Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

41.1.3.5.7 TTabSet.DitherBackground Property

Determines whether the background color set with the BackgroundColor (see page 4522) property is dithered.

Pascal

```
property DitherBackground: Boolean;
```

C++

```
__property Boolean DitherBackground;
```

Description

Dithering means the background is lightened by 50%, which is intended to make the tabs easier to see. If DitherBackground is true, the tab set control background is dithered. If it is false, there is no dithering.

See Also

BackgroundColor (see page 4522)

SelectedColor (see page 4538)

41.1.3.5.8 TTabSet.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
```

```
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
```

```
        Font := (Source as TLabel).Font;
        Color := (Source as TLabel).Color;
        DoubleBuffered := true;
        Color := clWindow;
      end;
    end;
  end;
```

41.1.3.5.9 TTabSet.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

41.1.3.5.10 TTabSet.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

41.1.3.5.11 TTabSet.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
*/
void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
      int X, int Y)
{
  if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
    return;
  THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
  TNodeAttachMode AttachMode;
  TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
  if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
    AttachMode = naAddChild;
  else if (HT.Contains(htNowhere))
    AttachMode = naAdd;
  else if (HT.Contains(htOnIndent))
    AttachMode = naInsert;
  else
    return;
  TreeView1->Selected->MoveTo(Item, AttachMode);
}

void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
      int X, int Y, TDragState State, bool &Accept)
{
  Accept = (Source == dynamic_cast<TObject *>(TreeView1));
}
```

Delphi Examples:

```
{
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property must be set to dmAutomatic, and the TTreeView
OnDragOver event handler must be implemented to accept the
drop.
}
procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
var
  AnItem: TTreeNode;
  AttachMode: TNodeAttachMode;
```

```
    HT: THitTests;
  begin
    if TreeView1.Selected = nil then Exit;
    HT := TreeView1.GetHitTestInfoAt(X, Y);
    AnItem := TreeView1.GetNodeAt(X, Y);
    if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
    begin
      if (htOnItem in HT) or (htOnIcon in HT) then
        AttachMode := naAddChild
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);

41.1.3.5.12 TTabSet.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

EnableControls

Enabling Mouse

41.1.3.5.13 TTabSet.EndMargin Property

Determines how far, in pixels, the rightmost tab appears from the right edge of the tab set control.

Pascal

```
property EndMargin: Integer;
```

C++

```
__property int EndMargin;
```

Description

EndMargin determines how far in pixels the rightmost tab appears from the right edge of the tab set control. Together with the StartMargin (see page 4540) property, EndMargin can play a role in determining how many tabs can fit within the tab set control.

If AutoScroll (see page 4521) is true and scroll buttons appear in the tab set control, EndMargin determines how far in pixels the rightmost tab appears from the left edge of the scroll buttons, rather than the edge of the tab set control.

See Also

AutoScroll (see page 4521)

EndMargin

StartMargin (see page 4540)

41.1.3.5.14 TTabSet.FirstIndex Property

Specifies the tab that appears in the leftmost visible position in the tab set control.

Pascal

```
property FirstIndex: Integer;
```

C++

```
__property int FirstIndex;
```

Description

Any tabs with a lower value in the FirstIndex property scroll to the left in the tab set control and don't appear until the user scrolls the tabs.

The default value of FirstIndex is 0 indicating that the tab with an index of 0 is in the leftmost position. For example, if you have three tabs labeled First, Second, and Third with TabIndex (see page 4542) values of 0, 1, and 2, respectively, First appears first, by default, because it has an index value of 0. If you want to shift the tabs so the Second or Third tab appears leftmost in the tab set control, change the FirstIndex value to 1 or 2.

Tabs (see page 4542)

41.1.3.5.15 TTabSet.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

41.1.3.5.16 TTabSet.Images Property

Pascal

```
property Images: TCustomImageList;
```

C++

```
__property TCustomImageList Images;
```

Description

This is Images, a member of class TTabSet.

41.1.3.5.17 TTabSet.ParentBackground Property

Determines whether control uses parent's theme background.

Pascal

```
property ParentBackground;
```

C++

```
__property ParentBackground;
```

Description

If ParentBackground is true, the control uses the parent's theme background to draw its own background. ParentBackground has no effect unless XP themes are enabled.

41.1.3.5.18 TTabSet.ParentDoubleBuffered Property

ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.

Pascal

```
property ParentDoubleBuffered;
```

C++

```
__property ParentDoubleBuffered;
```

Description

ParentDoubleBuffered is a boolean indicating that the DoubleBuffered property of this component is overridden by the value of the parent's DoubleBuffered property.

41.1.3.5.19 TTabSet.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

41.1.3.5.20 TTabSet.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
```

```
    {
      if (pComponent->ClassNameIs("TEdit"))
        (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
      else
        MessageBeep(0);
    }
    else
      MessageBeep(0);
  }

  void __fastcall TForm1::Cut1Click(TObject *Sender)
  {
    TComponent *pComponent = PopupMenu1->PopupComponent;
    if (pComponent)
    {
      if (pComponent->ClassNameIs("TEdit"))

41.1.3.5.21 TTabSet.Scroller Property

Pascal

```
property Scroller: TScroller;
```

C++

```
__property TScroller Scroller;
```

Description

This is Scroller, a member of class TTabSet.

41.1.3.5.22 TTabSet.SelectedColor Property

Determines the color of the selected tab in the tab set control.

Pascal

```
property SelectedColor: TColor;
```

C++

```
__property TColor SelectedColor;
```

Description

SelectedColor determines the color of the selected tab in the tab set control.

See Also

BackgroundColor (see page 4522)

DitherBackground (see page 4525)

Color

41.1.3.5.23 TTabSet.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
```

```
    begin
      for I := 1 to 10 do
        Items.Add('Item ' + IntToStr(I));
      Hint := 'Select an item';
      ShowHint := True;
    end;
    Application.ShowHint := True;
  end;
  {
  Note: To see an example that displays the hints of controls
  in some place other than in a Help Hint box, see the OnHint
  example.
  }
```

41.1.3.5.24 TTabSet.ShrinkToFit Property

Pascal

```
property ShrinkToFit: Boolean;
```

C++

```
__property Boolean ShrinkToFit;
```

Description

This is ShrinkToFit, a member of class TTabSet.

41.1.3.5.25 TTabSet.SoftTop Property

Specifies whether a line appears at the edge of the tab set, setting off the non-current tabs.

Pascal

```
property SoftTop: Boolean;
```

C++

```
__property Boolean SoftTop;
```

Description

When SoftTop is false (the default), a line appears at the edge of the non-current tabs. When SoftTop is true, this line is not drawn, softening the border of the tab set.

41.1.3.5.26 TTabSet.StartMargin Property

Determines how far, in pixels, the first tab appears from the left edge of the tab set control.

Pascal

```
property StartMargin: Integer;
```

C++

```
__property int StartMargin;
```

Description

Together with the EndMargin (see page 4530) property, StartMargin determines how many tabs fit in the tab set control.

See Also

EndMargin (see page 4530)

41.1.3.5.27 TTabSet.Style Property

Determines whether the tab set is owner-drawn.

Pascal

```
property Style: TTabStyle;
```

C++

```
__property TTabStyle Style;
```

Description

Owner-draw tabs can display objects other than strings, such as graphical images. Owner-draw tabs require more programming, however, because the application needs information on how to render the image for each tab in the tab set control.

Each time an item is displayed in an owner-drawn tab, two events occur. The first is the OnMeasureTab (see page 4562) event. In the OnMeasureTab (see page 4562) event handler, you write the code that calculates the width of the tab needed to hold the text or graphical image. After the OnMeasureTab (see page 4562) event, the OnDrawTab (see page 4555) event occurs. The code you write for the OnDrawTab (see page 4555) event draws the tab and its contents using the width found with the OnMeasureTab (see page 4562) event and the height specified as the value of the TabHeight (see page 4541) property.

Note: The TTabStyle (see page 4578) type defined in the tabs unit for the Style property differs from the TTabStyle (see page 4578) type defined in the comctrls unit. Do not to use or include the comctrls unit in source files where you are working with the tab control. Doing so can lead to compiler errors because of type mismatches.

See Also

TabHeight (see page 4541)

OnDrawTab (see page 4555)

OnMeasureTab (see page 4562)

41.1.3.5.28 TTabSet.TabHeight Property

Determines the height of the tabs in an owner-drawn tab set control.

Pascal

```
property TabHeight: Integer;
```

C++

```
__property int TabHeight;
```

Description

If the Style (see page 4541) property value is tsStandard, the TabHeight property value is ignored. If the Style (see page 4541) property value is tsOwnerDraw, TabHeight is the height of the tabs.

See Also

Style (see page 4541)

41.1.3.5.29 TTabSet.TabIndex Property

Determines which tab of a tab set control is currently selected.

Pascal

```
property TabIndex: Integer;
```

C++

```
__property int TabIndex;
```

Description

The value of TabIndex can be from –1 to one less than the number of strings in the Tabs (see page 4542) property array (Count – 1). TabIndex is an index to the Tabs (see page 4542) array property: A value of 0 indicates the first tab in the tab set control, 1 is the second tab, and so on. If no tabs are selected, TabIndex has a value of –1.

When a value is assigned to TabIndex, the OnClick (see page 4547) event for the tab set occurs, followed by the OnChange (see page 4547) event, just as if the user had clicked on a new tab.

See Also

Tabs (see page 4542)

OnChange (see page 4547)

OnClick

41.1.3.5.30 TTabSet.TabPosition Property

Pascal

```
property TabPosition: TTabPosition;
```

C++

```
__property TTabPosition TabPosition;
```

Description

This is TabPosition, a member of class TTabSet.

41.1.3.5.31 TTabSet.Tabs Property

Contains the list of text strings that appear on the tabs.

Pascal

```
property Tabs: TStrings;
```

C++

```
__property TStrings Tabs;
```

Description

For each string in the Tabs property, a new tab is created to display the text string. At design time, you enter the text strings you want to appear on the tabs using the String List editor. Double-click the value column of the Tabs property to display the String List editor. You can also change strings in the Tabs property at runtime.

See Also

VisibleTabs (see page 4544)

41.1.3.5.32 TTabSet.UnselectedColor Property

Determines the color of the tabs that aren't currently selected in the tab set control.

Pascal

```
property UnselectedColor: TColor;
```

C++

```
__property TColor UnselectedColor;
```

Description

UnselectedColor determines the color of the tabs that aren't currently selected in the tab set control.

See Also

BackgroundColor (see page 4522)

SelectedColor (see page 4538)

41.1.3.5.33 TTabSet.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false, the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
```

```
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

41.1.3.5.34 TTabSet.VisibleTabs Property

Contains the number of tabs currently visible in the tab set control.

Pascal

```
property VisibleTabs: Integer;
```

C++

```
__property int VisibleTabs;
```

Description

Use VisibleTabs to determine how many tabs are visible in the tab set.

41.1.3.6 TTabSet Events

The events of the TTabSet class are listed here.

Published Events

	Name	Description
	OnAlignInsertBefore (see page 4545)	Occurs when an object with custom alignment is aligned.
	OnAlignPosition (see page 4546)	Occurs when an object with custom alignment is aligned.
	OnChange (see page 4547)	Occurs just before a new tab is selected.
	OnClick (see page 4547)	Occurs when the user clicks the control.
	OnDragDrop (see page 4549)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 4552)	Occurs when the user drags an object over a control.
	OnDrawTab (see page 4555)	Occurs when a tab in an owner-drawn tab set control needs to redisplay.
	OnEndDock (see page 4555)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 4556)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 4557)	Occurs when a control receives the input focus.
	OnExit (see page 4559)	Occurs when the input focus shifts away from one control to another.
	OnGetImageIndex (see page 4562)	This is OnGetImageIndex, a member of class TTabSet.
	OnMeasureTab (see page 4562)	Occurs when an application needs to redisplay a tab in an owner-draw tab set.
	OnMouseActivate (see page 4563)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 4564)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 4566)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4566)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 4566)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 4569)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnStartDock (see page 4571)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 4572)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

41.1.3.6.1 TTabSet.OnAlignInsertBefore Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignInsertBefore;
```

C++

```
__property OnAlignInsertBefore;
```

Description

OnAlignInsertBefore occurs for each pair of child controls with an Align property of **alCustom**.

It can determine the order in which custom-aligned child controls are placed. OnAlignInsertBefore returns true if **C2** should be presented before **C1**, and false otherwise. It holds a TAlignInsertBeforeEvent type.

CustomAlignInsertBefore triggers the OnAlignInsertBefore event. If this event is defined, CustomAlignInsertBefore returns the value returned by OnAlignInsertBefore. Defining this event allows users to define the order of control alignment without overriding CustomAlignInsertBefore.

See Also

CustomAlignInsertBefore

Align

TAlignInsertBeforeEvent

41.1.3.6.2 TTabSet.OnAlignPosition Event

Occurs when an object with custom alignment is aligned.

Pascal

```
property OnAlignPosition;
```

C++

```
__property OnAlignPosition;
```

Description

OnAlignPosition occurs when child controls with an Align property of **alCustom** are aligned.

CustomAlignPosition triggers the OnAlignPosition event. If this event is defined, CustomAlignPosition uses the alignment parameters it obtains from OnAlignPosition. Defining this event allows users to set the alignment parameters without overriding CustomAlignPosition. It holds a TAlignPositionEvent type.

These are the parameters:

Parameter	Meaning
NewLeft | NewTop | NewWidth | NewHeight	Location and size of child control, as determined by container's size and the Anchors TControl_Anchors constraints for the control. OnAlignPosition can modify these values to reposition the control.
AlignRect	The client area in which the control is aligned. OnAlignPosition can modify this value.
AlignInfo	Alignment information in a TAlignInfo.
As implemented in TWinControl, OnAlignPosition does nothing.

CustomAlignPosition

Align

Anchors

TAlignInfo

TAlignPositionEvent

41.1.3.6.3 TTabSet.OnChange Event

Occurs just before a new tab is selected.

Pascal

```
property OnChange: TTabChangeEvent;
```

C++

```
__property TTabChangeEvent OnChange;
```

Description

OnChange occurs just as the TabIndex (see page 4542) value is about to change. To prevent the TabIndex (see page 4542) value from changing, set AllowChange to false in the OnChange event handler.

41.1.3.6.4 TTabSet.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
```

```
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;
```

41.1.3.6.5 TTabSet.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
```

```
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
}

41.1.3.6.6 TTabSet.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = Source->ClassNameIs("TLabel");
}

void __fastcall TForm1::Panel1DragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{
  Accept = false;
```

```
  if ((Source->ClassNameIs("TLabel")) && (State == dsDragEnter))
    dynamic_cast<TLabel *>(Source)->EndDrag(false);
}
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.

41.1.3.6.7 TTabSet.OnDrawTab Event

Occurs when a tab in an owner-drawn tab set control needs to redisplay.

Pascal

```
property OnDrawTab: TDrawTabEvent;
```

C++

```
__property TDrawTabEvent OnDrawTab;
```

Description

OnDrawTab occurs when a tab redisplays if the Style (see page 4541) property value is tsOwnerDraw. For example, it happens when the user selects a tab or scrolls the tabs.

You must write the code in the OnDrawTab event handler to draw the tab.

OnDrawTab occurs just after the OnMeasureTab (see page 4562) event, which contains the code to calculate the width of the tab needed. The height of the tab is determined by the value of the TabHeight (see page 4541) property of the tab set control. The code you write in the OnDrawTab event handler, therefore, must use the width determined with the OnMeasureTab (see page 4562) event to draw the tab.

TabHeight (see page 4541)

OnMeasureTab (see page 4562)

Style (see page 4541)

41.1.3.6.8 TTabSet.OnEndDock Event

Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.

Pascal

```
property OnEndDock;
```

C++

```
__property OnEndDock;
```

Description

Use OnEndDock to specify actions or special processing that when a drag-and-dock operation stops.

41.1.3.6.9 TTabSet.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
```

```
    else
      S := S + 'rejected!';
    Status.Caption := S;
  end;

41.1.3.6.10 TTabSet.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/
TWinControl *myActiveControl;

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  FontDialog1->Options << fdApplyButton;
  FontDialog1->Execute();
}
```

```
void __fastcall TForm1::FontDialog1Apply(TObject *Sender, HWND Wnd)
{
  if (myActiveControl->ClassNameIs("TEdit"))
   (dynamic_cast<TEdit *>(myActiveControl))->Font->Assign(FontDialog1->Font);
  else if (myActiveControl->ClassNameIs("TRichEdit"))
    (dynamic_cast<TRichEdit *>(myActiveControl))->SelAttributes->Assign(FontDialog1->Font);
  else
    MessageBeep(0);
}

void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  myActiveControl = ActiveControl;
}
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
   FontDialog1.Options := FontDialog1.Options + [fdApplyButton];
   FontDialog1.Execute;
end;

procedure TForm1.Edit1Enter(Sender: TObject);
begin
  myActiveControl := ActiveControl;
end;

procedure TForm1.FontDialog1Apply(Sender: TObject; Wnd: HWND);
```

```
begin
  if myActiveControl is TEdit then
    with myActiveControl as TEdit do
       Font.Assign(TFontDialog(Sender).Font)
  else if myActiveControl is TRichEdit then
    with myActiveControl as TRichEdit do
      SelAttributes.Assign(TFontDialog(Sender).Font)
  else
    Beep;
end;
{

41.1.3.6.11 TTabSet.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit

event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
to contain the empty string, to use the Courier font and to
use a particular mask, corresponding to IP address coding convetions.
The mask edit boxes display the IP address, the subnet mask
and the subnet address correspondingly. When the user exits the
subnet mask edit box, the subnet address is automatically calculated
using bit-wise AND operations and displayed in the third mask edit box.
An additional test is made to assure that the values in the IP address
and in the subnet mask are in the interval from 0 to 255,
as this validation test cannot be accomplished
using the edit mask property alone.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  { initialize the maskedit boxes to contain the empty string }
  MaskEdit1.Text := '';
```

```
  MaskEdit2.Text := '';
  MaskEdit3.Text := '';

  { use the Courier font in the maskedit boxes }
  MaskEdit1.Font.Name := 'Courier';
  MaskEdit2.Font.Name := 'Courier';
  MaskEdit3.Font.Name := 'Courier';

  {
  initialize the mask of each maskedit box
  according to IP address coding conventions
  }
  MaskEdit1.EditMask := '!099.099.099.099;1; ';
  MaskEdit2.EditMask := '!099.099.099.099;1; ';
  MaskEdit3.EditMask := '!099.099.099.099;1; ';

  MaskEdit2.OnExit := MaskEdit2Exit;
end;

procedure TForm1.MaskEdit2Exit(Sender: TObject);
var
  net1, net2, host1, host2,
  netmask1, netmask2, hostmask1, hostmask2,
  sub_net1, sub_net2, sub_host1, sub_host2: Integer;

  IP, mask: String;

begin
  // extract the net and host address from the IP
  IP := MaskEdit1.Text;
  net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
  net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
  host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
  host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));

  // a range test that you cannot validate through edit masks
  if ((net1 < 0) Or (net1 > 255) Or
      (net2 < 0) Or (net2 > 255) Or
      (host1 < 0) Or (host1 > 255) Or
      (host2 < 0) Or (host2 > 255)) then
    raise EArgumentException.Create('Not a valid IP address.');

  // extract the net and host mask from the subnet mask
  mask := MaskEdit2.Text;
  netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
  netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
  hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
  hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

  // a range test that you cannot validate through edit masks
  if ((netmask1 < 0) Or (netmask1 > 255) Or
      (netmask2 < 0) Or (netmask2 > 255) Or
      (hostmask1 < 0) Or (hostmask1 > 255) Or
      (hostmask2 < 0) Or (hostmask2 > 255)) then
    raise EArgumentException.Create('Not a valid subnet mask.');

  // compute the subnet address using bit-wise AND
  sub_net1 := net1 And netmask1;
  sub_net2 := net2 And netmask2;
  sub_host1 := host1 And hostmask1;
  sub_host2 := host2 And hostmask2;

  // display the subnet address
  MaskEdit3.Text :=
    IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
    IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
```

```
end;
{
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
}
procedure TForm1.Edit1Enter(Sender: TObject);
begin
  Edit1.Color := clYellow;
end;

procedure TForm1.Edit1Exit(Sender: TObject);
begin
  Edit1.Color := clWindow;
end;

procedure TForm1.Memo1Enter(Sender: TObject);

41.1.3.6.12 TTabSet.OnGetImageIndex Event

Pascal

```
property OnGetImageIndex: TTabGetImageEvent;
```

C++

```
__property TTabGetImageEvent OnGetImageIndex;
```

Description

This is OnGetImageIndex, a member of class TTabSet.

41.1.3.6.13 TTabSet.OnMeasureTab Event

Occurs when an application needs to redisplay a tab in an owner-draw tab set.

Pascal

```
property OnMeasureTab: TMeasureTabEvent;
```

C++

```
__property TMeasureTabEvent OnMeasureTab;
```

Description

OnMeasureTab occurs only if the Style (see page 4541) property is tsOwnerDraw. In the OnMeasureTab event handler, write the code to calculate the width needed to draw the tab. Your code is responsible for calculating and returning the tab width, depending on what you have drawn in the tab (if the tab is of Style (see page 4541) tsOwnerDraw). After the OnMeasureTab

event occurs, the OnDrawTab (see page 4555) event occurs, when the OnDrawTab (see page 4555) event handler draws the tab using the width calculated in OnMeasureTab.

See Also

TabHeight (see page 4541)

OnDrawTab (see page 4555)

41.1.3.6.14 TTabSet.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture

41.1.3.6.15 TTabSet.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  StartX = X;
  StartY = Y;
}

// Use this code as the OnMouseUp event handler of the form:
void __fastcall TForm1::FormMouseUp(TObject *Sender, TMouseButton Button, TShiftState Shift,
int X, int Y)
{
  Form1->Canvas->Rectangle(StartX, StartY, X, Y);
  StatusBar1->Panels->Items[0]->Text = "";
  StatusBar1->Panels->Items[1]->Text = "";
  StatusBar1->Panels->Items[2]->Text = "";
  StatusBar1->Panels->Items[3]->Text = "";
}

// Use this code as the OnMouseMove event handler of the form:
void __fastcall TForm1::FormMouseMove(TObject *Sender, TShiftState Shift, int X, int Y)
{
  if (Shift.Contains(ssLeft)) // make sure button is down
  {
    if (Y > StartY)
```

```
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(StartY);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(Y);
    }
    else
    {
      StatusBar1->Panels->Items[0]->Text = "Top: " + IntToStr(Y);
      StatusBar1->Panels->Items[2]->Text = "Bottom: " + IntToStr(StartY);
    }
    if (X > StartX)
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(StartX);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(X);
    }
    else
    {
      StatusBar1->Panels->Items[1]->Text = "Left: " + IntToStr(X);
      StatusBar1->Panels->Items[3]->Text = "Right: " + IntToStr(StartX);
    }
  }
}
```

Delphi Examples:

```
{
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
}
procedure TForm1.FormMouseDown(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X,
Y: Integer);
begin
  StartX := X;
  StartY := Y;
end;

procedure TForm1.FormMouseUp(Sender: TObject; Button: TMouseButton; Shift: TShiftState; X, Y:
Integer);
begin
  Form1.Canvas.Rectangle(StartX, StartY, X, Y);
  StatusBar1.Panels[0].Text := '';
  StatusBar1.Panels[1].Text := '';
  StatusBar1.Panels[2].Text := '';
  StatusBar1.Panels[3].Text := '';
end;

procedure TForm1.FormMouseMove(Sender: TObject; Shift: TShiftState; X, Y: Integer);
begin
  if ssLeft in Shift then { make sure button is down }
  begin
    if Y > StartY then
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
      end
    else
      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
      StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
```

```
      end;
    if X > StartX then
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
      StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
      end
    else
      begin
      StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);

41.1.3.6.16 TTabSet.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

41.1.3.6.17 TTabSet.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

41.1.3.6.18 TTabSet.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a

MouseCapture

41.1.3.6.19 TTabSet.OnMouseUp Event

Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.

Pascal

```
property OnMouseUp;
```

C++

```
__property OnMouseUp;
```

Description

Use an OnMouseUp event handler to implement special processing when the user releases a mouse button.

The OnMouseUp event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150

OnMouseDown

OnMouseMove

Responding to a Mouse-up Action

41.1.3.6.20 TTabSet.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

OnEndDock

TDragDockObjectEx

DragKind

OnDragOver

OnDockDrop

41.1.3.6.21 TTabSet.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

41.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TEdgePart (see page 4573)	This is record Tabs.TEdgePart.
	TEdgeType (see page 4573)	This is record Tabs.TEdgeType.
	TScrollBtn (see page 4574)	This is record Tabs.TScrollBtn.
	TScrollOrientation (see page 4574)	This is record Tabs.TScrollOrientation.
	TTabSetTabStyle (see page 4575)	This is record Tabs.TTabSetTabStyle.

41.2.1 Tabs.TEdgePart Enumeration

Pascal

```
TEdgePart = (
  epSelectedLeft,
  epUnselectedLeft,
  epSelectedRight,
  epUnselectedRight
);
```

C++

```
enum TEdgePart {
  epSelectedLeft,
  epUnselectedLeft,
  epSelectedRight,
  epUnselectedRight
};
```

File

Tabs

Description

This is record Tabs.TEdgePart.

41.2.2 Tabs.TEdgeType Enumeration

Pascal

```
TEdgeType = (
  etNone,
  etFirstIsSel,
  etFirstNotSel,
  etLastIsSel,
  etLastNotSel,
  etNotSelToSel,
  etSelToNotSel,
  etNotSelToNotSel
```

```
);
```

C++

```
enum TEdgeType {
  etNone,
  etFirstIsSel,
  etFirstNotSel,
  etLastIsSel,
  etLastNotSel,
  etNotSelToSel,
  etSelToNotSel,
  etNotSelToNotSel
};
```

File

Tabs

Description

This is record Tabs.TEdgeType.

41.2.3 Tabs.TScrollBtn Enumeration

Pascal

```
TScrollBtn = (
  sbLeft,
  sbRight
);
```

C++

```
enum TScrollBtn {
  sbLeft,
  sbRight
};
```

File

Tabs

Description

This is record Tabs.TScrollBtn.

41.2.4 Tabs.TScrollOrientation Enumeration

Pascal

```
TScrollOrientation = (
  soLeftRight,
  soUpDown
);
```

C++

```
enum TScrollOrientation {
  soLeftRight,
  soUpDown
};
```

File

Tabs

Description

This is record Tabs.TScrollOrientation.

41.2.5 Tabs.TTabSetTabStyle Enumeration

Pascal

```
TTabSetTabStyle = (
  tsStandard,
  tsOwnerDraw,
  tsSoftTabs,
  tsModernTabs,
  tsModernPopout
);
```

C++

```
enum TTabSetTabStyle {
  tsStandard,
  tsOwnerDraw,
  tsSoftTabs,
  tsModernTabs,
  tsModernPopout
};
```

File

Tabs

Description

This is record Tabs.TTabSetTabStyle.

41.3 Types

The following table lists types in this documentation.

Types

Name	Description
TDrawTabEvent (see page 4576)	TDrawTabEvent is the type for event handlers that render the tab of an owner-drawn TTabSet (see page 4506) control.
TMeasureTabEvent (see page 4576)	TMeasureTabEvent is the type for event handlers that indicate the size of the tabs in an owner-drawn TTabSet (see page 4506) control.
TTabChangeEvent (see page 4577)	TTabChangeEvent is the type for event handlers that respond when the current tab of a TTabSet (see page 4506) control changes.
TTabSetDrawTabEvent (see page 4577)	TTabSetDrawTabEvent is the type for event handlers that render the tab of an owner-drawn TTabSet (see page 4506) control.
TTabStyle (see page 4578)	TTabStyle indicates whether a TTabSet (see page 4506) control is owner-drawn.

41.3.1 Tabs.TDrawTabEvent Type

TDrawTabEvent is the type for event handlers that render the tab of an owner-drawn TTabSet (see page 4506) control.

Pascal

```
TDrawTabEvent = TTabSetDrawTabEvent;
```

C++

```
TTabSetDrawTabEvent TDrawTabEvent;
```

File

Tabs

Description

TDrawTabEvent is the type for event handlers that render the tab of an owner-drawn TTabSet (see page 4506) control.

Note: The TDrawTabEvent type defined in the tabs unit for the OnDrawTab event handler differs from the TDrawTabEvent type defined in the comctrls unit. Do not use the comctrls unit in source files where you are working with the tab control.

41.3.2 Tabs.TMeasureTabEvent Type

TMeasureTabEvent is the type for event handlers that indicate the size of the tabs in an owner-drawn TTabSet (see page 4506) control.

Pascal

```
TMeasureTabEvent = procedure (Sender: TObject; Index: Integer; var TabWidth: Integer) of
object;
```

C++

```
(Sender: TObject; Index: Integer; var TabWidth: Integer) ( TMeasureTabEvent)();
```

File

Tabs

Description

Sender is the TTabSet (see page 4506) control whose tab is about to be drawn.

Index identifies the position of the tab in the tab set control.

TabWidth is the width of the tab.

41.3.3 Tabs.TTabChangeEvent Type

TTabChangeEvent is the type for event handlers that respond when the current tab of a TTabSet (see page 4506) control changes.

Pascal

```
TTabChangeEvent = procedure (Sender: TObject; NewTab: Integer; var AllowChange: Boolean) of
object;
```

C++

```
(Sender: TObject; NewTab: Integer; var AllowChange: Boolean) ( TTabChangeEvent)();
```

File

Tabs

Description

Sender is the TTabSet (see page 4506) control whose tab is about to change.

NewTab is the tab that is about to become the selected tab.

AllowChange determines whether the change is permitted. If the event handler sets AllowChange to false, the user won't be able to select the new tab, in effect disabling it.

41.3.4 Tabs.TTabSetDrawTabEvent Type

TTabSetDrawTabEvent is the type for event handlers that render the tab of an owner-drawn TTabSet (see page 4506) control.

Pascal

```
TTabSetDrawTabEvent = procedure (Sender: TObject; TabCanvas: TCanvas; R: TRect; Index:
Integer; Selected: Boolean) of object;
```

C++

```
(Sender: TObject; TabCanvas: TCanvas; R: TRect; Index: Integer; Selected: Boolean) (
TTabSetDrawTabEvent)();
```

File

Tabs

Description

TabCanvas is the canvas on which the item is drawn.

Index is the position of the tab in the tab set control.

R is the area in the tab where the item is to be drawn.

Selected indicates whether the tab is currently selected.

41.3.5 Tabs.TTabStyle Type

TTabStyle indicates whether a TTabSet (see page 4506) control is owner-drawn.

Pascal

```
TTabStyle = TTabSetTabStyle;
```

C++

```
TTabSetTabStyle TTabStyle;
```

File

Tabs

Description

These are the possible values:

Value	Meaning
tsStandard	Each tab has the standard size and look.

tsOwnerDrawEach tab has the height specified with the TabHeight property and width needed to hold the text or glyph.

42 TConnect Namespace

This is namespace TConnect.

Topics

Name	Description
Classes (see page 4580)	The following table lists classes in this documentation.

Classes

	Name	Description
	TLocalConnection (see page 4580)	TLocalConnection represents the connection between a client dataset or XML broker and a provider that resides in the same application.

42.1 Classes

The following table lists classes in this documentation.

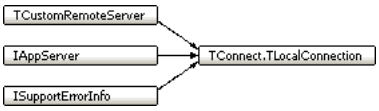
Classes

	Name	Description
	TLocalConnection (see page 4580)	TLocalConnection represents the connection between a client dataset or XML broker and a provider that resides in the same application.

42.1.1 TLocalConnection Class

TLocalConnection represents the connection between a client dataset or XML broker and a provider that resides in the same application.

Class Hierarchy



Pascal

```
TLocalConnection = class(TCustomRemoteServer, IAppServer, ISupportErrorInfo);
```

C++

```
class TLocalConnection : public TCustomRemoteServer, public IAppServer, public
ISupportErrorInfo;
```

File

TConnect

Description

Use TLocalConnection to manage the connection between one or more client datasets or XML brokers and the providers that reside in the same application. When working with local providers, it is not necessary to set the RemoteServer property of a client dataset or XML broker to a TLocalConnection component. However, using TLocalConnection lets your application communicate directly with local providers through the AppServer (see page 4591) property. This provides access to methods that would otherwise be unavailable, and makes it easier to scale up to a multi-tiered application at a later time.

TLocalConnection implements the IAppServer interface.

Warning: TLocalConnection only links clients to providers that are instances of TDataSetProvider.

42.1.1.1 TLocalConnection Members

The following tables list the members exposed by TLocalConnection.

Protected Methods

	Name	Description
	AS_ApplyUpdates (see page 4583)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 4583)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 4584)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 4585)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 4586)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 4586)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 4587)	Returns information from a specified record of the provider's dataset.
V	GetConnected (see page 4588)	Returns the value of the Connected property.
V	GetProvider (see page 4588)	This is GetProvider, a member of class TLocalConnection.
	InterfaceSupportsErrorInfo (see page 4589)	This is InterfaceSupportsErrorInfo, a member of class TLocalConnection.
V	Notification (see page 4589)	Forwards notification messages to all owned components.
	RegisterProvider (see page 4590)	This is RegisterProvider, a member of class TLocalConnection.
	UnRegisterProvider (see page 4591)	This is UnRegisterProvider, a member of class TLocalConnection.

Public Methods

	Name	Description
V	Create (see page 4581)	Creates and initializes a local connection component.
V	Destroy (see page 4582)	Frees an instance of TLocalConnection (see page 4580).
V	GetProviderNames (see page 4589)	Executes a callback for all provider objects on the application server.
V	GetServer (see page 4589)	Returns the IAppServer interface for communicating with local providers.
V	SafeCallException (see page 4590)	Handles exceptions in methods declared using the safecall calling convention.

Public Properties

	Name	Description
R	AppServer (see page 4591)	Provides access to the IAppServer interface that handles communication with providers.
R	ProviderCount (see page 4591)	Indicates the number of providers in the Providers (see page 4592) property list.
R	Providers (see page 4592)	Lists the local providers with which this local connection component can communicate.

42.1.1.2 TLocalConnection.Create Constructor

Creates and initializes a local connection component.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TLocalConnection(TComponent * AOwner);
```

Description

Call Create to instantiate TLocalConnection (see page 4580) at runtime. TLocalConnection (see page 4580) components placed in forms or data modules at design time are created automatically.

The AOwner parameter specifies the component (usually the form or data module) that is responsible for freeing the TLocalConnection (see page 4580) instance.

See Also

Owner

42.1.1.3 TLocalConnection.Destroy Destructor

Frees an instance of TLocalConnection (see page 4580).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TLocalConnection();
```

Description

Do not call Destroy directly in an application. Instead, call Free, which checks that the TLocalConnection (see page 4580) reference is not nil before calling the destructor.

See Also

System::TObject::Free (see page 3382)

42.1.1.4 TLocalConnection Methods

The methods of the TLocalConnection class are listed here.

Protected Methods

	Name	Description
	AS_ApplyUpdates (see page 4583)	Applies updates received from a client dataset using a specified provider.
	AS_DataRequest (see page 4583)	Generates an OnAS_DataRequest event on the specified provider component.
	AS_Execute (see page 4584)	AS_Executes the query or stored procedure bound to a specified provider.
	AS_GetParams (see page 4585)	Fetches current parameter values from the dataset bound to a specified provider.
	AS_GetProviderNames (see page 4586)	Returns a list of all the available providers on a remote data module.
	AS_GetRecords (see page 4586)	Returns a data packet that contains the specified data.
	AS_RowRequest (see page 4587)	Returns information from a specified record of the provider's dataset.
	GetConnected (see page 4588)	Returns the value of the Connected property.
	GetProvider (see page 4588)	This is GetProvider, a member of class TLocalConnection.
	InterfaceSupportsErrorInfo (see page 4589)	This is InterfaceSupportsErrorInfo, a member of class TLocalConnection.
	Notification (see page 4589)	Forwards notification messages to all owned components.
	RegisterProvider (see page 4590)	This is RegisterProvider, a member of class TLocalConnection.
	UnRegisterProvider (see page 4591)	This is UnRegisterProvider, a member of class TLocalConnection.

Public Methods

	Name	Description
	GetProviderNames (see page 4589)	Executes a callback for all provider objects on the application server.
	GetServer (see page 4589)	Returns the IAppServer interface for communicating with local providers.
	SafeCallException (see page 4590)	Handles exceptions in methods declared using the safecall calling convention.

42.1.1.4.1 TLocalConnection.AS_ApplyUpdates Method

Applies updates received from a client dataset using a specified provider.

Pascal

```
function AS_ApplyUpdates(const ProviderName: WideString; Delta: OleVariant; MaxErrors:
Integer; out ErrorCount: Integer; var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(const BSTR ProviderName, OleVariant Delta, int
MaxErrors, int ErrorCount, OleVariant OwnerData);
```

Description

AS_AS_ApplyUpdates writes client updates to a dataset or database server.

ProviderName specifies the name of the provider component that manages the update operation.

Delta is a Variant containing the updated, inserted, and deleted records to write to the database.

MaxErrors indicates the maximum number of errors to permit before stopping the update operation.

ErrorCount returns the actual number of errors encountered during the update operation.

OwnerData is information supplied by the client application in a BeforeAS_ApplyUpdates event handler and returned to the client application in an AfterAS_ApplyUpdates event handler.

AS_AS_ApplyUpdates (Delphi) or AS_ApplyUpdates_result parameter (C++) returns a Variant that is a data packet containing all records that could not be applied to the database.

BeforeApplyUpdates

AfterApplyUpdates

AS_ApplyUpdates

as_applyupdates (see page 1151)

Communicating with the Client Dataset

42.1.1.4.2 TLocalConnection.AS_DataRequest Method

Generates an OnAS_DataRequest event on the specified provider component.

Pascal

```
function AS_DataRequest(const ProviderName: WideString; Data: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_DataRequest(const BSTR ProviderName, OleVariant Data);
```

Description

Use AS_AS_DataRequest to invoke an OnAS_DataRequest event handler of the provider named by ProviderName. This method is provided to allow application developers to customize the communication between a client application and a provider component. There is no predefined meaning for the Data parameter or the return value (Delphi) or the AS_DataRequest_result parameter (C++), which is returned to the caller.

See Also

OnDataRequest

DataRequest

Communicating with the Client Dataset

42.1.1.4.3 TLocalConnection.AS_Execute Method

AS_Executes the query or stored procedure bound to a specified provider.

Pascal

```
procedure AS_Execute(const ProviderName: WideString; const CommandText: WideString; var
Params: OleVariant; var OwnerData: OleVariant); safecall;
```

C++

```
__fastcall AS_Execute(const BSTR ProviderName, const BSTR CommandText, OleVariant Params,
OleVariant OwnerData);
```

Description

Use AS_AS_Execute to pass an execute command to a remote provider, using a specified set of parameters. AS_AS_Execute calls the AS_Execute method of the specified provider after assigning any parameters. Output parameters that result from executing a query or stored procedure are returned in the Params parameter.

The provider's AS_Execute method generates a BeforeAS_Execute event, passes the command on to its associated dataset, and generates an AfterAS_Execute event. The dataset must represent a query or stored procedure that does not return a cursor.

The ProviderName parameter specifies the name of the provider component associated with the query or stored procedure.

CommandText specifies an optional SQL statement that replaces the SQL of the query, or the name of a stored procedure that replaces the dataset's stored procedure. This parameter is ignored if the provider's Options property does not include poAllowCommandText.

The Params parameter encodes any parameters expected by the query or stored procedure and returns any output parameters. To create a properly encoded value for Params from a TParams object, use the PackageParams routine. To decode Params into a TParams object, use the Unpackparams routine.

The OwnerData parameter contains custom information that appears as an argument to the provider's BeforeAS_Execute and AfterAS_Execute event handlers. This information originates in a client dataset's BeforeAS_Execute event handler. The value returned in OwnerData is passed to the client dataset's AfterAS_Execute event handler.

Communicating with the Client Dataset

42.1.1.4.4 TLocalConnection.AS_GetParams Method

Fetches current parameter values from the dataset bound to a specified provider.

Pascal

```
function AS_GetParams(const ProviderName: WideString; var OwnerData: OleVariant): OleVariant;
safecall;
```

C++

```
__fastcall OleVariant AS_GetParams(const BSTR ProviderName, OleVariant OwnerData);
```

Description

Use AS_AS_GetParams to retrieve the current parameter values from the dataset associated with a provider.

The ProviderName parameter specifies the name of the provider component whose dataset has the parameters.

The OwnerData represents custom information that originates in a client dataset's BeforeAS_GetParams event handler and returns information that is passed to the client dataset's AfterAS_GetParams event handler.

AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns the parameters, encoded as a Variant array, where each element is a 2-element Variant array containing a parameter name and a parameter value. These parameters can be converted to a TParams object using the UnpackParams procedure. If the dataset has no parameters, or if the provider does not support parameter fetching, AS_GetParams_result (C++) or AS_AS_GetParams (Delphi) returns a Null Variant.

Note: AS_AS_GetParams should not be used to retrieve output parameters from stateless application servers, because parameter values may be changed by other applications. When writing a stateless application server, retrieve parameter values using the AS_Execute method instead.

Communicating with the Client Dataset

42.1.1.4.5 TLocalConnection.AS_GetProviderNames Method

Returns a list of all the available providers on a remote data module.

Pascal

```
function AS_GetProviderNames: OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetProviderNames();
```

Description

Call AS_AS_GetProviderNames for a list of all providers available from a remote data module. These values indicate the possible values for the ProviderName property of a client dataset that uses the IAppServer interface of an application server. When calling any other IAppServer method, pass one of these names to indicate the provider that is the target of the method call.

AS_AS_GetProviderNames returns the names of the providers in a Variant array. Client datasets are associated with a provider by setting their ProviderName property to one of these names.

