLDocument or TXMLNode when

An error occurs when loading an XML document.

An error occurs when creating a node in an XML document.

A required DOM interface is not found.

An option is requested that is not supported by the DOM implementation.

An attempt is made to perform an action that is not consistent with the specified node type.

See Also

XMLDocError

TXMLDocument (see page 7299)

TXMLNode (see page 7348)

84.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IXMLDocument (see page 7586)	IXMLDocument represents an XML (see page 7614) document.
	IXMLNode (see page 7615)	IXMLNode is the interface for a node in an XML (see page 7643) document.
	IXMLNodeCollection (see page 7644)	IXMLNodeCollection is the interface for a set of child nodes that are all the same type.
	IXMLNodeList (see page 7649)	IXMLNodeList represents a set of nodes in an XML document.

84.2.1 IXMLDocument Interface

IXMLDocument represents an XML (see page 7614) document.

Class Hierarchy

Pascal

```
IXMLDocument = interface(IInterface);
```

C++

```
__interface IXMLDocument : public IInterface;
```

File

XMLIntf

Description

Use IXMLDocument to work with an XML (see page 7614) document. Applications can obtain an IXMLDocument interface through a TXMLDocument component, using the global LoadXMLDocument function, or through the OwnerDocument property of any node in the document.

Like the related DOM interface IDOMDocument (see page 7482), you can use IXMLDocument to access the contents of an XML (see page 7614) document and to create new nodes. In addition, IXMLDocument lets you load an XML (see page 7614) document that is stored on disk or assign a string of raw (unparsed) XML (see page 7614) as the contents of the document.

TXMLDocument implements the IXMLDocument interface. Typically, the TXMLDocument component is the starting point for working with an XML (see page 7614) document.

Note: C++ method declarations that use IXMLDocument use the _di_IXMLDocument type instead. This type is a DelphiInterface (see page 3263) wrapper around the IXMLDocument interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IXMLDocument >  _di_IXMLDocument;
```

See Also

IXMLNode (see page 7615)

EXMLDocError (see page 7585)

TXMLDocument (see page 7299)

IXMLNode (see page 7615)

LoadXMLDocument

84.2.1.1 IXMLDocument Members

The following tables list the members exposed by IXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7589)	This is the overview for the AddChild method overload.
	CreateElement (see page 7590)	Creates a new element node that is associated with this document.
	CreateNode (see page 7591)	Creates a new node that is associated with this document.
	GeneratePrefix (see page 7592)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 7592)	Returns the value of the Active (see page 7607) property.
	GetAsyncLoadState (see page 7593)	Returns the value of the AsyncLoadState (see page 7608) property.
	GetChildNodes (see page 7593)	Returns the value of the ChildNodes (see page 7609) property.
	GetDocBinding (see page 7593)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 7594)	Returns the value of the DocumentElement (see page 7609) property.
	GetDocumentNode (see page 7594)	Returns the value of the Node (see page 7611) property.
	GetDOMDocument (see page 7594)	Returns the value of the DOMDocument (see page 7609) property.
	GetEncoding (see page 7595)	Returns the value of the Encoding (see page 7610) property.
	GetFileName (see page 7595)	Returns the value of the FileName (see page 7610) property.
	GetModified (see page 7595)	Returns the value of the Modified (see page 7611) property.
	GetNodeIndentStr (see page 7596)	Returns the value of the NodeIndentStr (see page 7612) property.
	GetOptions (see page 7596)	Returns the value of the Options (see page 7612) property.
	GetParseOptions (see page 7596)	Returns the value of the ParseOptions (see page 7613) property.
	GetSchemaRef (see page 7596)	Returns the value of the SchemaRef (see page 7613) property.
	GetStandAlone (see page 7597)	Returns the value of the StandAlone (see page 7614) property.
	GetVersion (see page 7597)	Returns the value of the Version (see page 7614) property.
	GetXML (see page 7597)	Returns the value of the XML (see page 7614) property.
	IsEmptyDoc (see page 7598)	Indicates whether the IXMLDocument (see page 7586) instance represents an empty document.
	LoadFromFile (see page 7598)	Loads an XML (see page 7614) document from disk.
	LoadFromStream (see page 7599)	Loads an XML (see page 7614) document from a stream and activates it.
	LoadFromXML (see page 7599)	This is the overview for the LoadFromXML method overload.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7600)	Updates the parsed XML (see page 7614) document to reflect external changes.
	RegisterDocBinding (see page 7600)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7601)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7601)	Saves the XML (see page 7614) document to disk.
	SaveToStream (see page 7602)	Saves the XML (see page 7614) document to a stream.
	SaveToXML (see page 7602)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7603)	Sets the value of the Active (see page 7607) property.
	SetDocumentElement (see page 7603)	Sets the value of the DocumentElement (see page 7609) property.
	SetDOMDocument (see page 7604)	Sets the value of the DOMDocument (see page 7609) property.

	SetEncoding (see page 7604)	Sets the value of the Encoding (see page 7610) property.
	SetFileName (see page 7604)	Sets the value of the FileName (see page 7610) property.
	SetNodeIndentStr (see page 7605)	Sets the value of the NodeIndentStr (see page 7612) property.
	SetOnAsyncLoad (see page 7605)	Supplies an event handler that responds when the AsyncLoadState (see page 7608) property changes.
	SetOptions (see page 7605)	Sets the value of the Options (see page 7612) property.
	SetParseOptions (see page 7606)	Sets the value of the ParseOptions (see page 7613) property.
	SetStandAlone (see page 7606)	Sets the value of the StandAlone (see page 7614) property.
	SetVersion (see page 7606)	Sets the value of the Version (see page 7614) property.
	SetXML (see page 7607)	Sets the value of the XML (see page 7614) property.

Public Properties

	Name	Description
	Active (see page 7607)	Specifies whether the XML (see page 7614) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 7608)	Indicates the state of the DOM parser when it parses the XML (see page 7614) document asynchronously.
R	ChildNodes (see page 7609)	Lists all of the child nodes of the document.
	DocumentElement (see page 7609)	Provides access to the root node of the XML (see page 7614) document.
	DOMDocument (see page 7609)	Provides access to the DOM interface for the parsed XML (see page 7614) document.
	Encoding (see page 7610)	Indicates the character set that the XML (see page 7614) document uses to encode characters.
	FileName (see page 7610)	Indicates the XML (see page 7614) document file, if any, that this interface represents.
R	Modified (see page 7611)	Indicates whether the XML (see page 7614) document has been modified.
R	Node (see page 7611)	Provides access to the document node for the XML (see page 7614) document.
	NodeIndentStr (see page 7612)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7614) text.
	Options (see page 7612)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7613)	Specifies implementation-specific options that are followed when parsing the XML (see page 7614) document.
R	SchemaRef (see page 7613)	Returns the name of the schema associated with this XML (see page 7614) document.
	StandAlone (see page 7614)	Indicates whether the XML (see page 7614) document includes any external markup declarations.
	Version (see page 7614)	Indicates the XML (see page 7614) version that the document uses.
	XML (see page 7614)	Specifies the content of the XML document associated with this IXMLDocument (see page 7586) interface.

84.2.1.2 IXMLDocument Methods

The methods of the IXMLDocument class are listed here.

Public Methods

	Name	Description
	AddChild (see page 7589)	This is the overview for the AddChild method overload.
	CreateElement (see page 7590)	Creates a new element node that is associated with this document.
	CreateNode (see page 7591)	Creates a new node that is associated with this document.
	GeneratePrefix (see page 7592)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 7592)	Returns the value of the Active (see page 7607) property.
	GetAsyncLoadState (see page 7593)	Returns the value of the AsyncLoadState (see page 7608) property.
	GetChildNodes (see page 7593)	Returns the value of the ChildNodes (see page 7609) property.
	GetDocBinding (see page 7593)	Replaces a specified child node with an instance of a specified implementation class.

	GetDocumentElement (see page 7594)	Returns the value of the DocumentElement (see page 7609) property.
	GetDocumentNode (see page 7594)	Returns the value of the Node (see page 7611) property.
	GetDOMDocument (see page 7594)	Returns the value of the DOMDocument (see page 7609) property.
	GetEncoding (see page 7595)	Returns the value of the Encoding (see page 7610) property.
	GetFileName (see page 7595)	Returns the value of the FileName (see page 7610) property.
	GetModified (see page 7595)	Returns the value of the Modified (see page 7611) property.
	GetNodeIndentStr (see page 7596)	Returns the value of the NodeIndentStr (see page 7612) property.
	GetOptions (see page 7596)	Returns the value of the Options (see page 7612) property.
	GetParseOptions (see page 7596)	Returns the value of the ParseOptions (see page 7613) property.
	GetSchemaRef (see page 7596)	Returns the value of the SchemaRef (see page 7613) property.
	GetStandAlone (see page 7597)	Returns the value of the StandAlone (see page 7614) property.
	GetVersion (see page 7597)	Returns the value of the Version (see page 7614) property.
	GetXML (see page 7597)	Returns the value of the XML (see page 7614) property.
	IsEmptyDoc (see page 7598)	Indicates whether the IXMLDocument (see page 7586) instance represents an empty document.
	LoadFromFile (see page 7598)	Loads an XML (see page 7614) document from disk.
	LoadFromStream (see page 7599)	Loads an XML (see page 7614) document from a stream and activates it.
	LoadFromXML (see page 7599)	This is the overview for the LoadFromXML method overload.
	Refresh (see page 7600)	Updates the parsed XML (see page 7614) document to reflect external changes.
	RegisterDocBinding (see page 7600)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7601)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7601)	Saves the XML (see page 7614) document to disk.
	SaveToStream (see page 7602)	Saves the XML (see page 7614) document to a stream.
	SaveToXML (see page 7602)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7603)	Sets the value of the Active (see page 7607) property.
	SetDocumentElement (see page 7603)	Sets the value of the DocumentElement (see page 7609) property.
	SetDOMDocument (see page 7604)	Sets the value of the DOMDocument (see page 7609) property.
	SetEncoding (see page 7604)	Sets the value of the Encoding (see page 7610) property.
	SetFileName (see page 7604)	Sets the value of the FileName (see page 7610) property.
	SetNodeIndentStr (see page 7605)	Sets the value of the NodeIndentStr (see page 7612) property.
	SetOnAsyncLoad (see page 7605)	Supplies an event handler that responds when the AsyncLoadState (see page 7608) property changes.
	SetOptions (see page 7605)	Sets the value of the Options (see page 7612) property.
	SetParseOptions (see page 7606)	Sets the value of the ParseOptions (see page 7613) property.
	SetStandAlone (see page 7606)	Sets the value of the StandAlone (see page 7614) property.
	SetVersion (see page 7606)	Sets the value of the Version (see page 7614) property.
	SetXML (see page 7607)	Sets the value of the XML (see page 7614) property.

84.2.1.2.1 AddChild Method

This is the overview for the AddChild method overload.

Overload List

	Name	Description
	IXMLDocument.AddChild (DOMString) (see page 7589)	Creates and adds a node to the child nodes of this document.
	IXMLDocument.AddChild (DOMString, DOMString) (see page 7589)	Creates and adds a node to the child nodes of this document.

84.2.1.2.1.1 IXMLDocument.AddChild Method (DOMString)

Creates and adds a node to the child nodes of this document.

Pascal

```
function AddChild(const TagName: DOMString): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI);
```

Description

Call AddChild to add a new child element node to the document itself. The new node is added to the end of the list maintained by the ChildNodes (see page 7609) property.

TagName is the tag name for the new element node.

NamespaceURI identifies the namespace, if any, that includes the new node's definition.

AddChild returns the interface for the newly created node.

Note: Do not call AddChild to add a child to the document element of this document. When adding data to the XML (see page 7614) document, use the AddChild method of the document element or of the node in the hierarchy that should be the parent of the new node.

See Also

AddChild (see page 7618)

CreateNode (see page 7591)

CreateElement (see page 7590)

ChildNodes (see page 7609)

DocumentElement (see page 7609)

84.2.1.2.2 IXMLDocument.CreateElement Method

Creates a new element node that is associated with this document.

Pascal

```
function CreateElement(const TagOrData: DOMString; const NamespaceURI: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateElement(const DOMString TagOrData, const DOMString NamespaceURI);
```

Description

Call CreateElement to create a new generic element node. The resulting node does not have a parent, but can be added to the ChildNodes (see page 7609) list of any node in the document (including this document's ChildNodes (see page 7609) property). It can also be assigned to the DocumentElement (see page 7609) property to replace the entire data hierarchy of this document.

TagOrData provides the tag name of the newly created node.

NamespaceURI identifies the namespace that includes the new node's definition.

CreateElement returns the interface for the new node.

Note: To add a node as the child of another node in this document, it is simpler to call that node's AddChild (see page 7589) method.

See Also

AddChild (see page 7618)

ChildNodes (see page 7609)

DocumentElement (see page 7609)

AddChild (see page 7589)

CreateNode (see page 7591)

84.2.1.2.3 IXMLDocument.CreateNode Method

Creates a new node that is associated with this document.

Pascal

```
function CreateNode(const NameOrData: DOMString; NodeType: TNodeType = ntElement; const
AddlData: DOMString = ''): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateNode(const DOMString NameOrData, TNodeType NodeType = ntElement,
const DOMString AddlData = '');
```

Description

Call CreateNode to create a new generic XML (see page 7614) node. The resulting node does not have a parent, but can be added to the ChildNodes (see page 7609) or AttributeNodes list of any node in the document (including this document's ChildNodes (see page 7609) property).

NameOrData provides the tag name or value of the newly created node. Its interpretation depends on the type of node created, as indicated in the following table:

NodeType	NameOrData
ntElement	The tag name.
ntAttribute	The attribute name.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.
ntProcessingInstr	The content of the processing instruction, except for the target.

NodeType indicates the type of node to create. It can only be one of the types listed in the previous table.

The meaning of AddlData depends on the node type, as indicated in the following table:

NodeType	AddlData
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.

ntProcessingInstr	The content of the processing instruction, except for the target.

CreateNode returns the interface for the new node.

Note: To add a node as the child of another node in this document, it is simpler to call that node's AddChild (see page 7589) method.

See Also

AddChild (see page 7618)

ChildNodes (see page 7609)

AttributeNodes (see page 7634)

DocumentElement (see page 7609)

CreateElement (see page 7590)

AddChild (see page 7589)

84.2.1.2.4 IXMLDocument.GeneratePrefix Method

Generates a unique namespace prefix that can be used for a node in the document.

Pascal

```
function GeneratePrefix(const Node: IXMLNode): DOMString;
```

C++

```
__fastcall DOMString GeneratePrefix(const IXMLNode Node);
```

Description

The AddChild (see page 7589) method for each node allows the caller to specify that the new node should use an automatically-generated namespace prefix. When this option is specified, the node calls GeneratePrefix to generate a unique string to act as a namespace prefix.

Node (see page 7611) is the interface for the node which will use the newly-generated namespace prefix.

GeneratePrefix returns a unique string that is not already used in the document to represent a namespace URI. The generated namespace prefixes are only unique within a single document.

See Also

AddChild (see page 7618)

84.2.1.2.5 IXMLDocument.GetActive Method

Returns the value of the Active (see page 7607) property.

Pascal

```
function GetActive: Boolean;
```

C++

```
__fastcall Boolean GetActive();
```

Description

GetActive is the read implementation of the Active (see page 7607) property.

See Also

Active (see page 7607)

84.2.1.2.6 IXMLDocument.GetAsyncLoadState Method

Returns the value of the AsyncLoadState (see page 7608) property.

Pascal

```
function GetAsyncLoadState: Integer;
```

C++

```
__fastcall int GetAsyncLoadState();
```

Description

GetAsyncLoadState is the read implementation of the AsyncLoadState (see page 7608) property.

See Also

AsyncLoadState (see page 7608)

84.2.1.2.7 IXMLDocument.GetChildNodes Method

Returns the value of the ChildNodes (see page 7609) property.

Pascal

```
function GetChildNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetChildNodes();
```

Description

GetChildNodes is the read implementation of the ChildNodes (see page 7609) property.

See Also

ChildNodes (see page 7609)

84.2.1.2.8 IXMLDocument.GetDocBinding Method

Replaces a specified child node with an instance of a specified implementation class.

Pascal

```
function GetDocBinding(const TagName: DOMString; DocNodeClass: TClass; NamespaceURI: DOMString
= ''): IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocBinding(const DOMString TagName, TClass DocNodeClass, DOMString
NamespaceURI = '');
```

Description

Call GetDocBinding to specify the implementation class for one of the child nodes of the document node. After replacing the specified node with an instance of the specified class, GetDocBinding returns the interface of the document element.

TagName is the tag name of the child node to be replaced. Typically, this identifies the document element.

DocNodeClass is the implementation class to use for all child nodes with the specified tag name.

NamespaceURI is the URI of the namespace in which TagName is defined.

See Also

DocumentElement (see page 7609)

RegisterDocBinding (see page 7600)

ChildNodes (see page 7609)

84.2.1.2.9 IXMLDocument.GetDocumentElement Method

Returns the value of the DocumentElement (see page 7609) property.

Pascal

```
function GetDocumentElement: IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocumentElement();
```

Description

GetDocumentElement is the read implementation of the DocumentElement (see page 7609) property.

See Also

DocumentElement (see page 7609)

84.2.1.2.10 IXMLDocument.GetDocumentNode Method

Returns the value of the Node (see page 7611) property.

Pascal

```
function GetDocumentNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocumentNode();
```

Description

GetDocumentNode is the read implementation of the Node (see page 7611) property.

See Also

Node (see page 7611)

84.2.1.2.11 IXMLDocument.GetDOMDocument Method

Returns the value of the DOMDocument (see page 7609) property.

Pascal

```
function GetDOMDocument: IDOMDocument;
```

C++

```
__fastcall IDOMDocument GetDOMDocument();
```

Description

GetDOMDocument is the read implementation of the DOMDocument (see page 7609) property.

See Also

DOMDocument (see page 7609)

84.2.1.2.12 IXMLDocument.GetEncoding Method

Returns the value of the Encoding (see page 7610) property.

Pascal

```
function GetEncoding: DOMString;
```

C++

```
__fastcall DOMString GetEncoding();
```

Description

GetEncoding is the read implementation of the Encoding (see page 7610) property.

See Also

Encoding (see page 7610)

84.2.1.2.13 IXMLDocument.GetFileName Method

Returns the value of the FileName (see page 7610) property.

Pascal

```
function GetFileName: DOMString;
```

C++

```
__fastcall DOMString GetFileName();
```

Description

GetFileName is the read implementation of the FileName (see page 7610) property.

See Also

FileName (see page 7610)

84.2.1.2.14 IXMLDocument.GetModified Method

Returns the value of the Modified (see page 7611) property.

Pascal

```
function GetModified: Boolean;
```

C++

```
__fastcall Boolean GetModified();
```

Description

GetModified is the read implementation of the Modified (see page 7611) property.

See Also

Modified (see page 7611)

84.2.1.2.15 IXMLDocument.GetNodeIndentStr Method

Returns the value of the NodeIndentStr (see page 7612) property.

Pascal

```
function GetNodeIndentStr: DOMString;
```

C++

```
__fastcall DOMString GetNodeIndentStr();
```

Description

GetNodeIndentStr is the read implementation of the NodeIndentStr (see page 7612) property.

See Also

NodeIndentStr (see page 7612)

84.2.1.2.16 IXMLDocument.GetOptions Method

Returns the value of the Options (see page 7612) property.

Pascal

```
function GetOptions: TXMLDocOptions;
```

C++

```
__fastcall TXMLDocOptions GetOptions();
```

Description

GetOptions is the read implementation of the Options (see page 7612) property.

See Also

Options (see page 7612)

84.2.1.2.17 IXMLDocument.GetParseOptions Method

Returns the value of the ParseOptions (see page 7613) property.

Pascal

```
function GetParseOptions: TParseOptions;
```

C++

```
__fastcall TParseOptions GetParseOptions();
```

Description

GetParseOptions is the read implementation of the ParseOptions (see page 7613) property.

See Also

ParseOptions (see page 7613)

84.2.1.2.18 IXMLDocument.GetSchemaRef Method

Returns the value of the SchemaRef (see page 7613) property.

Pascal

```
function GetSchemaRef: DOMString;
```

C++

```
__fastcall DOMString GetSchemaRef();
```

Description

GetSchemaRef is the read implementation of the SchemaRef (see page 7613) property.

See Also

SchemaRef (see page 7613)

84.2.1.2.19 IXMLDocument.GetStandAlone Method

Returns the value of the StandAlone (see page 7614) property.

Pascal

```
function GetStandAlone: DOMString;
```

C++

```
__fastcall DOMString GetStandAlone();
```

Description

GetStandAlone is the read implementation of the StandAlone (see page 7614) property.

See Also

StandAlone (see page 7614)

84.2.1.2.20 IXMLDocument.GetVersion Method

Returns the value of the Version (see page 7614) property.

Pascal

```
function GetVersion: DOMString;
```

C++

```
__fastcall DOMString GetVersion();
```

Description

GetVersion is the read implementation of the Version (see page 7614) property.

See Also

Version (see page 7614)

84.2.1.2.21 IXMLDocument.GetXML Method

Returns the value of the XML (see page 7614) property.

Pascal

```
function GetXML: TStrings;
```

C++

```
__fastcall TStrings GetXML();
```

Description

GetXML is the read implementation of the XML (see page 7614) property.

See Also

XML (see page 7614)

84.2.1.2.22 IXMLDocument.IsEmptyDoc Method

Indicates whether the IXMLDocument (see page 7586) instance represents an empty document.

Pascal

```
function IsEmptyDoc: Boolean;
```

C++

```
__fastcall Boolean IsEmptyDoc();
```

Description

Call IsEmptyDoc to determine whether the IXMLDocument (see page 7586) instance represents an empty document. IsEmptyDoc returns true if the DOMDocument (see page 7609) property is not set (for example, if there is no DOM implementation) or if this interface represents a document with no child nodes.

See Also

XML (see page 7614)

ChildNodes (see page 7609)

DOMDocument (see page 7609)

84.2.1.2.23 IXMLDocument.LoadFromFile Method

Loads an XML (see page 7614) document from disk.

Pascal

```
procedure LoadFromFile(const AFileName: DOMString);
```

C++

```
__fastcall LoadFromFile(const DOMString AFileName);
```

Description

Call LoadFromFile to load the XML (see page 7614) document specified by AFileName so that you can examine or modify it.

AFileName is the name of the file to load.

Once you have loaded an XML (see page 7614) document, any changes you make to the document are not saved back to disk until you call the SaveToFile (see page 7601) method.

See Also

SaveToFile (see page 7601)

XML (see page 7614)

FileName (see page 7610)

84.2.1.2.24 IXMLDocument.LoadFromStream Method

Loads an XML (see page 7614) document from a stream and activates it.

Pascal

```
procedure LoadFromStream(const Stream: TStream; EncodingType: TXMLEncodingType = xetUnknown);
```

C++

```
__fastcall LoadFromStream(const TStream Stream, TXMLEncodingType EncodingType = xetUnknown);
```

Description

Call LoadFromStream to load the XML (see page 7614) document from a stream.

Stream is a stream object that can be used to read the string of XML (see page 7614) that makes up the document.

EncodingType indicates the character set that is used for Stream. If EncodingType is xetUnknown (the default), LoadFromStream attempts to infer the encoding type from the XML (see page 7614) encoding declaration at the beginning of the document.

After loading the document from Stream, LoadFromStream sets the Active (see page 7607) property to true.

See Also

SaveToStream (see page 7602)

LoadFromFile (see page 7598)

LoadFromXML (see page 7599)

Active (see page 7607)

84.2.1.2.25 LoadFromXML Method

This is the overview for the LoadFromXML method overload.

Overload List

	Name	Description
	IXMLDocument.LoadFromXML (AnsiString) (see page 7599)	Loads a string representation of an XML (see page 7614) document and activates it.
	IXMLDocument.LoadFromXML (DOMString) (see page 7599)	Loads a string representation of an XML (see page 7614) document and activates it.

84.2.1.2.25.1 IXMLDocument.LoadFromXML Method (AnsiString)

Loads a string representation of an XML (see page 7614) document and activates it.

Pascal

```
procedure LoadFromXML(const XML: AnsiString); overload;
procedure LoadFromXML(const XML: DOMString); overload;
```

C++

```
__fastcall LoadFromXML(const AnsiString XML);
__fastcall LoadFromXML(const DOMString XML);
```

Description

Call LoadFromXML to assign a string as the value of the XML (see page 7614) document. Unlike the XML (see page 7614)

property, which lets you assign XML (see page 7614) on a line-by-line basis, LoadFromXML treats the text of the XML (see page 7614) document as a whole.

After assigning the XML (see page 7614) property as the contents of the document, LoadFromXML sets the Active (see page 7607) property to true.

See Also

SaveToXML (see page 7602)

LoadFromFile (see page 7598)

Active (see page 7607)

LoadFromStream (see page 7599)

XML (see page 7614)

84.2.1.2.26 IXMLDocument.Refresh Method

Updates the parsed XML (see page 7614) document to reflect external changes.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh when the XML (see page 7614) document specified by FileName (see page 7610) has changed due to an external cause. Refresh updates the parsed version of the XML (see page 7614) document (which can be traversed starting with DocumentElement (see page 7609)) to reflect the current contents of the file specified by FileName (see page 7610).

The Active (see page 7607) property must be true when you call Refresh.

Note: Do not call Refresh after making changes directly to the XML (see page 7614) property, because assigning a value to XML (see page 7614) automatically closes the XML (see page 7614) document. To refresh the XML (see page 7614) document after assigning a new value to XML (see page 7614), set the Active (see page 7607) property to true.

See Also

FileName (see page 7610)

Active (see page 7607)

DOMDocument (see page 7609)

DocumentElement (see page 7609)

Resync (see page 7601)

84.2.1.2.27 IXMLDocument.RegisterDocBinding Method

Registers an implementation class for child nodes with a specified tag name.

Pascal

```
procedure RegisterDocBinding(const TagName: DOMString; DocNodeClass: TClass; NamespaceURI:
DOMString = '');
```

C++

```
__fastcall RegisterDocBinding(const DOMString TagName, TClass DocNodeClass, DOMString
NamespaceURI = '');
```

Description

Call RegisterDocBinding to specify the implementation class for one of the child nodes of the document node. RegisterDocBinding replaces the specified node with an instance of the specified class.

TagName is the tag name of the child node to be replaced. Typically, this identifies the document element.

DocNodeClass is the implementation class to use for all child nodes with the specified tag name.

NamespaceURI is the URI of the namespace in which TagName is defined.

See Also

DocumentElement (see page 7609)

GetDocBinding (see page 7593)

ChildNodes (see page 7609)

84.2.1.2.28 IXMLDocument.Resync Method

Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

Pascal

```
procedure Resync;
```

C++

```
__fastcall Resync();
```

Description

Resync forces the document to reread the values of its child nodes and attribute nodes, discarding any changes that have not been propagated to the underlying DOM implementation.

See Also

ChildNodes (see page 7609)

84.2.1.2.29 IXMLDocument.SaveToFile Method

Saves the XML (see page 7614) document to disk.

Pascal

```
procedure SaveToFile(const AFileName: DOMString);
```

C++

```
__fastcall SaveToFile(const DOMString AFileName);
```

Description

Call SaveToFile to save any modifications you have made to the parsed XML (see page 7614) document.

AFileName is the name of the file to save.

Tip: To save the modifications back to the file from which the document was originally read, use the value of the FileName (see page 7610) property for the AFileName parameter.

See Also

LoadFromFile (see page 7598)

XML (see page 7614)

FileName (see page 7610)

84.2.1.2.30 IXMLDocument.SaveToStream Method

Saves the XML (see page 7614) document to a stream.

Pascal

```
procedure SaveToStream(const Stream: TStream);
```

C++

```
__fastcall SaveToStream(const TStream Stream);
```

Description

Call SaveToStream to save the contents of the XML (see page 7614) document to the stream specified by Stream. Regardless of the encoding system of the original XML (see page 7614) document, SaveToStream always saves the stream in UTF-16.

See Also

LoadFromStream (see page 7599)

SaveToXML (see page 7602)

SaveToFile (see page 7601)

84.2.1.2.31 SaveToXML Method

This is the overview for the SaveToXML method overload.

Overload List

	Name	Description
	IXMLDocument.SaveToXML (DOMString) (see page 7602)	Saves the XML (see page 7614) document to a string-type variable.
	IXMLDocument.SaveToXML (UTF8String) (see page 7602)	Saves the XML (see page 7614) document to a string-type variable.
	IXMLDocument.SaveToXML (WideString) (see page 7602)	Saves the XML (see page 7614) document to a string-type variable.

84.2.1.2.31.1 IXMLDocument.SaveToXML Method (DOMString)

Saves the XML (see page 7614) document to a string-type variable.

Pascal

```
procedure SaveToXML(var XML: DOMString); overload;
procedure SaveToXML(var XML: WideString); overload;
procedure SaveToXML(var XML: UTF8String); overload;
```

C++

```
__fastcall SaveToXML(DOMString XML);
```

```
__fastcall SaveToXML(BSTR XML);
__fastcall SaveToXML(UTF8String XML);
```

Description

Call SaveToXML to save the contents of the XML (see page 7614) document to the string-type variable specified by XML (see page 7614). SaveToXML writes the contents of XML (see page 7614) document using UTF-8 or UTF-16 as an encoding system, depending on the type of the XML (see page 7614) parameter.

Unlike the XML (see page 7614) property, which lets you write individual lines from the XML (see page 7614) document, SaveToXML writes the entire text of the XML (see page 7614) document.

See Also

LoadFromXML (see page 7599)

SaveToStream (see page 7602)

SaveToFile (see page 7601)

XML (see page 7614)

84.2.1.2.32 IXMLDocument.SetActive Method

Sets the value of the Active (see page 7607) property.

Pascal

```
procedure SetActive(const Value: Boolean);
```

C++

```
__fastcall SetActive(const Boolean Value);
```

Description

SetActive is the write implementation of the Active (see page 7607) property.

Value is the new value to set.

See Also

Active (see page 7607)

84.2.1.2.33 IXMLDocument.SetDocumentElement Method

Sets the value of the DocumentElement (see page 7609) property.

Pascal

```
procedure SetDocumentElement(const Value: IXMLNode);
```

C++

```
__fastcall SetDocumentElement(const IXMLNode Value);
```

Description

SetDocumentElement is the write implementation of the DocumentElement (see page 7609) property.

Value is the interface for the node tree that replaces the current document element.

See Also

DocumentElement (see page 7609)

84.2.1.2.34 IXMLDocument.SetDOMDocument Method

Sets the value of the DOMDocument (see page 7609) property.

Pascal

```
procedure SetDOMDocument(const Value: IDOMDocument);
```

C++

```
__fastcall SetDOMDocument(const IDOMDocument Value);
```

Description

SetDOMDocument is the write implementation of the DOMDocument (see page 7609) property.

Value is the DOM interface for the document to assign.

See Also

DOMDocument (see page 7609)

84.2.1.2.35 IXMLDocument.SetEncoding Method

Sets the value of the Encoding (see page 7610) property.

Pascal

```
procedure SetEncoding(const Value: DOMString);
```

C++

```
__fastcall SetEncoding(const DOMString Value);
```

Description

SetEncoding is the write implementation of the Encoding (see page 7610) property.

Value is the value of the encoding attribute of the document type node.

See Also

Encoding (see page 7610)

84.2.1.2.36 IXMLDocument.SetFileName Method

Sets the value of the FileName (see page 7610) property.

Pascal

```
procedure SetFileName(const Value: DOMString);
```

C++

```
__fastcall SetFileName(const DOMString Value);
```

Description

SetFileName is the write implementation of the FileName (see page 7610) property.

Value is the name of an XML (see page 7614) document or, if the vendor supports it, an URL for the XML (see page 7614) document.

See Also

FileName (see page 7610)

84.2.1.2.37 IXMLDocument.SetNodeIndentStr Method

Sets the value of the NodeIndentStr (see page 7612) property.

Pascal

```
procedure SetNodeIndentStr(const Value: DOMString);
```

C++

```
__fastcall SetNodeIndentStr(const DOMString Value);
```

Description

SetNodeIndentStr is the write implementation of the NodeIndentStr (see page 7612) property.

Value is the string that is inserted before nested nodes to indicate a level of nesting.

See Also

NodeIndentStr (see page 7612)

84.2.1.2.38 IXMLDocument.SetOnAsyncLoad Method

Supplies an event handler that responds when the AsyncLoadState (see page 7608) property changes.

Pascal

```
procedure SetOnAsyncLoad(const Value: TAsyncEventHandler);
```

C++

```
__fastcall SetOnAsyncLoad(const TAsyncEventHandler Value);
```

Description

Use SetOnAsyncLoad to supply a callback that responds when the asynchronous parsing of an XML (see page 7614) document progresses to a certain point.

Value is a method that is called when the AsyncLoadState (see page 7608) property changes to reflect a new stage in the parsing process.

See Also

AsyncLoadState (see page 7608)

84.2.1.2.39 IXMLDocument.SetOptions Method

Sets the value of the Options (see page 7612) property.

Pascal

```
procedure SetOptions(const Value: TXMLDocOptions);
```

C++

```
__fastcall SetOptions(const TXMLDocOptions Value);
```

Description

GetOptions (see page 7596) is the write implementation of the Options (see page 7612) property.

Value is the set of options to assign.

See Also

Options (see page 7612)

84.2.1.2.40 IXMLDocument.SetParseOptions Method

Sets the value of the ParseOptions (see page 7613) property.

Pascal

```
procedure SetParseOptions(const Value: TParseOptions);
```

C++

```
__fastcall SetParseOptions(const TParseOptions Value);
```

Description

GetParseOptions (see page 7596) is the write implementation of the ParseOptions (see page 7613) property.

Value is the set of parser options to assign.

See Also

ParseOptions (see page 7613)

84.2.1.2.41 IXMLDocument.SetStandAlone Method

Sets the value of the StandAlone (see page 7614) property.

Pascal

```
procedure SetStandAlone(const Value: DOMString);
```

C++

```
__fastcall SetStandAlone(const DOMString Value);
```

Description

SetStandAlone is the write implementation of the StandAlone (see page 7614) property.

Value is the value of the stand-alone attribute of the document type node.

See Also

StandAlone (see page 7614)

84.2.1.2.42 IXMLDocument.SetVersion Method

Sets the value of the Version (see page 7614) property.

Pascal

```
procedure SetVersion(const Value: DOMString);
```

C++

```
__fastcall SetVersion(const DOMString Value);
```

Description

SetVersion is the write implementation of the Version (see page 7614) property.

Value is the value of the version attribute of the document type node.

See Also

Version (see page 7614)

84.2.1.2.43 IXMLDocument.SetXML Method

Sets the value of the XML (see page 7614) property.

Pascal

```
procedure SetXML(const Value: TStrings);
```

C++

```
__fastcall SetXML(const TStrings Value);
```

Description

SetXML is the write implementation of the XML (see page 7614) property.

Value contains the raw (unparsed) XML (see page 7614) to assign.

See Also

XML (see page 7614)

84.2.1.3 IXMLDocument Properties

The properties of the IXMLDocument class are listed here.

Public Properties

	Name	Description
	Active (see page 7607)	Specifies whether the XML (see page 7614) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 7608)	Indicates the state of the DOM parser when it parses the XML (see page 7614) document asynchronously.
R	ChildNodes (see page 7609)	Lists all of the child nodes of the document.
	DocumentElement (see page 7609)	Provides access to the root node of the XML (see page 7614) document.
	DOMDocument (see page 7609)	Provides access to the DOM interface for the parsed XML (see page 7614) document.
	Encoding (see page 7610)	Indicates the character set that the XML (see page 7614) document uses to encode characters.
	FileName (see page 7610)	Indicates the XML (see page 7614) document file, if any, that this interface represents.
R	Modified (see page 7611)	Indicates whether the XML (see page 7614) document has been modified.
R	Node (see page 7611)	Provides access to the document node for the XML (see page 7614) document.
	NodeIndentStr (see page 7612)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7614) text.
	Options (see page 7612)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7613)	Specifies implementation-specific options that are followed when parsing the XML (see page 7614) document.
R	SchemaRef (see page 7613)	Returns the name of the schema associated with this XML (see page 7614) document.
	StandAlone (see page 7614)	Indicates whether the XML (see page 7614) document includes any external markup declarations.
	Version (see page 7614)	Indicates the XML (see page 7614) version that the document uses.
	XML (see page 7614)	Specifies the content of the XML document associated with this IXMLDocument (see page 7586) interface.

84.2.1.3.1 IXMLDocument.Active Property

Specifies whether the XML (see page 7614) document has been parsed so that the DOM interfaces are available to examine or change its contents.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before you can use IXMLDocument (see page 7586) to examine or change the contents of an XML (see page 7614) document, it must be active. Setting Active to true results in the parsing of the XML (see page 7614) document specified by the FileName (see page 7610) property or by the XML (see page 7614) property. If both FileName (see page 7610) and XML (see page 7614) are empty strings, Setting Active to true causes IXMLDocument (see page 7586) to represent an empty document.

Active must be true before you can access the DOMDocument (see page 7609) or DocumentElement (see page 7609) properties.

See Also

DOMDocument (see page 7609)

DocumentElement (see page 7609)

FileName (see page 7610)

XML (see page 7614)

84.2.1.3.2 IXMLDocument.AsyncLoadState Property

Indicates the state of the DOM parser when it parses the XML (see page 7614) document asynchronously.

Pascal

```
property AsyncLoadState: Integer;
```

C++

```
__property int AsyncLoadState;
```

Description

Use AsyncLoadState to determine that status of the DOM parser when it is parsing an XML (see page 7614) document asynchronously. The value of AsyncLoadState is vendor-specific. That is, each DOM parser that loads and parses an XML (see page 7614) document asynchronously supplies its own flags to indicate state information.

When the DOM vendor is MSXML, AsyncLoadState can have any of the following values:

Value	Meaning
0	Uninitialized: The AsyncLoadState is not assigned. (Usually indicates that the parser has not tried to parse a document or it is not parsing the document asynchronously.)
1	Loading: The parser is currently parsing the structure of the XML (see page 7614) document.
2	Loaded: The parser has finished reading and parsing the structure of the XML (see page 7614) document, but the corresponding DOM interfaces are not yet available.
3	Interactive: The parser has parsed the structure of the XML (see page 7614) document, the corresponding DOM interfaces are available, but the parser has not finished reading all the node values.
4	Complete: The parser has fully read and parsed the XML (see page 7614) document.

See Also

SetOnAsyncLoad (see page 7605)

84.2.1.3.3 IXMLDocument.ChildNodes Property

Lists all of the child nodes of the document.

Pascal

```
property ChildNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList ChildNodes;
```

Description

Use ChildNodes to access all of the nodes that are children of the document object. In addition to DocumentElement (see page 7609), which is the root of the data hierarchy, ChildNodes can include nodes for comments, processing instructions, and so on.

See Also

DocumentElement (see page 7609)

Node (see page 7611)

84.2.1.3.4 IXMLDocument.DocumentElement Property

Provides access to the root node of the XML (see page 7614) document.

Pascal

```
property DocumentElement: IXMLNode;
```

C++

```
__property IXMLNode DocumentElement;
```

Description

Use DocumentElement to access the root node of the XML (see page 7614) document. Because XML (see page 7614) documents are hierarchical in structure, DocumentElement is the entry point to all data in the XML (see page 7614) document. Setting DocumentElement replaces the entire data hierarchy with a new hierarchy of nodes.

The IXMLNode (see page 7615) interface includes properties and methods for examining and changing the text and attributes of a node, for adding and deleting child nodes, and for traversing the hierarchy of nodes rooted at that node.

See Also

DOMDocument (see page 7609)

ChildNodes (see page 7609)

84.2.1.3.5 IXMLDocument.DOMDocument Property

Provides access to the DOM interface for the parsed XML (see page 7614) document.

Pascal

```
property DOMDocument: IDOMDocument;
```

C++

```
__property IDOMDocument DOMDocument;
```

Description

Use DOMDocument to directly access the IDOMDocument (see page 7482) interface for the parsed XML (see page 7614) document. This is the interface supported by the DOM parser for the document.

Most applications do not need to use the DOMDocument property directly. Instead, it supplies the underlying support for parsing and manipulating the nodes accessed through DocumentElement (see page 7609). If you do want to make use of DOMDocument's low-level support, you must be familiar with the W3C Document Object Model (DOM) Specification.

See Also

DocumentElement (see page 7609)

84.2.1.3.6 IXMLDocument.Encoding Property

Indicates the character set that the XML (see page 7614) document uses to encode characters.

Pascal

```
property Encoding: DOMString;
```

C++

```
__property DOMString Encoding;
```

Description

Encoding is the encoding name that appears in the document type declaration of the XML (see page 7614) document. It is a string such as 'UTF-8', 'UTF-16', or 'ISO-10646-UCS-2' that indicates the character set used in the document.

See Also

FileName (see page 7610)

DOMDocument (see page 7609)

XML (see page 7614)

84.2.1.3.7 IXMLDocument.FileName Property

Indicates the XML (see page 7614) document file, if any, that this interface represents.

Pascal

```
property FileName: DOMString;
```

C++

```
__property DOMString FileName;
```

Description

Use FileName to get or set the name of the XML (see page 7614) file that this document represents. FileName is set automatically when an application calls the LoadFromFile (see page 7598) method or when this interface is obtained from the global LoadXMLDocument function.

When you set the value of FileName, the XML (see page 7614) property automatically changes (at runtime) to represent the contents of that file.

Note: The content of this XML (see page 7614) document, which is available as the value of the XML (see page 7614) property, may not be the same as the content of the specified file. If an application uses IXMLDocument (see page 7586) to

edit the document, those changes are not saved back to the XML (see page 7614) document file until you call the SaveToFile (see page 7601) method.

Tip: If the underlying DOM implementation supports it, you can use FileName to specify an URL rather than a file on disk.

See Also

SaveToFile (see page 7601)

LoadFromFile (see page 7598)

LoadXMLDocument (see page 7442)

XML (see page 7614)

84.2.1.3.8 IXMLDocument.Modified Property

Indicates whether the XML (see page 7614) document has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Read (see page 3727) Modified to determine whether the application has made any changes to the nodes in the XML (see page 7614) document. When Modified is true, the value of the XML (see page 7614) property may differ from the contents of the file specified by FileName (see page 7610). You can call the SaveToFile (see page 7601) method to update the XML (see page 7614) document file to reflect the changes.

See Also

Resync (see page 7601)

SaveToFile (see page 7601)

XML (see page 7614)

FileName (see page 7610)

84.2.1.3.9 IXMLDocument.Node Property

Provides access to the document node for the XML (see page 7614) document.

Pascal

```
property Node: IXMLNode;
```

C++

```
__property IXMLNode Node;
```

Description

Read (see page 3727) Node to access the document node for the XML (see page 7614) document. The document node represents information about the entire document. It may have several child nodes, which represent comments, processing instructions, and which include the DocumentElement (see page 7609) node that acts as the root of the data hierarchy.

See Also

DocumentElement (see page 7609)

ChildNodes (see page 7609)

84.2.1.3.10 IXMLDocument.NodeIndentStr Property

Indicates the string that is inserted before nested nodes in the formatted XML (see page 7614) text.

Pascal

```
property NodeIndentStr: DOMString;
```

C++

```
__property DOMString NodeIndentStr;
```

Description

Use NodeIndentStr to customize how the document formats nodes that are added. When the Options (see page 7612) property includes doNodeAutoIndent, this string is inserted in the generated XML (see page 7614) before any newly added node, once for each nesting level.

If you do not assign a value to NodeIndentStr, IXMLDocument (see page 7586) inserts two spaces to represent each nesting level.

See Also

Options (see page 7612)

NestingLevel (see page 7380)

FormatXMLData (see page 7441)

XML (see page 7614)

84.2.1.3.11 IXMLDocument.Options Property

Influences various aspects of the document's behavior.

Pascal

```
property Options: TXMLDocOptions;
```

C++

```
__property TXMLDocOptions Options;
```

Description

Set Options to configure how you want the document to respond when the application tries to read nodes or attributes that do not exist, when it creates a new namespace when adding a node, when it generates XML (see page 7614) text from the nodes in the document, or whether it saves its value automatically when you close the document. Options can include any of the following values:

Value	Meaning
doNodeAutoCreate	If the application tries to read a node by name, using the Nodes property of an IXMLNodeList (see page 7649) interface, and that node does not exist, then the application creates a new node using the specified name.
doNodeAutoIndent	When formatting the XML (see page 7614) text from the parsed set of nodes, child nodes are automatically indented from their parent nodes.

doAttrNull	When reading the value of an attribute that does not exist, the value is given as a Null Variant (see page 3430) (as opposed to a value of an empty string).
doAutoPrefix	When generating the name of a new node, the value is automatically given a namespace prefix if a namespace URI is supplied.
doNamespaceDecl	When the AddChild (see page 7589) method must create a new namespace for the node, it also adds a namespace attribute to declare that new namespace. If doNamespaceDecl is not included, AddChild (see page 7589) creates the new namespace but does not add an attribute to declare it.
doAutoSave	When you close the document (set Active (see page 7607) to false), any changes are automatically saved back to the file specified by FileName (see page 7610) or to the XML (see page 7614) property.

See Also

Nodes (see page 7660)

Attributes (see page 7634)

AddChild (see page 7618)

84.2.1.3.12 IXMLDocument.ParseOptions Property

Specifies implementation-specific options that are followed when parsing the XML (see page 7614) document.

Pascal

```
property ParseOptions: TParseOptions;
```

C++

```
__property TParseOptions ParseOptions;
```

Description

Set ParseOptions to influence the way the DOM implementation parses the XML (see page 7614) document. Different DOM implementations support different options. If you attempt to use an option that is not supported by your DOM implementation, IXMLDocument (see page 7586) raises an EXMLDocError (see page 7585) exception.

See Also

domimplementation (see page 7337)

EXMLDocError (see page 7585)

84.2.1.3.13 IXMLDocument.SchemaRef Property

Returns the name of the schema associated with this XML (see page 7614) document.

Pascal

```
property SchemaRef: DOMString;
```

C++

```
__property DOMString SchemaRef;
```

Description

Read (see page 3727) SchemaRef to determine the schema associated with this XML (see page 7614) document. If the document does not have an attribute that identifies an associated schema, the value of SchemaRef is an empty string.

See Also

DOMDocument (see page 7609)

84.2.1.3.14 IXMLDocument.StandAlone Property

Indicates whether the XML (see page 7614) document includes any external markup declarations.

Pascal

```
property StandAlone: DOMString;
```

C++

```
__property DOMString StandAlone;
```

Description

StandAlone is the value of the stand-alone attribute on the document type declaration of the XML (see page 7614) document. StandAlone has a value of 'yes' or 'no'.

When StandAlone is 'yes', the document contains no external markup declarations. It may, however, still contain references to external entities, as long as they are not declarations.

When StandAlone is 'no', the document may or may not contain external markup declarations.

See Also

DOMDocument (see page 7609)

84.2.1.3.15 IXMLDocument.Version Property

Indicates the XML (see page 7614) version that the document uses.

Pascal

```
property Version: DOMString;
```

C++

```
__property DOMString Version;
```

Description

Version indicates the XML (see page 7614) version number that the document uses. An XML (see page 7614) version number is a string of the form 'n.m', where n is the major version number and m is the minor version number.

See Also

XML (see page 7614)

84.2.1.3.16 IXMLDocument.XML Property

Specifies the content of the XML document associated with this IXMLDocument (see page 7586) interface.

Pascal

```
property XML: TStrings;
```

C++

```
__property TStrings XML;
```

Description

Read (see page 3727) XML to obtain the contents of the associated XML document. Set XML to specify the raw (unparsed)

XML you want to examine or manipulate.

XML is a TStrings object. This means you can manipulate the XML line by line. To read or write the XML in the document as a single string, use the LoadFromXML (see page 7599) or SaveToXML (see page 7602) method.

Note: If you call the LoadFromFile (see page 7598), LoadFromStream (see page 7599), or LoadFromXML (see page 7599) method, XML is automatically updated to reflect the contents of that file.

See Also

LoadFromFile (see page 7598)

DocumentElement (see page 7609)

TXMLDocument (see page 7299)

LoadFromXML (see page 7599)

SaveToXML (see page 7602)

LoadFromStream (see page 7599)

84.2.2 IXMLNode Interface

IXMLNode is the interface for a node in an XML (see page 7643) document.

Class Hierarchy

Pascal

```
IXMLNode = interface;
```

C++

```
__interface IXMLNode;
```

File

XMLIntf

Description

Use IXMLNode to work with a node in an XML (see page 7643) document. The IXMLNode interface is designed to work with TXMLDocument and the code generated by the Data Binding wizard.

IXMLNode is similar to the IDOMNode (see page 7509) interface that is defined as part of the Document Object Model (DOM) specification. However, IXMLNode is designed to simplify the task of navigating and editing XML (see page 7643) documents by

including some of the properties and methods from the IDOMElement (see page 7494) interface, resulting in a simpler model for examining an XML (see page 7643) node.

including additional properties and methods to simplify access to data in common XML (see page 7643) structures.

The Data Binding wizard generates descendants of IXMLNode that further simplify the task of working with XML (see page 7643) documents by converting the attributes and child nodes of a node into properties of the node interface.

Note: C++ method declarations that use IXMLNode use the _di_IXMLNode type instead. This type is a DelphiInterface (see page 3263) wrapper around the IXMLNode interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IXMLNode >  _di_IXMLNode;
```

See Also

TXMLNode (see page 7348)

TXMLDocument (see page 7299)

IXMLNodeCollection (see page 7644)

IDOMNode (see page 7509)

IXMLNodeList (see page 7649)

Working with XML Nodes

84.2.2.1 IXMLNode Members

The following tables list the members exposed by IXMLNode.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.

	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

84.2.2.2 IXMLNode Methods

The methods of the IXMLNode class are listed here.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.

	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

84.2.2.2.1 AddChild Method

This is the overview for the AddChild method overload.

Overload List

	Name	Description
	IXMLNode.AddChild (DOMString, DOMString, Boolean, Integer) (see page 7618)	Adds a new child node to this node.
	IXMLNode.AddChild (DOMString, Integer) (see page 7618)	Adds a new child node to this node.

84.2.2.2.1.1 IXMLNode.AddChild Method (DOMString, DOMString, Boolean, Integer)

Adds a new child node to this node.

Pascal

```
function AddChild(const TagName: DOMString; Index: Integer = -1): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString; GenPrefix: Boolean
= False; Index: Integer = -1): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName, int Index = -1);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI, Boolean
GenPrefix = False, int Index = -1);
```

Description

AddChild creates a new element node as the child of this node.

TagName provides the tag name of the newly created node.

NamespaceURI (see page 7639) identifies the namespace that includes the new node's definition. If NamespaceURI (see page 7639) is omitted (the second syntax), the namespace of the new node is deduced from the namespace prefix of TagName. If TagName has no namespace prefix and there is no NamespaceURI (see page 7639) parameter, the namespace is the

same as this node's NamespaceURI (see page 7639) property.

GenPrefix controls whether AddChild generates a namespace prefix for the namespace URI when the NamespaceURI (see page 7639) parameter identifies a URI that is not already declared in the document. Note that setting GenPrefix to true does not cause AddChild to add a declaration of the new namespace prefix unless the document's Options property includes doNamespaceDecl.

Index indicates the position of the child node in this node's list of children, where 0 is the first position, 1 is the second position, and so on. If Index is –1, the new node is added to the end.

AddChild returns the interface for the newly created child node.

Tip: AddChild only adds element nodes. To add other types of child nodes, use the XML (see page 7643) document's CreateNode method instead, and then add the resulting node to the ChildNodes (see page 7635) property array.

See Also

Delete (see page 7653)

ChildNodes (see page 7635)

CreateNode (see page 7591)

NamespaceURI (see page 7639)

Options (see page 7341)

Working with XML Nodes

84.2.2.2.2 IXMLNode.CloneNode Method

Creates a copy of this node and returns its interface.

Pascal

```
function CloneNode(Deep: Boolean): IXMLNode;
```

C++

```
__fastcall IXMLNode CloneNode(Boolean Deep);
```

Description

CloneNode returns a copy of this node that has no parent. Any attributes of this node are copied as well, including attribute nodes that represent default values.

Deep indicates whether the child nodes of this node should be cloned as well. For example, if an element node contains any text, CloneNode only copies then text when deep is true, because in the underlying DOM implementation, the text is contained in a child node.

After calling CloneNode to create a new node, you can add that node into the ChildNodes (see page 7635) property of another node (or, if this node represents an attribute, into the AttributeNodes (see page 7634) property) by calling ChildNodes (see page 7635). ->Add or ChildNodes (see page 7635). ->Insert (see page 3698).

See Also

ChildNodes (see page 7635)

AddChild (see page 7618)

ParentNode (see page 7641)

CloneNode (see page 7512)

Add (see page 7651)

Insert (see page 7658)

84.2.2.2.3 IXMLNode.DeclareNamespace Method

Adds an attribute to the node that declares a specified namespace URI.

Pascal

```
procedure DeclareNamespace(const Prefix: DOMString; const URI: DOMString);
```

C++

```
__fastcall DeclareNamespace(const DOMString Prefix, const DOMString URI);
```

Description

DeclareNamespace adds an attribute to this node that declares the specified namespace URI as the value of the specified prefix.

Prefix (see page 7642) is the namespace prefix that appears in tag names that reference the namespace.

URI is the corresponding namespace URI.

Note: This method is called automatically for newly created nodes when the document's Options property includes doNamespaceDecl.

See Also

Options (see page 7612)

Attributes (see page 7634)

FindNamespaceDecl (see page 7620)

84.2.2.2.4 IXMLNode.FindNamespaceDecl Method

Returns the attribute node that declares a specified Namespace URI.

Pascal

```
function FindNamespaceDecl(const NamespaceURI: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode FindNamespaceDecl(const DOMString NamespaceURI);
```

Description

FindNamespaceDecl searches the node hierarchy that contains this node for an attribute that specifies the mapping between a namespace prefix and the namespace URI identified by NamespaceURI (see page 7639). If it finds such a mapping, FindNamespaceDecl returns the interface for the Attribute node. If it does not find a mapping, FindNamespaceDecl returns nil (Delphi) or NULL (C++).

NamespaceURI (see page 7639) is the namespace URI to locate.

See Also

FindNamespaceURI (see page 7620)

DeclareNamespace (see page 7620)

84.2.2.2.5 IXMLNode.FindNamespaceURI Method

Returns the namespace URI for a namespace prefix or qualified tag name.

Pascal

```
function FindNamespaceURI(const TagOrPrefix: DOMString): DOMString;
```

C++

```
__fastcall DOMString FindNamespaceURI(const DOMString TagOrPrefix);
```

Description

FindNamespaceDecl (see page 7620) searches the node hierarchy that contains this node for an attribute that specifies the mapping between the namespace prefix identified by TagOrPrefix and a namespace URI. If it finds such a mapping, FindNamespaceURI returns the namespace URI. If it does not find a mapping, FindNamespaceURI returns an empty string.

TagOrPrefix is the namespace prefix or a tag name that includes the namespace prefix.

See Also

GetNamespaceURI (see page 7625)

GetPrefix (see page 7626)

FindNamespaceDecl (see page 7620)

84.2.2.2.6 IXMLNode.GetAttribute Method

Returns the value of one of this node's attributes.