See Also

providers

ProviderName

Providers (see page 1168)

Communicating with the Client Dataset

42.1.1.4.6 TLocalConnection.AS_GetRecords Method

Returns a data packet that contains the specified data.

Pascal

```
function AS_GetRecords(const ProviderName: WideString; Count: Integer; out RecsOut: Integer;
Options: Integer; const CommandText: WideString; var Params: OleVariant; var OwnerData:
OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_GetRecords(const BSTR ProviderName, int Count, int RecsOut, int
Options, const BSTR CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

Call AS_AS_GetRecords to retrieve a specified number of records. AS_GetRecords returns the requested records, starting with the current record of the provider's dataset. When working with a stateless remote data module, you may need to reposition the cursor or re-execute a query or stored procedure in the provider's BeforeAS_GetRecords event handler.

ProviderName gives the name of the provider component that provides the records.

Count indicates the number or type of records to retrieve. If Count is -1, all records are retrieved. If Count is 0, only metadata is retrieved. If Count is greater than 0, only Count records are retrieved.

RecsOut returns the actual number of records retrieved.

Options indicates what information should be added to the data packet in addition to data. It is a combination of the GetRecordOption constants. For example, the following value requests metadata along with a data packet encoded in XML:

```
MetaDataOption + XMLOption
MetaDataOption || XMLOption
```

CommandText specifies an optional SQL statement that replaces the SQL of a query, or the name of a table or stored procedure that replaces the provider's table or stored procedure. This parameter is ignored if the Options property does not include poAllowCommandText.

Params is a Variant containing any parameters that should be passed to the provider's dataset before it executes to generate the requested data. It returns any output parameters. You can convert between the Variant format for parameters used by this argument and a TParams object using the global PackageParams and UnpackParams routines.

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_GetRecords event handler. This information is passed to the provider's BeforeAS_GetRecords event handler. OwnerData returns information supplied by the provider's AfterAS_GetRecords event handler.

Records are returned as a data packet in a Variantparameter, AS_GetRecords_result (C++).

Communicating with the Client Dataset

42.1.1.4.7 TLocalConnection.AS_RowRequest Method

Returns information from a specified record of the provider's dataset.

Pascal

```
function AS_RowRequest(const ProviderName: WideString; Row: OleVariant; RequestType: Integer;
var OwnerData: OleVariant): OleVariant; safecall;
```

C++

```
__fastcall OleVariant AS_RowRequest(const BSTR ProviderName, OleVariant Row, int RequestType,
OleVariant OwnerData);
```

Description

Client datasets call AS_AS_RowRequest automatically to implement their FetchBlobs, FetchDetails , or RefreshRecord method.

The ProviderName parameter indicates the provider associated with the dataset from which information should be fetched.

The Row parameter is an OleVariant that describes the current record on the client dataset.

The RequestType parameter indicates the type of information required. It is an integer version of the TFetchOptions type. (An integer because the value may be marshaled to a remote application server). To create a value for RequestType, take the corresponding TFetchOptions value, cast it to a Byte, and cast the result to an Integer:

```
Integer(Byte([foBlobs, foDetails]));
(int) (Byte) (TFetchOptions() << foBlobs << foDetails);
```

OwnerData contains custom information that is supplied by a client dataset's BeforeAS_RowRequest event handler. This information is passed to the provider's BeforeAS_RowRequest event handler. OwnerData returns custom information supplied by the provider's AfterAS_RowRequest event handler.

The requested data is returned as a delta packet in AS_RowRequest_result (C++).

Communicating with the Client Dataset

42.1.1.4.8 TLocalConnection.GetConnected Method

Returns the value of the Connected property.

Pascal

```
function GetConnected: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetConnected();
```

Description

GetConnected is the protected read implementation of the Connected property. Descendant classes override this method to return true if a connection is open and false otherwise. As defined in TCustomConnection, GetConnected always returns false.

See Also

Connected

SetConnected

42.1.1.4.9 TLocalConnection.GetProvider Method

Pascal

```
function GetProvider(const ProviderName: string): TCustomProvider; virtual;
```

C++

```
virtual __fastcall TCustomProvider GetProvider(const UnicodeString ProviderName);
```

Description

This is GetProvider, a member of class TLocalConnection.

42.1.1.4.10 TLocalConnection.GetProviderNames Method

Executes a callback for all provider objects on the application server.

Pascal

```
procedure GetProviderNames(Proc: TGetStrProc); override;
```

C++

```
virtual __fastcall GetProviderNames(TGetStrProc Proc);
```

Description

Call GetProviderNames to execute the procedure specified by the Proc parameter for every provider exposed by the application server. For every provider listed by the remote data module's AS_GetProviderNames method, Proc is called with the name of the provider.

See Also

AS_GetProviderNames

AppServer

ProviderName

42.1.1.4.11 TLocalConnection.GetServer Method

Returns the IAppServer interface for communicating with local providers.

Pascal

```
function GetServer: IAppServer; override;
```

C++

```
virtual __fastcall IAppServer GetServer();
```

Description

GetServer returns the value of the AppServer (see page 4591) property.

See Also

AppServer (see page 4591)

42.1.1.4.12 TLocalConnection.InterfaceSupportsErrorInfo Method

Pascal

```
function InterfaceSupportsErrorInfo(const iid: TIID): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT InterfaceSupportsErrorInfo(const TIID iid);
```

Description

This is InterfaceSupportsErrorInfo, a member of class TLocalConnection.

42.1.1.4.13 TLocalConnection.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

FreeNotification

InsertComponent

RemoveComponent

Owner

42.1.1.4.14 TLocalConnection.RegisterProvider Method

Pascal

```
procedure RegisterProvider(Prov: TCustomProvider);
```

C++

```
__fastcall RegisterProvider(TCustomProvider Prov);
```

Description

This is RegisterProvider, a member of class TLocalConnection.

42.1.1.4.15 TLocalConnection.SafeCallException Method

Handles exceptions in methods declared using the safecall calling convention.

Pascal

```
function SafeCallException(ExceptObject: TObject; ExceptAddr: Pointer): HResult; override;
```

C++

```
virtual __fastcall HRESULT SafeCallException(TObject * ExceptObject, void * ExceptAddr);
```

Description

SafeCallException handles exceptions in methods that use the safecall calling convention. Some classes that implement interfaces override this method to handle errors that might occur. TComponent calls the implementation of this method for the interface supported by the component, if it exists. If the component does not support interfaces, this method calls the SafeCallException method inherited from TObject, which returns E_UNEXPECTED. This is a default return value that is appropriate for classes that do not support any interfaces.

See Also

System::TObject::SafeCallException (see page 3391)

42.1.1.4.16 TLocalConnection.UnRegisterProvider Method

Pascal

```
procedure UnRegisterProvider(Prov: TCustomProvider);
```

C++

```
__fastcall UnRegisterProvider(TCustomProvider Prov);
```

Description

This is UnRegisterProvider, a member of class TLocalConnection.

42.1.1.5 TLocalConnection Properties

The properties of the TLocalConnection class are listed here.

Public Properties

	Name	Description
R	AppServer (see page 4591)	Provides access to the IAppServer interface that handles communication with providers.
R	ProviderCount (see page 4591)	Indicates the number of providers in the Providers (see page 4592) property list.
R	Providers (see page 4592)	Lists the local providers with which this local connection component can communicate.

42.1.1.5.1 TLocalConnection.AppServer Property

Provides access to the IAppServer interface that handles communication with providers.

Pascal

```
property AppServer: IAppServer;
```

C++

```
__property IAppServer AppServer;
```

Description

Use AppServer to make explicit IAppServer calls to communicate with the local providers. The IAppServer interface lets you call provider methods that are otherwise unavailable because they are protected.

See Also

Providers (see page 4592)

AppServer

42.1.1.5.2 TLocalConnection.ProviderCount Property

Indicates the number of providers in the Providers (see page 4592) property list.

Pascal

```
property ProviderCount: integer;
```

C++

```
__property int ProviderCount;
```

Description

Read (see page 3727) ProviderCount to determine the number of local providers. This is the number of entries in the Providers (see page 4592) property list.

See Also

Providers (see page 4592)

42.1.1.5.3 TLocalConnection.Providers Property

Lists the local providers with which this local connection component can communicate.

Pascal

```
property Providers [const ProviderName: string]: TCustomProvider;
```

C++

```
__property TCustomProvider Providers[UnicodeString const ProviderName];
```

Description

Providers provides access to the local providers that are available through the IAppServer interface. Providers only lists the providers whose Exported property is set to true.

ProviderName is the name of a provider. If you specify a name of a provider that is not listed, TLocalConnection (see page 4580) raises an exception.

See Also

ProviderCount (see page 4591)

AppServer (see page 4591)

Exported

43 ThemedActnCtrls Namespace

This is namespace ThemedActnCtrls.

Topics

Name	Description
Classes (see page 4594)	The following table lists classes in this documentation.

Classes

	Name	Description
	TThemedAddRemoveItem (see page 4594)	This is class ThemedActnCtrls.TThemedAddRemoveItem.
	TThemedButtonControl (see page 4597)	This is class ThemedActnCtrls.TThemedButtonControl.
	TThemedCustomizePopup (see page 4599)	This is class ThemedActnCtrls.TThemedCustomizePopup.
	TThemedDropDownButton (see page 4601)	This is class ThemedActnCtrls.TThemedDropDownButton.
	TThemedExpandBtn (see page 4604)	This is class ThemedActnCtrls.TThemedExpandBtn.
	TThemedMenuButton (see page 4605)	This is class ThemedActnCtrls.TThemedMenuButton.
	TThemedMenuItem (see page 4607)	This is class ThemedActnCtrls.TThemedMenuItem.
	TThemedPopupMenu (see page 4611)	This is class ThemedActnCtrls.TThemedPopupMenu.
	TThemedToolScrollBtn (see page 4613)	This is class ThemedActnCtrls.TThemedToolScrollBtn.

43.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TThemedAddRemoveItem (see page 4594)	This is class ThemedActnCtrls.TThemedAddRemoveItem.
	TThemedButtonControl (see page 4597)	This is class ThemedActnCtrls.TThemedButtonControl.
	TThemedCustomizePopup (see page 4599)	This is class ThemedActnCtrls.TThemedCustomizePopup.
	TThemedDropDownButton (see page 4601)	This is class ThemedActnCtrls.TThemedDropDownButton.
	TThemedExpandBtn (see page 4604)	This is class ThemedActnCtrls.TThemedExpandBtn.
	TThemedMenuButton (see page 4605)	This is class ThemedActnCtrls.TThemedMenuButton.
	TThemedMenuItem (see page 4607)	This is class ThemedActnCtrls.TThemedMenuItem.
	TThemedPopupMenu (see page 4611)	This is class ThemedActnCtrls.TThemedPopupMenu.
	TThemedToolScrollBtn (see page 4613)	This is class ThemedActnCtrls.TThemedToolScrollBtn.

43.1.1 TThemedAddRemoveItem Class

Class Hierarchy

Pascal

```
TThemedAddRemoveItem = class(TCustomAddRemoveItem);
```

C++

```
class TThemedAddRemoveItem : public TCustomAddRemoveItem;
```

File

ThemedActnCtrls

Description

This is class ThemedActnCtrls.TThemedAddRemoveItem.

43.1.1.1 TThemedAddRemoveItem Members

The following tables list the members exposed by TThemedAddRemoveItem.

Protected Methods

	Name	Description
	DrawBackground (see page 4595)	Draws a background image on the control.
	DrawGlyph (see page 4596)	Draws a symbol on the control.
	DrawSeparator (see page 4596)	This is DrawSeparator, a member of class TThemedAddRemoveItem.
	DrawText (see page 4596)	Draws text on the control.
	DrawUnusedEdges (see page 4597)	This is DrawUnusedEdges, a member of class TThemedAddRemoveItem.
	GetImageSize (see page 4597)	This is GetImageSize, a member of class TThemedAddRemoveItem.

Public Methods

	Name	Description
	CalcBounds (see page 4595)	Calculates the size of the add/remove menu item.

43.1.1.2 TThemedAddRemoveItem Methods

The methods of the TThemedAddRemoveItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 4595)	Draws a background image on the control.
	DrawGlyph (see page 4596)	Draws a symbol on the control.
	DrawSeparator (see page 4596)	This is DrawSeparator, a member of class TThemedAddRemoveItem.
	DrawText (see page 4596)	Draws text on the control.
	DrawUnusedEdges (see page 4597)	This is DrawUnusedEdges, a member of class TThemedAddRemoveItem.
	GetImageSize (see page 4597)	This is GetImageSize, a member of class TThemedAddRemoveItem.

Public Methods

	Name	Description
	CalcBounds (see page 4595)	Calculates the size of the add/remove menu item.

43.1.1.2.1 TThemedAddRemoveItem.CalcBounds Method

Calculates the size of the add/remove menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

CalcBounds updates the Height, Width, and TextBounds properties to reflect current conditions (such as the item's caption and the current font).

See Also

Height

Width

TextBounds

43.1.1.2.2 TThemedAddRemoveItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

43.1.1.2.3 TThemedAddRemoveItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

43.1.1.2.4 TThemedAddRemoveItem.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TThemedAddRemoveItem.

43.1.1.2.5 TThemedAddRemoveItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var Rect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect Rect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

43.1.1.2.6 TThemedAddRemoveItem.DrawUnusedEdges Method

Pascal

```
procedure DrawUnusedEdges; override;
```

C++

```
virtual __fastcall DrawUnusedEdges();
```

Description

This is DrawUnusedEdges, a member of class TThemedAddRemoveItem.

43.1.1.2.7 TThemedAddRemoveItem.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

Description

This is GetImageSize, a member of class TThemedAddRemoveItem.

43.1.2 TThemedButtonControl Class

Class Hierarchy

Pascal

```
TThemedButtonControl = class(TCustomButtonControl);
```

C++

```
class TThemedButtonControl : public TCustomButtonControl;
```

File

ThemedActnCtrls

Description

This is class ThemedActnCtrls.TThemedButtonControl.

43.1.2.1 TThemedButtonControl Members

The following tables list the members exposed by TThemedButtonControl.

Protected Methods

	Name	Description
	DrawBackground (see page 4598)	Draws a background image on the control.
	DrawFrame (see page 4598)	This is DrawFrame, a member of class TThemedButtonControl.
	DrawGlyph (see page 4598)	Draws a symbol on the control.

	DrawLargeGlyph (see page 4599)	This is DrawLargeGlyph, a member of class TThemedButtonControl.
	DrawText (see page 4599)	Draws text on the control.

43.1.2.2 TThemedButtonControl Methods

The methods of the TThemedButtonControl class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 4598)	Draws a background image on the control.
	DrawFrame (see page 4598)	This is DrawFrame, a member of class TThemedButtonControl.
	DrawGlyph (see page 4598)	Draws a symbol on the control.
	DrawLargeGlyph (see page 4599)	This is DrawLargeGlyph, a member of class TThemedButtonControl.
	DrawText (see page 4599)	Draws text on the control.

43.1.2.2.1 TThemedButtonControl.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

43.1.2.2.2 TThemedButtonControl.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TThemedButtonControl.

43.1.2.2.3 TThemedButtonControl.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

43.1.2.2.4 TThemedButtonControl.DrawLargeGlyph Method

Pascal

```
procedure DrawLargeGlyph(Location: TPoint); override;
```

C++

```
virtual __fastcall DrawLargeGlyph(TPoint Location);
```

Description

This is DrawLargeGlyph, a member of class TThemedButtonControl.

43.1.2.2.5 TThemedButtonControl.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

43.1.3 TThemedCustomizePopup Class

Class Hierarchy

Pascal

```
TThemedCustomizePopup = class(TCustomizeActionToolBar);
```

C++

```
class TThemedCustomizePopup : public TCustomizeActionToolBar;
```

File

ThemedActnCtrls

Description

This is class ThemedActnCtrls.TThemedCustomizePopup.

43.1.3.1 TThemedCustomizePopup Members

The following tables list the members exposed by TThemedCustomizePopup.

Protected Methods

	Name	Description
	GetAddRemoveItemClass (see page 4600)	This is GetAddRemoveItemClass, a member of class TThemedCustomizePopup.
	GetDefaultColorMapClass (see page 4601)	This is GetDefaultColorMapClass, a member of class TThemedCustomizePopup.
	NCPaint (see page 4601)	This is NCPaint, a member of class TThemedCustomizePopup.

Public Methods

	Name	Description
	Create (see page 4600)	Creates and initializes a TCustomActionPopupMenu instance.

43.1.3.2 TThemedCustomizePopup.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TThemedCustomizePopup(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

43.1.3.3 TThemedCustomizePopup Methods

The methods of the TThemedCustomizePopup class are listed here.

Protected Methods

	Name	Description
	GetAddRemoveItemClass (see page 4600)	This is GetAddRemoveItemClass, a member of class TThemedCustomizePopup.
	GetDefaultColorMapClass (see page 4601)	This is GetDefaultColorMapClass, a member of class TThemedCustomizePopup.
	NCPaint (see page 4601)	This is NCPaint, a member of class TThemedCustomizePopup.

43.1.3.3.1 TThemedCustomizePopup.GetAddRemoveItemClass Method

Pascal

```
function GetAddRemoveItemClass: TCustomAddRemoveItemClass; override;
```

C++

```
virtual __fastcall TCustomAddRemoveItemClass GetAddRemoveItemClass();
```

Description

This is GetAddRemoveItemClass, a member of class TThemedCustomizePopup.

43.1.3.3.2 TThemedCustomizePopup.GetDefaultColorMapClass Method

Pascal

```
function GetDefaultColorMapClass: TCustomColorMapClass; override;
```

C++

```
virtual __fastcall TCustomColorMapClass GetDefaultColorMapClass();
```

Description

This is GetDefaultColorMapClass, a member of class TThemedCustomizePopup.

43.1.3.3.3 TThemedCustomizePopup.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TThemedCustomizePopup.

43.1.4 TThemedDropDownButton Class

Class Hierarchy

Pascal

```
TThemedDropDownButton = class(TCustomDropDownButton);
```

C++

```
class TThemedDropDownButton : public TCustomDropDownButton;
```

File

ThemedActnCtrls

Description

This is class ThemedActnCtrls.TThemedDropDownButton.

43.1.4.1 TThemedDropDownButton Members

The following tables list the members exposed by TThemedDropDownButton.

Protected Methods

	Name	Description
	DrawBackground (see page 4602)	Draws a background image on the control.
	DrawFrame (see page 4602)	This is DrawFrame, a member of class TThemedDropDownButton.
	DrawGlyph (see page 4603)	Draws a symbol on the control.
	DrawLargeGlyph (see page 4603)	This is DrawLargeGlyph, a member of class TThemedDropDownButton.
	GetDropDownButtonWidth (see page 4603)	This is GetDropDownButtonWidth, a member of class TThemedDropDownButton.
	GetPopupClass (see page 4603)	This is GetPopupClass, a member of class TThemedDropDownButton.

43.1.4.2 TThemedDropDownButton Methods

The methods of the TThemedDropDownButton class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 4602)	Draws a background image on the control.
	DrawFrame (see page 4602)	This is DrawFrame, a member of class TThemedDropDownButton.
	DrawGlyph (see page 4603)	Draws a symbol on the control.
	DrawLargeGlyph (see page 4603)	This is DrawLargeGlyph, a member of class TThemedDropDownButton.
	GetDropDownButtonWidth (see page 4603)	This is GetDropDownButtonWidth, a member of class TThemedDropDownButton.
	GetPopupClass (see page 4603)	This is GetPopupClass, a member of class TThemedDropDownButton.

43.1.4.2.1 TThemedDropDownButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

43.1.4.2.2 TThemedDropDownButton.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TThemedDropDownButton.

43.1.4.2.3 TThemedDropDownButton.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

43.1.4.2.4 TThemedDropDownButton.DrawLargeGlyph Method

Pascal

```
procedure DrawLargeGlyph(Location: TPoint); override;
```

C++

```
virtual __fastcall DrawLargeGlyph(TPoint Location);
```

Description

This is DrawLargeGlyph, a member of class TThemedDropDownButton.

43.1.4.2.5 TThemedDropDownButton.GetDropDownButtonWidth Method

Pascal

```
function GetDropDownButtonWidth: Integer; override;
```

C++

```
virtual __fastcall int GetDropDownButtonWidth();
```

Description

This is GetDropDownButtonWidth, a member of class TThemedDropDownButton.

43.1.4.2.6 TThemedDropDownButton.GetPopupClass Method

Pascal

```
function GetPopupClass: TCustomActionBarClass; override;
```

C++

```
virtual __fastcall TCustomActionBarClass GetPopupClass();
```

Description

This is GetPopupClass, a member of class TThemedDropDownButton.

43.1.5 TThemedExpandBtn Class

Class Hierarchy

Pascal

```
TThemedExpandBtn = class(TCustomMenuExpandBtn);
```

C++

```
class TThemedExpandBtn : public TCustomMenuExpandBtn;
```

File

ThemedActnCtrls

Description

This is class ThemedActnCtrls.TThemedExpandBtn.

43.1.5.1 TThemedExpandBtn Members

The following tables list the members exposed by TThemedExpandBtn.

Protected Methods

	Name	Description
	DrawBackground (see page 4604)	Draws a background image on the control.
	DrawFrame (see page 4605)	This is DrawFrame, a member of class TThemedExpandBtn.
	GetImageSize (see page 4605)	This is GetImageSize, a member of class TThemedExpandBtn.

43.1.5.2 TThemedExpandBtn Methods

The methods of the TThemedExpandBtn class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 4604)	Draws a background image on the control.
	DrawFrame (see page 4605)	This is DrawFrame, a member of class TThemedExpandBtn.
	GetImageSize (see page 4605)	This is GetImageSize, a member of class TThemedExpandBtn.

43.1.5.2.1 TThemedExpandBtn.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

43.1.5.2.2 TThemedExpandBtn.DrawFrame Method

Pascal

```
procedure DrawFrame(ARect: TRect; Down: Boolean); override;
```

C++

```
virtual __fastcall DrawFrame(TRect ARect, Boolean Down);
```

Description

This is DrawFrame, a member of class TThemedExpandBtn.

43.1.5.2.3 TThemedExpandBtn.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

Description

This is GetImageSize, a member of class TThemedExpandBtn.

43.1.6 TThemedMenuButton Class

Class Hierarchy

Pascal

```
TThemedMenuButton = class(TCustomMenuButton);
```

C++

```
class TThemedMenuButton : public TCustomMenuButton;
```

File

ThemedActnCtrls

Description

This is class ThemedActnCtrls.TThemedMenuButton.

43.1.6.1 TThemedMenuButton Members

The following tables list the members exposed by TThemedMenuButton.

Protected Methods

	Name	Description
	DrawBackground (see page 4606)	Draws a background image on the control.
	DrawText (see page 4607)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 4606)	Calculates the size of the control.

43.1.6.2 TThemedMenuButton Methods

The methods of the TThemedMenuButton class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 4606)	Draws a background image on the control.
	DrawText (see page 4607)	Draws text on the control.

Public Methods

	Name	Description
	CalcBounds (see page 4606)	Calculates the size of the control.

43.1.6.2.1 TThemedMenuButton.CalcBounds Method

Calculates the size of the control.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

This method is largely the same as CalcBounds (TCustomActionControl), with one minor exception. The width of the control is set to be one pixel wider. For more information, see the documentation for the inherited method.

See Also

CalcBounds

43.1.6.2.2 TThemedMenuButton.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

43.1.6.2.3 TThemedMenuButton.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var ARect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect ARect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

43.1.7 TThemedMenuItem Class

Class Hierarchy

Pascal

```
TThemedMenuItem = class(TCustomMenuItem);
```

C++

```
class TThemedMenuItem : public TCustomMenuItem;
```

File

ThemedActnCtrls

Description

This is class ThemedActnCtrls.TThemedMenuItem.

43.1.7.1 TThemedMenuItem Members

The following tables list the members exposed by TThemedMenuItem.

Protected Methods

	Name	Description
	DrawBackground (see page 4608)	Draws a background image on the control.
	DrawGlyph (see page 4609)	Draws a symbol on the control.
	DrawLargeGlyph (see page 4609)	This is DrawLargeGlyph, a member of class TThemedMenuItem.
	DrawSeparator (see page 4609)	This is DrawSeparator, a member of class TThemedMenuItem.

	DrawShadowedText (see page 4610)	This is DrawShadowedText, a member of class TThemedMenuItem.
	DrawSubMenuGlyph (see page 4610)	This is DrawSubMenuGlyph, a member of class TThemedMenuItem.
	DrawText (see page 4610)	Draws text on the control.
	DrawUnusedEdges (see page 4610)	This is DrawUnusedEdges, a member of class TThemedMenuItem.
	GetImageSize (see page 4611)	This is GetImageSize, a member of class TThemedMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 4608)	Calculates the size of the menu item.

43.1.7.2 TThemedMenuItem Methods

The methods of the TThemedMenuItem class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 4608)	Draws a background image on the control.
	DrawGlyph (see page 4609)	Draws a symbol on the control.
	DrawLargeGlyph (see page 4609)	This is DrawLargeGlyph, a member of class TThemedMenuItem.
	DrawSeparator (see page 4609)	This is DrawSeparator, a member of class TThemedMenuItem.
	DrawShadowedText (see page 4610)	This is DrawShadowedText, a member of class TThemedMenuItem.
	DrawSubMenuGlyph (see page 4610)	This is DrawSubMenuGlyph, a member of class TThemedMenuItem.
	DrawText (see page 4610)	Draws text on the control.
	DrawUnusedEdges (see page 4610)	This is DrawUnusedEdges, a member of class TThemedMenuItem.
	GetImageSize (see page 4611)	This is GetImageSize, a member of class TThemedMenuItem.

Public Methods

	Name	Description
	CalcBounds (see page 4608)	Calculates the size of the menu item.

43.1.7.2.1 TThemedMenuItem.CalcBounds Method

Calculates the size of the menu item.

Pascal

```
procedure CalcBounds; override;
```

C++

```
virtual __fastcall CalcBounds();
```

Description

The size of the control depends on many factors, such as whether or not the menu item is a separator or not. CalcBounds computes the boundaries of the menu item considering these kinds of factors. At the end, it calls SetBounds and other routines to ensure that the values are set properly.

See Also

SetBounds

43.1.7.2.2 TThemedMenuItem.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

See Also

DrawGlyph

DrawText

43.1.7.2.3 TThemedMenuItem.DrawGlyph Method

Draws a symbol on the control.

Pascal

```
procedure DrawGlyph(const Location: TPoint); override;
```

C++

```
virtual __fastcall DrawGlyph(const TPoint Location);
```

Description

Use DrawGlyph to draw a symbol on the control at the specified location.

See Also

DrawBackground

DrawText

43.1.7.2.4 TThemedMenuItem.DrawLargeGlyph Method

Pascal

```
procedure DrawLargeGlyph(Location: TPoint); override;
```

C++

```
virtual __fastcall DrawLargeGlyph(TPoint Location);
```

Description

This is DrawLargeGlyph, a member of class TThemedMenuItem.

43.1.7.2.5 TThemedMenuItem.DrawSeparator Method

Pascal

```
procedure DrawSeparator(const Offset: Integer); override;
```

C++

```
virtual __fastcall DrawSeparator(const int Offset);
```

Description

This is DrawSeparator, a member of class TThemedMenuItem.

43.1.7.2.6 TThemedMenuItem.DrawShadowedText Method

Pascal

```
procedure DrawShadowedText(Rect: TRect; Flags: Cardinal; Text: string; TextColor: TColor;
ShadowColor: TColor); override;
```

C++

```
virtual __fastcall DrawShadowedText(TRect Rect, unsigned Flags, UnicodeString Text, TColor
TextColor, TColor ShadowColor);
```

Description

This is DrawShadowedText, a member of class TThemedMenuItem.

43.1.7.2.7 TThemedMenuItem.DrawSubMenuGlyph Method

Pascal

```
procedure DrawSubMenuGlyph; override;
```

C++

```
virtual __fastcall DrawSubMenuGlyph();
```

Description

This is DrawSubMenuGlyph, a member of class TThemedMenuItem.

43.1.7.2.8 TThemedMenuItem.DrawText Method

Draws text on the control.

Pascal

```
procedure DrawText(var Rect: TRect; var Flags: Cardinal; Text: string); override;
```

C++

```
virtual __fastcall DrawText(TRect Rect, unsigned Flags, UnicodeString Text);
```

Description

Use DrawText to draw the text specified by Text on the control within the area specified by ARect.

See Also

DrawBackground

DrawGlyph

43.1.7.2.9 TThemedMenuItem.DrawUnusedEdges Method

Pascal

```
procedure DrawUnusedEdges; override;
```

C++

```
virtual __fastcall DrawUnusedEdges();
```

Description

This is DrawUnusedEdges, a member of class TThemedMenuItem.

43.1.7.2.10 TThemedMenuItem.GetImageSize Method

Pascal

```
function GetImageSize: TPoint; override;
```

C++

```
virtual __fastcall TPoint GetImageSize();
```

Description

This is GetImageSize, a member of class TThemedMenuItem.

43.1.8 TThemedPopupMenu Class

Class Hierarchy

Pascal

```
TThemedPopupMenu = class(TCustomActionPopupMenu);
```

C++

```
class TThemedPopupMenu : public TCustomActionPopupMenu;
```

File

ThemedActnCtrls

Description

This is class ThemedActnCtrls.TThemedPopupMenu.

43.1.8.1 TThemedPopupMenu Members

The following tables list the members exposed by TThemedPopupMenu.

Protected Methods

	Name	Description
	GetExpandBtnClass (see page 4612)	This is GetExpandBtnClass, a member of class TThemedPopupMenu.
	NCPaint (see page 4612)	This is NCPaint, a member of class TThemedPopupMenu.
	PositionPopup (see page 4612)	This is PositionPopup, a member of class TThemedPopupMenu.
	VisibleChanging (see page 4613)	Provides the interface for a method that responds to changes in the control's visibility.

Public Methods

	Name	Description
	Create (see page 4611)	Creates and initializes a TCustomActionPopupMenu instance.

43.1.8.2 TThemedPopupMenu.Create Constructor

Creates and initializes a TCustomActionPopupMenu instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TThemedPopupMenu(TComponent * AOwner);
```

Description

Create generates a TCustomActionPopupMenu and initializes its properties.

```
__fastcall virtual TCustomActionMenuBar (Classes::TComponentTComponent_Object* AOwner);
__fastcall TCustomActionMenuBar (HWND ParentWindow) :
Controls::TWinControlTWinControl_Create(ParentWindow) { }
```

43.1.8.3 TThemedPopupMenu Methods

The methods of the TThemedPopupMenu class are listed here.

Protected Methods

	Name	Description
	GetExpandBtnClass (see page 4612)	This is GetExpandBtnClass, a member of class TThemedPopupMenu.
	NCPaint (see page 4612)	This is NCPaint, a member of class TThemedPopupMenu.
	PositionPopup (see page 4612)	This is PositionPopup, a member of class TThemedPopupMenu.
	VisibleChanging (see page 4613)	Provides the interface for a method that responds to changes in the control's visibility.

43.1.8.3.1 TThemedPopupMenu.GetExpandBtnClass Method

Pascal

```
function GetExpandBtnClass: TCustomMenuExpandBtnClass; override;
```

C++

```
virtual __fastcall TCustomMenuExpandBtnClass GetExpandBtnClass();
```

Description

This is GetExpandBtnClass, a member of class TThemedPopupMenu.

43.1.8.3.2 TThemedPopupMenu.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); override;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TThemedPopupMenu.

43.1.8.3.3 TThemedPopupMenu.PositionPopup Method

Pascal

```
procedure PositionPopup(AnOwner: TCustomActionBar; ParentItem: TCustomActionControl); override;
```

C++

```
virtual __fastcall PositionPopup(TCustomActionBar AnOwner, TCustomActionControl ParentItem);
```

Description

This is PositionPopup, a member of class TThemedPopupMenu.

43.1.8.3.4 TThemedPopupMenu.VisibleChanging Method

Provides the interface for a method that responds to changes in the control's visibility.

Pascal

```
procedure VisibleChanging; override;
```

C++

```
virtual __fastcall VisibleChanging();
```

Description

VisibleChanging is called before the value of a control's Visible property changes. As implemented in TControl, it does nothing. Override VisibleChanging to respond to changes in the control's visibility. For example, if a control should not change its visibility, override VisibleChanging to raise an exception when an attempt is made to alter the control's visibility.

Visible

43.1.9 TThemedToolScrollBtn Class

Class Hierarchy

Pascal

```
TThemedToolScrollBtn = class(TCustomToolScrollBtn);
```

C++

```
class TThemedToolScrollBtn : public TCustomToolScrollBtn;
```

File

ThemedActnCtrls

Description

This is class ThemedActnCtrls.TThemedToolScrollBtn.

43.1.9.1 TThemedToolScrollBtn Members

The following tables list the members exposed by TThemedToolScrollBtn.

Protected Methods

	Name	Description
	DrawBackground (see page 4614)	Draws a background image on the control.

43.1.9.2 TThemedToolScrollBtn Methods

The methods of the TThemedToolScrollBtn class are listed here.

Protected Methods

	Name	Description
	DrawBackground (see page 4614)	Draws a background image on the control.

43.1.9.2.1 TThemedToolScrollBtn.DrawBackground Method

Draws a background image on the control.

Pascal

```
procedure DrawBackground(var PaintRect: TRect); override;
```

C++

```
virtual __fastcall DrawBackground(TRect PaintRect);
```

Description

Use DrawBackground to draw a background image on the control within the area specified by PaintRect.

	TThemedElement (see page 4639)	This is record Themes.TThemedElement.
	TThemedElementDetails (see page 4640)	This is record Themes.TThemedElementDetails.
	TThemedExplorerBar (see page 4641)	This is record Themes.TThemedExplorerBar.
	TThemedHeader (see page 4642)	This is record Themes.TThemedHeader.
	TThemedListview (see page 4643)	This is record Themes.TThemedListview.
	TThemedMenu (see page 4643)	This is record Themes.TThemedMenu.
	TThemedPage (see page 4644)	This is record Themes.TThemedPage.
	TThemedProgress (see page 4645)	This is record Themes.TThemedProgress.
	TThemedRebar (see page 4646)	This is record Themes.TThemedRebar.

	TThemedScrollBar (see page 4647)	This is record Themes.TThemedScrollBar.
	TThemedSpin (see page 4649)	This is record Themes.TThemedSpin.
	TThemedStartPanel (see page 4650)	This is record Themes.TThemedStartPanel.
	TThemedStatus (see page 4650)	This is record Themes.TThemedStatus.
	TThemedTab (see page 4651)	This is record Themes.TThemedTab.
	TThemedTaskBand (see page 4653)	This is record Themes.TThemedTaskBand.
	TThemedTaskBar (see page 4653)	This is record Themes.TThemedTaskBar.
	TThemedToolBar (see page 4654)	This is record Themes.TThemedToolBar.
	TThemedToolTip (see page 4655)	This is record Themes.TThemedToolTip.
	TThemedTrackBar (see page 4656)	This is record Themes.TThemedTrackBar.
	TThemedTrayNotify (see page 4657)	This is record Themes.TThemedTrayNotify.
	TThemedTreeview (see page 4658)	This is record Themes.TThemedTreeview.
	TThemedWindow (see page 4658)	This is record Themes.TThemedWindow.

Types

Name	Description
PThemedElementDetails (see page 4663)	This is type Themes.PThemedElementDetails.
TThemeData (see page 4663)	This is type Themes.TThemeData.
TThemeServicesClass (see page 4663)	This is type Themes.TThemeServicesClass.

Variables

Name	Description
ThemeServicesClass (see page 4665)	This is variable Themes.ThemeServicesClass.

44.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TThemeServices (see page 4617)	This is class Themes.TThemeServices.

44.1.1 TThemeServices Class

Class Hierarchy

Pascal

```
TThemeServices = class(TObject);
```

C++

```
class TThemeServices : public TObject;
```

File

Themes

Description

This is class Themes.TThemeServices.

44.1.1.1 TThemeServices Members

The following tables list the members exposed by TThemeServices.

Protected Methods

	Name	Description
	DoOnThemeChange (see page 4621)	This is DoOnThemeChange, a member of class TThemeServices.
	UnloadThemeData (see page 4631)	This is UnloadThemeData, a member of class TThemeServices.

Public Events

	Name	Description
	OnThemeChange (see page 4633)	This is OnThemeChange, a member of class TThemeServices.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	ApplyThemeChange (see page 4620)	This is ApplyThemeChange, a member of class TThemeServices.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.

	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ColorToRGB (see page 4620)	This is the overview for the ColorToRGB method overload.
	ContentRect (see page 4621)	This is ContentRect, a member of class TThemeServices.
V	Create (see page 4618)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 4619)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DrawEdge (see page 4621)	This is the overview for the DrawEdge method overload.
	DrawElement (see page 4622)	This is the overview for the DrawElement method overload.
	DrawIcon (see page 4623)	This is DrawIcon, a member of class TThemeServices.
	DrawParentBackground (see page 4623)	This is the overview for the DrawParentBackground method overload.
	DrawText (see page 4625)	This is DrawText, a member of class TThemeServices.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetElementDetails (see page 4625)	This is the overview for the GetElementDetails method overload.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	HasTransparentParts (see page 4631)	This is HasTransparentParts, a member of class TThemeServices.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	PaintBorder (see page 4631)	This is PaintBorder, a member of class TThemeServices.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.
	UpdateThemes (see page 4632)	This is UpdateThemes, a member of class TThemeServices.

Public Properties

	Name	Description
R	Theme (see page 4632)	This is Theme, a member of class TThemeServices.
R	ThemesAvailable (see page 4632)	This is ThemesAvailable, a member of class TThemeServices.
R	ThemesEnabled (see page 4632)	This is ThemesEnabled, a member of class TThemeServices.

44.1.1.2 TThemeServices.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create; virtual;
```

C++

```
virtual __fastcall TThemeServices();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

System::TObject::Free (see page 3382)

44.1.1.3 TThemeServices.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TThemeServices();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

44.1.1.4 TThemeServices Methods

The methods of the TThemeServices class are listed here.

Protected Methods

	Name	Description
	DoOnThemeChange (see page 4621)	This is DoOnThemeChange, a member of class TThemeServices.
	UnloadThemeData (see page 4631)	This is UnloadThemeData, a member of class TThemeServices.

Public Methods

	Name	Description
	ApplyThemeChange (see page 4620)	This is ApplyThemeChange, a member of class TThemeServices.
	ColorToRGB (see page 4620)	This is the overview for the ColorToRGB method overload.
	ContentRect (see page 4621)	This is ContentRect, a member of class TThemeServices.
	DrawEdge (see page 4621)	This is the overview for the DrawEdge method overload.
	DrawElement (see page 4622)	This is the overview for the DrawElement method overload.
	DrawIcon (see page 4623)	This is DrawIcon, a member of class TThemeServices.
	DrawParentBackground (see page 4623)	This is the overview for the DrawParentBackground method overload.
	DrawText (see page 4625)	This is DrawText, a member of class TThemeServices.
	GetElementDetails (see page 4625)	This is the overview for the GetElementDetails method overload.
	HasTransparentParts (see page 4631)	This is HasTransparentParts, a member of class TThemeServices.
	PaintBorder (see page 4631)	This is PaintBorder, a member of class TThemeServices.
	UpdateThemes (see page 4632)	This is UpdateThemes, a member of class TThemeServices.

44.1.1.4.1 TThemeServices.ApplyThemeChange Method

Pascal

```
procedure ApplyThemeChange;
```

C++

```
__fastcall ApplyThemeChange();
```

Description

This is ApplyThemeChange, a member of class TThemeServices.

44.1.1.4.2 ColorToRGB Method

This is the overview for the ColorToRGB method overload.

Overload List

	Name	Description
	TThemeServices.ColorToRGB (TColor) (see page 4620)	This is ColorToRGB, a member of class TThemeServices.
	TThemeServices.ColorToRGB (TColor, PThemedElementDetails) (see page 4621)	This is ColorToRGB, a member of class TThemeServices.

44.1.1.4.2.1 TThemeServices.ColorToRGB Method (TColor)

Pascal

```
function ColorToRGB(Color: TColor): COLORREF; overload;
```

C++

```
__fastcall COLORREF ColorToRGB(TColor Color);
```

Description

This is ColorToRGB, a member of class TThemeServices.

44.1.1.4.2.2 TThemeServices.ColorToRGB Method (TColor, PThemedElementDetails)

Pascal

```
function ColorToRGB(Color: TColor; Details: PThemedElementDetails): COLORREF; overload;
```

C++

```
__fastcall COLORREF ColorToRGB(TColor Color, PThemedElementDetails Details);
```

Description

This is ColorToRGB, a member of class TThemeServices.

44.1.1.4.3 TThemeServices.ContentRect Method

Pascal

```
function ContentRect(DC: HDC; Details: TThemedElementDetails; BoundingRect: TRect): TRect;
```

C++

```
__fastcall TRect ContentRect(HDC DC, TThemedElementDetails Details, TRect BoundingRect);
```

Description

This is ContentRect, a member of class TThemeServices.

44.1.1.4.4 TThemeServices.DoOnThemeChange Method

Pascal

```
procedure DoOnThemeChange; virtual;
```

C++

```
virtual __fastcall DoOnThemeChange();
```

Description

This is DoOnThemeChange, a member of class TThemeServices.

44.1.1.4.5 DrawEdge Method

This is the overview for the DrawEdge method overload.

Overload List

	Name	Description
	TThemeServices.DrawEdge (HDC, TThemedElementDetails, TRect, Cardinal, Cardinal) (see page 4622)	This is DrawEdge, a member of class TThemeServices.
	TThemeServices.DrawEdge (HDC, TThemedElementDetails, TRect, Cardinal, Cardinal, PRect) (see page 4622)	This is DrawEdge, a member of class TThemeServices.