Pascal

```
function GetAttribute(const AttrName: DOMString): OleVariant;
```

C++

```
__fastcall OleVariant GetAttribute(const DOMString AttrName);
```

Description

GetAttribute is the read implementation of the Attributes (see page 7634) property.

AttrName is the name of the attribute.

GetAttribute returns the value of the specified attribute. Typically, this value is a string. If the node does not have an attribute with the name specified by AttrName, GetAttribute returns a Null Variant (see page 3430).

Note: Do not call GetAttribute unless this node is an element node. Only element nodes have attributes.

See Also

Attributes (see page 7634)

GetAttributeNS (see page 7622)

84.2.2.2.7 IXMLNode.GetAttributeNodes Method

Returns the value of the AttributeNodes (see page 7634) property.

Pascal

```
function GetAttributeNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetAttributeNodes();
```

Description

GetAttributeNodes is the read implementation of the AttributeNodes (see page 7634) property.

See Also

AttributeNodes (see page 7634)

84.2.2.2.8 IXMLNode.GetAttributeNS Method

Returns the value of a specified attribute.

Pascal

```
function GetAttributeNS(const AttrName: DOMString; const NamespaceURI: DOMString): OleVariant;
```

C++

```
__fastcall OleVariant GetAttributeNS(const DOMString AttrName, const DOMString NamespaceURI);
```

Description

Call GetAttributeNS to determine the value of an attribute when you must explicitly specify the namespace for the attribute.

AttrName is the name of the attribute whose value you want to fetch.

NamespaceURI (see page 7639) identifies the namespace in which the attribute resides.

GetAttributeNS returns the value of the attribute. If AttrName and NamespaceURI (see page 7639) do not identify an attribute of this node, GetAttributeNS returns a Null Variant (see page 3430).

See Also

AttributeNodes (see page 7634)

Attributes (see page 7634)

NamespaceURI (see page 7639)

SetAttributeNS (see page 7630)

84.2.2.2.9 IXMLNode.GetChildNodes Method

Returns the value of the ChildNodes (see page 7635) property.

Pascal

```
function GetChildNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetChildNodes();
```

Description

GetChildNodes is the read implementation of the ChildNodes (see page 7635) property.

See Also

ChildNodes (see page 7635)

84.2.2.2.10 IXMLNode.GetChildValue Method

Returns the value of a specified child node.

Pascal

```
function GetChildValue(const IndexOrName: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant GetChildValue(const OleVariant IndexOrName);
```

Description

GetChildValue is the read implementation of the ChildValues (see page 7636) property.

IndexOrName identifies the desired child node by either its interface, or by a string that is the local name of the child node.

The return value depends on the type of the child node, as indicated in the following table:

NodeType (see page 7640)	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, reading the child's value causes an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntEntityRef	nil (Delphi) or NULL (C++)
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
ntDocFragment	nil (Delphi) or NULL (C++)

See Also

ChildValues (see page 7636)

84.2.2.2.11 IXMLNode.GetCollection Method

Returns the value of the Collection (see page 7636) property.

Pascal

```
function GetCollection: IXMLNodeCollection;
```

C++

```
__fastcall IXMLNodeCollection GetCollection();
```

Description

GetCollection is the read implementation of the Collection (see page 7636) property.

See Also

Collection (see page 7636)

84.2.2.2.12 IXMLNode.GetDOMNode Method

Returns the value of the DOMNode (see page 7637) property.

Pascal

```
function GetDOMNode: IDOMNode;
```

C++

```
__fastcall IDOMNode GetDOMNode();
```

Description

GetDOMNode is the read implementation of the DOMNode (see page 7637) property.

See Also

DOMNode (see page 7637)

84.2.2.2.13 IXMLNode.GetHasChildNodes Method

Indicates whether the node has any child nodes.

Pascal

```
function GetHasChildNodes: Boolean;
```

C++

```
__fastcall Boolean GetHasChildNodes();
```

Description

GetHasChildNodes is the read implementation of the HasChildNodes (see page 7637) property.

See Also

HasChildNodes (see page 7637)

84.2.2.2.14 IXMLNode.GetIsTextElement Method

Indicates whether the node has a single text value.

Pascal

```
function GetIsTextElement: Boolean;
```

C++

```
__fastcall Boolean GetIsTextElement();
```

Description

GetIsTextElement is the read implementation of the IsTextElement (see page 7638) property.

See Also

IsTextElement (see page 7638)

84.2.2.2.15 IXMLNode.GetLocalName Method

Returns the name of the node without any namespace prefix.

Pascal

```
function GetLocalName: DOMString;
```

C++

```
__fastcall DOMString GetLocalName();
```

Description

GetLocalName is the read implementation of the LocalName (see page 7638) property.

See Also

LocalName (see page 7638)

84.2.2.2.16 IXMLNode.GetNamespaceURI Method

Returns the namespace URI for the node's qualified name.

Pascal

```
function GetNamespaceURI: DOMString;
```

C++

```
__fastcall DOMString GetNamespaceURI();
```

Description

GetNamespaceURI is the read implementation of the NamespaceURI (see page 7639) property.

See Also

NamespaceURI (see page 7639)

84.2.2.2.17 IXMLNode.GetNodeName Method

Returns the name of the node.

Pascal

```
function GetNodeName: DOMString;
```

C++

```
__fastcall DOMString GetNodeName();
```

Description

GetNodeName is the read implementation of the NodeName (see page 7639) property.

See Also

NodeName (see page 7639)

84.2.2.2.18 IXMLNode.GetNodeType Method

Returns the type of the node.

Pascal

```
function GetNodeType: TNodeType;
```

C++

```
__fastcall TNodeType GetNodeType();
```

Description

GetNodeType is the read implementation of the NodeType (see page 7640) property.

See Also

NodeType (see page 7640)

84.2.2.2.19 IXMLNode.GetNodeValue Method

Returns the value of the node.

Pascal

```
function GetNodeValue: OleVariant;
```

C++

```
__fastcall OleVariant GetNodeValue();
```

Description

GetNodeValue is the read implementation of the NodeValue (see page 7641) property.

See Also

NodeValue (see page 7641)

84.2.2.2.20 IXMLNode.GetOwnerDocument Method

Returns the interface for the document in which this node appears.

Pascal

```
function GetOwnerDocument: IXMLDocument;
```

C++

```
__fastcall IXMLDocument GetOwnerDocument();
```

Description

GetOwnerDocument is the read implementation of the OwnerDocument (see page 7641) property.

See Also

OwnerDocument (see page 7641)

84.2.2.2.21 IXMLNode.GetParentNode Method

Returns the interface for the node's parent node.

Pascal

```
function GetParentNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetParentNode();
```

Description

GetParentNode is the read implementation of the ParentNode (see page 7641) property.

See Also

ParentNode (see page 7641)

84.2.2.2.22 IXMLNode.GetPrefix Method

Returns the namespace prefix from the node's name.

Pascal

```
function GetPrefix: DOMString;
```

C++

```
__fastcall DOMString GetPrefix();
```

Description

GetPrefix is the read implementation of the Prefix (see page 7642) property.

See Also

Prefix (see page 7642)

84.2.2.2.23 IXMLNode.GetReadOnly Method

Returns the value of the ReadOnly (see page 7642) property.

Pascal

```
function GetReadOnly: Boolean;
```

C++

```
__fastcall Boolean GetReadOnly();
```

Description

GetReadOnly is the read implementation of the ReadOnly (see page 7642) property.

See Also

ReadOnly (see page 7642)

84.2.2.2.24 IXMLNode.GetText Method

Returns the text value of the node.

Pascal

```
function GetText: DOMString;
```

C++

```
__fastcall DOMString GetText();
```

Description

GetText is the read implementation for the Text (see page 7643) property.

See Also

Text (see page 7643)

84.2.2.2.25 IXMLNode.GetXML Method

Returns the value of the XML (see page 7643) property.

Pascal

```
function GetXML: DOMString;
```

C++

```
__fastcall DOMString GetXML();
```

Description

GetXML is the read implementation of this node's XML (see page 7643) property.

See Also

XML (see page 7643)

84.2.2.2.26 HasAttribute Method

This is the overview for the HasAttribute method overload.

Overload List

	Name	Description
	IXMLNode.HasAttribute (DOMString) (see page 7628)	Indicates whether the node has an attribute with a specified name.
	IXMLNode.HasAttribute (DOMString, DOMString) (see page 7628)	Indicates whether the node has an attribute with a specified name.

84.2.2.2.26.1 IXMLNode.HasAttribute Method (DOMString)

Indicates whether the node has an attribute with a specified name.

Pascal

```
function HasAttribute(const Name: DOMString): Boolean; overload;
function HasAttribute(const Name: DOMString; const NamespaceURI: DOMString): Boolean; overload;
```

C++

```
__fastcall Boolean HasAttribute(const DOMString Name);
__fastcall Boolean HasAttribute(const DOMString Name, const DOMString NamespaceURI);
```

Description

Call HasAttribute to determine whether this node has a specified attribute.

Name is the name of the attribute about which you want to know.

NamespaceURI (see page 7639) is the namespace of the attribute.

HasAttribute returns true if this node has the specified attribute, false otherwise.

See Also

AttributeNodes (see page 7634)

Attributes (see page 7634)

84.2.2.2.27 IXMLNode.NextSibling Method

Returns the next child of this node's parent.

Pascal

```
function NextSibling: IXMLNode;
```

C++

```
__fastcall IXMLNode NextSibling();
```

Description

NextSibling returns the node that follows this one in the parent node's ChildNodes (see page 7635) property list.

If this node is the last node in its parent's child list, NextSibling raises an exception.

See Also

ParentNode (see page 7641)

PreviousSibling (see page 7629)

ChildNodes (see page 7635)

84.2.2.2.28 IXMLNode.Normalize Method

Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

Pascal

```
procedure Normalize;
```

C++

```
__fastcall Normalize();
```

Description

Use the IXMLNode (see page 7615) interface to call the protected Normalize method. Normalize consolidates adjacent text nodes and remove any empty text nodes in the subtree beneath this node. This method ensures that for all child nodes of this node and of its attributes, only structure nodes (element nodes, comments, processing instructions, CDATA sections, and entity references) separate text nodes and that there are no empty text nodes.

See Also

ChildNodes (see page 7635)

AttributeNodes (see page 7634)

84.2.2.2.29 IXMLNode.PreviousSibling Method

Returns the previous child of this node's parent.

Pascal

```
function PreviousSibling: IXMLNode;
```

C++

```
__fastcall IXMLNode PreviousSibling();
```

Description

PreviousSibling returns the node that precedes this one in the parent node's ChildNodes (see page 7635) property list.

If this node is the first node in its parent's child list, PreviousSibling raises an exception.

See Also

ParentNode (see page 7641)

NextSibling (see page 7628)

ChildNodes (see page 7635)

84.2.2.2.30 IXMLNode.Resync Method

Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

Pascal

```
procedure Resync;
```

C++

```
__fastcall Resync();
```

Description

Resync forces the node to reread the values of its child nodes and attribute nodes, discarding any changes that have not been propagated to the underlying DOM implementation.

See Also

ChildNodes (see page 7635)

AttributeNodes (see page 7634)

Refresh (see page 7323)

84.2.2.2.31 IXMLNode.SetAttribute Method

Sets the value of one of this node's attributes.

Pascal

```
procedure SetAttribute(const AttrName: DOMString; const Value: OleVariant);
```

C++

```
__fastcall SetAttribute(const DOMString AttrName, const OleVariant Value);
```

Description

SetAttribute is the write implementation for the Attributes (see page 7634) property.

AttrName is the name of the attribute. If the attribute already exists for the node, its value is changed. If the attribute does not already exist, a new attribute is created.

Value is the value to assign to the attribute. This value is a string that is not parsed. Any markup (for example, for an entity reference) is treated as literal text, and must include appropriate escape sequences. If Value is NULL, the attribute is removed from this node. If Value is an empty string, the attribute is assigned an empty value.

See Also

Attributes (see page 7634)

SetAttributeNS (see page 7630)

84.2.2.2.32 IXMLNode.SetAttributeNS Method

Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.

Pascal

```
procedure SetAttributeNS(const AttrName: DOMString; const NamespaceURI: DOMString; const
Value: OleVariant);
```

C++

```
__fastcall SetAttributeNS(const DOMString AttrName, const DOMString NamespaceURI, const
OleVariant Value);
```

Description

SetAttributeNS sets the value of a specified attribute of this node.

AttrName is the name of the attribute. If the attribute already exists for the node, its value is changed. If the attribute does not already exist, a new attribute is created.

NamespaceURI (see page 7639) is the namespace for the attribute.

Value is the value to assign to the attribute. This value is a string that is not parsed. Any markup (for example, for an entity reference) is treated as literal text, and must include appropriate escape sequences. If Value is NULL, the attribute is removed from this node. If Value is an empty string, the attribute is assigned an empty value.

See Also

SetAttribute (see page 7630)

GetAttributeNS (see page 7622)

AttributeNodes (see page 7634)

84.2.2.2.33 IXMLNode.SetChildValue Method

Sets the value of a specified child node.

Pascal

```
procedure SetChildValue(const IndexOrName: OleVariant; const Value: OleVariant);
```

C++

```
__fastcall SetChildValue(const OleVariant IndexOrName, const OleVariant Value);
```

Description

SetChildValue is the write implementation of the ChildValues (see page 7636) property.

IndexOrName identifies the desired child node by either its interface, or by a string that is the local name of the child node.

Value is the value to assign.

See Also

ChildValues (see page 7636)

84.2.2.2.34 IXMLNode.SetNodeValue Method

Sets the value of this node.

Pascal

```
procedure SetNodeValue(const Value: OleVariant);
```

C++

```
__fastcall SetNodeValue(const OleVariant Value);
```

Description

SetNodeValue is the write implementation of the NodeValue (see page 7641) property.

Value is the value to assign.

See Also

NodeValue (see page 7641)

84.2.2.2.35 IXMLNode.SetReadOnly Method

Specifies whether the node can be modified.

Pascal

```
procedure SetReadOnly(const Value: Boolean);
```

C++

```
__fastcall SetReadOnly(const Boolean Value);
```

Description

SetReadOnly is the write implementation of the ReadOnly (see page 7642) property.

Value is the new read-only status of the node.

See Also

ReadOnly (see page 7642)

84.2.2.2.36 IXMLNode.SetText Method

Sets the text value of the node.

Pascal

```
procedure SetText(const Value: DOMString);
```

C++

```
__fastcall SetText(const DOMString Value);
```

Description

SetText is the write implementation for the Text (see page 7643) property.

Value is the new text value for the node.

See Also

Text (see page 7643)

84.2.2.2.37 TransformNode Method

This is the overview for the TransformNode method overload.

Overload List

	Name	Description
	IXMLNode.TransformNode (IXMLNode, IXMLDocument) (see page 7633)	Transforms the subtree rooted at this node, using a specified XSL interface.
	IXMLNode.TransformNode (IXMLNode, WideString) (see page 7633)	Transforms the subtree rooted at this node, using a specified XSL interface.

84.2.2.2.37.1 IXMLNode.TransformNode Method (IXMLNode, IXMLDocument)

Transforms the subtree rooted at this node, using a specified XSL interface.

Pascal

```
procedure TransformNode(const stylesheet: IXMLNode; var output: WideString); overload;
procedure TransformNode(const stylesheet: IXMLNode; const output: IXMLDocument); overload;
```

C++

```
__fastcall TransformNode(const IXMLNode stylesheet, BSTR output);
__fastcall TransformNode(const IXMLNode stylesheet, const IXMLDocument output);
```

Description

Call TransformNode to transform the XML (see page 7643) that is the value of the XML (see page 7643) property using the transformation specified by an XSL document.

stylesheet is a node in an XML (see page 7643) document that represents an XSL transformation. Typically, it is the document element of that document.

output represents the result of the transformation. If output is a WideString (see page 3476), TransformNode returns a string of XML (see page 7643). If output is the interface to an XML (see page 7643) document, TransformNode replaces the content of that document with the results of the transformation.

Note: TransformNode is only available when the DOMVendor used to parse this node's XML (see page 7643) document is MSXML.

See Also

XML (see page 7643)

84.2.2.3 IXMLNode Properties

The properties of the IXMLNode class are listed here.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

84.2.2.3.1 IXMLNode.AttributeNodes Property

Lists the interfaces for nodes that represent attributes of this node.

Pascal

```
property AttributeNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList AttributeNodes;
```

Description

Use AttributeNodes to access the attributes of this node using an IXMLNode (see page 7615) interface. Attributes (see page 7634) modify a node in an XML (see page 7643) document. For example, given the node for

```
<Movie genre="scifi" title="Star Wars"> ... </Movie>
```

both genre and title are attributes of the node, with values of "scifi" and "Star Wars", respectively.

If an attribute consists of a simple Name=Value pair, it is simpler to use the Attributes (see page 7634) property to read or set attribute values. AttributeNodes is an IXMLNodeList (see page 7649) interface, which can be used to

Read (see page 3727) the count of attributes before iterating over all the attributes of this node.

Add or delete attribute nodes from this node.

Access attributes through an XML (see page 7643) node interface (for example, to read the attribute names from the nodes).

Only element nodes have attributes, and not every element node has them. If the node does not have any attributes, AttributeNodes is the interface for an empty list.

Note: Attributes (see page 7634) are not considered child nodes of a node and can't be accessed using the ChildNodes (see page 7635) property.

See Also

ChildNodes (see page 7635)

Attributes (see page 7634)

84.2.2.3.2 IXMLNode.Attributes Property

Represents the values of this node's attributes.

Pascal

```
property Attributes [const AttrName: DOMString]: OleVariant;
```

C++

```
__property OleVariant Attributes[DOMString const AttrName];
```

Description

Use Attributes to read or set the values of this node's attributes. Attributes modify a node in an XML (see page 7643) document. For example, given the node for

```
<Movie genre="scifi" title="Star Wars"> ... </Movie>
```

both genre and title are attributes of the node, with values of "scifi" and "Star Wars", respectively.

The AttrName index gives the name of the attribute to access. In the previous example, "genre" and "title" are the names of the attributes. When setting Attributes, if you specify the name of an attribute that already exists for a node, you change that attribute's value. If you specify an attribute name that does not correspond to an existing attribute of the node, a new attribute is

created.

When reading Attributes, if you specify the name of an attribute that does not exist for the node, the value depends on the Options property of the document that contains the node. If Options includes doAttrNull, reading an attribute that does not exist for the node results in a Null Variant (see page 3430). When Options does not include doAttrNull, reading an attribute that does not exist results in an empty string.

The value of Attributes is the text of the specified attribute. When setting attributes, the value string is not parsed. Any markup in the supplied value (for example, an entity reference) is treated as literal text. If you set an attribute to nil (Delphi) or NULL (C++), it is removed from this node. Note that you can set an attribute's value to an empty string.

See Also

AttributeNodes (see page 7634)

GetAttributeNS (see page 7622)

SetAttributeNS (see page 7630)

Options (see page 7341)

Working with XML Nodes

84.2.2.3.3 IXMLNode.ChildNodes Property

Represents the child nodes of the node.

Pascal

```
property ChildNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList ChildNodes;
```

Description

Use ChildNodes to access the children of a node. ChildNodes is an IXMLNodeList (see page 7649) interface, which can be used to access individual child nodes or to add child nodes to or delete them from this node. Each child node specifies this node as its parent node.

Tip: To get or set the values of the child nodes rather than their interfaces, use the ChildValues (see page 7636) property instead.

Note: Attributes (see page 7634) are not considered child nodes of a node. To get the values of this node's attributes, use the Attributes (see page 7634) or AttributeNodes (see page 7634) property instead.

See Also

ChildValues (see page 7636)

AttributeNodes (see page 7634)

ParentNode (see page 7641)

Attributes (see page 7634)

Working with XML Nodes

84.2.2.3.4 IXMLNode.ChildValues Property

Represents the values of this node's child nodes.

Pascal

```
property ChildValues [const IndexOrName: OleVariant]: OleVariant;
```

C++

```
__property OleVariant ChildValues[OleVariant const IndexOrName];
```

Description

Use ChildValues to access the values of this node's children.

IndexOrName identifies the desired child node either by its interface, or by a string that is the local name of the child node. If IndexOrName does not identify a child of this node, trying to get or set ChildValues causes an exception.

The value of a child node depends on the type of the child node, as indicated in the following table:

NodeType (see page 7640)	Value
ntElement	If the element contains only text, this is that text value. Otherwise, it is the Value of the first child node.
ntText	The text
ntCData	The content of the CDATA section.
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
If the child node is any other node type, reading or setting ChildValues causes an exception.	

Note: In Delphi, ChildValues is the default property for IXMLNode (see page 7615). That means that you can omit the property name when using this property. For example

```
Edit1.Text := XMLDocument1.DocumentElement.ChildValues['Name'];
```

can also be written

```
Edit1.Text := XMLDocument1.DocumentElement['Name'];
```

Note: Attributes (see page 7634) are not considered child nodes of a node. To get or set the values of this node's attributes, use the Attributes (see page 7634) property instead.

See Also

ChildNodes (see page 7635)

ParentNode (see page 7641)

Attributes (see page 7634)

84.2.2.3.5 IXMLNode.Collection Property

Indicates the collection in which this node appears.

Pascal

```
property Collection: IXMLNodeCollection;
```

C++

```
__property IXMLNodeCollection Collection;
```

Description

Read (see page 3727) Collection to determine whether this node is one of a repeating set of child nodes. The node specified by Collection represents the same node in the XML (see page 7643) document as this node's ParentNode (see page 7641) property, but it is specialized to work with this node and any other child nodes of the same type.

For example, consider the following XML (see page 7643) fragment:

```
<students>
  <student name="John Smith">
    <grade>incomplete</grade>
  </student>
  <student name="Jane Doe">
    <grade>B+</grade>
  </student>
  <auditor name="Bill Jones"></auditor>
</students>
```

If this node represents one of the <student> nodes, then ParentNode (see page 7641) represents the <students> node, and Collection represents a copy of the <students> node that is used for only those children that are <student> nodes, and not the <auditor> nodes.

If this node does not represent one of a set of repeating child elements, Collection is nil (Delphi) or NULL (C++).

See Also

ParentNode (see page 7641)

84.2.2.3.6 IXMLNode.DOMNode Property

Provides access to the IDOMNode (see page 7509) interface for this node.

Pascal

```
property DOMNode: IDOMNode;
```

C++

```
__property IDOMNode DOMNode;
```

Description

IDOMNode (see page 7509) is the interface for this node provided by the DOM implementation that parsed the XML (see page 7643) document. You can use this interface to work with the node using the lower-level properties and methods of the DOM.

Typically, applications use the IXMLNode (see page 7615) interface to work with a node rather than the IDOMNode (see page 7509) interface. For more information on DOM interfaces, see the DOM specification on the W3 website or the documentation provided by your DOM vendor.

84.2.2.3.7 IXMLNode.HasChildNodes Property

Indicates whether this node has any child nodes.

Pascal

```
property HasChildNodes: Boolean;
```

C++

```
__property Boolean HasChildNodes;
```

Description

HasChildNodes is true if the underlying DOM node has any child nodes, false if it has no children.

Note that in the underlying DOM implementation, given the following XML (see page 7643)

```
<Title> Understanding XML </Title>
```

the "Title" node has a single child (a text node with the value 'Understanding XML (see page 7643)').

See Also

ChildNodes (see page 7635)

DOMNode (see page 7637)

84.2.2.3.8 IXMLNode.IsTextElement Property

Indicates whether the node has a single text value.

Pascal

```
property IsTextElement: Boolean;
```

C++

```
__property Boolean IsTextElement;
```

Description

Read (see page 3727) IsTextElement to determine whether this node represents a single text value. For example, if the node represents the following:

```
<Title> Understanding XML </Title>
```

IsTextElement is true, because the node represents a tagged element and the text that is its value.

Note: In the underlying DOM implementation, nodes for which IsTextElement is true are element nodes that have a single child node that is a text node. IXMLNode (see page 7615) flattens this out so that you can use the element node to work with the text value (through the Text (see page 7643) property), rather than requiring you to use a separate node for the text value.

See Also

NodeType (see page 7640)

Text (see page 7643)

Working with XML Nodes

84.2.2.3.9 IXMLNode.LocalName Property

Indicates the name of the node without any namespace prefix.

Pascal

```
property LocalName: DOMString;
```

C++

```
__property DOMString LocalName;
```

Description

Read (see page 3727) LocalName to determine the local name of the underlying DOM node. LocalName is only defined for

nodes of type ntElement or ntAttrribute.

For element nodes, LocalName is derived from the name that appears in the XML (see page 7643) tag. For example, the local name for <xsi:Name First="John" Last="Doe"> is 'Name'. (The string "xsi" is called the prefix).

For attribute nodes, the local name is derived from the string that appears to the left of the equals sign in the attribute declaration. For example, the element <xsi:Name xsi:First="John" xsi:Last="Doe"> results in two attribute nodes, with the local names 'First' and 'Last'.

For any other node types, localName is nil (Delphi) or NULL (C++).

To get the name of a node when localName is not defined, use the NodeName (see page 7639) property instead. If the node's name has no namespace prefix, LocalName has the same value as NodeName (see page 7639).

See Also

NamespaceURI (see page 7639)

Prefix (see page 7642)

NodeName (see page 7639)

84.2.2.3.10 IXMLNode.NamespaceURI Property

Identifies the URI for the namespace used in the qualified node name.

Pascal

```
property NamespaceURI: DOMString;
```

C++

```
__property DOMString NamespaceURI;
```

Description

NamespaceURI is the URI for the namespace that should be used to interpret the node's name.

Only element and attribute nodes can have a namespace URI value. For any other node type, NamespaceURI is an empty string.

The namespace URI is only available if it is explicitly assigned when the node is created. By default, IXMLNode (see page 7615) does not assign namespaces to the new nodes it creates.

See Also

NodeName (see page 7639)

NodeType (see page 7640)

Prefix (see page 7642)

LocalName (see page 7638)

CreateDOMNode (see page 7439)

NamespaceURI (see page 7521)

84.2.2.3.11 IXMLNode.NodeName Property

Indicates the node name.

Pascal

```
property NodeName: DOMstring;
```

C++

```
__property DOMstring NodeName;
```

Description

NodeName is the name of the underlying DOM node.

The node's name depends on the type of the node, as indicated in the following table:

NodeType (see page 7640)	NodeName
ntAttribute	The attribute name
ntElement	The tag name
ntText	'#text'
ntCData	'#cdata-section'
ntEntityRef	The name of the entity reference.
ntEntity	The entity name
ntProcessingInstr	the target of the processing instruction
ntComment	'#comment'
ntDocument	'#document'
ntDocType	The document type name
ntDocFragment	'#document-fragment'
ntNotation	The notation name

Note: If Prefix (see page 7642) and LocalName (see page 7638) are both defined for a node, the node name is the combination of these two values.

See Also

NodeType (see page 7640)

Prefix (see page 7642)

LocalName (see page 7638)

84.2.2.3.12 IXMLNode.NodeType Property

Indicates the type of the node.

Pascal

```
property NodeType: TNodeType;
```

C++

```
__property TNodeType NodeType;
```

Description

Read (see page 3727) NodeType to determine the type of the node. The type reflects the way the node is used in the XML (see page 7643) document.

See Also

IsTextElement (see page 7638)

84.2.2.3.13 IXMLNode.NodeValue Property

Specifies the value of this node.

Pascal

```
property NodeValue: OleVariant;
```

C++

```
__property OleVariant NodeValue;
```

Description

Use NodeValue to get or set the value of the node. The meaning of a node's value depends on the type of the node, as indicated in the following table:

NodeType (see page 7640)	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, trying to read or set NodeValue causes an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.

Trying to read or set the value of any other node type causes an exception.

See Also

ChildValues (see page 7636)

Text (see page 7643)

84.2.2.3.14 IXMLNode.OwnerDocument Property

Identifies the document in which this node appears.

Pascal

```
property OwnerDocument: IXMLDocument;
```

C++

```
__property IXMLDocument OwnerDocument;
```

Description

Read (see page 3727) OwnerDocument to obtain the IXMLDocument (see page 7586) interface of the document to which this node belongs.

See Also

ParentNode (see page 7641)

84.2.2.3.15 IXMLNode.ParentNode Property

Identifies the interface of the node's parent node.

Pascal

```
property ParentNode: IXMLNode;
```

C++

```
__property IXMLNode ParentNode;
```

Description

Read (see page 3727) ParentNode to access the node's parent node.

See Also

ChildNodes (see page 7635)

84.2.2.3.16 IXMLNode.Prefix Property

Identifies the namespace prefix of the node's name.

Pascal

```
property Prefix: DOMString;
```

C++

```
__property DOMString Prefix;
```

Description

Prefix is the namespace prefix of an element or attribute node's name. A namespace prefix is a symbolic name for a namespace URI.

For element nodes, the namespace prefix is derived from the name that appears in the XML (see page 7643) tag. For example, the namespace prefix for <xsi:Name First="John" Last="Doe"> is 'xsi'.

For attribute nodes, the namespace prefix is derived from the string that appears to the left of the equals sign in the attribute declaration. For example the element <xsi:Name xsn:First="John" Last="Doe"> results in two attribute nodes, with namespace prefixes of 'xsn' and '', respectively. Note that the attribute never inherits a namespace prefix from the node to which it is attached.

For any other node types, the namespace prefix is nil (Delphi) or NULL (C++).

See Also

LocalName (see page 7638)

NodeType (see page 7640)

NamespaceURI (see page 7639)

84.2.2.3.17 IXMLNode.ReadOnly Property

Specifies whether the node can be modified.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

ReadOnly specifies whether the value, child nodes, or attributes of the node can be changed. When ReadOnly is true, the node can't be modified. Read (see page 3727)-only nodes raise an exception when an attempt is made to modify them.

When ReadOnly is false, the node can be modified.

See Also

AttributeNodes (see page 7634)

ChildNodes (see page 7635)

NodeValue (see page 7641)

84.2.2.3.18 IXMLNode.Text Property

Represents the Text of the node.

Pascal

```
property Text: DOMString;
```

C++

```
__property DOMString Text;
```

Description

Text represents the text of the node. For example, if the node corresponds to

```
<Title> Understanding XML </Title>
```

The text of the node is the string 'Understanding XML (see page 7643)'.

Text is intended for use nodes where the IsTextElement (see page 7638) property is true. If IsTextElement (see page 7638) is false, then

If the node has no children, the value of Text is an empty string. Setting Text is this case result in a node where IsTextElement (see page 7638) istrue.

If the node has children (other than a single DOM text node), reading or setting Text causes an exception.

See Also

IsTextElement (see page 7638)

NodeValue (see page 7641)

Working with XML Nodes

84.2.2.3.19 IXMLNode.XML Property

Indicates the XML that corresponds to the subtree rooted at this node.

Pascal

```
property XML: DOMString;
```

C++

```
__property DOMString XML;
```

Description

XML is the XML that corresponds to the document fragment that consists of this node and any child nodes it contains.

Note: XML is only available when the DOMVendor used to parse this node's XML document is MSXML.

See Also

Text (see page 7643)

ChildValues (see page 7636)

DOMVendor (see page 7337)

84.2.3 IXMLNodeCollection Interface

IXMLNodeCollection is the interface for a set of child nodes that are all the same type.

Class Hierarchy

Pascal

```
IXMLNodeCollection = interface(IXMLNode);
```

C++

```
__interface IXMLNodeCollection : public IXMLNode;
```

File

XMLIntf

Description

Use IXMLNodeCollection to work with repeating elements in an XML (see page 7643) document. The XML (see page 7643) Data Binding wizard generates descendants of IXMLNodeCollection interface to represent sets of child nodes that are all of a particular type.

IXMLNodeCollection is a descendant of IXMLNode (see page 7615). As such, it provides generic support for working with a node in an XML (see page 7643) document. In addition, IXMLNodeCollection introduces properties and methods that manage a set of child nodes that are all the same type of node (that all have the same tag names or that are defined as the same type in an XML (see page 7643) schema).

Note: C++ method declarations that use IXMLNodeCollection use the _di_IXMLNodeCollection type instead. This type is a DelphiInterface (see page 3263) wrapper around the IXMLNodeCollection interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IXMLNodeCollection >
_di_IXMLNodeCollection;
```

See Also

TXMLDocument (see page 7299)

IXMLNode (see page 7615)

TXMLNodeCollection (see page 7396)

84.2.3.1 IXMLNodeCollection Members

The following tables list the members exposed by IXMLNodeCollection.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.

	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.

	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7639)	Indicates the node name.
	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

84.2.3.2 IXMLNodeCollection Methods

The methods of the IXMLNodeCollection class are listed here.

Public Methods

	Name	Description
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.

84.2.3.2.1 IXMLNodeCollection.Clear Method

Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Clear deletes every child node from the collection (all the nodes in the Nodes (see page 7649) property), along with the corresponding nodes in the ChildNodes (see page 7635) property.

See Also

Nodes (see page 7649)

Delete (see page 7646)

Remove (see page 7648)

ChildNodes (see page 7635)

84.2.3.2.2 IXMLNodeCollection.Delete Method

Removes one of the repeating child nodes from this node.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Delete removes a specified child node from this node.

Index identifies the child to remove. It is the index of the child in the Nodes (see page 7649) property list of repeating child nodes. The index 0 represents the first repetition, 1 represents the second repetition, and so on.

See Also

Remove (see page 7648)

AddChild (see page 7618)

Nodes (see page 7649)

Clear (see page 7646)

84.2.3.2.3 IXMLNodeCollection.GetCount Method

Returns the value of the Count (see page 7648) property.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the read implementation of the Count (see page 7648) property.

See Also

Count (see page 7648)

84.2.3.2.4 IXMLNodeCollection.GetNode Method

Returns the interface for one of the repeating child nodes.

Pascal

```
function GetNode(Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetNode(int Index);
```

Description

GetNode is the read implementation of the Nodes (see page 7649) property.

Index identifies which repetition of the child node is desired, where 0 is the first repetition, 1 is the second repetition, and so on.

See Also

Nodes (see page 7649)

84.2.3.2.5 IXMLNodeCollection.Remove Method

Removes one of the repeating child nodes from this node.

Pascal

```
function Remove(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Remove(const IXMLNode Node);
```

Description

Remove removes a specified child node from the collection of repeating child nodes. It removes the node from both the collection, and from the ChildNodes (see page 7635) property, which lists all children of this node.

Node is the interface of the child to remove. It must represent on of the repeating child nodes.

To remove a child that is not one of the repeating child nodes, use the ChildNodes (see page 7635) property instead.

See Also

Delete (see page 7646)

ChildNodes (see page 7635)

Nodes (see page 7649)

84.2.3.3 IXMLNodeCollection Properties

The properties of the IXMLNodeCollection class are listed here.

Public Properties

	Name	Description
	Count (see page 7648)	Indicates the number of repeating child nodes.
	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.

84.2.3.3.1 IXMLNodeCollection.Count Property

Indicates the number of repeating child nodes.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read (see page 3727) Count to obtain the number of repeating children of this node. Use Count to obtain an upper limit when addressing child nodes by index (for example, when iterating over all nodes in the Nodes (see page 7649) property list).

Count is changed when you add child nodes using the AddChild (see page 7618) method or delete them using the Delete (see page 7646) or Remove (see page 7648) method. You can access the individual repeating child nodes using the Nodes (see page 7649) property.

See Also

Nodes (see page 7649)

AddChild (see page 7618)

Remove (see page 7648)

Delete (see page 7646)

84.2.3.3.2 IXMLNodeCollection.Nodes Property

Lists the interfaces of the repeating child nodes.

Pascal

```
property Nodes [Index: Integer]: IXMLNode;
```

C++

```
__property IXMLNode Nodes[int Index];
```

Description

Use Nodes to access nodes from the set of repeating child nodes. The value of Nodes is the IXMLNode (see page 7615) interface that represents a specified child node.

Index identifies which repetition of the child node is desired, where 0 is the first repetition, 1 is the second repetition, and so on.

Note: The XML (see page 7643) Data Binding wizard generates a nearly identical property in IXMLNodeCollection (see page 7644) descendants called Items. Items differs from Nodes in that the value is an IXMLNode (see page 7615) descendant specific to the type of the repeating element, rather than the generic IXMLNode (see page 7615) interface.

Note: In Delphi, ChildNodes (see page 7635) is the default property for IXMLNodeCollection (see page 7644). That means that you can omit the property name when using this property. In IXMLNodeCollection (see page 7644) descendants that are generated by the XML (see page 7643) Data Binding wizard, the Items property is the default property instead.

Note: As a descendant of IXMLNode (see page 7615), IXMLNodeCollection (see page 7644) also inherits the ChildNodes (see page 7635) property, which lists all the child nodes for this node. Nodes differs from ChildNodes (see page 7635) in that it contains only those child nodes that are in the repeating collection.

See Also

Count (see page 7648)

ChildNodes (see page 7635)

84.2.4 IXMLNodeList Interface

IXMLNodeList represents a set of nodes in an XML document.

Class Hierarchy

Pascal

```
IXMLNodeList = interface;
```

C++

```
__interface IXMLNodeList;
```

File

XMLIntf

Description

Use IXMLNodeList to work with a set of related nodes in an XML document. IXMLNodeList can be used to add or delete nodes from the set, or to access specific nodes.

Note: C++ method declarations that use IXMLNodeList use the _di_IXMLNodeList type instead. This type is a DelphiInterface (see page 3263) wrapper around the IXMLNodeList interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IXMLNodeList >  _di_IXMLNodeList;
```

See Also

TXMLNodeList (see page 7411)

IXMLNode (see page 7615)

IXMLNode (see page 7615)

TXMLDocument (see page 7299)

84.2.4.1 IXMLNodeList Members

The following tables list the members exposed by IXMLNodeList.

Public Methods

	Name	Description
	Add (see page 7651)	Adds a new node to the end of the list.
	BeginUpdate (see page 7651)	Increments the value of UpdateCount (see page 7661).
	Clear (see page 7652)	Removes all nodes from the list.
	Delete (see page 7652)	This is the overview for the Delete method overload.
	EndUpdate (see page 7653)	Decrements the value of UpdateCount (see page 7661).
	FindNode (see page 7654)	This is the overview for the FindNode method overload.
	FindSibling (see page 7655)	Returns a node that appears a specified amount before or after another node.
	First (see page 7655)	Returns the first node in the list.
	Get (see page 7656)	Returns a specified node in the list.
	GetCount (see page 7656)	Returns the number of nodes in the list.
	GetNode (see page 7656)	Returns a specified node from the list.
	GetUpdateCount (see page 7657)	Returns the value of the UpdateCount (see page 7661) property.
	IndexOf (see page 7657)	This is the overview for the IndexOf method overload.
	Insert (see page 7658)	Inserts a new node into a specified position in the list.
	Last (see page 7658)	Returns the last node in the list.
	Remove (see page 7659)	Removes a specified node from the list.
	ReplaceNode (see page 7659)	Replaces a specified node in the list with another node.

Public Properties

	Name	Description
R	Count (see page 7660)	Indicates the number of nodes in the list.
R	Nodes (see page 7660)	Provides access to the nodes in the list.
R	UpdateCount (see page 7661)	Indicates the number of times an application has called BeginUpdate (see page 7651) without a matching call to EndUpdate (see page 7653).

84.2.4.2 IXMLNodeList Methods

The methods of the IXMLNodeList class are listed here.

Public Methods

	Name	Description
	Add (see page 7651)	Adds a new node to the end of the list.
	BeginUpdate (see page 7651)	Increments the value of UpdateCount (see page 7661).
	Clear (see page 7652)	Removes all nodes from the list.
	Delete (see page 7652)	This is the overview for the Delete method overload.
	EndUpdate (see page 7653)	Decrements the value of UpdateCount (see page 7661).
	FindNode (see page 7654)	This is the overview for the FindNode method overload.
	FindSibling (see page 7655)	Returns a node that appears a specified amount before or after another node.
	First (see page 7655)	Returns the first node in the list.
	Get (see page 7656)	Returns a specified node in the list.
	GetCount (see page 7656)	Returns the number of nodes in the list.
	GetNode (see page 7656)	Returns a specified node from the list.
	GetUpdateCount (see page 7657)	Returns the value of the UpdateCount (see page 7661) property.
	IndexOf (see page 7657)	This is the overview for the IndexOf method overload.
	Insert (see page 7658)	Inserts a new node into a specified position in the list.
	Last (see page 7658)	Returns the last node in the list.
	Remove (see page 7659)	Removes a specified node from the list.
	ReplaceNode (see page 7659)	Replaces a specified node in the list with another node.

84.2.4.2.1 IXMLNodeList.Add Method

Adds a new node to the end of the list.

Pascal

```
function Add(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Add(const IXMLNode Node);
```

Description

Call Add to add a node to the end of the list. Add returns the index of the node once it is added, where 0 is the index of the first node in the list, 1 is the index of the second node, and so on.

Node is the node to add to the list.

See Also

Delete (see page 7653)

Remove (see page 7659)

IndexOf (see page 7657)

Insert (see page 7658)

Nodes (see page 7660)

84.2.4.2.2 IXMLNodeList.BeginUpdate Method

Increments the value of UpdateCount (see page 7661).

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

Call BeginUpdate before making several changes to the nodes in the list (such as adding or removing several nodes). BeginUpdate increments the UpdateCount (see page 7661) property, to keep track of the fact that the list is in the middle of an update. When the update is complete, call EndUpdate (see page 7653) to decrement the UpdateCount (see page 7661) property.

Every call to BeginUpdate should be matched by a call to EndUpdate (see page 7653), so that the UpdateCount (see page 7661) property accurately reflects whether an update operation is underway.

See Also

UpdateCount (see page 7661)

EndUpdate (see page 7653)

84.2.4.2.3 IXMLNodeList.Clear Method

Removes all nodes from the list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the list.

Note: Clear does not call the BeginUpdate (see page 7651) and EndUpdate (see page 7653) methods, even though it may result in the deletion of more than one node.

See Also

Delete (see page 7653)

Remove (see page 7659)

Nodes (see page 7660)

84.2.4.2.4 Delete Method

This is the overview for the Delete method overload.

Overload List

	Name	Description
	IXMLNodeList.Delete (DOMString) (see page 7653)	Removes a specified node from the list.
	IXMLNodeList.Delete (DOMString, DOMString) (see page 7653)	Removes a specified node from the list.

	IXMLNodeList.Delete (Integer) (see page 7653)	Removes a specified node from the list.

84.2.4.2.4.1 IXMLNodeList.Delete Method (DOMString)

Removes a specified node from the list.

Pascal

```
function Delete(const Index: Integer): Integer; overload;
function Delete(const Name: DOMString): Integer; overload;
function Delete(const Name: DOMString; const NamespaceURI: DOMString): Integer; overload;
```

C++

```
__fastcall int Delete(const int Index);
__fastcall int Delete(const DOMString Name);
__fastcall int Delete(const DOMString Name, const DOMString NamespaceURI);
```

Description

Delete removes the node specified by the Index or Name parameter.

Name identifies the node to remove from the list. This is the local name of the node to remove.

NamespaceURI identifies the namespace to use when interpreting Name (if necessary).

Index identifies the node to remove by index rather than name. Index ranges from 0 to one less than the value of the Count (see page 7660) property.

Delete returns the index of the node that was removed. If there was no node that matched the value of Index or Name, Delete returns –1.

See Also

Remove (see page 7659)

Clear (see page 7652)

IndexOf (see page 7657)

LocalName (see page 7638)

NamespaceURI (see page 7639)

Working with XML Nodes

84.2.4.2.5 IXMLNodeList.EndUpdate Method

Decrements the value of UpdateCount (see page 7661).

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

Call EndUpdate after making several changes to the nodes in the list (such as adding or removing several nodes). EndUpdate decrements the UpdateCount (see page 7661) property, which was incremented by a previous call to BeginUpdate (see page 7651).

Every call to BeginUpdate (see page 7651) should be matched by a call to EndUpdate, so that the UpdateCount (see page

7661) property accurately reflects whether an update operation is underway.

See Also

UpdateCount (see page 7661)

BeginUpdate (see page 7651)

84.2.4.2.6 FindNode Method

This is the overview for the FindNode method overload.

Overload List

	Name	Description
	IXMLNodeList.FindNode (DOMString) (see page 7654)	Returns a specified node from the list.
	IXMLNodeList.FindNode (DOMString, DOMString) (see page 7654)	Returns a specified node from the list.
	IXMLNodeList.FindNode (TGuid) (see page 7654)	Returns a specified node from the list.

84.2.4.2.6.1 IXMLNodeList.FindNode Method (DOMString)

Returns a specified node from the list.

Pascal

```
function FindNode(NodeName: DOMString): IXMLNode; overload;
function FindNode(NodeName: DOMString; NamespaceURI: DOMString): IXMLNode; overload;
function FindNode(ChildNodeType: TGuid): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode FindNode(DOMString NodeName);
__fastcall IXMLNode FindNode(DOMString NodeName, DOMString NamespaceURI);
__fastcall IXMLNode FindNode(TGuid ChildNodeType);
```

Description

Call FindNode to access a particular node in the list.

NodeName is the node to access. It specifies the LocalName property of the desired node.

NamespaceURI identifies the namespace that qualifies NodeName. It is the same as the NamespaceURI property of the desired node.

ChildNodeType identifies the node to access by its interface type (GUID), rather than by name.

FindNode returns the interface for the node if it is in the list. If NodeName or ChildNodeType does not specify a node in the list, FindNode returns nil (Delphi) or NULL (C++).

See Also

FindSibling (see page 7655)

First (see page 7655)

Last (see page 7658)

IndexOf (see page 7657)

LocalName (see page 7638)

Nodes (see page 7660)

NamespaceURI (see page 7639)

84.2.4.2.7 IXMLNodeList.FindSibling Method

Returns a node that appears a specified amount before or after another node.

Pascal

```
function FindSibling(const Node: IXMLNode; Delta: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode FindSibling(const IXMLNode Node, int Delta);
```

Description

Call FindSibling to access the node whose position has a specified relationship to another node.

Node is a node in the list to use as a reference point.

Delta indicates where the desired node appears, relative to Node. If Delta is positive, FindSibling returns the node that appears Delta positions after Node. If Delta is negative, FindSibling returns a node that appears before Node.

FindSibling returns the node that appears at the position offset by Delta, relative to the position of Node. If Delta specifies a position before the first node or after the last node in the list, FindSibling returns nil (Delphi) or NULL (C++).

See Also

FindNode (see page 7654)

First (see page 7655)

Last (see page 7658)

IndexOf (see page 7657)

84.2.4.2.8 IXMLNodeList.First Method

Returns the first node in the list.

Pascal

```
function First: IXMLNode;
```

C++

```
__fastcall IXMLNode First();
```

Description

Call First to access the first node in the list. If the list is empty, First raises an exception.

See Also

FindNode (see page 7654)

FindSibling (see page 7655)

Last (see page 7658)

Nodes (see page 7660)

84.2.4.2.9 IXMLNodeList.Get Method

Returns a specified node in the list.

Pascal

```
function Get(Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode Get(int Index);
```

Description

Call Get to retrieve a node from the list, given its index.

Index specifies the node to fetch, where 0 identifies the first node, 1 identifies the second node, and so on. Index should be less than the value of the Count (see page 7660) property.

See Also

Nodes (see page 7660)

GetNode (see page 7656)

Count (see page 7660)

84.2.4.2.10 IXMLNodeList.GetCount Method

Returns the number of nodes in the list.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the read implementation of the Count (see page 7660) property.

See Also

Count (see page 7660)

84.2.4.2.11 IXMLNodeList.GetNode Method

Returns a specified node from the list.

Pascal

```
function GetNode(const IndexOrName: OleVariant): IXMLNode;
```

C++

```
__fastcall IXMLNode GetNode(const OleVariant IndexOrName);
```

Description

GetNode is the read implementation of the Nodes (see page 7660) property.

IndexOrName identifies the desired node. It can be

The index of the node, where 0 is the index of the first node, 1 is the index of the second node, and so on.

The LocalName property of a node in the list.

If IndexOrName does not identify a node in the list, GetNode tries to create a new node with the name specified by IndexOrName. If it can't create the new node, GetNode raises an exception.

See Also

FindNode (see page 7654)

Nodes (see page 7660)

LocalName (see page 7638)

Get (see page 7656)

84.2.4.2.12 IXMLNodeList.GetUpdateCount Method

Returns the value of the UpdateCount (see page 7661) property.

Pascal

```
function GetUpdateCount: Integer;
```

C++

```
__fastcall int GetUpdateCount();
```

Description

GetUpdateCount is the read implementation of the UpdateCount (see page 7661) property.

See Also

UpdateCount (see page 7661)

84.2.4.2.13 IndexOf Method

This is the overview for the IndexOf method overload.

Overload List

	Name	Description
	IXMLNodeList.IndexOf (DOMString) (see page 7657)	Returns the index of a specified node.
	IXMLNodeList.IndexOf (DOMString, DOMString) (see page 7657)	Returns the index of a specified node.
	IXMLNodeList.IndexOf (IXMLNode) (see page 7657)	Returns the index of a specified node.

84.2.4.2.13.1 IXMLNodeList.IndexOf Method (DOMString)

Returns the index of a specified node.

Pascal

```
function IndexOf(const Node: IXMLNode): Integer; overload;
function IndexOf(const Name: DOMString): Integer; overload;
function IndexOf(const Name: DOMString; const NamespaceURI: DOMString): Integer; overload;
```

C++

```
__fastcall int IndexOf(const IXMLNode Node);
```

```
__fastcall int IndexOf(const DOMString Name);
__fastcall int IndexOf(const DOMString Name, const DOMString NamespaceURI);
```

Description

Call IndexOf to locate a node in the list. You can specify which node to locate using its name or its interface.

Name is the LocalName property of the node to locate.

NamespaceURI identifies the namespace to use when interpreting LocalName (if necessary).

Node is the interface of the node to locate.

IndexOf returns the index of the specified node, where 0 is the index of the first node, 1 is the index of the second node, and so on. If the specified node is not in the list, IndexOf returns -1.

See Also

FindNode (see page 7654)

LocalName (see page 7638)

Nodes (see page 7660)

NamespaceURI (see page 7639)

84.2.4.2.14 IXMLNodeList.Insert Method

Inserts a new node into a specified position in the list.

Pascal

```
procedure Insert(Index: Integer; const Node: IXMLNode);
```

C++

```
__fastcall Insert(int Index, const IXMLNode Node);
```

Description

Call Insert to add a node at the position specified by Index.

Index specifies where to insert the node, where 0 is the first position, 1 is second position, and so on. If Index does not specify a valid index, Insert raises an exception.

Node is the node to add to the list.

See Also

Delete (see page 7653)

Remove (see page 7659)

IndexOf (see page 7657)

Add (see page 7651)

Nodes (see page 7660)

84.2.4.2.15 IXMLNodeList.Last Method

Returns the last node in the list.

Pascal

```
function Last: IXMLNode;
```

C++

```
__fastcall IXMLNode Last();
```

Description

Call Last to access the last node in the list. If the list is empty, Last raises an exception.

See Also

FindNode (see page 7654)

FindSibling (see page 7655)

First (see page 7655)

Nodes (see page 7660)

84.2.4.2.16 IXMLNodeList.Remove Method

Removes a specified node from the list.

Pascal

```
function Remove(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Remove(const IXMLNode Node);
```

Description

Remove removes the specified node from the list.

Node is the node to remove from the list.

Remove returns the index of Node before it was removed. If node is not a node in the list, Remove returns -1.

See Also

Delete (see page 7653)

Clear (see page 7652)

84.2.4.2.17 IXMLNodeList.ReplaceNode Method

Replaces a specified node in the list with another node.

Pascal

```
function ReplaceNode(const OldNode: IXMLNode; const NewNode: IXMLNode): IXMLNode;
```

C++

```
__fastcall IXMLNode ReplaceNode(const IXMLNode OldNode, const IXMLNode NewNode);
```

Description

Call ReplaceNode to replace the node specified by OldNode with the node specified by NewNode.

OldNode is the node to replace. If OldNode does not appear in the list, then ReplaceNode adds the new node to the end of the list.

NewNode is the node to add to the list in place of OldNode.

ReplaceNode returns OldNode (even if OldNode did not appear in the list).

See Also

Remove (see page 7659)

Insert (see page 7658)

84.2.4.3 IXMLNodeList Properties

The properties of the IXMLNodeList class are listed here.

Public Properties

	Name	Description
R	Count (see page 7660)	Indicates the number of nodes in the list.
R	Nodes (see page 7660)	Provides access to the nodes in the list.
R	UpdateCount (see page 7661)	Indicates the number of times an application has called BeginUpdate (see page 7651) without a matching call to EndUpdate (see page 7653).

84.2.4.3.1 IXMLNodeList.Count Property

Indicates the number of nodes in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read (see page 3727) Count to determine the number of nodes in the list. Count provides an upper limit to the indexes that can be used with the Nodes (see page 7660) property.

To change the value of Count, add nodes using the Add (see page 7651) or Insert (see page 7658) method, or remove them using the Delete (see page 7653) or Remove (see page 7659) method.

See Also

Nodes (see page 7660)

Add (see page 7651)

Delete (see page 7653)

Remove (see page 7659)

Insert (see page 7658)

84.2.4.3.2 IXMLNodeList.Nodes Property

Provides access to the nodes in the list.

Pascal

```
property Nodes [const IndexOrName: OleVariant]: IXMLNode;
```

C++

```
__property IXMLNode Nodes[OleVariant const IndexOrName];
```

Description

Read (see page 3727) Nodes to access a specified node in the list.

IndexOrName identifies the desired node. It can be

The index of the node, where 0 is the index of the first node, 1 is the index of the second node, and so on. The Count (see page 7660) property provides an upper bound on the indexes you can specify.

The LocalName property of a node in the list.

If IndexOrName does not identify a node in the list, and if the document that contains this node list's parent includes doNodeAutoCreate in its Options property, then the node list tries to create a new node with the name specified by IndexOrName. If the node list can't create the new node, it raises an exception.

See Also

Count (see page 7660)

FindNode (see page 7654)

LocalName (see page 7638)

Options (see page 7341)

84.2.4.3.3 IXMLNodeList.UpdateCount Property

Indicates the number of times an application has called BeginUpdate (see page 7651) without a matching call to EndUpdate (see page 7653).

Pascal

```
property UpdateCount: Integer;
```

C++

```
__property int UpdateCount;
```

Description

UpdateCount keeps track of whether all update operations have been completed. When an application starts making changes to the list, it calls BeginUpdate (see page 7651), which increments UpdateCount. When those changes are complete, it calls EndUpdate (see page 7653), which decrements UpdateCount. Thus, UpdateCount allows calls to BeginUpdate (see page 7651) and EndUpdate (see page 7653) to be nested.

Applications can avoid responding to updates in a piecemeal fashion by checking UpdateCount and only responding when it is 0.

See Also

BeginUpdate (see page 7651)

EndUpdate (see page 7653)

84.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TNodeType (see page 7662)	TNodeType identifies the type of a node in an XML document.
	TParseOption (see page 7664)	TParseOption and TParseOptions (see page 7667) represent implementation-specific options that are followed when parsing the XML document.
	TXMLDocOption (see page 7664)	TXMLDocOption and TXMLDocOptions (see page 7667) indicate types of information that an XML document automatically supplies.
	TXMLEncodingType (see page 7665)	TXMLEncodingType indicates the character set used to encode characters in an XML document.

84.3.1 XMLIntf.TNodeType Enumeration

TNodeType identifies the type of a node in an XML document.

Pascal

```
TNodeType = (
  ntReserved,
  ntElement,
  ntAttribute,
  ntText,
  ntCData,
  ntEntityRef,
  ntEntity,
  ntProcessingInstr,
  ntComment,
  ntDocument,
  ntDocType,
  ntDocFragment,
  ntNotation
);
```

C++

```
enum TNodeType {
  ntReserved,
  ntElement,
  ntAttribute,
  ntText,
  ntCData,
  ntEntityRef,
  ntEntity,
  ntProcessingInstr,
  ntComment,
  ntDocument,
  ntDocType,
  ntDocFragment,
  ntNotation
};
```

File

XMLIntf

Description

TNodeType identifies the type of a node in an XML document. The following table lists the possible values:

Value	Meaning
ntReserved	Not used
ntElement	The node represents an element. Element nodes represent simple tags that have child nodes. (Note that sometimes these child nodes do not appear when using IXMLNode (see page 7615). For example child nodes of type ntText are typically hidden by IXMLNode (see page 7615) and appear only as the value of the Text property). The child nodes of an element node can have the following node types: ntElement, ntText, ntCData, ntEntityRef, ntProcessingInstr, and ntComment. Element nodes can also have attributes (ntAttribute). Element nodes can be the child of a node of type ntDocument, ntDocFragment, ntEntityRef, and ntElement.
ntAttribute	The node represents an attribute of an element. It is not the child of another node, but its value can be accessed using the Attribute property of the element node's IXMLNode (see page 7615) interface. An attribute node can have child nodes of type ntText and ntEntityRef.
ntText	The node represents the text content of a tag. A text node cannot have any child nodes, but can appear as the child node of a node of type ntAttribute, ntDocFragment, ntElement, or ntEntityRef.
ntCData	The node represents a CDATA section in the XML source. CDATA sections identify blocks of text that would otherwise be interpreted as markup. An ntCData node can't have any child nodes. They can appear as the child of an ntDocFragment, ntEntityRef, or ntElement node.
ntEntityRef	The node represents a reference to an entity in the XML document. This can be any type of entity, including character entity references. The children of an entity reference node can be of the following types: ntElement, ntProcessingInstr, ntComment, ntText, ntCData, and ntEntityRef. The entity reference node can appear as the child of an ntAttribute, ntDocFragment, ntElement, or ntEntityRef node.
ntEntity	The node represents an expanded entity. Entity nodes can have child nodes that represent the expanded entity (for example, ntText and ntEntityRef nodes). Entity nodes only appear as the child of an ntDocType node.
ntProcessingInstr	The node represents a processing instruction (PI) from the XML document. A PI node cannot have any child nodes, but can appear as the child node of a node of type ntDocument, ntDocFragment, ntElement, or ntEntityRef.
ntComment	The node represents a comment in the XML document. Comment nodes do not have child nodes. They appear as the child of an ntDocument, ntDocFragment, ntElement, or ntEntityRef node.
ntDocument	The node represents a document object, which is the root of the entire XML document. Document nodes have a single ntElement node as a child (the DocumentElement). In addition, they can have child nodes of type ntProcessingInstr, ntComment, and ntDocType. Because the document is the root of the XML document, it never appears as a child node.
ntDocType	The node represents the document type declaration, indicated by the <!DOCTYPE > tag. The document type node can child nodes of type ntNotation and ntEntity. It always appears as the child of the document node.
ntDocFragment	The node represents a document fragment. A document fragment node associates a node or subtree with a document without actually being contained in the document. Document fragment nodes can have child nodes of type ntElement, ntProcessingInstr, ntComment, ntText, ntCData, and ntEntityRef. It never appears as the child of another node.
ntNotation	A node represents a notation in the document type declaration. It always appears as the child of an ntDocType node and never has any child nodes.

84.3.2 XMLIntf.TParseOption Enumeration

TParseOption and TParseOptions (see page 7667) represent implementation-specific options that are followed when parsing the XML document.

Pascal

```
TParseOption = (
  poResolveExternals,
  poValidateOnParse,
  poPreserveWhiteSpace,
  poAsyncLoad
);
```

C++

```
enum TParseOption {
  poResolveExternals,
  poValidateOnParse,
  poPreserveWhiteSpace,
  poAsyncLoad
};
```

File

XMLIntf

Description

TParseOptions (see page 7667) is a set of TParseOption values. Each TParseOption value provides information about how a DOM parser should parse an XML document. Different DOM implementations support different options.

The following table lists the possible values:

OptionDOM VendorMeaning

Option	DOM Vendor	Meaning
poResolveExternals	MSXML	External definitions (resolvable namespaces, DTD external subsets, and external entity references) are resolved at parse time.
poValidateOnParse	MSXML	The DOM parser validates the XML document against its schema information as well as verifying that it is well-formed XML.
poPreserveWhiteSpace	MSXML	White space in the text of the XML document is not stripped off.
poAsyncLoad	MSXML	The DOM parser works asynchronously. This can speed up performance, especially when parsing a large XML document, but can also lead to exceptions if the application tries to access nodes in the document before it is completely parsed.

84.3.3 XMLIntf.TXMLDocOption Enumeration

TXMLDocOption and TXMLDocOptions (see page 7667) indicate types of information that an XML document automatically supplies.

Pascal

```
TXMLDocOption = (
```

```
    doNodeAutoCreate,
    doNodeAutoIndent,
    doAttrNull,
    doAutoPrefix,
    doNamespaceDecl,
    doAutoSave
  );
```

C++

```
  enum TXMLDocOption {
    doNodeAutoCreate,
    doNodeAutoIndent,
    doAttrNull,
    doAutoPrefix,
    doNamespaceDecl,
    doAutoSave
  };
```

File

XMLIntf

Description

TXMLDocOptions (see page 7667) is a set of TXMLDocOption values. The following table lists the TXMLDocOption values:

Value	Meaning
doNodeAutoCreate	If the application tries to read a node by name, using the Nodes property of an IXMLNodeList (see page 7649) interface, and that node does not exist, then the application creates a new node using the specified name.
doNodeAutoIndent	When formatting the XML text from the parsed set of nodes, child nodes are automatically indented from their parent nodes.
doAttrNull	When reading the value of an attribute that does not exist, the value is given as a Null Variant (see page 3430) (as opposed to a value of an empty string).
doAutoPrefix	When generating the name of a new node, the value is automatically given a namespace prefix if a namespace URI is supplied.
doNamespaceDecl	When the AddChild method must create a new namespace for the node, it also adds a namespace attribute to declare that new namespace. If doNamespaceDecl is not included, AddChild creates the new namespace but does not add an attribute to declare it.
doAutoSave	When the XML document closes, any changes are automatically saved back to the XML document file or to the XML property.

84.3.4 XMLIntf.TXMLEncodingType Enumeration

TXMLEncodingType indicates the character set used to encode characters in an XML document.

Pascal

```
  TXMLEncodingType = (
    xetUnknown,
    xetUCS_4BE,
    xetUCS_4LE,
    xetUCS_4Order2134,
    xetUCS_4Order3412,
    xetUTF_16BE,
    xetUTF_16LE,
    xetUTF_8,
```

```
    xetUCS_4Like,
    xetUTF_16BELike,
    xetUTF_16LELike,
    xetUTF_8Like,
    xetEBCDICLike
  );
```

C++

```
  enum TXMLEncodingType {
    xetUnknown,
    xetUCS_4BE,
    xetUCS_4LE,
    xetUCS_4Order2134,
    xetUCS_4Order3412,
    xetUTF_16BE,
    xetUTF_16LE,
    xetUTF_8,
    xetUCS_4Like,
    xetUTF_16BELike,
    xetUTF_16LELike,
    xetUTF_8Like,
    xetEBCDICLike
  };
```

File

XMLIntf

Description

The following table lists the possible TXMLEncodingType values:

Value	Character encoding
xetUnknown	The character set is unknown.
xetUCS_4BE	UCS-4, big-endian (1234).
xetUCS_4LE	UCS-4, little-endian (4321).
xetUCS_4Order2134	UCS-4, unusual octet order (2134)
xetUCS_4Order3412	UCS-4, unusual octet order (3412)
xetUTF_16BE	UTF-16, big-endian order
xetUTF_16LE	UTF-16, little-endian order
xetUTF_8	UTF-8
xetUCS_4Like	Any UCS-4 encoding
xetUTF_16BELike	Any UTF-16, big-endian encoding, may be without byte order mark
xetUTF_16LELike	Any UTF-16, little-endian encoding, my be without byte order mark
xetUTF_8Like	UTF-8, ISO 646, ASCII, or other 7- or 8-bit encoding, including multi-byte character sets such as Shift-JIS.
xetEBCDICLike	EBCDIC

84.4 Types

The following table lists types in this documentation.

Types

Name	Description
TParseOptions (see page 7667)	This is type XMLIntf.TParseOptions.
TXMLDocOptions (see page 7667)	This is type XMLIntf.TXMLDocOptions.

84.4.1 XMLIntf.TParseOptions Type

Pascal

```
TParseOptions = set of TParseOption;
```

C++

```
TParseOption TParseOptions;
```

File

XMLIntf

Description

This is type XMLIntf.TParseOptions.

84.4.2 XMLIntf.TXMLDocOptions Type

Pascal

```
TXMLDocOptions = set of TXMLDocOption;
```

C++

```
TXMLDocOption TXMLDocOptions;
```

File

XMLIntf

Description

This is type XMLIntf.TXMLDocOptions.

84.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
NodeTypeNames (see page 7668)	This is constant XMLIntf.NodeTypeNames.

84.5.1 XMLIntf.NodeTypeNames Constant

Pascal

```
NodeTypeNames: array[TNodeType] of string = ('', 'Element','Attribute','Text','CDATASection',
'EntityRef','Entity', 'ProcessingInstr', 'Comment','Document','DocumentType',
'DocumentFragment','Notation');
```

C++

```
array[TNodeType] of string NodeTypeNames = ('', 'Element','Attribute','Text','CDATASection',
'EntityRef','Entity', 'ProcessingInstr', 'Comment','Document','DocumentType',
'DocumentFragment','Notation');
```

File

XMLIntf

Description

This is constant XMLIntf.NodeTypeNames.

85 Xmlxform Namespace

This is namespace Xmlxform.

Topics

Name	Description
Classes (see page 7670)	The following table lists classes in this documentation.
Types (see page 7705)	The following table lists types in this documentation.

Classes

	Name	Description
	TranslateException (see page 7670)	TranslateException is the exception class for errors that occur when converting an XML document to a data packet or a data packet to an XML document.
	TXMLTransform (see page 7671)	TXMLTransform converts an XML document into a data packet or an XML data packet into an XML document with another structure.
	TXMLTransformClient (see page 7683)	TXMLTransformClient acts as an adapter between an XML document and a provider component.
	TXMLTransformProvider (see page 7691)	TXMLTransformProvider provides data from and resolves updates to an XML document.

Types

Name	Description
TRowEvent (see page 7705)	This is type Xmlxform.TRowEvent.
TTranslateEvent (see page 7705)	This is type Xmlxform.TTranslateEvent.

85.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TranslateException (see page 7670)	TranslateException is the exception class for errors that occur when converting an XML document to a data packet or a data packet to an XML document.
	TXMLTransform (see page 7671)	TXMLTransform converts an XML document into a data packet or an XML data packet into an XML document with another structure.
	TXMLTransformClient (see page 7683)	TXMLTransformClient acts as an adapter between an XML document and a provider component.
	TXMLTransformProvider (see page 7691)	TXMLTransformProvider provides data from and resolves updates to an XML document.

85.1.1 TranslateException Class

TranslateException is the exception class for errors that occur when converting an XML document to a data packet or a data packet to an XML document.

Class Hierarchy

Pascal

```
TranslateException = class(Exception);
```

C++

```
class TranslateException : public Exception;
```

File

Xmlxform

Description

TranslateException is raised by the transform components (TXMLTransform (see page 7671), TXMLTransformClient (see page 7683), and TXMLTransformProvider (see page 7691)) when they can't find a file that is needed to perform a transformation. The missing file can be the XML document that is to be translated into a data packet, or a transformation file that contains instructions on how to map between a data packet and an XML document.

See Also

TXMLTransform (see page 7671)

TXMLTransformClient (see page 7683)

TXMLTransformProvider (see page 7691)

85.1.2 TXMLTransform Class

TXMLTransform converts an XML document into a data packet or an XML data packet into an XML document with another structure.

Class Hierarchy

Pascal

```
TXMLTransform = class(TComponent);
```

C++

```
class TXMLTransform : public TComponent;
```

File

Xmlxform

Description

Use TXMLTransform to convert an XML document into a data packet or an XML data packet into an XML document that is not a data packet. You can use a TXMLTransform component by itself, or specify the transformation to be performed on a TXMLTransform component that is part of another component such as TXMLTransformClient (see page 7683) or TXMLTransformProvider (see page 7691).

TXMLTransform uses a special XML document called a transformation, which indicates how to perform the conversion. This transformation is specified by the TransformationFile (see page 7680) or TransformationDocument (see page 7679) property. You can generate a transformation file using the xmlmapper.exe utility.

There are three ways to specify the source document or data packet that TXMLTransform converts:

Use the SourceXmlFile (see page 7679) property if the source document is a file on disk.

Use the SourceXml (see page 7678) property if the source document is an in-memory string of XML.

Use the SourceXmlDocument (see page 7678) property if the source document is available through a DOM interface (IDOMDocument (see page 7482)).

TXMLTransform performs its transformation when you read the Data (see page 7675) property or call the TransformXML (see page 7674) method. Once the source XML has been transformed, you can access the DOM interface for the resulting XML document or data packet using the ResultDocument (see page 7677) property, or read the Data (see page 7675) property to directly access the string of XML.

TXMLTransformClient (see page 7683)

TXMLTransformProvider (see page 7691)

Converting XML Documents into Data Packets

85.1.2.1 TXMLTransform Members

The following tables list the members exposed by TXMLTransform.

Protected Methods

	Name	Description
	DoTransform (see page 7673)	This is DoTransform, a member of class TXMLTransform.
	GetData (see page 7673)	This is GetData, a member of class TXMLTransform.
	GetResultString (see page 7673)	This is GetResultString, a member of class TXMLTransform.
	Transform (see page 7673)	This is Transform, a member of class TXMLTransform.
	Translate (see page 7674)	This is Translate, a member of class TXMLTransform.

Public Methods

	Name	Description
	TransformXML (see page 7674)	Converts an XML document using the specifications in a transformation file.

Public Properties

	Name	Description
R	Data (see page 7675)	Represents the translated string of XML.
	EmptyDestinationDocument (see page 7676)	Specifies the DOM interface for an XML document that defines the structure of the transformation result.
R	ResultDocument (see page 7677)	Specifies the DOM interface for the results of the transformation.
R	ResultString (see page 7677)	Specifies the results of the transformation.
	SourceXml (see page 7678)	Specifies a string of XML to be translated.
	SourceXmlDocument (see page 7678)	Specifies the DOM interface for the XML document to be converted.
	SourceXmlFile (see page 7679)	Specifies an XML document or XML data packet file to be translated.
	TransformationDocument (see page 7679)	Specifies the transformation that indicates how to convert the source XML document.

Published Events

	Name	Description
	AfterEachRow (see page 7681)	Occurs after TXMLTransform (see page 7671) has finished transforming a record in the XML data packet.
	AfterEachRowSet (see page 7681)	Occurs after TXMLTransform (see page 7671) has finished transforming the entire XML data packet or a nested detail set.
	BeforeEachRow (see page 7682)	Occurs immediately before TXMLTransform (see page 7671) starts transforming a record in the XML data packet.
	BeforeEachRowSet (see page 7682)	Occurs immediately before TXMLTransform (see page 7671) starts transforming the entire XML data packet or a nested detail set.
	OnTranslate (see page 7683)	Occurs when the TXMLTransform (see page 7671) component needs to translate a user-defined node.

Published Properties

	Name	Description
	TransformationFile (see page 7680)	Specifies the transformation file that indicates how to convert the source XML document.

85.1.2.2 TXMLTransform Methods

The methods of the TXMLTransform class are listed here.

Protected Methods

	Name	Description
	DoTransform (see page 7673)	This is DoTransform, a member of class TXMLTransform.
	GetData (see page 7673)	This is GetData, a member of class TXMLTransform.
	GetResultString (see page 7673)	This is GetResultString, a member of class TXMLTransform.
	Transform (see page 7673)	This is Transform, a member of class TXMLTransform.
	Translate (see page 7674)	This is Translate, a member of class TXMLTransform.

Public Methods

	Name	Description
	TransformXML (see page 7674)	Converts an XML document using the specifications in a transformation file.

85.1.2.2.1 TXMLTransform.DoTransform Method

Pascal

```
function DoTransform(const XMLSrc: IDOMDocument; const XMLExtract: IDOMDocument; const XMLOut:
IDOMDocument): string;
```

C++

```
__fastcall UnicodeString DoTransform(const IDOMDocument XMLSrc, const IDOMDocument XMLExtract,
const IDOMDocument XMLOut);
```

Description

This is DoTransform, a member of class TXMLTransform.

85.1.2.2.2 TXMLTransform.GetData Method

Pascal

```
function GetData: string;
```

C++

```
__fastcall UnicodeString GetData();
```

Description

This is GetData, a member of class TXMLTransform.

85.1.2.2.3 TXMLTransform.GetResultString Method

Pascal

```
function GetResultString: string;
```

C++

```
__fastcall UnicodeString GetResultString();
```

Description

This is GetResultString, a member of class TXMLTransform.

85.1.2.2.4 TXMLTransform.Transform Method

Pascal

```
procedure Transform(TransNode: IDOMNode; SrcNode: IDOMNode; DestNode: IDOMNode; Count:
Integer; InFromList: TStringList; InDestList: TStringList; InIdStrList: TStringList;
InValueList: TStringList; InOptionalList: TStringList; InDateFormatList: TStringList;
InDateFormatTypeList: TStringList; InMapValuesList: TStringList);
```

C++

```
__fastcall Transform(IDOMNode TransNode, IDOMNode SrcNode, IDOMNode DestNode, int Count,
TStringList InFromList, TStringList InDestList, TStringList InIdStrList, TStringList
InValueList, TStringList InOptionalList, TStringList InDateFormatList, TStringList
InDateFormatTypeList, TStringList InMapValuesList);
```

Description

This is Transform, a member of class TXMLTransform.

85.1.2.2.5 TXMLTransform.TransformXML Method

Converts an XML document using the specifications in a transformation file.

Pascal

```
function TransformXML(const SourceXml: string; const ATransformationFile: string = ''): string;
```

C++

```
__fastcall UnicodeString TransformXML(const UnicodeString SourceXml, const UnicodeString
ATransformationFile = '');
```

Description

Call TransformXML to convert an XML document when the source XML is an in-memory string.

SourceXml (see page 7678) is a string of XML to be transformed. It can be any type of XML document, including an XML data packet. It must, however, conform to the schema expected by the transformation document used to perform the transformation. If the transformation converts a specific type of XML document into a data packet, SourceXml (see page 7678) must conform to the expected schema. If the transformation converts a data packet into an XML document, SourceXml (see page 7678) must be an XML data packet with the expected metadata.

ATransformationFile is the transformation file to use when performing the translation. A transformation file is a special type of XML file with the .xtr extension. Each transformation file is specific to a particular XML schema and data packet format and represents a one-way transformation. Use the xmlmapper utility to create transformation files.

If the ATransformationFile parameter is omitted, TransformXML uses the file specified by the TransformationFile (see page 7680) property, or the document specified by the TransformationDocument (see page 7679) property.

TransformXML returns the results of the conversion as a string of XML.

See Also

Data (see page 7675)

TransformationFile (see page 7680)

TransformationDocument (see page 7679)

85.1.2.2.6 TXMLTransform.Translate Method

Pascal

```
procedure Translate(const Id: string; const SrcNode: IDOMNode; var SrcValue: string; const
DestNode: IDOMNode); dynamic;
```

C++

```
__fastcall Translate(const UnicodeString Id, const IDOMNode SrcNode, UnicodeString SrcValue,
const IDOMNode DestNode);
```

Description

This is Translate, a member of class TXMLTransform.

85.1.2.3 TXMLTransform Properties

The properties of the TXMLTransform class are listed here.

Public Properties

	Name	Description
	Data (see page 7675)	Represents the translated string of XML.
	EmptyDestinationDocument (see page 7676)	Specifies the DOM interface for an XML document that defines the structure of the transformation result.
	ResultDocument (see page 7677)	Specifies the DOM interface for the results of the transformation.
	ResultString (see page 7677)	Specifies the results of the transformation.
	SourceXml (see page 7678)	Specifies a string of XML to be translated.
	SourceXmlDocument (see page 7678)	Specifies the DOM interface for the XML document to be converted.
	SourceXmlFile (see page 7679)	Specifies an XML document or XML data packet file to be translated.
	TransformationDocument (see page 7679)	Specifies the transformation that indicates how to convert the source XML document.

Published Properties

	Name	Description
	TransformationFile (see page 7680)	Specifies the transformation file that indicates how to convert the source XML document.

85.1.2.3.1 TXMLTransform.Data Property

Represents the translated string of XML.

Pascal

```
property Data: string;
```

C++

```
__property UnicodeString Data;
```

Description

Read (see page 3727) Data to obtain the results of the transformation. Reading the Data property causes TXMLTransform (see page 7671) to translate its source XML document or data packet into the destination format, which becomes the value of the Data property. The resulting XML string is not cached in memory: reading Data a second time causes TXMLTransform (see page 7671) to perform its transformation a second time.

If the source XML is an XML document and the transformation indicates how to convert it into a data packet, Data is the contents of a data packet in XML format.

If the source XML is an XML data packet and the transformation indicates how to convert it into another type of XML document, Data is the contents of the resulting document.

There are three ways to specify the source document or data packet that is converted to produce Data:

- Use the SourceXmlFile (see page 7679) property if the source document is a file on disk.
- Use the SourceXml (see page 7678) property if the source document is an in-memory string of XML.
- Use the SourceXmlDocument (see page 7678) property if the source document is available through a DOM interface (IDOMDocument (see page 7482)).
- If SourceXMLFile is set to an invalid file name or SourceXMLFile is an empty string and SourceXml (see page 7678) is not a valid string of XML, or SourceXMLFile and SourceXML are both empty strings and SourceXmlDocument (see page 7678) is not set, TXMLTransform (see page 7671) raises a TranslateException (see page 7670) when you try to read Data.
- There are two ways to specify the transformation that converts the source XML into Data:

- Use the TransformationFile (see page 7680) property if the transformation is stored in a file on disk.
- Use the TransformationDocument (see page 7679) method if the transformation is available through a DOM interface (IDOMDocument (see page 7482)).
- If TransformationFile (see page 7680) is set to an invalid file name or TransformationFile (see page 7680) is an empty string and TransformationDocument (see page 7679) is not set, TXMLTransform (see page 7671) raises a TranslateException (see page 7670) when you try to read Data.
- You can augment the transformation by using the EmptyDestinationDocument (see page 7676) property to supply a skeleton document that gives the form for the resulting XML document.
- When you read Data, for every user-defined node in the source XML document, TXMLTransform (see page 7671) generates an OnTranslate (see page 7683) event to convert the node.

Tip: When converting an XML document into a data packet, the value of Data can be assigned to a client dataset's XMLData property.

Converting XML Documents into Data Packets

85.1.2.3.2 TXMLTransform.EmptyDestinationDocument Property

Specifies the DOM interface for an XML document that defines the structure of the transformation result.

Pascal

```
property EmptyDestinationDocument: IDOMDocument;
```

C++

```
__property IDOMDocument EmptyDestinationDocument;
```

Description

The transformation defined by TransformationFile (see page 7680) or TransformationDocument (see page 7679) contains a default structure for the results of transforming the source document in addition to the mappings between nodes in the source document and nodes in the destination. You can override this default structure, however, by setting EmptyDestinationDocument. This is the DOM interface for an XML document that has the desired structure, but with no values in the nodes that should be filled in using values in the source document. This is useful, for example, when you want to add additional information that does not come from the source document.

EmptyDestinationDocument is not changed when TXMLTransform (see page 7671) performs its transformation. To obtain a DOM interface for the resulting document, use the ResultDocument (see page 7677) property.

ResultDocument (see page 7677)

Data (see page 7675)

TransformXML (see page 7674)

TransformationFile (see page 7680)

TransformationDocument (see page 7679)

85.1.2.3.3 TXMLTransform.ResultDocument Property

Specifies the DOM interface for the results of the transformation.

Pascal

```
property ResultDocument: IDOMDocument;
```

C++

```
__property IDOMDocument ResultDocument;
```

Description

Read (see page 3727) ResultDocument to work with the results of the transformation using a DOM interface. ResultDocument is created when you call the TransformXML (see page 7674) method to perform the transformation.

See Also

SourceXmlDocument (see page 7678)

Data (see page 7675)

TransformXML (see page 7674)

EmptyDestinationDocument (see page 7676)

ResultString (see page 7677)

85.1.2.3.4 TXMLTransform.ResultString Property

Specifies the results of the transformation.

Pascal

```
property ResultString: string;
```

C++

```
__property UnicodeString ResultString;
```

Description

Read (see page 3727) ResultString to obtain the results of the transformation as a string of XML. ResultString is created when you call the TransformXML (see page 7674) method to perform the transformation.

See Also

SourceXmlDocument (see page 7678)

Data (see page 7675)

TransformXML (see page 7674)

EmptyDestinationDocument (see page 7676)

ResultString

85.1.2.3.5 TXMLTransform.SourceXml Property

Specifies a string of XML to be translated.

Pascal

```
property SourceXml: string;
```

C++

```
__property UnicodeString SourceXml;
```

Description

Specify the XML to be translated as the value of SourceXml. SourceXml can be the text of any XML document, including an XML data packet. It must, however, conform to the schema expected by the transformation specified by TransformationFile (see page 7680) or TransformationDocument (see page 7679). If the transformation converts a specific type of XML document into a data packet, SourceXml must conform to the expected schema. If the transformation converts a data packet into an XML document, SourceXml is an XML data packet with the expected metadata.

SourceXmlDocument (see page 7678) is used only if the SourceXMLFile property has not been set. If both SourceXMLFile and SourceXml are empty strings, TXMLTransform (see page 7671) uses the SourceXmlDocument (see page 7678) property instead. SourceXml takes precedence over SourceXmlDocument (see page 7678): If SourceXmlDocument (see page 7678) is set, TXMLTransform (see page 7671) still uses SourceXml (even if its value is not a valid string of XML).

Converting XML Documents into Data Packets

85.1.2.3.6 TXMLTransform.SourceXmlDocument Property

Specifies the DOM interface for the XML document to be converted.

Pascal

```
property SourceXmlDocument: IDOMDocument;
```

C++

```
__property IDOMDocument SourceXmlDocument;
```

Description

Specify the document to be translated as the value of SourceXmlDocument. SourceXmlDocument can be any type of XML document, including an XML data packet. It must, however, conform to the schema expected by the transformation specified by TransformationFile (see page 7680) or TransformationDocument (see page 7679). If the transformation converts a specific type of XML document into a data packet, then SourceXmlDocument is a document with the expected schema. If the transformation converts a data packet into an XML document, SourceXmlDocument is the interface to an XML data packet with the expected metadata.

SourceXmlDocument is used only if the SourceXMLFile and SourceXml (see page 7678) properties have not been set.

See Also

SourceXmlFile (see page 7679)

Converting XML Documents into Data Packets

85.1.2.3.7 TXMLTransform.SourceXmlFile Property

Specifies an XML document or XML data packet file to be translated.

Pascal

```
property SourceXmlFile: string;
```

C++

```
__property UnicodeString SourceXmlFile;
```

Description

Specify the file to be translated as the value of SourceXmlFile. SourceXmlFile can be any type of XML document, including an XML data packet. It must, however, conform to the schema expected by the transformation specified by TransformationFile (see page 7680) or TransformationDocument (see page 7679). If the transformation converts a specific type of XML document into a data packet, SourceXmlFile is a document with the expected schema. If the transformation converts a data packet into an XML document, SourceXmlFile is an XML data packet with the expected metadata.

If SourceXmlFile is an empty string, TXMLTransform (see page 7671) uses the SourceXml (see page 7678) or SourceXmlDocument (see page 7678) property instead. SourceXmlFile takes precedence over both of these other properties. If SourceXml (see page 7678) or SourceXmlDocument (see page 7678) is set, TXMLTransform (see page 7671) still uses SourceXmlFile (even if it does not specify a valid file name).

Converting XML Documents into Data Packets

85.1.2.3.8 TXMLTransform.TransformationDocument Property

Specifies the transformation that indicates how to convert the source XML document.

Pascal

```
property TransformationDocument: IDOMDocument;
```

C++

```
__property IDOMDocument TransformationDocument;
```

Description

TransformationDocument is the DOM interface for the transformation that contains instructions for converting the source XML document into the XML that is the value of Data (see page 7675) and ResultDocument (see page 7677).

A transformation is a special type of XML document that defines the mapping between the nodes of a source document and a destination document and the structure of the destination document. Each transformation is specific to a particular XML schema

and data packet format and represents a one-way transformation. Use the xmlmapper utility to create transformations.

If the EmptyDestinationDocument (see page 7676) property is set, TXMLTransform (see page 7671) uses that to override the default structure for the destination document that is defined in TransformationDocument.

TransformationDocument is used only if the value of TransformationFile (see page 7680) is an empty string.

See Also

Converting XML Documents into Data Packets

Using an XML Document as the Client of a Provider

Using an XML Document as the Source for a Provider

85.1.2.3.9 TXMLTransform.TransformationFile Property

Specifies the transformation file that indicates how to convert the source XML document.

Pascal

```
property TransformationFile: string;
```

C++

```
__property UnicodeString TransformationFile;
```

Description

TransformationFile is a file that contains instructions for converting the source XML document into the XML that is the value of Data (see page 7675) and ResultDocument (see page 7677). If the source document is a general XML document, TransformationFile represents a transformation from that document's schema into a data packet. If the source document is an XML data packet, TransformationFile represents a transformation from that data packet into another type of XML document.

A transformation file is a special type of XML file with the .xtr extension. Each transformation file is specific to a particular XML schema and data packet format and represents a one-way transformation. Use the xmlmapper utility to create transformation files.

If the EmptyDestinationDocument (see page 7676) property is set, TXMLTransform (see page 7671) uses that to override the default structure for the destination document that is defined in the transformation file.

TransformationFile takes precedence over the TransformationDocument (see page 7679) property. That is, TXMLTransform (see page 7671) only uses TransformationDocument (see page 7679) if TransformationFile is an empty string.

85.1.2.4 TXMLTransform Events

The events of the TXMLTransform class are listed here.

Published Events

	Name	Description
	AfterEachRow (see page 7681)	Occurs after TXMLTransform (see page 7671) has finished transforming a record in the XML data packet.
	AfterEachRowSet (see page 7681)	Occurs after TXMLTransform (see page 7671) has finished transforming the entire XML data packet or a nested detail set.
	BeforeEachRow (see page 7682)	Occurs immediately before TXMLTransform (see page 7671) starts transforming a record in the XML data packet.
	BeforeEachRowSet (see page 7682)	Occurs immediately before TXMLTransform (see page 7671) starts transforming the entire XML data packet or a nested detail set.
	OnTranslate (see page 7683)	Occurs when the TXMLTransform (see page 7671) component needs to translate a user-defined node.

85.1.2.4.1 TXMLTransform.AfterEachRow Event

Occurs after TXMLTransform (see page 7671) has finished transforming a record in the XML data packet.

Pascal

```
property AfterEachRow: TRowEvent;
```

C++

```
__property TRowEvent AfterEachRow;
```

Description

Write (see page 3789) an AfterEachRow event handler to take specific action after the XML transform component has translated each row in the data packet. For example, you can use AfterEachRow to read the data from the generated row and use it to compute the value of an internally calculated field.

See Also

TransformXML (see page 7674)

AfterEachRowSet (see page 7681)

BeforeEachRow (see page 7682)

Data (see page 7675)

85.1.2.4.2 TXMLTransform.AfterEachRowSet Event

Occurs after TXMLTransform (see page 7671) has finished transforming the entire XML data packet or a nested detail set.

Pascal

```
property AfterEachRowSet: TRowEvent;
```

C++

```
__property TRowEvent AfterEachRowSet;
```

Description

Write (see page 3789) an AfterEachRowSet event handler to take specific action after the XML transform component has translated an entire dataset. This can be a nested detail set, or the entire XML data packet.

For example, you can use AfterEachRowSet with the BeforeEachRowSet (see page 7682) and OnTranslate (see page 7683) methods to compute summary values: initialize a variable in the BeforeEachRowSet (see page 7682) method, update it for every OnTranslate (see page 7683) event, and use the result in the AfterEachRowSet event.

See Also

TransformXML (see page 7674)

AfterEachRow (see page 7681)

BeforeEachRow (see page 7682)

Data (see page 7675)

85.1.2.4.3 TXMLTransform.BeforeEachRow Event

Occurs immediately before TXMLTransform (see page 7671) starts transforming a record in the XML data packet.

Pascal

```
property BeforeEachRow: TRowEvent;
```

C++

```
__property TRowEvent BeforeEachRow;
```

Description

Write (see page 3789) a BeforeEachRow event handler to take specific action before the XML transform component starts translating each row in the data packet.

See Also

TransformXML (see page 7674)

BeforeEachRowSet (see page 7682)

AfterEachRow (see page 7681)

Data (see page 7675)

85.1.2.4.4 TXMLTransform.BeforeEachRowSet Event

Occurs immediately before TXMLTransform (see page 7671) starts transforming the entire XML data packet or a nested detail set.

Pascal

```
property BeforeEachRowSet: TRowEvent;
```

C++

```
__property TRowEvent BeforeEachRowSet;
```

Description

Write (see page 3789) an BeforeEachRowSet event handler to take specific action before the XML transform component starts translating a dataset. This can be a nested detail set, or the entire XML data packet.

For example, you can use BeforeEachRowSet with the AfterEachRowSet (see page 7681) and OnTranslate (see page

7683) methods to compute summary values: initialize a variable in the BeforeEachRowSet method, update it for every OnTranslate (see page 7683) event, and use the result in the AfterEachRowSet (see page 7681) event.

See Also

TransformXML (see page 7674)

AfterEachRowSet (see page 7681)

BeforeEachRow (see page 7682)

Data (see page 7675)

85.1.2.4.5 TXMLTransform.OnTranslate Event

Occurs when the TXMLTransform (see page 7671) component needs to translate a user-defined node.

Pascal

```
property OnTranslate: TTranslateEvent;
```

C++

```
__property TTranslateEvent OnTranslate;
```

Description

Write (see page 3789) an OnTranslate event handler to provide the translation for user-defined nodes.

TXMLTransform (see page 7671) performs a translation when an application reads the Data (see page 7675) property or calls the TransformXML (see page 7674) method. If the transformation document that governs how to perform that translation indicates that a node in the XML document is user defined, TXMLTransform (see page 7671) generates an OnTranslate event when it needs to translate to or from that node. OnTranslate only occurs for nodes that are marked as user defined.

If you do not translate a user-defined node in an OnTranslate event handler, the corresponding node in the translated XML is assigned the source XML node's value, if available. Otherwise, it is left blank.

Converting XML Documents into Data Packets

Using an XML Document as the Client of a Provider

Using an XML Document as the Source for a Provider

85.1.3 TXMLTransformClient Class

TXMLTransformClient acts as an adapter between an XML document and a provider component.

Class Hierarchy

Pascal

```
TXMLTransformClient = class(TComponent);
```

C++

```
class TXMLTransformClient : public TComponent;
```

File

Xmlxform

Description

Use TXMLTransformClient to convert the data from a provider into an XML document or to apply updates in the form of an XML document to a provider component. TXMLTransformClient can act as the client of any provider component, local or remote. It uses a transformation file that is generated using the xmlmapper utility to convert between XML documents and the data packets and delta packets used by the provider.

See Also

TXMLTransform (see page 7671)

TXMLTransformProvider (see page 7691)

Using an XML Document as the Client of a Provider

85.1.3.1 TXMLTransformClient Members

The following tables list the members exposed by TXMLTransformClient.

Protected Methods

	Name	Description
	SetupAppServer (see page 7688)	This is SetupAppServer, a member of class TXMLTransformClient.

Public Methods

	Name	Description
V	ApplyUpdates (see page 7686)	Inserts or deletes the records corresponding to the data in an XML document.
V	Create (see page 7685)	Creates and initializes a TXMLTransformClient (see page 7683) object.
V	Destroy (see page 7685)	Destroys the instance of a TXMLTransformClient (see page 7683) component.
V	GetDataAsXml (see page 7686)	Fetches a data packet from the provider and converts it to an XML document.
	SetParams (see page 7687)	Sets input parameters to values supplied in an XML document.

Published Properties

	Name	Description
	ProviderName (see page 7689)	Specifies the name of a provider component that supplies data to and applies updates from the XML transform client.
	RemoteServer (see page 7689)	Specifies the connection component that this XML transform client uses to connect to an application server.
R	TransformApplyUpdates (see page 7690)	Specifies the TXMLTransform (see page 7671) component that converts XML into delta packets that are then sent to the provider to apply updates.
R	TransformGetData (see page 7690)	Specifies the TXMLTransform (see page 7671) component that converts data packets from the provider into XML.
R	TransformSetParams (see page 7691)	Specifies the TXMLTransform (see page 7671) component that converts the XML supplied to the SetParams (see page 7687) method into a data packet format.

85.1.3.2 TXMLTransformClient.Create Constructor

Creates and initializes a TXMLTransformClient (see page 7683) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLTransformClient(TComponent * AOwner);
```

Description

Call Create to instantiate an XML transform client at runtime. XML transform clients placed in forms or data modules at design time are created automatically.

The AOwner parameter specifies another component (typically a form or data module) that is responsible for freeing the TXMLTransformClient (see page 7683) object.

See Also

Owner

85.1.3.3 TXMLTransformClient.Destroy Destructor

Destroys the instance of a TXMLTransformClient (see page 7683) component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLTransformClient();
```

Description

Do not call Destroy directly in an application. Usually destruction of TXMLTransformClient (see page 7683) objects is handled automatically. If an application creates its own instances of TXMLTransformClient (see page 7683) without assigning an Owner, however, it should call Free, which verifies that the dataset component is not nil before calling Destroy.

See Also

Owner

Create (see page 7685)

System::TObject::Free (see page 3382)

85.1.3.4 TXMLTransformClient Methods

The methods of the TXMLTransformClient class are listed here.

Protected Methods

	Name	Description
	SetupAppServer (see page 7688)	This is SetupAppServer, a member of class TXMLTransformClient.

Public Methods

	Name	Description
	ApplyUpdates (see page 7686)	Inserts or deletes the records corresponding to the data in an XML document.
	GetDataAsXml (see page 7686)	Fetches a data packet from the provider and converts it to an XML document.
	SetParams (see page 7687)	Sets input parameters to values supplied in an XML document.

85.1.3.4.1 TXMLTransformClient.ApplyUpdates Method

Inserts or deletes the records corresponding to the data in an XML document.

Pascal

```
function ApplyUpdates(const UpdateXML: string; const UpdateTransformFile: string; MaxErrors:
Integer): Integer; virtual;
```

C++

```
virtual __fastcall int ApplyUpdates(const UnicodeString UpdateXML, const UnicodeString
UpdateTransformFile, int MaxErrors);
```

Description

Call ApplyUpdates to transform an XML document into a delta packet that inserts or deletes all of the resulting records and send it to the associated provider so that it can be applied. Before you can call ApplyUpdates, you must define the transformation to use by setting properties on the XML transform component specified by TransformApplyUpdates (see page 7690).

UpdateXML is the XML document that can be transformed into a delta packet. Typically, it contains the contents of an XML document file.

UpdateTransformFile is the name of a transformation file that converts UpdateXML into an insert or delete delta packet. A transformation file is a special type of XML file with the .xtr extension. The transformation file is specific to a particular XML schema, data packet format, and update operation (insert or delete). Use the xmlmapper utility to create the transformation file.

Note: If UpdateTransformFile includes any user-defined conversions, ApplyUpdates generates an OnTranslate event on TransformApplyUpdates (see page 7690) when it needs to transform user-defined nodes in the UpdateXML string into corresponding field values.

MaxErrors indicates the maximum number of errors that the provider should allow before prematurely stopping the update operation. Set MaxErrors to –1 to indicate that there is no limit to the number of errors.

ApplyUpdates returns the number of errors it encountered.

See Also

ProviderName (see page 7689)

TransformApplyUpdates (see page 7690)

ApplyUpdates

Using an XML Document as the Client of a Provider

85.1.3.4.2 TXMLTransformClient.GetDataAsXml Method

Fetches a data packet from the provider and converts it to an XML document.

Pascal

```
function GetDataAsXml(const PublishTransformFile: string): string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDataAsXml(const UnicodeString PublishTransformFile);
```

Description

Call GetDataAsXml to obtain an XML document that is the translation of a data packet from the associated provider. GetDataAsXml

1. Passes any parameters supplied to the SetParams (see page 7687) method to the provider specified by ProviderName (see page 7689).
2. Obtains a data packet that the provider returns.
3. Uses the transform component specified by TransformGetData (see page 7690) to convert the data packet to an XML document. If the PublishTransformFile parameter is not an empty string, GetDataAsXml uses the file specified by this parameter as the transformation file. Otherwise, it uses the transformation file specified on the TransformGetData (see page 7690) property.
4. Generates an OnTranslate event for every user-defined conversion in its transformation. The application can use this event to perform the user-defined conversion that converts field values into XML nodes.
5. Returns the resulting XML document as a string.

Once you have obtained the resulting, translated XML document, you can assign it to a TXMLDocument component or save it to a file.

Note: Before you can call GetDataAsXml, you must supply any input parameters using the SetParams (see page 7687) method and set properties on TransformGetData (see page 7690) to indicate what transformation to perform.

See Also

ProviderName (see page 7689)

TransformGetData (see page 7690)

XML (see page 7344)

OnTranslate (see page 7683)

SetParams (see page 7687)

Using an XML Document as the Client of a Provider

85.1.3.4.3 TXMLTransformClient.SetParams Method

Sets input parameters to values supplied in an XML document.

Pascal

```
procedure SetParams(const ParamsXml: string; const ParamsTransformFile: string);
```

C++

```
__fastcall SetParams(const UnicodeString ParamsXml, const UnicodeString ParamsTransformFile);
```

Description

Call SetParams to supply input parameter values before fetching data from the provider. Parameter values can represent the input parameters to a query or stored procedure, or they can represent field values that filter the data when the provider represents the data in a TTable or TSQLTable component.

ParamsXML is the XML document that represents the parameter values to set. Typically, it contains the contents of an XML document file.

ParamsTransformFile is the name of a transformation file that converts ParamsXml into a data packet. A transformation file is a special type of XML file with the .xtr extension. The transformation file is specific to a particular XML schema and data packet format. Use the xmlmapper.exe utility to create the transformation file.

Note: If ParamsTransformFile includes any user-defined conversions, the component specified by TransformSetParams (see page 7691) generates an OnTranslate event when it needs to transform user-defined nodes in the ParamsXml string into corresponding parameter values.

The TXMLTransformClient (see page 7683) component stores parameter values internally. Each time you call SetParams, you update those internally stored values. Parameter values from previous calls are not cleared, so be sure to set every parameter value you want to change.

The next the GetDataAsXml (see page 7686) method is called, TXMLTransformClient (see page 7683) sends the currently stored parameter values to the provider.

85.1.3.4.4 TXMLTransformClient.SetupAppServer Method

Pascal

```
procedure SetupAppServer;
```

C++

```
__fastcall SetupAppServer();
```

Description

This is SetupAppServer, a member of class TXMLTransformClient.

85.1.3.5 TXMLTransformClient Properties

The properties of the TXMLTransformClient class are listed here.

Published Properties

	Name	Description
	ProviderName (see page 7689)	Specifies the name of a provider component that supplies data to and applies updates from the XML transform client.
	RemoteServer (see page 7689)	Specifies the connection component that this XML transform client uses to connect to an application server.
R	TransformApplyUpdates (see page 7690)	Specifies the TXMLTransform (see page 7671) component that converts XML into delta packets that are then sent to the provider to apply updates.
R	TransformGetData (see page 7690)	Specifies the TXMLTransform (see page 7671) component that converts data packets from the provider into XML.

	TransformSetParams (see page 7691)	Specifies the TXMLTransform (see page 7671) component that converts the XML supplied to the SetParams (see page 7687) method into a data packet format.

85.1.3.5.1 TXMLTransformClient.ProviderName Property

Specifies the name of a provider component that supplies data to and applies updates from the XML transform client.

Pascal

```
property ProviderName: string;
```

C++

```
__property UnicodeString ProviderName;
```

Description

Use ProviderName to specify the provider object that supplies the XML transform client with data packets and applies updates on its behalf. This property is passed as a parameter to IAppServer interface calls when the client fetches data from or applies updates to the source dataset, its database server, or the source XML document.

The provider specified by ProviderName can reside in the same application as the XML transform client or in an application server running on another system.

If the provider is in the same application as the XML transform client, it must have the same Owner as the client.

If the provider is on a remote application server, it must be exported by that application server. If the application server contains multiple provider objects, you can set ProviderName to any of them once the XML transform client establishes an initial connection to the application server through its RemoteServer (see page 7689) property.

ProviderName can be set from a drop-down in the Object Inspector once the RemoteServer (see page 7689) property is set if

The connection component is a SOAP connection.

The connection component is a Web connection or socket connection (Windows only).

The application server is COM-based and registered on the client system using TRegsvr.exe (Windows only).

ApplyUpdates (see page 7686)

Using an XML Document as the Client of a Provider

85.1.3.5.2 TXMLTransformClient.RemoteServer Property

Specifies the connection component that this XML transform client uses to connect to an application server.

Pascal

```
property RemoteServer: TCustomRemoteServer;
```

C++

```
__property TCustomRemoteServer RemoteServer;
```

Description

If the XML transform client is in the client portion of a multi-tiered application, use RemoteServer to specify the connection

component that connects to the application server. The connection component locates the application server and obtains its IAppServer interface, which the XML transform client can use for communicating with a remote provider.

If a client application uses more than connection component, the application can change which connection an XML transform client uses by changing the value for this property.

IAppServer

Using an XML Document as the Client of a Provider

85.1.3.5.3 TXMLTransformClient.TransformApplyUpdates Property

Specifies the TXMLTransform (see page 7671) component that converts XML into delta packets that are then sent to the provider to apply updates.

Pascal

```
property TransformApplyUpdates: TXMLTransform;
```

C++

```
__property TXMLTransform TransformApplyUpdates;
```

Description

Use TransformApplyUpdates to access the subcomponent that transforms the XML passed as the UpdateXML parameter of the ApplyUpdates (see page 7686) method into a delta packet, which is then forwarded to the provider. If the transformation passed to the ApplyUpdates (see page 7686) method includes any user-defined nodes, you must supply TransformApplyUpdates with an OnTranslate event handler.

See Also

ApplyUpdates (see page 7686)

ProviderName (see page 7689)

OnTranslate (see page 7683)

85.1.3.5.4 TXMLTransformClient.TransformGetData Property

Specifies the TXMLTransform (see page 7671) component that converts data packets from the provider into XML.

Pascal

```
property TransformGetData: TXMLTransform;
```

C++

```
__property TXMLTransform TransformGetData;
```

Description

Use TransformGetData to access the subcomponent that performs the transformation of data packets from the provider into another XML format. When an application calls the GetDataAsXml (see page 7686) method, this subcomponent converts the data packet from the provider into XML.

Before you can call GetDataAsXml (see page 7686), you must specify the transformation that this subcomponent uses by setting its TransformationFile or TransformationDocument property. In addition, if the transformation includes any user-defined nodes, you must supply TransformGetData with an OnTranslate event handler.

See Also

GetDataAsXml (see page 7686)

TransformationFile (see page 7680)

TransformationDocument (see page 7679)

OnTranslate (see page 7683)

Using an XML Document as the Client of a Provider

85.1.3.5.5 TXMLTransformClient.TransformSetParams Property

Specifies the TXMLTransform (see page 7671) component that converts the XML supplied to the SetParams (see page 7687) method into a data packet format.

Pascal

```
property TransformSetParams: TXMLTransform;
```

C++

```
__property TXMLTransform TransformSetParams;
```

Description

Use TransformSetParams to directly access the subcomponent that performs the transformation of an XML document into a set of parameter values. When an application calls the SetParams (see page 7687) method, this subcomponent converts the XML supplied as the ParamsXml parameter into a data packet, which it then uses to read and store parameter values. These parameter values are later passed to the provider when you call GetDataAsXml (see page 7686).

If the transformation passed to the SetParams (see page 7687) method includes any user-defined nodes, you must supply TransformSetParams with an OnTranslate event handler.

85.1.4 TXMLTransformProvider Class

TXMLTransformProvider provides data from and resolves updates to an XML document.

Class Hierarchy

Pascal

```
TXMLTransformProvider = class(TCustomProvider);
```

C++

```
class TXMLTransformProvider : public TCustomProvider;
```

File

Xmlxform

Description

Use TXMLTransformProvider to provide data from an XML document to a client dataset or XML broker and to resolve updates from that client dataset or XML broker back to the source XML document. TXMLTransformProvider can be a part of the same application as the client dataset or XML broker, or it can be placed in the application server of a multi-tiered application. It serves as a translator between an XML document and a client dataset.

TDataSetProvider packages data from the source XML document and passes it in one or more transportable data packets to the client dataset or XML broker.

When the provider supplies data to a client dataset, the client dataset reconstructs the data in the data packet to create a local, in-memory copy for user access. When user access is complete, the client dataset repackages any changed data and sends the updates back to the provider. The provider applies the updates to the source XML document.

When the provider supplies data to an XML broker, the XML broker adds the data packet, in XML format, to an HTML document that is downloaded by a Web client. When the XML broker receives updates from the Web client, it sends the updates to the provider, which applies them to the source XML document.

Client datasets and XML brokers communicate with a provider through the IAppServer interface. In multi-tiered applications, this is the interface of the remote data module that contains the provider. To enable the remote data module to pass calls to the provider, the provider's Exported property must be true, and its Owner property must specify the remote data module.

Determining the Source of Data

Using Provider Components

Using an XML Document as the Source for a Provider

85.1.4.1 TXMLTransformProvider Members

The following tables list the members exposed by TXMLTransformProvider.

Protected Methods

	Name	Description
	InternalApplyUpdates (see page 7694)	Provides the underlying implementation of the ApplyUpdates method.
	InternalGetRecords (see page 7695)	Provides the underlying implementation of the GetRecords method.

Public Methods

	Name	Description
	Create (see page 7693)	Creates and initializes a TXMLTransformProvider (see page 7691) object.
	Destroy (see page 7694)	Frees an instance of a provider object.

Published Events

	Name	Description
	AfterApplyUpdates (see page 7698)	Occurs after the provider applies updates.
	AfterGetRecords (see page 7699)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 7700)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 7701)	Occurs before the provider applies updates from a client dataset.
	BeforeGetRecords (see page 7701)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 7703)	Occurs before the provider creates a delta packet with information about the current record.
	OnDataRequest (see page 7703)	Occurs when a provider calls its DataRequest method.

Published Properties

	Name	Description
	CacheData (see page 7696)	Specifies whether the provider caches the data packet internally in memory.
R	TransformRead (see page 7696)	Specifies the TXMLTransform (see page 7671) component that converts the source XML document into data packets.
R	TransformWrite (see page 7697)	Specifies the TXMLTransform (see page 7671) component that generates the new value of the source XML document when updates are applied.
	XMLDataFile (see page 7697)	Specifies the XML document from which the provider creates data packets and to which it applies updates.

85.1.4.2 TXMLTransformProvider.Create Constructor

Creates and initializes a TXMLTransformProvider (see page 7691) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLTransformProvider(TComponent * AOwner);
```

Description

Call Create to instantiate an XML transform provider at runtime. Providers placed in forms or data modules at design time are created automatically.

The AOwner parameter specifies another component (typically a form or data module) that is responsible for freeing the provider.

See Also

Owner

85.1.4.3 TXMLTransformProvider.Destroy Destructor

Frees an instance of a provider object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLTransformProvider();
```

Description

Do not call Destroy directly. Instead, use the delete keyword, which indirectly calls Destroy.

See Also

delete

85.1.4.4 TXMLTransformProvider Methods

The methods of the TXMLTransformProvider class are listed here.

Protected Methods

	Name	Description
	InternalApplyUpdates (see page 7694)	Provides the underlying implementation of the ApplyUpdates method.
	InternalGetRecords (see page 7695)	Provides the underlying implementation of the GetRecords method.

85.1.4.4.1 TXMLTransformProvider.InternalApplyUpdates Method

Provides the underlying implementation of the ApplyUpdates method.

Pascal

```
function InternalApplyUpdates(const Delta: OleVariant; MaxErrors: Integer; out ErrorCount:
Integer): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalApplyUpdates(const OleVariant Delta, int MaxErrors, int
ErrorCount);
```

Description

The ApplyUpdates method calls InternalApplyUpdates to apply the updates contained in a delta packet after generating the BeforeApplyUpdates event and before generating the AfterApplyUpdates event. The InternalApplyUpdates method of TCustomProvider is abstract (Delphi) or pure virtual (C++), meaning that it has no implementation. Descendant classes override this method to apply updates, resolve update errors, and return any updates that could not be applied.

Delta is the delta packet containing insertions, deletions, and modifications to be applied.

MaxErrors indicates the maximum number of errors that can be applied before stopping the update operation. If MaxErrors is –1, the provider tries to apply all updates.

ErrorCount returns the number of errors encountered during the update operation.

InternalApplyUpdates returns a data packet of updates that could not be applied to the database as an OleVariant.

See Also

applyupdates

85.1.4.4.2 TXMLTransformProvider.InternalGetRecords Method

Provides the underlying implementation of the GetRecords method.

Pascal

```
function InternalGetRecords(Count: Integer; out RecsOut: Integer; Options: TGetRecordOptions;
const CommandText: WideString; var Params: OleVariant): OleVariant; override;
```

C++

```
virtual __fastcall OleVariant InternalGetRecords(int Count, int RecsOut, TGetRecordOptions
Options, const BSTR CommandText, OleVariant Params);
```

Description

The GetRecords method calls InternalGetRecords to assemble a data packet after calling DoBeforeGetRecords to apply the CommandText and Params and generate a BeforeGetRecords event. As implemented in TCustomProvider, InternalGetRecords always returns NULL. Descendant classes override this method to fetch the requested records and assemble them into a data packet.

Count indicates the number of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only the specified number of records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It can include grMetaData (include metadata), grReset (start providing records with the first one in the dataset), and grXML (encode the datapacket in XML rather than as an OleVariant) or grXMLUTF8 (same as grXML except extended characters are encoded using UTF8).

CommandText specifies an optional SQL statement that replaces the SQL of an associated query, or the name of a table or stored procedure that replaces the associated table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText or if the provider does not have an Options property.

Params specifies any parameter values that should be applied to CommandText or to an associated query or stored procedure. If the provider is associated with a TTable object, Params specifies field values that filter the result set. On exit from GetRecords, Params returns any output parameters.

Records are returned as a data packet in a Variant.

DoBeforeGetRecords

85.1.4.5 TXMLTransformProvider Properties

The properties of the TXMLTransformProvider class are listed here.