44.1.1.4.5.1 TThemeServices.DrawEdge Method (HDC, TThemedElementDetails, TRect, Cardinal, Cardinal)

Pascal

```
procedure DrawEdge(DC: HDC; Details: TThemedElementDetails; const R: TRect; Edge: Cardinal;
Flags: Cardinal); overload;
```

C++

```
__fastcall DrawEdge(HDC DC, TThemedElementDetails Details, const TRect R, unsigned Edge,
unsigned Flags);
```

Description

This is DrawEdge, a member of class TThemeServices.

44.1.1.4.5.2 TThemeServices.DrawEdge Method (HDC, TThemedElementDetails, TRect, Cardinal, Cardinal, PRect)

Pascal

```
procedure DrawEdge(DC: HDC; Details: TThemedElementDetails; const R: TRect; Edge: Cardinal;
Flags: Cardinal; ContentRect: PRect); overload;
```

C++

```
__fastcall DrawEdge(HDC DC, TThemedElementDetails Details, const TRect R, unsigned Edge,
unsigned Flags, PRect ContentRect);
```

Description

This is DrawEdge, a member of class TThemeServices.

44.1.1.4.6 DrawElement Method

This is the overview for the DrawElement method overload.

Overload List

	Name	Description
	TThemeServices.DrawElement (HDC, TThemedElementDetails, TRect) (see page 4622)	This is DrawElement, a member of class TThemeServices.
	TThemeServices.DrawElement (HDC, TThemedElementDetails, TRect, PRect) (see page 4623)	This is DrawElement, a member of class TThemeServices.
	TThemeServices.DrawElement (HDC, TThemedElementDetails, TRect, TRect) (see page 4623)	This is DrawElement, a member of class TThemeServices.

44.1.1.4.6.1 TThemeServices.DrawElement Method (HDC, TThemedElementDetails, TRect)

Pascal

```
procedure DrawElement(DC: HDC; Details: TThemedElementDetails; const R: TRect); overload;
```

C++

```
__fastcall DrawElement(HDC DC, TThemedElementDetails Details, const TRect R);
```

Description

This is DrawElement, a member of class TThemeServices.

44.1.1.4.6.2 TThemeServices.DrawElement Method (HDC, TThemedElementDetails, TRect, PRect)

Pascal

```
procedure DrawElement(DC: HDC; Details: TThemedElementDetails; const R: TRect; ClipRect:
PRect); overload;
```

C++

```
__fastcall DrawElement(HDC DC, TThemedElementDetails Details, const TRect R, PRect ClipRect);
```

Description

This is DrawElement, a member of class TThemeServices.

44.1.1.4.6.3 TThemeServices.DrawElement Method (HDC, TThemedElementDetails, TRect, TRect)

Pascal

```
procedure DrawElement(DC: HDC; Details: TThemedElementDetails; const R: TRect; ClipRect:
TRect); overload;
```

C++

```
__fastcall DrawElement(HDC DC, TThemedElementDetails Details, const TRect R, TRect ClipRect);
```

Description

This is DrawElement, a member of class TThemeServices.

44.1.1.4.7 TThemeServices.DrawIcon Method

Pascal

```
procedure DrawIcon(DC: HDC; Details: TThemedElementDetails; const R: TRect; himl: HIMAGELIST;
Index: Integer);
```

C++

```
__fastcall DrawIcon(HDC DC, TThemedElementDetails Details, const TRect R, HIMAGELIST himl, int
Index);
```

Description

This is DrawIcon, a member of class TThemeServices.

44.1.1.4.8 DrawParentBackground Method

This is the overview for the DrawParentBackground method overload.

Overload List

	Name	Description
	TThemeServices.DrawParentBackground (HWND, HDC, PThemedElementDetails, Boolean, PRect) (see page 4624)	This is DrawParentBackground, a member of class TThemeServices.

	TThemeServices.DrawParentBackground (HWND, HDC, PThemedElementDetails, Boolean, TRect) (see page 4624)	This is DrawParentBackground, a member of class TThemeServices.
	TThemeServices.DrawParentBackground (HWND, HDC, TThemedElementDetails, Boolean, PRect) (see page 4624)	This is DrawParentBackground, a member of class TThemeServices.

44.1.1.4.8.1 TThemeServices.DrawParentBackground Method (HWND, HDC, PThemedElementDetails, Boolean, PRect)

Pascal

```
procedure DrawParentBackground(Window: HWND; Target: HDC; Details: PThemedElementDetails;
OnlyIfTransparent: Boolean; Bounds: PRect = nil); overload;
```

C++

```
__fastcall DrawParentBackground(HWND Window, HDC Target, PThemedElementDetails Details,
Boolean OnlyIfTransparent, PRect Bounds = nil);
```

Description

This is DrawParentBackground, a member of class TThemeServices.

44.1.1.4.8.2 TThemeServices.DrawParentBackground Method (HWND, HDC, PThemedElementDetails, Boolean, TRect)

Pascal

```
procedure DrawParentBackground(Window: HWND; Target: HDC; Details: PThemedElementDetails;
OnlyIfTransparent: Boolean; const Bounds: TRect); overload;
```

C++

```
__fastcall DrawParentBackground(HWND Window, HDC Target, PThemedElementDetails Details,
Boolean OnlyIfTransparent, const TRect Bounds);
```

Description

This is DrawParentBackground, a member of class TThemeServices.

44.1.1.4.8.3 TThemeServices.DrawParentBackground Method (HWND, HDC, TThemedElementDetails, Boolean, PRect)

Pascal

```
procedure DrawParentBackground(Window: HWND; Target: HDC; const Details:
TThemedElementDetails; OnlyIfTransparent: Boolean; Bounds: PRect = nil); overload;
```

C++

```
__fastcall DrawParentBackground(HWND Window, HDC Target, const TThemedElementDetails Details,
Boolean OnlyIfTransparent, PRect Bounds = nil);
```

Description

This is DrawParentBackground, a member of class TThemeServices.

44.1.1.4.9 TThemeServices.DrawText Method

Pascal

```
procedure DrawText(DC: HDC; Details: TThemedElementDetails; const S: WideString; R: TRect;
Flags: Cardinal; Flags2: Cardinal);
```

C++

```
__fastcall DrawText(HDC DC, TThemedElementDetails Details, const BSTR S, TRect R, unsigned
Flags, unsigned Flags2);
```

Description

This is DrawText, a member of class TThemeServices.

44.1.1.4.10 GetElementDetails Method

This is the overview for the GetElementDetails method overload.

Overload List

	Name	Description
	TThemeServices.GetElementDetails (TThemedButton) (see page 4626)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedClock) (see page 4626)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedComboBox) (see page 4626)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedEdit) (see page 4627)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedExplorerBar) (see page 4627)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedHeader) (see page 4627)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedListView) (see page 4627)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedMenu) (see page 4627)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedPage) (see page 4628)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedProgress) (see page 4628)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedRebar) (see page 4628)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedScrollBar) (see page 4628)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedSpin) (see page 4629)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedStartPanel) (see page 4629)	This is GetElementDetails, a member of class TThemeServices.

	TThemeServices.GetElementDetails (TThemedStatus) (see page 4629)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedTab) (see page 4629)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedTaskBand) (see page 4629)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedTaskBar) (see page 4630)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedToolBar) (see page 4630)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedToolTip) (see page 4630)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedTrackBar) (see page 4630)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedTrayNotify) (see page 4630)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedTreeview) (see page 4631)	This is GetElementDetails, a member of class TThemeServices.
	TThemeServices.GetElementDetails (TThemedWindow) (see page 4631)	This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.1 TThemeServices.GetElementDetails Method (TThemedButton)

Pascal

```
function GetElementDetails(Detail: TThemedButton): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedButton Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.2 TThemeServices.GetElementDetails Method (TThemedClock)

Pascal

```
function GetElementDetails(Detail: TThemedClock): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedClock Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.3 TThemeServices.GetElementDetails Method (TThemedComboBox)

Pascal

```
function GetElementDetails(Detail: TThemedComboBox): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedComboBox Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.4 TThemeServices.GetElementDetails Method (TThemedEdit)

Pascal

```
function GetElementDetails(Detail: TThemedEdit): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedEdit Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.5 TThemeServices.GetElementDetails Method (TThemedExplorerBar)

Pascal

```
function GetElementDetails(Detail: TThemedExplorerBar): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedExplorerBar Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.6 TThemeServices.GetElementDetails Method (TThemedHeader)

Pascal

```
function GetElementDetails(Detail: TThemedHeader): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedHeader Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.7 TThemeServices.GetElementDetails Method (TThemedListView)

Pascal

```
function GetElementDetails(Detail: TThemedListView): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedListView Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.8 TThemeServices.GetElementDetails Method (TThemedMenu)

Pascal

```
function GetElementDetails(Detail: TThemedMenu): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedMenu Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.9 TThemeServices.GetElementDetails Method (TThemedPage)

Pascal

```
function GetElementDetails(Detail: TThemedPage): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedPage Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.10 TThemeServices.GetElementDetails Method (TThemedProgress)

Pascal

```
function GetElementDetails(Detail: TThemedProgress): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedProgress Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.11 TThemeServices.GetElementDetails Method (TThemedRebar)

Pascal

```
function GetElementDetails(Detail: TThemedRebar): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedRebar Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.12 TThemeServices.GetElementDetails Method (TThemedScrollBar)

Pascal

```
function GetElementDetails(Detail: TThemedScrollBar): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedScrollBar Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.13 TThemeServices.GetElementDetails Method (TThemedSpin)

Pascal

```
function GetElementDetails(Detail: TThemedSpin): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedSpin Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.14 TThemeServices.GetElementDetails Method (TThemedStartPanel)

Pascal

```
function GetElementDetails(Detail: TThemedStartPanel): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedStartPanel Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.15 TThemeServices.GetElementDetails Method (TThemedStatus)

Pascal

```
function GetElementDetails(Detail: TThemedStatus): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedStatus Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.16 TThemeServices.GetElementDetails Method (TThemedTab)

Pascal

```
function GetElementDetails(Detail: TThemedTab): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedTab Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.17 TThemeServices.GetElementDetails Method (TThemedTaskBand)

Pascal

```
function GetElementDetails(Detail: TThemedTaskBand): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedTaskBand Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.18 TThemeServices.GetElementDetails Method (TThemedTaskBar)

Pascal

```
function GetElementDetails(Detail: TThemedTaskBar): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedTaskBar Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.19 TThemeServices.GetElementDetails Method (TThemedToolBar)

Pascal

```
function GetElementDetails(Detail: TThemedToolBar): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedToolBar Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.20 TThemeServices.GetElementDetails Method (TThemedToolTip)

Pascal

```
function GetElementDetails(Detail: TThemedToolTip): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedToolTip Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.21 TThemeServices.GetElementDetails Method (TThemedTrackBar)

Pascal

```
function GetElementDetails(Detail: TThemedTrackBar): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedTrackBar Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.22 TThemeServices.GetElementDetails Method (TThemedTrayNotify)

Pascal

```
function GetElementDetails(Detail: TThemedTrayNotify): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedTrayNotify Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.23 TThemeServices.GetElementDetails Method (TThemedTreeview)

Pascal

```
function GetElementDetails(Detail: TThemedTreeview): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedTreeview Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.10.24 TThemeServices.GetElementDetails Method (TThemedWindow)

Pascal

```
function GetElementDetails(Detail: TThemedWindow): TThemedElementDetails; overload;
```

C++

```
__fastcall TThemedElementDetails GetElementDetails(TThemedWindow Detail);
```

Description

This is GetElementDetails, a member of class TThemeServices.

44.1.1.4.11 TThemeServices.HasTransparentParts Method

Pascal

```
function HasTransparentParts(Details: TThemedElementDetails): Boolean;
```

C++

```
__fastcall Boolean HasTransparentParts(TThemedElementDetails Details);
```

Description

This is HasTransparentParts, a member of class TThemeServices.

44.1.1.4.12 TThemeServices.PaintBorder Method

Pascal

```
procedure PaintBorder(Control: TWinControl; EraseLRCorner: Boolean);
```

C++

```
__fastcall PaintBorder(TWinControl * Control, Boolean EraseLRCorner);
```

Description

This is PaintBorder, a member of class TThemeServices.

44.1.1.4.13 TThemeServices.UnloadThemeData Method

Pascal

```
procedure UnloadThemeData;
```

C++

```
__fastcall UnloadThemeData();
```

Description

This is UnloadThemeData, a member of class TThemeServices.

44.1.1.4.14 TThemeServices.UpdateThemes Method

Pascal

```
procedure UpdateThemes;
```

C++

```
__fastcall UpdateThemes();
```

Description

This is UpdateThemes, a member of class TThemeServices.

44.1.1.5 TThemeServices Properties

The properties of the TThemeServices class are listed here.

Public Properties

	Name	Description
	Theme (see page 4632)	This is Theme, a member of class TThemeServices.
	ThemesAvailable (see page 4632)	This is ThemesAvailable, a member of class TThemeServices.
	ThemesEnabled (see page 4632)	This is ThemesEnabled, a member of class TThemeServices.

44.1.1.5.1 TThemeServices.Theme Property

Pascal

```
property Theme [Element: TThemedElement]: HTHEME;
```

C++

```
__property HTHEME Theme[TThemedElement Element];
```

Description

This is Theme, a member of class TThemeServices.

44.1.1.5.2 TThemeServices.ThemesAvailable Property

Pascal

```
property ThemesAvailable: Boolean;
```

C++

```
__property Boolean ThemesAvailable;
```

Description

This is ThemesAvailable, a member of class TThemeServices.

44.1.1.5.3 TThemeServices.ThemesEnabled Property

Pascal

```
property ThemesEnabled: Boolean;
```

C++

```
__property Boolean ThemesEnabled;
```

Description

This is ThemesEnabled, a member of class TThemeServices.

44.1.1.6 TThemeServices Events

The events of the TThemeServices class are listed here.

Public Events

	Name	Description
	OnThemeChange (see page 4633)	This is OnThemeChange, a member of class TThemeServices.

44.1.1.6.1 TThemeServices.OnThemeChange Event

Pascal

```
property OnThemeChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnThemeChange;
```

Description

This is OnThemeChange, a member of class TThemeServices.

44.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ThemeControl (see page 4634)	This is function Themes.ThemeControl.
	ThemeServices (see page 4634)	This is function Themes.ThemeServices.
	UnthemedDesigner (see page 4634)	This is function Themes.UnthemedDesigner.

44.2.1 Themes.ThemeControl Function

Pascal

```
function ThemeControl(AControl: TControl): Boolean;
```

C++

```
Boolean ThemeControl(TControl * AControl);
```

File

Themes

Description

This is function Themes.ThemeControl.

44.2.2 Themes.ThemeServices Function

Pascal

```
function ThemeServices: TThemeServices;
```

C++

```
TThemeServices ThemeServices();
```

File

Themes

Description

This is function Themes.ThemeServices.

44.2.3 Themes.UnthemedDesigner Function

Pascal

```
function UnthemedDesigner(AControl: TControl): Boolean;
```

C++

```
Boolean UnthemedDesigner(TControl * AControl);
```

File

Themes

Description

This is function Themes.UnthemedDesigner.

44.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TThemedButton (see page 4636)	This is record Themes.TThemedButton.
	TThemedClock (see page 4638)	This is record Themes.TThemedClock.
	TThemedComboBox (see page 4638)	This is record Themes.TThemedComboBox.
	TThemedEdit (see page 4639)	This is record Themes.TThemedEdit.
	TThemedElement (see page 4639)	This is record Themes.TThemedElement.
	TThemedExplorerBar (see page 4641)	This is record Themes.TThemedExplorerBar.
	TThemedHeader (see page 4642)	This is record Themes.TThemedHeader.
	TThemedListview (see page 4643)	This is record Themes.TThemedListview.
	TThemedMenu (see page 4643)	This is record Themes.TThemedMenu.
	TThemedPage (see page 4644)	This is record Themes.TThemedPage.
	TThemedProgress (see page 4645)	This is record Themes.TThemedProgress.
	TThemedRebar (see page 4646)	This is record Themes.TThemedRebar.
	TThemedScrollBar (see page 4647)	This is record Themes.TThemedScrollBar.
	TThemedSpin (see page 4649)	This is record Themes.TThemedSpin.
	TThemedStartPanel (see page 4650)	This is record Themes.TThemedStartPanel.
	TThemedStatus (see page 4650)	This is record Themes.TThemedStatus.
	TThemedTab (see page 4651)	This is record Themes.TThemedTab.
	TThemedTaskBand (see page 4653)	This is record Themes.TThemedTaskBand.
	TThemedTaskBar (see page 4653)	This is record Themes.TThemedTaskBar.
	TThemedToolBar (see page 4654)	This is record Themes.TThemedToolBar.
	TThemedToolTip (see page 4655)	This is record Themes.TThemedToolTip.
	TThemedTrackBar (see page 4656)	This is record Themes.TThemedTrackBar.
	TThemedTrayNotify (see page 4657)	This is record Themes.TThemedTrayNotify.
	TThemedTreeview (see page 4658)	This is record Themes.TThemedTreeview.
	TThemedWindow (see page 4658)	This is record Themes.TThemedWindow.

Records

	Name	Description
	TThemedElementDetails (see page 4640)	This is record Themes.TThemedElementDetails.

44.3.1 Themes.TThemedButton Enumeration

Pascal

```
TThemedButton = (
  tbButtonDontCare,
  tbButtonRoot,
  tbPushButtonNormal,
  tbPushButtonHot,
  tbPushButtonPressed,
  tbPushButtonDisabled,
  tbPushButtonDefaulted,
  tbRadioButtonUncheckedNormal,
  tbRadioButtonUncheckedHot,
```

```
    tbRadioButtonUncheckedPressed,
    tbRadioButtonUncheckedDisabled,
    tbRadioButtonCheckedNormal,
    tbRadioButtonCheckedHot,
    tbRadioButtonCheckedPressed,
    tbRadioButtonCheckedDisabled,
    tbCheckBoxUncheckedNormal,
    tbCheckBoxUncheckedHot,
    tbCheckBoxUncheckedPressed,
    tbCheckBoxUncheckedDisabled,
    tbCheckBoxCheckedNormal,
    tbCheckBoxCheckedHot,
    tbCheckBoxCheckedPressed,
    tbCheckBoxCheckedDisabled,
    tbCheckBoxMixedNormal,
    tbCheckBoxMixedHot,
    tbCheckBoxMixedPressed,
    tbCheckBoxMixedDisabled,
    tbGroupBoxNormal,
    tbGroupBoxDisabled,
    tbUserButton
  );
```

C++

```
  enum TThemedButton {
    tbButtonDontCare,
    tbButtonRoot,
    tbPushButtonNormal,
    tbPushButtonHot,
    tbPushButtonPressed,
    tbPushButtonDisabled,
    tbPushButtonDefaulted,
    tbRadioButtonUncheckedNormal,
    tbRadioButtonUncheckedHot,
    tbRadioButtonUncheckedPressed,
    tbRadioButtonUncheckedDisabled,
    tbRadioButtonCheckedNormal,
    tbRadioButtonCheckedHot,
    tbRadioButtonCheckedPressed,
    tbRadioButtonCheckedDisabled,
    tbCheckBoxUncheckedNormal,
    tbCheckBoxUncheckedHot,
    tbCheckBoxUncheckedPressed,
    tbCheckBoxUncheckedDisabled,
    tbCheckBoxCheckedNormal,
    tbCheckBoxCheckedHot,
    tbCheckBoxCheckedPressed,
    tbCheckBoxCheckedDisabled,
    tbCheckBoxMixedNormal,
    tbCheckBoxMixedHot,
    tbCheckBoxMixedPressed,
    tbCheckBoxMixedDisabled,
    tbGroupBoxNormal,
    tbGroupBoxDisabled,
    tbUserButton
  };
```

File

Themes

Description

This is record Themes.TThemedButton.

44.3.2 Themes.TThemedClock Enumeration

Pascal

```
  TThemedClock = (
    tcClockDontCare,
    tcClockRoot,
    tcTimeNormal
  );
```

C++

```
  enum TThemedClock {
    tcClockDontCare,
    tcClockRoot,
    tcTimeNormal
  };
```

File

Themes

Description

This is record Themes.TThemedClock.

44.3.3 Themes.TThemedComboBox Enumeration

Pascal

```
  TThemedComboBox = (
    tcComboBoxDontCare,
    tcComboBoxRoot,
    tcDropDownButtonNormal,
    tcDropDownButtonHot,
    tcDropDownButtonPressed,
    tcDropDownButtonDisabled
  );
```

C++

```
  enum TThemedComboBox {
    tcComboBoxDontCare,
    tcComboBoxRoot,
    tcDropDownButtonNormal,
    tcDropDownButtonHot,
    tcDropDownButtonPressed,
    tcDropDownButtonDisabled
  };
```

File

Themes

Description

This is record Themes.TThemedComboBox.

44.3.4 Themes.TThemedEdit Enumeration

Pascal

```
TThemedEdit = (
  teEditDontCare,
  teEditRoot,
  teEditTextNormal,
  teEditTextHot,
  teEditTextSelected,
  teEditTextDisabled,
  teEditTextFocused,
  teEditTextReadOnly,
  teEditTextAssist,
  teEditCaret
);
```

C++

```
enum TThemedEdit {
  teEditDontCare,
  teEditRoot,
  teEditTextNormal,
  teEditTextHot,
  teEditTextSelected,
  teEditTextDisabled,
  teEditTextFocused,
  teEditTextReadOnly,
  teEditTextAssist,
  teEditCaret
};
```

File

Themes

Description

This is record Themes.TThemedEdit.

44.3.5 Themes.TThemedElement Enumeration

Pascal

```
TThemedElement = (
  teButton,
  teClock,
  teComboBox,
  teEdit,
  teExplorerBar,
  teHeader,
  teListView,
  teMenu,
  tePage,
  teProgress,
  teRebar,
  teScrollBar,
  teSpin,
  teStartPanel,
  teStatus,
```

```
    teTab,
    teTaskBand,
    teTaskBar,
    teToolBar,
    teToolTip,
    teTrackBar,
    teTrayNotify,
    teTreeview,
    teWindow
  );
```

C++

```
  enum TThemedElement {
    teButton,
    teClock,
    teComboBox,
    teEdit,
    teExplorerBar,
    teHeader,
    teListView,
    teMenu,
    tePage,
    teProgress,
    teRebar,
    teScrollBar,
    teSpin,
    teStartPanel,
    teStatus,
    teTab,
    teTaskBand,
    teTaskBar,
    teToolBar,
    teToolTip,
    teTrackBar,
    teTrayNotify,
    teTreeview,
    teWindow
  };
```

File

Themes

Description

This is record Themes.TThemedElement.

44.3.6 Themes.TThemedElementDetails Record

Pascal

```
  TThemedElementDetails = record
    Element: TThemedElement;
    Part: Integer;
    State: Integer;
  end;
```

C++

```
  struct TThemedElementDetails {
    TThemedElement Element;
    int Part;
    int State;
  };
```

File

Themes

Description

This is record Themes.TThemedElementDetails.

44.3.7 Themes.TThemedExplorerBar Enumeration

Pascal

```
TThemedExplorerBar = (
  tebExplorerBarDontCare,
  tebExplorerBarRoot,
  tebHeaderBackgroundNormal,
  tebHeaderBackgroundHot,
  tebHeaderBackgroundPressed,
  tebHeaderCloseNormal,
  tebHeaderCloseHot,
  tebHeaderClosePressed,
  tebHeaderPinNormal,
  tebHeaderPinHot,
  tebHeaderPinPressed,
  tebHeaderPinSelectedNormal,
  tebHeaderPinSelectedHot,
  tebHeaderPinSelectedPressed,
  tebIEBarMenuNormal,
  tebIEBarMenuHot,
  tebIEBarMenuPressed,
  tebNormalGroupBackground,
  tebNormalGroupCollapseNormal,
  tebNormalGroupCollapseHot,
  tebNormalGroupCollapsePressed,
  tebNormalGroupExpandNormal,
  tebNormalGroupExpandHot,
  tebNormalGroupExpandPressed,
  tebNormalGroupHead,
  tebSpecialGroupBackground,
  tebSpecialGroupCollapseSpecial,
  tebSpecialGroupCollapseHot,
  tebSpecialGroupCollapsePressed,
  tebSpecialGroupExpandSpecial,
  tebSpecialGroupExpandHot,
  tebSpecialGroupExpandPressed,
  tebSpecialGroupHead
);
```

C++

```
enum TThemedExplorerBar {

  tebHeaderCloseHot,
  tebHeaderClosePressed,
  tebHeaderPinNormal,
  tebHeaderPinHot,
  tebHeaderPinPressed,
  tebHeaderPinSelectedNormal,
```

```
    tebHeaderPinSelectedHot,
    tebHeaderPinSelectedPressed,
    tebIEBarMenuNormal,
    tebIEBarMenuHot,
    tebIEBarMenuPressed,
    tebNormalGroupBackground,
    tebNormalGroupCollapseNormal,
    tebNormalGroupCollapseHot,
    tebNormalGroupCollapsePressed,
    tebNormalGroupExpandNormal,
    tebNormalGroupExpandHot,
    tebNormalGroupExpandPressed,
    tebNormalGroupHead,
    tebSpecialGroupBackground,
    tebSpecialGroupCollapseSpecial,
    tebSpecialGroupCollapseHot,
    tebSpecialGroupCollapsePressed,
    tebSpecialGroupExpandSpecial,
    tebSpecialGroupExpandHot,
    tebSpecialGroupExpandPressed,
    tebSpecialGroupHead
  };
```

File

Themes

Description

This is record Themes.TThemedExplorerBar.

44.3.8 Themes.TThemedHeader Enumeration

Pascal

```
  TThemedHeader = (
    thHeaderDontCare,
    thHeaderRoot,
    thHeaderItemNormal,
    thHeaderItemHot,
    thHeaderItemPressed,
    thHeaderItemLeftNormal,
    thHeaderItemLeftHot,
    thHeaderItemLeftPressed,
    thHeaderItemRightNormal,
    thHeaderItemRightHot,
    thHeaderItemRightPressed,
    thHeaderSortArrowSortedUp,
    thHeaderSortArrowSortedDown
  );
```

C++

```
  enum TThemedHeader {
    thHeaderDontCare,
    thHeaderRoot,
    thHeaderItemNormal,
    thHeaderItemHot,
    thHeaderItemPressed,
    thHeaderItemLeftNormal,
    thHeaderItemLeftHot,
    thHeaderItemLeftPressed,
    thHeaderItemRightNormal,
    thHeaderItemRightHot,
```

```
    thHeaderItemRightPressed,
    thHeaderSortArrowSortedUp,
    thHeaderSortArrowSortedDown
  };
```

File

Themes

Description

This is record Themes.TThemedHeader.

44.3.9 Themes.TThemedListview Enumeration

Pascal

```
  TThemedListview = (
    tlListviewDontCare,
    tlListviewRoot,
    tlListItemNormal,
    tlListItemHot,
    tlListItemSelected,
    tlListItemDisabled,
    tlListItemSelectedNotFocus,
    tlListGroup,
    tlListDetail,
    tlListSortDetail,
    tlEmptyText
  );
```

C++

```
  enum TThemedListview {
    tlListviewDontCare,
    tlListviewRoot,
    tlListItemNormal,
    tlListItemHot,
    tlListItemSelected,

    twVertScrollPushed,
    twVertScrollDisabled,
```

```
    twVertThumbNormal,
    twVertThumbHot,
    twVertThumbPushed,
    twVertThumbDisabled,
    twDialog,
    twCaptionSizingTemplate,
    twSmallCaptionSizingTemplate,
    twFrameLeftSizingTemplate,
    twSmallFrameLeftSizingTemplate,
    twFrameRightSizingTemplate,
    twSmallFrameRightSizingTemplate,
    twFrameBottomSizingTemplate,
    twSmallFrameBottomSizingTemplate
  };
```

File

Themes

Description

This is record Themes.TThemedWindow.

44.4 Types

The following table lists types in this documentation.

Types

Name	Description
PThemedElementDetails (see page 4663)	This is type Themes.PThemedElementDetails.
TThemeData (see page 4663)	This is type Themes.TThemeData.
TThemeServicesClass (see page 4663)	This is type Themes.TThemeServicesClass.

44.4.1 Themes.PThemedElementDetails Type

Pascal

```
PThemedElementDetails = ^TThemedElementDetails;
```

C++

```
^TThemedElementDetails PThemedElementDetails;
```

File

Themes

Description

This is type Themes.PThemedElementDetails.

44.4.2 Themes.TThemeData Type

Pascal

```
TThemeData = array[TThemedElement] of HTHEME;
```

C++

```
array[TThemedElement] of HTHEME TThemeData;
```

File

Themes

Description

This is type Themes.TThemeData.

44.4.3 Themes.TThemeServicesClass Type

Pascal

```
TThemeServicesClass = class of TThemeServices;
```

C++

```
TThemeServices TThemeServicesClass;
```

File

Themes

Description

This is type Themes.TThemeServicesClass.

44.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
ThemeServicesClass (see page 4665)	This is variable Themes.ThemeServicesClass.

44.5.1 Themes.ThemeServicesClass Variable

Pascal

```
ThemeServicesClass: TThemeServicesClass = TThemeServices;
```

C++

```
TThemeServicesClass ThemeServicesClass = TThemeServices;
```

File

Themes

Description

This is variable Themes.ThemeServicesClass.

45 ToolWin Namespace

This is namespace ToolWin.

Topics

Name	Description
Classes (see page 4668)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 4678)	The following table lists structs, records, enums in this documentation.
Types (see page 4681)	The following table lists types in this documentation.

Classes

	Name	Description
	TToolDockForm (see page 4668)	TToolDockForm is a default floating dock site class for tool buttons.
	TToolDockObject (see page 4671)	Handles drag-and-dock operations for toolbar controls.
	TToolWindow (see page 4673)	TToolWindow is the ancestor for windowed controls that require a custom client area and edge borders.

Structs, Records, Enums

	Name	Description
	TEdgeBorder (see page 4678)	TEdgeBorders (see page 4681) is the type of the EdgeBorders property.
	TEdgeStyle (see page 4679)	TEdgeStyle describes the appearance of an edge border.
	TSizingOrientation (see page 4679)	TSizingOrientation specifies the dimension along which a control's size is adjusted when docked.

Types

Name	Description
TEdgeBorders (see page 4681)	This is type ToolWin.TEdgeBorders.

45.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TToolDockForm (see page 4668)	TToolDockForm is a default floating dock site class for tool buttons.
	TToolDockObject (see page 4671)	Handles drag-and-dock operations for toolbar controls.
	TToolWindow (see page 4673)	TToolWindow is the ancestor for windowed controls that require a custom client area and edge borders.

45.1.1 TToolDockForm Class

TToolDockForm is a default floating dock site class for tool buttons.

Class Hierarchy

Pascal

```
TToolDockForm = class(TCustomDockForm);
```

C++

```
class TToolDockForm : public TCustomDockForm;
```

File

ToolWin

Description

Assign TToolDockForm to the FloatingDockSiteClass property of tool buttons to get appropriate docking behavior.

45.1.1.1 TToolDockForm Members

The following tables list the members exposed by TToolDockForm.

Protected Methods

	Name	Description
V	CanResize (see page 4669)	Specifies whether the control can resize itself.
V	CreateParams (see page 4670)	Initializes the window-creation parameter record when the form window is created.
V	DoAddDockClient (see page 4670)	Performs actions when a control is docked to the form.
	WMNCCreate (see page 4670)	This is WMNCCreate, a member of class TToolDockForm.
	WMNCHitTest (see page 4670)	This is WMNCHitTest, a member of class TToolDockForm.
	WMNCLButtonDown (see page 4671)	This is WMNCLButtonDown, a member of class TToolDockForm.
	WMSize (see page 4671)	This is WMSize, a member of class TToolDockForm.
	WMSysCommand (see page 4671)	This is WMSysCommand, a member of class TToolDockForm.

Public Methods

	Name	Description
	Create (see page 4669)	Creates an instance of TToolDockForm (see page 4668).

45.1.1.2 TToolDockForm.Create Constructor

Creates an instance of TToolDockForm (see page 4668).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TToolDockForm(TComponent * AOwner);
```

Description

AOwner is the dock form's owner, which is responsible for freeing the tool dock form.

The constructor initializes the BorderWidth property to 1.

See Also

BorderWidth

Owner

45.1.1.3 TToolDockForm Methods

The methods of the TToolDockForm class are listed here.

Protected Methods

	Name	Description
	CanResize (see page 4669)	Specifies whether the control can resize itself.
	CreateParams (see page 4670)	Initializes the window-creation parameter record when the form window is created.
	DoAddDockClient (see page 4670)	Performs actions when a control is docked to the form.
	WMNCCreate (see page 4670)	This is WMNCCreate, a member of class TToolDockForm.
	WMNCHitTest (see page 4670)	This is WMNCHitTest, a member of class TToolDockForm.
	WMNCLButtonDown (see page 4671)	This is WMNCLButtonDown, a member of class TToolDockForm.
	WMSize (see page 4671)	This is WMSize, a member of class TToolDockForm.
	WMSysCommand (see page 4671)	This is WMSysCommand, a member of class TToolDockForm.

45.1.1.3.1 TToolDockForm.CanResize Method

Specifies whether the control can resize itself.

Pascal

```
function CanResize(var NewWidth: Integer; var NewHeight: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean CanResize(int NewWidth, int NewHeight);
```

Description

CanResize is called automatically when an attempt is made to resize the control, after any autosizing has occurred. The NewWidth and NewHeight parameters specify the attempted new values for the control's height and width. CanResize optionally

adjusts the values of NewWidth and NewHeight, and returns true if the control can be resized to the returned values. CanResize returns false if the control can't be resized.

45.1.1.3.2 TToolDockForm.CreateParams Method

Initializes the window-creation parameter record when the form window is created.

Pascal

```
procedure CreateParams(var Params: TCreateParams); override;
```

C++

```
virtual __fastcall CreateParams(TCreateParams Params);
```

Description

CreateParams calls the inherited CreateParams method, and then adds WS_POPUP to the Style property.

45.1.1.3.3 TToolDockForm.DoAddDockClient Method

Performs actions when a control is docked to the form.

Pascal

```
procedure DoAddDockClient(Client: TControl; const ARect: TRect); override;
```

C++

```
virtual __fastcall DoAddDockClient(TControl * Client, const TRect ARect);
```

Description

DoAddDockClient sets the client's Align property to alNone and its BoundsRect property to ClientRect. Then DoAddDockClient calls the inherited DoAddDockClient method and sets the form's AutoSize property to true.

45.1.1.3.4 TToolDockForm.WMNCCreate Method

Pascal

```
procedure WMNCCreate(var Message: TWMNCCreate); message WM_NCCREATE;
```

C++

```
__fastcall WMNCCreate(TWMNCCreate Message);
```

Description

This is WMNCCreate, a member of class TToolDockForm.

45.1.1.3.5 TToolDockForm.WMNCHitTest Method

Pascal

```
procedure WMNCHitTest(var Message: TWMNCHitTest); message WM_NCHITTEST;
```

C++

```
__fastcall WMNCHitTest(TWMNCHitTest Message);
```

Description

This is WMNCHitTest, a member of class TToolDockForm.

45.1.1.3.6 TToolDockForm.WMNCLButtonDown Method

Pascal

```
procedure WMNCLButtonDown(var Message: TWMNCLButtonDown); message WM_NCLBUTTONDOWN;
```

C++

```
__fastcall WMNCLButtonDown(TWMNCLButtonDown Message);
```

Description

This is WMNCLButtonDown, a member of class TToolDockForm.

45.1.1.3.7 TToolDockForm.WMSize Method

Pascal

```
procedure WMSize(var Message: TWMSize); message WM_SIZE;
```

C++

```
__fastcall WMSize(TWMSize Message);
```

Description

This is WMSize, a member of class TToolDockForm.

45.1.1.3.8 TToolDockForm.WMSysCommand Method

Pascal

```
procedure WMSysCommand(var Message: TWMSysCommand); message WM_SYSCOMMAND;
```

C++

```
__fastcall WMSysCommand(TWMSysCommand Message);
```

Description

This is WMSysCommand, a member of class TToolDockForm.

45.1.2 TToolDockObject Class

Handles drag-and-dock operations for toolbar controls.

Class Hierarchy

Pascal

```
TToolDockObject = class(TDragDockObject);
```

C++

```
class TToolDockObject : public TDragDockObject;
```

File

ToolWin

Description

Use TToolDockObject to handle drag-and-dock operations for toolbar controls that are docked to a TControlBar object.

Note: TToolDockObject is designed for tool bars that are docked to TControlBar. It may not work as expected when the application is docking a tool bar to a form or panel.

See Also

TToolBar

TControlBar

45.1.2.1 TToolDockObject Members

The following tables list the members exposed by TToolDockObject.

Protected Methods

	Name	Description
	AdjustDockRect (see page 4673)	This is AdjustDockRect, a member of class TToolDockObject.
	DrawDragDockImage (see page 4673)	Called when the dock image for a toolbar control is drawn.
	EraseDragDockImage (see page 4673)	Called when the dock image for a toolbar control is erased.

Public Methods

	Name	Description
	Create (see page 4672)	Creates and initializes an instance of TDragDockObject.

45.1.2.2 TToolDockObject.Create Constructor

Creates and initializes an instance of TDragDockObject.

Pascal

```
constructor Create(AControl: TControl); override;
```

C++

```
virtual __fastcall TToolDockObject(TControl * AControl);
```

Description

Create calls the inherited constructor and allocates memory for the Brush property.

45.1.2.3 TToolDockObject Methods

The methods of the TToolDockObject class are listed here.

Protected Methods

	Name	Description
	AdjustDockRect (see page 4673)	This is AdjustDockRect, a member of class TToolDockObject.
	DrawDragDockImage (see page 4673)	Called when the dock image for a toolbar control is drawn.
	EraseDragDockImage (see page 4673)	Called when the dock image for a toolbar control is erased.

45.1.2.3.1 TToolDockObject.AdjustDockRect Method

Pascal

```
procedure AdjustDockRect(ARect: TRect); override;
```

C++

```
virtual __fastcall AdjustDockRect(TRect ARect);
```

Description

This is AdjustDockRect, a member of class TToolDockObject.

45.1.2.3.2 TToolDockObject.DrawDragDockImage Method

Called when the dock image for a toolbar control is drawn.

Pascal

```
procedure DrawDragDockImage; override;
```

C++

```
virtual __fastcall DrawDragDockImage();
```

Description

DrawDragDockImage draws a control that is moved in a toolbar.

45.1.2.3.3 TToolDockObject.EraseDragDockImage Method

Called when the dock image for a toolbar control is erased.

Pascal

```
procedure EraseDragDockImage; override;
```

C++

```
virtual __fastcall EraseDragDockImage();
```

Description

EraseDragDockImage erases a control that is moved in a toolbar.

45.1.3 TToolWindow Class

TToolWindow is the ancestor for windowed controls that require a custom client area and edge borders.

Class Hierarchy

Pascal

```
TToolWindow = class(TWinControl);
```

C++

```
class TToolWindow : public TWinControl;
```

File

ToolWin

Description

TToolWindow is the ancestor of the TCoolBar and TToolBar components, which facilitate the arrangement of buttons and other visual controls.

See Also

TCoolBar

TToolBar

45.1.3.1 TToolWindow Members

The following tables list the members exposed by TToolWindow.

Protected Methods

	Name	Description
	CMBorderChanged (see page 4675)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 4675)	This is CMCtl3DChanged, a member of class TToolWindow.
V	NCPaint (see page 4675)	This is NCPaint, a member of class TToolWindow.
	WMNCCalcSize (see page 4675)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 4676)	This is WMNCPaint, a member of class TToolWindow.

Public Methods

	Name	Description
V	Create (see page 4674)	Creates and initializes a TToolWindow (see page 4673) instance.

Public Properties

	Name	Description
	EdgeBorders (see page 4676)	Determines which sides of the control have visible borders.
	EdgeInner (see page 4676)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 4677)	Determines the border style for the control's outer edge.

45.1.3.2 TToolWindow.Create Constructor

Creates and initializes a TToolWindow (see page 4673) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TToolWindow(TComponent * AOwner);
```

Description

Create generates a TToolWindow (see page 4673) and initializes its properties.

45.1.3.3 TToolWindow Methods

The methods of the TToolWindow class are listed here.

Protected Methods

	Name	Description
	CMBorderChanged (see page 4675)	This is CMBorderChanged, a member of class TToolWindow.
	CMCtl3DChanged (see page 4675)	This is CMCtl3DChanged, a member of class TToolWindow.
V	NCPaint (see page 4675)	This is NCPaint, a member of class TToolWindow.
	WMNCCalcSize (see page 4675)	This is WMNCCalcSize, a member of class TToolWindow.
	WMNCPaint (see page 4676)	This is WMNCPaint, a member of class TToolWindow.

45.1.3.3.1 TToolWindow.CMBorderChanged Method

Pascal

```
procedure CMBorderChanged(var Message: TMessage); message CM_BORDERCHANGED;
```

C++

```
__fastcall CMBorderChanged(TMessage Message);
```

Description

This is CMBorderChanged, a member of class TToolWindow.

45.1.3.3.2 TToolWindow.CMCtl3DChanged Method

Pascal

```
procedure CMCtl3DChanged(var Message: TMessage); message CM_CTL3DCHANGED;
```

C++

```
__fastcall CMCtl3DChanged(TMessage Message);
```

Description

This is CMCtl3DChanged, a member of class TToolWindow.

45.1.3.3.3 TToolWindow.NCPaint Method

Pascal

```
procedure NCPaint(DC: HDC); virtual;
```

C++

```
virtual __fastcall NCPaint(HDC DC);
```

Description

This is NCPaint, a member of class TToolWindow.

45.1.3.3.4 TToolWindow.WMNCCalcSize Method

Pascal

```
procedure WMNCCalcSize(var Message: TWMNCCalcSize); message WM_NCCALCSIZE;
```

C++

```
__fastcall WMNCCalcSize(TWMNCCalcSize Message);
```

Description

This is WMNCCalcSize, a member of class TToolWindow.

45.1.3.3.5 TToolWindow.WMNCPaint Method

Pascal

```
procedure WMNCPaint(var Message: TWMNCPaint); message WM_NCPAINT;
```

C++

```
__fastcall WMNCPaint(TWMNCPaint Message);
```

Description

This is WMNCPaint, a member of class TToolWindow.

45.1.3.4 TToolWindow Properties

The properties of the TToolWindow class are listed here.

Public Properties

	Name	Description
	EdgeBorders (see page 4676)	Determines which sides of the control have visible borders.
	EdgeInner (see page 4676)	Determines the border style for the control's inner edge.
	EdgeOuter (see page 4677)	Determines the border style for the control's outer edge.

45.1.3.4.1 TToolWindow.EdgeBorders Property

Determines which sides of the control have visible borders.

Pascal

```
property EdgeBorders: TEdgeBorders;
```

C++

```
__property TEdgeBorders EdgeBorders;
```

Description

Use the EdgeBorders property to add or remove borders. The appearance of the borders can be set with the EdgeInner (see page 4676) and EdgeOuter (see page 4677) properties.

See Also

EdgeInner (see page 4676)

EdgeOuter (see page 4677)

45.1.3.4.2 TToolWindow.EdgeInner Property

Determines the border style for the control's inner edge.

Pascal

```
property EdgeInner: TEdgeStyle;
```

C++

```
__property TEdgeStyle EdgeInner;
```

Description

Use EdgeInner to provide the tool window with a three-dimensional beveled look. A tool window has two borders on each side,

an outer border drawn next to the outer edge, and an inner border drawn inside the outer border. EdgeInner specifies the appearance of the inner border. It can be raised (esRaised), lowered (esLowered), or left off altogether (esNone).

Note: The EdgeInner property has an effect only on the sides specified by the EdgeBorders (see page 4676) property.

Use EdgeInner with EdgeOuter (see page 4677) to give the component a three-dimensional look.

See Also

EdgeBorders (see page 4676)

EdgeOuter (see page 4677)

45.1.3.4.3 TToolWindow.EdgeOuter Property

Determines the border style for the control's outer edge.

Pascal

```
property EdgeOuter: TEdgeStyle;
```

C++

```
__property TEdgeStyle EdgeOuter;
```

Description

Use EdgeOuter to provide the tool window with a three-dimensional beveled look. A tool window has two borders on each side, an outer border drawn next to the outer edge, and an inner border drawn inside the outer border. EdgeOuter specifies the appearance of the outer border. It can be raised (esRaised), lowered (esLowered), or left off altogether (esNone).

Note: The EdgeInner (see page 4676) property has an effect only on the sides specified by the EdgeBorders (see page 4676) property.

Use EdgeOuter with EdgeInner (see page 4676) to give the component a three-dimensional look.

See Also

EdgeBorders (see page 4676)

EdgeInner (see page 4676)

45.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TEdgeBorder (see page 4678)	TEdgeBorders (see page 4681) is the type of the EdgeBorders property.
	TEdgeStyle (see page 4679)	TEdgeStyle describes the appearance of an edge border.
	TSizingOrientation (see page 4679)	TSizingOrientation specifies the dimension along which a control's size is adjusted when docked.

45.2.1 ToolWin.TEdgeBorder Enumeration

TEdgeBorders (see page 4681) is the type of the EdgeBorders property.

Pascal

```
TEdgeBorder = (
  ebLeft,
  ebTop,
  ebRight,
  ebBottom
);
```

C++

```
enum TEdgeBorder {
  ebLeft,
  ebTop,
  ebRight,
  ebBottom
};
```

File

ToolWin

Description

TEdgeBorders (see page 4681) is a set of TEdgeBorder values. Each TEdgeBorder value indicates whether a beveled edge appears on a particular side of a control. The following table lists the TEdgeBorder values:

Value	Meaning
ebLeft	The control has a beveled left edge.
ebTop	The control has a beveled top edge.
ebRight	The control has a beveled right edge.
ebBottom	The control has a beveled bottom edge.

In addition to the values in the preceding table, the QGraphics unit defines the ebRect constant to represent all the edges of a control:

const ebRect = [ebLeft, ebTop, ebRight, ebBottom];

#define ebRect (System::Set<TEdgeBorder, ebLeft, ebBottom> () << TEdgeBorder(0) << TEdgeBorder(1) << TEdgeBorder(2)

<< TEdgeBorder(3))

45.2.2 ToolWin.TEdgeStyle Enumeration

TEdgeStyle describes the appearance of an edge border.

Pascal

```
TEdgeStyle = (
  esNone,
  esRaised,
  esLowered
);
```

C++

```
enum TEdgeStyle {
  esNone,
  esRaised,
  esLowered
};
```

File

ToolWin

Description

TEdgeStyle indicates the appearance of a particular border. The following table lists the possible values:

Value	Meaning
esNone	The border is not drawn.
esRaised	The border appears raised.
esLowered	The border appears lowered.

45.2.3 ToolWin.TSizingOrientation Enumeration

TSizingOrientation specifies the dimension along which a control's size is adjusted when docked.

Pascal

```
TSizingOrientation = (
  soNone,
  soHorizontal,
  soVertical
);
```

C++

```
enum TSizingOrientation {
  soNone,
  soHorizontal,
  soVertical
};
```

File

ToolWin

Description

TSizingOrientation can have one of the following values:

Value	Meaning
soNone	The control's size is not readjusted when it is docked.
soHorizontal	The control's width is adjusted when it is docked.
soVertical	The control's height is adjusted when it is docked.

45.3 Types

The following table lists types in this documentation.

Types

Name	Description
TEdgeBorders (see page 4681)	This is type ToolWin.TEdgeBorders.

45.3.1 ToolWin.TEdgeBorders Type

Pascal

```
TEdgeBorders = set of TEdgeBorder;
```

C++

```
TEdgeBorder TEdgeBorders;
```

File

ToolWin

Description

This is type ToolWin.TEdgeBorders.

46 Types Namespace

This is namespace Types.

Topics

Name	Description
Functions (see page 4685)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 4693)	The following table lists structs, records, enums in this documentation.
Types (see page 4697)	The following table lists types in this documentation.
Constants (see page 4709)	The following table lists constants in this documentation.

Constants

Name	Description
EqualsValue (see page 4709)	EqualsValue indicates that both values are equal in a comparison operation.
GreaterThanValue (see page 4709)	GreaterThanValue indicates that one value is greater than an other in a comparison operation.
LessThanValue (see page 4710)	LessThanValue indicates that one value is less than an other in a comparison operation.
RT_RCDATA (see page 4710)	This is constant Types.RT_RCDATA.

Functions

	Name	Description
	Bounds (see page 4685)	Returns the TRect (see page 4694) for a rectangle of given dimensions.
	CenteredRect (see page 4686)	This is function Types.CenteredRect.
	CenterPoint (see page 4686)	Returns the point in the center of a rectangle.
	EqualRect (see page 4686)	Indicates whether two TRect (see page 4694) values are the same.
	IntersectRect (see page 4687)	Returns the intersection of two rectangles
	IsRectEmpty (see page 4687)	Indicates wither a specified rectangle has a positive width and height.
	OffsetRect (see page 4688)	Changes the origin of a rectangle by a specified amount.
	Point (see page 4688)	Creates a TPoint (see page 4694) structure from a pair of coordinates.
	PtInRect (see page 4689)	Indicates whether a specified point lies inside a specified rectangle.
	Rect (see page 4689)	Creates a TRect (see page 4694) structure from a set of coordinates.
	RectHeight (see page 4690)	This is function Types.RectHeight.
	RectWidth (see page 4690)	This is function Types.RectWidth.
	SmallPoint (see page 4690)	Creates a TSmallPoint (see page 4695) structure from a pair of coordinates.
	SmallPoint (see page 4690)	Creates a TSmallPoint (see page 4695) structure from a pair of coordinates.
	SplitRect (see page 4691)	This is function Types.SplitRect.

	SplitRect (see page 4691)	This is function Types.SplitRect.
	UnionRect (see page 4692)	Returns the union of two rectangles

Structs, Records, Enums

	Name	Description
	tagSIZE (see page 4693)	tagSIZE is a record holding width and height values.
	TPoint (see page 4694)	TPoint type defines a pixel location onscreen.
	TRect (see page 4694)	TRect defines a rectangle.
	TSmallPoint (see page 4695)	TSmallPoint type defines a point with two 16-bit coordinates.
	TSplitRectType (see page 4696)	This is record Types.TSplitRectType.

Types

Name	Description
DWORD (see page 4697)	DWORD is equivalent to LongWord.
PByte (see page 4698)	PByte is a pointer to a Byte variable.
PDouble (see page 4698)	PDouble is a pointer to a Double variable.
PInteger (see page 4699)	PInteger is a pointer to a Integer variable.
PLongint (see page 4699)	This is type Types.PLongint.
PPoint (see page 4699)	PPoint is a pointer to a TPoint (see page 4694) variable.
PRect (see page 4700)	PRect is a pointer to a TRect (see page 4694) variable.
PSize (see page 4700)	PSize is a pointer to a TSize (see page 4706) variable.
PSmallInt (see page 4701)	This is type Types.PSmallInt.
PSmallPoint (see page 4701)	This is type Types.PSmallPoint.
SIZE (see page 4701)	This is type Types.SIZE.
tagPOINT (see page 4702)	This is type Types.tagPOINT.
TBooleanDynArray (see page 4702)	TBooleanDynArray defines an array of Boolean elements.
TByteDynArray (see page 4702)	This is type Types.TByteDynArray.
TCardinalDynArray (see page 4703)	TCardinalDynArray defines an array of Cardinal elements.
TDoubleDynArray (see page 4703)	TDoubleDynArray defines an array of Double elements.
TInt64DynArray (see page 4704)	TInt64DynArray defines an array of Int64 elements.
TIntegerDynArray (see page 4704)	This is type Types.TIntegerDynArray.
TLongWordDynArray (see page 4704)	TLongWordDynArray defines an array of LongWord elements.
TShortIntDynArray (see page 4705)	TShortIntDynArray defines an array of ShortInt elements.
TSingleDynArray (see page 4705)	TSingleDynArray defines an array of Single elements.
TSize (see page 4706)	TSize represents a width and height.
TSmallIntDynArray (see page 4706)	TSmallIntDynArray defines an array of SmallInt elements.
TStringDynArray (see page 4706)	TStringDynArray defines an array of String elements.
TValueRelationship (see page 4707)	TValueRelationship defines value comparison possibilities.
TWideStringDynArray (see page 4707)	TWideStringDynArray defines an array of WideString (see page 3476) elements.
TWordDynArray (see page 4708)	TWordDynArray defines an array of Word elements.

46.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	Bounds (see page 4685)	Returns the TRect (see page 4694) for a rectangle of given dimensions.
	CenteredRect (see page 4686)	This is function Types.CenteredRect.
	CenterPoint (see page 4686)	Returns the point in the center of a rectangle.
	EqualRect (see page 4686)	Indicates whether two TRect (see page 4694) values are the same.
	IntersectRect (see page 4687)	Returns the intersection of two rectangles
	IsRectEmpty (see page 4687)	Indicates wither a specified rectangle has a positive width and height.
	OffsetRect (see page 4688)	Changes the origin of a rectangle by a specified amount.
	Point (see page 4688)	Creates a TPoint (see page 4694) structure from a pair of coordinates.
	PtInRect (see page 4689)	Indicates whether a specified point lies inside a specified rectangle.
	Rect (see page 4689)	Creates a TRect (see page 4694) structure from a set of coordinates.
	RectHeight (see page 4690)	This is function Types.RectHeight.
	RectWidth (see page 4690)	This is function Types.RectWidth.
	SmallPoint (see page 4690)	Creates a TSmallPoint (see page 4695) structure from a pair of coordinates.
	SmallPoint (see page 4690)	Creates a TSmallPoint (see page 4695) structure from a pair of coordinates.
	SplitRect (see page 4691)	This is function Types.SplitRect.
	SplitRect (see page 4691)	This is function Types.SplitRect.
	UnionRect (see page 4692)	Returns the union of two rectangles

46.1.1 Types.Bounds Function

Returns the TRect (see page 4694) for a rectangle of given dimensions.

Pascal

```
function Bounds(ALeft: Integer; ATop: Integer; AWidth: Integer; AHeight: Integer): TRect;
```

C++

```
TRect Bounds(int ALeft, int ATop, int AWidth, int AHeight);
```

File

Types

Description

Call Bounds to obtain a TRect (see page 4694) for a rectangle with upper left corner at the point (ALeft, ATop) with width AWidth and height AHeight.

See Also

Rect (see page 4689)

46.1.2 Types.CenteredRect Function

Pascal

```
function CenteredRect(SourceRect: TRect; CenteredRect: TRect): TRect;
```

C++

```
TRect CenteredRect(TRect SourceRect, TRect CenteredRect);
```

File

Types

Description

This is function Types.CenteredRect.

46.1.3 Types.CenterPoint Function

Returns the point in the center of a rectangle.

Pascal

```
function CenterPoint(const Rect: TRect): TPoint;
```

C++

```
TPoint CenterPoint(const TRect Rect);
```

File

Types

Description

Call CenterPoint to obtain the point in the center of a rectangle.

Rect (see page 4689) is the rectangle whose center you want to locate.

See Also

PtInRect (see page 4689)

IsRectEmpty (see page 4687)

UnionRect (see page 4692)

IntersectRect (see page 4687)

46.1.4 Types.EqualRect Function

Indicates whether two TRect (see page 4694) values are the same.

Pascal

```
function EqualRect(const R1: TRect; const R2: TRect): Boolean;
```

C++

```
Boolean EqualRect(const TRect R1, const TRect R2);
```

File

Types

Description

Call EqualRect to compare two TRect (see page 4694) values. EqualRect returns true if R1 and R2 are identical (same position and size), false if they are different.

See Also

Rect (see page 4689)

Bounds (see page 4685)

IntersectRect (see page 4687)

46.1.5 Types.IntersectRect Function

Returns the intersection of two rectangles

Pascal

```
function IntersectRect(out Rect: TRect; const R1: TRect; const R2: TRect): Boolean;
```

C++

```
Boolean IntersectRect(TRect Rect, const TRect R1, const TRect R2);
```

File

Types

Description

Call IntersectRect to obtain the rectangle that is the intersection of R1 and R2. The intersection is returned as the Rect (see page 4689) parameter.

IntersectRect returns true if the two rectangles have a nonempty intersection. If R1 and R2 do not overlap, IntersectRect returns false, and the Rect (see page 4689) parameter is set to a rectangle at position (0,0) with 0 Width and 0 Height.

See Also

PtInRect (see page 4689)

IsRectEmpty (see page 4687)

UnionRect (see page 4692)

46.1.6 Types.IsRectEmpty Function

Indicates wither a specified rectangle has a positive width and height.

Pascal

```
function IsRectEmpty(const Rect: TRect): Boolean;
```

C++

```
Boolean IsRectEmpty(const TRect Rect);
```

File

Types

Description

Call IsRectEmpty to determine whether the rectangle specified by Rect (see page 4689) encloses a positive amount of space.

IsRectEmpty returns true if both the width and height of Rect (see page 4689) are greater than 0. If either the width or height is less than or equal to 0, IsRectEmpty returns false. Note that this means non-normalized rectangles (rectangles with negative height or width) are considered empty.

See Also

PtInRect (see page 4689)

IntersectRect (see page 4687)

46.1.7 Types.OffsetRect Function

Changes the origin of a rectangle by a specified amount.

Pascal

```
function OffsetRect(var Rect: TRect; DX: Integer; DY: Integer): Boolean;
```

C++

```
Boolean OffsetRect(TRect Rect, int DX, int DY);
```

File

Types

Description

Call OffsetRect to move the upper left corner of the rectangle specified by Rect (see page 4689) while maintaining the same width and height. The left of the rectangle moves by DX while the top moves by DY.

OffsetRect returns true if the Rect (see page 4689) parameter is not nil (Delphi) or NULL (C++), false if it can't return a new rectangle because Rect (see page 4689) is nil(Delphi) or NULL (C++).

See Also

Rect (see page 4689)

Bounds (see page 4685)

46.1.8 Types.Point Function

Creates a TPoint (see page 4694) structure from a pair of coordinates.

Pascal

```
function Point(X: Integer; Y: Integer): TPoint;
```

C++

```
TPoint Point(int X, int Y);
```

File

Types

Description

Call Point to create a TPoint (see page 4694) that represents the specified coordinates. Use Point to construct parameters for functions that require a point, rather than setting up local variables for each parameter.

See Also

SmallPoint (see page 4690)

Rect (see page 4689)

46.1.9 Types.PtInRect Function

Indicates whether a specified point lies inside a specified rectangle.

Pascal

```
function PtInRect(const Rect: TRect; const P: TPoint): Boolean;
```

C++

```
Boolean PtInRect(const TRect Rect, const TPoint P);
```

File

Types

Description

PtInRect returns true if the point, P, lies inside the rectangle, Rect (see page 4689), and false if P is not in Rect (see page 4689).

PtInRect does not consider a point inside a rectangle if the rectangle has a negative width or height. A point is considered inside a rectangle if it lies on the left or top edge, but not if it lies on the right or bottom edge.

See Also

IntersectRect (see page 4687)

IsRectEmpty (see page 4687)

CenterPoint (see page 4686)

46.1.10 Types.Rect Function

Creates a TRect (see page 4694) structure from a set of coordinates.

Pascal

```
function Rect(Left: Integer; Top: Integer; Right: Integer; Bottom: Integer): TRect;
```

C++

```
TRect Rect(int Left, int Top, int Right, int Bottom);
```

File

Types

Description

Call Rect to create a TRect (see page 4694) that represents the rectangle with the specified coordinates. Use Rect to construct parameters for functions that require TRect (see page 4694), rather than setting up local variables for each parameter.

See Also

Bounds (see page 4685)

Point (see page 4688)

46.1.11 Types.RectHeight Function

Pascal

```
function RectHeight(const Rect: TRect): Integer;
```

C++

```
int RectHeight(const TRect Rect);
```

File

Types

Description

This is function Types.RectHeight.

46.1.12 Types.RectWidth Function

Pascal

```
function RectWidth(const Rect: TRect): Integer;
```

C++

```
int RectWidth(const TRect Rect);
```

File

Types

Description

This is function Types.RectWidth.

46.1.13 Types.SmallPoint Function

Creates a TSmallPoint (see page 4695) structure from a pair of coordinates.

Pascal

```
function SmallPoint(X: Integer; Y: Integer): TSmallPoint; overload;
function SmallPoint(XY: LongWord): TSmallPoint; overload;
```

C++

```
TSmallPoint SmallPoint(int X, int Y);
TSmallPoint SmallPoint(LongWord XY);
```

File

Types

Description

Call SmallPoint to create a TSmallPoint (see page 4695) that represents the specified coordinates.

See Also

Point

46.1.14 Types.SplitRect Function

Pascal

```
function SplitRect(Rect: TRect; SplitType: TSplitRectType; Percent: Double): TRect; overload;
```

C++

```
TRect SplitRect(TRect Rect, TSplitRectType SplitType, Double Percent);
```

File

Types

Description

This is function Types.SplitRect.

46.1.15 Types.SplitRect Function

Pascal

```
function SplitRect(Rect: TRect; SplitType: TSplitRectType; Size: Integer): TRect; overload;
```

C++

```
TRect SplitRect(TRect Rect, TSplitRectType SplitType, int Size);
```

File

Types

Description

This is function Types.SplitRect.

46.1.16 Types.UnionRect Function

Returns the union of two rectangles

Pascal

```
function UnionRect(out Rect: TRect; const R1: TRect; const R2: TRect): Boolean;
```

C++

```
Boolean UnionRect(TRect Rect, const TRect R1, const TRect R2);
```

File

Types

Description

Call UnionRect to obtain the smallest rectangle that includes both R1 and R2. The union is returned as the Rect (see page 4689) parameter.

UnionRect returns true if the resulting rectangle is nonempty. If the resulting rectangle as a width or height that is less than or equal to 0, UnionRect returns false.

See Also

IntersectRect (see page 4687)

OffsetRect (see page 4688)

IsRectEmpty (see page 4687)

46.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TSplitRectType (see page 4696)	This is record Types.TSplitRectType.

Records

	Name	Description
	tagSIZE (see page 4693)	tagSIZE is a record holding width and height values.
	TPoint (see page 4694)	TPoint type defines a pixel location onscreen.
	TRect (see page 4694)	TRect defines a rectangle.
	TSmallPoint (see page 4695)	TSmallPoint type defines a point with two 16-bit coordinates.

46.2.1 Types.tagSIZE Record

tagSIZE is a record holding width and height values.

Pascal

```
tagSIZE = record
  cx: Longint;
  cy: Longint;
end;
```

C++

```
struct tagSIZE {
  Longint cx;
  Longint cy;
};
```

File

Types

Description

The SIZE (see page 4701) equates to a TSize (see page 4706) type, which in turn equates to a tagSIZE record.

tagSIZE holds the width (cx) and height (cy) of something, typically in pixels. For example, TextExtent returns the width and height, in pixels, of a string rendered in the current font.

See Also

SIZE (see page 4701)

TextExtent

TSize (see page 4706)

46.2.2 Types.TPoint Record

TPoint type defines a pixel location onscreen.

Pascal

```
TPoint = record
  X: Longint;
  Y: Longint;
end;
```

C++

```
struct TPoint {
  Longint X;
  Longint Y;
};
```

File

Types

Description

The TPoint type defines a pixel location onscreen, with the origin in the top left corner. X specifies the horizontal coordinate of the point, Y specifies the vertical coordinate.

C++ Examples:

```
/*
This example draws a polygon in the specified shape, and
fills it with the color teal.
*/
void __fastcall TForm1::PaintBox1Paint(TObject *Sender)
{
  TPoint points[4];
  points[0] = Point(10,10);
  points[1] = Point(30,10);
  points[2] = Point(130,30);
  points[3] = Point(240,120);
  (dynamic_cast<TPaintBox *>(Sender))->Canvas->Brush->Color = clTeal;
  (dynamic_cast<TPaintBox *>(Sender))->Canvas->Polygon(points, 3);
}
```

See Also

Point (see page 4688)

46.2.3 Types.TRect Record

TRect defines a rectangle.

Pascal

```
TRect = record
  case Integer of
    0: (Bottom: Longint;
        Left: Longint;
        Right: Longint;
        Top: Longint;);
```

```
      1: (BottomRight: TPoint;
          TopLeft: TPoint;);
  end;
```

C++

```
  struct TRect {
    Longint Bottom;
    Longint Left;
    Longint Right;
    Longint Top;
    TPoint BottomRight;
    TPoint TopLeft;
  };
```

File

Types

Description

TRect represents the dimensions of a rectangle. The coordinates are specified as either four separate integers representing the left, top, right, and bottom sides, or as two points representing the locations of the top left and bottom right corners.

Typically, TRect values represent pixel locations, where the origin of the pixel coordinate system is in the top left corner of the screen (screen coordinates) or the top left corner of a control's client area (client coordinates). When a TRect value represents a rectangle on the screen, by convention the top and left edges are considered inside the rectangle and the bottom and right edges are considered outside the rectangle. This convention allows the width of the rectangle to be Right - Left and the height to be Bottom - Top.

46.2.4 Types.TSmallPoint Record

TSmallPoint type defines a point with two 16-bit coordinates.

Pascal

```
  TSmallPoint = record
    x: SmallInt;
    y: SmallInt;
  end;
```

C++

```
  struct TSmallPoint {
    SmallInt x;
    SmallInt y;
  };
```

File

Types

Description

The TSmallPoint type defines a point where each coordinate is a 16-bit integer. x specifies the horizontal coordinate of the point, y specifies the vertical coordinate.

46.2.5 Types.TSplitRectType Enumeration

Pascal

```
TSplitRectType = (
  srLeft,
  srRight,
  srTop,
  srBottom
);
```

C++

```
enum TSplitRectType {
  srLeft,
  srRight,
  srTop,
  srBottom
};
```

File

Types

Description

This is record Types.TSplitRectType.

46.3 Types

The following table lists types in this documentation.

Types

Name	Description
DWORD (see page 4697)	DWORD is equivalent to LongWord.
PByte (see page 4698)	PByte is a pointer to a Byte variable.
PDouble (see page 4698)	PDouble is a pointer to a Double variable.
PInteger (see page 4699)	PInteger is a pointer to a Integer variable.
PLongint (see page 4699)	This is type Types.PLongint.
PPoint (see page 4699)	PPoint is a pointer to a TPoint (see page 4694) variable.
PRect (see page 4700)	PRect is a pointer to a TRect (see page 4694) variable.
PSize (see page 4700)	PSize is a pointer to a TSize (see page 4706) variable.
PSmallInt (see page 4701)	This is type Types.PSmallInt.
PSmallPoint (see page 4701)	This is type Types.PSmallPoint.
SIZE (see page 4701)	This is type Types.SIZE.
tagPOINT (see page 4702)	This is type Types.tagPOINT.
TBooleanDynArray (see page 4702)	TBooleanDynArray defines an array of Boolean elements.
TByteDynArray (see page 4702)	This is type Types.TByteDynArray.
TCardinalDynArray (see page 4703)	TCardinalDynArray defines an array of Cardinal elements.
TDoubleDynArray (see page 4703)	TDoubleDynArray defines an array of Double elements.
TInt64DynArray (see page 4704)	TInt64DynArray defines an array of Int64 elements.
TIntegerDynArray (see page 4704)	This is type Types.TIntegerDynArray.
TLongWordDynArray (see page 4704)	TLongWordDynArray defines an array of LongWord elements.
TShortIntDynArray (see page 4705)	TShortIntDynArray defines an array of ShortInt elements.
TSingleDynArray (see page 4705)	TSingleDynArray defines an array of Single elements.
TSize (see page 4706)	TSize represents a width and height.
TSmallIntDynArray (see page 4706)	TSmallIntDynArray defines an array of SmallInt elements.
TStringDynArray (see page 4706)	TStringDynArray defines an array of String elements.
TValueRelationship (see page 4707)	TValueRelationship defines value comparison possibilities.
TWideStringDynArray (see page 4707)	TWideStringDynArray defines an array of WideString (see page 3476) elements.
TWordDynArray (see page 4708)	TWordDynArray defines an array of Word elements.

46.3.1 Types.DWORD Type

DWORD is equivalent to LongWord.

Pascal

```
DWORD = LongWord;
```

C++

```
LongWord DWORD;
```

File

Types

Description

The DWORD holds positive integers up to a maximum value of 4,294,967,295.

See Also

LongWord

46.3.2 Types.PByte Type

PByte is a pointer to a Byte variable.

Pascal

```
PByte = System.PByte;
```

C++

```
System.PByte PByte;
```

File

Types

Description

Types.PByte is the same as System.PByte (see page 3830).

See Also

Byte

PByte (see page 3830)

46.3.3 Types.PDouble Type

PDouble is a pointer to a Double variable.

Pascal

```
PDouble = System.PDouble;
```

C++

```
System.PDouble PDouble;
```

File

Types

Description

Types.PDouble is the same as System.PDouble (see page 3834).

See Also

Double

PDouble (see page 3834)

46.3.4 Types.PInteger Type

PInteger is a pointer to a Integer variable.

Pascal

```
PInteger = System.PInteger;
```

C++

```
System.PInteger PInteger;
```

File

Types

Description

Types.PInteger is the same as System.PInteger (see page 3837).

See Also

Integer

PInteger (see page 3837)

46.3.5 Types.PLongint Type

Pascal

```
PLongint = System.PLongint;
```

C++

```
System.PLongint PLongint;
```

File

Types

Description

This is type Types.PLongint.

46.3.6 Types.PPoint Type

PPoint is a pointer to a TPoint (see page 4694) variable.

Pascal

```
PPoint = ^TPoint;
```

C++

```
^TPoint PPoint;
```

File

Types

Description

The TPoint (see page 4694) type defines a pixel location onscreen, with the origin in the top left corner.

See Also

TPoint (see page 4694)

46.3.7 Types.PRect Type

PRect is a pointer to a TRect (see page 4694) variable.

Pascal

```
PRect = ^TRect;
```

C++

```
^TRect PRect;
```

File

Types

Description

The TRect (see page 4694) type represents the dimensions of a rectangle.

See Also

TRect (see page 4694)

46.3.8 Types.PSize Type

PSize is a pointer to a TSize (see page 4706) variable.

Pascal

```
PSize = ^TSize;
```

C++

```
^TSize PSize;
```

File

Types

Description

The TSize (see page 4706) type holds the width and height of something, typically in pixels.

See Also

TSize (see page 4706)

46.3.9 Types.PSmallInt Type

Pascal

```
PSmallInt = System.PSmallInt;
```

C++

```
System.PSmallInt PSmallInt;
```

File

Types

Description

This is type Types.PSmallInt.

46.3.10 Types.PSmallPoint Type

Pascal

```
PSmallPoint = ^TSmallPoint;
```

C++

```
^TSmallPoint PSmallPoint;
```

File

Types

Description

This is type Types.PSmallPoint.

46.3.11 Types.SIZE Type

Pascal

```
SIZE = tagSIZE;
```

C++

```
tagSIZE SIZE;
```

File

Types

Description

This is type Types.SIZE.

46.3.12 Types.tagPOINT Type

Pascal

```
tagPOINT = TPoint;
```

C++

```
TPoint tagPOINT;
```

File

Types

Description

This is type Types.tagPOINT.

46.3.13 Types.TBooleanDynArray Type

TBooleanDynArray defines an array of Boolean elements.

Pascal

```
TBooleanDynArray = array of Boolean;
```

C++

```
array of Boolean TBooleanDynArray;
```

File

Types

Description

The TBooleanDynArray defines a dynamic array of Boolean elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.14 Types.TByteDynArray Type

Pascal

```
TByteDynArray = array of Byte;
```

C++

```
array of Byte TByteDynArray;
```

File

Types

Description

This is type Types.TByteDynArray.

46.3.15 Types.TCardinalDynArray Type

TCardinalDynArray defines an array of Cardinal elements.

Pascal

```
TCardinalDynArray = array of Cardinal;
```

C++

```
array of Cardinal TCardinalDynArray;
```

File

Types

Description

The TCardinalDynArray defines a dynamic array of Cardinal elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.16 Types.TDoubleDynArray Type

TDoubleDynArray defines an array of Double elements.

Pascal

```
TDoubleDynArray = array of Double;
```

C++

```
array of Double TDoubleDynArray;
```

File

Types

Description

The TDoubleDynArray defines a dynamic array of Double elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.17 Types.TInt64DynArray Type

TInt64DynArray defines an array of Int64 elements.

Pascal

```
TInt64DynArray = array of Int64;
```

C++

```
array of Int64 TInt64DynArray;
```

File

Types

Description

The TInt64DynArray defines a dynamic array of Int64 elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.18 Types.TIntegerDynArray Type

Pascal

```
TIntegerDynArray = array of Integer;
```

C++

```
array of Integer TIntegerDynArray;
```

File

Types

Description

This is type Types.TIntegerDynArray.

46.3.19 Types.TLongWordDynArray Type

TLongWordDynArray defines an array of LongWord elements.

Pascal

```
TLongWordDynArray = array of LongWord;
```

C++

```
array of LongWord TLongWordDynArray;
```

File

Types

Description

The TLongWordDynArray defines a dynamic array of LongWord elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.20 Types.TShortIntDynArray Type

TShortIntDynArray defines an array of ShortInt elements.

Pascal

```
TShortIntDynArray = array of ShortInt;
```

C++

```
array of ShortInt TShortIntDynArray;
```

File

Types

Description

The TShortIntDynArray defines a dynamic array of ShortInt elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.21 Types.TSingleDynArray Type

TSingleDynArray defines an array of Single elements.

Pascal

```
TSingleDynArray = array of Single;
```

C++

```
array of Single TSingleDynArray;
```

File

Types

Description

The TSingleDynArray defines a dynamic array of Single elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.22 Types.TSize Type

TSize represents a width and height.

Pascal

```
TSize = tagSIZE;
```

C++

```
tagSIZE TSize;
```

File

Types

Description

TSize represents the size of something. Typically, the implied units of measurement are pixels.

cx is the width.

cy is the height.

46.3.23 Types.TSmallIntDynArray Type

TSmallIntDynArray defines an array of SmallInt elements.

Pascal

```
TSmallIntDynArray = array of SmallInt;
```

C++

```
array of SmallInt TSmallIntDynArray;
```

File

Types

Description

The TSmallIntDynArray defines a dynamic array of SmallInt elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.24 Types.TStringDynArray Type

TStringDynArray defines an array of String elements.

Pascal

```
TStringDynArray = array of string;
```

C++

```
array of string TStringDynArray;
```

File

Types

Description

The TStringDynArray defines a dynamic array of String elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.25 Types.TValueRelationship Type

TValueRelationship defines value comparison possibilities.

Pascal

```
TValueRelationship = -1..1;
```

C++

```
-1..1 TValueRelationship;
```

File

Types

Description

Routines such as the CompareValue routine compare two values for equality. They return the result in a TValueRelationship value as follows :

Value	Associated constant	Meaning
-1	LessThanValue (see page 4710)	The first value is less than the second value.
0	EqualsValue (see page 4709)	The two values are equal.
+1	GreaterThanValue (see page 4709)	The first value is greater than the second value.

See Also

LessThanValue (see page 4710)

EqualsValue (see page 4709)

GreaterThanValue (see page 4709)

TValueRelationship

46.3.26 Types.TWideStringDynArray Type

TWideStringDynArray defines an array of WideString (see page 3476) elements.

Pascal

```
TWideStringDynArray = array of WideString;
```

C++

```
array of WideString TWideStringDynArray;
```

File

Types

Description

The TWideStringDynArray defines a dynamic array of WideString (see page 3476) elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.3.27 Types.TWordDynArray Type

TWordDynArray defines an array of Word elements.

Pascal

```
TWordDynArray = array of Word;
```

C++

```
array of Word TWordDynArray;
```

File

Types

Description

The TWordDynArray defines a dynamic array of Word elements.

Use SetLength (see page 3748) to allocate storage for such an array.

See Also

TSize (see page 4706)

46.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
EqualsValue (see page 4709)	EqualsValue indicates that both values are equal in a comparison operation.
GreaterThanValue (see page 4709)	GreaterThanValue indicates that one value is greater than an other in a comparison operation.
LessThanValue (see page 4710)	LessThanValue indicates that one value is less than an other in a comparison operation.
RT_RCDATA (see page 4710)	This is constant Types.RT_RCDATA.

46.4.1 Types.EqualsValue Constant

EqualsValue indicates that both values are equal in a comparison operation.

Pascal

```
EqualsValue = 0;
```

C++

```
EqualsValue = 0;
```

File

Types

Description

Routines such as the CompareValue routine compare two values for equality. They return the result in a TValueRelationship (see page 4707) value. If the first value is equal to the second, the value is EqualsValue

See Also

CompareValue

GreaterThanValue

LessThanValue

TValueRelationship

46.4.2 Types.GreaterThanValue Constant

GreaterThanValue indicates that one value is greater than an other in a comparison operation.

Pascal

```
GreaterThanValue = High(TValueRelationship);
```

C++

```
GreaterThanValue = High(TValueRelationship);
```

File

Types

Description

Routines such as the CompareValue routine compare two values for equality. They return the result in a TValueRelationship (see page 4707) value. If the first value is greater than the second, the value is GreaterThanValue

See Also

EqualsValue

CompareValue

LessThanValue

TValueRelationship

46.4.3 Types.LessThanValue Constant

LessThanValue indicates that one value is less than an other in a comparison operation.

Pascal

```
LessThanValue = Low(TValueRelationship);
```

C++

```
LessThanValue = Low(TValueRelationship);
```

File

Types

Description

Routines such as the CompareValue routine compare two values for equality. They return the result in a TValueRelationship (see page 4707) value. If the first value is less than the second, the value is LessThanValue

See Also

EqualsValue

CompareValue

GreaterThanValue

TValueRelationship

46.4.4 Types.RT_RCDATA Constant

Pascal

```
RT_RCDATA = PChar(10);
```

C++

```
RT_RCDATA = PChar(10);
```

File

Types

Description

This is constant Types.RT_RCDATA.

47 TypeTrans Namespace

This is namespace TypeTrans.

Topics

Name	Description
Classes (see page 4714)	The following table lists classes in this documentation.
Functions (see page 4718)	The following table lists functions in this documentation.
Variables (see page 4721)	The following table lists variables in this documentation.

Classes

	Name	Description
	ETypeTransException (see page 4714)	ETypeTransException is the exception raised when a conversion between a SOAP type description and an Object Pascal type fails.
	TTypeTranslator (see page 4714)	This is class TypeTrans.TTypeTranslator.

Functions

	Name	Description
	FloatToStrEx (see page 4718)	This is function TypeTrans.FloatToStrEx.
	GetEnumValueEx (see page 4718)	This is function TypeTrans.GetEnumValueEx.
	GetEnumValueExW (see page 4719)	This is function TypeTrans.GetEnumValueExW.
	SetEnumPropEx (see page 4719)	This is function TypeTrans.SetEnumPropEx.
	SetEnumPropExW (see page 4719)	This is function TypeTrans.SetEnumPropExW.
	StrToFloatEx (see page 4720)	This is function TypeTrans.StrToFloatEx.

Variables

Name	Description
TypeTranslator (see page 4721)	This is variable TypeTrans.TypeTranslator.

47.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ETypeTransException (see page 4714)	ETypeTransException is the exception raised when a conversion between a SOAP type description and an Object Pascal type fails.
	TTypeTranslator (see page 4714)	This is class TypeTrans.TTypeTranslator.

47.1.1 ETypeTransException Class

ETypeTransException is the exception raised when a conversion between a SOAP type description and an Object Pascal type fails.

Class Hierarchy

Pascal

```
ETypeTransException = class(Exception);
```

C++

```
class ETypeTransException : public Exception;
```

File

TypeTrans

Description

ETypeTransException is thrown when an application attempts to convert a type in a SOAP packet to an Object Pascal type and fails for some reason.

See Also

TOPToSoapDomConvert

47.1.2 TTypeTranslator Class

Class Hierarchy

Pascal

```
TTypeTranslator = class;
```

C++

```
class TTypeTranslator;
```

File

TypeTrans

Description

This is class TypeTrans.TTypeTranslator.

47.1.2.1 TTypeTranslator Members

The following tables list the members exposed by TTypeTranslator.

Public Methods

	Name	Description
	Base64ToVar (see page 4716)	This is the overview for the Base64ToVar method overload.
	CastNativeToSoap (see page 4716)	This is CastNativeToSoap, a member of class TTypeTranslator.
	CastSoapToNative (see page 4717)	This is CastSoapToNative, a member of class TTypeTranslator.
	CastSoapToVariant (see page 4717)	This is the overview for the CastSoapToVariant method overload.
	Create (see page 4715)	This is Create, a member of class TTypeTranslator.
	Destroy (see page 4715)	This is Destroy, a member of class TTypeTranslator.

47.1.2.2 TTypeTranslator.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TTypeTranslator();
```

Description

This is Create, a member of class TTypeTranslator.