Published Properties

	Name	Description
	CacheData (see page 7696)	Specifies whether the provider caches the data packet internally in memory.
R	TransformRead (see page 7696)	Specifies the TXMLTransform (see page 7671) component that converts the source XML document into data packets.
R	TransformWrite (see page 7697)	Specifies the TXMLTransform (see page 7671) component that generates the new value of the source XML document when updates are applied.
	XMLDataFile (see page 7697)	Specifies the XML document from which the provider creates data packets and to which it applies updates.

85.1.4.5.1 TXMLTransformProvider.CacheData Property

Specifies whether the provider caches the data packet internally in memory.

Pascal

```
property CacheData: Boolean;
```

C++

```
__property Boolean CacheData;
```

Description

Set CacheData to true to specify that the provider should cache its data packet in memory after the first time it is read from the source XML document. When CacheData is false, every time the Data property is read, the GetRecords method is called, or updates are applied, the provider must reread the source document specified by XMLDataFile (see page 7697).

Caching the data improves performance on subsequent data fetches or when applying updates, but consumes additional resources.

Data

TransformRead (see page 7696)

GetRecords

TransformRead (see page 7696)

XMLDataFile (see page 7697)

85.1.4.5.2 TXMLTransformProvider.TransformRead Property

Specifies the TXMLTransform (see page 7671) component that converts the source XML document into data packets.

Pascal

```
property TransformRead: TXMLTransform;
```

C++

```
__property TXMLTransform TransformRead;
```

Description

Use TransformRead to access the subcomponent that transforms the source XML document into the data packet that is the value of the Data property. Before you can use TXMLTransformProvider (see page 7691), you must specify the transformation that this subcomponent uses by setting its TransformationFile or TransformationDocument property. In addition, if the transformation includes any user-defined nodes, you must supply TransformRead with an OnTranslate event handler.

See Also

XMLDataFile (see page 7697)

Determining the Source of Data

Using an XML Document as the Source for a Provider

85.1.4.5.3 TXMLTransformProvider.TransformWrite Property

Specifies the TXMLTransform (see page 7671) component that generates the new value of the source XML document when updates are applied.

Pascal

```
property TransformWrite: TXMLTransform;
```

C++

```
__property TXMLTransform TransformWrite;
```

Description

Use TransformWrite to access the subcomponent that transforms a data packet back into the format required by the source XML document. When a client calls the ApplyUpdates method, the delta packet is merged into the transformed data from the XML document, and then TransformWrite converts the resulting dataset into the format of the source XML document.

Before you can use TXMLTransformProvider (see page 7691) to apply updates, you must specify the transformation that this subcomponent uses by setting its TransformationFile or TransformationDocument property. In addition, if the transformation includes any user-defined nodes, you must supply TransformWrite with an OnTranslate event handler.

applyupdates

TransformRead (see page 7696)

TransformationFile (see page 7680)

TransformationDocument (see page 7679)

OnTranslate (see page 7683)

Using an XML Document as the Source for a Provider

85.1.4.5.4 TXMLTransformProvider.XMLDataFile Property

Specifies the XML document from which the provider creates data packets and to which it applies updates.

Pascal

```
property XMLDataFile: string;
```

C++

```
__property UnicodeString XMLDataFile;
```

Description

Use XMLDataFile to specify the XML document whose data the provider represents. When the Data property is read or the GetRecords method is called, TXMLTransformProvider (see page 7691) reads the contents of XMLDataFile and converts it into a data packet using the transform component specified by TransformRead (see page 7696). When the ApplyUpdates method is called, TXMLTransformProvider (see page 7691) uses the transform component specified by TransformWrite (see page 7697) to convert the data into the proper format for XMLDataFile and updates this XML document accordingly.

XMLDataFile is the same as the SourceXmlFile property of TransformRead (see page 7696).

85.1.4.6 TXMLTransformProvider Events

The events of the TXMLTransformProvider class are listed here.

Published Events

	Name	Description
	AfterApplyUpdates (see page 7698)	Occurs after the provider applies updates.
	AfterGetRecords (see page 7699)	Occurs after the provider creates a data packet to send to the client dataset.
	AfterRowRequest (see page 7700)	Occurs after the provider fetches new information about the current record.
	BeforeApplyUpdates (see page 7701)	Occurs before the provider applies updates from a client dataset.
	BeforeGetRecords (see page 7701)	Occurs before the provider creates a data packet and sends it to a client dataset.
	BeforeRowRequest (see page 7703)	Occurs before the provider creates a delta packet with information about the current record.
	OnDataRequest (see page 7703)	Occurs when a provider calls its DataRequest method.

85.1.4.6.1 TXMLTransformProvider.AfterApplyUpdates Event

Occurs after the provider applies updates.

Pascal

```
property AfterApplyUpdates;
```

C++

```
__property AfterApplyUpdates;
```

Description

Write an AfterApplyUpdates event handler to return custom information to a client dataset after applying updates. AfterApplyUpdates is part of the mechanism by which a client dataset and a provider communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_ApplyUpdates method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeApplyUpdates event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnUpdateData event where it can edit the updates before they are applied.

3. The provider applies the updates, and attempts to resolve problems.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates is called without the OwnerData parameter, on entry to the event handler the OwnerData parameter contains the value set in the BeforeApplyUpdates event handler and it is ignored on exit from the AfterApplyUpdates event handler.

85.1.4.6.2 TXMLTransformProvider.AfterGetRecords Event

Occurs after the provider creates a data packet to send to the client dataset.

Pascal

```
property AfterGetRecords;
```

C++

```
__property AfterGetRecords;
```

Description

Write an AfterGetRecords event handler to send custom information to a client dataset when providing a data packet. AfterGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_GetRecords method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeGetRecords event, where it can respond to or change custom information that the client dataset sends.

2.If it is a dataset provider, the provider receives an OnGetData event where it can edit the data before creating a data packet, and then generates the data packet.

3.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

4.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

Responding to Client Data Requests

85.1.4.6.3 TXMLTransformProvider.AfterRowRequest Event

Occurs after the provider fetches new information about the current record.

Pascal

```
property AfterRowRequest;
```

C++

```
__property AfterRowRequest;
```

Description

Write an AfterRowRequest event handler to send custom information to a client dataset along with information about the current record. AfterRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset calls the AS_RowRequest method of the IAppServer interface, the following events occur:

1.The provider receives a BeforeRowRequest event, where it can respond to or change custom information that the client dataset sends.

2.The provider creates a delta packet that contains the requested information.

3.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

4.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

Communicating with the Client Dataset

85.1.4.6.4 TXMLTransformProvider.BeforeApplyUpdates Event

Occurs before the provider applies updates from a client dataset.

Pascal

```
property BeforeApplyUpdates;
```

C++

```
__property BeforeApplyUpdates;
```

Description

Write a BeforeApplyUpdates event handler to respond to custom information from a client dataset. BeforeApplyUpdates is part of the mechanism by which a provider and a client dataset communicate information about updates. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset's ApplyUpdates method is called, the following events occur:

1.The client dataset receives a BeforeApplyUpdates event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeApplyUpdates event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before applying the updates.

3.If it is a dataset provider, the provider applies the updates, and receives an OnUpdateError event for any problem records.

4.The provider receives an AfterApplyUpdates event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeApplyUpdates event handler.

5.The client dataset receives an AfterApplyUpdates event, where it can respond to the custom information returned by the provider in its AfterApplyUpdates event handler.

Note: If ApplyUpdates is called without the OwnerData parameter, the OwnerData parameter is nil (Delphi) or NULL (C++) on entry to the event handler and its value (on exit) is only passed to the AfterApplyUpdates event handler but not returned to the caller.

Communicating with the Client Dataset

85.1.4.6.5 TXMLTransformProvider.BeforeGetRecords Event

Occurs before the provider creates a data packet and sends it to a client dataset.

Pascal

```
property BeforeGetRecords;
```

C++

```
__property BeforeGetRecords;
```

Description

Write a BeforeGetRecords event handler to respond to custom information from a client dataset. BeforeGetRecords is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches data from the provider, the following events occur:

1.The client dataset receives a BeforeGetRecords event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeGetRecords event, where the OleVariant from the client dataset appears as the OwnerData parameter. The provider can respond to or change that information before it creates a data packet.

3.The provider generates the data packet.

4.The provider receives an AfterGetRecords event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeGetRecords event handler.

5.The client dataset receives an AfterGetRecords event, where it can respond to the custom information returned by the provider in its AfterGetRecords event handler.

Delphi Examples:

```
{
This example shows the implementation of a provider BeforeGetRecords
event handler and a RemoteDataModule UpdateRegistry method.  The
complete project using this code example is in
Demos/DelphiWin32/VCLWin32/MIDAS/Pooler.
}
procedure TPooledRDM.DataSetProvider1BeforeGetRecords(Sender: TObject;
  var OwnerData: OleVariant);
begin
  try
    Query1.Close;
    Query1.SQL.Text := OwnerData[0];
    if not VarIsNull(OwnerData[1]) and not VarIsEmpty(OwnerData[1]) then
    begin
      Query1.Open;
      if not Query1.Locate(Query1.Fields[0].FieldName, OwnerData[1], []) then
        raise Exception.Create('Record not found');
      Query1.Next;
    end;
  finally
    OwnerData := NULL;
  end;
end;
```

Communicating with the Client Dataset

Responding to Client Data Requests

85.1.4.6.6 TXMLTransformProvider.BeforeRowRequest Event

Occurs before the provider creates a delta packet with information about the current record.

Pascal

```
property BeforeRowRequest;
```

C++

```
__property BeforeRowRequest;
```

Description

Write a BeforeRowRequest event handler to respond to custom information from a client dataset. BeforeRowRequest is part of the mechanism by which a provider and a client dataset communicate information about data fetching. When the provider is part of a stateless application server, this mechanism allows the provider and the client dataset to communicate persistent state information.

When the client dataset fetches detail information about the current record or refreshes the current record, the following events occur:

1.The client dataset receives a BeforeRowRequest event, where it can encode custom information into an OleVariant.

2.The provider receives a BeforeRowRequest event, where the custom information appears as the OwnerData parameter. The provider can respond to or change that information before it looks up the requested information.

3.The provider creates a delta packet that contains the requested information.

4.The provider receives an AfterRowRequest event, where it can encode custom information into its OwnerData parameter or respond to information from the BeforeRowRequest event handler.

5.The client dataset receives an AfterRowRequest event, where it can respond to the custom information returned by the provider in its AfterRowRequest event handler.

Communicating with the Client Dataset

85.1.4.6.7 TXMLTransformProvider.OnDataRequest Event

Occurs when a provider calls its DataRequest method.

Pascal

```
property OnDataRequest;
```

C++

```
__property OnDataRequest;
```

Description

Write an OnDataRequest event handler to do custom processing of data. OnDataRequest has no built-in use. Instead, it allows developers to augment the IAppServer interface so that clients in a multi-tiered application can communicate directly with an individual provider.

If an application does not provide an OnDataRequest event handler, calls to DataRequest return NULL.

Note: To provide the same sort of custom processing on the client side, use an automation method on the connection component.

85.2 Types

The following table lists types in this documentation.

Types

Name	Description
TRowEvent (see page 7705)	This is type Xmlxform.TRowEvent.
TTranslateEvent (see page 7705)	This is type Xmlxform.TTranslateEvent.

85.2.1 Xmlxform.TRowEvent Type

Pascal

```
TRowEvent = procedure (Sender: TObject; Id: string; SrcNode: IDOMNode; DestNode: IDOMNode) of object;
```

C++

```
(Sender: TObject; Id: string; SrcNode: IDOMNode; DestNode: IDOMNode) ( TRowEvent)();
```

File

Xmlxform

Description

This is type Xmlxform.TRowEvent.

85.2.2 Xmlxform.TTranslateEvent Type

Pascal

```
TTranslateEvent = procedure (Sender: TObject; Id: string; SrcNode: IDOMNode; var Value: string; DestNode: IDOMNode) of object;
```

C++

```
(Sender: TObject; Id: string; SrcNode: IDOMNode; var Value: string; DestNode: IDOMNode) ( TTranslateEvent)();
```

File

Xmlxform

Description

This is type Xmlxform.TTranslateEvent.

86 XPActnCtrls Namespace

This is namespace XPActnCtrls.

Topics

Name	Description
Classes (see page 7708)	The following table lists classes in this documentation.

Classes

	Name	Description
	TXPStyleAddRemoveItem (see page 7708)	This is class XPActnCtrls.TXPStyleAddRemoveItem.
	TXPStyleButton (see page 7711)	This is class XPActnCtrls.TXPStyleButton.
	TXPStyleCustomizePopup (see page 7713)	This is class XPActnCtrls.TXPStyleCustomizePopup.
	TXPStyleDropDownBtn (see page 7714)	This is class XPActnCtrls.TXPStyleDropDownBtn.
	TXPStyleExpandBtn (see page 7716)	This is class XPActnCtrls.TXPStyleExpandBtn.
	TXPStyleMenuButton (see page 7718)	This is class XPActnCtrls.TXPStyleMenuButton.
	TXPStyleMenuItem (see page 7719)	This is class XPActnCtrls.TXPStyleMenuItem.
	TXPStylePopupMenu (see page 7722)	This is class XPActnCtrls.TXPStylePopupMenu.
	TXPStyleToolScrollBtn (see page 7726)	This is class XPActnCtrls.TXPStyleToolScrollBtn.

86.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TXPStyleAddRemoveItem (see page 7708)	This is class XPActnCtrls.TXPStyleAddRemoveItem.
	TXPStyleButton (see page 7711)	This is class XPActnCtrls.TXPStyleButton.
	TXPStyleCustomizePopup (see page 7713)	This is class XPActnCtrls.TXPStyleCustomizePopup.
	TXPStyleDropDownBtn (see page 7714)	This is class XPActnCtrls.TXPStyleDropDownBtn.
	TXPStyleExpandBtn (see page 7716)	This is class XPActnCtrls.TXPStyleExpandBtn.
	TXPStyleMenuButton (see page 7718)	This is class XPActnCtrls.TXPStyleMenuButton.
	TXPStyleMenuItem (see page 7719)	This is class XPActnCtrls.TXPStyleMenuItem.
	TXPStylePopupMenu (see page 7722)	This is class XPActnCtrls.TXPStylePopupMenu.
	TXPStyleToolScrollBtn (see page 7726)	This is class XPActnCtrls.TXPStyleToolScrollBtn.

86.1.1 TXPStyleAddRemoveItem Class

Class Hierarchy

Pascal

```
TXPStyleAddRemoveItem = class(TCustomAddRemoveItem);
```

C++

```
class TXPStyleAddRemoveItem : public TCustomAddRemoveItem;
```

File

XPActnCtrls

Description

This is class XPActnCtrls.TXPStyleAddRemoveItem.

86.1.1.1 TXPStyleAddRemoveItem Members

The following tables list the members exposed by TXPStyleAddRemoveItem.

Protected Methods

	Name	Description
	DrawBackground (see page 7709)	Draws a background image on the control.
	DrawGlyph (see page 7710)	Draws a symbol on the control.
	DrawSeparator (see page 7710)	This is DrawSeparator, a member of class TXPStyleAddRemoveItem.
	DrawText (see page 7710)	This is DrawText, a member of class TXPStyleAddRemoveItem.
	DrawUnusedEdges (see page 7710)	This is DrawUnusedEdges, a member of class TXPStyleAddRemoveItem.

Public Methods

	Name	Description
	CalcBounds (see page 7709)	Calculates the size of the add/remove menu item.

86.1.1.2 TXPStyleAddRemoveItem Methods

The methods of the TXPStyleAddRemoveItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7709)	Draws a background image on the control.
	DrawGlyph (see page 7710)	Draws a symbol on the control.
	DrawSeparator (see page 7710)	This is DrawSeparator, a member of class TXPStyleAddRemoveItem.
	DrawText (see page 7710)	This is DrawText, a member of class TXPStyleAddRemoveItem.
	DrawUnusedEdges (see page 7710)	This is DrawUnusedEdges, a member of class TXPStyleAddRemoveItem.

Public Methods

	Name	Description
	CalcBounds (see page 7709)	Calculates the size of the add/remove menu item.

86.1.1.2.1 TXPStyleAddRemoveItem.CalcBounds Method

Calculates the size of the add/remove menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

CalcBounds updates the Height, Width, and TextBounds properties to reflect current conditions (such as the item's caption and the current font).

See Also

Height

Width

TextBounds

86.1.1.2.2 TXPStyleAddRemoveItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

86.1.1.2.3 TXPStyleAddRemoveItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

86.1.1.2.4 TXPStyleAddRemoveItem.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TXPStyleAddRemoveItem.

86.1.1.2.5 TXPStyleAddRemoveItem.DrawText Method

Pascal

```
procedure DrawText(var Rect: TRect; var Flags: Cardinal; Text: String); override;
```

C++

```
virtual __fastcall DrawText(TRect Rect, unsigned Flags, UnicodeString Text);
```

Description

This is DrawText, a member of class TXPStyleAddRemoveItem.

86.1.1.2.6 TXPStyleAddRemoveItem.DrawUnusedEdges Method

Pascal

```
procedure DrawUnusedEdges; override;
```

C++

```
virtual __fastcall DrawUnusedEdges();
```

Description

This is DrawUnusedEdges, a member of class TXPStyleAddRemoveItem.

86.1.2 TXPStyleButton Class

Class Hierarchy

Pascal

```
TXPStyleButton = class(TCustomButtonControl);
```

C++

```
class TXPStyleButton : public TCustomButtonControl;
```

File

XPActnCtrls

Description

This is class XPActnCtrls.TXPStyleButton.

86.1.2.1 TXPStyleButton Members

The following tables list the members exposed by TXPStyleButton.

Protected Methods

	Name	Description
	DrawBackground (see page 7711)	Draws a background image on the control.
	DrawFrame (see page 7712)	This is DrawFrame, a member of class TXPStyleButton.
	DrawGlyph (see page 7712)	Draws a symbol on the control.
	DrawText (see page 7712)	This is DrawText, a member of class TXPStyleButton.

86.1.2.2 TXPStyleButton Methods

The methods of the TXPStyleButton class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7711)	Draws a background image on the control.
	DrawFrame (see page 7712)	This is DrawFrame, a member of class TXPStyleButton.
	DrawGlyph (see page 7712)	Draws a symbol on the control.
	DrawText (see page 7712)	This is DrawText, a member of class TXPStyleButton.

86.1.2.2.1 TXPStyleButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

86.1.2.2.2 TXPStyleButton.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TXPStyleButton.

86.1.2.2.3 TXPStyleButton.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

86.1.2.2.4 TXPStyleButton.DrawText Method

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: String); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

This is DrawText, a member of class TXPStyleButton.

86.1.3 TXPStyleCustomizePopup Class

Class Hierarchy

Pascal

```
TXPStyleCustomizePopup = class(TCustomizeActionToolBar);
```

C++

```
class TXPStyleCustomizePopup : public TCustomizeActionToolBar;
```

File

XPActnCtrls

Description

This is class XPActnCtrls.TXPStyleCustomizePopup.

86.1.3.1 TXPStyleCustomizePopup Members

The following tables list the members exposed by TXPStyleCustomizePopup.

Protected Methods

	Name	Description
	GetAddRemoveItemClass (see page 7714)	This is GetAddRemoveItemClass, a member of class TXPStyleCustomizePopup.
	GetDefaultColorMapClass (see page 7714)	This is GetDefaultColorMapClass, a member of class TXPStyleCustomizePopup.
	NCPaint (see page 7714)	This is NCPaint, a member of class TXPStyleCustomizePopup.

Public Methods

	Name	Description
	Create (see page 7713)	Creates and initializes a TCustomActionPopupMenu instance.

86.1.3.2 TXPStyleCustomizePopup.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXPStyleCustomizePopup(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

86.1.3.3 TXPStyleCustomizePopup Methods

The methods of the TXPStyleCustomizePopup class are listed here.

Protected Methods

	Name	Description
	GetAddRemoveItemClass (see page 7714)	This is GetAddRemoveItemClass, a member of class TXPStyleCustomizePopup.
	GetDefaultColorMapClass (see page 7714)	This is GetDefaultColorMapClass, a member of class TXPStyleCustomizePopup.
	NCPaint (see page 7714)	This is NCPaint, a member of class TXPStyleCustomizePopup.

86.1.3.3.1 TXPStyleCustomizePopup.GetAddRemoveItemClass Method

Pascal

```
function GetAddRemoveItemClass: TCustomAddRemoveItemClass; override;
```

C++

```
virtual __fastcall TCustomAddRemoveItemClass GetAddRemoveItemClass();
```

Description

This is GetAddRemoveItemClass, a member of class TXPStyleCustomizePopup.

86.1.3.3.2 TXPStyleCustomizePopup.GetDefaultColorMapClass Method

Pascal

```
function GetDefaultColorMapClass: TCustomColorMapClass; override;
```

C++

```
virtual __fastcall TCustomColorMapClass GetDefaultColorMapClass();
```

Description

This is GetDefaultColorMapClass, a member of class TXPStyleCustomizePopup.

86.1.3.3.3 TXPStyleCustomizePopup.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TXPStyleCustomizePopup.

86.1.4 TXPStyleDropDownBtn Class

Class Hierarchy

Pascal

```
TXPStyleDropDownBtn = class(TCustomDropDownButton);
```

C++

```
class TXPStyleDropDownBtn : public TCustomDropDownButton;
```

File

XPActnCtrls

Description

This is class XPActnCtrls.TXPStyleDropDownBtn.

86.1.4.1 TXPStyleDropDownBtn Members

The following tables list the members exposed by TXPStyleDropDownBtn.

Protected Methods

	Name	Description
	DrawBackground (see page 7715)	Draws a background image on the control.
	DrawFrame (see page 7716)	This is DrawFrame, a member of class TXPStyleDropDownBtn.
	DrawGlyph (see page 7716)	Draws a symbol on the control.
	GetPopupClass (see page 7716)	This is GetPopupClass, a member of class TXPStyleDropDownBtn.

86.1.4.2 TXPStyleDropDownBtn Methods

The methods of the TXPStyleDropDownBtn class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7715)	Draws a background image on the control.
	DrawFrame (see page 7716)	This is DrawFrame, a member of class TXPStyleDropDownBtn.
	DrawGlyph (see page 7716)	Draws a symbol on the control.
	GetPopupClass (see page 7716)	This is GetPopupClass, a member of class TXPStyleDropDownBtn.

86.1.4.2.1 TXPStyleDropDownBtn.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

86.1.4.2.2 TXPStyleDropDownBtn.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TXPStyleDropDownBtn.

86.1.4.2.3 TXPStyleDropDownBtn.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

86.1.4.2.4 TXPStyleDropDownBtn.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomActionBarClass; override;
```

C++

```
virtual __fastcall TCustomActionBarClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TXPStyleDropDownBtn.

86.1.5 TXPStyleExpandBtn Class

Class Hierarchy

Pascal

```
TXPStyleExpandBtn = class(TCustomMenuExpandBtn);
```

C++

```
class TXPStyleExpandBtn : public TCustomMenuExpandBtn;
```

File

XPActnCtrls

Description

This is class XPActnCtrls.TXPStyleExpandBtn.

86.1.5.1 TXPStyleExpandBtn Members

The following tables list the members exposed by TXPStyleExpandBtn.

Protected Methods

	Name	Description
	DrawBackground (see page 7717)	Draws a background image on the control.
	DrawFrame (see page 7717)	This is DrawFrame, a member of class TXPStyleExpandBtn.

86.1.5.2 TXPStyleExpandBtn Methods

The methods of the TXPStyleExpandBtn class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7717)	Draws a background image on the control.
	DrawFrame (see page 7717)	This is DrawFrame, a member of class TXPStyleExpandBtn.

86.1.5.2.1 TXPStyleExpandBtn.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

86.1.5.2.2 TXPStyleExpandBtn.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TXPStyleExpandBtn.

86.1.6 TXPStyleMenuButton Class

Class Hierarchy

Pascal

```
TXPStyleMenuButton = class(TCustomMenuButton);
```

C++

```
class TXPStyleMenuButton : public TCustomMenuButton;
```

File

XPActnCtrls

Description

This is class XPActnCtrls.TXPStyleMenuButton.

86.1.6.1 TXPStyleMenuButton Members

The following tables list the members exposed by TXPStyleMenuButton.

Protected Methods

	Name	Description
	DrawBackground (see page 7718)	Draws a background image on the control.
	DrawText (see page 7719)	This is DrawText, a member of class TXPStyleMenuButton.

86.1.6.2 TXPStyleMenuButton Methods

The methods of the TXPStyleMenuButton class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7718)	Draws a background image on the control.
	DrawText (see page 7719)	This is DrawText, a member of class TXPStyleMenuButton.

86.1.6.2.1 TXPStyleMenuButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

86.1.6.2.2 TXPStyleMenuButton.DrawText Method

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: String); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

This is DrawText, a member of class TXPStyleMenuButton.

86.1.7 TXPStyleMenuItem Class

Class Hierarchy

Pascal

```
TXPStyleMenuItem = class(TCustomMenuItem);
```

C++

```
class TXPStyleMenuItem : public TCustomMenuItem;
```

File

XPActnCtrls

Description

This is class XPActnCtrls.TXPStyleMenuItem.

86.1.7.1 TXPStyleMenuItem Members

The following tables list the members exposed by TXPStyleMenuItem.

Protected Methods

	Name	Description
	CalcLayout (see page 7720)	This is CalcLayout, a member of class TXPStyleMenuItem.
	DrawBackground (see page 7721)	Draws a background image on the control.
	DrawGlyph (see page 7721)	Draws a symbol on the control.
	DrawSeparator (see page 7721)	This is DrawSeparator, a member of class TXPStyleMenuItem.
	DrawShadowedText (see page 7721)	This is DrawShadowedText, a member of class TXPStyleMenuItem.
	DrawSubMenuGlyph (see page 7722)	This is DrawSubMenuGlyph, a member of class TXPStyleMenuItem.
	DrawText (see page 7722)	This is DrawText, a member of class TXPStyleMenuItem.

	DrawUnusedEdges (see page 7722)	This is DrawUnusedEdges, a member of class TXPStyleMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7720)	Calculates the size of the menu item.

86.1.7.2 TXPStyleMenuItem Methods

The methods of the TXPStyleMenuItem class are listed here.

Protected Methods

	Name	Description
	CalcLayout (see page 7720)	This is CalcLayout, a member of class TXPStyleMenuItem.
	DrawBackground (see page 7721)	Draws a background image on the control.
	DrawGlyph (see page 7721)	Draws a symbol on the control.
	DrawSeparator (see page 7721)	This is DrawSeparator, a member of class TXPStyleMenuItem.
	DrawShadowedText (see page 7721)	This is DrawShadowedText, a member of class TXPStyleMenuItem.
	DrawSubMenuGlyph (see page 7722)	This is DrawSubMenuGlyph, a member of class TXPStyleMenuItem.
	DrawText (see page 7722)	This is DrawText, a member of class TXPStyleMenuItem.
	DrawUnusedEdges (see page 7722)	This is DrawUnusedEdges, a member of class TXPStyleMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 7720)	Calculates the size of the menu item.

86.1.7.2.1 TXPStyleMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

86.1.7.2.2 TXPStyleMenuItem.CalcLayout Method

Pascal

```
procedure CalcLayout; override;
```

C++

```
virtual __fastcall CalcLayout();
```

Description

This is CalcLayout, a member of class TXPStyleMenuItem.

86.1.7.2.3 TXPStyleMenuItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

86.1.7.2.4 TXPStyleMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

86.1.7.2.5 TXPStyleMenuItem.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TXPStyleMenuItem.

86.1.7.2.6 TXPStyleMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: String; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TXPStyleMenuItem.

86.1.7.2.7 TXPStyleMenuItem.DrawSubMenuGlyph Method

Pascal

```
procedure DrawSubMenuGlyph; override;
```

C++

```
virtual __fastcall DrawSubMenuGlyph();
```

Description

This is DrawSubMenuGlyph, a member of class TXPStyleMenuItem.

86.1.7.2.8 TXPStyleMenuItem.DrawText Method

Pascal

```
procedure DrawText(var Rect: TRect; var Flags: Cardinal; Text: String); override;
```

C++

```
virtual __fastcall DrawText(TRect Rect, unsigned Flags, UnicodeString Text);
```

Description

This is DrawText, a member of class TXPStyleMenuItem.

86.1.7.2.9 TXPStyleMenuItem.DrawUnusedEdges Method

Pascal

```
procedure DrawUnusedEdges; override;
```

C++

```
virtual __fastcall DrawUnusedEdges();
```

Description

This is DrawUnusedEdges, a member of class TXPStyleMenuItem.

86.1.8 TXPStylePopupMenu Class

Class Hierarchy

Pascal

```
TXPStylePopupMenu = class(TCustomActionPopupMenu);
```

C++

```
class TXPStylePopupMenu : public TCustomActionPopupMenu;
```

File

XPActnCtrls

Description

This is class XPActnCtrls.TXPStylePopupMenu.

86.1.8.1 TXPStylePopupMenu Members

The following tables list the members exposed by TXPStylePopupMenu.

Protected Methods

	Name	Description
	DisplayShadow (see page 7724)	This is DisplayShadow, a member of class TXPStylePopupMenu.
	GetExpandBtnClass (see page 7724)	This is GetExpandBtnClass, a member of class TXPStylePopupMenu.
	HideShadow (see page 7725)	This is HideShadow, a member of class TXPStylePopupMenu.
	NCPaint (see page 7725)	This is NCPaint, a member of class TXPStylePopupMenu.
	PositionPopup (see page 7725)	This is PositionPopup, a member of class TXPStylePopupMenu.
	VisibleChanging (see page 7725)	Provides the interface for a method that responds to changes in the control's visibility.

Public Methods

	Name	Description
	Create (see page 7723)	Creates and initializes a TCustomActionPopupMenu instance.
	Destroy (see page 7723)	Destroys an instance of TCustomActionMenuBar.

86.1.8.2 TXPStylePopupMenu.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXPStylePopupMenu(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

86.1.8.3 TXPStylePopupMenu.Destroy Destructor

Destroys an instance of TCustomActionMenuBar.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXPStylePopupMenu();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TCustomActionMenuBar reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free (see page 3382)

Destroy

86.1.8.4 TXPStylePopupMenu Methods

The methods of the TXPStylePopupMenu class are listed here.

Protected Methods

	Name	Description
	DisplayShadow (see page 7724)	This is DisplayShadow, a member of class TXPStylePopupMenu.
	GetExpandBtnClass (see page 7724)	This is GetExpandBtnClass, a member of class TXPStylePopupMenu.
	HideShadow (see page 7725)	This is HideShadow, a member of class TXPStylePopupMenu.
	NCPaint (see page 7725)	This is NCPaint, a member of class TXPStylePopupMenu.
	PositionPopup (see page 7725)	This is PositionPopup, a member of class TXPStylePopupMenu.
	VisibleChanging (see page 7725)	Provides the interface for a method that responds to changes in the control's visibility.

86.1.8.4.1 TXPStylePopupMenu.DisplayShadow Method

Pascal

```
procedure DisplayShadow; override;
```

C++

```
virtual __fastcall DisplayShadow();
```

Description

This is DisplayShadow, a member of class TXPStylePopupMenu.

86.1.8.4.2 TXPStylePopupMenu.GetExpandBtnClass Method

Pascal

```
function GetExpandBtnClass: TCustomMenuExpandBtnClass; override;
```

C++

```
virtual __fastcall TCustomMenuExpandBtnClass GetExpandBtnClass();
```

Description

This is GetExpandBtnClass, a member of class TXPStylePopupMenu.

86.1.8.4.3 TXPStylePopupMenu.HideShadow Method

Pascal

```
procedure HideShadow; override;
```

C++

```
virtual __fastcall HideShadow();
```

Description

This is HideShadow, a member of class TXPStylePopupMenu.

86.1.8.4.4 TXPStylePopupMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TXPStylePopupMenu.

86.1.8.4.5 TXPStylePopupMenu.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TXPStylePopupMenu.

86.1.8.4.6 TXPStylePopupMenu.VisibleChanging Method

Provides the interface for a method that responds to changes in the control's visibility.

Pascal

```
procedure VisibleChanging; override;
```

C++

```
virtual __fastcall VisibleChanging();
```

Description

VisibleChanging is called before the value of a control's Visible property changes. As implemented in TControl, it does nothing. Override VisibleChanging to respond to changes in the control's visibility. For example, if a control should not change its visibility, override VisibleChanging to raise an exception when an attempt is made to alter the control's visibility.

Visible

86.1.9 TXPStyleToolScrollBtn Class

Class Hierarchy

Pascal

```
TXPStyleToolScrollBtn = class(TCustomToolScrollBtn);
```

C++

```
class TXPStyleToolScrollBtn : public TCustomToolScrollBtn;
```

File

XPActnCtrls

Description

This is class XPActnCtrls.TXPStyleToolScrollBtn.

86.1.9.1 TXPStyleToolScrollBtn Members

The following tables list the members exposed by TXPStyleToolScrollBtn.

Protected Methods

	Name	Description
	DrawBackground (see page 7726)	Draws a background image on the control.

86.1.9.2 TXPStyleToolScrollBtn Methods

The methods of the TXPStyleToolScrollBtn class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 7726)	Draws a background image on the control.

86.1.9.2.1 TXPStyleToolScrollBtn.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

Name	Description
Classes (see page 7730)	The following table lists classes in this documentation.

Classes

	Name	Description
	TXPManifest (see page 7730)	This is class XPMan.TXPManifest.

87.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TXPManifest (see page 7730)	This is class XPMan.TXPManifest.

87.1.1 TXPManifest Class

Class Hierarchy

Pascal

```
[RootDesignerSerializerAttribute('', '', False)]
TXPManifest = class(TComponent);
```

C++

```
[RootDesignerSerializerAttribute('', '', False)]
class TXPManifest : public TComponent;
```

File

XPMan

Description

This is class XPMan.TXPManifest.

88 XPStyleActnCtrls Namespace

This is namespace XPStyleActnCtrls.

Topics

Name	Description
Classes (see page 7732)	The following table lists classes in this documentation.
Variables (see page 7735)	The following table lists variables in this documentation.

Classes

	Name	Description
	TXPStyleActionBars (see page 7732)	This is class XPStyleActnCtrls.TXPStyleActionBars.

Variables

Name	Description
XPStyle (see page 7735)	This is variable XPStyleActnCtrls.XPStyle.

88.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TXPStyleActionBars (see page 7732)	This is class XPStyleActnCtrls.TXPStyleActionBars.

88.1.1 TXPStyleActionBars Class

Class Hierarchy

Pascal

```
TXPStyleActionBars = class(TActionBarStyleEx);
```

C++

```
class TXPStyleActionBars : public TActionBarStyleEx;
```

File

XPStyleActnCtrls

Description

This is class XPStyleActnCtrls.TXPStyleActionBars.

88.1.1.1 TXPStyleActionBars Members

The following tables list the members exposed by TXPStyleActionBars.

Public Methods

	Name	Description
	GetAddRemoveItemClass (see page 7733)	Returns the base class for ActionBand menus for customizing action bands.
	GetColorMapClass (see page 7733)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 7733)	Returns the control class type on an action bar item.
	GetPopupClass (see page 7734)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 7734)	This is GetScrollBtnClass, a member of class TXPStyleActionBars.
	GetStyleName (see page 7734)	Returns the style associated with action manager.

88.1.1.2 TXPStyleActionBars Methods

The methods of the TXPStyleActionBars class are listed here.

Public Methods

	Name	Description
	GetAddRemoveItemClass (see page 7733)	Returns the base class for ActionBand menus for customizing action bands.

	GetColorMapClass (see page 7733)	Returns the class type of the colormap for an action bar.
	GetControlClass (see page 7733)	Returns the control class type on an action bar item.
	GetPopupClass (see page 7734)	Returns the popup class added to a menu action band.
	GetScrollBtnClass (see page 7734)	This is GetScrollBtnClass, a member of class TXPStyleActionBars.
	GetStyleName (see page 7734)	Returns the style associated with action manager.

88.1.1.2.1 TXPStyleActionBars.GetAddRemoveItemClass Method

Returns the base class for ActionBand menus for customizing action bands.

Pascal

```
function GetAddRemoveItemClass(ActionBar: TCustomActionBar): TCustomAddRemoveItemClass;
override;
```

C++

```
virtual __fastcall TCustomAddRemoveItemClass GetAddRemoveItemClass(TCustomActionBar ActionBar);
```

Description

Call GetAddRemoveItemClass to customize action bands.

See Also

TCustomAddRemoveItem

88.1.1.2.2 TXPStyleActionBars.GetColorMapClass Method

Returns the class type of the colormap for an action bar.

Pascal

```
function GetColorMapClass(ActionBar: TCustomActionBar): TCustomColorMapClass; override;
```

C++

```
virtual __fastcall TCustomColorMapClass GetColorMapClass(TCustomActionBar ActionBar);
```

Description

Returns the class type TCustomActionBarColorMap, which is a colormap associated with an action bar. Override this method to customize the appearance of your applications.

88.1.1.2.3 TXPStyleActionBars.GetControlClass Method

Returns the control class type on an action bar item.

Pascal

```
function GetControlClass(ActionBar: TCustomActionBar; AnItem: TActionClientItem):
TCustomActionControlClass; override;
```

C++

```
virtual __fastcall TCustomActionControlClass GetControlClass(TCustomActionBar ActionBar,
TActionClientItem AnItem);
```

Description

Returns the control class type on an item in the action bar, such as a button or menu item.

88.1.1.2.4 TXPStyleActionBars.GetPopupClass Method

Returns the popup class added to a menu action band.

Pascal

```
function GetPopupClass(ActionBar: TCustomActionBar): TCustomPopupClass; override;
```

C++

```
virtual __fastcall TCustomPopupClass GetPopupClass(TCustomActionBar ActionBar);
```

Description

Call GetPopupClass to find the popup menu associated with a menu action band. Override GetPopupClass to change which popup class is associated with a menu action band depending on the state of the control.

See Also

TCustomActionPopupMenu

88.1.1.2.5 TXPStyleActionBars.GetScrollBtnClass Method

Pascal

```
function GetScrollBtnClass: TCustomToolScrollBtnClass; override;
```

C++

```
virtual __fastcall TCustomToolScrollBtnClass GetScrollBtnClass();
```

Description

This is GetScrollBtnClass, a member of class TXPStyleActionBars.

88.1.1.2.6 TXPStyleActionBars.GetStyleName Method

Returns the style associated with action manager.

Pascal

```
function GetStyleName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetStyleName();
```

Description

Returns the value of the Style property.

88.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
XPStyle (see page 7735)	This is variable XPStyleActnCtrls.XPStyle.

88.2.1 XPStyleActnCtrls.XPStyle Variable

Pascal

```
XPStyle: TXPStyleActionBars;
```

C++

```
TXPStyleActionBars XPStyle;
```

File

XPStyleActnCtrls

Description

This is variable XPStyleActnCtrls.XPStyle.

89 XSBuiltIns Namespace

This is namespace XSBuiltIns.

Topics

Name	Description
Classes (see page 7739)	The following table lists classes in this documentation.
Functions (see page 7805)	The following table lists functions in this documentation.
Types (see page 7809)	The following table lists types in this documentation.
Constants (see page 7810)	The following table lists constants in this documentation.

Classes

	Name	Description
	EXSDateTimeException (see page 7739)	EXSDateTimeException is the exception class for errors encountered by the remotable objects that represent XML schema date and time values.
	EXSDecimalException (see page 7740)	EXSDecimalException is the exception class for errors encountered by the remotable objects that represent decimal values.
	EXSHexBinaryException (see page 7740)	EXSHexBinaryException is the exception class for errors encountered by the remotable objects that represent hexadecimal values.
	TXMLData (see page 7741)	This is class XSBuiltIns.TXMLData.
	TXSBoolean (see page 7745)	This is class XSBuiltIns.TXSBoolean.
	TXSCustomDateTime (see page 7747)	TXSCustomDateTime is the base class for classes that represent both date and time values for an invokable interface.
	TXSDate (see page 7766)	TXSDate implements the XML schema date type so that it can be used on invokable interfaces.
	TXSDateTime (see page 7772)	TXSDateTime implements the XML schema datetime type so that it can be used on invokable interfaces.
	TXSDecimal (see page 7776)	TXSDecimal implements the XML schema decimal type so that it can be used on invokable interfaces.
	TXSDuration (see page 7780)	TXSDuration implements the XML schema duration type so that it can be used on invokable interfaces.
	TXSHexBinary (see page 7784)	TXSHexBinary implements the XML schema hexBinary type so that it can be used on invokable interfaces.
	TXSInteger (see page 7787)	This is class XSBuiltIns.TXSInteger.
	TXSLong (see page 7789)	This is class XSBuiltIns.TXSLong.
	TXSString (see page 7791)	This is class XSBuiltIns.TXSString.
	TXSTime (see page 7792)	TXSTime implements the XML schema time type so that it can be used on invokable interfaces.

Constants

Name	Description
IncrementAmount (see page 7810)	This is constant XSBuiltIns.IncrementAmount.
MaxDay (see page 7811)	This is constant XSBuiltIns.MaxDay.
MaxMonth (see page 7811)	This is constant XSBuiltIns.MaxMonth.
MinDay (see page 7811)	This is constant XSBuiltIns.MinDay.
MinMonth (see page 7812)	This is constant XSBuiltIns.MinMonth.
SDecimal (see page 7812)	This is constant XSBuiltIns.SDecimal.
SHexMarker (see page 7812)	This is constant XSBuiltIns.SHexMarker.
SLocalTimeMarker (see page 7813)	This is constant XSBuiltIns.SLocalTimeMarker.
SNAN (see page 7813)	This is constant XSBuiltIns.SNAN.
SNegative (see page 7813)	This is constant XSBuiltIns.SNegative.
SoapDecimalSeparator (see page 7814)	This is constant XSBuiltIns.SoapDecimalSeparator.
SoapTimePrefix (see page 7814)	This is constant XSBuiltIns.SoapTimePrefix.
SPlus (see page 7814)	This is constant XSBuiltIns.SPlus.
SSciNotationMarker (see page 7815)	This is constant XSBuiltIns.SSciNotationMarker.
XMLDateSeparator (see page 7815)	This is constant XSBuiltIns.XMLDateSeparator.
XMLDayPos (see page 7815)	This is constant XSBuiltIns.XMLDayPos.
XMLDefaultYearDigits (see page 7816)	This is constant XSBuiltIns.XMLDefaultYearDigits.
XMLDurationDay (see page 7816)	This is constant XSBuiltIns.XMLDurationDay.
XMLDurationHour (see page 7816)	This is constant XSBuiltIns.XMLDurationHour.
XMLDurationMinute (see page 7817)	This is constant XSBuiltIns.XMLDurationMinute.
XMLDurationMonth (see page 7817)	This is constant XSBuiltIns.XMLDurationMonth.
XMLDurationSecond (see page 7817)	This is constant XSBuiltIns.XMLDurationSecond.
XMLDurationStart (see page 7818)	This is constant XSBuiltIns.XMLDurationStart.
XMLDurationYear (see page 7818)	This is constant XSBuiltIns.XMLDurationYear.
XMLHourOffsetMinusMarker (see page 7818)	This is constant XSBuiltIns.XMLHourOffsetMinusMarker.
XMLHourOffsetPlusMarker (see page 7819)	This is constant XSBuiltIns.XMLHourOffsetPlusMarker.
XMLMilSecPos (see page 7819)	This is constant XSBuiltIns.XMLMilSecPos.
XMLMonthPos (see page 7819)	This is constant XSBuiltIns.XMLMonthPos.
XMLTimeSeparator (see page 7820)	This is constant XSBuiltIns.XMLTimeSeparator.
XMLYearPos (see page 7820)	This is constant XSBuiltIns.XMLYearPos.

Functions

	Name	Description
	DateTimeToXMLTime (see page 7805)	Returns the XML string that represents a TDateTime (see page 3335) value.
	DateTimeToXSDateTime (see page 7805)	Returns a TXSDateTime (see page 7772) object that encodes a TDateTime (see page 3335) value.
	GetDataFromFile (see page 7806)	This is function XSBuiltIns.GetDataFromFile.
	InitXSTypes (see page 7806)	This is function XSBuiltIns.InitXSTypes.
	SoapFloatToStr (see page 7807)	This is function XSBuiltIns.SoapFloatToStr.
	SoapStrToFloat (see page 7807)	This is function XSBuiltIns.SoapStrToFloat.
	XMLTimeToDateTime (see page 7807)	Returns a TDateTime (see page 3335) value to represent an XML datetime value.

Types

Name	Description
TXSTimeInstant (see page 7809)	This is type XSBuiltIns.TXSTimeInstant.

89.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EXSDateTimeException (see page 7739)	EXSDateTimeException is the exception class for errors encountered by the remotable objects that represent XML schema date and time values.
	EXSDecimalException (see page 7740)	EXSDecimalException is the exception class for errors encountered by the remotable objects that represent decimal values.
	EXSHexBinaryException (see page 7740)	EXSHexBinaryException is the exception class for errors encountered by the remotable objects that represent hexadecimal values.
	TXMLData (see page 7741)	This is class XSBuiltIns.TXMLData.
	TXSBoolean (see page 7745)	This is class XSBuiltIns.TXSBoolean.
	TXSCustomDateTime (see page 7747)	TXSCustomDateTime is the base class for classes that represent both date and time values for an invokable interface.
	TXSDate (see page 7766)	TXSDate implements the XML schema date type so that it can be used on invokable interfaces.
	TXSDateTime (see page 7772)	TXSDateTime implements the XML schema datetime type so that it can be used on invokable interfaces.
	TXSDecimal (see page 7776)	TXSDecimal implements the XML schema decimal type so that it can be used on invokable interfaces.
	TXSDuration (see page 7780)	TXSDuration implements the XML schema duration type so that it can be used on invokable interfaces.
	TXSHexBinary (see page 7784)	TXSHexBinary implements the XML schema hexBinary type so that it can be used on invokable interfaces.
	TXSInteger (see page 7787)	This is class XSBuiltIns.TXSInteger.
	TXSLong (see page 7789)	This is class XSBuiltIns.TXSLong.
	TXSString (see page 7791)	This is class XSBuiltIns.TXSString.
	TXSTime (see page 7792)	TXSTime implements the XML schema time type so that it can be used on invokable interfaces.

89.1.1 EXSDateTimeException Class

EXSDateTimeException is the exception class for errors encountered by the remotable objects that represent XML schema date and time values.

Class Hierarchy

Pascal

```
EXSDateTimeException = class(Exception);
```

C++

```
class EXSDateTimeException : public Exception;
```

File

XSBuiltIns

Description

EXSDateTimeException is raised by the TXSDate (see page 7766), TXSTime (see page 7792), TXSDateTime (see page

7772), and TXSDuration (see page 7780) objects when

An application assigns a value that is out of range to one of their properties. Such values include Month values greater than 12, Hour values greater than 23, Minute values greater than 59, and so on.

The string that represents the object's value does not have the proper format and can't be parsed.

See Also

TXSTime (see page 7792)

TXSDate (see page 7766)

TXSDateTime (see page 7772)

TXSDuration (see page 7780)

89.1.2 EXSDecimalException Class

EXSDecimalException is the exception class for errors encountered by the remotable objects that represent decimal values.

Class Hierarchy

Pascal

```
EXSDecimalException = class(Exception);
```

C++

```
class EXSDecimalException : public Exception;
```

File

XSBuiltIns

Description

EXSDecimalException is raised by TXSDecimal (see page 7776) when it is unable to convert between its string value and a TBcd value.

See Also

TXSDecimal (see page 7776)

TBcd

89.1.3 EXSHexBinaryException Class

EXSHexBinaryException is the exception class for errors encountered by the remotable objects that represent hexadecimal values.

Class Hierarchy

Pascal

```
EXSHexBinaryException = class(Exception);
```

C++

```
class EXSHexBinaryException : public Exception;
```

File

XSBuiltIns

Description

EXSHexBinaryException is raised by TXSHexBinary (see page 7784) when it encounters a string that contains invalid characters for a hexadecimal value.

See Also

TXSDecimal (see page 7776)

TBcd

89.1.4 TXMLData Class

Class Hierarchy

Pascal

```
TXMLData = class(TRemotable);
```

C++

```
class TXMLData : public TRemotable;
```

File

XSBuiltIns

Description

This is class XSBuiltIns.TXMLData.

89.1.4.1 TXMLData Members

The following tables list the members exposed by TXMLData.

Public Methods

	Name	Description
	Create (see page 7742)	Creates and initializes a TRemotable object.
	Destroy (see page 7742)	Frees the memory associated with the TRemotable object.
	LoadFromXML (see page 7743)	This is the overview for the LoadFromXML method overload.
	ObjectToSOAP (see page 7743)	Converts this remotable object to its SOAP representation.
	SOAPToObject (see page 7744)	Initializes this TRemotable instance to represent the value of its SOAP representation.

Public Properties

	Name	Description
	XMLNode (see page 7745)	This is XMLNode, a member of class TXMLData.

89.1.4.2 TXMLData.Create Constructor

Creates and initializes a TRemotable object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TXMLData();
```

Description

The TRemotable constructor does nothing special. It exists primarily because

The remotable type registry knows how to call it.

It is virtual, so that the remotable type registry can also instantiate descendant classes.

See Also

RemTypeRegistry

89.1.4.3 TXMLData.Destroy Destructor

Frees the memory associated with the TRemotable object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLData();
```

Description

Use the Free method to free a TRemotable instance. Free checks that the object is not nil before calling Destroy.

On server applications, there is typically no need to explicitly free a TRemotable instance (for example, one created as a return value or output parameter). By default, when a TRemotable descendant is created in a method that was called remotely using an invokable interface, it is added to a data context (the value of the DataContext property). As long as the remotable object belongs to the data context, the data context handles freeing the object. Similarly, TRemotable instances that are passed in as a parameter belong to the data context.

On client applications, TRemotable instances created and passed to an invokable interface or returned as a parameter or result of an invokable interface must be freed by the calling application.

See Also

System::TObject::Free (see page 3382)

DataContext

89.1.4.4 TXMLData Methods

The methods of the TXMLData class are listed here.

Public Methods

	Name	Description
	LoadFromXML (see page 7743)	This is the overview for the LoadFromXML method overload.
V	ObjectToSOAP (see page 7743)	Converts this remotable object to its SOAP representation.
V	SOAPToObject (see page 7744)	Initializes this TRemotable instance to represent the value of its SOAP representation.

89.1.4.4.1 LoadFromXML Method

This is the overview for the LoadFromXML method overload.

Overload List

	Name	Description
	TXMLData.LoadFromXML (string) (see page 7743)	This is LoadFromXML, a member of class TXMLData.
	TXMLData.LoadFromXML (WideString) (see page 7743)	This is LoadFromXML, a member of class TXMLData.

89.1.4.4.1.1 TXMLData.LoadFromXML Method (WideString)

Pascal

```
procedure LoadFromXML(const XML: WideString); overload;
```

C++

```
__fastcall LoadFromXML(const BSTR XML);
```

Description

This is LoadFromXML, a member of class TXMLData.

89.1.4.4.1.2 TXMLData.LoadFromXML Method (string)

Pascal

```
procedure LoadFromXML(const XML: string); overload;
```

C++

```
__fastcall LoadFromXML(const UnicodeString XML);
```

Description

This is LoadFromXML, a member of class TXMLData.

89.1.4.4.2 TXMLData.ObjectToSOAP Method

Converts this remotable object to its SOAP representation.

Pascal

```
function ObjectToSOAP(RootNode: IXMLNode; ParentNode: IXMLNode; const ObjConverter:
IObjConverter; const Name: InvString; const URI: InvString; ObjConvOpts:
TObjectConvertOptions; out RefID: InvString): IXMLNode; override;
```

C++

```
virtual __fastcall IXMLNode ObjectToSOAP(IXMLNode RootNode, IXMLNode ParentNode, const
IObjConverter ObjConverter, const InvString Name, const InvString URI, TObjectConvertOptions
```

```
ObjConvOpts, InvString RefID);
```

Description

Override ObjectToSOAP to customize the way your application converts a TRemotable descendant to its SOAP representation. In TRemotable, ObjectToSOAP simply calls the ObjInstanceToSOAP method of the converter that is supplied by the ObjConverter parameter.

RootNode is an ancestor of the generated node to which information about the generated node can be added as attributes.

ParentNode is the node in the SOAP representation that should act as a parent to the node that ObjectToSOAP generates.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

Name is the name of the node that is generated.

URI is the URI for the namespace in which Name is defined.

ObjConvOpts are flags that customize the way the node is serialized.

RefID returns a reference ID for the node. This is used if the node is multi-referenced.

ObjectToSOAP returns the XML for the newly generated node.

See Also

ObjInstanceToSOAP

SOAPToObject

89.1.4.4.3 TXMLData.SOAPToObject Method

Initializes this TRemotable instance to represent the value of its SOAP representation.

Pascal

```
procedure SOAPToObject(const RootNode: IXMLNode; const Node: IXMLNode; const ObjConverter:
IObjConverter); override;
```

C++

```
virtual __fastcall SOAPToObject(const IXMLNode RootNode, const IXMLNode Node, const
IObjConverter ObjConverter);
```

Description

SOAPToObject initializes the published properties of this object instance so that they reflect the header's SOAP representation. Override this method to customize the way your application creates a specific remotable type from its XML representation.

RootNode is an ancestor node of the node for this object that can contain information about the remotable type's value.

Node is the node in the SOAP envelope that represents the remotable type's value.

ObjConverter is the interface of the default converter that translates between remotable objects and their SOAP representation. This is the interface to a TOPToSoapDomConvert instance.

In TRemotable, SOAPToObject simply calls the InitObjectFromSOAP method of the converter supplied by the ObjConverter parameter.

See Also

ObjectToSOAP

InitObjectFromSOAP

89.1.4.5 TXMLData Properties

The properties of the TXMLData class are listed here.

Public Properties

	Name	Description
	XMLNode (see page 7745)	This is XMLNode, a member of class TXMLData.

89.1.4.5.1 TXMLData.XMLNode Property

Pascal

```
property XMLNode: IXMLNode;
```

C++

```
__property IXMLNode XMLNode;
```

Description

This is XMLNode, a member of class TXMLData.

89.1.5 TXSBoolean Class

Class Hierarchy

Pascal

```
TXSBoolean = class(TRemotableXS);
```

C++

```
class TXSBoolean : public TRemotableXS;
```

File

XSBuiltIns

Description

This is class XSBuiltIns.TXSBoolean.

89.1.5.1 TXSBoolean Members

The following tables list the members exposed by TXSBoolean.

Public Methods

	Name	Description
	NativeToXS (see page 7746)	Returns a string that represents the value of a TRemotableXS instance.
	XSToNative (see page 7746)	Assigns the value of a string to the TRemotableXS instance.

Public Properties

	Name	Description
	AsBoolean (see page 7747)	This is AsBoolean, a member of class TXSBoolean.

89.1.5.2 TXSBoolean Methods

The methods of the TXSBoolean class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 7746)	Returns a string that represents the value of a TRemotableXS instance.
	XSToNative (see page 7746)	Assigns the value of a string to the TRemotableXS instance.

89.1.5.2.1 TXSBoolean.NativeToXS Method

Returns a string that represents the value of a TRemotableXS instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

Override NativeToXS when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS returns a string that represents the value of the TRemotableXS instance. This string is used when marshaling the value of the TRemotableXS descendant.

Classes that implement NativeToXS must also override the XSToNative method so that it performs the converse transformation.