47.1.2.3 TTypeTranslator.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TTypeTranslator();
```

Description

This is Destroy, a member of class TTypeTranslator.

47.1.2.4 TTypeTranslator Methods

The methods of the TTypeTranslator class are listed here.

Public Methods

	Name	Description
	Base64ToVar (see page 4716)	This is the overview for the Base64ToVar method overload.

	CastNativeToSoap (see page 4716)	This is CastNativeToSoap, a member of class TTypeTranslator.
	CastSoapToNative (see page 4717)	This is CastSoapToNative, a member of class TTypeTranslator.
	CastSoapToVariant (see page 4717)	This is the overview for the CastSoapToVariant method overload.

47.1.2.4.1 Base64ToVar Method

This is the overview for the Base64ToVar method overload.

Overload List

	Name	Description
	TTypeTranslator.Base64ToVar (Pointer, InvString) (see page 4716)	This is Base64ToVar, a member of class TTypeTranslator.
	TTypeTranslator.Base64ToVar (Variant, InvString) (see page 4716)	This is Base64ToVar, a member of class TTypeTranslator.

47.1.2.4.1.1 TTypeTranslator.Base64ToVar Method (Pointer, InvString)

Pascal

```
procedure Base64ToVar(NatData: Pointer; const SoapData: InvString); overload;
```

C++

```
__fastcall Base64ToVar(void * NatData, const InvString SoapData);
```

Description

This is Base64ToVar, a member of class TTypeTranslator.

47.1.2.4.1.2 TTypeTranslator.Base64ToVar Method (Variant, InvString)

Pascal

```
procedure Base64ToVar(var V: Variant; const SoapData: InvString); overload;
```

C++

```
__fastcall Base64ToVar(Variant V, const InvString SoapData);
```

Description

This is Base64ToVar, a member of class TTypeTranslator.

47.1.2.4.2 TTypeTranslator.CastNativeToSoap Method

Pascal

```
procedure CastNativeToSoap(Info: PTypeInfo; var SoapData: InvString; NatData: Pointer; var
IsNull: Boolean);
```

C++

```
__fastcall CastNativeToSoap(PTypeInfo Info, InvString SoapData, void * NatData, Boolean
IsNull);
```

Description

This is CastNativeToSoap, a member of class TTypeTranslator.

47.1.2.4.3 TTypeTranslator.CastSoapToNative Method

Pascal

```
function CastSoapToNative(Info: PTypeInfo; const SoapData: InvString; NatData: Pointer;
IsNull: Boolean): Boolean;
```

C++

```
__fastcall Boolean CastSoapToNative(PTypeInfo Info, const InvString SoapData, void * NatData,
Boolean IsNull);
```

Description

This is CastSoapToNative, a member of class TTypeTranslator.

47.1.2.4.4 CastSoapToVariant Method

This is the overview for the CastSoapToVariant method overload.

Overload List

	Name	Description
	TTypeTranslator.CastSoapToVariant (PTypeInfo, InvString) (see page 4717)	This is CastSoapToVariant, a member of class TTypeTranslator.
	TTypeTranslator.CastSoapToVariant (PTypeInfo, InvString, Pointer) (see page 4717)	This is CastSoapToVariant, a member of class TTypeTranslator.

47.1.2.4.4.1 TTypeTranslator.CastSoapToVariant Method (PTypeInfo, InvString)

Pascal

```
function CastSoapToVariant(SoapInfo: PTypeInfo; const SoapData: InvString): Variant; overload;
```

C++

```
__fastcall Variant CastSoapToVariant(PTypeInfo SoapInfo, const InvString SoapData);
```

Description

This is CastSoapToVariant, a member of class TTypeTranslator.

47.1.2.4.4.2 TTypeTranslator.CastSoapToVariant Method (PTypeInfo, InvString, Pointer)

Pascal

```
procedure CastSoapToVariant(SoapInfo: PTypeInfo; const SoapData: InvString; NatData: Pointer);
overload;
```

C++

```
__fastcall CastSoapToVariant(PTypeInfo SoapInfo, const InvString SoapData, void * NatData);
```

Description

This is CastSoapToVariant, a member of class TTypeTranslator.

47.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FloatToStrEx (see page 4718)	This is function TypeTrans.FloatToStrEx.
	GetEnumValueEx (see page 4718)	This is function TypeTrans.GetEnumValueEx.
	GetEnumValueExW (see page 4719)	This is function TypeTrans.GetEnumValueExW.
	SetEnumPropEx (see page 4719)	This is function TypeTrans.SetEnumPropEx.
	SetEnumPropExW (see page 4719)	This is function TypeTrans.SetEnumPropExW.
	StrToFloatEx (see page 4720)	This is function TypeTrans.StrToFloatEx.

47.2.1 TypeTrans.FloatToStrEx Function

Pascal

```
function FloatToStrEx(Value: Extended): string;
```

C++

```
UnicodeString FloatToStrEx(Extended Value);
```

File

TypeTrans

Description

This is function TypeTrans.FloatToStrEx.

47.2.2 TypeTrans.GetEnumValueEx Function

Pascal

```
function GetEnumValueEx(TypInfo: PTypeInfo; const Name: string): Integer; deprecated;
```

C++

```
int GetEnumValueEx(PTypeInfo TypInfo, const UnicodeString Name);
```

File

TypeTrans

Description

This is function TypeTrans.GetEnumValueEx.

47.2.3 TypeTrans.GetEnumValueExW Function

Pascal

```
function GetEnumValueExW(TypInfo: PTypeInfo; const Name: InvString): Integer;
```

C++

```
int GetEnumValueExW(PTypeInfo TypInfo, const InvString Name);
```

File

TypeTrans

Description

This is function TypeTrans.GetEnumValueExW.

47.2.4 TypeTrans.SetEnumPropEx Function

Pascal

```
procedure SetEnumPropEx(Instance: TObject; PropInfo: PPropInfo; const Value: string);
deprecated;
```

C++

```
SetEnumPropEx(TObject * Instance, PPropInfo PropInfo, const UnicodeString Value);
```

File

TypeTrans

Description

This is function TypeTrans.SetEnumPropEx.

47.2.5 TypeTrans.SetEnumPropExW Function

Pascal

```
procedure SetEnumPropExW(Instance: TObject; PropInfo: PPropInfo; const Value: InvString);
```

C++

```
SetEnumPropExW(TObject * Instance, PPropInfo PropInfo, const InvString Value);
```

File

TypeTrans

Description

This is function TypeTrans.SetEnumPropExW.

47.2.6 TypeTrans.StrToFloatEx Function

Pascal

```
function StrToFloatEx(const S: string): Extended;
```

C++

```
Extended StrToFloatEx(const UnicodeString S);
```

File

TypeTrans

Description

This is function TypeTrans.StrToFloatEx.

47.3 Variables

The following table lists variables in this documentation.

Variables

Name	Description
TypeTranslator (see page 4721)	This is variable TypeTrans.TypeTranslator.

47.3.1 TypeTrans.TypeTranslator Variable

Pascal

```
TypeTranslator: TTypeTranslator;
```

C++

```
TTypeTranslator TypeTranslator;
```

File

TypeTrans

Description

This is variable TypeTrans.TypeTranslator.

48 TypInfo Namespace

This is namespace TypInfo.

Topics

Name	Description
Classes (see page 4727)	The following table lists classes in this documentation.
Functions (see page 4735)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 4779)	The following table lists structs, records, enums in this documentation.
Types (see page 4789)	The following table lists types in this documentation.
Variables (see page 4801)	The following table lists variables in this documentation.
Constants (see page 4802)	The following table lists constants in this documentation.

Classes

	Name	Description
	EPropertyConvertError (see page 4727)	EPropertyConvertError is the exception class for type errors when attempting to get or set the value of a property.
	EPropertyError (see page 4727)	EPropertyError is the exception class for unsuccessful attempts to set the value of a property.
	TPublishableVariantType (see page 4728)	TPublishableVariantType is the base class for custom Variant (see page 3430) types that surface the published properties of an object that represents the Variant (see page 3430)'s data.

Constants

Name	Description
tkAny (see page 4802)	This is constant TypInfo.tkAny.
tkMethods (see page 4802)	This is constant TypInfo.tkMethods.
tkProperties (see page 4802)	This is constant TypInfo.tkProperties.

Functions

	Name	Description
	FreeAndNilProperties (see page 4737)	Frees any property values that are objects and sets their value to nil (Delphi) or NULL (C++).
	GetAnsiStrProp (see page 4737)	This is function TypInfo.GetAnsiStrProp.
	GetAnsiStrProp (see page 4738)	This is function TypInfo.GetAnsiStrProp.
	GetDynArrayProp (see page 4738)	Returns the value of a component property that is a dynamic array type.
	GetDynArrayProp (see page 4738)	Returns the value of a component property that is a dynamic array type.
	GetEnumName (see page 4739)	Returns the name of a Delphi enumerated type constant given its value.

	GetEnumProp (see page 4742)	Returns the value of a component property that is an enumerated type.
	GetEnumProp (see page 4742)	Returns the value of a component property that is an enumerated type.
	GetEnumValue (see page 4744)	Returns the value of an enumerated type constant given its string representation.
	GetFloatProp (see page 4745)	Returns the value of a component property that is a float type.
	GetFloatProp (see page 4745)	Returns the value of a component property that is a float type.
	GetInt64Prop (see page 4746)	Returns the value of a component property that is an Int64 type.
	GetInt64Prop (see page 4746)	Returns the value of a component property that is an Int64 type.
	GetInterfaceProp (see page 4746)	Returns the value of a component property that is an interface type.
	GetInterfaceProp (see page 4746)	Returns the value of a component property that is an interface type.
	GetMethodProp (see page 4747)	Returns the value of a component property that is a method type.
	GetMethodProp (see page 4747)	Returns the value of a component property that is a method type.
	GetObjectProp (see page 4748)	Returns the value of a component property that is an object type.
	GetObjectProp (see page 4748)	Returns the value of a component property that is an object type.
	GetObjectPropClass (see page 4749)	Returns the class type of a component property that is an object type.
	GetObjectPropClass (see page 4749)	Returns the class type of a component property that is an object type.
	GetObjectPropClass (see page 4749)	Returns the class type of a component property that is an object type.
	GetOrdProp (see page 4750)	Returns the value of a component property that is an ordinal type.
	GetOrdProp (see page 4750)	Returns the value of a component property that is an ordinal type.
	GetPropInfo (see page 4751)	Retrieves information about a component's property.
	GetPropInfo (see page 4751)	Retrieves information about a component's property.
	GetPropInfo (see page 4751)	Retrieves information about a component's property.
	GetPropInfo (see page 4751)	Retrieves information about a component's property.
	GetPropInfos (see page 4751)	Retrieves a list of component properties.
	GetPropList (see page 4752)	Retrieves a list of component properties.
	GetPropList (see page 4752)	Retrieves a list of component properties.
	GetPropList (see page 4752)	Retrieves a list of component properties.
	GetPropName (see page 4753)	This is function TypInfo.GetPropName.
	GetPropValue (see page 4753)	Retrieves a component's property value as a variant.
	GetPropValue (see page 4753)	Retrieves a component's property value as a variant.
	GetSetElementName (see page 4754)	This is function TypInfo.GetSetElementName.
	GetSetElementValue (see page 4754)	This is function TypInfo.GetSetElementValue.
	GetSetProp (see page 4755)	Returns the value of a component property that is a set type.
	GetSetProp (see page 4755)	Returns the value of a component property that is a set type.
	GetStrProp (see page 4756)	Returns the value of a component property that is a string type.
	GetStrProp (see page 4756)	Returns the value of a component property that is a string type.
	GetTypeData (see page 4756)	Returns a pointer to information about a type.
	GetTypeName (see page 4757)	This is function TypInfo.GetTypeName.
	GetUnicodeStrProp (see page 4757)	This is function TypInfo.GetUnicodeStrProp.
	GetUnicodeStrProp (see page 4758)	This is function TypInfo.GetUnicodeStrProp.
	GetVariantProp (see page 4758)	Returns the value of a component property that is a variant type.
	GetVariantProp (see page 4758)	Returns the value of a component property that is a variant type.
	GetWideStrProp (see page 4759)	Returns the value of a component property that is a WideString (see page 3476) type.
	GetWideStrProp (see page 4759)	Returns the value of a component property that is a WideString (see page 3476) type.
	IsPublishedProp (see page 4759)	Determines if a specified component property is a published property.
	IsPublishedProp (see page 4759)	Determines if a specified component property is a published property.
	IsStoredProp (see page 4760)	Determines if a specified component property has the stored attribute.
	IsStoredProp (see page 4760)	Determines if a specified component property has the stored attribute.
	PropIsType (see page 4761)	Determines if a component property is of a particular data type.
	PropIsType (see page 4761)	Determines if a component property is of a particular data type.
	PropType (see page 4761)	Retrieves a component's property type.
	PropType (see page 4761)	Retrieves a component's property type.
	SamePropTypeName (see page 4762)	This is function TypInfo.SamePropTypeName.
	SetAnsiStrProp (see page 4762)	This is function TypInfo.SetAnsiStrProp.

	SetAnsiStrProp (see page 4763)	This is function TypInfo.SetAnsiStrProp.
	SetDynArrayProp (see page 4763)	Sets the value of a component property that is a dynamic array type.
	SetDynArrayProp (see page 4763)	Sets the value of a component property that is a dynamic array type.
	SetEnumProp (see page 4764)	Sets the value of a component property that is an enumerated type.
	SetEnumProp (see page 4764)	Sets the value of a component property that is an enumerated type.
	SetFloatProp (see page 4766)	Sets the value of a component property that is a float type.
	SetFloatProp (see page 4766)	Sets the value of a component property that is a float type.
	SetInt64Prop (see page 4767)	Sets the value of a component property that is an Int64 type.
	SetInt64Prop (see page 4767)	Sets the value of a component property that is an Int64 type.
	SetInterfaceProp (see page 4768)	Sets the value of a component property that is an Interface type.
	SetInterfaceProp (see page 4768)	Sets the value of a component property that is an Interface type.
	SetMethodProp (see page 4769)	Sets the value of a component property that is a method type.
	SetMethodProp (see page 4769)	Sets the value of a component property that is a method type.
	SetObjectProp (see page 4770)	Sets the value of a component property that is an object type.
	SetObjectProp (see page 4770)	Sets the value of a component property that is an object type.
	SetOrdProp (see page 4770)	Sets the value of a component property that is an ordinal type.
	SetOrdProp (see page 4770)	Sets the value of a component property that is an ordinal type.
	SetPropValue (see page 4771)	Sets the value of a component property using a variant value.
	SetPropValue (see page 4771)	Sets the value of a component property using a variant value.
	SetSetProp (see page 4772)	Sets the value of a component property that is a set type.
	SetSetProp (see page 4772)	Sets the value of a component property that is a set type.
	SetStrProp (see page 4773)	Sets the value of a component property that is a string type.
	SetStrProp (see page 4773)	Sets the value of a component property that is a string type.
	SetToString (see page 4774)	Returns one or more of the set values of a component's property.
	SetUnicodeStrProp (see page 4775)	This is function TypInfo.SetUnicodeStrProp.
	SetUnicodeStrProp (see page 4775)	This is function TypInfo.SetUnicodeStrProp.
	SetVariantProp (see page 4775)	Sets the value of a component property that is a variant type.
	SetVariantProp (see page 4775)	Sets the value of a component property that is a variant type.
	SetWideStrProp (see page 4776)	Sets the value of a component property that is a WideString (see page 3476) type.
	SetWideStrProp (see page 4776)	Sets the value of a component property that is a WideString (see page 3476) type.
	SortPropList (see page 4777)	Sorts a list of component properties into alphanumeric sequence.
	StringToSet (see page 4778)	Returns a bit mask of set values for a set type component property.

Structs, Records, Enums

	Name	Description
	TFloatType (see page 4779)	This is record TypInfo.TFloatType.
	TIntfFlag (see page 4780)	This is record TypInfo.TIntfFlag.
	TManagedField (see page 4780)	This is record TypInfo.TManagedField.
	TMethodKind (see page 4780)	Enumerates floating point number types in the TTypeData (see page 4785) record.
	TOrdType (see page 4782)	Enumerates floating point number types in the TTypeData (see page 4785) record.
	TParamFlag (see page 4783)	TParamFlag and TParamFlags (see page 4799) indicates the attributes of a method parameter.
	TPropData (see page 4783)	This is record TypInfo.TPropData.
	TPropInfo (see page 4784)	TPropInfo is a record of component property type information.
	TTypeData (see page 4785)	TTypeData is used internally to represent type information.
	TTypeInfo (see page 4786)	Holds information for a data type as returned by TypeInfo.
	TTypeKind (see page 4787)	These types describe a type that is manipulated in the forms designer.

Types

Name	Description
PPropInfo (see page 4789)	PPropInfo points to a TPropInfo (see page 4784) record that holds component property information.

PPropList (see page 4790)	Defines a pointer to a TPropList (see page 4800) array.
PPTypeInfo (see page 4790)	Holds a pointer to a pointer to information for a data type as returned by TypeInfo.
PTypeData (see page 4791)	PTypeData points to a TTypeData (see page 4785) record that holds component property type information.
PTypeInfo (see page 4794)	Holds a pointer to information for a data type as returned by TypeInfo.
ShortStringBase (see page 4797)	Defines a fixed length string for general use in the TTypeData (see page 4785) record.
TIntfFlags (see page 4797)	Enumerates interface flag types in the TTypeData (see page 4785) record.
TIntfFlagsBase (see page 4798)	Set of interface flag types in the TTypeData (see page 4785) record.
TParamFlags (see page 4799)	This is type TypInfo.TParamFlags.
TParamFlagsBase (see page 4799)	This is type TypInfo.TParamFlagsBase.
TPropInfoProc (see page 4799)	This is type TypInfo.TPropInfoProc.
TPropList (see page 4800)	Defines an array of PPropInfo (see page 4789) values.
TTypeKinds (see page 4800)	Defines a set of TTypeKind (see page 4787) values.

Variables

Name	Description
BooleanIdents (see page 4801)	An array of string representations of true and false.
DotSep (see page 4801)	This is variable TypInfo.DotSep.

48.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EPropertyConvertError (see page 4727)	EPropertyConvertError is the exception class for type errors when attempting to get or set the value of a property.
	EPropertyError (see page 4727)	EPropertyError is the exception class for unsuccessful attempts to set the value of a property.
	TPublishableVariantType (see page 4728)	TPublishableVariantType is the base class for custom Variant (see page 3430) types that surface the published properties of an object that represents the Variant (see page 3430)'s data.

48.1.1 EPropertyConvertError Class

EPropertyConvertError is the exception class for type errors when attempting to get or set the value of a property.

Class Hierarchy

Pascal

```
EPropertyConvertError = class(Exception);
```

C++

```
class EPropertyConvertError : public Exception;
```

File

TypInfo

Description

EPropertyConvertError is raised when an application tries to set a property to a value of the wrong type or to read a property that has invalid type information.

See Also

EPropertyError (see page 4727)

TPropertyEditor

48.1.2 EPropertyError Class

EPropertyError is the exception class for unsuccessful attempts to set the value of a property.

Class Hierarchy

Pascal

```
EPropertyError = class(Exception);
```

C++

```
class EPropertyError : public Exception;
```

File

TypInfo

Description

EPropertyError is raised by the SetValue (or Edit) methods of property-editor objects when they cannot set a requested property value. This usually occurs because the requested value is out of range or of an invalid data type.

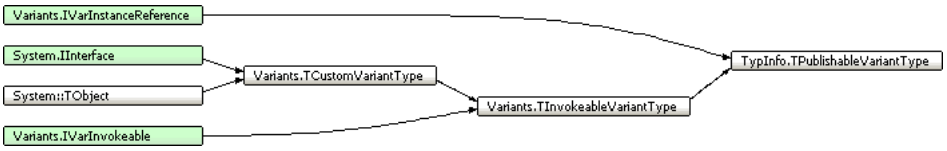
48.1.3 TPublishableVariantType Class

TPublishableVariantType is the base class for custom Variant (see page 3430) types that surface the published properties of an object that represents the Variant (see page 3430)'s data.

Class Hierarchy



Pascal

```
TPublishableVariantType = class(TInvokeableVariantType, IVarInstanceReference);
```

C++

```
class TPublishableVariantType : public TInvokeableVariantType, public IVarInstanceReference;
```

File

TypInfo

Description

TPublishableVariantType is the base class for new data types for Variants (see page 4997) that have properties and methods. TPublishableVariantType descendants do not represent the Variants (see page 4997) themselves. Rather, they act as utility classes that the custom Variants (see page 4997) call on to perform their operations. TPublishableVariantType adds to its ancestor's ability to implement properties and methods on Variants (see page 4997) of the custom type by automatically implementing all published properties of the object it uses to store its data.

Note: To create a Variant (see page 3430) type that descends from TPublishableVariantType,

Note: 1. Map the storage of the Variant (see page 3430)'s data on to the TVarData (see page 3813) record.

Note: 2. Write (see page 3789) a method that creates instances of your custom Variant (see page 3430). This fills in the Variant (see page 3430)'s data as defined in step 1.

Note: 3. Declare a class that descends from TPublishableVariantType.

Note: 4. Override the GetInstance (see page 4732) method to return the object that stores the custom Variant (see page 3430)'s data.

Note: 5. Implement all other required behavior (including type conversion rules) in the new class. This involves overriding the appropriate virtual methods (typically DoFunction, DoProcedure, BinaryOp, UnaryOp, CompareOp or Compare, Cast, CastTo, Clear, Copy (see page 3648), IsClear, LeftPromotion, and RightPromotion).

Note: 6. In the initialization section of the unit that defines your TPublishableVariantType descendant, create an instance of your class. When you instantiate your object, it automatically registers itself with the Variant (see page 3430)-handling system so that the new Variant (see page 3430) type is enabled.

Note: 7. In the finalization section of the unit that defines your TPublishableVariantType descendant, free the instance of your class. This automatically unregisters the Variant (see page 3430) type.

Note: For an example, see the VarCmplx (see page 4925) (Windows) or FMTBcd (Linux) unit, which implements a custom Variant (see page 3430) type for complex (Windows) or binary-coded decimal (Linux) numbers.

Note: Do not create your own custom Variant (see page 3430) types in C++. They are only supported in Delphi.

Supporting Properties and Methods in Custom Variants

48.1.3.1 TPublishableVariantType Members

The following tables list the members exposed by TPublishableVariantType.

Protected Methods

	Name	Description
	_AddRef (see page 5017)	Increments the reference count for this interface.
	_Release (see page 5017)	Decrements the reference count for this interface.
V	DispInvoke (see page 5022)	Invokes a method call when the Variant (see page 3430) supports such operations.
V	DispInvoke (see page 5041)	Invokes a method call by dispatching it to the appropriate TInvokeableVariantType (see page 5037) method.
V	FixupIdent (see page 5043)	Fixes up dispatch identifier.
A	GetInstance (see page 4732)	Returns the object instance that represents the data from a Variant (see page 3430) of the custom type.

	LeftPromotion (see page 5023)	Indicates whether the left argument to a binary operation should be coerced to a different type.
	OlePromotion (see page 5024)	Indicates the type to which a Variant (see page 3430) value must be cast to make it Automation-compatible.
	QueryInterface (see page 5025)	Returns a reference to a specified interface if the object supports that interface.
	RaiseCastError (see page 5025)	Generates a system error that indicates an invalid cast.
	RaiseDispError (see page 5026)	Generates a system error indicating an invalid dispatch attempt.
	RaiseInvalidOp (see page 5026)	Generates a system error indicating an invalid operation.
	RightPromotion (see page 5027)	Indicates whether the right argument to a binary operation should be coerced to a different type.
	SimplisticClear (see page 5028)	Clears a TVarData (see page 3813) record by re-initializing it.
	SimplisticCopy (see page 5028)	Performs a simple block copy of one TVarData (see page 3813) record to another.
	VarDataCast (see page 5029)	Performs a cast from one Variant (see page 3430) type to another.
	VarDataCastTo (see page 5030)	This is the overview for the VarDataCastTo method overload.
	VarDataCastToOleStr (see page 5030)	Performs a cast to a Variant (see page 3430) type of varOleStr (see page 3936).
	VarDataClear (see page 5031)	Clears the data from a built-in Variant (see page 3430) type.
	VarDataCopy (see page 5031)	Copies the data from one built-in Variant (see page 3430) type to another.
	VarDataCopyNoInd (see page 5032)	Copies the data from one built-in Variant (see page 3430) type to another.
	VarDataFromOleStr (see page 5032)	Creates a TVarData (see page 3813) record to represent a Unicode string.
	VarDataFromStr (see page 5033)	Creates a TVarData (see page 3813) record to represent a string.
	VarDataInit (see page 5033)	Initializes a TVarData (see page 3813) record.
	VarDataIsArray (see page 5033)	Indicates whether a TVarData (see page 3813) record represents the data from a Variant (see page 3430) array.
	VarDataIsByRef (see page 5034)	Indicates whether a TVarData (see page 3813) record stores its data indirectly.
	VarDataIsEmptyParam (see page 5034)	Indicates whether a TVarData (see page 3813) record represents an unassigned optional parameter.
	VarDataIsFloat (see page 5034)	Indicates whether a TVarData (see page 3813) record represents a floating-point value.
	VarDataIsNumeric (see page 5035)	Indicates whether a TVarData (see page 3813) record represents a numeric value.
	VarDataIsOrdinal (see page 5035)	Indicates whether a TVarData (see page 3813) record represents a ordinal value.
	VarDataIsStr (see page 5036)	Indicates whether a TVarData (see page 3813) record represents a string (normal or Unicode).
	VarDataToStr (see page 5036)	Returns a string that represents the value from a TVarData (see page 3813) record.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	BinaryOp (see page 5018)	Implements any binary operations of which the custom Variant (see page 3430) type is capable.
	Cast (see page 5018)	Converts the data from another Variant (see page 3430) type so that it represents this custom type's data format.
	CastTo (see page 5019)	This is CastTo, a member of class TCustomVariantType.
	CastToOle (see page 5019)	This is CastToOle, a member of class TCustomVariantType.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.

	Clear (see page 5019)	Sets the data for this custom Variant (see page 3430) type to a blank or unassigned value.
	Compare (see page 5020)	Implements comparisons that involve the custom Variant (see page 3430) type.
	CompareOp (see page 5021)	Implements any comparison operations of which the custom Variant (see page 3430) type is capable.
	Copy (see page 5022)	Copies the data from a Variant (see page 3430) of this custom type.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 5014)	This is the overview for the Create constructor overload.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 5015)	Frees an instance of TCustomVariantType (see page 5011).
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoFunction (see page 5047)	This is DoFunction, a member of class IVarInvokeable.
	DoFunction (see page 5041)	Implements all methods that return values.
	DoProcedure (see page 5047)	This is DoProcedure, a member of class IVarInvokeable.
	DoProcedure (see page 5042)	Implements all methods that do not return values.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetProperty (see page 4732)	Returns the value of a published property on the object that GetInstance (see page 4732) returns, so that it is available in custom Variants (see page 4997).
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	IsClear (see page 5023)	Indicates whether the data from a custom Variant (see page 3430) represents a blank or unassigned value.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetProperty (see page 4733)	Sets the value of a published property on the object that GetInstance (see page 4732) returns, so that it is available in custom Variants (see page 4997).
	ToString (see page 3391)	Returns a string containing the class name.
	UnaryOp (see page 5029)	Implements any unary operations of which the custom Variant (see page 3430) type is capable.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	VarType (see page 5037)	Indicates the Variant (see page 3430) type code for the custom Variant (see page 3430) type.

48.1.3.2 TPublishableVariantType Methods

The methods of the TPublishableVariantType class are listed here.

Protected Methods

	Name	Description
	GetInstance (see page 4732)	Returns the object instance that represents the data from a Variant (see page 3430) of the custom type.

Public Methods

	Name	Description
	GetProperty (see page 4732)	Returns the value of a published property on the object that GetInstance (see page 4732) returns, so that it is available in custom Variants (see page 4997).
	SetProperty (see page 4733)	Sets the value of a published property on the object that GetInstance (see page 4732) returns, so that it is available in custom Variants (see page 4997).

48.1.3.2.1 TPublishableVariantType.GetInstance Method

Returns the object instance that represents the data from a Variant (see page 3430) of the custom type.

Pascal

```
function GetInstance(const V: TVarData): TObject; virtual; abstract;
```

C++

```
virtual __fastcall TObject * GetInstance(const TVarData V) = 0;
```

Description

Override GetInstance to return the object that represents the data from a Variant (see page 3430) of the custom Type. TPublishableVariantType (see page 4728) implements all the published properties of that object so that they are published properties of the Variant (see page 3430).

V is the data from a Variant (see page 3430) of the custom type. This data must include a reference to an object that represents the Variant (see page 3430)'s data, and which GetInstance returns.

GetInstance is abstract or, in C++ terminology, pure virtual in TPublishableVariantType (see page 4728), which means it has no implementation. Descendant classes override this method to enable Variants (see page 4997) to publish the properties from the object that implements their data.

See Also

GetProperty (see page 4732)

SetProperty (see page 4733)

Supporting Properties and Methods in Custom Variants

48.1.3.2.2 TPublishableVariantType.GetProperty Method

Returns the value of a published property on the object that GetInstance (see page 4732) returns, so that it is available in custom Variants (see page 4997).

Pascal

```
function GetProperty(var Dest: TVarData; const V: TVarData; const Name: string): Boolean;
override;
```

C++

```
virtual __fastcall Boolean GetProperty(TVarData Dest, const TVarData V, const UnicodeString
Name);
```

Description

GetProperty enables an application to read the properties of instances of the publishable Variant (see page 3430) type. It

implements all the properties that are published by the object that GetInstance (see page 4732) returns.

When the application contains a line such as

```
PropValue := MyVariant.SpecialProperty;
```

(Delphi) or calls the Exec method of the Variant (see page 3430) (C++), a call is automatically generated to GetProperty. If SpecialProperty is a published property on the object that implements the Variant (see page 3430)'s data, GetProperty fills in the Dest parameter with the property value.

Dest is a TVarData (see page 3813) record (Delphi) or structure (C++) that receives the property value.

V is the TVarData (see page 3813) record or structure from the Variant (see page 3430) instance whose property is being read.

Name is the name of the property.

GetProperty returns true if it returns a property value, and raises an exception if it does not implement the specified property.

See Also

DoFunction (see page 5041)

DoProcedure (see page 5042)

GetInstance (see page 4732)

Exec

48.1.3.2.3 TPublishableVariantType.SetProperty Method

Sets the value of a published property on the object that GetInstance (see page 4732) returns, so that it is available in custom Variants (see page 4997).

Pascal

```
function SetProperty(const V: TVarData; const Name: string; const Value: TVarData): Boolean;
override;
```

C++

```
virtual __fastcall Boolean SetProperty(const TVarData V, const UnicodeString Name, const
TVarData Value);
```

Description

SetProperty enables an application to set the properties of instances of the publishable Variant (see page 3430) type. It implements all the settable properties that are published by the object that GetInstance (see page 4732) returns.

When the application contains a line such as

```
MyVariant.SpecialProperty := NewValue;
```

(Delphi) or calls the Exec method of the Variant (see page 3430) (C++), a call is automatically generated to SetProperty. If SpecialProperty is a published settable property on the object that implements the Variant (see page 3430)'s data, SetProperty sets the property on the object included in V so that the Variant (see page 3430)'s value is changed accordingly.

V is the TVarData (see page 3813) record (Delphi) or structure (C++) from the Variant (see page 3430) instance whose property is being set. It includes the object that the GetInstance (see page 4732) method returns.

Name is the name of the property.

Value is a TVarData (see page 3813) record or structure that contains the new property value.

GetProperty (see page 4732) returns true if it sets a property value, and raises an exception of Name does not specify a published settable property on the object that GetInstance (see page 4732) returns.

Exec

48.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FreeAndNilProperties (see page 4737)	Frees any property values that are objects and sets their value to nil (Delphi) or NULL (C++).
	GetAnsiStrProp (see page 4737)	This is function TypInfo.GetAnsiStrProp.
	GetAnsiStrProp (see page 4738)	This is function TypInfo.GetAnsiStrProp.
	GetDynArrayProp (see page 4738)	Returns the value of a component property that is a dynamic array type.
	GetDynArrayProp (see page 4738)	Returns the value of a component property that is a dynamic array type.
	GetEnumName (see page 4739)	Returns the name of a Delphi enumerated type constant given its value.
	GetEnumProp (see page 4742)	Returns the value of a component property that is an enumerated type.
	GetEnumProp (see page 4742)	Returns the value of a component property that is an enumerated type.
	GetEnumValue (see page 4744)	Returns the value of an enumerated type constant given its string representation.
	GetFloatProp (see page 4745)	Returns the value of a component property that is a float type.
	GetFloatProp (see page 4745)	Returns the value of a component property that is a float type.
	GetInt64Prop (see page 4746)	Returns the value of a component property that is an Int64 type.
	GetInt64Prop (see page 4746)	Returns the value of a component property that is an Int64 type.
	GetInterfaceProp (see page 4746)	Returns the value of a component property that is an interface type.
	GetInterfaceProp (see page 4746)	Returns the value of a component property that is an interface type.
	GetMethodProp (see page 4747)	Returns the value of a component property that is a method type.
	GetMethodProp (see page 4747)	Returns the value of a component property that is a method type.
	GetObjectProp (see page 4748)	Returns the value of a component property that is an object type.
	GetObjectProp (see page 4748)	Returns the value of a component property that is an object type.
	GetObjectPropClass (see page 4749)	Returns the class type of a component property that is an object type.
	GetObjectPropClass (see page 4749)	Returns the class type of a component property that is an object type.
	GetObjectPropClass (see page 4749)	Returns the class type of a component property that is an object type.
	GetOrdProp (see page 4750)	Returns the value of a component property that is an ordinal type.
	GetOrdProp (see page 4750)	Returns the value of a component property that is an ordinal type.
	GetPropInfo (see page 4751)	Retrieves information about a component's property.
	GetPropInfo (see page 4751)	Retrieves information about a component's property.
	GetPropInfo (see page 4751)	Retrieves information about a component's property.
	GetPropInfo (see page 4751)	Retrieves information about a component's property.
	GetPropInfos (see page 4751)	Retrieves a list of component properties.
	GetPropList (see page 4752)	Retrieves a list of component properties.
	GetPropList (see page 4752)	Retrieves a list of component properties.
	GetPropList (see page 4752)	Retrieves a list of component properties.
	GetPropName (see page 4753)	This is function TypInfo.GetPropName.
	GetPropValue (see page 4753)	Retrieves a component's property value as a variant.
	GetPropValue (see page 4753)	Retrieves a component's property value as a variant.
	GetSetElementName (see page 4754)	This is function TypInfo.GetSetElementName.
	GetSetElementValue (see page 4754)	This is function TypInfo.GetSetElementValue.
	GetSetProp (see page 4755)	Returns the value of a component property that is a set type.
	GetSetProp (see page 4755)	Returns the value of a component property that is a set type.
	GetStrProp (see page 4756)	Returns the value of a component property that is a string type.
	GetStrProp (see page 4756)	Returns the value of a component property that is a string type.
	GetTypeData (see page 4756)	Returns a pointer to information about a type.
	GetTypeName (see page 4757)	This is function TypInfo.GetTypeName.
	GetUnicodeStrProp (see page 4757)	This is function TypInfo.GetUnicodeStrProp.

	GetUnicodeStrProp (see page 4758)	This is function TypInfo.GetUnicodeStrProp.
	GetVariantProp (see page 4758)	Returns the value of a component property that is a variant type.
	GetVariantProp (see page 4758)	Returns the value of a component property that is a variant type.
	GetWideStrProp (see page 4759)	Returns the value of a component property that is a WideString (see page 3476) type.
	GetWideStrProp (see page 4759)	Returns the value of a component property that is a WideString (see page 3476) type.
	IsPublishedProp (see page 4759)	Determines if a specified component property is a published property.
	IsPublishedProp (see page 4759)	Determines if a specified component property is a published property.
	IsStoredProp (see page 4760)	Determines if a specified component property has the stored attribute.
	IsStoredProp (see page 4760)	Determines if a specified component property has the stored attribute.
	PropIsType (see page 4761)	Determines if a component property is of a particular data type.
	PropIsType (see page 4761)	Determines if a component property is of a particular data type.
	PropType (see page 4761)	Retrieves a component's property type.
	PropType (see page 4761)	Retrieves a component's property type.
	SamePropTypeName (see page 4762)	This is function TypInfo.SamePropTypeName.
	SetAnsiStrProp (see page 4762)	This is function TypInfo.SetAnsiStrProp.
	SetAnsiStrProp (see page 4763)	This is function TypInfo.SetAnsiStrProp.
	SetDynArrayProp (see page 4763)	Sets the value of a component property that is a dynamic array type.
	SetDynArrayProp (see page 4763)	Sets the value of a component property that is a dynamic array type.
	SetEnumProp (see page 4764)	Sets the value of a component property that is an enumerated type.
	SetEnumProp (see page 4764)	Sets the value of a component property that is an enumerated type.
	SetFloatProp (see page 4766)	Sets the value of a component property that is a float type.
	SetFloatProp (see page 4766)	Sets the value of a component property that is a float type.
	SetInt64Prop (see page 4767)	Sets the value of a component property that is an Int64 type.
	SetInt64Prop (see page 4767)	Sets the value of a component property that is an Int64 type.
	SetInterfaceProp (see page 4768)	Sets the value of a component property that is an Interface type.
	SetInterfaceProp (see page 4768)	Sets the value of a component property that is an Interface type.
	SetMethodProp (see page 4769)	Sets the value of a component property that is a method type.
	SetMethodProp (see page 4769)	Sets the value of a component property that is a method type.
	SetObjectProp (see page 4770)	Sets the value of a component property that is an object type.
	SetObjectProp (see page 4770)	Sets the value of a component property that is an object type.
	SetOrdProp (see page 4770)	Sets the value of a component property that is an ordinal type.
	SetOrdProp (see page 4770)	Sets the value of a component property that is an ordinal type.
	SetPropValue (see page 4771)	Sets the value of a component property using a variant value.
	SetPropValue (see page 4771)	Sets the value of a component property using a variant value.
	SetSetProp (see page 4772)	Sets the value of a component property that is a set type.
	SetSetProp (see page 4772)	Sets the value of a component property that is a set type.
	SetStrProp (see page 4773)	Sets the value of a component property that is a string type.
	SetStrProp (see page 4773)	Sets the value of a component property that is a string type.
	SetToString (see page 4774)	Returns one or more of the set values of a component's property.
	SetUnicodeStrProp (see page 4775)	This is function TypInfo.SetUnicodeStrProp.
	SetUnicodeStrProp (see page 4775)	This is function TypInfo.SetUnicodeStrProp.
	SetVariantProp (see page 4775)	Sets the value of a component property that is a variant type.
	SetVariantProp (see page 4775)	Sets the value of a component property that is a variant type.
	SetWideStrProp (see page 4776)	Sets the value of a component property that is a WideString (see page 3476) type.
	SetWideStrProp (see page 4776)	Sets the value of a component property that is a WideString (see page 3476) type.
	SortPropList (see page 4777)	Sorts a list of component properties into alphanumeric sequence.
	StringToSet (see page 4778)	Returns a bit mask of set values for a set type component property.

48.2.1 TypInfo.FreeAndNilProperties Function

Frees any property values that are objects and sets their value to nil (Delphi) or NULL (C++).

Pascal

```
procedure FreeAndNilProperties(AObject: TObject);
```

C++

```
FreeAndNilProperties(TObject * AObject);
```

File

TypInfo

Description

Call FreeAndNilProperties from a destructor to free all internally created objects and set the corresponding property values to nil (Delphi) or NULL (C++). FreeAndNilProperties searches the properties of AObject, identifying any that are objects. It frees those objects, and sets the corresponding property to nil (Delphi) or NULL (C++).

. By default, all persistent objects (TPersistent and descendants) are compiled with RTTI. Other TObject (see page 3364) descendants can be compiled with RTTI by using the $M+ compiler switch in Delphi or the __declspec(delphirtti) directive in C++.

Warning: Calling FreeAndNilProperties frees all object properties, which may lead to unintended results. FreeAndNilProperties can't distinguish between objects that were created by AObject (and typically stored in a class member) from objects that are created independently and which should not be freed with AObject. To avoid unintentionally freeing independently-created objects, set properties that refer to external objects to nil (Delphi) or NULL (C++) before calling FreeAndNilProperties.

48.2.2 TypInfo.GetAnsiStrProp Function

Pascal

```
function GetAnsiStrProp(Instance: TObject; PropInfo: PPropInfo): AnsiString; overload;
```

C++

```
AnsiString GetAnsiStrProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

This is function TypInfo.GetAnsiStrProp.

48.2.3 TypInfo.GetAnsiStrProp Function

Pascal

```
function GetAnsiStrProp(Instance: TObject; const PropName: string): AnsiString; overload;
```

C++

```
AnsiString GetAnsiStrProp(TObject * Instance, const UnicodeString PropName);
```

File

TypInfo

Description

This is function TypInfo.GetAnsiStrProp.

48.2.4 TypInfo.GetDynArrayProp Function

Returns the value of a component property that is a dynamic array type.

Pascal

```
function GetDynArrayProp(Instance: TObject; const PropName: string): Pointer; overload;
function GetDynArrayProp(Instance: TObject; PropInfo: PPropInfo): Pointer; overload;
```

C++

```
void * GetDynArrayProp(TObject * Instance, const UnicodeString PropName);
void * GetDynArrayProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetDynArrayProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is a dynamic array type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as a pointer to the array.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.5 TypInfo.GetEnumName Function

Returns the name of a Delphi enumerated type constant given its value.

Pascal

```
function GetEnumName(TypeInfo: PTypeInfo; Value: Integer): string;
```

C++

```
UnicodeString GetEnumName(PTypeInfo TypeInfo, int Value);
```

File

TypInfo

Description

Use GetEnumName to convert a Delphi enumerated value into the symbolic name that represents it in code.

TypeInfo is the type information record that describes the enumerated type. You can obtain the type information for a type by calling the TypeInfo function in Delphi or the __delphirtti operator in C++.

Value is the enumerated value, represented as an integer.

GetEnumName returns the string that represents the specified value.

C++ Examples:

```
/*
Add the Delphi source file that appears on this Help page into
a CPP Builder project that includes a CPP module containing the
following code.  An hpp file will be generated for the Delphi
code when you build the project.  Add the include line for
that hpp file at the top of the CPP module.  The FormCreates
for both forms will execute and the following generics code
will work.  Remember to give the forms different names!
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Prints type info for string type
  TGenericClass__1<System::UnicodeString> *GString = new
TGenericClass__1<System::UnicodeString>();
  GString->PrintTypeInfo(Memo1);

  // Prints type info for Byte type
  TGenericClass__1<Byte> *GByte = new TGenericClass__1<Byte>();
  GByte->PrintTypeInfo(Memo1);

  // Prints type info for Double type
  TGenericClass__1<Double> *GDouble = new TGenericClass__1<Double>();
  GDouble->PrintTypeInfo(Memo1);

  // Prints type info for "array of String" type
  // TGenericClass__1<array of string> *GStringArray = new TGenericClass__1<array of string>();
```

```
  // GStringArray->PrintTypeInfo(Memo1);
}
```

Delphi Examples:

```
{
This example demostrates the methods to retreive of
Run-time Type Information (RTTI) information.
This example will print useful information about any given
type including it's name, size, kind and sub-kind.
}

type
  TForm2 = class(TForm)
    Memo1: TMemo;
    procedure FormCreate(Sender: TObject);
  private
    { Private declarations }
  public
    { Public declarations }
  end;
{ Defining a generic type that contains a single class (static)
  method that will print information about the type it operates on.
}
  TGenericClass<T> = class(TList<T>)  // TList is a class in Generics.Collections
  public
    procedure PrintTypeInfo(memo: TMemo);
  end;
  TGenericString = class(TGenericClass<UnicodeString>)
  end;
  TGenericByte = class(TGenericClass<Byte>)
  end;
  TGenericDouble = class(TGenericClass<Double>)
  end;

48.2.6 TypInfo.GetEnumProp Function

Returns the value of a component property that is an enumerated type.

Pascal

```
function GetEnumProp(Instance: TObject; const PropName: string): string; overload;
function GetEnumProp(Instance: TObject; PropInfo: PPropInfo): string; overload;
```

C++

```
UnicodeString GetEnumProp(TObject * Instance, const UnicodeString PropName);
UnicodeString GetEnumProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetEnumProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is an enumerated type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as a string.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

C++ Examples:

```
/*
This example shows how to use GetEnumProp and SetEnumProp in order to
check for visual components properties and to change them.
This example uses two buttons, Button1 and Button2.
*/
void __fastcall TForm2::Button1Click(TObject *Sender)
{
    //getting the current color of the workspace
    String currentPropColor = GetEnumProp(this,"Color");
    int currentColorInt = StrToInt(currentPropColor);
```

```
    //getting the first button align enum and if different,
    //setting it to alLeft
    String currentAlignProp = GetEnumProp(Button1, "Align");
    if (currentAlignProp != "alLeft")
    {
         SetEnumProp(Button1, "Align", "alLeft");
     }

    //checking if the form background color was set.
    if(currentColorInt < 0)
    {
        currentColorInt = GetSysColor(COLOR_APPWORKSPACE);
    }

    //setting the form background color as the negative value
    //of the current background color
    SetEnumProp(this, "Color",
                IntToStr((int)(clWhite - currentColorInt)));
}

void __fastcall TForm2::Button2Click(TObject *Sender)
{
    int p[5] = {clYellow, clGreen, clRed, clBlue, clBlack};
    SetEnumProp(this, "Color", IntToStr(p[random(5)]));

    //getting the second button align enum and if different,
    //setting it to alRight
    String currentAlignProp = GetEnumProp(Button2, "Align");
    if (currentAlignProp != "alRight")
    {
         SetEnumProp(Button2, "Align", "alRight");
     }
}
```

Delphi Examples:

```
{
This example shows how to use GetEnumProp and SetEnumProp in order to
check for visual components properties and to change them.
This example uses two buttons, Button1 and Button2.
}
procedure TForm3.Button1Click(Sender: TObject);
var
  currentPropColor : String;
  currentAlignProp : String;
  currentColorInt : Integer;
begin
  //getting the current color of the workspace
  currentPropColor := GetEnumProp(Self,'Color');
  currentColorInt := StrToInt(currentPropColor);

  //getting the first button align enum and if different,
  //setting it to alLeft
  currentAlignProp := GetEnumProp(Button1, 'Align');
  if GetEnumValue(TypeInfo(TAlign), currentAlignProp) <> Ord(alLeft) then
     SetEnumProp(Button1, 'Align', 'alLeft');

  //checking if the form background color was set.
    if currentColorInt < 0 then
    begin
        currentColorInt := GetSysColor(COLOR_APPWORKSPACE);
    end;

  //setting the form background color as the negative value
  // of the current background color
  currentColorInt := clWhite - currentColorInt;
```

```
    SetEnumProp(Self, 'Color', IntToStr(currentColorInt));
  end;

  procedure TForm3.Button2Click(Sender: TObject);
  var
    p : array [0..4] of Integer;
    currentAlignProp : String;
  begin
    p[0] := clYellow;
    p[1] := clRed;
    p[2] := clBlue;
    p[3] := clBlack;
    p[4] := clGreen;

      SetEnumProp(Self, 'Color', IntToStr(p[random(5)]));

    //getting the second button align enum and if different,
    //setting it to alRight
    currentAlignProp := GetEnumProp(Button2, 'Align');
    if GetEnumValue(TypeInfo(TAlign), currentAlignProp) <> Ord(alRight) then
       SetEnumProp(Button2, 'Align', 'alRight');

  end;
```

48.2.7 TypInfo.GetEnumValue Function

Returns the value of an enumerated type constant given its string representation.

Pascal

```
function GetEnumValue(TypeInfo: PTypeInfo; const Name: string): Integer;
```

C++

```
int GetEnumValue(PTypeInfo TypeInfo, const UnicodeString Name);
```

File

TypInfo

Description

Use GetEnumValue to convert the string that represents an enumerated value into the corresponding integer that is its implemented value.

TypeInfo is the type information record that describes the enumerated type. You can obtain the type information for a type by calling the TypeInfo function in Delphi or using the __delphirtti operator in C++.

Name is the string that is used in code to represent the enumerated value.

GetEnumValue returns the corresponding integer value.

48.2.8 TypInfo.GetFloatProp Function

Returns the value of a component property that is a float type.

Pascal

```
function GetFloatProp(Instance: TObject; const PropName: string): Extended; overload;
function GetFloatProp(Instance: TObject; PropInfo: PPropInfo): Extended; overload;
```

C++

```
Extended GetFloatProp(TObject * Instance, const UnicodeString PropName);
Extended GetFloatProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetFloatProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is a floating point number type. 0.0 is returned if the property is not of this type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as a float value.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.9 TypInfo.GetInt64Prop Function

Returns the value of a component property that is an Int64 type.

Pascal

```
function GetInt64Prop(Instance: TObject; const PropName: string): Int64; overload;
function GetInt64Prop(Instance: TObject; PropInfo: PPropInfo): Int64; overload;
```

C++

```
Int64 GetInt64Prop(TObject * Instance, const UnicodeString PropName);
Int64 GetInt64Prop(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetInt64Prop utilises Delphi's RTTI (Run Time see page 4338) Type Information) to return the current value of a component's property where that property is an Int64 type. 0 is returned if the property is not of this type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as an Int64 value.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.10 TypInfo.GetInterfaceProp Function

Returns the value of a component property that is an interface type.

Pascal

```
function GetInterfaceProp(Instance: TObject; const PropName: string): IInterface; overload;
function GetInterfaceProp(Instance: TObject; PropInfo: PPropInfo): IInterface; overload;
```

C++

```
IInterface GetInterfaceProp(TObject * Instance, const UnicodeString PropName);
IInterface GetInterfaceProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetInterfaceProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is an interface type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as an interface value.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.11 TypInfo.GetMethodProp Function

Returns the value of a component property that is a method type.

Pascal

```
function GetMethodProp(Instance: TObject; const PropName: string): TMethod; overload;
function GetMethodProp(Instance: TObject; PropInfo: PPropInfo): TMethod; overload;
```

C++

```
TMethod GetMethodProp(TObject * Instance, const UnicodeString PropName);
TMethod GetMethodProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetMethodProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is a method type : an event routine.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as a method value.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.12 TypInfo.GetObjectProp Function

Returns the value of a component property that is an object type.

Pascal

```
function GetObjectProp(Instance: TObject; const PropName: string; MinClass: TClass = nil):
TObject; overload;
function GetObjectProp(Instance: TObject; PropInfo: PPropInfo; MinClass: TClass = nil):
TObject; overload;
```

C++

```
TObject * GetObjectProp(TObject * Instance, const UnicodeString PropName, TClass MinClass =
nil);
TObject * GetObjectProp(TObject * Instance, PPropInfo PropInfo, TClass MinClass = nil);
```

File

TypInfo

Description

GetObjectProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is an object type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as an object, or nil if the property is not an object type.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.13 TypInfo.GetObjectPropClass Function

Returns the class type of a component property that is an object type.

Pascal

```
function GetObjectPropClass(Instance: TObject; const PropName: string): TClass; overload;
function GetObjectPropClass(Instance: TObject; PropInfo: PPropInfo): TClass; overload;
function GetObjectPropClass(PropInfo: PPropInfo): TClass; overload;
```

C++

```
TClass GetObjectPropClass(TObject * Instance, const UnicodeString PropName);
TClass GetObjectPropClass(TObject * Instance, PPropInfo PropInfo);
TClass GetObjectPropClass(PPropInfo PropInfo);
```

File

TypInfo

Description

GetObjectPropClass utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the class type of a component's property where that property is an object.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the class type of the property object value is returned.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

See Also

GetPropInfo (see page 4751)

GetPropList (see page 4752)

GetPropValue (see page 4753)

PPropInfo (see page 4789)

48.2.14 TypInfo.GetOrdProp Function

Returns the value of a component property that is an ordinal type.

Pascal

```
function GetOrdProp(Instance: TObject; const PropName: string): Longint; overload;
function GetOrdProp(Instance: TObject; PropInfo: PPropInfo): Longint; overload;
```

C++

```
Longint GetOrdProp(TObject * Instance, const UnicodeString PropName);
Longint GetOrdProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetOrdProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is an Integer, Char, WideChar, or Class type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as an LongInt value.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

See Also

GetPropInfo (see page 4751)

GetPropList (see page 4752)

GetPropValue (see page 4753)

PPropInfo (see page 4789)

SetOrdProp (see page 4770)

48.2.15 TypInfo.GetPropInfo Function

Retrieves information about a component's property.

Pascal

```
function GetPropInfo(Instance: TObject; const PropName: string; AKinds: TTypeKinds = []):
PPropInfo; overload;
function GetPropInfo(AClass: TClass; const PropName: string; AKinds: TTypeKinds = []):
PPropInfo; overload;
function GetPropInfo(TypeInfo: PTypeInfo; const PropName: string): PPropInfo; overload;
function GetPropInfo(TypeInfo: PTypeInfo; const PropName: string; AKinds: TTypeKinds):
PPropInfo; overload;
```

C++

```
PPropInfo GetPropInfo(TObject * Instance, const UnicodeString PropName, TTypeKinds AKinds =
[]);
PPropInfo GetPropInfo(TClass AClass, const UnicodeString PropName, TTypeKinds AKinds = []);
PPropInfo GetPropInfo(PTypeInfo TypeInfo, const UnicodeString PropName);
PPropInfo GetPropInfo(PTypeInfo TypeInfo, const UnicodeString PropName, TTypeKinds AKinds);
```

File

TypInfo

Description

GetPropInfo utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to retrieve a pointer to a property information record for a component.

In the first form of this function, **TypeInfo** specifies the component type whose property you want to retrieve. **PropName** specifies the property name as a string. You may optionally specify a **AKinds** set of TTypeKind (see page 4787) property value types that the property must belong to.

The second form of the function is similar to the first, with **AClass** replacing **TypeInfo** as the means of specifying the component type. **AKinds** is now a required value.

The final form of the function is like the second form, with **Instance** specifying a component instance.

In all forms of the function, the returned value is a pointer to a TPropInfo (see page 4784) value. This provides rich data about the property being investigated at run time. This enables more elegant component processing than can be achieved with hard coded component names/properties.

Note: If the specified property does not exist, a nil pointer is returned.

See Also

PTypeInfo (see page 4794)

PPropInfo (see page 4789)

TTypeKinds (see page 4800)

48.2.16 TypInfo.GetPropInfos Function

Retrieves a list of component properties.

Pascal

```
procedure GetPropInfos(TypeInfo: PTypeInfo; PropList: PPropList);
```

C++

```
GetPropInfos(PTypeInfo TypeInfo, PPropList PropList);
```

File

TypInfo

Description

GetPropInfos utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to retrieve a list of property information records for a component or component type.

The **TypeInfo** defines the component type and **PropList** defines a variable to receive the list of properties : a pointer to a TPropList (see page 4800) variable

The Delphi inbuilt TypeInfo function may be used to provide the **TypeInfo** value.

Note: If you want the count of properties returned in PropList

, use GetPropList (see page 4752) instead.

See Also

GetPropList (see page 4752)

PTypeInfo (see page 4794)

PPropList (see page 4790)

TPropList (see page 4800)

TTypeKinds (see page 4800)

48.2.17 TypInfo.GetPropList Function

Retrieves a list of component properties.

Pascal

```
function GetPropList(TypeInfo: PTypeInfo; TypeKinds: TTypeKinds; PropList: PPropList;
SortList: Boolean = True): Integer; overload;
function GetPropList(TypeInfo: PTypeInfo; out PropList: PPropList): Integer; overload;
function GetPropList(AObject: TObject; out PropList: PPropList): Integer; overload;
```

C++

```
int GetPropList(PTypeInfo TypeInfo, TTypeKinds TypeKinds, PPropList PropList, Boolean SortList
= True);
int GetPropList(PTypeInfo TypeInfo, PPropList PropList);
int GetPropList(TObject * AObject, PPropList PropList);
```

File

TypInfo

Description

GetPropList utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to retrieve a list of property information records for a component or component type.

In one form of this function, **TypeInfo** defines the component type, **PropList** defines a variable to receive the list of properties : a pointer to a TPropList (see page 4800) variable, and **TypeKinds** defines the type of properties that will be returned. Use tkAny (see page 4802) to return all types. The list may optionally be sorted by setting **SortList** true.

The Delphi inbuilt TypeInfo function may be used to provide the **TypeInfo** value.

In the other form of this function, you specify a component instance rather than component type. The **TypeKinds** and **SortList** parameters can no longer be specified.

In both forms of the function, the returned value is the number of properties in **PropList**.

Note: If you do not need the count of properties returned, use GetPropInfos (see page 4751).

See Also

GetPropInfos (see page 4751)

PTypeInfo (see page 4794)

PPropList (see page 4790)

48.2.18 TypInfo.GetPropName Function

Pascal

```
function GetPropName(PropInfo: PPropInfo): string;
```

C++

```
UnicodeString GetPropName(PPropInfo PropInfo);
```

File

TypInfo

Description

This is function TypInfo.GetPropName.

48.2.19 TypInfo.GetPropValue Function

Retrieves a component's property value as a variant.

Pascal

```
function GetPropValue(Instance: TObject; const PropName: string; PreferStrings: Boolean =
True): Variant; overload;
function GetPropValue(Instance: TObject; PropInfo: PPropInfo; PreferStrings: Boolean = True):
Variant; overload;
```

C++

```
Variant GetPropValue(TObject * Instance, const UnicodeString PropName, Boolean PreferStrings =
True);
Variant GetPropValue(TObject * Instance, PPropInfo PropInfo, Boolean PreferStrings = True);
```

File

TypInfo

Description

GetPropValue utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to retrieve a a component property as a variant.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the returned value the property value as a variant.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

See Also

PTypeInfo (see page 4794)

PPropInfo (see page 4789)

TTypeKinds (see page 4800)

48.2.20 TypInfo.GetSetElementName Function

Pascal

```
function GetSetElementName(TypeInfo: PTypeInfo; Value: Integer): string;
```

C++

```
UnicodeString GetSetElementName(PTypeInfo TypeInfo, int Value);
```

File

TypInfo

Description

This is function TypInfo.GetSetElementName.

48.2.21 TypInfo.GetSetElementValue Function

Pascal

```
function GetSetElementValue(TypeInfo: PTypeInfo; const Name: string): Integer;
```

C++

```
int GetSetElementValue(PTypeInfo TypeInfo, const UnicodeString Name);
```

File

TypInfo

Description

This is function TypInfo.GetSetElementValue.

48.2.22 TypInfo.GetSetProp Function

Returns the value of a component property that is a set type.

Pascal

```
function GetSetProp(Instance: TObject; const PropName: string; Brackets: Boolean = False):
string; overload;
function GetSetProp(Instance: TObject; PropInfo: PPropInfo; Brackets: Boolean = False):
string; overload;
```

C++

```
UnicodeString GetSetProp(TObject * Instance, const UnicodeString PropName, Boolean Brackets =
False);
UnicodeString GetSetProp(TObject * Instance, PPropInfo PropInfo, Boolean Brackets = False);
```

File

TypInfo

Description

GetSetProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is a set of values type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the list if set values is returned as a comma separated string. You may optionally set **Brackets** true so as to enclose this within square brackets, as shown in the IDE for the property.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

See Also

GetPropInfo (see page 4751)

GetPropList (see page 4752)

GetPropValue (see page 4753)

PPropInfo (see page 4789)

SetSetProp (see page 4772)

48.2.23 TypInfo.GetStrProp Function

Returns the value of a component property that is a string type.

Pascal

```
function GetStrProp(Instance: TObject; const PropName: string): string; overload;
function GetStrProp(Instance: TObject; PropInfo: PPropInfo): string; overload;
```

C++

```
UnicodeString GetStrProp(TObject * Instance, const UnicodeString PropName);
UnicodeString GetStrProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetStrProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is a String, LongString or WideString (see page 3476) type. An empty string is returned if the property is not of this type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as a string.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

GetPropValue (see page 4753)

PPropInfo (see page 4789)

SetStrProp (see page 4773)

48.2.24 TypInfo.GetTypeData Function

Returns a pointer to information about a type.

Pascal

```
function GetTypeData(TypeInfo: PTypeInfo): PTypeData;
```

C++

```
PTypeData GetTypeData(PTypeInfo TypeInfo);
```

File

TypInfo

Description

GetTypeData utilises Delphi's RTTI (Run Time see page 4338) Type Information) to return a pointer to TTypeData (see page 4785) record.

The TTypeData (see page 4785) record is a variant type, but does not contain the variant as a tag. To identify which variant applies to a particular type, you should retrieve the TTypeKind (see page 4787) value using the TypeInfo routine.

The TTypeData (see page 4785) record holds meta data about a property. For example, the name of the unit a class type is stored in.

See Also

PTypeData (see page 4791)

TTypeData (see page 4785)

TTypeKind (see page 4787)

48.2.25 TypInfo.GetTypeName Function

Pascal

```
function GetTypeName(TypeInfo: PTypeInfo): string;
```

C++

```
UnicodeString GetTypeName(PTypeInfo TypeInfo);
```

File

TypInfo

Description

This is function TypInfo.GetTypeName.

48.2.26 TypInfo.GetUnicodeStrProp Function

Pascal

```
function GetUnicodeStrProp(Instance: TObject; PropInfo: PPropInfo): UnicodeString; overload;
```

C++

```
UnicodeString GetUnicodeStrProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

This is function TypInfo.GetUnicodeStrProp.

48.2.27 TypInfo.GetUnicodeStrProp Function

Pascal

```
function GetUnicodeStrProp(Instance: TObject; const PropName: string): UnicodeString; overload;
```

C++

```
UnicodeString GetUnicodeStrProp(TObject * Instance, const UnicodeString PropName);
```

File

TypInfo

Description

This is function TypInfo.GetUnicodeStrProp.

48.2.28 TypInfo.GetVariantProp Function

Returns the value of a component property that is a variant type.

Pascal

```
function GetVariantProp(Instance: TObject; const PropName: string): Variant; overload;
function GetVariantProp(Instance: TObject; PropInfo: PPropInfo): Variant; overload;
```

C++

```
Variant GetVariantProp(TObject * Instance, const UnicodeString PropName);
Variant GetVariantProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetVariantProp utilises Delphi's RTTI (Run Time see page 4338) Type Information) to return the current value of a component's property that is a variant type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as a variant.

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown. If the property is not a variant type, an EVariantBadVarTypeError (see page 5004) exception is thrown.

See Also

GetPropInfo (see page 4751)

GetPropList (see page 4752)

GetPropValue (see page 4753)

PPropInfo (see page 4789)

SetVariantProp (see page 4775)

48.2.29 TypInfo.GetWideStrProp Function

Returns the value of a component property that is a WideString (see page 3476) type.

Pascal

```
function GetWideStrProp(Instance: TObject; const PropName: string): WideString; overload;
function GetWideStrProp(Instance: TObject; PropInfo: PPropInfo): WideString; overload;
```

C++

```
BSTR GetWideStrProp(TObject * Instance, const UnicodeString PropName);
BSTR GetWideStrProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

GetWideStrProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the current value of a component's property where that property is a WideString (see page 3476) type. A string or LongString type is returned via a call to the GetWideStrProp routine. Otherwise, for other types, an empty string is returned if the property is not of this type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the current value of the property is returned as a WideString (see page 3476).

The intrinsic value of this function is to allow retrieval of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use GetPropValue (see page 4753) to retrieve a property value where the type is unknown - it is returned in a Variant (see page 3430) type.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

GetPropInfo (see page 4751)

GetPropList (see page 4752)

GetPropValue (see page 4753)

PPropInfo (see page 4789)

SetWideStrProp (see page 4776)

48.2.30 TypInfo.IsPublishedProp Function

Determines if a specified component property is a published property.

Pascal

```
function IsPublishedProp(Instance: TObject; const PropName: string): Boolean; overload;
function IsPublishedProp(AClass: TClass; const PropName: string): Boolean; overload;
```

C++

```
Boolean IsPublishedProp(TObject * Instance, const UnicodeString PropName);
Boolean IsPublishedProp(TClass AClass, const UnicodeString PropName);
```

File

TypInfo

Description

IsPublishedProp returns true if the specified property is published. Delphi's RTTI (Run Time (see page 4338) Type Information) facility requires that properties are published.

In one form of this function, the component is defined by the **TClass (see page 3856)** parameter.

In the other form of this function, an **Instance** of the component is used.

In both forms of the function, **PropName** specifies the property as a string.

See Also

GetPropInfo (see page 4751)

GetPropValue (see page 4753)

48.2.31 TypInfo.IsStoredProp Function

Determines if a specified component property has the stored attribute.

Pascal

```
function IsStoredProp(Instance: TObject; const PropName: string): Boolean; overload;
function IsStoredProp(Instance: TObject; PropInfo: PPropInfo): Boolean; overload;
```

C++

```
Boolean IsStoredProp(TObject * Instance, const UnicodeString PropName);
Boolean IsStoredProp(TObject * Instance, PPropInfo PropInfo);
```

File

TypInfo

Description

IsStoredProp returns true if the specified property is saved in the form file. The stored attribute is set true by default : only those that have the keyword stored defined as false do not.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the value of the stored attribute is returned.

See Also

GetPropInfo (see page 4751)

GetPropValue (see page 4753)

PPropInfo (see page 4789)

48.2.32 TypInfo.PropIsType Function

Determines if a component property is of a particular data type.

Pascal

```
function PropIsType(Instance: TObject; const PropName: string; TypeKind: TTypeKind): Boolean;
overload;
function PropIsType(AClass: TClass; const PropName: string; TypeKind: TTypeKind): Boolean;
overload;
```

C++

```
Boolean PropIsType(TObject * Instance, const UnicodeString PropName, TTypeKind TypeKind);
Boolean PropIsType(TClass AClass, const UnicodeString PropName, TTypeKind TypeKind);
```

File

TypInfo

Description

PropIsType returns true if the property is of the specified data type.

In the first form of this function, **AClass** specifies the component class whose property you want to look at.

The second form of the function a class **Instance** replaces **AClass**.

In both forms of the function, **PropName** specifies the property name as a string. If the property has the **TypeKind** data type, then true is returned. Otherwise false is returned.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

GetPropInfo (see page 4751)

GetPropValue (see page 4753)

PPropInfo (see page 4789)

TTypeKinds (see page 4800)

48.2.33 TypInfo.PropType Function

Retrieves a component's property type.

Pascal

```
function PropType(Instance: TObject; const PropName: string): TTypeKind; overload;
function PropType(AClass: TClass; const PropName: string): TTypeKind; overload;
```

C++

```
TTypeKind PropType(TObject * Instance, const UnicodeString PropName);
TTypeKind PropType(TClass AClass, const UnicodeString PropName);
```

File

TypInfo

Description

PropType utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return the type of a component property in a TTypeKind (see page 4787) value.

In the first form of this function, **AClass** specifies the component class whose property you want to retrieve. **PropName** specifies the property name as a string.

The second form of the function is similar to the first, with **Instance** replacing **AClass** as the means of specifying the component.

In both forms of the function, the returned value is a TTypeKind (see page 4787) value.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

See Also

PTypeInfo (see page 4794)

PPropInfo (see page 4789)

TTypeKind (see page 4787)

48.2.34 TypInfo.SamePropTypeName Function

Pascal

```
function SamePropTypeName(const Name1: ShortString; const Name2: ShortString): Boolean;
```

C++

```
Boolean SamePropTypeName(const ShortString Name1, const ShortString Name2);
```

File

TypInfo

Description

This is function TypInfo.SamePropTypeName.

48.2.35 TypInfo.SetAnsiStrProp Function

Pascal

```
procedure SetAnsiStrProp(Instance: TObject; PropInfo: PPropInfo; const Value: AnsiString);
overload;
```

C++

```
SetAnsiStrProp(TObject * Instance, PPropInfo PropInfo, const AnsiString Value);
```

File

TypInfo

Description

This is function TypInfo.SetAnsiStrProp.

48.2.36 TypInfo.SetAnsiStrProp Function

Pascal

```
procedure SetAnsiStrProp(Instance: TObject; const PropName: string; const Value: AnsiString);
overload;
```

C++

```
SetAnsiStrProp(TObject * Instance, const UnicodeString PropName, const AnsiString Value);
```

File

TypInfo

Description

This is function TypInfo.SetAnsiStrProp.

48.2.37 TypInfo.SetDynArrayProp Function

Sets the value of a component property that is a dynamic array type.

Pascal

```
procedure SetDynArrayProp(Instance: TObject; const PropName: string; const Value: Pointer);
overload;
procedure SetDynArrayProp(Instance: TObject; PropInfo: PPropInfo; const Value: Pointer);
overload;
```

C++

```
SetDynArrayProp(TObject * Instance, const UnicodeString PropName, const void * Value);
SetDynArrayProp(TObject * Instance, PPropInfo PropInfo, const void * Value);
```

File

TypInfo

Description

SetDynArrayProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is a dynamic array type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

See Also

GetEnumProp (see page 4742)

GetPropInfo (see page 4751)

GetPropList (see page 4752)

SetPropValue (see page 4771)

PPropInfo (see page 4789)

48.2.38 TypInfo.SetEnumProp Function

Sets the value of a component property that is an enumerated type.

Pascal

```
procedure SetEnumProp(Instance: TObject; const PropName: string; const Value: string);
overload;
procedure SetEnumProp(Instance: TObject; PropInfo: PPropInfo; const Value: string); overload;
```

C++

```
SetEnumProp(TObject * Instance, const UnicodeString PropName, const UnicodeString Value);
SetEnumProp(TObject * Instance, PPropInfo PropInfo, const UnicodeString Value);
```

File

TypInfo

Description

SetEnumProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is an enumerated type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

C++ Examples:

```
/*
This example shows how to use GetEnumProp and SetEnumProp in order to
check for visual components properties and to change them.
This example uses two buttons, Button1 and Button2.
```

```
*/
void __fastcall TForm2::Button1Click(TObject *Sender)
{
    //getting the current color of the workspace
    String currentPropColor = GetEnumProp(this,"Color");
    int currentColorInt = StrToInt(currentPropColor);

    //getting the first button align enum and if different,
    //setting it to alLeft
    String currentAlignProp = GetEnumProp(Button1, "Align");
    if (currentAlignProp != "alLeft")
    {
         SetEnumProp(Button1, "Align", "alLeft");
     }

    //checking if the form background color was set.
    if(currentColorInt < 0)
    {
        currentColorInt = GetSysColor(COLOR_APPWORKSPACE);
    }

    //setting the form background color as the negative value
    //of the current background color
    SetEnumProp(this, "Color",
                IntToStr((int)(clWhite - currentColorInt)));
}

void __fastcall TForm2::Button2Click(TObject *Sender)
{
    int p[5] = {clYellow, clGreen, clRed, clBlue, clBlack};
    SetEnumProp(this, "Color", IntToStr(p[random(5)]));

    //getting the second button align enum and if different,
    //setting it to alRight
    String currentAlignProp = GetEnumProp(Button2, "Align");
    if (currentAlignProp != "alRight")
    {
         SetEnumProp(Button2, "Align", "alRight");
     }
}
```

Delphi Examples:

```
{
This example shows how to use GetEnumProp and SetEnumProp in order to
check for visual components properties and to change them.
This example uses two buttons, Button1 and Button2.
}
procedure TForm3.Button1Click(Sender: TObject);
var
  currentPropColor : String;
  currentAlignProp : String;
  currentColorInt : Integer;
begin
  //getting the current color of the workspace
  currentPropColor := GetEnumProp(Self,'Color');
  currentColorInt := StrToInt(currentPropColor);

  //getting the first button align enum and if different,
  //setting it to alLeft
  currentAlignProp := GetEnumProp(Button1, 'Align');
  if GetEnumValue(TypeInfo(TAlign), currentAlignProp) <> Ord(alLeft) then
     SetEnumProp(Button1, 'Align', 'alLeft');

  //checking if the form background color was set.
    if currentColorInt < 0 then
    begin
```

```
          currentColorInt := GetSysColor(COLOR_APPWORKSPACE);
      end;

    //setting the form background color as the negative value
    // of the current background color
    currentColorInt := clWhite - currentColorInt;

    SetEnumProp(Self, 'Color', IntToStr(currentColorInt));
  end;

  procedure TForm3.Button2Click(Sender: TObject);
  var
    p : array [0..4] of Integer;
    currentAlignProp : String;
  begin
    p[0] := clYellow;
    p[1] := clRed;
    p[2] := clBlue;
    p[3] := clBlack;
    p[4] := clGreen;

      SetEnumProp(Self, 'Color', IntToStr(p[random(5)]));

    //getting the second button align enum and if different,
    //setting it to alRight
    currentAlignProp := GetEnumProp(Button2, 'Align');
    if GetEnumValue(TypeInfo(TAlign), currentAlignProp) <> Ord(alRight) then
       SetEnumProp(Button2, 'Align', 'alRight');

  end;
```

48.2.39 TypInfo.SetFloatProp Function

Sets the value of a component property that is a float type.

Pascal

```
procedure SetFloatProp(Instance: TObject; const PropName: string; const Value: Extended);
overload;
procedure SetFloatProp(Instance: TObject; PropInfo: PPropInfo; const Value: Extended);
overload;
```

C++

```
SetFloatProp(TObject * Instance, const UnicodeString PropName, const Extended Value);
SetFloatProp(TObject * Instance, PPropInfo PropInfo, const Extended Value);
```

File

TypInfo

Description

SetFloatProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is a floating point number.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.40 TypInfo.SetInt64Prop Function

Sets the value of a component property that is an Int64 type.

Pascal

```
procedure SetInt64Prop(Instance: TObject; const PropName: string; const Value: Int64);
overload;
procedure SetInt64Prop(Instance: TObject; PropInfo: PPropInfo; const Value: Int64); overload;
```

C++

```
SetInt64Prop(TObject * Instance, const UnicodeString PropName, const Int64 Value);
SetInt64Prop(TObject * Instance, PPropInfo PropInfo, const Int64 Value);
```

File

TypInfo

Description

SetInt64Prop utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is an Int64 number.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.41 TypInfo.SetInterfaceProp Function

Sets the value of a component property that is an Interface type.

Pascal

```
procedure SetInterfaceProp(Instance: TObject; const PropName: string; const Value:
IInterface); overload;
procedure SetInterfaceProp(Instance: TObject; PropInfo: PPropInfo; const Value: IInterface);
overload;
```

C++

```
SetInterfaceProp(TObject * Instance, const UnicodeString PropName, const IInterface Value);
SetInterfaceProp(TObject * Instance, PPropInfo PropInfo, const IInterface Value);
```

File

TypInfo

Description

SetInterfaceProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is an Interface.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.42 TypInfo.SetMethodProp Function

Sets the value of a component property that is a method type.

Pascal

```
procedure SetMethodProp(Instance: TObject; const PropName: string; const Value: TMethod);
overload;
procedure SetMethodProp(Instance: TObject; PropInfo: PPropInfo; const Value: TMethod);
overload;
```

C++

```
SetMethodProp(TObject * Instance, const UnicodeString PropName, const TMethod Value);
SetMethodProp(TObject * Instance, PPropInfo PropInfo, const TMethod Value);
```

File

TypInfo

Description

SetMethodProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is an Event (Method property).

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.43 TypInfo.SetObjectProp Function

Sets the value of a component property that is an object type.

Pascal

```
procedure SetObjectProp(Instance: TObject; const PropName: string; Value: TObject); overload;
procedure SetObjectProp(Instance: TObject; PropInfo: PPropInfo; Value: TObject; ValidateClass:
Boolean = True); overload;
```

C++

```
SetObjectProp(TObject * Instance, const UnicodeString PropName, TObject * Value);
SetObjectProp(TObject * Instance, PPropInfo PropInfo, TObject * Value, Boolean ValidateClass =
True);
```

File

TypInfo

Description

SetObjectProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is an object.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.44 TypInfo.SetOrdProp Function

Sets the value of a component property that is an ordinal type.

Pascal

```
procedure SetOrdProp(Instance: TObject; const PropName: string; Value: Longint); overload;
procedure SetOrdProp(Instance: TObject; PropInfo: PPropInfo; Value: Longint); overload;
```

C++

```
SetOrdProp(TObject * Instance, const UnicodeString PropName, Longint Value);
SetOrdProp(TObject * Instance, PPropInfo PropInfo, Longint Value);
```

File

TypInfo

Description

SetOrdProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is an Integer, Char, WideChar, or Class type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

See Also

GetOrdProp (see page 4750)

PPropInfo (see page 4789)

48.2.45 TypInfo.SetPropValue Function

Sets the value of a component property using a variant value.

Pascal

```
procedure SetPropValue(Instance: TObject; const PropName: string; const Value: Variant);
overload;
procedure SetPropValue(Instance: TObject; PropInfo: PPropInfo; const Value: Variant); overload;
```

C++

```
SetPropValue(TObject * Instance, const UnicodeString PropName, const Variant Value);
SetPropValue(TObject * Instance, PPropInfo PropInfo, const Variant Value);
```

File

TypInfo

Description

SetPropValue utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property using a variant value.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**. Note that only certain property assignments are possible using variants. It is normally be used when using GetPropValue (see page 4753) from another property.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

See Also

GetPropValue (see page 4753)

GetPropList (see page 4752)

SetPropValue

PPropInfo (see page 4789)

48.2.46 TypInfo.SetSetProp Function

Sets the value of a component property that is a set type.

Pascal

```
procedure SetSetProp(Instance: TObject; const PropName: string; const Value: string); overload;
procedure SetSetProp(Instance: TObject; PropInfo: PPropInfo; const Value: string); overload;
```

C++

```
SetSetProp(TObject * Instance, const UnicodeString PropName, const UnicodeString Value);
SetSetProp(TObject * Instance, PPropInfo PropInfo, const UnicodeString Value);
```

File

TypInfo

Description

SetSetProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is a set type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**. You specify the set of values as a comma separated string. You may optionally enclose these in square brackets. This allows the returned value from one GetSetProp (see page 4755) call to be used as the assignment value in a SetSetProp call.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

See Also

GetSetProp (see page 4755)

GetPropInfo (see page 4751)

GetPropList (see page 4752)

SetPropValue (see page 4771)

PPropInfo (see page 4789)

48.2.47 TypInfo.SetStrProp Function

Sets the value of a component property that is a string type.

Pascal

```
procedure SetStrProp(Instance: TObject; const PropName: string; const Value: string); overload;
procedure SetStrProp(Instance: TObject; PropInfo: PPropInfo; const Value: string); overload;
```

C++

```
SetStrProp(TObject * Instance, const UnicodeString PropName, const UnicodeString Value);
SetStrProp(TObject * Instance, PPropInfo PropInfo, const UnicodeString Value);
```

File

TypInfo

Description

SetStrProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is a String, LongString or WideString (see page 3476) type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is

thrown.

See Also

GetStrProp (see page 4756)

GetPropList (see page 4752)

SetPropValue (see page 4771)

PPropInfo (see page 4789)

48.2.48 TypInfo.SetToString Function

Returns one or more of the set values of a component's property.

Pascal

```
function SetToString(PropInfo: PPropInfo; Value: Integer; Brackets: Boolean = False): string;
```

C++

```
UnicodeString SetToString(PPropInfo PropInfo, int Value, Boolean Brackets = False);
```

File

TypInfo

Description

SetToString utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to retrieve one or more of the values of a component property that is of the set type.

The property to interrogate is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

Value defines a bit mask that selects the possible values of this property. Each bit corresponds to a set value. The low order bit corresponds to the first set value. A string is returned with the selected set values as a comma separated value string. Note that the current property set values are not taken into account - the set values selected by **Value** are those in the complete set.

You may optionally set **Brackets** true so as to enclose this returned string within square brackets, as shown in the IDE for the property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.50 TypInfo.SetUnicodeStrProp Function

Pascal

```
procedure SetUnicodeStrProp(Instance: TObject; const PropName: string; const Value:
UnicodeString); overload;
```

C++

```
SetUnicodeStrProp(TObject * Instance, const UnicodeString PropName, const UnicodeString Value);
```

File

TypInfo

Description

This is function TypInfo.SetUnicodeStrProp.

48.2.51 TypInfo.SetVariantProp Function

Sets the value of a component property that is a variant type.

Pascal

```
procedure SetVariantProp(Instance: TObject; const PropName: string; const Value: Variant);
overload;
procedure SetVariantProp(Instance: TObject; PropInfo: PPropInfo; const Value: Variant);
overload;
```

C++

```
SetVariantProp(TObject * Instance, const UnicodeString PropName, const Variant Value);
SetVariantProp(TObject * Instance, PPropInfo PropInfo, const Variant Value);
```

File

TypInfo

Description

SetVariantProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is a variant type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

GetPropList (see page 4752)

SetPropValue (see page 4771)

PPropInfo (see page 4789)

48.2.52 TypInfo.SetWideStrProp Function

Sets the value of a component property that is a WideString (see page 3476) type.

Pascal

```
procedure SetWideStrProp(Instance: TObject; const PropName: string; const Value: WideString);
overload;
procedure SetWideStrProp(Instance: TObject; PropInfo: PPropInfo; const Value: WideString);
overload;
```

C++

```
SetWideStrProp(TObject * Instance, const UnicodeString PropName, const BSTR Value);
SetWideStrProp(TObject * Instance, PPropInfo PropInfo, const BSTR Value);
```

File

TypInfo

Description

SetWideStrProp utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to set the value of a component's property where that property is a WideString (see page 3476) type.

In one form of this function, the object **Instance**'s property is defined by a **PropInfo** record. GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record.

In the other form of this function, the name of the property, **PropName**, is explicitly given.

In both forms of the function, the new property value is defined by **Value**.

The intrinsic value of this function is to allow setting of component properties without the need to hard code the property name. This allows mass visual component processing at run time.

Use SetPropValue (see page 4771) to set a property value where the type is unknown. This would normally be used when using GetPropValue (see page 4753) from another property.

Note: If the specified property does not exist, or is not a published property, an EPropertyError (see page 4727) exception is thrown.

48.2.53 TypInfo.SortPropList Function

Sorts a list of component properties into alphanumeric sequence.

Pascal

```
procedure SortPropList(PropList: PPropList; PropCount: Integer);
```

C++

```
SortPropList(PPropList PropList, int PropCount);
```

File

TypInfo

Description

SortPropList is used to sort a PPropList (see page 4790) that was originally created in natural rather than sorted sequence (by GetPropList (see page 4752)).

PropList defines a pointer to the array of TPropInfo (see page 4784) pointers (normally obtained using GetPropList (see page 4752)). **Count** specifies the number of TPropList (see page 4800)

See Also

GetPropList (see page 4752)

PPropList (see page 4790)

PPropInfo (see page 4789)

TPropInfo (see page 4784)

48.2.54 TypInfo.StringToSet Function

Returns a bit mask of set values for a set type component property.

Pascal

```
function StringToSet(PropInfo: PPropInfo; const Value: string): Integer;
```

C++

```
int StringToSet(PPropInfo PropInfo, const UnicodeString Value);
```

File

TypInfo

Description

StringToSet utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return a bit mask of set indices for component's property where that property is a set type.

The property is defined by the **PropInfo** pointer. (GetPropInfo (see page 4751) and GetPropList (see page 4752) can be used to obtain such a record).

Value defines a comma separated string of set values the property may have.

The resulting integer value is a bit mask. The 0 bit relates to the 1st set value for the property. If that property value is included in the **Value** string, it is set to 1, otherwise 0. This continues for bits 1, 2 and so on referring to set positions 2, 3 and so on.

PPropInfo (see page 4789)

TPropInfo (see page 4784)

48.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFloatType (see page 4779)	This is record TypInfo.TFloatType.
	TIntfFlag (see page 4780)	This is record TypInfo.TIntfFlag.
	TMethodKind (see page 4780)	Enumerates floating point number types in the TTypeData (see page 4785) record.
	TOrdType (see page 4782)	Enumerates floating point number types in the TTypeData (see page 4785) record.
	TParamFlag (see page 4783)	TParamFlag and TParamFlags (see page 4799) indicates the attributes of a method parameter.
	TTypeKind (see page 4787)	These types describe a type that is manipulated in the forms designer.

Records

	Name	Description
	TManagedField (see page 4780)	This is record TypInfo.TManagedField.
	TPropData (see page 4783)	This is record TypInfo.TPropData.
	TPropInfo (see page 4784)	TPropInfo is a record of component property type information.
	TTypeData (see page 4785)	TTypeData is used internally to represent type information.
	TTypeInfo (see page 4786)	Holds information for a data type as returned by TypeInfo.

48.3.1 TypInfo.TFloatType Enumeration

Pascal

```
TFloatType = (
  ftSingle,
  ftDouble,
  ftExtended,
  ftComp,
  ftCurr
);
```

C++

```
enum TFloatType {
  ftSingle,
  ftDouble,
  ftExtended,
  ftComp,
  ftCurr
};
```

File

TypInfo

Description

This is record TypInfo.TFloatType.

48.3.2 TypInfo.TIntfFlag Enumeration

Pascal

```
TIntfFlag = (
  ifHasGuid,
  ifDispInterface,
  ifDispatch
);
```

C++

```
enum TIntfFlag {
  ifHasGuid,
  ifDispInterface,
  ifDispatch
};
```

File

TypInfo

Description

This is record TypInfo.TIntfFlag.

48.3.3 TypInfo.TManagedField Record

Pascal

```
TManagedField = record
  TypeRef: PTypeInfo;
  FldOffset: Integer;
end;
```

C++

```
struct TManagedField {
  PTypeInfo TypeRef;
  int FldOffset;
};
```

File

TypInfo

Description

This is record TypInfo.TManagedField.

48.3.4 TypInfo.TMethodKind Enumeration

Enumerates floating point number types in the TTypeData (see page 4785) record.

Pascal

```
TMethodKind = (
```

```
    mkProcedure,
    mkFunction,
    mkConstructor,
    mkDestructor,
    mkClassProcedure,
    mkClassFunction,
    mkClassConstructor,
    mkOperatorOverload,
    mkSafeProcedure,
    mkSafeFunction
  );
```

C++

```
  enum TMethodKind {
    mkProcedure,
    mkFunction,
    mkConstructor,
    mkDestructor,
    mkClassProcedure,
    mkClassFunction,
    mkClassConstructor,
    mkOperatorOverload,
    mkSafeProcedure,
    mkSafeFunction
  };
```

File

TypInfo

Description

The GetTypeData (see page 4756) routine utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return a pointer to TTypeData (see page 4785) record that describes a component property data type.