See Also

XSToNative

Using Remotable Objects

89.1.5.2.2 TXSBoolean.XSToNative Method

Assigns the value of a string to the TRemotableXS instance.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

Override XSToNative when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS interprets a string that represents the value of the TRemotableXS instance and uses it to make any necessary changes so that the TRemotableXS object reflects that value. It reverses the transformation that the NativeToXS method performs.

Data is a string that represents the value of the TRemotableXS instance.

Using Remotable Objects

89.1.5.3 TXSBoolean Properties

The properties of the TXSBoolean class are listed here.

Public Properties

	Name	Description
	AsBoolean (see page 7747)	This is AsBoolean, a member of class TXSBoolean.

89.1.5.3.1 TXSBoolean.AsBoolean Property

Pascal

```
property AsBoolean: Boolean;
```

C++

```
__property Boolean AsBoolean;
```

Description

This is AsBoolean, a member of class TXSBoolean.

89.1.6 TXSCustomDateTime Class

TXSCustomDateTime is the base class for classes that represent both date and time values for an invokable interface.

Class Hierarchy

Pascal

```
TXSCustomDateTime = class(TRemotableXS);
```

C++

```
class TXSCustomDateTime : public TRemotableXS;
```

File

XSBuiltIns

Description

Use TXSCustomDateTime as a base class when defining a class to represent a type that includes both date and time portions and that represents a scalar value in a WSDL document. When creating a TXSCustomDateTime descendant, override the XSToNative and NativeToXS methods to indicate how the value of the class can be converted to and from the string representation that is used to encode the value for transport.

On server applications, instances of TXSCustomDateTime descendants that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSCustomDateTime descendant is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSCustomDateTime instances that it passes as input parameters, and for freeing any TXSCustomDateTime instances it creates or that are returned as output parameters or method results.

IInvokable (see page 3505)

TXSDateTime (see page 7772)

TXSDuration (see page 7780)

89.1.6.1 TXSCustomDateTime Members

The following tables list the members exposed by TXSCustomDateTime.

Protected Fields

	Name	Description
	FDateTime (see page 7750)	This is FDateTime, a member of class TXSCustomDateTime.

Protected Methods

	Name	Description
	GetAsDateTime (see page 7751)	Returns the value of the AsDateTime (see page 7759) property.
	GetAsUTCDateTime (see page 7751)	This is GetAsUTCDateTime, a member of class TXSCustomDateTime.
	GetDay (see page 7751)	Returns the value of the Day (see page 7760) property.
	GetFractionalSeconds (see page 7752)	Returns the value of the FractionalSeconds (see page 7761) property.
	GetHour (see page 7752)	Returns the value of the Hour (see page 7761) property.
	GetHourOffset (see page 7752)	Returns the value of the HourOffset (see page 7762) property.
	GetMillisecond (see page 7752)	Returns the value of the Millisecond (see page 7762) property.
	GetMinute (see page 7753)	Returns the value of the Minute (see page 7763) property.
	GetMinuteOffset (see page 7753)	Returns the value of the MinuteOffset (see page 7763) property.
	GetMonth (see page 7753)	Returns the value of the Month (see page 7764) property.
	GetSecond (see page 7754)	Returns the value of the Second (see page 7764) property.
	GetUseZeroMilliseconds (see page 7754)	Returns the value of the UseZeroMilliseconds (see page 7765) property.
	GetYear (see page 7754)	Returns the value of the Year (see page 7765) property.
	SetAsDateTime (see page 7755)	Sets the value of the AsDateTime (see page 7759) property.
	SetAsUTCDateTime (see page 7755)	Sets the value of the AsUTCDateTime (see page 7760) property.
	SetDay (see page 7755)	Sets the value of the Day (see page 7760) property.
	SetFractionalSeconds (see page 7755)	Sets the value of the FractionalSeconds (see page 7761) property.
	SetHour (see page 7756)	Sets the value of the Hour (see page 7761) property.
	SetHourOffset (see page 7756)	Sets the value of the HourOffset (see page 7762) property.
	SetMillisecond (see page 7756)	Sets the value of the Millisecond (see page 7762) property.
	SetMinute (see page 7757)	Sets the value of the Minute (see page 7763) property.
	SetMinuteOffset (see page 7757)	Sets the value of the MinuteOffset (see page 7763) property.
	SetMonth (see page 7757)	Sets the value of the Month (see page 7764) property.
	SetSecond (see page 7758)	Sets the value of the Second (see page 7764) property.
	SetUseZeroMilliseconds (see page 7758)	Sets the value of the UseZeroMilliseconds (see page 7765) property.
	SetYear (see page 7758)	Sets the value of the Year (see page 7765) property.

Protected Properties

	Name	Description
	Millisecond (see page 7762)	Indicates the Millisecond of the second that the object represents.

Public Methods

	Name	Description
	Create (see page 7749)	Creates and initializes a TXSCustomDateTime (see page 7747) object.
	Destroy (see page 7749)	Frees the memory associated with the TXSCustomDateTime (see page 7747) object.

Public Properties

	Name	Description
	AsDateTime (see page 7759)	Represents the object's value as a TDateTime (see page 3335) value.
	AsUTCDateTime (see page 7760)	Represents the object's value as a TDateTime (see page 3335) value using UTC time.
	Day (see page 7760)	Indicates the Day of the month that the object represents.
	FractionalSeconds (see page 7761)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 7764) property.
	Hour (see page 7761)	Indicates the hour of the day that the object represents.
	HourOffset (see page 7762)	Indicates the difference between the Hour (see page 7761) property and the hour in the local time zone.
	Minute (see page 7763)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 7763)	Indicates the difference between the Minute (see page 7763) property and the minute of the hour in local time.
	Month (see page 7764)	Indicates the month of the year that the object represents.
	Second (see page 7764)	Indicates the second of the minute that the object represents.
	UseZeroMilliseconds (see page 7765)	Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 7762) is zero.
	Year (see page 7765)	Indicates the year that the object represents.

89.1.6.2 TXSCustomDateTime.Create Constructor

Creates and initializes a TXSCustomDateTime (see page 7747) object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TXSCustomDateTime();
```

Description

Call Create to create a TXSCustomDateTime (see page 7747) object at runtime.

See Also

Destroy (see page 7749)

89.1.6.3 TXSCustomDateTime.Destroy Destructor

Frees the memory associated with the TXSCustomDateTime (see page 7747) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXSCustomDateTime();
```

Description

Do not call Destroy to free a TXSCustomDateTime (see page 7747) object. Instead, use the Free method, which checks that the TXSCustomDatetime reference is not nil before calling Destroy.

On server applications, there is typically no need to explicitly free a TXSCustomDateTime (see page 7747) instance (for example, one created as a return value or output parameter). By default, when a TXSCustomDateTime (see page 7747) descendant is created in a method that was called remotely using an invokable interface, it is added to a data context (the value of the DataContext property). As long as the remotable object belongs to the data context, the data context handles freeing the

object. Similarly, TCustomXSDateTime objects that are passed in as a parameter belong to the data context.

On client applications, TXSCustomDateTime (see page 7747) instances created and passed to an invokable interface or returned as a parameter or result of an invokable interface must be freed by the calling application.

See Also

DataContext

89.1.6.4 TXSCustomDateTime Fields

The fields of the TXSCustomDateTime class are listed here.

Protected Fields

	Name	Description
	FDateTime (see page 7750)	This is FDateTime, a member of class TXSCustomDateTime.

89.1.6.4.1 TXSCustomDateTime.FDateTime Field

Pascal

```
FDateTime: WideString;
```

C++

```
BSTR FDateTime;
```

Description

This is FDateTime, a member of class TXSCustomDateTime.

89.1.6.5 TXSCustomDateTime Methods

The methods of the TXSCustomDateTime class are listed here.

Protected Methods

	Name	Description
	GetAsDateTime (see page 7751)	Returns the value of the AsDateTime (see page 7759) property.
	GetAsUTCDateTime (see page 7751)	This is GetAsUTCDateTime, a member of class TXSCustomDateTime.
	GetDay (see page 7751)	Returns the value of the Day (see page 7760) property.
	GetFractionalSeconds (see page 7752)	Returns the value of the FractionalSeconds (see page 7761) property.
	GetHour (see page 7752)	Returns the value of the Hour (see page 7761) property.
	GetHourOffset (see page 7752)	Returns the value of the HourOffset (see page 7762) property.
	GetMillisecond (see page 7752)	Returns the value of the Millisecond (see page 7762) property.
	GetMinute (see page 7753)	Returns the value of the Minute (see page 7763) property.
	GetMinuteOffset (see page 7753)	Returns the value of the MinuteOffset (see page 7763) property.
	GetMonth (see page 7753)	Returns the value of the Month (see page 7764) property.
	GetSecond (see page 7754)	Returns the value of the Second (see page 7764) property.
	GetUseZeroMilliseconds (see page 7754)	Returns the value of the UseZeroMilliseconds (see page 7765) property.
	GetYear (see page 7754)	Returns the value of the Year (see page 7765) property.
	SetAsDateTime (see page 7755)	Sets the value of the AsDateTime (see page 7759) property.
	SetAsUTCDateTime (see page 7755)	Sets the value of the AsUTCDateTime (see page 7760) property.
	SetDay (see page 7755)	Sets the value of the Day (see page 7760) property.
	SetFractionalSeconds (see page 7755)	Sets the value of the FractionalSeconds (see page 7761) property.
	SetHour (see page 7756)	Sets the value of the Hour (see page 7761) property.
	SetHourOffset (see page 7756)	Sets the value of the HourOffset (see page 7762) property.

	SetMillisecond (see page 7756)	Sets the value of the Millisecond (see page 7762) property.
	SetMinute (see page 7757)	Sets the value of the Minute (see page 7763) property.
	SetMinuteOffset (see page 7757)	Sets the value of the MinuteOffset (see page 7763) property.
	SetMonth (see page 7757)	Sets the value of the Month (see page 7764) property.
	SetSecond (see page 7758)	Sets the value of the Second (see page 7764) property.
	SetUseZeroMilliseconds (see page 7758)	Sets the value of the UseZeroMilliseconds (see page 7765) property.
	SetYear (see page 7758)	Sets the value of the Year (see page 7765) property.

89.1.6.5.1 TXSCustomDateTime.GetAsDateTime Method

Returns the value of the AsDateTime (see page 7759) property.

Pascal

```
function GetAsDateTime: TDateTime;
```

C++

```
__fastcall TDateTime GetAsDateTime();
```

Description

GetAsDateTime is the protected read implementation of the AsDateTime (see page 7759) property.

See Also

AsDateTime (see page 7759)

89.1.6.5.2 TXSCustomDateTime.GetAsUTCDateTime Method

Pascal

```
function GetAsUTCDateTime: TDateTime;
```

C++

```
__fastcall TDateTime GetAsUTCDateTime();
```

Description

This is GetAsUTCDateTime, a member of class TXSCustomDateTime.

89.1.6.5.3 TXSCustomDateTime.GetDay Method

Returns the value of the Day (see page 7760) property.

Pascal

```
function GetDay: Word;
```

C++

```
__fastcall Word GetDay();
```

Description

GetDay is the protected read implementation of the Day (see page 7760) property.

See Also

Day (see page 7760)

89.1.6.5.4 TXSCustomDateTime.GetFractionalSeconds Method

Returns the value of the FractionalSeconds (see page 7761) property.

Pascal

```
function GetFractionalSeconds: Double;
```

C++

```
__fastcall Double GetFractionalSeconds();
```

Description

GetFractionalSeconds is the protected read implementation of the FractionalSeconds (see page 7761) property.

See Also

FractionalSeconds (see page 7761)

89.1.6.5.5 TXSCustomDateTime.GetHour Method

Returns the value of the Hour (see page 7761) property.

Pascal

```
function GetHour: Word;
```

C++

```
__fastcall Word GetHour();
```

Description

GetHour is the protected read implementation of the Hour (see page 7761) property.

See Also

Hour (see page 7761)

89.1.6.5.6 TXSCustomDateTime.GetHourOffset Method

Returns the value of the HourOffset (see page 7762) property.

Pascal

```
function GetHourOffset: SmallInt;
```

C++

```
__fastcall SmallInt GetHourOffset();
```

Description

GetHourOffset is the protected read implementation of the HourOffset (see page 7762) property.

See Also

HourOffset (see page 7762)

89.1.6.5.7 TXSCustomDateTime.GetMillisecond Method

Returns the value of the Millisecond (see page 7762) property.

Pascal

```
function GetMillisecond: Word;
```

C++

```
__fastcall Word GetMillisecond();
```

Description

GetMillisecond is the protected read implementation of the Millisecond (see page 7762) property.

See Also

Millisecond (see page 7762)

89.1.6.5.8 TXSCustomDateTime.GetMinute Method

Returns the value of the Minute (see page 7763) property.

Pascal

```
function GetMinute: Word;
```

C++

```
__fastcall Word GetMinute();
```

Description

GetMinute is the protected read implementation of the Minute (see page 7763) property.

See Also

Minute (see page 7763)

89.1.6.5.9 TXSCustomDateTime.GetMinuteOffset Method

Returns the value of the MinuteOffset (see page 7763) property.

Pascal

```
function GetMinuteOffset: SmallInt;
```

C++

```
__fastcall SmallInt GetMinuteOffset();
```

Description

GetMinuteOffset is the protected read implementation of the MinuteOffset (see page 7763) property.

See Also

MinuteOffset (see page 7763)

89.1.6.5.10 TXSCustomDateTime.GetMonth Method

Returns the value of the Month (see page 7764) property.

Pascal

```
function GetMonth: Word;
```

C++

```
__fastcall Word GetMonth();
```

Description

GetMonth is the protected read implementation of the Month (see page 7764) property.

See Also

Month (see page 7764)

89.1.6.5.11 TXSCustomDateTime.GetSecond Method

Returns the value of the Second (see page 7764) property.

Pascal

```
function GetSecond: Word;
```

C++

```
__fastcall Word GetSecond();
```

Description

GetSecond is the protected read implementation of the Second (see page 7764) property.

See Also

Second (see page 7764)

89.1.6.5.12 TXSCustomDateTime.GetUseZeroMilliseconds Method

Returns the value of the UseZeroMilliseconds (see page 7765) property.

Pascal

```
function GetUseZeroMilliseconds: Boolean;
```

C++

```
__fastcall Boolean GetUseZeroMilliseconds();
```

Description

GetUseZeroMilliseconds is the protected read implementation of the UseZeroMilliseconds (see page 7765) property.

See Also

UseZeroMilliseconds (see page 7765)

89.1.6.5.13 TXSCustomDateTime.GetYear Method

Returns the value of the Year (see page 7765) property.

Pascal

```
function GetYear: Integer;
```

C++

```
__fastcall int GetYear();
```

Description

GetYear is the protected read implementation of the Year (see page 7765) property.

See Also

Year (see page 7765)

89.1.6.5.14 TXSCustomDateTime.SetAsDateTime Method

Sets the value of the AsDateTime (see page 7759) property.

Pascal

```
procedure SetAsDateTime(const Value: TDateTime);
```

C++

```
__fastcall SetAsDateTime(const TDateTime Value);
```

Description

SetAsDateTime is the protected write implementation of the AsDateTime (see page 7759) property.

See Also

AsDateTime (see page 7759)

89.1.6.5.15 TXSCustomDateTime.SetAsUTCDateTime Method

Sets the value of the AsUTCDateTime (see page 7760) property.

Pascal

```
procedure SetAsUTCDateTime(const Value: TDateTime);
```

C++

```
__fastcall SetAsUTCDateTime(const TDateTime Value);
```

Description

SetAsUTCDateTime is the protected write implementation of the AsUTCDateTime (see page 7760) property.

See Also

AsUTCDateTime (see page 7760)

89.1.6.5.16 TXSCustomDateTime.SetDay Method

Sets the value of the Day (see page 7760) property.

Pascal

```
procedure SetDay(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetDay(const Word Value);
```

Description

SetDay is the protected write implementation of the Day (see page 7760) property.

See Also

Day (see page 7760)

89.1.6.5.17 TXSCustomDateTime.SetFractionalSeconds Method

Sets the value of the FractionalSeconds (see page 7761) property.

Pascal

```
procedure SetFractionalSeconds(const Value: Double);
```

C++

```
__fastcall SetFractionalSeconds(const Double Value);
```

Description

SetDay (see page 7755) is the protected write implementation of the FractionalSeconds (see page 7761) property.

Value is the fraction of a second. It is a value between 0 and 1.

See Also

FractionalSeconds (see page 7761)

89.1.6.5.18 TXSCustomDateTime.SetHour Method

Sets the value of the Hour (see page 7761) property.

Pascal

```
procedure SetHour(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetHour(const Word Value);
```

Description

SetHour is the protected write implementation of the Hour (see page 7761) property.

See Also

Hour (see page 7761)

89.1.6.5.19 TXSCustomDateTime.SetHourOffset Method

Sets the value of the HourOffset (see page 7762) property.

Pascal

```
procedure SetHourOffset(const Value: SmallInt); virtual;
```

C++

```
virtual __fastcall SetHourOffset(const SmallInt Value);
```

Description

SetHourOffset is the protected write implementation of the HourOffset (see page 7762) property.

See Also

HourOffset (see page 7762)

89.1.6.5.20 TXSCustomDateTime.SetMillisecond Method

Sets the value of the Millisecond (see page 7762) property.

Pascal

```
procedure SetMillisecond(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetMillisecond(const Word Value);
```

Description

SetMillisecond is the protected write implementation for the Millisecond (see page 7762) property.

See Also

Millisecond (see page 7762)

89.1.6.5.21 TXSCustomDateTime.SetMinute Method

Sets the value of the Minute (see page 7763) property.

Pascal

```
procedure SetMinute(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetMinute(const Word Value);
```

Description

SetMinute is the protected write implementation of the Minute (see page 7763) property.

See Also

Minute (see page 7763)

89.1.6.5.22 TXSCustomDateTime.SetMinuteOffset Method

Sets the value of the MinuteOffset (see page 7763) property.

Pascal

```
procedure SetMinuteOffset(const Value: SmallInt); virtual;
```

C++

```
virtual __fastcall SetMinuteOffset(const SmallInt Value);
```

Description

SetMinuteOffest is the protected write implementation of the MinuteOffset (see page 7763) property.

See Also

MinuteOffset (see page 7763)

89.1.6.5.23 TXSCustomDateTime.SetMonth Method

Sets the value of the Month (see page 7764) property.

Pascal

```
procedure SetMonth(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetMonth(const Word Value);
```

Description

SetMonth is the protected write implementation of the Month (see page 7764) property.

See Also

Month (see page 7764)

89.1.6.5.24 TXSCustomDateTime.SetSecond Method

Sets the value of the Second (see page 7764) property.

Pascal

```
procedure SetSecond(const Value: Word); virtual;
```

C++

```
virtual __fastcall SetSecond(const Word Value);
```

Description

SetSecond is the protected write implementation of the Second (see page 7764) property.

See Also

Second (see page 7764)

89.1.6.5.25 TXSCustomDateTime.SetUseZeroMilliseconds Method

Sets the value of the UseZeroMilliseconds (see page 7765) property.

Pascal

```
procedure SetUseZeroMilliseconds(const Value: Boolean);
```

C++

```
__fastcall SetUseZeroMilliseconds(const Boolean Value);
```

Description

SetUseZeroMilliseconds is the protected write implementation of the UseZeroMilliseconds (see page 7765) property.

See Also

UseZeroMilliseconds (see page 7765)

89.1.6.5.26 TXSCustomDateTime.SetYear Method

Sets the value of the Year (see page 7765) property.

Pascal

```
procedure SetYear(const Value: Integer); virtual;
```

C++

```
virtual __fastcall SetYear(const int Value);
```

Description

SetYear is the protected write implementation of the Year (see page 7765) property.

See Also

Year (see page 7765)

89.1.6.6 TXSCustomDateTime Properties

The properties of the TXSCustomDateTime class are listed here.

Protected Properties

	Name	Description
	Millisecond (see page 7762)	Indicates the Millisecond of the second that the object represents.

Public Properties

	Name	Description
	AsDateTime (see page 7759)	Represents the object's value as a TDateTime (see page 3335) value.
	AsUTCDateTime (see page 7760)	Represents the object's value as a TDateTime (see page 3335) value using UTC time.
	Day (see page 7760)	Indicates the Day of the month that the object represents.
	FractionalSeconds (see page 7761)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 7764) property.
	Hour (see page 7761)	Indicates the hour of the day that the object represents.
	HourOffset (see page 7762)	Indicates the difference between the Hour (see page 7761) property and the hour in the local time zone.
	Minute (see page 7763)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 7763)	Indicates the difference between the Minute (see page 7763) property and the minute of the hour in local time.
	Month (see page 7764)	Indicates the month of the year that the object represents.
	Second (see page 7764)	Indicates the second of the minute that the object represents.
	UseZeroMilliseconds (see page 7765)	Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 7762) is zero.
	Year (see page 7765)	Indicates the year that the object represents.

89.1.6.6.1 TXSCustomDateTime.AsDateTime Property

Represents the object's value as a TDateTime (see page 3335) value.

Pascal

```
property AsDateTime: TDateTime;
```

C++

```
__property TDateTime AsDateTime;
```

Description

Use AsDateTime to read the value of the TXSCustomDateTime (see page 7747) object into a variable of type TDateTime (see page 3335) or set its value from a TDateTime (see page 3335) value. AsDateTime handles the mapping between a TDateTime (see page 3335) value and the Year (see page 7765), Month (see page 7764), Day (see page 7760), Hour (see page 7761), Minute (see page 7763), and Second (see page 7764) values.

Note: AsDateTime represents the local date-and-time, without using Coordinated Universal Time (see page 4338) (UTC). That is, AsDateTime ignores the HourOffset (see page 7762) and MinuteOffset (see page 7763) properties. To get or set the value taking the HourOffset (see page 7762) and MinuteOffset (see page 7763) properties into account, use the AsUTCDateTime (see page 7760) property instead.

See Also

Day (see page 7760)

Hour (see page 7761)

Minute (see page 7763)

Month (see page 7764)

Second (see page 7764)

Year (see page 7765)

HourOffset (see page 7762)

MinuteOffset (see page 7763)

Millisecond (see page 7762)

AsUTCDateTime (see page 7760)

89.1.6.6.2 TXSCustomDateTime.AsUTCDateTime Property

Represents the object's value as a TDateTime (see page 3335) value using UTC time.

Pascal

```
property AsUTCDateTime: TDateTime;
```

C++

```
__property TDateTime AsUTCDateTime;
```

Description

Use AsUTCDateTime to read the value of the TXSCustomDateTime (see page 7747) object into a variable of type TDateTime (see page 3335) or set its value from a TDateTime (see page 3335) value. AsUTCDateTime handles the mapping between a TDateTime (see page 3335) value and the Year (see page 7765), Month (see page 7764), Day (see page 7760), Hour (see page 7761), Minute (see page 7763), and Second (see page 7764) values. It also makes an adjustment for the HourOffset (see page 7762) and MinuteOffset (see page 7763) properties, so that the value of AsUTCDateTime is a Coordinated Universal Time (see page 4338) (UTC) value rather than a local time value.

Note: To get or set the value as a local time value ignoring the HourOffset (see page 7762) and MinuteOffset (see page 7763) properties, use the AsDateTime (see page 7759) property instead.

See Also

Day (see page 7760)

Hour (see page 7761)

Minute (see page 7763)

Month (see page 7764)

Second (see page 7764)

Year (see page 7765)

HourOffset (see page 7762)

MinuteOffset (see page 7763)

Millisecond (see page 7762)

AsDateTime (see page 7759)

89.1.6.6.3 TXSCustomDateTime.Day Property

Indicates the Day of the month that the object represents.

Pascal

```
property Day: Word;
```

C++

```
__property Word Day;
```

Description

Use Day to get or set the day portion of the date-and-time value. Valid Day values are 1 through 28, 29, 30, or 31, depending on the Month (see page 7764) value.

See Also

AsDateTime (see page 7759)

Hour (see page 7761)

Minute (see page 7763)

Month (see page 7764)

Second (see page 7764)

Year (see page 7765)

Millisecond (see page 7762)

89.1.6.6.4 TXSCustomDateTime.FractionalSeconds Property

Indicates any factional portion of a second beyond the seconds specified in the Second (see page 7764) property.

Pascal

```
property FractionalSeconds: Double;
```

C++

```
__property Double FractionalSeconds;
```

Description

Use FractionalSeconds to get or set the fractional seconds of the time value. FractionalSeconds represents the same information as the Millisecond (see page 7762) property, but can provide greater precision.

See Also

AsDateTime (see page 7759)

Minute (see page 7763)

Second (see page 7764)

Millisecond (see page 7762)

UseZeroMilliseconds (see page 7765)

89.1.6.6.5 TXSCustomDateTime.Hour Property

Indicates the hour of the day that the object represents.

Pascal

```
property Hour: Word;
```

C++

```
__property Word Hour;
```

Description

Use Hour to get or set the hour portion of the date-and-time value. Valid Hour values are 0 through 23.

Note: Hour represents the hour using Coordinated Universal Time (see page 4338) (UTC). To convert the hour to local time, you must add the hour offset.

See Also

AsDateTime (see page 7759)

Day (see page 7760)

Minute (see page 7763)

Month (see page 7764)

Second (see page 7764)

Year (see page 7765)

HourOffset (see page 7762)

Millisecond (see page 7762)

89.1.6.6.6 TXSCustomDateTime.HourOffset Property

Indicates the difference between the Hour (see page 7761) property and the hour in the local time zone.

Pascal

```
property HourOffset: SmallInt;
```

C++

```
__property SmallInt HourOffset;
```

Description

The Hour (see page 7761) property represents the hour of the day using Coordinated Universal Time (see page 4338) (UTC). HourOffset is the correction factor you can add to Hour (see page 7761) to obtain the hour of the day in local time.

See Also

Hour (see page 7761)

89.1.6.6.7 TXSCustomDateTime.Millisecond Property

Indicates the Millisecond of the second that the object represents.

Pascal

```
property Millisecond: Word;
```

C++

```
__property Word Millisecond;
```

Description

Use Millisecond to get or set the millisecond portion of the date-and-time value. Valid Millisecond values are 1 through 59.

Note: Millisecond values are not used by TXSDuration (see page 7780).

Note: You can also use the FractionalSeconds (see page 7761) property to obtain fractional portions of the seconds. Unlike Millisecond, which gives the value in milliseconds, FractionalSeconds (see page 7761) returns a fraction of a second.

See Also

AsDateTime (see page 7759)

Day (see page 7760)

Hour (see page 7761)

Minute (see page 7763)

Second (see page 7764)

Year (see page 7765)

Month (see page 7764)

UseZeroMilliseconds (see page 7765)

FractionalSeconds (see page 7761)

89.1.6.6.8 TXSCustomDateTime.Minute Property

Indicates the minute of the hour that the object represents.

Pascal

```
property Minute: Word;
```

C++

```
__property Word Minute;
```

Description

Use Minute to get or set the minute portion of the date-and-time value. Valid Minute values are 0 through 59.

Note: Minute represents the minute using Coordinated Universal Time (see page 4338) (UTC). To convert the minutes to local time, you must add the minute offset.

See Also

AsDateTime (see page 7759)

Day (see page 7760)

Hour (see page 7761)

Month (see page 7764)

Second (see page 7764)

Year (see page 7765)

MinuteOffset (see page 7763)

Millisecond (see page 7762)

89.1.6.6.9 TXSCustomDateTime.MinuteOffset Property

Indicates the difference between the Minute (see page 7763) property and the minute of the hour in local time.

Pascal

```
property MinuteOffset: SmallInt;
```

C++

```
__property SmallInt MinuteOffset;
```

Description

The Minute (see page 7763) property represents the minute of the hour using Coordinated Universal Time (see page 4338) (UTC). MinuteOffset is the correction factor you can add to Minute (see page 7763) to obtain the minute of the hour in local time.

See Also

Minute (see page 7763)

89.1.6.6.10 TXSCustomDateTime.Month Property

Indicates the month of the year that the object represents.

Pascal

```
property Month: Word;
```

C++

```
__property Word Month;
```

Description

Use Month to get or set the month portion of the date-and-time value. Valid Month values are 1 through 12.

See Also

AsDateTime (see page 7759)

Day (see page 7760)

Hour (see page 7761)

Minute (see page 7763)

Second (see page 7764)

Year (see page 7765)

Millisecond (see page 7762)

89.1.6.6.11 TXSCustomDateTime.Second Property

Indicates the second of the minute that the object represents.

Pascal

```
property Second: Word;
```

C++

```
__property Word Second;
```

Description

Use Second to get or set the seconds portion of the date-and-time value. Valid Second values are 0 through 59.

See Also

AsDateTime (see page 7759)

Day (see page 7760)

Hour (see page 7761)

Minute (see page 7763)

Second

Year (see page 7765)

Millisecond (see page 7762)

89.1.6.6.12 TXSCustomDateTime.UseZeroMilliseconds Property

Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 7762) is zero.

Pascal

```
property UseZeroMilliseconds: Boolean;
```

C++

```
__property Boolean UseZeroMilliseconds;
```

Description

By default, the NativeToXS method does not include the milliseconds in the string encoding of this object's value when the value of the Millisecond (see page 7762) property is zero. If you set UseZeroMilliseconds, NativeToXS changes its encoding to include the milliseconds even when the value is zero. This is necessary for some Web Services that do not support the full schema defined by W3C.

See Also

Millisecond (see page 7762)

NativeToXS

89.1.6.6.13 TXSCustomDateTime.Year Property

Indicates the year that the object represents.

Pascal

```
property Year: Integer;
```

C++

```
__property int Year;
```

Description

Use Year to get or set the year portion of the date-and-time value. Valid Year values are 1 through 9999.

See Also

AsDateTime (see page 7759)

Day (see page 7760)

Hour (see page 7761)

Minute (see page 7763)

Second (see page 7764)

Month (see page 7764)

Millisecond (see page 7762)

89.1.7 TXSDate Class

TXSDate implements the XML schema date type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSDate = class(TRemotableXS);
```

C++

```
class TXSDate : public TRemotableXS;
```

File

XSBuiltIns

Description

TXSDate acts as a wrapper for the simple scalar type date that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSDate enables this marshaling because it is a descendant of TRemotable.

To convert a TXSDate value to a TDateTime (see page 3335) value, use the AsDate (see page 7771) property. Other properties give the Year (see page 7772), Month (see page 7771), and Day (see page 7771) that make up that value.

On server applications, instances of TXSDate that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSDate instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSDate instances that it passes as input parameters, and for freeing any TXSDate instances it creates or that are returned as output parameters or method results.

IInvokable (see page 3505)

TXSDate

TXSDuration (see page 7780)

TXSTime (see page 7792)

89.1.7.1 TXSDate Members

The following tables list the members exposed by TXSDate.

Protected Methods

	Name	Description
	GetAsDate (see page 7768)	This is GetAsDate, a member of class TXSDate.
	GetDay (see page 7768)	This is GetDay, a member of class TXSDate.
	GetMonth (see page 7768)	This is GetMonth, a member of class TXSDate.
	GetYear (see page 7769)	This is GetYear, a member of class TXSDate.
	SetAsDate (see page 7769)	This is SetAsDate, a member of class TXSDate.
	SetDay (see page 7769)	This is SetDay, a member of class TXSDate.
	SetMonth (see page 7770)	This is SetMonth, a member of class TXSDate.
	SetYear (see page 7770)	This is SetYear, a member of class TXSDate.

Public Methods

	Name	Description
	Clone (see page 7768)	Returns a new TXSDate (see page 7766) object that represents the same value as this one.
V	Create (see page 7767)	Creates and initializes a Create object.
V	NativeToXS (see page 7769)	Returns a string that represents the value of a TXSDate (see page 7766) instance.
V	XSToNative (see page 7770)	Assigns the properties of the TXSDate (see page 7766) instance from the string representation of its value.

Public Properties

	Name	Description
	AsDate (see page 7771)	Represents the object's value as a TDateTime (see page 3335) value.
	Day (see page 7771)	Indicates the Day of the month that the object represents.
	Month (see page 7771)	Indicates the month of the year that the object represents.
	Year (see page 7772)	Indicates the year that the object represents.

89.1.7.2 TXSDate.Create Constructor

Creates and initializes a Create object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TXSDate();
```

Description

Call Create indirectly, using the new keyword, to create a Create object at runtime.

89.1.7.3 TXSDate Methods

The methods of the TXSDate class are listed here.

Protected Methods

	Name	Description
	GetAsDate (see page 7768)	This is GetAsDate, a member of class TXSDate.
	GetDay (see page 7768)	This is GetDay, a member of class TXSDate.
	GetMonth (see page 7768)	This is GetMonth, a member of class TXSDate.
	GetYear (see page 7769)	This is GetYear, a member of class TXSDate.
	SetAsDate (see page 7769)	This is SetAsDate, a member of class TXSDate.
	SetDay (see page 7769)	This is SetDay, a member of class TXSDate.

	SetMonth (see page 7770)	This is SetMonth, a member of class TXSDate.
	SetYear (see page 7770)	This is SetYear, a member of class TXSDate.

Public Methods

	Name	Description
	Clone (see page 7768)	Returns a new TXSDate (see page 7766) object that represents the same value as this one.
	NativeToXS (see page 7769)	Returns a string that represents the value of a TXSDate (see page 7766) instance.
	XSToNative (see page 7770)	Assigns the properties of the TXSDate (see page 7766) instance from the string representation of its value.

89.1.7.3.1 TXSDate.Clone Method

Returns a new TXSDate (see page 7766) object that represents the same value as this one.

Pascal

```
function Clone: TXSDate;
```

C++

```
__fastcall TXSDate Clone();
```

Description

Call Clone to obtain a new TXSDate (see page 7766) instance that represents the same time as this one. Clone returns the new TXSDate (see page 7766) object.

89.1.7.3.2 TXSDate.GetAsDate Method

Pascal

```
function GetAsDate: TDateTime;
```

C++

```
__fastcall TDateTime GetAsDate();
```

Description

This is GetAsDate, a member of class TXSDate.

89.1.7.3.3 TXSDate.GetDay Method

Pascal

```
function GetDay: Word;
```

C++

```
__fastcall Word GetDay();
```

Description

This is GetDay, a member of class TXSDate.

89.1.7.3.4 TXSDate.GetMonth Method

Pascal

```
function GetMonth: Word;
```

C++

```
__fastcall Word GetMonth();
```

Description

This is GetMonth, a member of class TXSDate.

89.1.7.3.5 TXSDate.GetYear Method

Pascal

```
function GetYear: Integer;
```

C++

```
__fastcall int GetYear();
```

Description

This is GetYear, a member of class TXSDate.

89.1.7.3.6 TXSDate.NativeToXS Method

Returns a string that represents the value of a TXSDate (see page 7766) instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSDate (see page 7766) in a SOAP packet.

See Also

XSToNative (see page 7770)

89.1.7.3.7 TXSDate.SetAsDate Method

Pascal

```
procedure SetAsDate(const Value: TDateTime);
```

C++

```
__fastcall SetAsDate(const TDateTime Value);
```

Description

This is SetAsDate, a member of class TXSDate.

89.1.7.3.8 TXSDate.SetDay Method

Pascal

```
procedure SetDay(const Value: Word);
```

C++

```
__fastcall SetDay(const Word Value);
```

Description

This is SetDay, a member of class TXSDate.

89.1.7.3.9 TXSDate.SetMonth Method

Pascal

```
procedure SetMonth(const Value: Word);
```

C++

```
__fastcall SetMonth(const Word Value);
```

Description

This is SetMonth, a member of class TXSDate.

89.1.7.3.10 TXSDate.SetYear Method

Pascal

```
procedure SetYear(const Value: Integer);
```

C++

```
__fastcall SetYear(const int Value);
```

Description

This is SetYear, a member of class TXSDate.

89.1.7.3.11 TXSDate.XSToNative Method

Assigns the properties of the TXSDate (see page 7766) instance from the string representation of its value.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

XSToNative parses the string specified by Data, which is the SOAP encoding of a date value. It uses this information to set the properties of the TXSDate (see page 7766) object.

See Also

NativeToXS (see page 7769)

89.1.7.4 TXSDate Properties

The properties of the TXSDate class are listed here.

Public Properties

	Name	Description
	AsDate (see page 7771)	Represents the object's value as a TDateTime (see page 3335) value.
	Day (see page 7771)	Indicates the Day of the month that the object represents.
	Month (see page 7771)	Indicates the month of the year that the object represents.

	Year (see page 7772)	Indicates the year that the object represents.

89.1.7.4.1 TXSDate.AsDate Property

Represents the object's value as a TDateTime (see page 3335) value.

Pascal

```
property AsDate: TDateTime;
```

C++

```
__property TDateTime AsDate;
```

Description

Use AsDate to read the value of the TXSDate (see page 7766) object into a variable of type TDateTime (see page 3335) or set this objects value from a TDateTime (see page 3335) value. AsDate handles the mapping between a TDateTime (see page 3335) value and the Year (see page 7772), Month (see page 7771), and Day (see page 7771) properties. When reading AsDate, the resulting TDateTime (see page 3335) value has a time portion of 0. When setting AsDate, the time portion is ignored.

See Also

Day (see page 7771)

Month (see page 7771)

Year (see page 7772)

89.1.7.4.2 TXSDate.Day Property

Indicates the Day of the month that the object represents.

Pascal

```
property Day: Word;
```

C++

```
__property Word Day;
```

Description

Use Day to get or set the day portion of the date-and-time value. Valid Day values are 1 through 28, 29, 30, or 31, depending on the Month (see page 7771) value.

See Also

AsDate (see page 7771)

Month (see page 7771)

Year (see page 7772)

89.1.7.4.3 TXSDate.Month Property

Indicates the month of the year that the object represents.

Pascal

```
property Month: Word;
```

C++

```
__property Word Month;
```

Description

Use Month to get or set the month portion of the date-and-time value. Valid Month values are 1 through 12.

See Also

AsDate (see page 7771)

Day (see page 7771)

Year (see page 7772)

89.1.7.4.4 TXSDate.Year Property

Indicates the year that the object represents.

Pascal

```
property Year: Integer;
```

C++

```
__property int Year;
```

Description

Use Year to get or set the year portion of the date-and-time value. Valid Year values are 1 through 9999.

See Also

AsDate (see page 7771)

Day (see page 7771)

Month (see page 7771)

89.1.8 TXSDateTime Class

TXSDateTime implements the XML schema datetime type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSDateTime = class(TXSCustomDateTime);
```

C++

```
class TXSDateTime : public TXSCustomDateTime;
```

File

XSBuiltIns

Description

TXSDateTime acts as a wrapper for the simple scalar type datetime that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSDateTime enables this marshaling because it is a descendant of TRemotable.

To convert a TXSDateTime value to a TDateTime (see page 3335) value, use the AsDateTime (see page 7759) property. The resulting value represents the time portion using Coordinated Universal Time (see page 4338) (UTC). To convert that to a local time zone, adjust the hour and minute portions using the HourOffset (see page 7762) and MinuteOffset (see page 7763) properties.

On server applications, instances of TXSDateTime that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSDateTime instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSDateTime instances that it passes as input parameters, and for freeing any TXSDateTime instances it creates or that are returned as output parameters or method results.

89.1.8.1 TXSDateTime Members

The following tables list the members exposed by TXSDateTime.

Protected Fields

	Name	Description
	FDateTime (see page 7750)	This is FDateTime, a member of class TXSCustomDateTime.

Protected Methods

	Name	Description
	GetAsDateTime (see page 7751)	Returns the value of the AsDateTime (see page 7759) property.
	GetAsUTCDateTime (see page 7751)	This is GetAsUTCDateTime, a member of class TXSCustomDateTime.
	GetDay (see page 7751)	Returns the value of the Day (see page 7760) property.
	GetFractionalSeconds (see page 7752)	Returns the value of the FractionalSeconds (see page 7761) property.
	GetHour (see page 7752)	Returns the value of the Hour (see page 7761) property.
	GetHourOffset (see page 7752)	Returns the value of the HourOffset (see page 7762) property.
	GetMillisecond (see page 7752)	Returns the value of the Millisecond (see page 7762) property.
	GetMinute (see page 7753)	Returns the value of the Minute (see page 7763) property.
	GetMinuteOffset (see page 7753)	Returns the value of the MinuteOffset (see page 7763) property.
	GetMonth (see page 7753)	Returns the value of the Month (see page 7764) property.
	GetSecond (see page 7754)	Returns the value of the Second (see page 7764) property.
	GetUseZeroMilliseconds (see page 7754)	Returns the value of the UseZeroMilliseconds (see page 7765) property.
	GetYear (see page 7754)	Returns the value of the Year (see page 7765) property.
	SetAsDateTime (see page 7755)	Sets the value of the AsDateTime (see page 7759) property.
	SetAsUTCDateTime (see page 7755)	Sets the value of the AsUTCDateTime (see page 7760) property.
	SetDay (see page 7755)	Sets the value of the Day (see page 7760) property.
	SetFractionalSeconds (see page 7755)	Sets the value of the FractionalSeconds (see page 7761) property.
	SetHour (see page 7756)	Sets the value of the Hour (see page 7761) property.
	SetHourOffset (see page 7756)	Sets the value of the HourOffset (see page 7762) property.
	SetMillisecond (see page 7756)	Sets the value of the Millisecond (see page 7762) property.
	SetMinute (see page 7757)	Sets the value of the Minute (see page 7763) property.
	SetMinuteOffset (see page 7757)	Sets the value of the MinuteOffset (see page 7763) property.

	SetMonth (see page 7757)	Sets the value of the Month (see page 7764) property.
	SetSecond (see page 7758)	Sets the value of the Second (see page 7764) property.
	SetUseZeroMilliseconds (see page 7758)	Sets the value of the UseZeroMilliseconds (see page 7765) property.
	SetYear (see page 7758)	Sets the value of the Year (see page 7765) property.

Public Methods

	Name	Description
	Clone (see page 7774)	Returns a new TXSDateTime (see page 7772) object that represents the same value as this one.
	CompareDateTimeParam (see page 7775)	This is CompareDateTimeParam, a member of class TXSDateTime.
	Create (see page 7749)	Creates and initializes a TXSCustomDateTime (see page 7747) object.
	Destroy (see page 7749)	Frees the memory associated with the TXSCustomDateTime (see page 7747) object.
	NativeToXS (see page 7775)	Returns a string that represents the value of a TXSDateTime (see page 7772) instance.
	XSToNative (see page 7775)	Assigns the properties of the TXSDateTime (see page 7772) instance from the string representation of its value.

Public Properties

	Name	Description
	AsDateTime (see page 7759)	Represents the object's value as a TDateTime (see page 3335) value.
	AsUTCDateTime (see page 7760)	Represents the object's value as a TDateTime (see page 3335) value using UTC time.
	Day (see page 7760)	Indicates the Day of the month that the object represents.
	FractionalSeconds (see page 7761)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 7764) property.
	Hour (see page 7761)	Indicates the hour of the day that the object represents.
	HourOffset (see page 7762)	Indicates the difference between the Hour (see page 7761) property and the hour in the local time zone.
	Millisecond (see page 7776)	Indicates the Millisecond of the second that the object represents.
	Minute (see page 7763)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 7763)	Indicates the difference between the Minute (see page 7763) property and the minute of the hour in local time.
	Month (see page 7764)	Indicates the month of the year that the object represents.
	Second (see page 7764)	Indicates the second of the minute that the object represents.
	UseZeroMilliseconds (see page 7765)	Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 7762) is zero.
	Year (see page 7765)	Indicates the year that the object represents.

89.1.8.2 TXSDateTime Methods

The methods of the TXSDateTime class are listed here.

Public Methods

	Name	Description
	Clone (see page 7774)	Returns a new TXSDateTime (see page 7772) object that represents the same value as this one.
	CompareDateTimeParam (see page 7775)	This is CompareDateTimeParam, a member of class TXSDateTime.
	NativeToXS (see page 7775)	Returns a string that represents the value of a TXSDateTime (see page 7772) instance.
	XSToNative (see page 7775)	Assigns the properties of the TXSDateTime (see page 7772) instance from the string representation of its value.

89.1.8.2.1 TXSDateTime.Clone Method

Returns a new TXSDateTime (see page 7772) object that represents the same value as this one.

Pascal

```
function Clone: TXSDateTime;
```

C++

```
__fastcall TXSDateTime Clone();
```

Description

Call Clone to obtain a new TXSDateTime (see page 7772) instance that represents the same date and time as this one. Clone returns the new TXSDateTime (see page 7772) object.

89.1.8.2.2 TXSDateTime.CompareDateTimeParam Method

Pascal

```
function CompareDateTimeParam(const Value1: TXSDateTime; const Value2: TXSDateTime):
TXSDuration;
```

C++

```
__fastcall TXSDuration CompareDateTimeParam(const TXSDateTime Value1, const TXSDateTime
Value2);
```

Description

This is CompareDateTimeParam, a member of class TXSDateTime.

89.1.8.2.3 TXSDateTime.NativeToXS Method

Returns a string that represents the value of a TXSDateTime (see page 7772) instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSDateTime (see page 7772) in a SOAP packet.

See Also

XSToNative (see page 7775)

UseZeroMilliseconds (see page 7765)

89.1.8.2.4 TXSDateTime.XSToNative Method

Assigns the properties of the TXSDateTime (see page 7772) instance from the string representation of its value.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

XSToNative parses the string specified by Data, which is the SOAP encoding of a datetime value. It uses this information to set the properties of the TXSDateTime (see page 7772) object.

See Also

NativeToXS (see page 7775)

89.1.8.3 TXSDateTime Properties

The properties of the TXSDateTime class are listed here.

Public Properties

	Name	Description
	Millisecond (see page 7776)	Indicates the Millisecond of the second that the object represents.

89.1.8.3.1 TXSDateTime.Millisecond Property

Indicates the Millisecond of the second that the object represents.

Pascal

```
property Millisecond: Word;
```

C++

```
__property Word Millisecond;
```

Description

Use Millisecond to get or set the millisecond portion of the date-and-time value. Valid Millisecond values are 1 through 59.

Note: Millisecond values are not used by TXSDuration.

Note: You can also use the FractionalSeconds property to obtain fractional portions of the seconds. Unlike Millisecond, which gives the value in milliseconds, FractionalSeconds returns a fraction of a second.

See Also

AsDateTime (see page 7759)

Day (see page 7760)

Hour (see page 7761)

Minute (see page 7763)

Second (see page 7764)

Year (see page 7765)

Month (see page 7764)

UseZeroMilliseconds (see page 7765)

FractionalSeconds (see page 7761)

89.1.9 TXSDecimal Class

TXSDecimal implements the XML schema decimal type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSDecimal = class(TRemotableXS);
```

C++

```
class TXSDecimal : public TRemotableXS;
```

File

XSBuiltIns

Description

TXSDecimal acts as a wrapper for the simple scalar decimal type that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSDecimal enables this marshaling because it is a descendant of TRemotable.

To convert a TXSDecimal value to a TBcd value, use the AsBcd (see page 7779) property.

On server applications, instances of TXSDecimal that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSDecimal instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSDecimal instances that it passes as input parameters, and for freeing any TXSDecimal instances it creates or that are returned as output parameters or method results.

IInvokable (see page 3505)

TXSHexBinary (see page 7784)

EXSDecimalException (see page 7740)

89.1.9.1 TXSDecimal Members

The following tables list the members exposed by TXSDecimal.

Public Methods

	Name	Description
	NativeToXS (see page 7778)	Returns a string that represents the value of a TXSDecimal (see page 7776) instance.
	XSToNative (see page 7778)	Assigns a string as the value of the TXSDecimal (see page 7776) instance.

Public Properties

	Name	Description
	AsBcd (see page 7779)	Represents the object's value as a TBcd value.
	DecimalString (see page 7779)	Represents the object's value as a string.

89.1.9.2 TXSDecimal Methods

The methods of the TXSDecimal class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 7778)	Returns a string that represents the value of a TXSDecimal (see page 7776) instance.
	XSToNative (see page 7778)	Assigns a string as the value of the TXSDecimal (see page 7776) instance.

89.1.9.2.1 TXSDecimal.NativeToXS Method

Returns a string that represents the value of a TXSDecimal (see page 7776) instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSDecimal (see page 7776) object in a SOAP packet. That is, NativeToXS converts the DecimalString (see page 7779) property to a WideString (see page 3476) and returns the result.

See Also

XSToNative (see page 7778)

DecimalString (see page 7779)

89.1.9.2.2 TXSDecimal.XSToNative Method

Assigns a string as the value of the TXSDecimal (see page 7776) instance.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

XSToNative sets the value of this TXSDecimal (see page 7776) object to a string that represents a formatted decimal value.

Data is the SOAP encoding of a decimal value. It becomes the value of the DecimalString (see page 7779) property.

See Also

NativeToXS (see page 7778)

DecimalString (see page 7779)

89.1.9.3 TXSDecimal Properties

The properties of the TXSDecimal class are listed here.

Public Properties

	Name	Description
	AsBcd (see page 7779)	Represents the object's value as a TBcd value.
	DecimalString (see page 7779)	Represents the object's value as a string.

89.1.9.3.1 TXSDecimal.AsBcd Property

Represents the object's value as a TBcd value.

Pascal

```
property AsBcd: TBcd;
```

C++

```
__property TBcd AsBcd;
```

Description

Use AsBcd to get or set this object's value as a TBcd type. TXSDecimal (see page 7776) converts between the internal string representation that is the value of the DecimalString (see page 7779) property and a TBcd value when the application gets or sets this property. Thus, if the string representation is ill-formed, reading AsBcd can cause an EXSDecimalException (see page 7740) exception. Similarly, setting AsBcd can cause an EXSDecimalException (see page 7740) exception if the TBcd value has an invalid scale or precision.

See Also

BcdToStr

TryStrToBCD

DecimalString (see page 7779)

EXSDecimalException (see page 7740)

89.1.9.3.2 TXSDecimal.DecimalString Property

Represents the object's value as a string.

Pascal

```
property DecimalString: string;
```

C++

```
__property UnicodeString DecimalString;
```

Description

Use DecimalString to obtain the value of the TXSDecimal (see page 7776) object as a string. This value is the same as the string that appears in XML documents to represent the decimal value. To work with this object's value as a TBcd value, use the AsBcd (see page 7779) property instead.

Note: If you do not need the precision of binary-coded decimal values, you can use global functions such as StrToFloat (see page 4324) and FloatToStr (see page 4224) or StrToCurr (see page 4319) and CurrToStr (see page 4150) to convert this string to a floating-point representation.

See Also

StrToCurr (see page 4319)

CurrToStr (see page 4150)

StrToFloat (see page 4324)

FloatToStr (see page 4224)

AsBcd (see page 7779)

89.1.10 TXSDuration Class

TXSDuration implements the XML schema duration type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSDuration = class(TXSCustomDateTime);
```

C++

```
class TXSDuration : public TXSCustomDateTime;
```

File

XSBuiltIns

Description

TXSDuration acts as a wrapper for the simple scalar type duration that W3C defines for XML schemas. That is, TXSDuration represents the interval between two points in time. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSDuration enables this marshaling because it is a descendant of TRemotable.

To convert a TXSDuration value to a TDateTime (see page 3335) value, use the AsDateTime (see page 7759) property.

On server applications, instances of TXSDuration that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSDuration instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSDuration instances that it passes as input parameters, and for freeing any TXSDuration instances it creates or that are returned as output parameters or method results.

IInvokable (see page 3505)

TXSDate (see page 7766)

TXSDuration

TXSTime (see page 7792)

89.1.10.1 TXSDuration Members

The following tables list the members exposed by TXSDuration.

Protected Fields

	Name	Description
	FDateTime (see page 7750)	This is FDateTime, a member of class TXSCustomDateTime.

Protected Methods

	Name	Description
	GetAsDateTime (see page 7751)	Returns the value of the AsDateTime (see page 7759) property.
	GetAsUTCDateTime (see page 7751)	This is GetAsUTCDateTime, a member of class TXSCustomDateTime.
	GetDay (see page 7751)	Returns the value of the Day (see page 7760) property.
	GetDecimalSecond (see page 7782)	This is GetDecimalSecond, a member of class TXSDuration.
	GetFractionalSeconds (see page 7752)	Returns the value of the FractionalSeconds (see page 7761) property.
	GetHour (see page 7752)	Returns the value of the Hour (see page 7761) property.
	GetHourOffset (see page 7752)	Returns the value of the HourOffset (see page 7762) property.
	GetMillisecond (see page 7752)	Returns the value of the Millisecond (see page 7762) property.
	GetMinute (see page 7753)	Returns the value of the Minute (see page 7763) property.
	GetMinuteOffset (see page 7753)	Returns the value of the MinuteOffset (see page 7763) property.
	GetMonth (see page 7753)	Returns the value of the Month (see page 7764) property.
	GetSecond (see page 7754)	Returns the value of the Second (see page 7764) property.
	GetUseZeroMilliseconds (see page 7754)	Returns the value of the UseZeroMilliseconds (see page 7765) property.
	GetYear (see page 7754)	Returns the value of the Year (see page 7765) property.
	SetAsDateTime (see page 7755)	Sets the value of the AsDateTime (see page 7759) property.
	SetAsUTCDateTime (see page 7755)	Sets the value of the AsUTCDateTime (see page 7760) property.
	SetDay (see page 7755)	Sets the value of the Day (see page 7760) property.
	SetDecimalSecond (see page 7783)	This is SetDecimalSecond, a member of class TXSDuration.
	SetFractionalSeconds (see page 7755)	Sets the value of the FractionalSeconds (see page 7761) property.
	SetHour (see page 7756)	Sets the value of the Hour (see page 7761) property.
	SetHourOffset (see page 7756)	Sets the value of the HourOffset (see page 7762) property.
	SetMillisecond (see page 7756)	Sets the value of the Millisecond (see page 7762) property.
	SetMinute (see page 7757)	Sets the value of the Minute (see page 7763) property.
	SetMinuteOffset (see page 7757)	Sets the value of the MinuteOffset (see page 7763) property.
	SetMonth (see page 7757)	Sets the value of the Month (see page 7764) property.
	SetSecond (see page 7758)	Sets the value of the Second (see page 7764) property.
	SetUseZeroMilliseconds (see page 7758)	Sets the value of the UseZeroMilliseconds (see page 7765) property.
	SetYear (see page 7758)	Sets the value of the Year (see page 7765) property.

Protected Properties

	Name	Description
	Millisecond (see page 7762)	Indicates the Millisecond of the second that the object represents.

Public Methods

	Name	Description
	Create (see page 7782)	Creates and initializes a TXSDuration (see page 7780) object.
	Destroy (see page 7749)	Frees the memory associated with the TXSCustomDateTime (see page 7747) object.
	NativeToXS (see page 7783)	Returns a string that represents the value of a TXSDuration (see page 7780) instance.
	XSToNative (see page 7783)	Assigns the properties of the TXSDuration (see page 7780) instance from the string representation of its value.

Public Properties

	Name	Description
	AsDateTime (see page 7759)	Represents the object's value as a TDateTime (see page 3335) value.
	AsUTCDateTime (see page 7760)	Represents the object's value as a TDateTime (see page 3335) value using UTC time.
	Day (see page 7760)	Indicates the Day of the month that the object represents.
	DecimalSecond (see page 7784)	Indicates the number of seconds, including fractional seconds, in the duration.
	FractionalSeconds (see page 7761)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 7764) property.
	Hour (see page 7761)	Indicates the hour of the day that the object represents.

	HourOffset (see page 7762)	Indicates the difference between the Hour (see page 7761) property and the hour in the local time zone.
	Minute (see page 7763)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 7763)	Indicates the difference between the Minute (see page 7763) property and the minute of the hour in local time.
	Month (see page 7764)	Indicates the month of the year that the object represents.
	Second (see page 7764)	Indicates the second of the minute that the object represents.
	UseZeroMilliseconds (see page 7765)	Indicates whether the string representation of this object's value includes a portion for milliseconds when the value of Millisecond (see page 7762) is zero.
	Year (see page 7765)	Indicates the year that the object represents.

89.1.10.2 TXSDuration.Create Constructor

Creates and initializes a TXSDuration (see page 7780) object.

Pascal

```
constructor Create; override;
```

C++

```
virtual __fastcall TXSDuration();
```

Description

Call Create to create a TXSDuration (see page 7780) object at runtime.

89.1.10.3 TXSDuration Methods

The methods of the TXSDuration class are listed here.

Protected Methods

	Name	Description
	GetDecimalSecond (see page 7782)	This is GetDecimalSecond, a member of class TXSDuration.
	SetDecimalSecond (see page 7783)	This is SetDecimalSecond, a member of class TXSDuration.

Public Methods

	Name	Description
	NativeToXS (see page 7783)	Returns a string that represents the value of a TXSDuration (see page 7780) instance.
	XSToNative (see page 7783)	Assigns the properties of the TXSDuration (see page 7780) instance from the string representation of its value.

89.1.10.3.1 TXSDuration.GetDecimalSecond Method

Pascal

```
function GetDecimalSecond: Double;
```

C++

```
__fastcall Double GetDecimalSecond();
```

Description

This is GetDecimalSecond, a member of class TXSDuration.

89.1.10.3.2 TXSDuration.NativeToXS Method

Returns a string that represents the value of a TXSDuration (see page 7780) instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSDuration (see page 7780) in a SOAP packet.

See Also

XSToNative (see page 7783)

89.1.10.3.3 TXSDuration.SetDecimalSecond Method

Pascal

```
procedure SetDecimalSecond(const Value: Double);
```

C++

```
__fastcall SetDecimalSecond(const Double Value);
```

Description

This is SetDecimalSecond, a member of class TXSDuration.

89.1.10.3.4 TXSDuration.XSToNative Method

Assigns the properties of the TXSDuration (see page 7780) instance from the string representation of its value.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

XSToNative parses the string specified by Data, which is the SOAP encoding of a duration value. It uses this information to set the properties of the TXSDuration (see page 7780) object.

See Also

NativeToXS (see page 7783)

89.1.10.4 TXSDuration Properties

The properties of the TXSDuration class are listed here.

Public Properties

	Name	Description
	DecimalSecond (see page 7784)	Indicates the number of seconds, including fractional seconds, in the duration.

89.1.10.4.1 TXSDuration.DecimalSecond Property

Indicates the number of seconds, including fractional seconds, in the duration.

Pascal

```
property DecimalSecond: Double;
```

C++

```
__property Double DecimalSecond;
```

Description

Use the DecimalSecond property to determine the size of the duration with a granularity finer than the Seconds property provides. DecimalSecond represents the number of seconds in the duration (above and beyond the years, months, days, hours and minutes represented by the other TXSDuration (see page 7780) properties), including any fractional seconds.

See Also

Second (see page 7764)

FractionalSeconds (see page 7761)

89.1.11 TXSHexBinary Class

TXSHexBinary implements the XML schema hexBinary type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSHexBinary = class(TRemotableXS);
```

C++

```
class TXSHexBinary : public TRemotableXS;
```

File

XSBuiltIns

Description

TXSHexBinary acts as a wrapper for the simple scalar hexBinary type that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSHexBinary enables this marshaling because it is a descendant of TRemotable.

Use the AsByteArray (see page 7786) property to get or set the value of TXSHexBinary as an array of bytes. You can also set the value of TXSHexBinary from an integer using the global IntToHex (see page 4259) function to convert an integer into a hexadecimal string and setting the HexBinaryString (see page 7787) property.

On server applications, instances of TXSHexBinary that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSHexBinary instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSHexBinary instances that it passes as input

parameters, and for freeing any TXSHexBinary instances it creates or that are returned as output parameters or method results.

IntToHex

EXSHexBinaryException (see page 7740)

89.1.11.1 TXSHexBinary Members

The following tables list the members exposed by TXSHexBinary.

Public Methods

	Name	Description
	NativeToXS (see page 7785)	Returns a string that represents the value of a TXSHexBinary (see page 7784) instance.
	XSToNative (see page 7786)	Assigns a string as the value of the TXSHexBinary (see page 7784) instance.

Public Properties

	Name	Description
	AsByteArray (see page 7786)	Represents the object's value as an array of bytes.
	HexBinaryString (see page 7787)	This is HexBinaryString, a member of class TXSHexBinary.

89.1.11.2 TXSHexBinary Methods

The methods of the TXSHexBinary class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 7785)	Returns a string that represents the value of a TXSHexBinary (see page 7784) instance.
	XSToNative (see page 7786)	Assigns a string as the value of the TXSHexBinary (see page 7784) instance.

89.1.11.2.1 TXSHexBinary.NativeToXS Method

Returns a string that represents the value of a TXSHexBinary (see page 7784) instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSHexBinary (see page 7784) object in a SOAP packet. That is, NativeToXS converts the HexBinaryString (see page 7787) property to a WideString (see page 3476) and returns the result.

See Also

XSToNative (see page 7786)

hexbinarystring (see page 7787)

89.1.11.2.2 TXSHexBinary.XSToNative Method

Assigns a string as the value of the TXSHexBinary (see page 7784) instance.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

XSToNative sets the value of this TXSHexBinary (see page 7784) object to a string that represents a formatted hexadecimal value.

Data is the SOAP encoding of a hexadecimal value. It becomes the value of the HexBinaryString (see page 7787) property.

See Also

NativeToXS (see page 7785)

hexbinarystring (see page 7787)

89.1.11.3 TXSHexBinary Properties

The properties of the TXSHexBinary class are listed here.

Public Properties

	Name	Description
	AsByteArray (see page 7786)	Represents the object's value as an array of bytes.
	HexBinaryString (see page 7787)	This is HexBinaryString, a member of class TXSHexBinary.

89.1.11.3.1 TXSHexBinary.AsByteArray Property

Represents the object's value as an array of bytes.

Pascal

```
property AsByteArray: TByteDynArray;
```

C++

```
__property TByteDynArray AsByteArray;
```

Description

Use AsByteArray to obtain the value of the TXSHexBinary (see page 7784) object as an array of bytes. This value is obtained from the HexBinaryString (see page 7787) property using the global HexToBin function. When you set AsByteArray, TXSHexBinary (see page 7784) uses the global BinToHex function to convert the binary value to a string and sets the HexBinaryString (see page 7787) property.

See Also

BinToHex

HexToBin

hexbinarystring (see page 7787)

89.1.11.3.2 TXSHexBinary.HexBinaryString Property

Pascal

```
property HexBinaryString: string;
```

C++

```
__property UnicodeString HexBinaryString;
```

Description

This is HexBinaryString, a member of class TXSHexBinary.

89.1.12 TXSInteger Class

Class Hierarchy

Pascal

```
TXSInteger = class(TRemotableXS);
```

C++

```
class TXSInteger : public TRemotableXS;
```

File

XSBuiltIns

Description

This is class XSBuiltIns.TXSInteger.

89.1.12.1 TXSInteger Members

The following tables list the members exposed by TXSInteger.

Public Methods

	Name	Description
	NativeToXS (see page 7788)	Returns a string that represents the value of a TRemotableXS instance.
	XSToNative (see page 7788)	Assigns the value of a string to the TRemotableXS instance.

Public Properties

	Name	Description
	AsInteger (see page 7789)	This is AsInteger, a member of class TXSInteger.

89.1.12.2 TXSInteger Methods

The methods of the TXSInteger class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 7788)	Returns a string that represents the value of a TRemotableXS instance.
	XSToNative (see page 7788)	Assigns the value of a string to the TRemotableXS instance.

89.1.12.2.1 TXSInteger.NativeToXS Method

Returns a string that represents the value of a TRemotableXS instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

Override NativeToXS when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS returns a string that represents the value of the TRemotableXS instance. This string is used when marshaling the value of the TRemotableXS descendant.

Classes that implement NativeToXS must also override the XSToNative method so that it performs the converse transformation.

See Also

XSToNative

Using Remotable Objects

89.1.12.2.2 TXSInteger.XSToNative Method

Assigns the value of a string to the TRemotableXS instance.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

Override XSToNative when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS interprets a string that represents the value of the TRemotableXS instance and uses it to make any necessary changes so that the TRemotableXS object reflects that value. It reverses the transformation that the NativeToXS method performs.

Data is a string that represents the value of the TRemotableXS instance.

89.1.12.3 TXSInteger Properties

The properties of the TXSInteger class are listed here.

Public Properties

	Name	Description
	AsInteger (see page 7789)	This is AsInteger, a member of class TXSInteger.

89.1.12.3.1 TXSInteger.AsInteger Property

Pascal

```
property AsInteger: Integer;
```

C++

```
__property int AsInteger;
```

Description

This is AsInteger, a member of class TXSInteger.

89.1.13 TXSLong Class

Class Hierarchy

Pascal

```
TXSLong = class(TRemotableXS);
```

C++

```
class TXSLong : public TRemotableXS;
```

File

XSBuiltIns

Description

This is class XSBuiltIns.TXSLong.

89.1.13.1 TXSLong Members

The following tables list the members exposed by TXSLong.

Public Methods

	Name	Description
	NativeToXS (see page 7790)	Returns a string that represents the value of a TRemotableXS instance.
	XSToNative (see page 7790)	Assigns the value of a string to the TRemotableXS instance.

Public Properties

	Name	Description
	AsLong (see page 7791)	This is AsLong, a member of class TXSLong.

89.1.13.2 TXSLong Methods

The methods of the TXSLong class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 7790)	Returns a string that represents the value of a TRemotableXS instance.
	XSToNative (see page 7790)	Assigns the value of a string to the TRemotableXS instance.

89.1.13.2.1 TXSLong.NativeToXS Method

Returns a string that represents the value of a TRemotableXS instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

Override NativeToXS when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS returns a string that represents the value of the TRemotableXS instance. This string is used when marshaling the value of the TRemotableXS descendant.

Classes that implement NativeToXS must also override the XSToNative method so that it performs the converse transformation.

See Also

XSToNative

Using Remotable Objects

89.1.13.2.2 TXSLong.XSToNative Method

Assigns the value of a string to the TRemotableXS instance.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

Override XSToNative when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS interprets a string that represents the value of the TRemotableXS instance and uses it to make any necessary changes so that the TRemotableXS object reflects that value. It reverses the transformation that the NativeToXS method performs.

Data is a string that represents the value of the TRemotableXS instance.

89.1.13.3 TXSLong Properties

The properties of the TXSLong class are listed here.

Public Properties

	Name	Description
	AsLong (see page 7791)	This is AsLong, a member of class TXSLong.

89.1.13.3.1 TXSLong.AsLong Property

Pascal

```
property AsLong: Int64;
```

C++

```
__property Int64 AsLong;
```

Description

This is AsLong, a member of class TXSLong.

89.1.14 TXSString Class

Class Hierarchy

Pascal

```
TXSString = class(TRemotableXS);
```

C++

```
class TXSString : public TRemotableXS;
```

File

XSBuiltIns

Description

This is class XSBuiltIns.TXSString.

89.1.14.1 TXSString Members

The following tables list the members exposed by TXSString.

Public Methods

	Name	Description
	NativeToXS (see page 7792)	Returns a string that represents the value of a TRemotableXS instance.
	XSToNative (see page 7792)	Assigns the value of a string to the TRemotableXS instance.

89.1.14.2 TXSString Methods

The methods of the TXSString class are listed here.

Public Methods

	Name	Description
	NativeToXS (see page 7792)	Returns a string that represents the value of a TRemotableXS instance.

	XSToNative (see page 7792)	Assigns the value of a string to the TRemotableXS instance.

89.1.14.2.1 TXSString.NativeToXS Method

Returns a string that represents the value of a TRemotableXS instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

Override NativeToXS when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS returns a string that represents the value of the TRemotableXS instance. This string is used when marshaling the value of the TRemotableXS descendant.

Classes that implement NativeToXS must also override the XSToNative method so that it performs the converse transformation.

XSToNative

Using Remotable Objects

89.1.14.2.2 TXSString.XSToNative Method

Assigns the value of a string to the TRemotableXS instance.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

Override XSToNative when implementing a TRemotableXS descendant that represents a non-native scalar type. NativeToXS interprets a string that represents the value of the TRemotableXS instance and uses it to make any necessary changes so that the TRemotableXS object reflects that value. It reverses the transformation that the NativeToXS method performs.

Data is a string that represents the value of the TRemotableXS instance.

89.1.15 TXSTime Class

TXSTime implements the XML schema time type so that it can be used on invokable interfaces.

Class Hierarchy

Pascal

```
TXSTime = class(TRemotableXS);
```

C++

```
class TXSTime : public TRemotableXS;
```

File

XSBuiltIns

Description

TXSTime acts as a wrapper for the simple scalar type time that W3C defines for XML schemas. Because this type does not correspond directly to a Delphi or C++ type, it requires special marshaling when used in an invokable interface. TXSTime enables this marshaling because it is a descendant of TRemotable.

To convert a TXSTime value to a TDateTime (see page 3335) value, use the AsTime (see page 7800) property. Other properties give the Hour (see page 7801), Minute (see page 7802), Second (see page 7803), and Millisecond (see page 7802) that make up that value. These properties represent the time using Coordinated Universal Time (see page 4338) (UTC). To convert that to a local time zone, adjust the hour and minute portions using the HourOffset (see page 7802) and MinuteOffset (see page 7803) properties.

On server applications, instances of TXSTime that are input parameters on an invokable interface are automatically created when the method call is unmarshaled and automatically freed after any output parameters or return value are marshaled so that they can be sent to the client. When a TXSTime instance is created in a method that was called remotely using an invokable interface, the instance is automatically freed after the value of the TRemotable descendant is marshaled for transport back to the client application.

The caller of an invokable interface (client) is responsible for creating any TXSTime instances that it passes as input parameters, and for freeing any TXSTime instances it creates or that are returned as output parameters or method results.

89.1.15.1 TXSTime Members

The following tables list the members exposed by TXSTime.

Protected Methods

	Name	Description
	GetAsTime (see page 7795)	This is GetAsTime, a member of class TXSTime.
	GetFractionalSeconds (see page 7795)	This is GetFractionalSeconds, a member of class TXSTime.
	GetFractionalSecondString (see page 7796)	This is GetFractionalSecondString, a member of class TXSTime.
	GetHour (see page 7796)	This is GetHour, a member of class TXSTime.
	GetHourOffset (see page 7796)	This is GetHourOffset, a member of class TXSTime.
	GetMillisecond (see page 7796)	This is GetMillisecond, a member of class TXSTime.
	GetMinute (see page 7796)	This is GetMinute, a member of class TXSTime.
	GetMinuteOffset (see page 7797)	This is GetMinuteOffset, a member of class TXSTime.
	GetSecond (see page 7797)	This is GetSecond, a member of class TXSTime.
	SetAsTime (see page 7797)	This is SetAsTime, a member of class TXSTime.

	SetFractionalSeconds (see page 7798)	This is SetFractionalSeconds, a member of class TXSTime.
	SetHour (see page 7798)	This is SetHour, a member of class TXSTime.
	SetHourOffset (see page 7798)	This is SetHourOffset, a member of class TXSTime.
	SetMillisecond (see page 7798)	This is SetMillisecond, a member of class TXSTime.
	SetMinute (see page 7799)	This is SetMinute, a member of class TXSTime.
	SetMinuteOffset (see page 7799)	This is SetMinuteOffset, a member of class TXSTime.
	SetSecond (see page 7799)	This is SetSecond, a member of class TXSTime.

Protected Properties

	Name	Description
R	FractionalSecondString (see page 7801)	This is FractionalSecondString, a member of class TXSTime.

Public Methods

	Name	Description
	Clone (see page 7795)	Returns a new TXSTime (see page 7792) object that represents the same value as this one.
V	NativeToXS (see page 7797)	Returns a string that represents the value of a TXSTime (see page 7792) instance.
V	XSToNative (see page 7799)	Assigns the properties of the TXSTime (see page 7792) instance from the string representation of its value.

Public Properties

	Name	Description
	AsTime (see page 7800)	Represents the object's value as a TDateTime (see page 3335) value.
	FractionalSeconds (see page 7801)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 7803) property.
	Hour (see page 7801)	Indicates the hour of the day that the object represents.
	HourOffset (see page 7802)	Indicates the difference between the Hour (see page 7801) property and the hour in the local time zone.
	Millisecond (see page 7802)	Indicates the Millisecond of the second that the object represents.
	Minute (see page 7802)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 7803)	Indicates the difference between the Minute (see page 7802) property and the minute of the hour in local time.
	Second (see page 7803)	Indicates the second of the minute that the object represents.
	UseZeroMilliseconds (see page 7804)	Indicates whether the string representation of this object's value includes a portion for fractions of a second when the value of Millisecond (see page 7802) and FractionalSeconds (see page 7801) is zero.

89.1.15.2 TXSTime Methods

The methods of the TXSTime class are listed here.

Protected Methods

	Name	Description
	GetAsTime (see page 7795)	This is GetAsTime, a member of class TXSTime.
	GetFractionalSeconds (see page 7795)	This is GetFractionalSeconds, a member of class TXSTime.
	GetFractionalSecondString (see page 7796)	This is GetFractionalSecondString, a member of class TXSTime.
	GetHour (see page 7796)	This is GetHour, a member of class TXSTime.
	GetHourOffset (see page 7796)	This is GetHourOffset, a member of class TXSTime.
	GetMillisecond (see page 7796)	This is GetMillisecond, a member of class TXSTime.
	GetMinute (see page 7796)	This is GetMinute, a member of class TXSTime.
	GetMinuteOffset (see page 7797)	This is GetMinuteOffset, a member of class TXSTime.
	GetSecond (see page 7797)	This is GetSecond, a member of class TXSTime.
	SetAsTime (see page 7797)	This is SetAsTime, a member of class TXSTime.
	SetFractionalSeconds (see page 7798)	This is SetFractionalSeconds, a member of class TXSTime.
	SetHour (see page 7798)	This is SetHour, a member of class TXSTime.

	SetHourOffset (see page 7798)	This is SetHourOffset, a member of class TXSTime.
	SetMillisecond (see page 7798)	This is SetMillisecond, a member of class TXSTime.
	SetMinute (see page 7799)	This is SetMinute, a member of class TXSTime.
	SetMinuteOffset (see page 7799)	This is SetMinuteOffset, a member of class TXSTime.
	SetSecond (see page 7799)	This is SetSecond, a member of class TXSTime.

Public Methods

	Name	Description
	Clone (see page 7795)	Returns a new TXSTime (see page 7792) object that represents the same value as this one.
V	NativeToXS (see page 7797)	Returns a string that represents the value of a TXSTime (see page 7792) instance.
V	XSToNative (see page 7799)	Assigns the properties of the TXSTime (see page 7792) instance from the string representation of its value.

89.1.15.2.1 TXSTime.Clone Method

Returns a new TXSTime (see page 7792) object that represents the same value as this one.

Pascal

```
function Clone: TXSTime;
```

C++

```
__fastcall TXSTime Clone();
```

Description

Call Clone to obtain a new TXSTime (see page 7792) instance that represents the same time as this one. Clone returns the new TXSTime (see page 7792) object.

89.1.15.2.2 TXSTime.GetAsTime Method

Pascal

```
function GetAsTime: TDateTime;
```

C++

```
__fastcall TDateTime GetAsTime();
```

Description

This is GetAsTime, a member of class TXSTime.

89.1.15.2.3 TXSTime.GetFractionalSeconds Method

Pascal

```
function GetFractionalSeconds: Double;
```

C++

```
__fastcall Double GetFractionalSeconds();
```

Description

This is GetFractionalSeconds, a member of class TXSTime.

89.1.15.2.4 TXSTime.GetFractionalSecondString Method

Pascal

```
function GetFractionalSecondString: string;
```

C++

```
__fastcall UnicodeString GetFractionalSecondString();
```

Description

This is GetFractionalSecondString, a member of class TXSTime.

89.1.15.2.5 TXSTime.GetHour Method

Pascal

```
function GetHour: Word;
```

C++

```
__fastcall Word GetHour();
```

Description

This is GetHour, a member of class TXSTime.

89.1.15.2.6 TXSTime.GetHourOffset Method

Pascal

```
function GetHourOffset: SmallInt;
```

C++

```
__fastcall SmallInt GetHourOffset();
```

Description

This is GetHourOffset, a member of class TXSTime.

89.1.15.2.7 TXSTime.GetMillisecond Method

Pascal

```
function GetMillisecond: Word;
```

C++

```
__fastcall Word GetMillisecond();
```

Description

This is GetMillisecond, a member of class TXSTime.

89.1.15.2.8 TXSTime.GetMinute Method

Pascal

```
function GetMinute: Word;
```

C++

```
__fastcall Word GetMinute();
```

Description

This is GetMinute, a member of class TXSTime.

89.1.15.2.9 TXSTime.GetMinuteOffset Method

Pascal

```
function GetMinuteOffset: SmallInt;
```

C++

```
__fastcall SmallInt GetMinuteOffset();
```

Description

This is GetMinuteOffset, a member of class TXSTime.

89.1.15.2.10 TXSTime.GetSecond Method

Pascal

```
function GetSecond: Word;
```

C++

```
__fastcall Word GetSecond();
```

Description

This is GetSecond, a member of class TXSTime.

89.1.15.2.11 TXSTime.NativeToXS Method

Returns a string that represents the value of a TXSTime (see page 7792) instance.

Pascal

```
function NativeToXS: InvString; override;
```

C++

```
virtual __fastcall InvString NativeToXS();
```

Description

NativeToXS returns the string that represents the value of this TXSTime (see page 7792) object in a SOAP packet.

See Also

XSToNative (see page 7799)

UseZeroMilliseconds (see page 7804)

89.1.15.2.12 TXSTime.SetAsTime Method

Pascal

```
procedure SetAsTime(const Value: TDateTime);
```

C++

```
__fastcall SetAsTime(const TDateTime Value);
```

Description

This is SetAsTime, a member of class TXSTime.

89.1.15.2.13 TXSTime.SetFractionalSeconds Method

Pascal

```
procedure SetFractionalSeconds(const Value: Double);
```

C++

```
__fastcall SetFractionalSeconds(const Double Value);
```

Description

This is SetFractionalSeconds, a member of class TXSTime.

89.1.15.2.14 TXSTime.SetHour Method

Pascal

```
procedure SetHour(const Value: Word);
```

C++

```
__fastcall SetHour(const Word Value);
```

Description

This is SetHour, a member of class TXSTime.

89.1.15.2.15 TXSTime.SetHourOffset Method

Pascal

```
procedure SetHourOffset(const Value: SmallInt);
```

C++

```
__fastcall SetHourOffset(const SmallInt Value);
```

Description

This is SetHourOffset, a member of class TXSTime.

89.1.15.2.16 TXSTime.SetMillisecond Method

Pascal

```
procedure SetMillisecond(const Value: Word);
```

C++

```
__fastcall SetMillisecond(const Word Value);
```

Description

This is SetMillisecond, a member of class TXSTime.

89.1.15.2.17 TXSTime.SetMinute Method

Pascal

```
procedure SetMinute(const Value: Word);
```

C++

```
__fastcall SetMinute(const Word Value);
```

Description

This is SetMinute, a member of class TXSTime.

89.1.15.2.18 TXSTime.SetMinuteOffset Method

Pascal

```
procedure SetMinuteOffset(const Value: SmallInt);
```

C++

```
__fastcall SetMinuteOffset(const SmallInt Value);
```

Description

This is SetMinuteOffset, a member of class TXSTime.

89.1.15.2.19 TXSTime.SetSecond Method

Pascal

```
procedure SetSecond(const Value: Word);
```

C++

```
__fastcall SetSecond(const Word Value);
```

Description

This is SetSecond, a member of class TXSTime.

89.1.15.2.20 TXSTime.XSToNative Method

Assigns the properties of the TXSTime (see page 7792) instance from the string representation of its value.

Pascal

```
procedure XSToNative(Value: InvString); override;
```

C++

```
virtual __fastcall XSToNative(InvString Value);
```

Description

XSToNative parses the string specified by Data, which is the SOAP encoding of a time value. It uses this information to set the properties of the TXSTime (see page 7792) object.

See Also

NativeToXS (see page 7797)

89.1.15.3 TXSTime Properties

The properties of the TXSTime class are listed here.

Protected Properties

	Name	Description
	FractionalSecondString (see page 7801)	This is FractionalSecondString, a member of class TXSTime.

Public Properties

	Name	Description
	AsTime (see page 7800)	Represents the object's value as a TDateTime (see page 3335) value.
	FractionalSeconds (see page 7801)	Indicates any factional portion of a second beyond the seconds specified in the Second (see page 7803) property.
	Hour (see page 7801)	Indicates the hour of the day that the object represents.
	HourOffset (see page 7802)	Indicates the difference between the Hour (see page 7801) property and the hour in the local time zone.
	Millisecond (see page 7802)	Indicates the Millisecond of the second that the object represents.
	Minute (see page 7802)	Indicates the minute of the hour that the object represents.
	MinuteOffset (see page 7803)	Indicates the difference between the Minute (see page 7802) property and the minute of the hour in local time.
	Second (see page 7803)	Indicates the second of the minute that the object represents.
	UseZeroMilliseconds (see page 7804)	Indicates whether the string representation of this object's value includes a portion for fractions of a second when the value of Millisecond (see page 7802) and FractionalSeconds (see page 7801) is zero.

89.1.15.3.1 TXSTime.AsTime Property

Represents the object's value as a TDateTime (see page 3335) value.

Pascal

```
property AsTime: TDateTime;
```

C++

```
__property TDateTime AsTime;
```

Description

Use AsTime to read the value of the TXSTime (see page 7792) object into a variable of type TDateTime (see page 3335) or set its value from a TDateTime (see page 3335) value. AsTime handles the mapping between a TDateTime (see page 3335) value and the Hour (see page 7801), Minute (see page 7802), and Second (see page 7803) properties. When reading AsTime, the resulting TDateTime (see page 3335) value is given a data portion of 0. When setting AsTime, the data portion is ignored.

Note: AsTime represents the time using Coordinated Universal Time (see page 4338) (UTC). To convert this to a local time, add the offsets specified by HourOffset (see page 7802) and MinuteOffset (see page 7803) to the hours and minutes.

See Also

Hour (see page 7801)

Minute (see page 7802)

Second (see page 7803)

HourOffset (see page 7802)

MinuteOffset (see page 7803)

89.1.15.3.2 TXSTime.FractionalSeconds Property

Indicates any factional portion of a second beyond the seconds specified in the Second (see page 7803) property.

Pascal

```
property FractionalSeconds: Double;
```

C++

```
__property Double FractionalSeconds;
```

Description

Use FractionalSeconds to get or set the fractional seconds of the time value. FractionalSeconds represents the same information as the Millisecond (see page 7802) property, but can provide greater precision.

See Also

AsTime (see page 7800)

Minute (see page 7802)

Second (see page 7803)

Millisecond (see page 7802)

UseZeroMilliseconds (see page 7804)

89.1.15.3.3 TXSTime.FractionalSecondString Property

Pascal

```
property FractionalSecondString: string;
```

C++

```
__property UnicodeString FractionalSecondString;
```

Description

This is FractionalSecondString, a member of class TXSTime.

89.1.15.3.4 TXSTime.Hour Property

Indicates the hour of the day that the object represents.

Pascal

```
property Hour: Word;
```

C++

```
__property Word Hour;
```

Description

Use Hour to get or set the hour portion of the time value. Valid Hour values are 0 through 23.

Note: Hour represents the hour using Coordinated Universal Time (see page 4338) (UTC). To convert the hour to local time, you must add the value of the HourOffset (see page 7802) property.

See Also

AsTime (see page 7800)

Minute (see page 7802)

Second (see page 7803)

Millisecond (see page 7802)

HourOffset (see page 7802)

89.1.15.3.5 TXSTime.HourOffset Property

Indicates the difference between the Hour (see page 7801) property and the hour in the local time zone.

Pascal

```
property HourOffset: SmallInt;
```

C++

```
__property SmallInt HourOffset;
```

Description

The Hour (see page 7801) property represents the hour of the day using Coordinated Universal Time (see page 4338) (UTC). HourOffset is the correction factor you can add to Hour (see page 7801) to obtain the hour of the day in local time.

See Also

Hour (see page 7801)

89.1.15.3.6 TXSTime.Millisecond Property

Indicates the Millisecond of the second that the object represents.

Pascal

```
property Millisecond: Word;
```

C++

```
__property Word Millisecond;
```

Description

Use Millisecond to get or set the millisecond portion of the time value. Valid Millisecond values are 1 through 59.

Note: You can also use the FractionalSeconds (see page 7801) property to obtain fractional portions of the seconds. Unlike Millisecond, which gives the value in milliseconds, FractionalSeconds (see page 7801) returns a fraction of a second.

See Also

AsTime (see page 7800)

Hour (see page 7801)

Minute (see page 7802)

Second (see page 7803)

UseZeroMilliseconds (see page 7804)

FractionalSeconds (see page 7801)

89.1.15.3.7 TXSTime.Minute Property

Indicates the minute of the hour that the object represents.

Pascal

```
property Minute: Word;
```

C++

```
__property Word Minute;
```

Description

Use Minute to get or set the minute portion of the time value. Valid Minute values are 0 through 59.

Note: Minute represents the minute using Coordinated Universal Time (see page 4338) (UTC). To convert the minutes to local time, you must add the value of the MinuteOffset (see page 7803) property.

See Also

AsTime (see page 7800)

Hour (see page 7801)

Second (see page 7803)

Millisecond (see page 7802)

MinuteOffset (see page 7803)

89.1.15.3.8 TXSTime.MinuteOffset Property

Indicates the difference between the Minute (see page 7802) property and the minute of the hour in local time.

Pascal

```
property MinuteOffset: SmallInt;
```

C++

```
__property SmallInt MinuteOffset;
```

Description

The Minute (see page 7802) property represents the minute of the hour using Coordinated Universal Time (see page 4338) (UTC). MinuteOffset is the correction factor you can add to Minute (see page 7802) to obtain the minute of the hour in local time.

See Also

Minute (see page 7802)

89.1.15.3.9 TXSTime.Second Property

Indicates the second of the minute that the object represents.

Pascal

```
property Second: Word;
```

C++

```
__property Word Second;
```

Description

Use Second to get or set the seconds portion of the time value. Valid Second values are 0 through 59.

See Also

AsTime (see page 7800)

Millisecond (see page 7802)

Hour (see page 7801)

Minute (see page 7802)

Second

89.1.15.3.10 TXSTime.UseZeroMilliseconds Property

Indicates whether the string representation of this object's value includes a portion for fractions of a second when the value of Millisecond (see page 7802) and FractionalSeconds (see page 7801) is zero.

Pascal

```
property UseZeroMilliseconds: Boolean;
```

C++

```
__property Boolean UseZeroMilliseconds;
```

Description

By default, the NativeToXS (see page 7797) method does not include the fractional portion of a second in the string encoding of this object's value when the value represents an exact number of seconds. If you set UseZeroMilliseconds, NativeToXS (see page 7797) changes its encoding to include milliseconds even when the value is zero. This is necessary for some Web Services that do not support the full time schema defined by W3C.

See Also

Millisecond (see page 7802)

NativeToXS (see page 7797)

FractionalSeconds (see page 7801)

89.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DateTimeToXMLTime (see page 7805)	Returns the XML string that represents a TDateTime (see page 3335) value.
	DateTimeToXSDateTime (see page 7805)	Returns a TXSDateTime (see page 7772) object that encodes a TDateTime (see page 3335) value.
	GetDataFromFile (see page 7806)	This is function XSBuiltIns.GetDataFromFile.
	InitXSTypes (see page 7806)	This is function XSBuiltIns.InitXSTypes.
	SoapFloatToStr (see page 7807)	This is function XSBuiltIns.SoapFloatToStr.
	SoapStrToFloat (see page 7807)	This is function XSBuiltIns.SoapStrToFloat.
	XMLTimeToDateTime (see page 7807)	Returns a TDateTime (see page 3335) value to represent an XML datetime value.

89.2.1 XSBuiltIns.DateTimeToXMLTime Function

Returns the XML string that represents a TDateTime (see page 3335) value.

Pascal

```
function DateTimeToXMLTime(Value: TDateTime; ApplyLocalBias: Boolean = True): WideString;
```

C++

```
BSTR DateTimeToXMLTime(TDateTime Value, Boolean ApplyLocalBias = True);
```

File

XSBuiltIns

Description

DateTimeToXMLTime returns the XML representation of a specified TDateTime (see page 3335) value.

Value is the TDateTime (see page 3335) value to convert. If the time zone information is important, this value is assumed to be given in Coordinated Universal Time (see page 4338) (UTC).

CalcLocalBias indicates whether the XML string should include offsets for converting Value to the local time.

See Also

DateTimeToXSDateTime (see page 7805)

XMLTimeToDateTime (see page 7807)

89.2.2 XSBuiltIns.DateTimeToXSDateTime Function

Returns a TXSDateTime (see page 7772) object that encodes a TDateTime (see page 3335) value.

Pascal

```
function DateTimeToXSDateTime(const Value: TDateTime; ApplyLocalBias: Boolean = False):
TXSDateTime;
```

C++

```
TXSDateTime DateTimeToXSDateTime(const TDateTime Value, Boolean ApplyLocalBias = False);
```

File

XSBuiltIns

Description

DateTimeToXSDateTime returns a TXSDateTime (see page 7772) object that corresponds to a specified TDateTime (see page 3335) value. The TXSDateTime (see page 7772) object can be used to represent a date-and-time value on an invokable interface. As a remotable object, it can encoded in SOAP packets.

Value is the TDateTime (see page 3335) value to convert. If the time zone information is important, this value is assumed to be given in Coordinated Universal Time (see page 4338) (UTC).

CalcLocalBias indicates whether the TXSDateTime (see page 7772) object should include offsets for converting Value to the local time zone. If CalcLocalBias is true, DateTimeToXSDateTime looks up the local time zone and uses it to set the HourOffset and MinuteOffset properties of the return value.

See Also

IInvokable

TXSCustomDateTime (see page 7747)

TXSCustomDateTime (see page 7747)

89.2.3 XSBuiltIns.GetDataFromFile Function

Pascal

```
function GetDataFromFile(AFileName: string): string;
```

C++

```
UnicodeString GetDataFromFile(UnicodeString AFileName);
```

File

XSBuiltIns

Description

This is function XSBuiltIns.GetDataFromFile.

89.2.4 XSBuiltIns.InitXSTypes Function

Pascal

```
procedure InitXSTypes;
```

C++

```
InitXSTypes();
```

File

XSBuiltIns

Description

This is function XSBuiltIns.InitXSTypes.

89.2.5 XSBuiltIns.SoapFloatToStr Function

Pascal

```
function SoapFloatToStr(Value: double): string;
```

C++

```
UnicodeString SoapFloatToStr(double Value);
```

File

XSBuiltIns

Description

This is function XSBuiltIns.SoapFloatToStr.

89.2.6 XSBuiltIns.SoapStrToFloat Function

Pascal

```
function SoapStrToFloat(Value: string): double;
```

C++

```
double SoapStrToFloat(UnicodeString Value);
```

File

XSBuiltIns

Description

This is function XSBuiltIns.SoapStrToFloat.

89.2.7 XSBuiltIns.XMLTimeToDateTime Function

Returns a TDateTime (see page 3335) value to represent an XML datetime value.

Pascal

```
function XMLTimeToDateTime(const XMLDateTime: WideString; AsUTCTime: Boolean = False):
TDateTime;
```

C++

```
TDateTime XMLTimeToDateTime(const BSTR XMLDateTime, Boolean AsUTCTime = False);
```

File

XSBuiltIns

Description

XMLTimeToDateTime returns a TDateTime (see page 3335) value for an XML date-and time value. This function is the inverse to the DateTimeToXMLTime (see page 7805) function.

Value is the XML string to convert.

See Also

DateTimeToXSDateTime (see page 7805)

DateTimeToXMLTime (see page 7805)

89.3 Types

The following table lists types in this documentation.

Types

Name	Description
TXSTimeInstant (see page 7809)	This is type XSBuiltIns.TXSTimeInstant.

89.3.1 XSBuiltIns.TXSTimeInstant Type

Pascal

```
TXSTimeInstant = TXSDateTime;
```

C++

```
TXSDateTime TXSTimeInstant;
```

File

XSBuiltIns

Description

This is type XSBuiltIns.TXSTimeInstant.

89.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
IncrementAmount (see page 7810)	This is constant XSBuiltIns.IncrementAmount.
MaxDay (see page 7811)	This is constant XSBuiltIns.MaxDay.
MaxMonth (see page 7811)	This is constant XSBuiltIns.MaxMonth.
MinDay (see page 7811)	This is constant XSBuiltIns.MinDay.
MinMonth (see page 7812)	This is constant XSBuiltIns.MinMonth.
SDecimal (see page 7812)	This is constant XSBuiltIns.SDecimal.
SHexMarker (see page 7812)	This is constant XSBuiltIns.SHexMarker.
SLocalTimeMarker (see page 7813)	This is constant XSBuiltIns.SLocalTimeMarker.
SNAN (see page 7813)	This is constant XSBuiltIns.SNAN.
SNegative (see page 7813)	This is constant XSBuiltIns.SNegative.
SoapDecimalSeparator (see page 7814)	This is constant XSBuiltIns.SoapDecimalSeparator.
SoapTimePrefix (see page 7814)	This is constant XSBuiltIns.SoapTimePrefix.
SPlus (see page 7814)	This is constant XSBuiltIns.SPlus.
SSciNotationMarker (see page 7815)	This is constant XSBuiltIns.SSciNotationMarker.
XMLDateSeparator (see page 7815)	This is constant XSBuiltIns.XMLDateSeparator.
XMLDayPos (see page 7815)	This is constant XSBuiltIns.XMLDayPos.
XMLDefaultYearDigits (see page 7816)	This is constant XSBuiltIns.XMLDefaultYearDigits.
XMLDurationDay (see page 7816)	This is constant XSBuiltIns.XMLDurationDay.
XMLDurationHour (see page 7816)	This is constant XSBuiltIns.XMLDurationHour.
XMLDurationMinute (see page 7817)	This is constant XSBuiltIns.XMLDurationMinute.
XMLDurationMonth (see page 7817)	This is constant XSBuiltIns.XMLDurationMonth.
XMLDurationSecond (see page 7817)	This is constant XSBuiltIns.XMLDurationSecond.
XMLDurationStart (see page 7818)	This is constant XSBuiltIns.XMLDurationStart.
XMLDurationYear (see page 7818)	This is constant XSBuiltIns.XMLDurationYear.
XMLHourOffsetMinusMarker (see page 7818)	This is constant XSBuiltIns.XMLHourOffsetMinusMarker.
XMLHourOffsetPlusMarker (see page 7819)	This is constant XSBuiltIns.XMLHourOffsetPlusMarker.
XMLMilSecPos (see page 7819)	This is constant XSBuiltIns.XMLMilSecPos.
XMLMonthPos (see page 7819)	This is constant XSBuiltIns.XMLMonthPos.
XMLTimeSeparator (see page 7820)	This is constant XSBuiltIns.XMLTimeSeparator.
XMLYearPos (see page 7820)	This is constant XSBuiltIns.XMLYearPos.

89.4.1 XSBuiltIns.IncrementAmount Constant

Pascal

```
IncrementAmount: array[Boolean] of Integer = (1, -1);
```

C++

```
array[Boolean] of Integer IncrementAmount = (1, -1);
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.IncrementAmount.

89.4.2 XSBuiltIns.MaxDay Constant

Pascal

```
MaxDay = 31;
```

C++

```
MaxDay = 31;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.MaxDay.

89.4.3 XSBuiltIns.MaxMonth Constant

Pascal

```
MaxMonth = 12;
```

C++

```
MaxMonth = 12;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.MaxMonth.

89.4.4 XSBuiltIns.MinDay Constant

Pascal

```
MinDay = 1;
```

C++

```
MinDay = 1;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.MinDay.

89.4.5 XSBuiltIns.MinMonth Constant

Pascal

```
MinMonth = 1;
```

C++

```
MinMonth = 1;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.MinMonth.

89.4.6 XSBuiltIns.SDecimal Constant

Pascal

```
SDecimal: Char = '.';
```

C++

```
Char SDecimal = '.';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SDecimal.

89.4.7 XSBuiltIns.SHexMarker Constant

Pascal

```
SHexMarker = '$';
```

C++

```
SHexMarker = '$';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SHexMarker.

89.4.8 XSBuiltIns.SLocalTimeMarker Constant

Pascal

```
SLocalTimeMarker = 'Z';
```

C++

```
SLocalTimeMarker = 'Z';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SLocalTimeMarker.

89.4.9 XSBuiltIns.SNAN Constant

Pascal

```
SNAN = 'NAN';
```

C++

```
SNAN = 'NAN';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SNAN.

89.4.10 XSBuiltIns.SNegative Constant

Pascal

```
SNegative: Char = '-';
```

C++

```
Char SNegative = '-';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SNegative.

89.4.11 XSBuiltIns.SoapDecimalSeparator Constant

Pascal

```
SoapDecimalSeparator = '.';
```

C++

```
SoapDecimalSeparator = '.';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SoapDecimalSeparator.

89.4.12 XSBuiltIns.SoapTimePrefix Constant

Pascal

```
SoapTimePrefix: InvString = 'T';
```

C++

```
InvString SoapTimePrefix = 'T';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SoapTimePrefix.

89.4.13 XSBuiltIns.SPlus Constant

Pascal

```
SPlus: Char = '+';
```

C++

```
Char SPlus = '+';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SPlus.

89.4.14 XSBuiltIns.SSciNotationMarker Constant

Pascal

```
SSciNotationMarker: Char = 'E';
```

C++

```
Char SSciNotationMarker = 'E';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.SSciNotationMarker.

89.4.15 XSBuiltIns.XMLDateSeparator Constant

Pascal

```
XMLDateSeparator = '-';
```

C++

```
XMLDateSeparator = '-';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDateSeparator.

89.4.16 XSBuiltIns.XMLDayPos Constant

Pascal

```
XMLDayPos = 9;
```

C++

```
XMLDayPos = 9;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDayPos.

89.4.17 XSBuiltIns.XMLDefaultYearDigits Constant

Pascal

```
XMLDefaultYearDigits = 4;
```

C++

```
XMLDefaultYearDigits = 4;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDefaultYearDigits.

89.4.18 XSBuiltIns.XMLDurationDay Constant

Pascal

```
XMLDurationDay = 'D';
```

C++

```
XMLDurationDay = 'D';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationDay.

89.4.19 XSBuiltIns.XMLDurationHour Constant

Pascal

```
XMLDurationHour = 'H';
```

C++

```
XMLDurationHour = 'H';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationHour.

89.4.20 XSBuiltIns.XMLDurationMinute Constant

Pascal

```
XMLDurationMinute = 'M';
```

C++

```
XMLDurationMinute = 'M';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationMinute.

89.4.21 XSBuiltIns.XMLDurationMonth Constant

Pascal

```
XMLDurationMonth = 'M';
```

C++

```
XMLDurationMonth = 'M';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationMonth.

89.4.22 XSBuiltIns.XMLDurationSecond Constant

Pascal

```
XMLDurationSecond = 'S';
```

C++

```
XMLDurationSecond = 'S';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationSecond.

89.4.23 XSBuiltIns.XMLDurationStart Constant

Pascal

```
XMLDurationStart = 'P';
```

C++

```
XMLDurationStart = 'P';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationStart.

89.4.24 XSBuiltIns.XMLDurationYear Constant

Pascal

```
XMLDurationYear = 'Y';
```

C++

```
XMLDurationYear = 'Y';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLDurationYear.

89.4.25 XSBuiltIns.XMLHourOffsetMinusMarker Constant

Pascal

```
XMLHourOffsetMinusMarker = '-';
```

C++

```
XMLHourOffsetMinusMarker = '-';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLHourOffsetMinusMarker.

89.4.26 XSBuiltIns.XMLHourOffsetPlusMarker Constant

Pascal

```
XMLHourOffsetPlusMarker = '+';
```

C++

```
XMLHourOffsetPlusMarker = '+';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLHourOffsetPlusMarker.

89.4.27 XSBuiltIns.XMLMilSecPos Constant

Pascal

```
XMLMilSecPos = 10;
```

C++

```
XMLMilSecPos = 10;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLMilSecPos.

89.4.28 XSBuiltIns.XMLMonthPos Constant

Pascal

```
XMLMonthPos = 6;
```

C++

```
XMLMonthPos = 6;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLMonthPos.

89.4.29 XSBuiltIns.XMLTimeSeparator Constant

Pascal

```
XMLTimeSeparator = ':';
```

C++

```
XMLTimeSeparator = ':';
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLTimeSeparator.

89.4.30 XSBuiltIns.XMLYearPos Constant

Pascal

```
XMLYearPos = 1;
```

C++

```
XMLYearPos = 1;
```

File

XSBuiltIns

Description

This is constant XSBuiltIns.XMLYearPos.

90 XSLProd Namespace

This is namespace XSLProd.

Topics

Name	Description
Classes (see page 7822)	The following table lists classes in this documentation.

Classes

	Name	Description
	EXSLPageProducerError (see page 7822)	EXSLPageProducerError is the exception that is raised when TXSLPageProducer (see page 7837) encounters a problem.
	TCustomXSLPageProducer (see page 7822)	TCustomXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.
	TXSLPageProducer (see page 7837)	TXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.

90.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EXSLPageProducerError (see page 7822)	EXSLPageProducerError is the exception that is raised when TXSLPageProducer (see page 7837) encounters a problem.
	TCustomXSLPageProducer (see page 7822)	TCustomXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.
	TXSLPageProducer (see page 7837)	TXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.

90.1.1 EXSLPageProducerError Class

EXSLPageProducerError is the exception that is raised when TXSLPageProducer (see page 7837) encounters a problem.

Class Hierarchy

Pascal

```
EXSLPageProducerError = class(EWebBrokerException);
```

C++

```
class EXSLPageProducerError : public EWebBrokerException;
```

File

XSLProd

Description

TXSLPageProducer (see page 7837) raises an EXSLPageProducerError exception when it tries to produce content and the WebSnap application has not yet specified the source XML document or the XSL template that transforms that source into the final content.

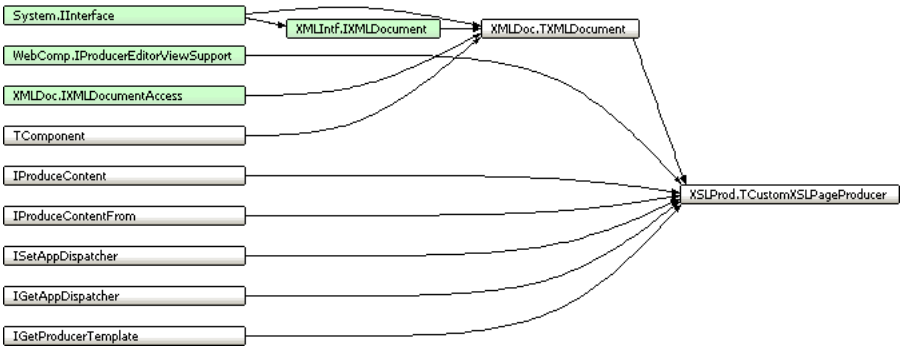
See Also

TXSLPageProducer (see page 7837)

90.1.2 TCustomXSLPageProducer Class

TCustomXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.

Class Hierarchy



Pascal

```
TCustomXSLPageProducer = class(TXMLDocument, IProduceContent, IProduceContentFrom,
ISetAppDispatcher, IGetAppDispatcher, IProducerEditorViewSupport, IGetProducerTemplate);
```

C++