TTypeData (see page 4785) is a variant record : the layout depends on the property TTypeKind (see page 4787) value. When it is tkMethod, the data is one of the TMethodKind enumerated values.

The TMethodKind value meanings are as follows :

Value	Meaning
mkProcedure	Stand alone procedure.
mkFunction	Stand alone function.
mkDestructor	Destructor.
mkConstructor	Constructor.
mkClassProcedure	Class procedure.
mkClassFunction	Class function.
mkClassConstructor	Class constructor.
mkOperatorOverload	Operator overload.
mkSafeProcedure	Safe procedure.
mkSafeFunction	Safe function.

See Also

GetTypeData (see page 4756)

TTypeData (see page 4785)

TTypeKind (see page 4787)

48.3.5 TypInfo.TOrdType Enumeration

Enumerates floating point number types in the TTypeData (see page 4785) record.

Pascal

```
TOrdType = (
  otSByte,
  otUByte,
  otSWord,
  otUWord,
  otSLong,
  otULong
);
```

C++

```
enum TOrdType {
  otSByte,
  otUByte,
  otSWord,
  otUWord,
  otSLong,
  otULong
};
```

File

TypInfo

Description

The GetTypeData (see page 4756) routine utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return a pointer to TTypeData (see page 4785) record that describes a component property data type.

TTypeData (see page 4785) is a variant record : the layout depends on the property TTypeKind (see page 4787) value. When it is tkWChar, the data is one of the TOrdType enumerated values.

The TOrdType value meanings are as follows :

Value	Meaning
otSByte	Signed byte.
otUByte	Unsigned byte
otSWord	Signed Word
otUWord	Unsigned Word
otSLong	Signed Long
otULong	Unsigned Long

See Also

GetTypeData (see page 4756)

TTypeData (see page 4785)

TTypeKind (see page 4787)

48.3.6 TypInfo.TParamFlag Enumeration

TParamFlag and TParamFlags (see page 4799) indicates the attributes of a method parameter.

Pascal

```
TParamFlag = (
  pfVar,
  pfConst,
  pfArray,
  pfAddress,
  pfReference,
  pfOut
);
```

C++

```
enum TParamFlag {
  pfVar,
  pfConst,
  pfArray,
  pfAddress,
  pfReference,
  pfOut
};
```

File

TypInfo

Description

TParamFlags (see page 4799) indicates the attributes of a parameter on a Delphi language function or procedure. It is a set of TParamFlag values:

Value	Meaning
pfVar	The parameter is input/output. Caller must supply a variable to receive output.
pfConst	The parameter can't be changed by the function or procedure.
pfArray	The parameter represents an open array of values.
pfAddress	The parameter is a memory address (pointer).
pfReference	The parameter is passed by reference.
pfOut	The parameter is output. Caller supplies a variable to receive the output.

48.3.7 TypInfo.TPropData Record

Pascal

```
TPropData = packed record
  PropCount: Word;
  PropList: record;
end;
```

C++

```
struct TPropData {
```

```
  Word PropCount;
  record PropList;
};
```

File

TypInfo

Description

This is record TypInfo.TPropData.

48.3.8 TypInfo.TPropInfo Record

TPropInfo is a record of component property type information.

Pascal

```
TPropInfo = packed record
  PropType: PPTypeInfo;
  GetProc: Pointer;
  SetProc: Pointer;
  StoredProc: Pointer;
  Index: Integer;
  Default: Longint;
  NameIndex: SmallInt;
  Name: ShortString;
end;
```

C++

```
struct TPropInfo {
  PPTypeInfo PropType;
  void * GetProc;
  void * SetProc;
  void * StoredProc;
  int Index;
  Longint Default;
  SmallInt NameIndex;
  ShortString Name;
};
```

File

TypInfo

Description

TPropInfo is principally used to hold the results of a call to GetPropInfo (see page 4751). It provides meta details about a component property as part of Delphi's RTTI (Run Time (see page 4338) Type Information) mechanism, giving run time component property processing. This allows for more generalised component handling that avoids excessive hard coded values.

The TPropInfo fields have the foillowing meanings :

Field	Meaning
PropType	Points to a data structure that gives information about the property type.
GetProc	Method pointer for the method that gets the component property value.
SetProc	Method pointer for the method that sets the component property value.
Index	The index of the property. It is used as a parameter to the GetProc and SetProc methods on indexed properties.

Default	The default value of the property.
NameIndex	The offset into the Name field where the property's name starts.
Name	The qualified property name.

See Also

GetPropInfo (see page 4751)

PPropInfo (see page 4789)

48.3.9 TypInfo.TTypeData Record

TTypeData is used internally to represent type information.

Pascal

```
TTypeData = packed record
  case TTypeKind of
    tkClass: (ClassType: TClass;
              ParentInfo: PPTypeInfo;
              PropCount: SmallInt;
              UnitName: ShortStringBase;);
    tkDynArray: (elSize: Longint;
                 elType: PPTypeInfo;
                 varType: Integer;
                 elType2: PPTypeInfo;
                 DynUnitName: ShortStringBase;);
    tkEnumeration: (BaseType: PPTypeInfo;
                    NameList: ShortStringBase;
                    EnumUnitName: ShortStringBase;);
    tkFloat: (FloatType: TFloatType;);
    tkInt64: (MaxInt64Value: Int64;
              MinInt64Value: Int64;);
    tkLString: (CodePage: Word;);
    tkMethod: (MethodKind: TMethodKind;
               ParamCount: Byte;
               ParamList: array[0..1023] of AnsiChar );
               tkInterface: ( IntfParent : PPTypeInfo; IntfFlags : TIntfFlagsBase; Guid :
TGUID; IntfUnit : ShortStringBase;;);
    tkRecord: (RecSize: Integer;
               ManagedFldCount: Integer;);
    tkSet: (CompType: PPTypeInfo;);
    tkString: (MaxLength: Byte;);
    tkWChar: (OrdType: TOrdType;
              MinValue: Longint;
              MaxValue: Longint;);
end;
```

C++

```
struct TTypeData {
  Word CodePage;
  TOrdType OrdType;
  Longint MinValue;
  Longint MaxValue;
  PPTypeInfo BaseType;
  ShortStringBase NameList;
  ShortStringBase EnumUnitName;
  PPTypeInfo CompType;
  TFloatType FloatType;
```

```
    Byte MaxLength;
    TClass ClassType;
    PPTypeInfo ParentInfo;
    SmallInt PropCount;
    ShortStringBase UnitName;
    TMethodKind MethodKind;
    Byte ParamCount;
    array[0..1023] of AnsiChar ) ParamList;
    ( IntfParent : PPTypeInfo; IntfFlags : TIntfFlagsBase; Guid : TGUID; IntfUnit :
  ShortStringBase; tkInterface;
    Int64 MaxInt64Value;
    Int64 MinInt64Value;
    Longint elSize;
    PPTypeInfo elType;
    int varType;
    PPTypeInfo elType2;
    ShortStringBase DynUnitName;
    int RecSize;
    int ManagedFldCount;
  };
```

File

TypInfo

Description

A TTypeData structure represents a category of properties, events, or methods in parameters passed to several routines in the TypInfo (see page 4723) unit.

48.3.10 TypInfo.TTypeInfo Record

Holds information for a data type as returned by TypeInfo.

Pascal

```
TTypeInfo = record
  Kind: TTypeKind;
  Name: ShortString;
end;
```

C++

```
struct TTypeInfo {
  TTypeKind Kind;
  ShortString Name;
};
```

File

TypInfo

Description

The TypeInfo function is part of Delphi's Run Time (see page 4338) Type Information (RTTI) mechanism. It provides run time information about a specific data type. TypeInfo returns a PTypeInfo (see page 4794) pointer to a TTypeInfo value.

The TTypeInfo holds the following fields :

Field	Meaning
Kind	The kind of type in RTTI terms. This value is required to select the appropriate variant section in the TTypeData (see page 4785) returned by the GetTypeData (see page 4756).

Name	The name of the data type.

See Also

GetTypeData (see page 4756)

PTypeInfo (see page 4794)

PPTypeInfo (see page 4790)

TTypeKind (see page 4787)

TTypeData (see page 4785)

48.3.11 TypInfo.TTypeKind Enumeration

These types describe a type that is manipulated in the forms designer.

Pascal

```
TTypeKind = (
  tkUnknown,
  tkInteger,
  tkChar,
  tkEnumeration,
  tkFloat,
  tkString,
  tkSet,
  tkClass,
  tkMethod,
  tkWChar,
  tkLString,
  tkWString,
  tkVariant,
  tkArray,
  tkRecord,
  tkInterface,
  tkInt64,
  tkDynArray,
  tkUString
);
```

C++

```
enum TTypeKind {
  tkUnknown,
  tkInteger,
  tkChar,
  tkEnumeration,
  tkFloat,
  tkString,
  tkSet,
  tkClass,
  tkMethod,
  tkWChar,
  tkLString,
  tkWString,
  tkVariant,
  tkArray,
  tkRecord,
  tkInterface,
  tkInt64,
```

```
    tkDynArray,
    tkUString
};
```

File

TypInfo

Description

TTypeKind is an enumerated type that classifies a type.

TTypeInfo (see page 4786) describes a type by giving its classification and its name.

PTypeInfo (see page 4794) is a pointer to a TTypeInfo (see page 4786) value.

PPTypeInfo (see page 4790) is a pointer to a PTypeInfo (see page 4794) pointer.

48.4 Types

The following table lists types in this documentation.

Types

Name	Description
PPropInfo (see page 4789)	PPropInfo points to a TPropInfo (see page 4784) record that holds component property information.
PPropList (see page 4790)	Defines a pointer to a TPropList (see page 4800) array.
PPTypeInfo (see page 4790)	Holds a pointer to a pointer to information for a data type as returned by TypeInfo.
PTypeData (see page 4791)	PTypeData points to a TTypeData (see page 4785) record that holds component property type information.
PTypeInfo (see page 4794)	Holds a pointer to information for a data type as returned by TypeInfo.
ShortStringBase (see page 4797)	Defines a fixed length string for general use in the TTypeData (see page 4785) record.
TIntfFlags (see page 4797)	Enumerates interface flag types in the TTypeData (see page 4785) record.
TIntfFlagsBase (see page 4798)	Set of interface flag types in the TTypeData (see page 4785) record.
TParamFlags (see page 4799)	This is type TypInfo.TParamFlags.
TParamFlagsBase (see page 4799)	This is type TypInfo.TParamFlagsBase.
TPropInfoProc (see page 4799)	This is type TypInfo.TPropInfoProc.
TPropList (see page 4800)	Defines an array of PPropInfo (see page 4789) values.
TTypeKinds (see page 4800)	Defines a set of TTypeKind (see page 4787) values.

48.4.1 TypInfo.PPropInfo Type

PPropInfo points to a TPropInfo (see page 4784) record that holds component property information.

Pascal

```
PPropInfo = ^TPropInfo;
```

C++

```
^TPropInfo PPropInfo;
```

File

TypInfo

Description

TPropInfo (see page 4784) is principally used to hold the results of a call to GetPropInfo (see page 4751). It provides meta details about a component property as part of Delphi's RTTI (Run Time (see page 4338) Type Information) mechanism, giving run time component property processing. This allows for more generalised component handling that avoids excessive hard coded values. PPropInfo is a pointer to a TPropInfo (see page 4784) record.

See Also

GetPropInfo (see page 4751)

TPropInfo (see page 4784)

48.4.2 TypInfo.PPropList Type

Defines a pointer to a TPropList (see page 4800) array.

Pascal

```
PPropList = ^TPropList;
```

C++

```
^TPropList PPropList;
```

File

TypInfo

Description

PPropList defines a pointer to an array of PPropInfo (see page 4789) values. This TPropList (see page 4800) array is principally used to hold the results of a call to GetPropList (see page 4752). This list (array) holds pointers to TPropInfo (see page 4784) records that describe the nature of the properties of the component provided to GetPropList (see page 4752).

See Also

GetPropList (see page 4752)

PPropInfo (see page 4789)

TPropInfo (see page 4784)

TPropList (see page 4800)

48.4.3 TypInfo.PPTypeInfo Type

Holds a pointer to a pointer to information for a data type as returned by TypeInfo.

Pascal

```
PPTypeInfo = ^PTypeInfo;
```

C++

```
^PTypeInfo PPTypeInfo;
```

File

TypInfo

Description

The TypeInfo function is part of Delphi's Run Time (see page 4338) Type Information (RTTI) mechanism. It provides run time information about a specific data type. TypeInfo returns a PTypeInfo (see page 4794) pointer to a TTypeInfo (see page 4786) value. PPTypeInfo is a PTypeInfo (see page 4794) pointer.

See Also

GetTypeData (see page 4756)

PTypeInfo (see page 4794)

TTypeInfo (see page 4786)

TTypeKind (see page 4787)

TTypeData (see page 4785)

48.4.4 TypInfo.PTypeData Type

PTypeData points to a TTypeData (see page 4785) record that holds component property type information.

Pascal

```
PTypeData = ^TTypeData;
```

C++

```
^TTypeData PTypeData;
```

File

TypInfo

Description

TTypeData (see page 4785) is principally used to hold the results of a call to GetTypeData (see page 4756). It provides meta details about a component property type as part of Delphi's RTTI (Run Time (see page 4338) Type Information) mechanism, giving run time component property processing. This allows for more generalised component handling that avoids excessive hard coded values. PTypeData is a pointer to a TTypeData (see page 4785) record.

C++ Examples:

```
/*
Add the Delphi source file that appears on this Help page into
a CPP Builder project that includes a CPP module containing the
following code.  An hpp file will be generated for the Delphi
code when you build the project.  Add the include line for
that hpp file at the top of the CPP module.  The FormCreates
for both forms will execute and the following generics code
will work.  Remember to give the forms different names!
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Prints type info for string type
  TGenericClass__1<System::UnicodeString> *GString = new
TGenericClass__1<System::UnicodeString>();
  GString->PrintTypeInfo(Memo1);

  // Prints type info for Byte type
  TGenericClass__1<Byte> *GByte = new TGenericClass__1<Byte>();
  GByte->PrintTypeInfo(Memo1);

  // Prints type info for Double type
  TGenericClass__1<Double> *GDouble = new TGenericClass__1<Double>();
  GDouble->PrintTypeInfo(Memo1);

  // Prints type info for "array of String" type
  // TGenericClass__1<array of string> *GStringArray = new TGenericClass__1<array of string>();
  // GStringArray->PrintTypeInfo(Memo1);
}
```

Delphi Examples:

```
{
This example demostrates the methods to retreive of
Run-time Type Information (RTTI) information.
```

```
  This example will print useful information about any given
  type including it's name, size, kind and sub-kind.
  }

  type
    TForm2 = class(TForm)
      Memo1: TMemo;
      procedure FormCreate(Sender: TObject);
    private
      { Private declarations }
    public
      { Public declarations }
    end;
  { Defining a generic type that contains a single class (static)
    method that will print information about the type it operates on.
  }
    TGenericClass<T> = class(TList<T>)  // TList is a class in Generics.Collections
    public
      procedure PrintTypeInfo(memo: TMemo);
    end;
    TGenericString = class(TGenericClass<UnicodeString>)
    end;
    TGenericByte = class(TGenericClass<Byte>)
    end;
    TGenericDouble = class(TGenericClass<Double>)
    end;

  var
    Form2: TForm2;

  implementation

  {$R *.dfm}

  { Method defintition }
  procedure TGenericClass<T>.PrintTypeInfo(memo: TMemo);
  var
    Info     : PTypeInfo;
    Data     : PTypeData;
    KindName : String;
    SubName  : String;
  begin
    { Get type info for the "yet unknown type" }
    Info := System.TypeInfo(T);

    { There is no RTTI attached for some types like Records for example. }
    if Info <> nil then
    begin
      memo.Lines.Add('Type name: ' + Info^.Name);

      { Find out the name of an enum item from it's ordinal value }
      KindName := TypInfo.GetEnumName(System.TypeInfo(TTypeKind), Ord(Info^.Kind));

      memo.Lines.Add('Type kind: ' + KindName);

      Data := GetTypeData(Info);

      if Info^.Kind = tkInteger then
      begin
        { In case of integer let's see the actual sub-type name }
        SubName := TypInfo.GetEnumName(System.TypeInfo(TOrdType), Ord(Data^.OrdType));
        memo.Lines.Add('Integer kind: ' + SubName);
      end;

      if Info^.Kind = tkFloat then
      begin
```

```
        { In case of float let's see the actual sub-type name }
        SubName := TypInfo.GetEnumName(System.TypeInfo(TFloatType), Ord(Data^.FloatType));
        memo.Lines.Add('Float kind: ' + SubName);
      end;

      if Info^.Kind = tkDynArray then
      begin
        { Let's check out the element size  }
        memo.Lines.Add('Array element type name: ' + Data^.elType^^.Name);
        memo.Lines.Add('Array element type size: ' + IntToStr(Data^.elSize));
      end;

    end;
    memo.Lines.Add('Size of type: ' + IntToStr(SizeOf(T)));
  end;

  procedure TForm2.FormCreate(Sender: TObject);
  var
    GenericString : TGenericClass<UnicodeString>;
    GenericByte : TGenericClass<Byte>;
    GenericDouble : TGenericClass<Double>;
  //  GenericStringArray : TGenericClass<array of string>;
  begin
    { Prints type info for string type}

    GenericString := TGenericClass<UnicodeString>.Create;
    GenericString.PrintTypeInfo(Memo1);

    { Prints type info for Byte type}
    GenericByte := TGenericClass<Byte>.Create;
    GenericByte.PrintTypeInfo(Memo1);

    { Prints type info for Double type}
    GenericDouble := TGenericClass<Double>.Create;
    GenericDouble.PrintTypeInfo(Memo1);
  end;

  {
  Expected results are:

  Type name: string
  Type kind: tkUString
  Size of type: 4

  Type name: Byte
  Type kind: tkInteger
  Integer kind: otUByte
  Size of type: 1

  Type name: Double
  Type kind: tkFloat
  Float kind: ftDouble
  Size of type: 8

  Type name: .1
  Type kind: tkDynArray
  Array element type name: string
  Array element type size: 4
  Size of type: 4
  }
```

See Also

GetTypeData (see page 4756)

TTypeData (see page 4785)

48.4.5 TypInfo.PTypeInfo Type

Holds a pointer to information for a data type as returned by TypeInfo.

Pascal

```
PTypeInfo = ^TTypeInfo;
```

C++

```
^TTypeInfo PTypeInfo;
```

File

TypInfo

Description

The TypeInfo function is part of Delphi's Run Time (see page 4338) Type Information (RTTI) mechanism. It provides run time information about a specific data type. TypeInfo returns a PTypeInfo pointer to a TTypeInfo (see page 4786) value.

The TTypeInfo (see page 4786) holds the following fields :

Field	Meaning
Kind	The kind of type in RTTI terms. This value is required to select the appropriate variant section in the TTypeData (see page 4785) returned by the GetTypeData (see page 4756).
Name	The name of the data type.

C++ Examples:

```
/*
Add the Delphi source file that appears on this Help page into
a CPP Builder project that includes a CPP module containing the
following code.  An hpp file will be generated for the Delphi
code when you build the project.  Add the include line for
that hpp file at the top of the CPP module.  The FormCreates
for both forms will execute and the following generics code
will work.  Remember to give the forms different names!
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  // Prints type info for string type
  TGenericClass__1<System::UnicodeString> *GString = new
TGenericClass__1<System::UnicodeString>();
  GString->PrintTypeInfo(Memo1);

  // Prints type info for Byte type
  TGenericClass__1<Byte> *GByte = new TGenericClass__1<Byte>();
  GByte->PrintTypeInfo(Memo1);

  // Prints type info for Double type
  TGenericClass__1<Double> *GDouble = new TGenericClass__1<Double>();
  GDouble->PrintTypeInfo(Memo1);

  // Prints type info for "array of String" type
  // TGenericClass__1<array of string> *GStringArray = new TGenericClass__1<array of string>();
  // GStringArray->PrintTypeInfo(Memo1);
}
```

Delphi Examples:

```
{
This example demostrates the methods to retreive of
Run-time Type Information (RTTI) information.
This example will print useful information about any given
type including it's name, size, kind and sub-kind.
}

type
  TForm2 = class(TForm)
    Memo1: TMemo;
    procedure FormCreate(Sender: TObject);
  private
    { Private declarations }
  public
    { Public declarations }
  end;
{ Defining a generic type that contains a single class (static)
  method that will print information about the type it operates on.
}
  TGenericClass<T> = class(TList<T>)  // TList is a class in Generics.Collections

48.4.6 TypInfo.ShortStringBase Type

Defines a fixed length string for general use in the TTypeData (see page 4785) record.

Pascal

```
ShortStringBase = string[255];
```

C++

```
string[255] ShortStringBase;
```

File

TypInfo

Description

The GetTypeData (see page 4756) routine utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return a pointer to TTypeData (see page 4785) record that describes a component property data type.

A number of the variant data sections in the TTypeData (see page 4785) record use the ShortStringBase to define a 255 character string to hold Name values such as UnitName for a class data type.

48.4.7 TypInfo.TIntfFlags Type

Enumerates interface flag types in the TTypeData (see page 4785) record.

Pascal

```
TIntfFlags = set of TIntfFlag;
```

C++

```
TIntfFlag TIntfFlags;
```

File

TypInfo

Description

The GetTypeData (see page 4756) routine utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return a

pointer to TTypeData (see page 4785) record that describes a component property data type.

TTypeData (see page 4785) is a variant record : the layout depends on the property TTypeKind (see page 4787) value. When it is tkInterface, the data contains a TIntfFlagsBase (see page 4798) set of TIntfFlags values.

The TIntfFlags value meanings are as follows :

Value	Meaning
ifHasGuid	Interface has a GUID (Globally Unique IDentifier).
ifDispInterface	Is a dispatch interface.
ifDispatch	Can be dispatched.

48.4.8 TypInfo.TIntfFlagsBase Type

Set of interface flag types in the TTypeData (see page 4785) record.

Pascal

```
TIntfFlagsBase = set of TIntfFlag;
```

C++

```
TIntfFlag TIntfFlagsBase;
```

File

TypInfo

Description

The GetTypeData (see page 4756) routine utilises Delphi's RTTI (Run Time (see page 4338) Type Information) to return a pointer to TTypeData (see page 4785) record that describes a component property data type.

TTypeData (see page 4785) is a variant record : the layout depends on the property TTypeKind (see page 4787) value. When it is tkInterface, the data contains a TIntfFlagsBase set of TIntfFlag (see page 4780) values.

The TIntfFlag (see page 4780) value meanings are as follows :

Value	Meaning
ifHasGuid	Interface has a GUID (Globally Unique IDentifier).
ifDispInterface	Is a dispatch interface.
ifDispatch	Can be dispatched.

48.4.9 TypInfo.TParamFlags Type

Pascal

```
TParamFlags = set of TParamFlag;
```

C++

```
TParamFlag TParamFlags;
```

File

TypInfo

Description

This is type TypInfo.TParamFlags.

48.4.10 TypInfo.TParamFlagsBase Type

Pascal

```
TParamFlagsBase = set of TParamFlag;
```

C++

```
TParamFlag TParamFlagsBase;
```

File

TypInfo

Description

This is type TypInfo.TParamFlagsBase.

48.4.11 TypInfo.TPropInfoProc Type

Pascal

```
TPropInfoProc = procedure (PropInfo: PPropInfo) of object;
```

C++

```
(PropInfo: PPropInfo) ( TPropInfoProc)();
```

File

TypInfo

Description

This is type TypInfo.TPropInfoProc.

48.4.12 TypInfo.TPropList Type

Defines an array of PPropInfo (see page 4789) values.

Pascal

```
TPropList = array[0..16379] of PPropInfo;
```

C++

```
array[0..16379] of PPropInfo TPropList;
```

File

TypInfo

Description

TPropList is principally used to hold the results of a call to GetPropList (see page 4752). This list (array) holds pointers to TPropInfo (see page 4784) records that describe the nature of the properties of the component provided to GetPropList (see page 4752).

See Also

GetPropList (see page 4752)

TPropInfo (see page 4784)

48.4.13 TypInfo.TTypeKinds Type

Defines a set of TTypeKind (see page 4787) values.

Pascal

```
TTypeKinds = set of TTypeKind;
```

C++

```
TTypeKind TTypeKinds;
```

File

TypInfo

Description

TTypeKinds defines a set of TTypeKind (see page 4787) values. It is used to select which component property types to use in various routines, such as GetPropInfo (see page 4751).

See Also

GetPropInfo (see page 4751)

TTypeKind (see page 4787)

48.5 Variables

The following table lists variables in this documentation.

Variables

Name	Description
BooleanIdents (see page 4801)	An array of string representations of true and false.
DotSep (see page 4801)	This is variable TypInfo.DotSep.

48.5.1 TypInfo.BooleanIdents Variable

An array of string representations of true and false.

Pascal

```
BooleanIdents: array [Boolean] of string = ('False', 'True');
```

C++

```
array [Boolean] of string BooleanIdents = ('False', 'True');
```

File

TypInfo

Description

The GetEnumName (see page 4739) routine is part of Delphi's RTTI (Run Time (see page 4338) Type Information). It returns a string representation of an enumerated type value. If that type is true or false, BooleanIdents is used internally.

See Also

GetEnumName (see page 4739)

48.5.2 TypInfo.DotSep Variable

Pascal

```
DotSep: string = '.';
```

C++

```
UnicodeString DotSep = '.';
```

File

TypInfo

Description

This is variable TypInfo.DotSep.

48.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
tkAny (see page 4802)	This is constant TypInfo.tkAny.
tkMethods (see page 4802)	This is constant TypInfo.tkMethods.
tkProperties (see page 4802)	This is constant TypInfo.tkProperties.

48.6.1 TypInfo.tkAny Constant

Pascal

```
tkAny = [Low(TTypeKind)..High(TTypeKind)];
```

C++

```
tkAny = [Low(TTypeKind)..High(TTypeKind)];
```

File

TypInfo

Description

This is constant TypInfo.tkAny.

48.6.2 TypInfo.tkMethods Constant

Pascal

```
tkMethods = [tkMethod];
```

C++

```
tkMethods = [tkMethod];
```

File

TypInfo

Description

This is constant TypInfo.tkMethods.

48.6.3 TypInfo.tkProperties Constant

Pascal

```
tkProperties = tkAny - tkMethods - [tkUnknown];
```

C++

```
tkProperties = tkAny - tkMethods - [tkUnknown];
```

File

TypInfo

Description

This is constant TypInfo.tkProperties.

49 UDDIHelper Namespace

This is namespace UDDIHelper.

Topics

Name	Description
Functions (see page 4806)	The following table lists functions in this documentation.

Functions

	Name	Description
	GetBindingkeyAccessPoint (see page 4806)	Returns the URL for a Web Service as specified in a UDDI browser.

49.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetBindingkeyAccessPoint (see page 4806)	Returns the URL for a Web Service as specified in a UDDI browser.

49.1.1 UDDIHelper.GetBindingkeyAccessPoint Function

Returns the URL for a Web Service as specified in a UDDI browser.

Pascal

```
function GetBindingkeyAccessPoint(const Operator: String; const key: String): String;
```

C++

```
UnicodeString GetBindingkeyAccessPoint(const UnicodeString Operator, const UnicodeString key);
```

File

UDDIHelper

Description

Use GetBindingkeyAccessPoint to fetch the URL for calling a Web Service from a specified UDDI registry.

Operator is the URL of the UDDI registry from which to fetch the entry. You can obtain this value for a registered invokable interface by calling the invocation registry's GetUDDIInfo method.

BindingKey is the unique identifier for the TModel that describes the Web Service for which you want the URL.

GetBindingkeyAccessPoint returns the URL for the specified Web Service. This can be used to set the URL property of a THTTPRIO component.

See Also

THTTPRIO

TInvokableClassRegistry

50 ValEdit Namespace

This is namespace ValEdit.

Topics

Name	Description
Classes (see page 4808)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 4921)	The following table lists structs, records, enums in this documentation.
Types (see page 4923)	The following table lists types in this documentation.

Classes

	Name	Description
	TItemProp (see page 4808)	TItemProp configures how users can edit the item values in a value list editor.
	TValueListEditor (see page 4814)	TValueListEditor provides a simple way to edit string lists that contain name/value pairs.
	TValueListStrings (see page 4911)	This is class ValEdit.TValueListStrings.

Structs, Records, Enums

	Name	Description
	TDisplayOption (see page 4921)	TDisplayOption and TDisplayOptions (see page 4923) control the appearance of a value list editor.
	TKeyOption (see page 4922)	TKeyOption and TKeyOptions (see page 4924) indicate the response of a value list editor to certain keystrokes.

Types

Name	Description
TDisplayOptions (see page 4923)	This is type ValEdit.TDisplayOptions.
TGetPickListEvent (see page 4923)	This is type ValEdit.TGetPickListEvent.
TItemProps (see page 4924)	This is type ValEdit.TItemProps.
TKeyOptions (see page 4924)	This is type ValEdit.TKeyOptions.
TOnValidateEvent (see page 4924)	This is type ValEdit.TOnValidateEvent.

50.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TItemProp (see page 4808)	TItemProp configures how users can edit the item values in a value list editor.
	TValueListEditor (see page 4814)	TValueListEditor provides a simple way to edit string lists that contain name/value pairs.
	TValueListStrings (see page 4911)	This is class ValEdit.TValueListStrings.

50.1.1 TItemProp Class

TItemProp configures how users can edit the item values in a value list editor.

Class Hierarchy

Pascal

```
TItemProp = class(TPersistent);
```

C++

```
class TItemProp : public TPersistent;
```

File

ValEdit

Description

For each item that it allows users to edit, the TValueListEditor (see page 4814) component maintains a TItemProp object. This object's properties govern how users can edit the value in the value list editor.

TItemProp objects are created and owned by the value list editor that uses them to represent properties of item values (such as an edit mask or maximum length) or to supply a fixed pick list of values that users can assign to the item.

See Also

TValueListEditor (see page 4814)

TValueListEditor (see page 4814)

50.1.1.1 TItemProp Members

The following tables list the members exposed by TItemProp.

Protected Methods

	Name	Description
	AssignTo (see page 4810)	Copies the properties of an object to a destination object.
	UpdateEdit (see page 4811)	This is UpdateEdit, a member of class TItemProp.

Public Methods

	Name	Description
	Create (see page 4809)	Creates an instance of TItemProp (see page 4808).
	Destroy (see page 4809)	Destroys the TPersistent instance and frees its memory.
	HasPickList (see page 4810)	Indicates whether the PickList (see page 4813) property provides a static set of values for this item.

Published Properties

	Name	Description
	EditMask (see page 4811)	Restricts the value that can be entered for the associated item.
	EditStyle (see page 4812)	Determines whether the cell that contains the associated value has a drop-down arrow or ellipsis button.
	KeyDesc (see page 4812)	Specifies the name of the item, which appears in the names column of the Value list editor.
	MaxLength (see page 4813)	Specifies the maximum number of characters that users can enter for the item's value.
	PickList (see page 4813)	Lists the items that appear in the drop-down pick list for the item.
	ReadOnly (see page 4814)	Indicates whether users can edit the item's value by typing in a new value.

50.1.1.2 TItemProp.Create Constructor

Creates an instance of TItemProp (see page 4808).

Pascal

```
constructor Create(AEditor: TValueListEditor);
```

C++

```
__fastcall TItemProp(TValueListEditor AEditor);
```

Description

Do not call Create directly in an application. TValueListEditor (see page 4814) creates TItemProp (see page 4808) instances as needed when you make assignments to its ItemProps property.

The AEditor parameter is the value list editor that creates the TItemProp (see page 4808) instance to represent the properties of one of its items.

See Also

ItemProps (see page 4851)

50.1.1.3 TItemProp.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TItemProp();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3382)

System::TObject::Destroy (see page 3366)

50.1.1.4 TItemProp Methods

The methods of the TItemProp class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 4810)	Copies the properties of an object to a destination object.
	UpdateEdit (see page 4811)	This is UpdateEdit, a member of class TItemProp.

Public Methods

	Name	Description
	HasPickList (see page 4810)	Indicates whether the PickList (see page 4813) property provides a static set of values for this item.

50.1.1.4.1 TItemProp.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError (see page 3985)

50.1.1.4.2 TItemProp.HasPickList Method

Indicates whether the PickList (see page 4813) property provides a static set of values for this item.

Pascal

```
function HasPickList: Boolean;
```

C++

```
__fastcall Boolean HasPickList();
```

Description

Call PickList (see page 4813) to determine whether this TItemProp (see page 4808) object supplies values using the PickList (see page 4813) property. HasPickList returns true if the PickList (see page 4813) property contains a nonempty list of values.

See Also

PickList (see page 4813)

50.1.1.4.3 TItemProp.UpdateEdit Method

Pascal

```
procedure UpdateEdit;
```

C++

```
__fastcall UpdateEdit();
```

Description

This is UpdateEdit, a member of class TItemProp.

50.1.1.5 TItemProp Properties

The properties of the TItemProp class are listed here.

Published Properties

	Name	Description
	EditMask (see page 4811)	Restricts the value that can be entered for the associated item.
	EditStyle (see page 4812)	Determines whether the cell that contains the associated value has a drop-down arrow or ellipsis button.
	KeyDesc (see page 4812)	Specifies the name of the item, which appears in the names column of the Value list editor.
	MaxLength (see page 4813)	Specifies the maximum number of characters that users can enter for the item's value.
	PickList (see page 4813)	Lists the items that appear in the drop-down pick list for the item.
	ReadOnly (see page 4814)	Indicates whether users can edit the item's value by typing in a new value.

50.1.1.5.1 TItemProp.EditMask Property

Restricts the value that can be entered for the associated item.

Pascal

```
property EditMask: string;
```

C++

```
__property UnicodeString EditMask;
```

Description

Use EditMask to restrict the characters a user can enter. If the user attempts to enter a character that is not valid, the character

is not accepted. Validation using the EditMask property is performed on a character-by-character basis.

A mask consists of three fields with semicolons separating the fields. The first part of the mask is the mask itself. The second part is the character that determines whether the literal characters of a mask are included as part of the data. The third part of the mask is the character used to represent unentered characters in the mask.

Setting EditMask to an empty string removes the mask.

For more information on using edit masks, see the TEditMask type.

See Also

Values (see page 4865)

OnSetEditText

50.1.1.5.2 TItemProp.EditStyle Property

Determines whether the cell that contains the associated value has a drop-down arrow or ellipsis button.

Pascal

```
property EditStyle: TEditStyle;
```

C++

```
__property TEditStyle EditStyle;
```

Description

Set EditStyle to specify whether the cell in the value list editor that contains the associated value should allow users to drop down a pick list or to launch a dialog to edit the value.

When EditStyle is esSimple, the value cell is a simple edit box that lets users edit the associated value directly (unless the ReadOnly (see page 4814) property is true).

When EditStyle is esEllipsis, the value cell contains an ellipsis button that users can click to generate an OnEditButtonClick event. Typically, applications use this event to launch a dialog that edits the value.

When EditStyle is esPickList, the value cell contains a drop-down arrow that users can click to display a list of values from which to select. This value must be supplied by the PickList (see page 4813) property or in an OnGetPickList event handler (or supplied by the PickList (see page 4813) property and modified in an OnGetPickList event handler).

See Also

PickList (see page 4813)

OnGetPickList (see page 4889)

OnEditButtonClick (see page 4879)

ReadOnly (see page 4814)

KeyOptions (see page 4851)

DisplayOptions (see page 4841)

50.1.1.5.3 TItemProp.KeyDesc Property

Specifies the name of the item, which appears in the names column of the Value list editor.

Pascal

```
property KeyDesc: string;
```

C++

```
__property UnicodeString KeyDesc;
```

Description

Set KeyDesc to specify a name for this item. This name appears in the names column of the Value list editor.

If ItemProp is not set, then the name that appears in the key column of the Value list editor is the corresponding value of the Keys property.

See Also

Keys (see page 4851)

50.1.1.5.4 TItemProp.MaxLength Property

Specifies the maximum number of characters that users can enter for the item's value.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be typed when assigning a value to the item. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing value, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

Note: Even when MaxLength is 0, there may be limitations imposed by the operating system on the number of characters that may be entered.

See Also

Values (see page 4865)

EditMask (see page 4811)

50.1.1.5.5 TItemProp.PickList Property

Lists the items that appear in the drop-down pick list for the item.

Pascal

```
property PickList: TStrings;
```

C++

```
__property TStrings PickList;
```

Description

Use PickList to supply the values that appear in the drop-down pick list for the associated item. PickList lets you supply a static set of items that appear in the drop-down list for the associated item when EditStyle (see page 4812) is esPickList. These items can be subsequently modified by an OnGetPickList event handler.

Note: PickList is only used when the EditStyle (see page 4812) property is esPickList. If EditStyle (see page 4812) is

esPickList, and PickList does list a set of values, you must supply an OnGetPickList event handler to supply the items.

See Also

EditStyle (see page 4812)

OnGetPickList (see page 4889)

DropDownRows (see page 4846)

50.1.1.5.6 TItemProp.ReadOnly Property

Indicates whether users can edit the item's value by typing in a new value.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set ReadOnly to true to prevent users from typing in a new value for the associated item. For example, to force users to select item values only from a pick list, you can set the EditStyle (see page 4812) to esPickList and set ReadOnly to true. Similarly, to force users to enter values only using a property editor, you can set EditStyle (see page 4812) to esEllipsis and set ReadOnly to true.

See Also

EditStyle (see page 4812)

50.1.2 TValueListEditor Class

TValueListEditor provides a simple way to edit string lists that contain name/value pairs.

Class Hierarchy

Pascal

```
TValueListEditor = class(TCustomDrawGrid);
```

C++

```
class TValueListEditor : public TCustomDrawGrid;
```

File

ValEdit

Description

Use TValueListEditor to let users edit string lists that consist of strings with the form Name=Value. By default, the names appear in a column headed "Key", and the values in a column headed "Value", although you can customize these labels. You can control whether users can select, add, or edit the strings in the Key column. For each entry in the Value column, you can let users edit the string, supply a drop-down list from which they can select values, or provide a dialog in which they can edit values.

Value List Editors (VCL Only)

50.1.2.1 TValueListEditor Members

The following tables list the members exposed by TValueListEditor.

Protected Methods

	Name	Description
	AdjustColWidths (see page 4819)	This is AdjustColWidths, a member of class TValueListEditor.
	AdjustRowCount (see page 4819)	This is AdjustRowCount, a member of class TValueListEditor.
	CanEditModify (see page 4820)	Indicates whether the current cell in the grid can be edited.
	ColWidthsChanged (see page 4820)	Responds when the column widths change.
	CreateEditor (see page 4820)	Creates the inplace editor control.
	CreateWnd (see page 4821)	Creates the underlying window.
	DoExit (see page 4822)	Hides the inplace editor when selection moves to another control in a form.
	DoOnValidate (see page 4822)	This is DoOnValidate, a member of class TValueListEditor.
	DrawCell (see page 4822)	Generates an OnDrawCell event.
	EditListGetItems (see page 4823)	This is EditListGetItems, a member of class TValueListEditor.
	GetCell (see page 4823)	This is GetCell, a member of class TValueListEditor.
	GetColCount (see page 4824)	This is GetColCount, a member of class TValueListEditor.
	GetEditLimit (see page 4824)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 4824)	Generates an OnGetEditMask event.
	GetEditStyle (see page 4824)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
	GetEditText (see page 4825)	This is GetEditText, a member of class TValueListEditor.
	GetPickList (see page 4825)	This is GetPickList, a member of class TValueListEditor.
	GetRowCount (see page 4825)	This is GetRowCount, a member of class TValueListEditor.
	IsEmptyRow (see page 4826)	This is IsEmptyRow, a member of class TValueListEditor.
	KeyDown (see page 4826)	Provides special processing when the user presses a key.
	MouseDown (see page 4827)	Provides special processing when the user presses a mouse button.
	Resize (see page 4828)	Respond to control resize.
	RowMoved (see page 4828)	Generates an OnRowMoved event.
	SelectCell (see page 4829)	Determines whether a particular cell in the grid can be selected.
	SetCell (see page 4829)	This is SetCell, a member of class TValueListEditor.
	SetEditText (see page 4829)	This is SetEditText, a member of class TValueListEditor.
	SetStrings (see page 4829)	This is SetStrings, a member of class TValueListEditor.
	StringsChanging (see page 4830)	This is StringsChanging, a member of class TValueListEditor.
	TitleCaptionsStored (see page 4830)	This is TitleCaptionsStored, a member of class TValueListEditor.

Protected Properties

	Name	Description
	EditList (see page 4846)	This is EditList, a member of class TValueListEditor.

Public Methods

	Name	Description
	Create (see page 4817)	Creates and initializes new TValueListEditor (see page 4814) object.
	DeleteRow (see page 4821)	Deletes a row in the value list editor and a corresponding string from the associated TStrings object.
	Destroy (see page 4818)	Frees the memory associated with the TValueListEditor (see page 4814) object.
	FindRow (see page 4823)	Locates the row that corresponds to a specified key name.
	InsertRow (see page 4825)	Inserts a row in the value list editor and a corresponding string into the associated TStrings object.

	Refresh (see page 4827)	Updates the display to reflect the current value of the Strings (see page 4863) property.
	RestoreCurrentRow (see page 4828)	Undoes all edits to the current row.

Public Properties

	Name	Description
	Cells (see page 4836)	Lists the strings for each cell in the editor.
R	ColCount (see page 4836)	Indicates the number of columns in the value list editor.
	ItemProps (see page 4851)	Specifies various constraints on the way users can enter a value for each item in the list.
	Keys (see page 4851)	Lists the strings for each cell in the name (key) column.
R	RowCount (see page 4861)	Indicates the number of rows in the value list editor.
	Values (see page 4865)	Lists the strings for each value from the value column.
	VisibleColCount (see page 4867)	Indicates the number of scrollable columns visible in the grid.
	VisibleRowCount (see page 4867)	Indicates the number of scrollable rows visible in the grid.

Published Events

	Name	Description
	OnClick (see page 4868)	Occurs when the user clicks the control.
	OnContextPopup (see page 4870)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 4871)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 4871)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 4874)	Occurs when the user drags an object over a control.
	OnDrawCell (see page 4878)	Occurs when a cell in the grid needs to be drawn.
	OnEditButtonClick (see page 4879)	Occurs when the user click the ellipsis button on a cell in the values column or types Ctrl+Enter while focus is on a value cell with an ellipsis button.
	OnEndDock (see page 4880)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 4880)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 4881)	Occurs when a control receives the input focus.
	OnExit (see page 4883)	Occurs when the input focus shifts away from one control to another.
	OnGetEditMask (see page 4886)	Occurs when the in-place editor requests an edit mask.
	OnGetEditText (see page 4887)	Occurs when the in-place editor requests the value of a cell.
	OnGetPickList (see page 4889)	Supplies a pick list for values associated with a particular key.
	OnKeyDown (see page 4889)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 4893)	Occurs when a key is pressed.
	OnKeyUp (see page 4894)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 4896)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 4897)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 4899)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4899)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 4899)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 4902)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheelDown (see page 4904)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 4904)	Occurs when the mouse wheel is rotated upward.
	OnRowMoved (see page 4905)	Occurs immediately after the position of a row changes.
	OnSelectCell (see page 4906)	Occurs before a cell in the grid is selected.
	OnSetEditText (see page 4908)	Occurs when the user edits the value of a cell.
	OnStartDock (see page 4908)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 4909)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

	OnStringsChange (see page 4909)	Occurs immediately after the names or values in the string list change.
	OnStringsChanging (see page 4910)	Occurs immediately before the names or values in the string list change.
	OnTopLeftChanged (see page 4910)	Occurs immediately after the TopRow property or the LeftCol property changes.
	OnValidate (see page 4910)	Occurs when focus shifts away from a cell in the value list editor.

Published Properties

	Name	Description
	Align (see page 4831)	Determines how the control aligns within its container (parent control).
	Anchors (see page 4835)	Specifies how the control is anchored to its parent.
	BiDiMode (see page 4835)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 4836)	Determines whether a single line border is drawn around the grid.
	Color (see page 4837)	Specifies the background color of the control.
	Constraints (see page 4838)	Specifies the size constraints for the control.
	Ctl3D (see page 4838)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultColWidth (see page 4839)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 4840)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 4841)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	DisplayOptions (see page 4841)	Controls aspects of the value list editor's appearance.
	DoubleBuffered (see page 4842)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 4843)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 4844)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 4844)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownRows (see page 4846)	Limits the length of the drop-down list that appears for values that use a pick list.
	Enabled (see page 4847)	Controls whether the control responds to mouse, keyboard, and timer events.
	FixedColor (see page 4847)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 4847)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	Font (see page 4848)	Controls the attributes of text written on or in the control.
	GridLineWidth (see page 4849)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
	KeyOptions (see page 4851)	Controls the way the value list editor responds to user keystrokes.
	Options (see page 4852)	Specifies various display and behavioral properties of the grid.
	ParentBiDiMode (see page 4853)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 4854)	Determines where a control looks for its color information.
	ParentCtl3D (see page 4854)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 4855)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 4855)	Determines where a control looks for its font information.
	ParentShowHint (see page 4855)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 4856)	Identifies the pop-up menu associated with the control.
	ScrollBars (see page 4861)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowHint (see page 4862)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Strings (see page 4863)	Provides access to the string list that is being edited.
	TabOrder (see page 4864)	Indicates the position of the control in its parent's tab order.
	TitleCaptions (see page 4864)	Specifies the captions that label the columns of the value list editor.
	Visible (see page 4865)	Determines whether the component appears onscreen.

50.1.2.2 TValueListEditor.Create Constructor

Creates and initializes new TValueListEditor (see page 4814) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TValueListEditor(TComponent * AOwner);
```

Description

Call Create to create a value list editor component at runtime. TValueListEditor (see page 4814) components added to forms at design time are created automatically.