```
class TCustomXSLPageProducer : public TXMLDocument, public IProduceContent, public
IProduceContentFrom, public ISetAppDispatcher, public IGetAppDispatcher, public
IProducerEditorViewSupport, public IGetProducerTemplate;
```

File

XSLProd

Description

TCustomXSLPageProducer is the base class for components that transform the data in an XML document using an XSL template. This class introduces all the properties and methods necessary for specifying the XML document to transform, the XSL template that describes the transformation, and for performing the transformation.

The XMLData (see page 7836) property identifies the XML data that this component transforms. XMLData (see page 7836) must be set to a component that supports either the IXMLDocument (see page 7586) interface (for example, TXMLDocument (see page 7299) or one of its descendants) or the IGetXMLStream (see page 6056) interface (for example, TXMLBroker).

To obtain the results of the transformation, you can use any of the following methods:

The Content (see page 7829) method performs the transformation using the XSL template that is specified by the FileName or XML property. When using the Content (see page 7829) method, you can also read an XSL document by calling the LoadFromFile, LoadFromStream, or LoadFromXML method first.

The ContentFromString (see page 7830) and ContentFromWideString (see page 7830) methods perform the transformation using an XSL template that is supplied as a parameter.

The ContentFromStream (see page 7829) method performs the transformation using an XSL template that it reads from a specified stream.

90.1.2.1 TCustomXSLPageProducer Members

The following tables list the members exposed by TCustomXSLPageProducer.

Protected Methods

	Name	Description
	_AddRef (see page 7306)	Called when an application uses a component interface.

	_Release (see page 7306)	Called when an application releases a component interface.
	AssignParseOptions (see page 7308)	This is AssignParseOptions, a member of class TXMLDocument.
	CheckActive (see page 7308)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 7308)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 7309)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 7311)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 7311)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 7311)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 7312)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 7312)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 7312)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 7313)	Returns the value of the Active property.
	GetAppDispatcher (see page 7831)	This is GetAppDispatcher, a member of class TCustomXSLPageProducer.
	GetAsyncLoadState (see page 7313)	Returns the value of the AsyncLoadState property.
V	GetChildNodeClass (see page 7313)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 7313)	Returns the value of the ChildNodes property.
	GetDocumentElement (see page 7314)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 7315)	Returns the value of the Node property.
	GetDocumentObject (see page 7315)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 7315)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 7315)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 7316)	Returns the value of the Encoding property.
	GetFileName (see page 7316)	Returns the value of the FileName property.
	GetModified (see page 7316)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 7317)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 7317)	Returns the value of the Options property.
	GetParseOptions (see page 7317)	Returns the value of the ParseOptions property.
	GetProducerTemplateFileName (see page 7831)	This is GetProducerTemplateFileName, a member of class TCustomXSLPageProducer.
	GetProducerTemplateStream (see page 7831)	This is GetProducerTemplateStream, a member of class TCustomXSLPageProducer.
	GetPrologNode (see page 7317)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 7318)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 7318)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 7318)	Returns the value of the StandAlone property.
	GetTemplateFileType (see page 7831)	This is GetTemplateFileType, a member of class TCustomXSLPageProducer.
	GetTemplateStream (see page 7832)	This is GetTemplateStream, a member of class TCustomXSLPageProducer.
	GetVersion (see page 7318)	Returns the value of the Version property.
	GetXML (see page 7319)	Returns the value of the XML property.
	GetXMLData (see page 7832)	This is GetXMLData, a member of class TCustomXSLPageProducer.
	GetXMLDocument (see page 7832)	This is GetXMLDocument, a member of class TCustomXSLPageProducer.
	GetXSLData (see page 7832)	This is GetXSLData, a member of class TCustomXSLPageProducer.
	HasHTMLBrowserView (see page 7832)	This is HasHTMLBrowserView, a member of class TCustomXSLPageProducer.
	HasScriptView (see page 7833)	This is HasScriptView, a member of class TCustomXSLPageProducer.
	HasXMLBrowserView (see page 7833)	This is HasXMLBrowserView, a member of class TCustomXSLPageProducer.
	HasXSLBrowserView (see page 7833)	This is HasXSLBrowserView, a member of class TCustomXSLPageProducer.
	InternalSetPrologValue (see page 7319)	This is InternalSetPrologValue, a member of class TXMLDocument.
	LoadData (see page 7320)	This is LoadData, a member of class TXMLDocument.
V	Loaded (see page 7320)	Initializes the component after the form file has been read into memory.
V	Notification (see page 7833)	Forwards notification messages to all owned components.
	ProduceContent (see page 7834)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 7834)	This is ProduceContentFromStream, a member of class TCustomXSLPageProducer.
	ProduceContentFromString (see page 7834)	This is ProduceContentFromString, a member of class TCustomXSLPageProducer.

	ReadDOMVendor (see page 7323)	This is ReadDOMVendor, a member of class TXMLDocument.
	ReleaseDoc (see page 7324)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 7326)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 7327)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 7327)	Sets the value of the Active property.
	SetAppDispatcher (see page 7835)	This is SetAppDispatcher, a member of class TCustomXSLPageProducer.
	SetDocumentElement (see page 7327)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 7328)	Sets the value of the DOMDocument property.
	SetEncoding (see page 7328)	Sets the value of the Encoding property.
	SetFileName (see page 7328)	Sets the value of the FileName property.
	SetModified (see page 7329)	This is SetModified, a member of class TXMLDocument.
	SetNodeIndentStr (see page 7329)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 7329)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 7330)	Sets the value of the Options property.
	SetParseOptions (see page 7330)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 7330)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 7330)	Sets the value of the StandAlone property.
	SetVersion (see page 7331)	Sets the value of the Version property.
	SetXML (see page 7331)	Sets the value of the XML property.
	SetXMLStrings (see page 7331)	This is SetXMLStrings, a member of class TXMLDocument.
	WriteDOMVendor (see page 7332)	This is WriteDOMVendor, a member of class TXMLDocument.
	XMLStringsChanging (see page 7332)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 7335)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 7335)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 7337)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 7337)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 7342)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7307)	This is the overview for the AddChild method overload.
	AddChild (see page 7589)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7307)	Responds after the last constructor has executed.
V	Content (see page 7829)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property.
V	ContentFromStream (see page 7829)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using an XSL template that can be read from a specified stream.
	ContentFromString (see page 7830)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using a specified XSL template.
V	ContentFromWideString (see page 7830)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using a specified XSL template.
	Create (see page 7303)	This is the overview for the Create constructor overload.
	CreateElement (see page 7309)	Creates a new element node that is associated with this document.
	CreateElement (see page 7590)	Creates a new element node that is associated with this document.
	CreateNode (see page 7309)	Creates a new node that is associated with this document.
	CreateNode (see page 7591)	Creates a new node that is associated with this document.
V	Destroy (see page 7304)	Disposes of a TXMLDocument (see page 7299) object.
	GeneratePrefix (see page 7312)	Generates a unique namespace prefix that can be used for a node in the document.
	GeneratePrefix (see page 7592)	Generates a unique namespace prefix that can be used for a node in the document.

	GetActive (see page 7592)	Returns the value of the Active (see page 7607) property.
	GetAsyncLoadState (see page 7593)	Returns the value of the AsyncLoadState (see page 7608) property.
	GetChildNodes (see page 7593)	Returns the value of the ChildNodes (see page 7609) property.
	GetDocBinding (see page 7314)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 7593)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 7594)	Returns the value of the DocumentElement (see page 7609) property.
	GetDocumentNode (see page 7594)	Returns the value of the Node (see page 7611) property.
	GetDocumentObject (see page 7430)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 7594)	Returns the value of the DOMDocument (see page 7609) property.
	GetDOMPersist (see page 7430)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 7595)	Returns the value of the Encoding (see page 7610) property.
	GetFileName (see page 7595)	Returns the value of the FileName (see page 7610) property.
	GetModified (see page 7595)	Returns the value of the Modified (see page 7611) property.
	GetNodeIndentStr (see page 7596)	Returns the value of the NodeIndentStr (see page 7612) property.
	GetOptions (see page 7596)	Returns the value of the Options (see page 7612) property.
	GetParseOptions (see page 7596)	Returns the value of the ParseOptions (see page 7613) property.
	GetSchemaRef (see page 7596)	Returns the value of the SchemaRef (see page 7613) property.
	GetStandAlone (see page 7597)	Returns the value of the StandAlone (see page 7614) property.
	GetVersion (see page 7597)	Returns the value of the Version (see page 7614) property.
	GetXML (see page 7597)	Returns the value of the XML (see page 7614) property.
	IsEmptyDoc (see page 7319)	Indicates whether the TXMLDocument (see page 7299) instance represents an empty document.
	IsEmptyDoc (see page 7598)	Indicates whether the IXMLDocument (see page 7586) instance represents an empty document.
	LoadFromFile (see page 7321)	Loads an XML (see page 7344) document and activates it.
	LoadFromFile (see page 7598)	Loads an XML (see page 7614) document from disk.
	LoadFromStream (see page 7321)	Loads an XML (see page 7344) document from a stream and activates it.
	LoadFromStream (see page 7599)	Loads an XML (see page 7614) document from a stream and activates it.
	LoadFromXML (see page 7322)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 7599)	This is the overview for the LoadFromXML method overload.
	NewInstance (see page 7322)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7323)	Updates the parsed XML (see page 7344) document to reflect external changes.
	Refresh (see page 7600)	Updates the parsed XML (see page 7614) document to reflect external changes.
	RegisterDocBinding (see page 7324)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 7600)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7325)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 7601)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7325)	Saves the XML (see page 7344) document to disk.
	SaveToFile (see page 7601)	Saves the XML (see page 7614) document to disk.
	SaveToStream (see page 7325)	Saves the XML (see page 7344) document to a stream.
	SaveToStream (see page 7602)	Saves the XML (see page 7614) document to a stream.
	SaveToXML (see page 7326)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 7602)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7603)	Sets the value of the Active (see page 7607) property.
	SetDocumentElement (see page 7603)	Sets the value of the DocumentElement (see page 7609) property.
	SetDOMDocument (see page 7604)	Sets the value of the DOMDocument (see page 7609) property.
	SetEncoding (see page 7604)	Sets the value of the Encoding (see page 7610) property.
	SetFileName (see page 7604)	Sets the value of the FileName (see page 7610) property.
	SetNodeIndentStr (see page 7605)	Sets the value of the NodeIndentStr (see page 7612) property.

	SetOnAsyncLoad (see page 7605)	Supplies an event handler that responds when the AsyncLoadState (see page 7608) property changes.
	SetOptions (see page 7605)	Sets the value of the Options (see page 7612) property.
	SetParseOptions (see page 7606)	Sets the value of the ParseOptions (see page 7613) property.
	SetStandAlone (see page 7606)	Sets the value of the StandAlone (see page 7614) property.
	SetVersion (see page 7606)	Sets the value of the Version (see page 7614) property.
	SetXML (see page 7607)	Sets the value of the XML (see page 7614) property.

Public Properties

	Name	Description
	Active (see page 7607)	Specifies whether the XML (see page 7614) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 7334)	Indicates the state of the DOM parser when it parses the XML (see page 7344) document asynchronously.
R	AsyncLoadState (see page 7608)	Indicates the state of the DOM parser when it parses the XML (see page 7614) document asynchronously.
R	ChildNodes (see page 7335)	Lists all of the child nodes of the document.
R	ChildNodes (see page 7609)	Lists all of the child nodes of the document.
R	Dispatcher (see page 7835)	Specifies the interface of a component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
R	DispatcherComponent (see page 7836)	Specifies the component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
	DocumentElement (see page 7335)	Provides access to the root node of the XML (see page 7344) document.
	DocumentElement (see page 7609)	Provides access to the root node of the XML (see page 7614) document.
R	DocumentObject (see page 7430)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 7336)	Provides access to the DOM interface for the parsed XML (see page 7344) document.
	DOMDocument (see page 7609)	Provides access to the DOM interface for the parsed XML (see page 7614) document.
	DOMImplementation (see page 7337)	This is DOMImplementation, a member of class TXMLDocument.
R	DOMPersist (see page 7431)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 7338)	Indicates the character set that the XML (see page 7344) document uses to encode characters.
	Encoding (see page 7610)	Indicates the character set that the XML (see page 7614) document uses to encode characters.
	FileName (see page 7610)	Indicates the XML (see page 7614) document file, if any, that this interface represents.
R	Modified (see page 7339)	Indicates whether the XML (see page 7344) document has been modified.
R	Modified (see page 7611)	Indicates whether the XML (see page 7614) document has been modified.
R	Node (see page 7340)	Provides access to the document node for the XML (see page 7344) document.
R	Node (see page 7611)	Provides access to the document node for the XML (see page 7614) document.
	NodeIndentStr (see page 7612)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7614) text.
	NSPrefixBase (see page 7341)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 7612)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7613)	Specifies implementation-specific options that are followed when parsing the XML (see page 7614) document.
R	SchemaRef (see page 7343)	Returns the name of the schema associated with this XML (see page 7344) document.
R	SchemaRef (see page 7613)	Returns the name of the schema associated with this XML (see page 7614) document.
	StandAlone (see page 7343)	Indicates whether the XML (see page 7344) document includes any external markup declarations.
	StandAlone (see page 7614)	Indicates whether the XML (see page 7614) document includes any external markup declarations.
	Version (see page 7343)	Indicates the XML (see page 7344) version that the document uses.
	Version (see page 7614)	Indicates the XML (see page 7614) version that the document uses.

	XML (see page 7614)	Specifies the content of the XML document associated with this IXMLDocument (see page 7586) interface.
	XMLData (see page 7836)	Specifies the component that supplies the XML data that this component transforms.

Published Events

	Name	Description
	AfterClose (see page 7344)	Occurs after the XML (see page 7344) document is closed.
	AfterNodeChange (see page 7345)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 7345)	Occurs immediately after the XML (see page 7344) document is opened.
	BeforeClose (see page 7346)	Occurs immediately before the XML (see page 7344) document is closed.
	BeforeNodeChange (see page 7346)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 7347)	Occurs immediately before the XML (see page 7344) document is opened.
	OnAsyncLoad (see page 7347)	Occurs at various stages during the asynchronous parsing of an XML (see page 7344) document.

Published Properties

	Name	Description
	Active (see page 7333)	Specifies whether the XML (see page 7344) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 7337)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 7344) document.
	FileName (see page 7339)	Specifies the file name for the XML (see page 7344) document associated with this TXMLDocument (see page 7299) object.
	NodeIndentStr (see page 7340)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7344) text.
	Options (see page 7341)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7342)	Specifies implementation-specific options that are followed when parsing the XML (see page 7344) document.
	XML (see page 7344)	Specifies the content of the XML document associated with this TXMLDocument (see page 7299) object.

90.1.2.2 TCustomXSLPageProducer Methods

The methods of the TCustomXSLPageProducer class are listed here.

Protected Methods

	Name	Description
	GetAppDispatcher (see page 7831)	This is GetAppDispatcher, a member of class TCustomXSLPageProducer.
	GetProducerTemplateFileName (see page 7831)	This is GetProducerTemplateFileName, a member of class TCustomXSLPageProducer.
	GetProducerTemplateStream (see page 7831)	This is GetProducerTemplateStream, a member of class TCustomXSLPageProducer.
	GetTemplateFileType (see page 7831)	This is GetTemplateFileType, a member of class TCustomXSLPageProducer.
	GetTemplateStream (see page 7832)	This is GetTemplateStream, a member of class TCustomXSLPageProducer.
	GetXMLData (see page 7832)	This is GetXMLData, a member of class TCustomXSLPageProducer.
	GetXMLDocument (see page 7832)	This is GetXMLDocument, a member of class TCustomXSLPageProducer.
	GetXSLData (see page 7832)	This is GetXSLData, a member of class TCustomXSLPageProducer.
	HasHTMLBrowserView (see page 7832)	This is HasHTMLBrowserView, a member of class TCustomXSLPageProducer.
	HasScriptView (see page 7833)	This is HasScriptView, a member of class TCustomXSLPageProducer.
	HasXMLBrowserView (see page 7833)	This is HasXMLBrowserView, a member of class TCustomXSLPageProducer.
	HasXSLBrowserView (see page 7833)	This is HasXSLBrowserView, a member of class TCustomXSLPageProducer.
	Notification (see page 7833)	Forwards notification messages to all owned components.
	ProduceContent (see page 7834)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 7834)	This is ProduceContentFromStream, a member of class TCustomXSLPageProducer.

	ProduceContentFromString (see page 7834)	This is ProduceContentFromString, a member of class TCustomXSLPageProducer.
	SetAppDispatcher (see page 7835)	This is SetAppDispatcher, a member of class TCustomXSLPageProducer.

Public Methods

	Name	Description
	Content (see page 7829)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property.
	ContentFromStream (see page 7829)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using an XSL template that can be read from a specified stream.
	ContentFromString (see page 7830)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using a specified XSL template.
	ContentFromWideString (see page 7830)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using a specified XSL template.

90.1.2.2.1 TCustomXSLPageProducer.Content Method

Returns the transformed value of the XML supplied by the XMLData (see page 7836) property.

Pascal

```
function Content: string; virtual;
```

C++

```
virtual __fastcall UnicodeString Content();
```

Description

Call Content to retrieve the content for using in an HTTP response message. Content transforms the XML data that is supplied by the XMLData (see page 7836) property using the XSL template associated with this component. The XSL template can be specified in several ways:

If the FileName property is set, it specifies a file that contains the XSL template.

If FileName is not set, you can assign an XSL template using the XML property.

At runtime, you can supply an XSL template by calling the LoadFromFile, LoadFromStream, or LoadFromXML method first.

See Also

ContentFromStream (see page 7829)

ContentFromString (see page 7830)

ContentFromWideString (see page 7830)

XMLData (see page 7836)

FileName (see page 7339)

XML (see page 7344)

LoadFromFile (see page 7321)

LoadFromStream (see page 7321)

LoadFromXML (see page 7322)

90.1.2.2.2 TCustomXSLPageProducer.ContentFromStream Method

Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using an XSL template that can be read from a specified stream.

Pascal

```
function ContentFromStream(InStream: TStream): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ContentFromStream(TStream InStream);
```

Description

Call Content (see page 7829) to retrieve the content for using in an HTTP response message. Content (see page 7829) transforms the XML data that is supplied by the XMLData (see page 7836) property using the XSL template that is reads from InStream.

See Also

Content (see page 7829)

ContentFromString (see page 7830)

ContentFromWideString (see page 7830)

XMLData (see page 7836)

90.1.2.2.3 TCustomXSLPageProducer.ContentFromString Method

Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using a specified XSL template.

Pascal

```
function ContentFromString(const S: string): string;
```

C++

```
__fastcall UnicodeString ContentFromString(const UnicodeString S);
```

Description

Call Content (see page 7829) to retrieve the content for using in an HTTP response message. Content (see page 7829) transforms the XML data that is supplied by the XMLData (see page 7836) property using the XSL template specified by S.

See Also

Content (see page 7829)

ContentFromStream (see page 7829)

ContentFromWideString (see page 7830)

XMLData (see page 7836)

90.1.2.2.4 TCustomXSLPageProducer.ContentFromWideString Method

Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using a specified XSL template.

Pascal

```
function ContentFromWideString(const S: WideString): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ContentFromWideString(const BSTR S);
```

Description

Call Content (see page 7829) to retrieve the content for using in an HTTP response message. Content (see page 7829) transforms the XML data that is supplied by the XMLData (see page 7836) property using the XSL template specified by S.

See Also

Content (see page 7829)

ContentFromStream (see page 7829)

ContentFromString (see page 7830)

XMLData (see page 7836)

90.1.2.2.5 TCustomXSLPageProducer.GetAppDispatcher Method

Pascal

```
function GetAppDispatcher: TComponent;
```

C++

```
__fastcall TComponent * GetAppDispatcher();
```

Description

This is GetAppDispatcher, a member of class TCustomXSLPageProducer.

90.1.2.2.6 TCustomXSLPageProducer.GetProducerTemplateFileName Method

Pascal

```
function GetProducerTemplateFileName: string;
```

C++

```
__fastcall UnicodeString GetProducerTemplateFileName();
```

Description

This is GetProducerTemplateFileName, a member of class TCustomXSLPageProducer.

90.1.2.2.7 TCustomXSLPageProducer.GetProducerTemplateStream Method

Pascal

```
function GetProducerTemplateStream(out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetProducerTemplateStream(Boolean AOwned);
```

Description

This is GetProducerTemplateStream, a member of class TCustomXSLPageProducer.

90.1.2.2.8 TCustomXSLPageProducer.GetTemplateFileType Method

Pascal

```
function GetTemplateFileType: string;
```

C++

```
__fastcall UnicodeString GetTemplateFileType();
```

Description

This is GetTemplateFileType, a member of class TCustomXSLPageProducer.

90.1.2.2.9 TCustomXSLPageProducer.GetTemplateStream Method

Pascal

```
function GetTemplateStream(out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetTemplateStream(Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TCustomXSLPageProducer.

90.1.2.2.10 TCustomXSLPageProducer.GetXMLData Method

Pascal

```
function GetXMLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLData(Boolean Owned);
```

Description

This is GetXMLData, a member of class TCustomXSLPageProducer.

90.1.2.2.11 TCustomXSLPageProducer.GetXMLDocument Method

Pascal

```
function GetXMLDocument(out AXMLDocument: IXMLDocument): Boolean;
```

C++

```
__fastcall Boolean GetXMLDocument(IXMLDocument AXMLDocument);
```

Description

This is GetXMLDocument, a member of class TCustomXSLPageProducer.

90.1.2.2.12 TCustomXSLPageProducer.GetXSLData Method

Pascal

```
function GetXSLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXSLData(Boolean Owned);
```

Description

This is GetXSLData, a member of class TCustomXSLPageProducer.

90.1.2.2.13 TCustomXSLPageProducer.HasHTMLBrowserView Method

Pascal

```
function HasHTMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasHTMLBrowserView();
```

Description

This is HasHTMLBrowserView, a member of class TCustomXSLPageProducer.

90.1.2.2.14 TCustomXSLPageProducer.HasScriptView Method

Pascal

```
function HasScriptView: Boolean;
```

C++

```
__fastcall Boolean HasScriptView();
```

Description

This is HasScriptView, a member of class TCustomXSLPageProducer.

90.1.2.2.15 TCustomXSLPageProducer.HasXMLBrowserView Method

Pascal

```
function HasXMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXMLBrowserView();
```

Description

This is HasXMLBrowserView, a member of class TCustomXSLPageProducer.

90.1.2.2.16 TCustomXSLPageProducer.HasXSLBrowserView Method

Pascal

```
function HasXSLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXSLBrowserView();
```

Description

This is HasXSLBrowserView, a member of class TCustomXSLPageProducer.

90.1.2.2.17 TCustomXSLPageProducer.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component

has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

FreeNotification

InsertComponent

RemoveComponent

Owner

90.1.2.2.18 TCustomXSLPageProducer.ProduceContent Method

Returns the content that the producer creates.

Pascal

```
function ProduceContent: string;
```

C++

```
__fastcall UnicodeString ProduceContent();
```

Description

Call ProduceContent to retrieve the content for using in an HTTP response message. In most cases, this content is a string of HTML commands defining a Web page, although it can be any valid MIME type.

See Also

Content

90.1.2.2.19 TCustomXSLPageProducer.ProduceContentFromStream Method

Pascal

```
function ProduceContentFromStream(Stream: TStream): string;
```

C++

```
__fastcall UnicodeString ProduceContentFromStream(TStream Stream);
```

Description

This is ProduceContentFromStream, a member of class TCustomXSLPageProducer.

90.1.2.2.20 TCustomXSLPageProducer.ProduceContentFromString Method

Pascal

```
function ProduceContentFromString(const S: string): string;
```

C++

```
__fastcall UnicodeString ProduceContentFromString(const UnicodeString S);
```

Description

This is ProduceContentFromString, a member of class TCustomXSLPageProducer.

90.1.2.2.21 TCustomXSLPageProducer.SetAppDispatcher Method

Pascal

```
procedure SetAppDispatcher(const ADispatcher: TComponent);
```

C++

```
__fastcall SetAppDispatcher(const TComponent * ADispatcher);
```

Description

This is SetAppDispatcher, a member of class TCustomXSLPageProducer.

90.1.2.3 TCustomXSLPageProducer Properties

The properties of the TCustomXSLPageProducer class are listed here.

Public Properties

	Name	Description
	Dispatcher (see page 7835)	Specifies the interface of a component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
	DispatcherComponent (see page 7836)	Specifies the component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
	XMLData (see page 7836)	Specifies the component that supplies the XML data that this component transforms.

90.1.2.3.1 TCustomXSLPageProducer.Dispatcher Property

Specifies the interface of a component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.

Pascal

```
property Dispatcher: IWebDispatcherAccess;
```

C++

```
__property IWebDispatcherAccess Dispatcher;
```

Description

Read (see page 3727) Dispatcher to access the interface of the dispatcher. In Web Broker applications, this is the interface of a TWebDispatcher or TWebModule component. In WebSnap applications, this is the interface of a TWebAppComponents component.

The IWebDispatcherAccess interface has two methods:

Request, which returns the HTTP request message to which this page producer responds.

Response, which returns the HTTP response message for which this page producer generates content.

See Also

TWebModule

TWebDispatcher

TWebAppComponents (see page 6217)

TWebRequest

TWebResponse

DispatcherComponent (see page 7836)

90.1.2.3.2 TCustomXSLPageProducer.DispatcherComponent Property

Specifies the component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.

Pascal

```
property DispatcherComponent: TComponent;
```

C++

```
__property TComponent * DispatcherComponent;
```

Description

Read (see page 3727) DispatcherComponent to access the dispatcher that handles the HTTP request and response messages for this Web Server application. In Web Broker applications, this is the interface of a TWebDispatcherComponent or TWebModule component. In WebSnap applications, this is the interface of a TWebAppComponents component.

Dispatcher (see page 7835) implements the interface that is the value of the Dispatcher (see page 7835) property. The XSL page producer uses this property so that it can respond to notifications when the component is freed. To use the dispatcher, use the Dispatcher (see page 7835) property instead.

TWebDispatcher

TWebAppComponents (see page 6217)

TWebRequest

TWebResponse

Dispatcher (see page 7835)

90.1.2.3.3 TCustomXSLPageProducer.XMLData Property

Specifies the component that supplies the XML data that this component transforms.

Pascal

```
property XMLData: TComponent;
```

C++

```
__property TComponent * XMLData;
```

Description

Use the XMLData property to specify the XML data that this component transforms. XMLData must be set to a component that supports either the IXMLDocument (see page 7586) interface (for example, TXMLDocument (see page 7299) or one of its descendants) or the IGetXMLStream (see page 6056) interface (for example, TXMLBroker).

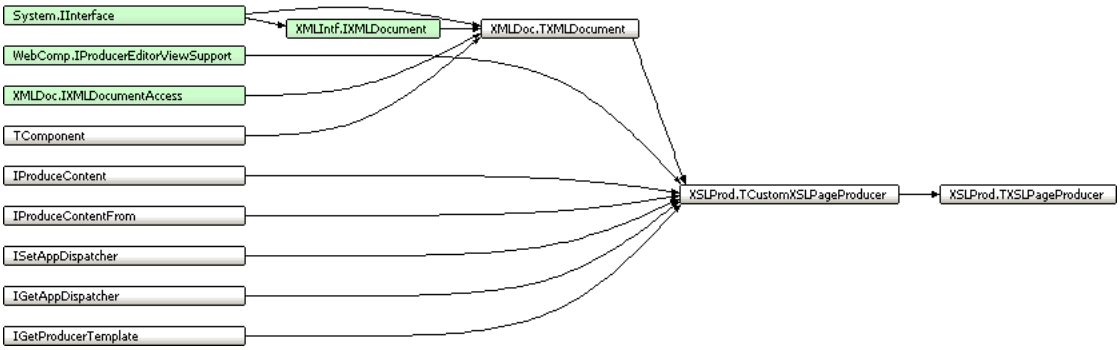
TXMLDocument (see page 7299)

TXMLBroker (see page 7255)

90.1.3 TXSLPageProducer Class

TXSLPageProducer generates web page content by transforming data described with XML (Extensible Markup Language) using an XSL (Extensible Stylesheet Language) template.

Class Hierarchy



Pascal

```
TXSLPageProducer = class(TCustomXSLPageProducer);
```

C++

```
class TXSLPageProducer : public TCustomXSLPageProducer;
```

File

XSLProd

Description

Use the Web Page Module wizard to create a web page that uses TXSLPageProducer. To produce content, TXSLPageProducer uses an XSL template to transform the data in an XML document. Typically, the XSL transforms the XML document into another XML document that is HTML compliant (that is, into a document whose tags are actually HTML tags). However, as specified by the XSL template, TXSLPageProducer can return any arbitrary output as a result of the transformation.

Use the XMLData (see page 7843) property to specify the XML data that this component transforms. XMLData (see page 7843) must be set to a component that supports either the IXMLDocument (see page 7586) interface (for example, TXMLDocument (see page 7299) or one of its descendants) or the IGetXMLStream (see page 6056) interface (for example, TXMLBroker).

To obtain the results of the transformation, you can use any of the following methods:

The Content (see page 7829) method performs the transformation using the XSL template that is specified by the FileName or XML property. When using the Content (see page 7829) method, you can also read an XSL document by calling the LoadFromFile, LoadFromStream, or LoadFromXML method first.

The ContentFromString (see page 7830) and ContentFromWideString (see page 7830) methods perform the transformation using an XSL template that is supplied as a parameter.

The ContentFromStream (see page 7829) method performs the transformation using an XSL template that it reads from a specified stream.

At design time, Web page modules that use the TXMLPageProducer have editor views called XML Tree and XSL Tree. These views provide a read only tree of the XML and XSL respectively.

TXMLDocument (see page 7299)

TXMLBroker (see page 7255)

90.1.3.1 TXSLPageProducer Members

The following tables list the members exposed by TXSLPageProducer.

Protected Methods

	Name	Description
	_AddRef (see page 7306)	Called when an application uses a component interface.
	_Release (see page 7306)	Called when an application releases a component interface.
	AssignParseOptions (see page 7308)	This is AssignParseOptions, a member of class TXMLDocument.
	CheckActive (see page 7308)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 7308)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 7309)	This is CheckDOM, a member of class TXMLDocument.
	DefineProperties (see page 7311)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 7311)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 7311)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 7312)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 7312)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 7312)	This is DoNodeChange, a member of class TXMLDocument.
	GetActive (see page 7313)	Returns the value of the Active property.
	GetAppDispatcher (see page 7831)	This is GetAppDispatcher, a member of class TCustomXSLPageProducer.
	GetAsyncLoadState (see page 7313)	Returns the value of the AsyncLoadState property.
	GetChildNodeClass (see page 7313)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 7313)	Returns the value of the ChildNodes property.
	GetDocumentElement (see page 7314)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 7315)	Returns the value of the Node property.
	GetDocumentObject (see page 7315)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 7315)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 7315)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 7316)	Returns the value of the Encoding property.
	GetFileName (see page 7316)	Returns the value of the FileName property.
	GetModified (see page 7316)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 7317)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 7317)	Returns the value of the Options property.
	GetParseOptions (see page 7317)	Returns the value of the ParseOptions property.
	GetProducerTemplateFileName (see page 7831)	This is GetProducerTemplateFileName, a member of class TCustomXSLPageProducer.
	GetProducerTemplateStream (see page 7831)	This is GetProducerTemplateStream, a member of class TCustomXSLPageProducer.
	GetPrologNode (see page 7317)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 7318)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 7318)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 7318)	Returns the value of the StandAlone property.
	GetTemplateFileType (see page 7831)	This is GetTemplateFileType, a member of class TCustomXSLPageProducer.
	GetTemplateStream (see page 7832)	This is GetTemplateStream, a member of class TCustomXSLPageProducer.
	GetVersion (see page 7318)	Returns the value of the Version property.
	GetXML (see page 7319)	Returns the value of the XML property.
	GetXMLData (see page 7832)	This is GetXMLData, a member of class TCustomXSLPageProducer.
	GetXMLDocument (see page 7832)	This is GetXMLDocument, a member of class TCustomXSLPageProducer.

	GetXSLData (see page 7832)	This is GetXSLData, a member of class TCustomXSLPageProducer.
	HasHTMLBrowserView (see page 7832)	This is HasHTMLBrowserView, a member of class TCustomXSLPageProducer.
	HasScriptView (see page 7833)	This is HasScriptView, a member of class TCustomXSLPageProducer.
	HasXMLBrowserView (see page 7833)	This is HasXMLBrowserView, a member of class TCustomXSLPageProducer.
	HasXSLBrowserView (see page 7833)	This is HasXSLBrowserView, a member of class TCustomXSLPageProducer.
	InternalSetPrologValue (see page 7319)	This is InternalSetPrologValue, a member of class TXMLDocument.
	LoadData (see page 7320)	This is LoadData, a member of class TXMLDocument.
V	Loaded (see page 7320)	Initializes the component after the form file has been read into memory.
V	Notification (see page 7833)	Forwards notification messages to all owned components.
	ProduceContent (see page 7834)	Returns the content that the producer creates.
	ProduceContentFromStream (see page 7834)	This is ProduceContentFromStream, a member of class TCustomXSLPageProducer.
	ProduceContentFromString (see page 7834)	This is ProduceContentFromString, a member of class TCustomXSLPageProducer.
	ReadDOMVendor (see page 7323)	This is ReadDOMVendor, a member of class TXMLDocument.
	ReleaseDoc (see page 7324)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 7326)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 7327)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 7327)	Sets the value of the Active property.
	SetAppDispatcher (see page 7835)	This is SetAppDispatcher, a member of class TCustomXSLPageProducer.
	SetDocumentElement (see page 7327)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 7328)	Sets the value of the DOMDocument property.
	SetEncoding (see page 7328)	Sets the value of the Encoding property.
	SetFileName (see page 7328)	Sets the value of the FileName property.
	SetModified (see page 7329)	This is SetModified, a member of class TXMLDocument.
	SetNodeIndentStr (see page 7329)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 7329)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 7330)	Sets the value of the Options property.
	SetParseOptions (see page 7330)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 7330)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 7330)	Sets the value of the StandAlone property.
	SetVersion (see page 7331)	Sets the value of the Version property.
	SetXML (see page 7331)	Sets the value of the XML property.
	SetXMLStrings (see page 7331)	This is SetXMLStrings, a member of class TXMLDocument.
	WriteDOMVendor (see page 7332)	This is WriteDOMVendor, a member of class TXMLDocument.
	XMLStringsChanging (see page 7332)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 7335)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 7335)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 7337)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 7337)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 7342)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7307)	This is the overview for the AddChild method overload.
	AddChild (see page 7589)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7307)	Responds after the last constructor has executed.
V	Content (see page 7829)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property.

	ContentFromStream (see page 7829)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using an XSL template that can be read from a specified stream.
	ContentFromString (see page 7830)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using a specified XSL template.
	ContentFromWideString (see page 7830)	Returns the transformed value of the XML supplied by the XMLData (see page 7836) property using a specified XSL template.
	Create (see page 7303)	This is the overview for the Create constructor overload.
	CreateElement (see page 7309)	Creates a new element node that is associated with this document.
	CreateElement (see page 7590)	Creates a new element node that is associated with this document.
	CreateNode (see page 7309)	Creates a new node that is associated with this document.
	CreateNode (see page 7591)	Creates a new node that is associated with this document.
	Destroy (see page 7304)	Disposes of a TXMLDocument (see page 7299) object.
	GeneratePrefix (see page 7312)	Generates a unique namespace prefix that can be used for a node in the document.
	GeneratePrefix (see page 7592)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 7592)	Returns the value of the Active (see page 7607) property.
	GetAsyncLoadState (see page 7593)	Returns the value of the AsyncLoadState (see page 7608) property.
	GetChildNodes (see page 7593)	Returns the value of the ChildNodes (see page 7609) property.
	GetDocBinding (see page 7314)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 7593)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 7594)	Returns the value of the DocumentElement (see page 7609) property.
	GetDocumentNode (see page 7594)	Returns the value of the Node (see page 7611) property.
	GetDocumentObject (see page 7430)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 7594)	Returns the value of the DOMDocument (see page 7609) property.
	GetDOMPersist (see page 7430)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 7595)	Returns the value of the Encoding (see page 7610) property.
	GetFileName (see page 7595)	Returns the value of the FileName (see page 7610) property.
	GetModified (see page 7595)	Returns the value of the Modified (see page 7611) property.
	GetNodeIndentStr (see page 7596)	Returns the value of the NodeIndentStr (see page 7612) property.
	GetOptions (see page 7596)	Returns the value of the Options (see page 7612) property.
	GetParseOptions (see page 7596)	Returns the value of the ParseOptions (see page 7613) property.
	GetSchemaRef (see page 7596)	Returns the value of the SchemaRef (see page 7613) property.
	GetStandAlone (see page 7597)	Returns the value of the StandAlone (see page 7614) property.
	GetTemplateFileType (see page 6063)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetVersion (see page 7597)	Returns the value of the Version (see page 7614) property.
	GetXML (see page 7597)	Returns the value of the XML (see page 7614) property.
	GetXMLData (see page 6063)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 6063)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 6063)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 6063)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 6064)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 6064)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IsEmptyDoc (see page 7319)	Indicates whether the TXMLDocument (see page 7299) instance represents an empty document.
	IsEmptyDoc (see page 7598)	Indicates whether the IXMLDocument (see page 7586) instance represents an empty document.
	LoadFromFile (see page 7321)	Loads an XML (see page 7344) document and activates it.
	LoadFromFile (see page 7598)	Loads an XML (see page 7614) document from disk.
	LoadFromStream (see page 7321)	Loads an XML (see page 7344) document from a stream and activates it.
	LoadFromStream (see page 7599)	Loads an XML (see page 7614) document from a stream and activates it.
	LoadFromXML (see page 7322)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 7599)	This is the overview for the LoadFromXML method overload.
	NewInstance (see page 7322)	Allocates memory for an instance of an object type and returns a pointer to that new instance.

	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7323)	Updates the parsed XML (see page 7344) document to reflect external changes.
	Refresh (see page 7600)	Updates the parsed XML (see page 7614) document to reflect external changes.
	RegisterDocBinding (see page 7324)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 7600)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7325)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 7601)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7325)	Saves the XML (see page 7344) document to disk.
	SaveToFile (see page 7601)	Saves the XML (see page 7614) document to disk.
	SaveToStream (see page 7325)	Saves the XML (see page 7344) document to a stream.
	SaveToStream (see page 7602)	Saves the XML (see page 7614) document to a stream.
	SaveToXML (see page 7326)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 7602)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7603)	Sets the value of the Active (see page 7607) property.
	SetDocumentElement (see page 7603)	Sets the value of the DocumentElement (see page 7609) property.
	SetDOMDocument (see page 7604)	Sets the value of the DOMDocument (see page 7609) property.
	SetEncoding (see page 7604)	Sets the value of the Encoding (see page 7610) property.
	SetFileName (see page 7604)	Sets the value of the FileName (see page 7610) property.
	SetNodeIndentStr (see page 7605)	Sets the value of the NodeIndentStr (see page 7612) property.
	SetOnAsyncLoad (see page 7605)	Supplies an event handler that responds when the AsyncLoadState (see page 7608) property changes.
	SetOptions (see page 7605)	Sets the value of the Options (see page 7612) property.
	SetParseOptions (see page 7606)	Sets the value of the ParseOptions (see page 7613) property.
	SetStandAlone (see page 7606)	Sets the value of the StandAlone (see page 7614) property.
	SetVersion (see page 7606)	Sets the value of the Version (see page 7614) property.
	SetXML (see page 7607)	Sets the value of the XML (see page 7614) property.

Public Properties

	Name	Description
	Active (see page 7607)	Specifies whether the XML (see page 7614) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 7334)	Indicates the state of the DOM parser when it parses the XML (see page 7344) document asynchronously.
R	AsyncLoadState (see page 7608)	Indicates the state of the DOM parser when it parses the XML (see page 7614) document asynchronously.
R	ChildNodes (see page 7335)	Lists all of the child nodes of the document.
R	ChildNodes (see page 7609)	Lists all of the child nodes of the document.
R	Dispatcher (see page 7835)	Specifies the interface of a component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
R	DispatcherComponent (see page 7836)	Specifies the component that manages the HTTP request messages to which this page producer responds and that receives the response content that this page producer creates.
	DocumentElement (see page 7335)	Provides access to the root node of the XML (see page 7344) document.
	DocumentElement (see page 7609)	Provides access to the root node of the XML (see page 7614) document.
R	DocumentObject (see page 7430)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 7336)	Provides access to the DOM interface for the parsed XML (see page 7344) document.
	DOMDocument (see page 7609)	Provides access to the DOM interface for the parsed XML (see page 7614) document.
	DOMImplementation (see page 7337)	This is DOMImplementation, a member of class TXMLDocument.
R	DOMPersist (see page 7431)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 7338)	Indicates the character set that the XML (see page 7344) document uses to encode characters.

	Encoding (see page 7610)	Indicates the character set that the XML (see page 7614) document uses to encode characters.
	FileName (see page 7610)	Indicates the XML (see page 7614) document file, if any, that this interface represents.
R	Modified (see page 7339)	Indicates whether the XML (see page 7344) document has been modified.
R	Modified (see page 7611)	Indicates whether the XML (see page 7614) document has been modified.
R	Node (see page 7340)	Provides access to the document node for the XML (see page 7344) document.
R	Node (see page 7611)	Provides access to the document node for the XML (see page 7614) document.
	NodeIndentStr (see page 7612)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7614) text.
	NSPrefixBase (see page 7341)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 7612)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7613)	Specifies implementation-specific options that are followed when parsing the XML (see page 7614) document.
R	SchemaRef (see page 7343)	Returns the name of the schema associated with this XML (see page 7344) document.
R	SchemaRef (see page 7613)	Returns the name of the schema associated with this XML (see page 7614) document.
	StandAlone (see page 7343)	Indicates whether the XML (see page 7344) document includes any external markup declarations.
	StandAlone (see page 7614)	Indicates whether the XML (see page 7614) document includes any external markup declarations.
	Version (see page 7343)	Indicates the XML (see page 7344) version that the document uses.
	Version (see page 7614)	Indicates the XML (see page 7614) version that the document uses.
	XML (see page 7614)	Specifies the content of the XML document associated with this IXMLDocument (see page 7586) interface.

Published Events

	Name	Description
	AfterClose (see page 7344)	Occurs after the XML (see page 7344) document is closed.
	AfterNodeChange (see page 7345)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 7345)	Occurs immediately after the XML (see page 7344) document is opened.
	BeforeClose (see page 7346)	Occurs immediately before the XML (see page 7344) document is closed.
	BeforeNodeChange (see page 7346)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 7347)	Occurs immediately before the XML (see page 7344) document is opened.
	OnAsyncLoad (see page 7347)	Occurs at various stages during the asynchronous parsing of an XML (see page 7344) document.

Published Properties

	Name	Description
	Active (see page 7333)	Specifies whether the XML (see page 7344) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 7337)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 7344) document.
	FileName (see page 7339)	Specifies the file name for the XML (see page 7344) document associated with this TXMLDocument (see page 7299) object.
	NodeIndentStr (see page 7340)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7344) text.
	Options (see page 7341)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7342)	Specifies implementation-specific options that are followed when parsing the XML (see page 7344) document.
	XML (see page 7344)	Specifies the content of the XML document associated with this TXMLDocument (see page 7299) object.
	XMLData (see page 7843)	Specifies the component that supplies the XML data that this component transforms.

90.1.3.2 TXSLPageProducer Properties

The properties of the TXSLPageProducer class are listed here.

Published Properties

	Name	Description
	XMLData (see page 7843)	Specifies the component that supplies the XML data that this component transforms.

90.1.3.2.1 TXSLPageProducer.XMLData Property

Specifies the component that supplies the XML data that this component transforms.

Pascal

```
property XMLData: TComponent;
```

C++

```
__property TComponent * XMLData;
```

Description

Use the XMLData property to specify the XML data that this component transforms. XMLData must be set to a component that supports either the IXMLDocument interface (for example, TXMLDocument or one of its descendants) or the IGetXMLStream interface (for example, TXMLBroker).

See Also

TXMLDocument (see page 7299)

TXMLBroker (see page 7255)

91 ZLib Namespace

This is namespace ZLib.

Topics

Name	Description
Classes (see page 7848)	The following table lists classes in this documentation.
Functions (see page 7859)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 7868)	The following table lists structs, records, enums in this documentation.
Types (see page 7871)	The following table lists types in this documentation.
Constants (see page 7874)	The following table lists constants in this documentation.

Classes

	Name	Description
	EZCompressionError (see page 7848)	This is class ZLib.EZCompressionError.
	EZDecompressionError (see page 7848)	This is class ZLib.EZDecompressionError.
	EZLibError (see page 7849)	This is class ZLib.EZLibError.
	TCustomZStream (see page 7849)	This is class ZLib.TCustomZStream.
	TZCompressionStream (see page 7851)	This is class ZLib.TZCompressionStream.
	TZDecompressionStream (see page 7855)	This is class ZLib.TZDecompressionStream.

Constants

Name	Description
_z_errmsg (see page 7874)	This is constant ZLib._z_errmsg.
SZInvalid (see page 7875)	This is constant ZLib.SZInvalid.
Z_ASCII (see page 7875)	This is constant ZLib.Z_ASCII.
Z_BEST_COMPRESSION (see page 7875)	This is constant ZLib.Z_BEST_COMPRESSION.
Z_BEST_SPEED (see page 7876)	This is constant ZLib.Z_BEST_SPEED.
Z_BINARY (see page 7876)	This is constant ZLib.Z_BINARY.
Z_BUF_ERROR (see page 7876)	This is constant ZLib.Z_BUF_ERROR.
Z_DATA_ERROR (see page 7877)	This is constant ZLib.Z_DATA_ERROR.
Z_DEFAULT_COMPRESSION (see page 7877)	This is constant ZLib.Z_DEFAULT_COMPRESSION.
Z_DEFAULT_STRATEGY (see page 7877)	This is constant ZLib.Z_DEFAULT_STRATEGY.
Z_DEFLATED (see page 7878)	This is constant ZLib.Z_DEFLATED.
Z_ERRNO (see page 7878)	This is constant ZLib.Z_ERRNO.
Z_FILTERED (see page 7878)	This is constant ZLib.Z_FILTERED.
Z_FINISH (see page 7879)	This is constant ZLib.Z_FINISH.

Z_FULL_FLUSH (see page 7879)	This is constant ZLib.Z_FULL_FLUSH.
Z_HUFFMAN_ONLY (see page 7879)	This is constant ZLib.Z_HUFFMAN_ONLY.
Z_MEM_ERROR (see page 7880)	This is constant ZLib.Z_MEM_ERROR.
Z_NEED_DICT (see page 7880)	This is constant ZLib.Z_NEED_DICT.
Z_NO_COMPRESSION (see page 7880)	This is constant ZLib.Z_NO_COMPRESSION.
Z_NO_FLUSH (see page 7881)	This is constant ZLib.Z_NO_FLUSH.
Z_OK (see page 7881)	This is constant ZLib.Z_OK.
Z_PARTIAL_FLUSH (see page 7881)	This is constant ZLib.Z_PARTIAL_FLUSH.
Z_STREAM_END (see page 7882)	This is constant ZLib.Z_STREAM_END.
Z_STREAM_ERROR (see page 7882)	This is constant ZLib.Z_STREAM_ERROR.
Z_SYNC_FLUSH (see page 7882)	This is constant ZLib.Z_SYNC_FLUSH.
Z_UNKNOWN (see page 7883)	This is constant ZLib.Z_UNKNOWN.
Z_VERSION_ERROR (see page 7883)	This is constant ZLib.Z_VERSION_ERROR.
ZLevels (see page 7883)	This is constant ZLib.ZLevels.
ZLIB_VERSION (see page 7884)	This is constant ZLib.ZLIB_VERSION.

Functions

	Name	Description
	adler32 (see page 7859)	This is function ZLib.adler32.
	deflate (see page 7860)	This is function ZLib.deflate.
	deflateEnd (see page 7860)	This is function ZLib.deflateEnd.
	deflateInit_ (see page 7860)	This is function ZLib.deflateInit_.
	DeflateInit2_ (see page 7861)	This is function ZLib.DeflateInit2_.
	inflate (see page 7861)	This is function ZLib.inflate.
	inflateEnd (see page 7861)	This is function ZLib.inflateEnd.
	inflateInit_ (see page 7862)	This is function ZLib.inflateInit_.
	inflateInit2_ (see page 7862)	This is function ZLib.inflateInit2_.
	inflateReset (see page 7862)	This is function ZLib.inflateReset.
	MoveI32 (see page 7863)	This is function ZLib.MoveI32.
	ZCompress (see page 7863)	This is function ZLib.ZCompress.
	ZCompress (see page 7863)	This is function ZLib.ZCompress.
	ZCompressStr (see page 7864)	This is function ZLib.ZCompressStr.
	ZCompressStr (see page 7864)	This is function ZLib.ZCompressStr.
	ZCompressStream (see page 7864)	This is function ZLib.ZCompressStream.
	ZCompressStream (see page 7865)	This is function ZLib.ZCompressStream.
	ZDecompress (see page 7865)	This is function ZLib.ZDecompress.
	ZDecompressStr (see page 7865)	This is function ZLib.ZDecompressStr.
	ZDecompressStream (see page 7866)	This is function ZLib.ZDecompressStream.
	zlibAllocMem (see page 7866)	This is function ZLib.zlibAllocMem.
	zlibFreeMem (see page 7866)	This is function ZLib.zlibFreeMem.
	ZSendToBrowser (see page 7867)	This is function ZLib.ZSendToBrowser.

Structs, Records, Enums

	Name	Description
	TCompressionLevel (see page 7868)	TCompressionLevel indicates the type of compression algorithm to be used when creating a compressed data stream.
	TZCompressionLevel (see page 7869)	This is record ZLib.TZCompressionLevel.
	TZStreamRec (see page 7869)	This is record ZLib.TZStreamRec.

Types

Name	Description
TCompressionStream (see page 7871)	Compresses data as it is written to the stream.
TCustomZLibStream (see page 7872)	This is type ZLib.TCustomZLibStream.
TDecompressionStream (see page 7872)	Decompresses data that was written to a TCompressionStream (see page 7871) object.

TZAlloc (see page 7872)	This is type ZLib.TZAlloc.
TZFree (see page 7873)	This is type ZLib.TZFree.

91.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EZCompressionError (see page 7848)	This is class ZLib.EZCompressionError.
	EZDecompressionError (see page 7848)	This is class ZLib.EZDecompressionError.
	EZLibError (see page 7849)	This is class ZLib.EZLibError.
	TCustomZStream (see page 7849)	This is class ZLib.TCustomZStream.
	TZCompressionStream (see page 7851)	This is class ZLib.TZCompressionStream.
	TZDecompressionStream (see page 7855)	This is class ZLib.TZDecompressionStream.

91.1.1 EZCompressionError Class

Class Hierarchy

Pascal

```
EZCompressionError = class(EZLibError);
```

C++

```
class EZCompressionError : public EZLibError;
```

File

ZLib

Description

This is class ZLib.EZCompressionError.

91.1.2 EZDecompressionError Class

Class Hierarchy

Pascal

```
EZDecompressionError = class(EZLibError);
```

C++

```
class EZDecompressionError : public EZLibError;
```

File

ZLib

Description

This is class ZLib.EZDecompressionError.

91.1.3 EZLibError Class

Class Hierarchy

Pascal

```
EZLibError = class(Exception);
```

C++

```
class EZLibError : public Exception;
```

File

ZLib

Description

This is class ZLib.EZLibError.

91.1.4 TCustomZStream Class

Class Hierarchy

Pascal

```
TCustomZStream = class(TStream);
```

C++

```
class TCustomZStream : public TStream;
```

File

ZLib

Description

This is class ZLib.TCustomZStream.

91.1.4.1 TCustomZStream Members

The following tables list the members exposed by TCustomZStream.

Protected Events

	Name	Description
	OnProgress (see page 7850)	This is OnProgress, a member of class TCustomZStream.

Protected Methods

	Name	Description
	Create (see page 7850)	This is Create, a member of class TCustomZStream.
	DoProgress (see page 7850)	This is DoProgress, a member of class TCustomZStream.

91.1.4.2 TCustomZStream.Create Constructor

Pascal

```
constructor Create(stream: TStream);
```

C++

```
__fastcall TCustomZStream(TStream stream);
```

Description

This is Create, a member of class TCustomZStream.

91.1.4.3 TCustomZStream Methods

The methods of the TCustomZStream class are listed here.

Protected Methods

	Name	Description
	DoProgress (see page 7850)	This is DoProgress, a member of class TCustomZStream.

91.1.4.3.1 TCustomZStream.DoProgress Method

Pascal

```
procedure DoProgress; dynamic;
```

C++

```
__fastcall DoProgress();
```

Description

This is DoProgress, a member of class TCustomZStream.

91.1.4.4 TCustomZStream Events

The events of the TCustomZStream class are listed here.

Protected Events

	Name	Description
	OnProgress (see page 7850)	This is OnProgress, a member of class TCustomZStream.

91.1.4.4.1 TCustomZStream.OnProgress Event

Pascal

```
property OnProgress: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnProgress;
```

Description

This is OnProgress, a member of class TCustomZStream.

91.1.5 TZCompressionStream Class

Class Hierarchy

Pascal

```
TZCompressionStream = class(TCustomZStream);
```

C++

```
class TZCompressionStream : public TCustomZStream;
```

File

ZLib

Description

This is class ZLib.TZCompressionStream.

91.1.5.1 TZCompressionStream Members

The following tables list the members exposed by TZCompressionStream.

Protected Methods

	Name	Description
	DoProgress (see page 7850)	This is DoProgress, a member of class TCustomZStream.

Public Events

	Name	Description
	OnProgress (see page 7855)	This is OnProgress, a member of class TZCompressionStream.

Public Methods

	Name	Description
	Create (see page 7852)	This is the overview for the Create constructor overload.
V	Destroy (see page 7852)	Disposes of an object instance.
V	Read (see page 7853)	Introduces an abstract or pure virtual method responsible for reading from the stream.
V	Seek (see page 7854)	This is Seek, a member of class TZCompressionStream.
V	Write (see page 7854)	Introduces a pure virtual method for writing to the stream.

Public Properties

	Name	Description
R	CompressionRate (see page 7854)	This is CompressionRate, a member of class TZCompressionStream.

91.1.5.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TZCompressionStream.Create (TCompressionLevel, TStream) (see page 7852)	This is Create, a member of class TZCompressionStream.
	TZCompressionStream.Create (TStream, TZCompressionLevel) (see page 7852)	This is Create, a member of class TZCompressionStream.

91.1.5.2.1 TZCompressionStream.Create Constructor (TCompressionLevel, TStream)

Pascal

```
constructor Create(compressionLevel: TCompressionLevel; dest: TStream); overload;
```

C++

```
__fastcall TZCompressionStream(TCompressionLevel compressionLevel, TStream dest);
```

Description

This is Create, a member of class TZCompressionStream.

91.1.5.2.2 TZCompressionStream.Create Constructor (TStream, TZCompressionLevel)

Pascal

```
constructor Create(dest: TStream; compressionLevel: TZCompressionLevel = zcDefault); overload;
```

C++

```
__fastcall TZCompressionStream(TStream dest, TZCompressionLevel compressionLevel = zcDefault);
```

Description

This is Create, a member of class TZCompressionStream.

91.1.5.3 TZCompressionStream.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TZCompressionStream();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil

before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

91.1.5.4 TZCompressionStream Methods

The methods of the TZCompressionStream class are listed here.

Public Methods

	Name	Description
	Read (see page 7853)	Introduces an abstract or pure virtual method responsible for reading from the stream.
	Seek (see page 7854)	This is Seek, a member of class TZCompressionStream.
	Write (see page 7854)	Introduces a pure virtual method for writing to the stream.

91.1.5.4.1 TZCompressionStream.Read Method

Introduces an abstract or pure virtual method responsible for reading from the stream.

Pascal

```
function Read(var buffer; count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( buffer, Longint count);
```

Description

Each descendant stream object defines a Read method that reads data from its particular storage medium (such as memory or a disk file).

Read is used in cases where the number of bytes to read from the stream is not necessarily fixed. It attempts to read up to Count bytes into buffer and returns the number of bytes actually read.

All the other data-reading methods of a stream (ReadBuffer, ReadComponent) call Read to do their actual reading.

See Also

EReadError

ReadBuffer

ReadComponent

91.1.5.4.2 TZCompressionStream.Seek Method

Pascal

```
function Seek(offset: Longint; origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint offset, Word origin);
```

Description

This is Seek, a member of class TZCompressionStream.

91.1.5.4.3 TZCompressionStream.Write Method

Introduces a pure virtual method for writing to the stream.

Pascal

```
function Write(const buffer; count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  buffer, Longint count);
```

Description

Each descendant stream object defines a Write method that writes data to its particular storage medium (such as memory or a disk file). Write attempts to write up to Count bytes from Buffer, and returns the number of bytes actually written.

All the other data-writing methods of a stream (WriteBuffer, WriteComponent) call Write to do their actual writing.

See Also

WriteBuffer

WriteComponent

91.1.5.5 TZCompressionStream Properties

The properties of the TZCompressionStream class are listed here.

Public Properties

	Name	Description
	CompressionRate (see page 7854)	This is CompressionRate, a member of class TZCompressionStream.

91.1.5.5.1 TZCompressionStream.CompressionRate Property

Pascal

```
property CompressionRate: Single;
```

C++

```
__property Single CompressionRate;
```

Description

This is CompressionRate, a member of class TZCompressionStream.

91.1.5.6 TZCompressionStream Events

The events of the TZCompressionStream class are listed here.

Public Events

	Name	Description
	OnProgress (see page 7855)	This is OnProgress, a member of class TZCompressionStream.

91.1.5.6.1 TZCompressionStream.OnProgress Event

Pascal

```
property OnProgress: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnProgress;
```

Description

This is OnProgress, a member of class TZCompressionStream.

91.1.6 TZDecompressionStream Class

Class Hierarchy

Pascal

```
TZDecompressionStream = class(TCustomZStream);
```

C++

```
class TZDecompressionStream : public TCustomZStream;
```

File

ZLib

Description

This is class ZLib.TZDecompressionStream.

91.1.6.1 TZDecompressionStream Members

The following tables list the members exposed by TZDecompressionStream.

Protected Methods

	Name	Description
	DoProgress (see page 7850)	This is DoProgress, a member of class TCustomZStream.

Public Events

	Name	Description
	OnProgress (see page 7858)	This is OnProgress, a member of class TZDecompressionStream.

Public Methods

	Name	Description
	Create (see page 7856)	This is Create, a member of class TZDecompressionStream.
	Destroy (see page 7856)	Disposes of an object instance.
	Read (see page 7857)	Introduces an abstract or pure virtual method responsible for reading from the stream.
	Seek (see page 7857)	This is Seek, a member of class TZDecompressionStream.
	Write (see page 7857)	Introduces a pure virtual method for writing to the stream.

91.1.6.2 TZDecompressionStream.Create Constructor

Pascal

```
constructor Create(source: TStream);
```

C++

```
__fastcall TZDecompressionStream(TStream source);
```

Description

This is Create, a member of class TZDecompressionStream.

91.1.6.3 TZDecompressionStream.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TZDecompressionStream();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

91.1.6.4 TZDecompressionStream Methods

The methods of the TZDecompressionStream class are listed here.

Public Methods

	Name	Description
	Read (see page 7857)	Introduces an abstract or pure virtual method responsible for reading from the stream.
	Seek (see page 7857)	This is Seek, a member of class TZDecompressionStream.
	Write (see page 7857)	Introduces a pure virtual method for writing to the stream.

91.1.6.4.1 TZDecompressionStream.Read Method

Introduces an abstract or pure virtual method responsible for reading from the stream.

Pascal

```
function Read(var buffer; count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Read( buffer, Longint count);
```

Description

Each descendant stream object defines a Read method that reads data from its particular storage medium (such as memory or a disk file).

Read is used in cases where the number of bytes to read from the stream is not necessarily fixed. It attempts to read up to Count bytes into buffer and returns the number of bytes actually read.

All the other data-reading methods of a stream (ReadBuffer, ReadComponent) call Read to do their actual reading.

See Also

EReadError

ReadBuffer

ReadComponent

91.1.6.4.2 TZDecompressionStream.Seek Method

Pascal

```
function Seek(offset: Longint; origin: Word): Longint; override;
```

C++

```
virtual __fastcall Longint Seek(Longint offset, Word origin);
```

Description

This is Seek, a member of class TZDecompressionStream.

91.1.6.4.3 TZDecompressionStream.Write Method

Introduces a pure virtual method for writing to the stream.

Pascal

```
function Write(const buffer; count: Longint): Longint; override;
```

C++

```
virtual __fastcall Longint Write(const  buffer, Longint count);
```

Description

Each descendant stream object defines a Write method that writes data to its particular storage medium (such as memory or a disk file). Write attempts to write up to Count bytes from Buffer, and returns the number of bytes actually written.

All the other data-writing methods of a stream (WriteBuffer, WriteComponent) call Write to do their actual writing.

See Also

WriteBuffer

WriteComponent

91.1.6.5 TZDecompressionStream Events

The events of the TZDecompressionStream class are listed here.

Public Events

	Name	Description
	OnProgress (see page 7858)	This is OnProgress, a member of class TZDecompressionStream.

91.1.6.5.1 TZDecompressionStream.OnProgress Event

Pascal

```
property OnProgress: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnProgress;
```

Description

This is OnProgress, a member of class TZDecompressionStream.

91.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	adler32 (see page 7859)	This is function ZLib.adler32.
	deflate (see page 7860)	This is function ZLib.deflate.
	deflateEnd (see page 7860)	This is function ZLib.deflateEnd.
	deflateInit_ (see page 7860)	This is function ZLib.deflateInit_.
	DeflateInit2_ (see page 7861)	This is function ZLib.DeflateInit2_.
	inflate (see page 7861)	This is function ZLib.inflate.
	inflateEnd (see page 7861)	This is function ZLib.inflateEnd.
	inflateInit_ (see page 7862)	This is function ZLib.inflateInit_.
	inflateInit2_ (see page 7862)	This is function ZLib.inflateInit2_.
	inflateReset (see page 7862)	This is function ZLib.inflateReset.
	MoveI32 (see page 7863)	This is function ZLib.MoveI32.
	ZCompress (see page 7863)	This is function ZLib.ZCompress.
	ZCompress (see page 7863)	This is function ZLib.ZCompress.
	ZCompressStr (see page 7864)	This is function ZLib.ZCompressStr.
	ZCompressStr (see page 7864)	This is function ZLib.ZCompressStr.
	ZCompressStream (see page 7864)	This is function ZLib.ZCompressStream.
	ZCompressStream (see page 7865)	This is function ZLib.ZCompressStream.
	ZDecompress (see page 7865)	This is function ZLib.ZDecompress.
	ZDecompressStr (see page 7865)	This is function ZLib.ZDecompressStr.
	ZDecompressStream (see page 7866)	This is function ZLib.ZDecompressStream.
	zlibAllocMem (see page 7866)	This is function ZLib.zlibAllocMem.
	zlibFreeMem (see page 7866)	This is function ZLib.zlibFreeMem.
	ZSendToBrowser (see page 7867)	This is function ZLib.ZSendToBrowser.

91.2.1 ZLib.adler32 Function

Pascal

```
function adler32(adler: LongInt; const buf: PChar; len: Integer): LongInt;
```

C++

```
LongInt adler32(LongInt adler, const const char * buf, int len);
```

File

ZLib

Description

This is function ZLib.adler32.

91.2.2 ZLib.deflate Function

Pascal

```
function deflate(var strm: TZStreamRec; flush: Integer): Integer;
```

C++

```
int deflate(TZStreamRec strm, int flush);
```

File

ZLib

Description

This is function ZLib.deflate.

91.2.3 ZLib.deflateEnd Function

Pascal

```
function deflateEnd(var strm: TZStreamRec): Integer;
```

C++

```
int deflateEnd(TZStreamRec strm);
```

File

ZLib

Description

This is function ZLib.deflateEnd.

91.2.4 ZLib.deflateInit_ Function

Pascal

```
function deflateInit_(var strm: TZStreamRec; level: Integer; version: PChar; recsize:
Integer): Integer;
```

C++

```
int deflateInit_(TZStreamRec strm, int level, const char * version, int recsize);
```

File

ZLib

Description

This is function ZLib.deflateInit_.

91.2.5 ZLib.DeflateInit2_ Function

Pascal

```
function DeflateInit2_(var strm: TZStreamRec; level: integer; method: integer; windowBits:
integer; memLevel: integer; strategy: integer; version: PChar; recsize: integer): integer;
```

C++

```
int DeflateInit2_(TZStreamRec strm, int level, int method, int windowBits, int memLevel, int
strategy, const char * version, int recsize);
```

File

ZLib

Description

This is function ZLib.DeflateInit2_.

91.2.6 ZLib.inflate Function

Pascal

```
function inflate(var strm: TZStreamRec; flush: Integer): Integer;
```

C++

```
int inflate(TZStreamRec strm, int flush);
```

File

ZLib

Description

This is function ZLib.inflate.

91.2.7 ZLib.inflateEnd Function

Pascal

```
function inflateEnd(var strm: TZStreamRec): Integer;
```

C++

```
int inflateEnd(TZStreamRec strm);
```

File

ZLib

Description

This is function ZLib.inflateEnd.

91.2.8 ZLib.inflateInit_ Function

Pascal

```
function inflateInit_(var strm: TZStreamRec; version: PChar; recsize: Integer): Integer;
```

C++

```
int inflateInit_(TZStreamRec strm, const char * version, int recsize);
```

File

ZLib

Description

This is function ZLib.inflateInit_.

91.2.9 ZLib.inflateInit2_ Function

Pascal

```
function inflateInit2_(var strm: TZStreamRec; windowBits: integer; version: PChar; recsize:
integer): integer;
```

C++

```
int inflateInit2_(TZStreamRec strm, int windowBits, const char * version, int recsize);
```

File

ZLib

Description

This is function ZLib.inflateInit2_.

91.2.10 ZLib.inflateReset Function

Pascal

```
function inflateReset(var strm: TZStreamRec): Integer;
```

C++

```
int inflateReset(TZStreamRec strm);
```

File

ZLib

Description

This is function ZLib.inflateReset.

91.2.11 ZLib.MoveI32 Function

Pascal

```
procedure MoveI32(const Source; var Dest; Count: Integer);
```

C++

```
MoveI32(const  Source,  Dest, int Count);
```

File

ZLib

Description

This is function ZLib.MoveI32.

91.2.12 ZLib.ZCompress Function

Pascal

```
procedure ZCompress(const inBuffer: Pointer; inSize: Integer; out outBuffer: Pointer; out
outSize: Integer; level: TCompressionLevel); overload;
```

C++

```
ZCompress(const void * inBuffer, int inSize, void * outBuffer, int outSize, TCompressionLevel
level);
```

File

ZLib

Description

This is function ZLib.ZCompress.

91.2.13 ZLib.ZCompress Function

Pascal

```
procedure ZCompress(const inBuffer: Pointer; inSize: Integer; out outBuffer: Pointer; out
outSize: Integer; level: TZCompressionLevel = zcDefault); overload;
```

C++

```
ZCompress(const void * inBuffer, int inSize, void * outBuffer, int outSize, TZCompressionLevel
level = zcDefault);
```

File

ZLib

Description

This is function ZLib.ZCompress.

91.2.14 ZLib.ZCompressStr Function

Pascal

```
function ZCompressStr(const s: string; level: TCompressionLevel): TBytes; overload;
```

C++

```
TBytes ZCompressStr(const UnicodeString s, TCompressionLevel level);
```

File

ZLib

Description

This is function ZLib.ZCompressStr.

91.2.15 ZLib.ZCompressStr Function

Pascal

```
function ZCompressStr(const s: string; level: TZCompressionLevel = zcDefault): TBytes;
overload;
```

C++

```
TBytes ZCompressStr(const UnicodeString s, TZCompressionLevel level = zcDefault);
```

File

ZLib

Description

This is function ZLib.ZCompressStr.

91.2.16 ZLib.ZCompressStream Function

Pascal

```
procedure ZCompressStream(inStream: TStream; outStream: TStream; level: TCompressionLevel);
overload;
```

C++

```
ZCompressStream(TStream inStream, TStream outStream, TCompressionLevel level);
```

File

ZLib

Description

This is function ZLib.ZCompressStream.

91.2.17 ZLib.ZCompressStream Function

Pascal

```
procedure ZCompressStream(inStream: TStream; outStream: TStream; level: TZCompressionLevel =
zcDefault); overload;
```

C++

```
ZCompressStream(TStream inStream, TStream outStream, TZCompressionLevel level = zcDefault);
```

File

ZLib

Description

This is function ZLib.ZCompressStream.

91.2.18 ZLib.ZDecompress Function

Pascal

```
procedure ZDecompress(const inBuffer: Pointer; inSize: Integer; out outBuffer: Pointer; out
outSize: Integer; outEstimate: Integer = 0);
```

C++

```
ZDecompress(const void * inBuffer, int inSize, void * outBuffer, int outSize, int outEstimate
= 0);
```

File

ZLib

Description

This is function ZLib.ZDecompress.

91.2.19 ZLib.ZDecompressStr Function

Pascal

```
function ZDecompressStr(const s: TBytes): string;
```

C++

```
UnicodeString ZDecompressStr(const TBytes s);
```

File

ZLib

Description

This is function ZLib.ZDecompressStr.

91.2.20 ZLib.ZDecompressStream Function

Pascal

```
procedure ZDecompressStream(inStream: TStream; outStream: TStream);
```

C++

```
ZDecompressStream(TStream inStream, TStream outStream);
```

File

ZLib

Description

This is function ZLib.ZDecompressStream.

91.2.21 ZLib.zlibAllocMem Function

Pascal

```
function zlibAllocMem(AppData: Pointer; Items: Integer; Size: Integer): Pointer;
```

C++

```
void * zlibAllocMem(void * AppData, int Items, int Size);
```

File

ZLib

Description

This is function ZLib.zlibAllocMem.

91.2.22 ZLib.zlibFreeMem Function

Pascal

```
procedure zlibFreeMem(AppData: Pointer; Block: Pointer);
```

C++

```
zlibFreeMem(void * AppData, void * Block);
```

File

ZLib

Description

This is function ZLib.zlibFreeMem.

91.2.23 ZLib.ZSendToBrowser Function

Pascal

```
procedure ZSendToBrowser(var s: string);
```

C++

```
ZSendToBrowser(UnicodeString s);
```

File

ZLib

Description

This is function ZLib.ZSendToBrowser.

91.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TCompressionLevel (see page 7868)	TCompressionLevel indicates the type of compression algorithm to be used when creating a compressed data stream.
	TZCompressionLevel (see page 7869)	This is record ZLib.TZCompressionLevel.

Records

	Name	Description
	TZStreamRec (see page 7869)	This is record ZLib.TZStreamRec.

91.3.1 ZLib.TCompressionLevel Enumeration

TCompressionLevel indicates the type of compression algorithm to be used when creating a compressed data stream.

Pascal

```
TCompressionLevel = (
  clNone = Integer(zcNone
);
```

C++

```
enum TCompressionLevel {
  clNone = Integer(zcNone
};
```

File

ZLib

Description

The following table lists the possible values:

Value	Meaning
clNone	Specifies no compression; data is merely copied to the output stream.
clFastest	Specifies fastest compression, resulting in a larger archive.
clDefault	Compromise between speed and amount of compression.
clMax	Specifies maximum compression, resulting in a longer time to perform the operation.

See Also

TCustomZlibStream

TDecompressionStream (see page 7872)

TCompressionStream (see page 7871)

91.3.2 ZLib.TZCompressionLevel Enumeration

Pascal

```
TZCompressionLevel = (
  zcNone,
  zcFastest,
  zcDefault,
  zcMax
);
```

C++

```
enum TZCompressionLevel {
  zcNone,
  zcFastest,
  zcDefault,
  zcMax
};
```

File

ZLib

Description

This is record ZLib.TZCompressionLevel.

91.3.3 ZLib.TZStreamRec Record

Pascal

```
TZStreamRec = packed record
  next_in: PAnsiChar;
  avail_in: Longint;
  total_in: Longint;
  next_out: PAnsiChar;
  avail_out: Longint;
  total_out: Longint;
  msg: PAnsiChar;
  state: Pointer;
  zalloc: TZAlloc;
  zfree: TZFree;
  opaque: Pointer;
  data_type: Integer;
  adler: Longint;
  reserved: Longint;
end;
```

C++

```
struct TZStreamRec {
  PAnsiChar next_in;
  Longint avail_in;
  Longint total_in;
  PAnsiChar next_out;
  Longint avail_out;
  Longint total_out;
  PAnsiChar msg;
  void * state;
```

```
    TZAlloc zalloc;
    TZFree zfree;
    void * opaque;
    int data_type;
    Longint adler;
    Longint reserved;
  };
```

File

ZLib

Description

This is record ZLib.TZStreamRec.

91.4 Types

The following table lists types in this documentation.

Types

Name	Description
TCompressionStream (see page 7871)	Compresses data as it is written to the stream.
TCustomZLibStream (see page 7872)	This is type ZLib.TCustomZLibStream.
TDecompressionStream (see page 7872)	Decompresses data that was written to a TCompressionStream (see page 7871) object.
TZAlloc (see page 7872)	This is type ZLib.TZAlloc.
TZFree (see page 7873)	This is type ZLib.TZFree.

91.4.1 ZLib.TCompressionStream Type

Compresses data as it is written to the stream.

Pascal

```
TCompressionStream = TZCompressionStream;
```

C++

```
TZCompressionStream TCompressionStream;
```

File

ZLib

Description

TCompressionStream is a write-only, sequential access stream that compresses data as it is written. The compressed data is written to a separate stream, which is passed to the TCompressionStream constructor. TCompressionStream does not take ownership of the output stream; you are responsible for creating, initializing, and destroying the stream when it is no longer needed.

Reading from a TCompressionStream object will raise an exception of type ECompressionError, with the message string set to "Invalid Stream Operation." Similarly, a Seek (see page 3741) operation causes an ECompressionError exception, however, you can perform a Seek (see page 3741) operation with a zero offset from the current position. This will return the number of raw, uncompressed bytes that have been written to the stream.

You set the compression level to be used when you create the stream object. The possible compression levels are: clNone, clFastest, clDefault, and clMax.

When the stream's output buffer is filled, a Write (see page 3789) operation on TCompressionStream will write the contents of the buffer to the output stream, and then call the OnProgress event. You can use the OnProgress event to update a user interface control such as a progress indicator.

See Also

TCustomZlibStream

TDecompressionStream (see page 7872)

TStream

91.4.2 ZLib.TCustomZLibStream Type

Pascal

```
TCustomZLibStream = TCustomZStream;
```

C++

```
TCustomZStream TCustomZLibStream;
```

File

ZLib

Description

This is type ZLib.TCustomZLibStream.

91.4.3 ZLib.TDecompressionStream Type

Decompresses data that was written to a TCompressionStream (see page 7871) object.

Pascal

```
TDecompressionStream = TZDecompressionStream;
```

C++

```
TZDecompressionStream TDecompressionStream;
```

File

ZLib

Description

TDecompressionStream is the analog of the TCompressionStream (see page 7871) class. It is a read-only, unidirectional stream; you can seek forward in the stream, but not backwards. A separate input stream provides the source data. The input stream will be a stream that was previously written to using a TCompressionStream (see page 7871) object. The input stream is passed to the constructor, however, TDecompressionStream does not take ownership of this object. You are responsible for creating, initializing, and destroying the input stream when it is no longer needed.

Writing to the stream will raise an exception, as will requesting the size of the stream, and attempting to perform a Seek (see page 3741) operation backwards or relative to the current position.

The TDecompressionStream object's OnProgress event is called when a block of data is read from the input stream. You can read the TDecompressionStream object's Position property to determine the number of raw, uncompressed bytes that have been read from the input stream so far.

91.4.4 ZLib.TZAlloc Type

Pascal

```
TZAlloc = function (opaque: Pointer; items, size: Integer): Pointer;
```

C++

```
(opaque: Pointer; items, size: Integer): Pointer ( TZAlloc)();
```

File

ZLib

Description

This is type ZLib.TZAlloc.

91.4.5 ZLib.TZFree Type

Pascal

```
TZFree = procedure (opaque, block: Pointer);
```

C++

```
(opaque, block: Pointer) ( TZFree)();
```

File

ZLib

Description

This is type ZLib.TZFree.

91.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
_z_errmsg (see page 7874)	This is constant ZLib._z_errmsg.
SZInvalid (see page 7875)	This is constant ZLib.SZInvalid.
Z_ASCII (see page 7875)	This is constant ZLib.Z_ASCII.
Z_BEST_COMPRESSION (see page 7875)	This is constant ZLib.Z_BEST_COMPRESSION.
Z_BEST_SPEED (see page 7876)	This is constant ZLib.Z_BEST_SPEED.
Z_BINARY (see page 7876)	This is constant ZLib.Z_BINARY.
Z_BUF_ERROR (see page 7876)	This is constant ZLib.Z_BUF_ERROR.
Z_DATA_ERROR (see page 7877)	This is constant ZLib.Z_DATA_ERROR.
Z_DEFAULT_COMPRESSION (see page 7877)	This is constant ZLib.Z_DEFAULT_COMPRESSION.
Z_DEFAULT_STRATEGY (see page 7877)	This is constant ZLib.Z_DEFAULT_STRATEGY.
Z_DEFLATED (see page 7878)	This is constant ZLib.Z_DEFLATED.
Z_ERRNO (see page 7878)	This is constant ZLib.Z_ERRNO.
Z_FILTERED (see page 7878)	This is constant ZLib.Z_FILTERED.
Z_FINISH (see page 7879)	This is constant ZLib.Z_FINISH.
Z_FULL_FLUSH (see page 7879)	This is constant ZLib.Z_FULL_FLUSH.
Z_HUFFMAN_ONLY (see page 7879)	This is constant ZLib.Z_HUFFMAN_ONLY.
Z_MEM_ERROR (see page 7880)	This is constant ZLib.Z_MEM_ERROR.
Z_NEED_DICT (see page 7880)	This is constant ZLib.Z_NEED_DICT.
Z_NO_COMPRESSION (see page 7880)	This is constant ZLib.Z_NO_COMPRESSION.
Z_NO_FLUSH (see page 7881)	This is constant ZLib.Z_NO_FLUSH.
Z_OK (see page 7881)	This is constant ZLib.Z_OK.
Z_PARTIAL_FLUSH (see page 7881)	This is constant ZLib.Z_PARTIAL_FLUSH.
Z_STREAM_END (see page 7882)	This is constant ZLib.Z_STREAM_END.
Z_STREAM_ERROR (see page 7882)	This is constant ZLib.Z_STREAM_ERROR.
Z_SYNC_FLUSH (see page 7882)	This is constant ZLib.Z_SYNC_FLUSH.
Z_UNKNOWN (see page 7883)	This is constant ZLib.Z_UNKNOWN.
Z_VERSION_ERROR (see page 7883)	This is constant ZLib.Z_VERSION_ERROR.
ZLevels (see page 7883)	This is constant ZLib.ZLevels.
ZLIB_VERSION (see page 7884)	This is constant ZLib.ZLIB_VERSION.

91.5.1 ZLib._z_errmsg Constant

Pascal

```
_z_errmsg: array[0..9] of PChar = ( 'need dictionary', 'stream end', '', 'file error', 'stream
error', 'data error', 'insufficient memory', 'buffer error', 'incompatible version', '' );
```

C++

```
array[0..9] of PChar _z_errmsg = ( 'need dictionary', 'stream end', '', 'file error', 'stream
error', 'data error', 'insufficient memory', 'buffer error', 'incompatible version', '' );
```

File

ZLib

Description

This is constant ZLib._z_errmsg.

91.5.2 ZLib.SZInvalid Constant

Pascal

```
SZInvalid = 'Invalid ZStream operation!';
```

C++

```
SZInvalid = 'Invalid ZStream operation!';
```

File

ZLib

Description

This is constant ZLib.SZInvalid.

91.5.3 ZLib.Z_ASCII Constant

Pascal

```
Z_ASCII = 1;
```

C++

```
Z_ASCII = 1;
```

File

ZLib

Description

This is constant ZLib.Z_ASCII.

91.5.4 ZLib.Z_BEST_COMPRESSION Constant

Pascal

```
Z_BEST_COMPRESSION = 9;
```

C++

```
Z_BEST_COMPRESSION = 9;
```

File

ZLib

Description

This is constant ZLib.Z_BEST_COMPRESSION.

91.5.5 ZLib.Z_BEST_SPEED Constant

Pascal

```
Z_BEST_SPEED = 1;
```

C++

```
Z_BEST_SPEED = 1;
```

File

ZLib

Description

This is constant ZLib.Z_BEST_SPEED.

91.5.6 ZLib.Z_BINARY Constant

Pascal

```
Z_BINARY = 0;
```

C++

```
Z_BINARY = 0;
```

File

ZLib

Description

This is constant ZLib.Z_BINARY.

91.5.7 ZLib.Z_BUF_ERROR Constant

Pascal

```
Z_BUF_ERROR = (-5);
```

C++

```
Z_BUF_ERROR = (-5);
```

File

ZLib

Description

This is constant ZLib.Z_BUF_ERROR.

91.5.8 ZLib.Z_DATA_ERROR Constant

Pascal

```
Z_DATA_ERROR = (-3);
```

C++

```
Z_DATA_ERROR = (-3);
```

File

ZLib

Description

This is constant ZLib.Z_DATA_ERROR.

91.5.9 ZLib.Z_DEFAULT_COMPRESSION Constant

Pascal

```
Z_DEFAULT_COMPRESSION = (-1);
```

C++

```
Z_DEFAULT_COMPRESSION = (-1);
```

File

ZLib

Description

This is constant ZLib.Z_DEFAULT_COMPRESSION.

91.5.10 ZLib.Z_DEFAULT_STRATEGY Constant

Pascal

```
Z_DEFAULT_STRATEGY = 0;
```

C++

```
Z_DEFAULT_STRATEGY = 0;
```

File

ZLib

Description

This is constant ZLib.Z_DEFAULT_STRATEGY.

91.5.11 ZLib.Z_DEFLATED Constant

Pascal

```
Z_DEFLATED = 8;
```

C++

```
Z_DEFLATED = 8;
```

File

ZLib

Description

This is constant ZLib.Z_DEFLATED.

91.5.12 ZLib.Z_ERRNO Constant

Pascal

```
Z_ERRNO = (-1);
```

C++

```
Z_ERRNO = (-1);
```

File

ZLib

Description

This is constant ZLib.Z_ERRNO.

91.5.13 ZLib.Z_FILTERED Constant

Pascal

```
Z_FILTERED = 1;
```

C++

```
Z_FILTERED = 1;
```

File

ZLib

Description

This is constant ZLib.Z_FILTERED.

91.5.14 ZLib.Z_FINISH Constant

Pascal

```
Z_FINISH = 4;
```

C++

```
Z_FINISH = 4;
```

File

ZLib

Description

This is constant ZLib.Z_FINISH.

91.5.15 ZLib.Z_FULL_FLUSH Constant

Pascal

```
Z_FULL_FLUSH = 3;
```

C++

```
Z_FULL_FLUSH = 3;
```

File

ZLib

Description

This is constant ZLib.Z_FULL_FLUSH.

91.5.16 ZLib.Z_HUFFMAN_ONLY Constant

Pascal

```
Z_HUFFMAN_ONLY = 2;
```

C++

```
Z_HUFFMAN_ONLY = 2;
```

File

ZLib

Description

This is constant ZLib.Z_HUFFMAN_ONLY.

91.5.17 ZLib.Z_MEM_ERROR Constant

Pascal

```
Z_MEM_ERROR = (-4);
```

C++

```
Z_MEM_ERROR = (-4);
```

File

ZLib

Description

This is constant ZLib.Z_MEM_ERROR.

91.5.18 ZLib.Z_NEED_DICT Constant

Pascal

```
Z_NEED_DICT = 2;
```

C++

```
Z_NEED_DICT = 2;
```

File

ZLib

Description

This is constant ZLib.Z_NEED_DICT.

91.5.19 ZLib.Z_NO_COMPRESSION Constant

Pascal

```
Z_NO_COMPRESSION = 0;
```

C++

```
Z_NO_COMPRESSION = 0;
```

File

ZLib

Description

This is constant ZLib.Z_NO_COMPRESSION.

91.5.20 ZLib.Z_NO_FLUSH Constant

Pascal

```
Z_NO_FLUSH = 0;
```

C++

```
Z_NO_FLUSH = 0;
```

File

ZLib

Description

This is constant ZLib.Z_NO_FLUSH.

91.5.21 ZLib.Z_OK Constant

Pascal

```
Z_OK = 0;
```

C++

```
Z_OK = 0;
```

File

ZLib

Description

This is constant ZLib.Z_OK.

91.5.22 ZLib.Z_PARTIAL_FLUSH Constant

Pascal

```
Z_PARTIAL_FLUSH = 1;
```

C++

```
Z_PARTIAL_FLUSH = 1;
```

File

ZLib

Description

This is constant ZLib.Z_PARTIAL_FLUSH.

91.5.23 ZLib.Z_STREAM_END Constant

Pascal

```
Z_STREAM_END = 1;
```

C++

```
Z_STREAM_END = 1;
```

File

ZLib

Description

This is constant ZLib.Z_STREAM_END.

91.5.24 ZLib.Z_STREAM_ERROR Constant

Pascal

```
Z_STREAM_ERROR = (-2);
```

C++

```
Z_STREAM_ERROR = (-2);
```

File

ZLib

Description

This is constant ZLib.Z_STREAM_ERROR.

91.5.25 ZLib.Z_SYNC_FLUSH Constant

Pascal

```
Z_SYNC_FLUSH = 2;
```

C++

```
Z_SYNC_FLUSH = 2;
```

File

ZLib

Description

This is constant ZLib.Z_SYNC_FLUSH.

91.5.26 ZLib.Z_UNKNOWN Constant

Pascal

```
Z_UNKNOWN = 2;
```

C++

```
Z_UNKNOWN = 2;
```

File

ZLib

Description

This is constant ZLib.Z_UNKNOWN.

91.5.27 ZLib.Z_VERSION_ERROR Constant

Pascal

```
Z_VERSION_ERROR = (-6);
```

C++

```
Z_VERSION_ERROR = (-6);
```

File

ZLib

Description

This is constant ZLib.Z_VERSION_ERROR.

91.5.28 ZLib.ZLevels Constant

Pascal

```
ZLevels: array[TZCompressionLevel] of Shortint = ( Z_NO_COMPRESSION, Z_BEST_SPEED,
Z_DEFAULT_COMPRESSION, Z_BEST_COMPRESSION );
```

C++

```
array[TZCompressionLevel] of Shortint ZLevels = ( Z_NO_COMPRESSION, Z_BEST_SPEED,
Z_DEFAULT_COMPRESSION, Z_BEST_COMPRESSION );
```

File

ZLib

Description

This is constant ZLib.ZLevels.

91.5.29 ZLib.ZLIB_VERSION Constant

Pascal

```
ZLIB_VERSION = '1.2.3';
```

C++

```
ZLIB_VERSION = '1.2.3';
```

File

ZLib

Description

This is constant ZLib.ZLIB_VERSION.

92 ZLibConst Namespace

This is namespace ZLibConst.

Topics

Name	Description
Constants (see page 7886)	The following table lists constants in this documentation.

Constants

Name	Description
sError (see page 7886)	This is constant ZLibConst.sError.
sInvalidStreamOp (see page 7886)	This is constant ZLibConst.sInvalidStreamOp.
sTargetBufferTooSmall (see page 7886)	This is constant ZLibConst.sTargetBufferTooSmall.

92.1 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sError (see page 7886)	This is constant ZLibConst.sError.
sInvalidStreamOp (see page 7886)	This is constant ZLibConst.sInvalidStreamOp.
sTargetBufferTooSmall (see page 7886)	This is constant ZLibConst.sTargetBufferTooSmall.

92.1.1 ZLibConst.sError Constant

Pascal

```
sError = 'Error';
```

C++

```
sError = 'Error';
```

File

ZLibConst

Description

This is constant ZLibConst.sError.

92.1.2 ZLibConst.sInvalidStreamOp Constant

Pascal

```
sInvalidStreamOp = 'Invalid stream operation';
```

C++

```
sInvalidStreamOp = 'Invalid stream operation';
```

File

ZLibConst

Description

This is constant ZLibConst.sInvalidStreamOp.

92.1.3 ZLibConst.sTargetBufferTooSmall Constant

Pascal

```
sTargetBufferTooSmall = 'ZLib error: target buffer may be too small';
```

C++

```
sTargetBufferTooSmall = 'ZLib error: target buffer may be too small';
```

File

ZLibConst

Description

This is constant ZLibConst.sTargetBufferTooSmall.

System.ExceptAddr 3663
System.ExceptAddr function 3663
System.ExceptClsProc 3888
System.ExceptClsProc variable 3888
System.ExceptionAcquired 3889
System.ExceptionAcquired variable 3889
System.ExceptionClass 3889
System.ExceptionClass variable 3889
System.ExceptObject 3664
System.ExceptObject function 3664
System.ExceptObjProc 3889
System.ExceptObjProc variable 3889
System.ExceptProc 3890
System.ExceptProc variable 3890
System.Exclude 3664
System.Exclude function 3664
System.Exit 3665
System.Exit function 3665
System.ExitCode 3891
System.ExitCode variable 3891
System.ExitProc 3891
System.ExitProc variable 3891
System.ExitProcessProc 3892
System.ExitProcessProc variable 3892
System.Exp 3667
System.Exp function 3667
System.FileMode 3892
System.FileMode variable 3892
System.FilePos 3668
System.FilePos function 3668
System.FileSize 3669
System.FileSize function 3669
System.FillChar 3670
System.FillChar function 3670
System.Finalize 3672
System.Finalize function 3672
System.FindClassHInstance 3672
System.FindClassHInstance function 3672
System.FindHInstance 3673
System.FindHInstance function 3673
System.FindResourceHInstance 3674
System.FindResourceHInstance function 3674
System.Flush 3674
System.Flush function 3674
System.fmClosed 3913
System.fmClosed constant 3913
System.fmInOut 3914
System.fmInOut constant 3914
System.fmInput 3914
System.fmInput constant 3914
System.fmOutput 3914
System.fmOutput constant 3914
System.FPower10 3675
System.FPower10 function 3675
System.Frac 3675
System.Frac function 3675
System.FreeMem 3676
System.FreeMem function 3676
System.FreeMemory 3678
System.FreeMemory function 3678
System.Get8087CW 3679
System.Get8087CW function 3679
System.GetCurrent 3679
System.GetCurrent function 3679
System.GetDir 3679
System.GetDir function 3679
System.GetEnumerator 3681
System.GetEnumerator function 3681
System.GetHeapStatus 3681

System.GetHeapStatus function 3681
System.GetLastError 3681
System.GetLastError function 3681
System.GetMem 3683
System.GetMem function 3683
System.GetMemory 3684
System.GetMemory function 3684
System.GetMemoryManager 3686
System.GetMemoryManager function 3686
System.GetMemoryManagerState 3690
System.GetMemoryManagerState function 3690
System.GetMemoryMap 3691
System.GetMemoryMap function 3691
System.GetMinimumBlockAlignment 3691
System.GetMinimumBlockAlignment function 3691
System.GetModuleFileName 3692
System.GetModuleFileName function 3692
System.GetPackageInfoTable 3825
System.GetPackageInfoTable type 3825
System.GetVariantManager 3692
System.GetVariantManager function 3692
System.Halt 3693
System.Halt function 3693
System.HeapAllocFlags 3893
System.HeapAllocFlags variable 3893
System.hfFieldSize 3915
System.hfFieldSize constant 3915
System.hfMonitorOffset 3915
System.hfMonitorOffset constant 3915
System.HGLOBAL 3825
System.HGLOBAL type 3825
System.Hi 3694
System.Hi function 3694
System.High 3694
System.High function 3694
System.HINST 3826
System.HINST type 3826
System.HMODULE 3826
System.HMODULE type 3826
System.HPrevInst 3894
System.HPrevInst variable 3894
System.HRESULT 3826
System.HRESULT type 3826
System.HRSRC 3827
System.HRSRC type 3827
System.IComparable 3497
System.IComparable.CompareTo 3498
System.IDispatch 3498
System.IDispatch.GetIDsOfNames 3499
System.IDispatch.GetTypeInfo 3499
System.IDispatch.GetTypeInfoCount 3499
System.IDispatch.Invoke 3499
System.IEnumerable 3500
System.IEnumerable.GetEnumerator 3500
System.IEnumerator 3501
System.IEnumerator.Current 3502
System.IEnumerator.GetCurrent 3501

System.IInterface._AddRef 3504
System.IInterface._Release 3504
System.IInterface.QueryInterface 3505
System.IInvokable 3505
System.Inc 3696
System.Inc function 3696
System.Include 3697
System.Include function 3697
System.INFINITE 3915
System.INFINITE constant 3915
System.Initialize 3698
System.Initialize function 3698
System.InitProc 3894
System.InitProc variable 3894
System.Input 3895
System.Input variable 3895
System.Insert 3698
System.Insert function 3698

System.Int 3699
System.Int function 3699
System.Int16 3827
System.Int16 type 3827
System.Int32 3827
System.Int32 type 3827
System.Int8 3828
System.Int8 type 3828
System.IntegerArray 3828
System.IntegerArray type 3828
System.IOResult 3700
System.IOResult function 3700
System.IsConsole 3896
System.IsConsole variable 3896
System.IsLibrary 3896
System.IsLibrary variable 3896
System.IsMemoryManagerSet 3701
System.IsMemoryManagerSet function 3701
System.IsMultiThread 3897
System.IsMultiThread variable 3897
System.IsVariantManagerSet 3701
System.IsVariantManagerSet function 3701
System.IUnknown 3828
System.IUnknown type 3828
System.JITEnable 3897
System.JITEnable variable 3897
System.Length 3702
System.Length function 3702
System.LibModuleList 3898
System.LibModuleList variable 3898
System.Ln 3703
System.Ln function 3703
System.Lo 3704
System.Lo function 3704
System.LoadResourceModule 3705
System.LoadResourceModule function 3705
System.LoadResString 3705
System.LoadResString function 3705
System.Low 3706
System.Low function 3706
System.MainInstance 3898
System.MainInstance variable 3898
System.MainThreadID 3899
System.MainThreadID variable 3899
System.Mark 3707
System.Mark function 3707
System.MaxInt 3916
System.MaxInt constant 3916
System.MaxLongint 3916
System.MaxLongint constant 3916
System.MemoryBarrier 3707
System.MemoryBarrier function 3707
System.MkDir 3708
System.MkDir function 3708
System.ModuleUnloadList 3899
System.ModuleUnloadList variable 3899
System.MonitorEnter 3709
System.MonitorEnter function 3709
System.MonitorExit 3709
System.MonitorExit function 3709
System.MonitorPulse 3710
System.MonitorPulse function 3710
System.MonitorPulseAll 3710
System.MonitorPulseAll function 3710
System.MonitorSupport 3900
System.MonitorSupport variable 3900
System.MonitorTryEnter 3710
System.MonitorTryEnter function 3710
System.MonitorWait 3711
System.MonitorWait function 3711
System.Move 3711
System.Move function 3711
System.MoveChars 3712
System.MoveChars function 3712
System.NeverSleepOnMMThreadContention 3900
System.NeverSleepOnMMThreadContention variable 3900
System.New 3712
System.New function 3712

System.NoErrMsg 3901
System.NoErrMsg variable 3901
System.NumSmallBlockTypes 3916
System.NumSmallBlockTypes constant 3916
System.Odd 3714
System.Odd function 3714
System.OleStrToString 3715
System.OleStrToString function 3715
System.OleStrToStrVar 3715
System.OleStrToStrVar function 3715
System.opAdd 3917
System.opAdd constant 3917
System.opAnd 3917
System.opAnd constant 3917
System.opCmpEQ 3918
System.opCmpEQ constant 3918
System.opCmpGE 3918
System.opCmpGE constant 3918
System.opCmpGT 3919
System.opCmpGT constant 3919
System.opCmpLE 3919
System.opCmpLE constant 3919
System.opCmpLT 3920
System.opCmpLT constant 3920
System.opCmpNE 3920
System.opCmpNE constant 3920
System.opCompare 3921
System.opCompare constant 3921
System.opDivide 3921
System.opDivide constant 3921
System.opIntDivide 3922
System.opIntDivide constant 3922
System.opModulus 3922
System.opModulus constant 3922
System.opMultiply 3923
System.opMultiply constant 3923
System.opNegate 3923
System.opNegate constant 3923
System.opNot 3924
System.opNot constant 3924
System.opOr 3924
System.opOr constant 3924
System.opShiftLeft 3925
System.opShiftLeft constant 3925
System.opShiftRight 3925
System.opShiftRight constant 3925
System.opSubtract 3926
System.opSubtract constant 3926
System.opXor 3926
System.opXor constant 3926
System.Ord 3716
System.Ord function 3716
System.Output 3901
System.Output variable 3901
System.PackageInfo 3829
System.PackageInfo type 3829
System.PackageInfoTable 3795
System.PackageInfoTable record 3795
System.PackageUnitEntry 3795
System.PackageUnitEntry record 3795
System.PAnsiString 3829
System.PAnsiString type 3829
System.ParamCount 3716
System.ParamCount function 3716
System.ParamStr 3718
System.ParamStr function 3718
System.PBoolean 3829
System.PBoolean type 3829
System.PByte 3830
System.PByte type 3830
System.PCardinal 3831
System.PCardinal type 3831
System.PComp 3831
System.PComp type 3831
System.PCurrency 3831
System.PCurrency type 3831
System.PCVModInfo 3832
System.PCVModInfo type 3832

System.PDate 3832
System.PDate type 3832
System.PDateTime 3833
System.PDateTime type 3833

SysUtils.ExceptionErrorMessage 4171
SysUtils.ExceptionErrorMessage function 4171
SysUtils.ExcludeTrailingBackslash 4172
SysUtils.ExcludeTrailingBackslash function 4172
SysUtils.ExcludeTrailingPathDelimiter 4173

SysUtils.ExcludeTrailingPathDelimiter function 4173
SysUtils.ExpandFileName 4173
SysUtils.ExpandFileName function 4173
SysUtils.ExpandFileNameCase 4174
SysUtils.ExpandFileNameCase function 4174
SysUtils.ExpandUNCFileName 4175
SysUtils.ExpandUNCFileName function 4175
SysUtils.ExtractFileDir 4176
SysUtils.ExtractFileDir function 4176
SysUtils.ExtractFileDrive 4176
SysUtils.ExtractFileDrive function 4176
SysUtils.ExtractFileExt 4177
SysUtils.ExtractFileExt function 4177
SysUtils.ExtractFileName 4177
SysUtils.ExtractFileName function 4177
SysUtils.ExtractFilePath 4179
SysUtils.ExtractFilePath function 4179
SysUtils.ExtractRelativePath 4181
SysUtils.ExtractRelativePath function 4181
SysUtils.ExtractShortPathName 4182
SysUtils.ExtractShortPathName function 4182
SysUtils.EZeroDivide 4032
SysUtils.faAnyFile 4411
SysUtils.faAnyFile constant 4411
SysUtils.faArchive 4412
SysUtils.faArchive constant 4412
SysUtils.faDirectory 4412
SysUtils.faDirectory constant 4412
SysUtils.faHidden 4413
SysUtils.faHidden constant 4413
SysUtils.FalseBoolStrs 4392
SysUtils.FalseBoolStrs variable 4392
SysUtils.faNormal 4414
SysUtils.faNormal constant 4414
SysUtils.faReadOnly 4414
SysUtils.faReadOnly constant 4414
SysUtils.faSymLink 4415
SysUtils.faSymLink constant 4415
SysUtils.faSysFile 4415
SysUtils.faSysFile constant 4415
SysUtils.faTemporary 4416
SysUtils.faTemporary constant 4416
SysUtils.faVolumeID 4416
SysUtils.faVolumeID constant 4416
SysUtils.FileAge 4183
SysUtils.FileAge function 4183
SysUtils.FileClose 4185
SysUtils.FileClose function 4185
SysUtils.FileCreate 4188
SysUtils.FileCreate function 4188
SysUtils.FileDateToDateTime 4191
SysUtils.FileDateToDateTime function 4191
SysUtils.FileExists 4193
SysUtils.FileExists function 4193
SysUtils.FileGetAttr 4197
SysUtils.FileGetAttr function 4197
SysUtils.FileGetDate 4199
SysUtils.FileGetDate function 4199
SysUtils.FileIsReadOnly 4200
SysUtils.FileIsReadOnly function 4200
SysUtils.FileOpen 4200
SysUtils.FileOpen function 4200
SysUtils.FileRead 4204
SysUtils.FileRead function 4204
SysUtils.FileSearch 4206
SysUtils.FileSearch function 4206
SysUtils.FileSeek 4207
SysUtils.FileSeek function 4207
SysUtils.FileSetAttr 4209
SysUtils.FileSetAttr function 4209
SysUtils.FileSetDate 4212
SysUtils.FileSetDate function 4212
SysUtils.FileSetReadOnly 4212
SysUtils.FileSetReadOnly function 4212
SysUtils.FileWrite 4213
SysUtils.FileWrite function 4213
SysUtils.FinalizePackage 4216
SysUtils.FinalizePackage function 4216

SysUtils.FindClose 4216
SysUtils.FindClose function 4216
SysUtils.FindCmdLineSwitch 4218
SysUtils.FindCmdLineSwitch function 4218
SysUtils.FindFirst 4218
SysUtils.FindFirst function 4218
SysUtils.FindNext 4221
SysUtils.FindNext function 4221
SysUtils.FloatToCurr 4223
SysUtils.FloatToCurr function 4223
SysUtils.FloatToDateTime 4223
SysUtils.FloatToDateTime function 4223
SysUtils.FloatToDecimal 4224
SysUtils.FloatToDecimal function 4224
SysUtils.FloatToStr 4224
SysUtils.FloatToStr function 4224
SysUtils.FloatToStrF 4226
SysUtils.FloatToStrF function 4226
SysUtils.FloatToText 4227
SysUtils.FloatToText function 4227
SysUtils.FloatToTextFmt 4228
SysUtils.FloatToTextFmt function 4228
SysUtils.fmOpenRead 4417
SysUtils.fmOpenRead constant 4417
SysUtils.fmOpenReadWrite 4417
SysUtils.fmOpenReadWrite constant 4417
SysUtils.fmOpenWrite 4418
SysUtils.fmOpenWrite constant 4418
SysUtils.fmShareCompat 4419
SysUtils.fmShareCompat constant 4419
SysUtils.fmShareDenyNone 4419
SysUtils.fmShareDenyNone constant 4419
SysUtils.fmShareDenyRead 4419
SysUtils.fmShareDenyRead constant 4419
SysUtils.fmShareDenyWrite 4420
SysUtils.fmShareDenyWrite constant 4420
SysUtils.fmShareExclusive 4420
SysUtils.fmShareExclusive constant 4420
SysUtils.FmtLoadStr 4229
SysUtils.FmtLoadStr function 4229
SysUtils.FmtStr 4229
SysUtils.FmtStr function 4229
SysUtils.ForceDirectories 4230
SysUtils.ForceDirectories function 4230
SysUtils.Format 4232
SysUtils.Format function 4232
SysUtils.FormatBuf 4237
SysUtils.FormatBuf function 4237
SysUtils.FormatCurr 4238
SysUtils.FormatCurr function 4238
SysUtils.FormatDateTime 4239
SysUtils.FormatDateTime function 4239
SysUtils.FormatFloat 4241
SysUtils.FormatFloat function 4241
SysUtils.FreeAndNil 4245
SysUtils.FreeAndNil function 4245
SysUtils.GDAL 4246
SysUtils.GDAL function 4246
SysUtils.GetCurrentDir 4246
SysUtils.GetCurrentDir function 4246
SysUtils.GetDiskFreeSpaceEx 4393
SysUtils.GetDiskFreeSpaceEx variable 4393
SysUtils.GetEnvironmentVariable 4248
SysUtils.GetEnvironmentVariable function 4248
SysUtils.GetFileVersion 4249
SysUtils.GetFileVersion function 4249
SysUtils.GetFormatSettings 4250
SysUtils.GetFormatSettings function 4250
SysUtils.GetLocaleChar 4250
SysUtils.GetLocaleChar function 4250
SysUtils.GetLocaleFormatSettings 4250
SysUtils.GetLocaleFormatSettings function 4250
SysUtils.GetLocaleStr 4251
SysUtils.GetLocaleStr function 4251
SysUtils.GetModuleName 4251
SysUtils.GetModuleName function 4251
SysUtils.GetPackageDescription 4252
SysUtils.GetPackageDescription function 4252

SysUtils.GetPackageInfo 4253
SysUtils.GetPackageInfo function 4253
SysUtils.GetTime 4253
SysUtils.GetTime function 4253
SysUtils.GUIDToString 4254
SysUtils.GUIDToString function 4254
SysUtils.HashName 4256
SysUtils.HashName function 4256
SysUtils.HexDisplayPrefix 4393
SysUtils.HexDisplayPrefix variable 4393
SysUtils.HoursPerDay 4420
SysUtils.HoursPerDay constant 4420
SysUtils.IncAMonth 4256
SysUtils.IncAMonth function 4256
SysUtils.IncludeTrailingBackslash 4257
SysUtils.IncludeTrailingBackslash function 4257
SysUtils.IncludeTrailingPathDelimiter 4257
SysUtils.IncludeTrailingPathDelimiter function 4257
SysUtils.IncMonth 4258
SysUtils.IncMonth function 4258
SysUtils.InitializePackage 4259
SysUtils.InitializePackage function 4259
SysUtils.Int64Rec 4361
SysUtils.Int64Rec record 4361
SysUtils.IntToHex 4259
SysUtils.IntToHex function 4259
SysUtils.IntToStr 4260
SysUtils.IntToStr function 4260
SysUtils.IReadWriteSync 4101
SysUtils.IReadWriteSync.BeginRead 4102
SysUtils.IReadWriteSync.BeginWrite 4102
SysUtils.IReadWriteSync.EndRead 4102
SysUtils.IReadWriteSync.EndWrite 4102
SysUtils.IsAssembly 4261
SysUtils.IsAssembly function 4261
SysUtils.IsDelimiter 4262
SysUtils.IsDelimiter function 4262
SysUtils.IsEqualGUID 4262
SysUtils.IsEqualGUID function 4262
SysUtils.IsLeadChar 4264
SysUtils.IsLeadChar function 4264
SysUtils.IsLeapYear 4264
SysUtils.IsLeapYear function 4264
SysUtils.IsPathDelimiter 4266
SysUtils.IsPathDelimiter function 4266
SysUtils.IsValidIdent 4266
SysUtils.IsValidIdent function 4266
SysUtils.Languages 4267
SysUtils.Languages function 4267
SysUtils.LastDelimiter 4267
SysUtils.LastDelimiter function 4267
SysUtils.LeadBytes 4394
SysUtils.LeadBytes variable 4394
SysUtils.ListSeparator 4394
SysUtils.ListSeparator variable 4394
SysUtils.LoadPackage 4268
SysUtils.LoadPackage function 4268
SysUtils.LoadStr 4268
SysUtils.LoadStr function 4268
SysUtils.LongDateFormat 4394
SysUtils.LongDateFormat variable 4394
SysUtils.LongDayNames 4395
SysUtils.LongDayNames variable 4395
SysUtils.LongMonthNames 4395
SysUtils.LongMonthNames variable 4395
SysUtils.LongRec 4362
SysUtils.LongRec record 4362
SysUtils.LongTimeFormat 4396
SysUtils.LongTimeFormat variable 4396
SysUtils.LowerCase 4269
SysUtils.LowerCase function 4269
SysUtils.MaxCurrency 4421
SysUtils.MaxCurrency constant 4421
SysUtils.MaxDateTime 4421
SysUtils.MaxDateTime constant 4421
SysUtils.MaxEraCount 4422
SysUtils.MaxEraCount constant 4422
SysUtils.MinCurrency 4422

SysUtils.MinCurrency constant 4422
SysUtils.MinDateTime 4423
SysUtils.MinDateTime constant 4423
SysUtils.MinsPerDay 4423
SysUtils.MinsPerDay constant 4423
SysUtils.MinsPerHour 4424
SysUtils.MinsPerHour constant 4424
SysUtils.MonthDays 4424
SysUtils.MonthDays constant 4424
SysUtils.MSecsPerDay 4425
SysUtils.MSecsPerDay constant 4425
SysUtils.MSecsPerSec 4425
SysUtils.MSecsPerSec constant 4425
SysUtils.MSecsToTimeStamp 4270
SysUtils.MSecsToTimeStamp function 4270
SysUtils.NegCurrFormat 4396
SysUtils.NegCurrFormat variable 4396
SysUtils.NewStr 4271
SysUtils.NewStr function 4271
SysUtils.NextCharIndex 4271
SysUtils.NextCharIndex function 4271
SysUtils.Now 4271
SysUtils.Now function 4271
SysUtils.NullAnsiStr 4397
SysUtils.NullAnsiStr variable 4397
SysUtils.NullStr 4397
SysUtils.NullStr variable 4397
SysUtils.NullWideStr 4398
SysUtils.NullWideStr variable 4398
SysUtils.OutOfMemoryError 4272
SysUtils.OutOfMemoryError function 4272
SysUtils.PathDelim 4426
SysUtils.PathDelim constant 4426
SysUtils.PathSep 4426
SysUtils.PathSep constant 4426
SysUtils.PByteArray 4378
SysUtils.PByteArray type 4378
SysUtils.PDayTable 4378
SysUtils.PDayTable type 4378
SysUtils.PExceptionRecord 4379
SysUtils.PExceptionRecord type 4379
SysUtils.pfBCB4Produced 4427
SysUtils.pfBCB4Produced constant 4427
SysUtils.pfConsumerBCB 4427
SysUtils.pfConsumerBCB constant 4427
SysUtils.pfConsumerCompat 4428
SysUtils.pfConsumerCompat constant 4428
SysUtils.pfConsumerDelphi 4428
SysUtils.pfConsumerDelphi constant 4428
SysUtils.pfConsumerMask 4428
SysUtils.pfConsumerMask constant 4428
SysUtils.pfDelphi4Produced 4429
SysUtils.pfDelphi4Produced constant 4429
SysUtils.pfDesignOnly 4429
SysUtils.pfDesignOnly constant 4429
SysUtils.pfExeModule 4430
SysUtils.pfExeModule constant 4430
SysUtils.pfIgnoreDupUnits 4430
SysUtils.pfIgnoreDupUnits constant 4430
SysUtils.pfLibraryModule 4431
SysUtils.pfLibraryModule constant 4431
SysUtils.pfModuleTypeMask 4431
SysUtils.pfModuleTypeMask constant 4431
SysUtils.pfNeverBuild 4432
SysUtils.pfNeverBuild constant 4432
SysUtils.pfPackageModule 4432
SysUtils.pfPackageModule constant 4432
SysUtils.pfProducerMask 4433
SysUtils.pfProducerMask constant 4433
SysUtils.pfProducerUndefined 4433
SysUtils.pfProducerUndefined constant 4433
SysUtils.pfRunOnly 4434
SysUtils.pfRunOnly constant 4434
SysUtils.pfV3Produced 4434
SysUtils.pfV3Produced constant 4434
SysUtils.PlatformBytesOf 4273
SysUtils.PlatformBytesOf function 4273
SysUtils.PlatformStringOf 4273

SysUtils.PlatformStringOf function 4273
SysUtils.PThreadInfo 4379
SysUtils.PThreadInfo type 4379
SysUtils.PWordArray 4379
SysUtils.PWordArray type 4379
SysUtils.QuotedStr 4273
SysUtils.QuotedStr function 4273
SysUtils.RaiseLastOSError 4274
SysUtils.RaiseLastOSError function 4274
SysUtils.RaiseLastWin32Error 4275
SysUtils.RaiseLastWin32Error function 4275
SysUtils.RCS 4276
SysUtils.RCS function 4276
SysUtils.RemoveDir 4276
SysUtils.RemoveDir function 4276
SysUtils.RenameFile 4277
SysUtils.RenameFile function 4277
SysUtils.ReplaceDate 4279
SysUtils.ReplaceDate function 4279
SysUtils.ReplaceTime 4280
SysUtils.ReplaceTime function 4280
SysUtils.RPR 4281
SysUtils.RPR function 4281
SysUtils.SafeLoadLibrary 4281
SysUtils.SafeLoadLibrary function 4281
SysUtils.SameFileName 4282
SysUtils.SameFileName function 4282
SysUtils.SameStr 4282
SysUtils.SameStr function 4282
SysUtils.SameText 4283
SysUtils.SameText function 4283
SysUtils.SecsPerDay 4435
SysUtils.SecsPerDay constant 4435
SysUtils.SecsPerHour 4435
SysUtils.SecsPerHour constant 4435
SysUtils.SecsPerMin 4436
SysUtils.SecsPerMin constant 4436
SysUtils.SetCurrentDir 4283
SysUtils.SetCurrentDir function 4283
SysUtils.ShortDateFormat 4398
SysUtils.ShortDateFormat variable 4398
SysUtils.ShortDayNames 4399
SysUtils.ShortDayNames variable 4399
SysUtils.ShortMonthNames 4399
SysUtils.ShortMonthNames variable 4399
SysUtils.ShortTimeFormat 4400
SysUtils.ShortTimeFormat variable 4400
SysUtils.ShowException 4284
SysUtils.ShowException function 4284
SysUtils.Sleep 4284
SysUtils.Sleep function 4284
SysUtils.StrAlloc 4285
SysUtils.StrAlloc function 4285
SysUtils.StrBufSize 4285
SysUtils.StrBufSize function 4285
SysUtils.StrByteType 4286
SysUtils.StrByteType function 4286
SysUtils.StrCat 4286
SysUtils.StrCat function 4286
SysUtils.StrCharLength 4288
SysUtils.StrCharLength function 4288
SysUtils.StrComp 4288
SysUtils.StrComp function 4288
SysUtils.StrCopy 4289
SysUtils.StrCopy function 4289
SysUtils.StrDispose 4291
SysUtils.StrDispose function 4291
SysUtils.StrECopy 4292
SysUtils.StrECopy function 4292
SysUtils.StrEnd 4293
SysUtils.StrEnd function 4293
SysUtils.StrFmt 4294
SysUtils.StrFmt function 4294
SysUtils.StrIComp 4295
SysUtils.StrIComp function 4295
SysUtils.StringOf 4296
SysUtils.StringOf function 4296
SysUtils.StringReplace 4297

SysUtils.StringReplace function 4297
SysUtils.StringToGUID 4297
SysUtils.StringToGUID function 4297
SysUtils.StrLCat 4299
SysUtils.StrLCat function 4299
SysUtils.StrLComp 4300
SysUtils.StrLComp function 4300
SysUtils.StrLCopy 4302
SysUtils.StrLCopy function 4302
SysUtils.StrLen 4303
SysUtils.StrLen function 4303
SysUtils.StrLFmt 4304
SysUtils.StrLFmt function 4304
SysUtils.StrLIComp 4305
SysUtils.StrLIComp function 4305
SysUtils.StrLower 4307
SysUtils.StrLower function 4307
SysUtils.StrMove 4308
SysUtils.StrMove function 4308
SysUtils.StrNew 4310
SysUtils.StrNew function 4310
SysUtils.StrNextChar 4311
SysUtils.StrNextChar function 4311
SysUtils.StrPas 4311
SysUtils.StrPas function 4311
SysUtils.StrPCopy 4313
SysUtils.StrPCopy function 4313
SysUtils.StrPLCopy 4314
SysUtils.StrPLCopy function 4314
SysUtils.StrPos 4314
SysUtils.StrPos function 4314
SysUtils.StrRScan 4315
SysUtils.StrRScan function 4315
SysUtils.StrScan 4317
SysUtils.StrScan function 4317
SysUtils.StrToBool 4318
SysUtils.StrToBool function 4318
SysUtils.StrToBoolDef 4318
SysUtils.StrToBoolDef function 4318
SysUtils.StrToCurr 4319
SysUtils.StrToCurr function 4319
SysUtils.StrToCurrDef 4320
SysUtils.StrToCurrDef function 4320
SysUtils.StrToDate 4320
SysUtils.StrToDate function 4320
SysUtils.StrToDateDef 4322
SysUtils.StrToDateDef function 4322
SysUtils.StrToDateTime 4322
SysUtils.StrToDateTime function 4322
SysUtils.StrToDateTimeDef 4323
SysUtils.StrToDateTimeDef function 4323
SysUtils.StrToFloat 4324
SysUtils.StrToFloat function 4324
SysUtils.StrToFloatDef 4327
SysUtils.StrToFloatDef function 4327
SysUtils.StrToInt 4328
SysUtils.StrToInt function 4328
SysUtils.StrToInt64 4329
SysUtils.StrToInt64 function 4329
SysUtils.StrToInt64Def 4329
SysUtils.StrToInt64Def function 4329
SysUtils.StrToIntDef 4330
SysUtils.StrToIntDef function 4330
SysUtils.StrToTime 4332
SysUtils.StrToTime function 4332
SysUtils.StrToTimeDef 4333
SysUtils.StrToTimeDef function 4333
SysUtils.StrUpper 4334
SysUtils.StrUpper function 4334
SysUtils.Supports 4335
SysUtils.Supports function 4335
SysUtils.SwitchChars 4436
SysUtils.SwitchChars constant 4436
SysUtils.SysErrorMessage 4336
SysUtils.SysErrorMessage function 4336
SysUtils.SysLocale 4400
SysUtils.SysLocale variable 4400
SysUtils.SystemTimeToDateTime 4336

SysUtils.SystemTimeToDateTime function 4336