The AOwner parameter specifies another component (typically the form) that is responsible for freeing the TValueListEditor (see page 4814) instance.

See Also

Owner

50.1.2.3 TValueListEditor.Destroy Destructor

Frees the memory associated with the TValueListEditor (see page 4814) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TValueListEditor();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the value list editor reference is not nil, and only then calls Destroy.

See Also

System::TObject::Free (see page 3382)

50.1.2.4 TValueListEditor Methods

The methods of the TValueListEditor class are listed here.

Protected Methods

	Name	Description
	AdjustColWidths (see page 4819)	This is AdjustColWidths, a member of class TValueListEditor.
	AdjustRowCount (see page 4819)	This is AdjustRowCount, a member of class TValueListEditor.
	CanEditModify (see page 4820)	Indicates whether the current cell in the grid can be edited.
	ColWidthsChanged (see page 4820)	Responds when the column widths change.
	CreateEditor (see page 4820)	Creates the inplace editor control.
	CreateWnd (see page 4821)	Creates the underlying window.
	DoExit (see page 4822)	Hides the inplace editor when selection moves to another control in a form.
	DoOnValidate (see page 4822)	This is DoOnValidate, a member of class TValueListEditor.
	DrawCell (see page 4822)	Generates an OnDrawCell event.
	EditListGetItems (see page 4823)	This is EditListGetItems, a member of class TValueListEditor.
	GetCell (see page 4823)	This is GetCell, a member of class TValueListEditor.
	GetColCount (see page 4824)	This is GetColCount, a member of class TValueListEditor.

	GetEditLimit (see page 4824)	Provides the interface for a method that limits the number of characters the user can type into cells.
	GetEditMask (see page 4824)	Generates an OnGetEditMask event.
	GetEditStyle (see page 4824)	Indicates whether a specified cell has an ellipsis button or drop-down arrow.
	GetEditText (see page 4825)	This is GetEditText, a member of class TValueListEditor.
	GetPickList (see page 4825)	This is GetPickList, a member of class TValueListEditor.
	GetRowCount (see page 4825)	This is GetRowCount, a member of class TValueListEditor.
	IsEmptyRow (see page 4826)	This is IsEmptyRow, a member of class TValueListEditor.
	KeyDown (see page 4826)	Provides special processing when the user presses a key.
	MouseDown (see page 4827)	Provides special processing when the user presses a mouse button.
	Resize (see page 4828)	Respond to control resize.
	RowMoved (see page 4828)	Generates an OnRowMoved event.
	SelectCell (see page 4829)	Determines whether a particular cell in the grid can be selected.
	SetCell (see page 4829)	This is SetCell, a member of class TValueListEditor.
	SetEditText (see page 4829)	This is SetEditText, a member of class TValueListEditor.
	SetStrings (see page 4829)	This is SetStrings, a member of class TValueListEditor.
	StringsChanging (see page 4830)	This is StringsChanging, a member of class TValueListEditor.
	TitleCaptionsStored (see page 4830)	This is TitleCaptionsStored, a member of class TValueListEditor.

Public Methods

	Name	Description
	DeleteRow (see page 4821)	Deletes a row in the value list editor and a corresponding string from the associated TStrings object.
	FindRow (see page 4823)	Locates the row that corresponds to a specified key name.
	InsertRow (see page 4825)	Inserts a row in the value list editor and a corresponding string into the associated TStrings object.
	Refresh (see page 4827)	Updates the display to reflect the current value of the Strings (see page 4863) property.
	RestoreCurrentRow (see page 4828)	Undoes all edits to the current row.

50.1.2.4.1 TValueListEditor.AdjustColWidths Method

Pascal

```
procedure AdjustColWidths; virtual;
```

C++

```
virtual __fastcall AdjustColWidths();
```

Description

This is AdjustColWidths, a member of class TValueListEditor.

50.1.2.4.2 TValueListEditor.AdjustRowCount Method

Pascal

```
procedure AdjustRowCount; virtual;
```

C++

```
virtual __fastcall AdjustRowCount();
```

Description

This is AdjustRowCount, a member of class TValueListEditor.

50.1.2.4.3 TValueListEditor.CanEditModify Method

Indicates whether the current cell in the grid can be edited.

Pascal

```
function CanEditModify: Boolean; override;
```

C++

```
virtual __fastcall Boolean CanEditModify();
```

Description

Grid components use CanEditModify internally to determine whether to allow the user to edit the current cell. CanEditModify returns true unless the inplace editor has disallowed editing for the cell.

See Also

CanEditShow

InplaceEditor

50.1.2.4.4 TValueListEditor.ColWidthsChanged Method

Responds when the column widths change.

Pascal

```
procedure ColWidthsChanged; override;
```

C++

```
virtual __fastcall ColWidthsChanged();
```

Description

ColWidthsChanged is called immediately after the column widths change. The change can result from setting the ColWidths property, from setting the DefaultColWidth property, from moving one of the columns, or from resizing the columns with the mouse.

ColWidthsChanged adjusts the scroll bar and the position of the inplace editor to take into account the new column size and positions of the columns.

See Also

ColWidths

DefaultColWidth

InplaceEditor

ScrollBars

50.1.2.4.5 TValueListEditor.CreateEditor Method

Creates the inplace editor control.

Pascal

```
function CreateEditor: TInplaceEdit; override;
```

C++

```
virtual __fastcall TInplaceEdit CreateEditor();
```

Description

Grid controls call CreateEditor internally the first time the grid goes into edit mode. CreateEditor is exposed as a protected method so that descendants of TCustomGrid can substitute a specialized descendant of TInplaceEdit to handle cell editing.

See Also

EditorMode

InplaceEditor

ShowEditor

50.1.2.4.6 TValueListEditor.CreateWnd Method

Creates the underlying window.

Pascal

```
procedure CreateWnd; override;
```

C++

```
virtual __fastcall CreateWnd();
```

Description

CreateWnd is called automatically when the control is first created or when the underlying screen object must be destroyed and recreated to reflect property changes. Override CreateWnd to pass additional initialization messages to the screen object when it is created.

See Also

CreateParams

CreateWindowHandle

Perform

DestroyWnd

50.1.2.4.7 TValueListEditor.DeleteRow Method

Deletes a row in the value list editor and a corresponding string from the associated TStrings object.

Pascal

```
procedure DeleteRow(ARow: Integer); override;
```

C++

```
virtual __fastcall DeleteRow(int ARow);
```

Description

Call DeleteRow to remove the row specified by the ARow parameter. Delete (see page 3653) removes the corresponding string from the TStrings object being edited and updates the display.

ARow must be the index of a row that displays a name/value pair. That is, it can't be less than 0 or greater than the number of rows. If DisplayOptions (see page 4841) includes doColumnTitles, ARow can't be 0, because that is the title row, not a name/value pair in the associated TStrings object.

Note: DeleteRow deletes the specified row regardless of the value of KeyOptions (see page 4851). The keyDelete member of KeyOptions (see page 4851) controls only whether the user can delete a row by pressing the Delete (see page 3653) key.

See Also

Cells (see page 4836)

Strings (see page 4863)

KeyOptions (see page 4851)

DisplayOptions (see page 4841)

50.1.2.4.8 TValueListEditor.DoExit Method

Hides the inplace editor when selection moves to another control in a form.

Pascal

```
procedure DoExit; override;
```

C++

```
virtual __fastcall DoExit();
```

Description

After calling the inherited method, which generates an OnExit event, DoExit hides the inplace editor unless the Options property includes goAlwaysShowEditor.

See Also

HideEditor

Options

OnExit

50.1.2.4.9 TValueListEditor.DoOnValidate Method

Pascal

```
procedure DoOnValidate; virtual;
```

C++

```
virtual __fastcall DoOnValidate();
```

Description

This is DoOnValidate, a member of class TValueListEditor.

50.1.2.4.10 TValueListEditor.DrawCell Method

Generates an OnDrawCell event.

Pascal

```
procedure DrawCell(ACol: Longint; ARow: Longint; ARect: TRect; AState: TGridDrawState);
override;
```

C++

```
virtual __fastcall DrawCell(Longint ACol, Longint ARow, TRect ARect, TGridDrawState AState);
```

Description

DrawCell is called automatically whenever a cell in the grid is drawn. If the DefaultDrawing property is true, the background of the cell is painted before DrawCell is called, and the 3D effects of the fixed cells or the focus rectangle around the focused cell

are drawn after DrawCell. Descendants of TCustomDrawGrid can override this method to draw the contents of the cell or to block the OnDrawCell event.

See Also

DefaultDrawing

FixedCols

FixedRows

OnDrawCell

50.1.2.4.11 TValueListEditor.EditListGetItems Method

Pascal

```
procedure EditListGetItems(ACol: Integer; ARow: Integer; Items: TStrings);
```

C++

```
__fastcall EditListGetItems(int ACol, int ARow, TStrings Items);
```

Description

This is EditListGetItems, a member of class TValueListEditor.

50.1.2.4.12 TValueListEditor.FindRow Method

Locates the row that corresponds to a specified key name.

Pascal

```
function FindRow(const KeyName: string; var Row: Integer): Boolean;
```

C++

```
__fastcall Boolean FindRow(const UnicodeString KeyName, int Row);
```

Description

Call FindRow to locate the row in the value list editor that has the value specified by KeyName in the first column. This corresponds to a name/value pair in the string list where the name part is KeyName.

If a row in the value list editor has the specified key name, FindRow returns true and the Row parameter returns the index of the first row found with the specified name. If the specified name does not correspond to any of the rows in the value list editor, FindRow returns false.

See Also

Keys (see page 4851)

50.1.2.4.13 TValueListEditor.GetCell Method

Pascal

```
function GetCell(ACol: Integer; ARow: Integer): string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetCell(int ACol, int ARow);
```

Description

This is GetCell, a member of class TValueListEditor.

50.1.2.4.14 TValueListEditor.GetColCount Method

Pascal

```
function GetColCount: Integer;
```

C++

```
__fastcall int GetColCount();
```

Description

This is GetColCount, a member of class TValueListEditor.

50.1.2.4.15 TValueListEditor.GetEditLimit Method

Provides the interface for a method that limits the number of characters the user can type into cells.

Pascal

```
function GetEditLimit: Integer; override;
```

C++

```
virtual __fastcall int GetEditLimit();
```

Description

The inplace editor calls GetEditLimit to determine if a limit should be placed on the number of characters a user can type into a cell. GetEditLimit sets no limits. Descendants of TCustomGrid override this method to limit the text for certain cells.

See Also

InplaceEditor

50.1.2.4.16 TValueListEditor.GetEditMask Method

Generates an OnGetEditMask event.

Pascal

```
function GetEditMask(ACol: Longint; ARow: Longint): string; override;
```

C++

```
virtual __fastcall UnicodeString GetEditMask(Longint ACol, Longint ARow);
```

Description

The inplace editor calls GetEditMask to obtain any input mask associated with the cell specified by the ACol and ARow parameters. GetEditMask returns the Value parameter set by the OnGetEditMask event handler. If there is no OnGetEditMask event handler, GetEditMask returns an empty string, indicating that there is no edit mask.

See Also

OnGetEditMask

50.1.2.4.17 TValueListEditor.GetEditStyle Method

Indicates whether a specified cell has an ellipsis button or drop-down arrow.

Pascal

```
function GetEditStyle(ACol: Longint; ARow: Longint): TEditStyle; override;
```

C++

```
virtual __fastcall TEditStyle GetEditStyle(Longint ACol, Longint ARow);
```

Description

GetEditStyle indicates whether the specified cell can only be edited directly (esSimple), whether it has an ellipsis button that users can click to launch an editor for modifying field values (esEllipsis), or whether it has a drop-down arrow that users can click to display a pick list of possible values (esPickList).

ACol is the column that contains the cell. ARow is the row that contains the cell.

In TCustomGrid, GetEditStyle always returns esSimple, indicating that there is no ellipsis button or drop-down arrow. Descendant classes can override this methods if they provide a way to add pick lists or ellipsis buttons to cells.

50.1.2.4.18 TValueListEditor.GetEditText Method

Pascal

```
function GetEditText(ACol: Integer; ARow: Integer): string; override;
```

C++

```
virtual __fastcall UnicodeString GetEditText(int ACol, int ARow);
```

Description

This is GetEditText, a member of class TValueListEditor.

50.1.2.4.19 TValueListEditor.GetPickList Method

Pascal

```
function GetPickList(Values: TStrings; ClearFirst: Boolean = True): Boolean;
```

C++

```
__fastcall Boolean GetPickList(TStrings Values, Boolean ClearFirst = True);
```

Description

This is GetPickList, a member of class TValueListEditor.

50.1.2.4.20 TValueListEditor.GetRowCount Method

Pascal

```
function GetRowCount: Integer;
```

C++

```
__fastcall int GetRowCount();
```

Description

This is GetRowCount, a member of class TValueListEditor.

50.1.2.4.21 TValueListEditor.InsertRow Method

Inserts a row in the value list editor and a corresponding string into the associated TStrings object.

Pascal

```
function InsertRow(const KeyName: string; const Value: string; Append: Boolean): Integer;
```

C++

```
__fastcall int InsertRow(const UnicodeString KeyName, const UnicodeString Value, Boolean
Append);
```

Description

Call InsertRow to add a name/value pair to the value list editor and the TStrings object it is editing.

InsertRow adds a string of the form

`KeyName=Value`

to the Strings (see page 4863) property and updates the display to reflect the change.

If the current row of the value list editor is empty (has no name or value portion), InsertRow assigns the new KeyName and Value to the current row. Otherwise, if the Append (see page 3624) parameter is true, the new string appears after the currently selected row, while if Append (see page 3624) is false, the new string appears before the currently selected row.

Note: InsertRow inserts the specified row regardless of the value of KeyOptions (see page 4851). The keyAdd member of KeyOptions (see page 4851) controls only whether the user can add new rows by pressing the Insert (see page 3698) key or navigating past the last row.

Strings (see page 4863)

KeyOptions (see page 4851)

DisplayOptions (see page 4841)

50.1.2.4.22 TValueListEditor.IsEmptyRow Method

Pascal

```
function IsEmptyRow: Boolean;
```

C++

```
__fastcall Boolean IsEmptyRow();
```

Description

This is IsEmptyRow, a member of class TValueListEditor.

50.1.2.4.23 TValueListEditor.KeyDown Method

Provides special processing when the user presses a key.

Pascal

```
procedure KeyDown(var Key: Word; Shift: TShiftState); override;
```

C++

```
virtual __fastcall KeyDown(Word Key, TShiftState Shift);
```

Description

After generating an OnKeyDown event, KeyDown calls CanGridAcceptKey to screen out problematic key combinations. KeyDown moves to the appropriate cell in response to navigational key combinations, or sets the EditorMode property to true when the user presses F2.

See Also

CanGridAcceptKey

EditorMode

KeyPress

OnKeyDown

50.1.2.4.24 TValueListEditor.MouseDown Method

Provides special processing when the user presses a mouse button.

Pascal

```
procedure MouseDown(Button: TMouseButton; Shift: TShiftState; X: Integer; Y: Integer);
override;
```

C++

```
virtual __fastcall MouseDown(TMouseButton Button, TShiftState Shift, int X, int Y);
```

Description

MouseDown hides the editor window so that it can move selection to the cell that receives the mouse click. If the mouse lands in the hot region for beginning a move or resize of a row or column, MouseDown starts the move or resize, and provides visual feedback by changing the cursor. If the editor window was hidden, it is brought back up in its new location. Finally, MouseDown generates an OnMouseDown event.

ShowEditor

OnMouseDown

50.1.2.4.25 TValueListEditor.Refresh Method

Updates the display to reflect the current value of the Strings (see page 4863) property.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh to ensure that the value list editor accurately reflects the value of the Strings (see page 4863) property. For example, call Refresh after programmatically editing the value of the Strings (see page 4863) property.

See Also

RestoreCurrentRow (see page 4828)

Repaint

Strings (see page 4863)

50.1.2.4.26 TValueListEditor.Resize Method

Respond to control resize.

Pascal

```
procedure Resize; override;
```

C++

```
virtual __fastcall Resize();
```

Description

Resize is called automatically immediately after the control's dimensions change. As implemented in TControl, Resize calls the control's OnResize event handler if it is assigned.

See Also

OnResize

50.1.2.4.27 TValueListEditor.RestoreCurrentRow Method

Undoes all edits to the current row.

Pascal

```
function RestoreCurrentRow: Boolean;
```

C++

```
__fastcall Boolean RestoreCurrentRow();
```

Description

Call RestoreCurrentRow to back out edits to the current cell in the value list editor. RestoreCurrentRow backs out edits to the current cell if it is still in edit mode, or deletes a newly inserted row.

The user can accomplish the same effect by pressing the Escape key.

See Also

Cells (see page 4836)

InsertRow (see page 4825)

50.1.2.4.28 TValueListEditor.RowMoved Method

Generates an OnRowMoved event.

Pascal

```
procedure RowMoved(FromIndex: Longint; ToIndex: Longint); override;
```

C++

```
virtual __fastcall RowMoved(Longint FromIndex, Longint ToIndex);
```

Description

RowMoved is called immediately after a row in the grid changes position. It overrides the inherited method to generate an OnRowMoved event. Descendants of TCustomDrawGrid can override this method to make internal adjustments or to block the OnRowMoved event.

See Also

OnRowMoved

50.1.2.4.29 TValueListEditor.SelectCell Method

Determines whether a particular cell in the grid can be selected.

Pascal

```
function SelectCell(ACol: Longint; ARow: Longint): Boolean; override;
```

C++

```
virtual __fastcall Boolean SelectCell(Longint ACol, Longint ARow);
```

Description

Grid controls call SelectCell internally before attempting to move selection to a the cell identified by the ACol and ARow parameters. ACol and ARow are the column and row indexes for the cell, where the first column has index 0, and the top row has index 0.

SelectCell generates an OnSelectCell event. This method then returns true, unless the OnSelectCell event handler indicates that the cell should not be selected. Descendants of TCustomDrawGrid can override this method to check the properties of the information displayed in the cell or block the OnSelectCell event.

See Also

OnSelectCell

50.1.2.4.30 TValueListEditor.SetCell Method

Pascal

```
procedure SetCell(ACol: Integer; ARow: Integer; const Value: string); virtual;
```

C++

```
virtual __fastcall SetCell(int ACol, int ARow, const UnicodeString Value);
```

Description

This is SetCell, a member of class TValueListEditor.

50.1.2.4.31 TValueListEditor.SetEditText Method

Pascal

```
procedure SetEditText(ACol: Integer; ARow: Integer; const Value: string); override;
```

C++

```
virtual __fastcall SetEditText(int ACol, int ARow, const UnicodeString Value);
```

Description

This is SetEditText, a member of class TValueListEditor.

50.1.2.4.32 TValueListEditor.SetStrings Method

Pascal

```
procedure SetStrings(const Value: TStrings); virtual;
```

C++

```
virtual __fastcall SetStrings(const TStrings Value);
```

Description

This is SetStrings, a member of class TValueListEditor.

50.1.2.4.33 TValueListEditor.StringsChanging Method

Pascal

```
procedure StringsChanging; dynamic;
```

C++

```
__fastcall StringsChanging();
```

Description

This is StringsChanging, a member of class TValueListEditor.

50.1.2.4.34 TValueListEditor.TitleCaptionsStored Method

Pascal

```
function TitleCaptionsStored: Boolean;
```

C++

```
__fastcall Boolean TitleCaptionsStored();
```

Description

This is TitleCaptionsStored, a member of class TValueListEditor.

50.1.2.5 TValueListEditor Properties

The properties of the TValueListEditor class are listed here.

Protected Properties

	Name	Description
	EditList (see page 4846)	This is EditList, a member of class TValueListEditor.

Public Properties

	Name	Description
	Cells (see page 4836)	Lists the strings for each cell in the editor.
R	ColCount (see page 4836)	Indicates the number of columns in the value list editor.
	ItemProps (see page 4851)	Specifies various constraints on the way users can enter a value for each item in the list.
	Keys (see page 4851)	Lists the strings for each cell in the name (key) column.
R	RowCount (see page 4861)	Indicates the number of rows in the value list editor.
	Values (see page 4865)	Lists the strings for each value from the value column.
	VisibleColCount (see page 4867)	Indicates the number of scrollable columns visible in the grid.
	VisibleRowCount (see page 4867)	Indicates the number of scrollable rows visible in the grid.

Published Properties

	Name	Description
	Align (see page 4831)	Determines how the control aligns within its container (parent control).
	Anchors (see page 4835)	Specifies how the control is anchored to its parent.

	BiDiMode (see page 4835)	Specifies the bi-directional mode for the control.
	BorderStyle (see page 4836)	Determines whether a single line border is drawn around the grid.
	Color (see page 4837)	Specifies the background color of the control.
	Constraints (see page 4838)	Specifies the size constraints for the control.
	Ctl3D (see page 4838)	Determines whether a control has a three-dimensional (3-D) or two-dimensional look.
	DefaultColWidth (see page 4839)	Determines the width (in pixels) of all columns that have not been explicitly resized.
	DefaultDrawing (see page 4840)	Determines whether the Cells are painted when the grid is drawn.
	DefaultRowHeight (see page 4841)	Specifies the height (in pixels) of all rows that have not been explicitly resized.
	DisplayOptions (see page 4841)	Controls aspects of the value list editor's appearance.
	DoubleBuffered (see page 4842)	Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.
	DragCursor (see page 4843)	Indicates the image used to represent the mouse pointer when the control is being dragged.
	DragKind (see page 4844)	Specifies whether the control is being dragged normally or for docking.
	DragMode (see page 4844)	Determines how the control initiates drag-and-drop or drag-and-dock operations.
	DropDownRows (see page 4846)	Limits the length of the drop-down list that appears for values that use a pick list.
	Enabled (see page 4847)	Controls whether the control responds to mouse, keyboard, and timer events.
	FixedColor (see page 4847)	Specifies the background color of the fixed rows and columns in the grid.
	FixedCols (see page 4847)	Specifies the number of columns on the left of the grid that cannot be scrolled.
	Font (see page 4848)	Controls the attributes of text written on or in the control.
	GridLineWidth (see page 4849)	Specifies the width (in pixels) of the lines that separate the cells of the grid.
	KeyOptions (see page 4851)	Controls the way the value list editor responds to user keystrokes.
	Options (see page 4852)	Specifies various display and behavioral properties of the grid.
	ParentBiDiMode (see page 4853)	Specifies whether the control uses its parent's BiDiMode.
	ParentColor (see page 4854)	Determines where a control looks for its color information.
	ParentCtl3D (see page 4854)	Determines where a component looks to determine if it should appear three dimensional.
	ParentDoubleBuffered (see page 4855)	ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.
	ParentFont (see page 4855)	Determines where a control looks for its font information.
	ParentShowHint (see page 4855)	Determines where a control looks to find out if its Help Hint should be shown.
	PopupMenu (see page 4856)	Identifies the pop-up menu associated with the control.
	ScrollBars (see page 4861)	Specifies whether the grid includes horizontal and vertical scroll bars.
	ShowHint (see page 4862)	Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.
	Strings (see page 4863)	Provides access to the string list that is being edited.
	TabOrder (see page 4864)	Indicates the position of the control in its parent's tab order.
	TitleCaptions (see page 4864)	Specifies the captions that label the columns of the value list editor.
	Visible (see page 4865)	Determines whether the component appears onscreen.

50.1.2.5.1 TValueListEditor.Align Property

Determines how the control aligns within its container (parent control).

Pascal

```
property Align;
```

C++

```
__property Align;
```

Description

Use Align to align a control to the top, bottom, left, or right of a form or panel and have it remain there even if the size of the form, panel, or component that contains the control changes. When the parent is resized, an aligned control also resizes so that it continues to span the top, bottom, left, or right edge of the parent.

For example, to use a panel component with various controls on it as a tool palette, change the panel's Align value to alLeft. The value of alLeft for the Align property of the panel guarantees that the tool palette remains on the left side of the form and always equals the client height of the form.

The default value of Align is alNone, which means a control remains where it is positioned on a form or panel.

Tip: If Align is set to alClient, the control fills the entire client area so that it is impossible to select the parent form by clicking on it. In this case, select the parent by selecting the control on the form and pressing Esc, or by using the Object Inspector.

Any number of child components within a single parent can have the same Align value, in which case they stack up along the edge of the parent. The child controls stack up in z-order. To adjust the order in which the controls stack up, drag the controls into their desired positions.

Note: To cause a control to maintain a specified relationship with an edge of its parent, but not necessarily lie along one edge of the parent, use the Anchors property instead.

C++ Examples:

```
/*
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
*/

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  TSplitter* ps = new TSplitter(Form1); // These objects will all be cleaned up by the owner
(Form1).
  TFileListBox* pflb = new TFileListBox(Form1); // The parent (Form1) will clean up these
objects.
  TDirectoryListBox* pdlb = new TDirectoryListBox(Form1);

  // Line up the directory list box on the left of the form.
  pdlb->Parent = Form1;
  pdlb->Align = alLeft;
  pdlb->Width = Form1->ClientWidth/3;

  // Now use the splitter to divide the directory pane from the file pane.
  ps->Parent = Form1;
  ps->Left = pdlb->Left + pdlb->Width + 1; // Move to right of directory list.
  ps->Align = pdlb->Align; // Give same alignment as directory list.

  // Each pane must be at least one quarter of the form's width.
  ps->MinSize = Form1->ClientWidth/4;

  // Finally, create the last pane - a file list box.
  pflb->Parent = Form1;
  pflb->Align = alClient;
  pdlb->FileList = pflb; // Link the file list box to the directory list box.
}
/*
Dynamically create a TProgressBar control and align it to
the bottom of the form.
*/

#include <ComCtrls.hpp>
#include <Controls.hpp>
```

```
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  TProgressBar *ProgressBar = new TProgressBar(this);  // The owner will clean this up.
  ProgressBar->Parent = this;
  ProgressBar->Align = alBottom;
  TButton *Button1 = new TButton(this);  // The owner will clean this up.
  Button1->Parent = this;
}
/*
This example dynamically creates a Page Control, then a
series of Tab Sheets on the Page Control.
*/
#include <Comctrls.hpp>
TPageControl* ppc;
const int MAXTABS = 3;
TTabSheet* pts[MAXTABS];
const char * ppcTabTitles[] = { "ShortString", "Orders", "Items", "Parts" };
int iTabTitles = sizeof(ppcTabTitles)/sizeof(ppcTabTitles[0]);
const TColor colorPalette[12] = {
  clRed, clGreen, clYellow, clBlue, clWhite, clFuchsia,
  clTeal, clNavy, clMaroon, clLime, clOlive, clPurple};

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    ppc = new TPageControl(this); // The owner (this) will clean this up.
    ppc->Parent = this;
    ppc->Align = alClient;
    for (int i=0;i<iTabTitles;i++)
  {
        pts[i] = new TTabSheet(this); // The owner (this) will clean this up.
        pts[i]->PageControl = ppc;
        pts[i]->Name = AnsiString("pts") + ppcTabTitles[i];
        pts[i]->Caption = ppcTabTitles[i];
        pts[i]->Brush->Color = colorPalette[i];
  }
}
```

Delphi Examples:

```
{
This example shows how to use a splitter to divide a form
into resizable panes.  All objects on the form are created
dynamically in the OnCreate event handler of the form. To
run this example, add ExtCtrls and FileCtrl to the uses
clause of the form's implementation section.
Note that when creating a splitter dynamically at runtime,
it is important to set its position to the appropriate side
of the control it will resize.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  Split: TSplitter;
  Files: TFileListBox;
  Dirs: TDirectoryListBox;
begin
  { first add a directory list box to the form }
  Dirs := TDirectoryListBox.Create(Form1);
  { line it up on the left of the form }
  Dirs.Parent := Form1;
  Dirs.Align := alLeft;
  Dirs.Width := Form1.ClientWidth div 3;
{ now add the splitter to divide the directory pane from the file pane }
  Split := TSplitter.Create(Form1);
  Split.Parent := Form1;
  { make sure the splitter is to the right of the directory list box! }
  Split.Left := Dirs.Left + Dirs.Width + 1;
  Split.Align := Dirs.Align; { give it the same alignment as the directory }
```

```
    { each pane must be at least one quarter of the form's width }
    Split.MinSize := Form1.ClientWidth div 4;
    { Finally, create the last pane – a file list box }
    Files := TFileListBox.Create(Form1);
    Files.Parent := Form1;
    Files.Align := alClient;
    Dirs.FileList := Files; { link the file list box to the directory list box }
end;
{
Dynamically create a TProgressBar control and align it to
the bottom of the form.
}

var
  I: Integer;

procedure TForm1.Button1Click(Sender: TObject);
var

Parent

Anchors

50.1.2.5.2 TValueListEditor.Anchors Property

Specifies how the control is anchored to its parent.

Pascal

```
property Anchors;
```

C++

```
__property Anchors;
```

Description

Use Anchors to ensure that a control maintains its current position relative to an edge of its parent, even if the parent is resized. When its parent is resized, the control holds its position relative to the edges to which it is anchored.

If a control is anchored to opposite edges of its parent, the control stretches when its parent is resized. For example, if a control has its Anchors property set to [akLeft, akRight], the control stretches when the width of its parent changes.

Anchors is enforced only when the parent is resized. Thus, for example, if a control is anchored to opposite edges of a form at design time and the form is created in a maximized state, the control is not stretched because the form is not resized after the control is created.

Note: If a control should maintain contact with three edges of its parent (hugging one side of the parent and stretching the length of that side), use the Align property instead. Unlike Anchors, Align allows controls to adjust to changes in the size of other aligned sibling controls as well as changes to the parent's size.

See Also

Parent

Align

50.1.2.5.3 TValueListEditor.BiDiMode Property

Specifies the bi-directional mode for the control.

Pascal

```
property BiDiMode;
```

C++

```
__property BiDiMode;
```

Description

Use BiDiMode to enable the control to adjust its appearance and behavior automatically when the application runs in a locale that reads from right to left instead of left to right. The bi-directional mode controls the reading order for the text, the placement of the vertical scroll bar, and whether the alignment is changed.

Alignment does not change for controls that are known to contain number, date, time, or currency values. For example, with data

aware controls, the alignment does not change for the following field types: ftSmallint, ftInteger, ftWord, ftFloat, ftCurrency, ftBCD, ftDate, ftTime, ftDateTime, ftAutoInc.

50.1.2.5.4 TValueListEditor.BorderStyle Property

Determines whether a single line border is drawn around the grid.

Pascal

```
property BorderStyle;
```

C++

```
__property BorderStyle;
```

Description

Set BorderStyle to bsSingle to add a single line border around the grid's image. Set BorderStyle to bsNone to omit the border.

50.1.2.5.5 TValueListEditor.Cells Property

Lists the strings for each cell in the editor.

Pascal

```
property Cells [ACol, ARow: Integer]: string;
```

C++

```
__property UnicodeString Cells[int ACol, ARow];
```

Description

Use Cells to access the string in a particular cell. ACol is the column coordinate of the cell, and ARow is the row coordinate of the cell. ACol can be 0 (for the name column) or 1 (for the value column). ARow can range from 0 (for the title row) to the number of strings in the associated TStrings descendant.

To access the strings in the name column, use the Keys (see page 4851) property instead. To access the strings in the value column, use the Values (see page 4865) property instead. To access the underlying string list, use the Strings (see page 4863) property.

See Also

Keys (see page 4851)

Values (see page 4865)

Strings (see page 4863)

50.1.2.5.6 TValueListEditor.ColCount Property

Indicates the number of columns in the value list editor.

Pascal

```
property ColCount;
```

C++

```
__property ColCount;
```

Description

TValueListEditor (see page 4814) redeclares the ColCount property, which it inherits from TCustomGrid, to change it to a read-only property. The value of ColCount is always 2 plus the number of fixed columns, because the value list editor is designed to display only the name and value of the strings in the associated string list.

See Also

Cells (see page 4836)

RowCount (see page 4861)

FixedCols

50.1.2.5.7 TValueListEditor.Color Property

Specifies the background color of the control.

Pascal

```
property Color;
```

C++

```
__property Color;
```

Description

Use Color to read or change the background color of the control.

If a control's ParentColor property is true, then changing the Color property of the control's parent automatically changes the Color property of the control. When the value of the Color property is changed, the control's ParentColor property is automatically set to false.

C++ Examples:

```
/*
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (ColorDialog1->Execute())
    Shape1->Brush->Color = ColorDialog1->Color;
}
```

Delphi Examples:

```
{
The following code changes the color of a shape control
using the Color dialog box. The example displays the Color
dialog box when the Button1 button is clicked, allowing the
user to select a color with the dialog box. When a color
value is selected with the dialog box, it is assigned to
the shape control.
```

```
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if ColorDialog1.Execute then
    Shape1.Brush.Color := ColorDialog1.Color;
end;
```

See Also

ParentColor

50.1.2.5.8 TValueListEditor.Constraints Property

Specifies the size constraints for the control.

Pascal

```
property Constraints;
```

C++

```
__property Constraints;
```

Description

Use Constraints to specify the minimum and maximum width and height of the control. When Constraints contains maximum or minimum values, the control cannot be resized to violate those constraints.

Note: Constraints apply to the height of the form. However, the height of the form depends on how large Windows makes the title bar. For example, Windows XP uses much larger title bars than other windowing systems. To work around this, note the ClientHeight when you design your form and set the constraints in the FormCreate event. In the following example, ClientHeight is represented by x: `Constraints.MinHeight := x + Height - ClientHeight`.

Warning: Do not set up constraints that conflict with the value of the Align or Anchors property. When these properties conflict, the response of the control to resize attempts is not well-defined.

AutoSize

Align

Anchors

OnConstrainedResize

OnCanResize

50.1.2.5.9 TValueListEditor.Ctl3D Property

Determines whether a control has a three-dimensional (3-D) or two-dimensional look.

Pascal

```
property Ctl3D;
```

C++

```
__property Ctl3D;
```

Description

Ctl3D is provided for backward compatibility. It is not used by 32-bit versions of Windows or NT4.0 and later, with the exception of Windows XP Home, where it is used on occasion.

On earlier platforms, Ctl3D controlled whether the control had a flat or beveled appearance.

ParentCtl3D

BevelKind

BevelInner

BevelOuter

BorderWidth

50.1.2.5.10 TValueListEditor.DefaultColWidth Property

Determines the width (in pixels) of all columns that have not been explicitly resized.

Pascal

```
property DefaultColWidth;
```

C++

```
__property DefaultColWidth;
```

Description

Set DefaultColWidth to change the size of all columns in the grid. When DefaultColWidth is set, columns that have been resized using the mouse or by setting the ColWidths property are given the DefaultColWidth as well.

When new columns are added to the grid using the ColCount property, they are created with a width of DefaultColWidth.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (DrawGrid1->DefaultColWidth > 90)
    DrawGrid1->GridLineWidth = 2;
  else
    DrawGrid1->GridLineWidth = 1;
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
  }
}
```

```
void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)

{
  CanSelect = True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if DrawGrid1.DefaultColWidth > 90 then
    DrawGrid1.GridLineWidth := 2
  else
    DrawGrid1.GridLineWidth := 1;
end;

procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clBackground;
  DrawGrid1.Canvas.FillRect(Rect);
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
  end;
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
```

DefaultRowHeight

50.1.2.5.11 TValueListEditor.DefaultDrawing Property

Determines whether the Cells are painted when the grid is drawn.

Pascal

```
property DefaultDrawing;
```

C++

```
__property DefaultDrawing;
```

Description

Set DefaultDrawing to true to have the grid automatically paint the cells in the grid, including adding the background color, the 3-D effects on the fixed cells, and the focus rectangle around the selected cell. Set DefaultDrawing to false to skip the painting of the cells when the grid is drawn.

When DefaultDrawing is false, the cells should be painted using the DrawCell method. For TCustomGrid, DrawCell is an abstract method. Descendants of TCustomGrid use DrawCell to provide their own customized drawing code, or to generate an OnDrawCell event.

DrawCell

OnDrawCell

50.1.2.5.12 TValueListEditor.DefaultRowHeight Property

Specifies the height (in pixels) of all rows that have not been explicitly resized.

Pascal

```
property DefaultRowHeight;
```

C++

```
__property DefaultRowHeight;
```

Description

Set DefaultRowHeight to change the size of all rows in the grid. When DefaultRowHeight is set, rows that have been resized using the mouse or by setting the RowHeights property are given the DefaultRowHeight as well.

When new rows are added to the grid using the RowCount property, they are created with a height of DefaultRowHeight.

RowHeights

50.1.2.5.13 TValueListEditor.DisplayOptions Property

Controls aspects of the value list editor's appearance.

Pascal

```
property DisplayOptions: TDisplayOptions;
```

C++

```
__property TDisplayOptions DisplayOptions;
```

Description

Use DisplayOptions to control whether titles appear at the top of the columns in the value list editor and how the control responds when it is resized.

See Also

KeyOptions (see page 4851)

Options

TitleCaptions (see page 4864)

50.1.2.5.14 TValueListEditor.DoubleBuffered Property

Determines whether the control's image is rendered directly to the window or painted to an in-memory bitmap first.

Pascal

```
property DoubleBuffered;
```

C++

```
__property DoubleBuffered;
```

Description

When DoubleBuffered is false, the windowed control paints itself directly to the window. When DoubleBuffered is true, the windowed control paints itself to an in-memory bitmap that is then used to paint the window. Double buffering reduces the amount of flicker when the control repaints, but is more memory intensive.

When a windowed control is a dock site and has an associated dock manager, it must be double-buffered.

Note: Some controls, such as TRichEdit, can't paint themselves into a bitmap. For such controls, DoubleBuffered must be set to false.

C++ Examples:

```
/*
This code comes from an application that contains a list box
and three labels, each with a different font and color.  The
DragMode property for each of the labels is dmAutomatic.
The user can select a label and drag it to a list box and
drop it. When the label is dropped, the items in the list
box assume the color and font of the dropped label.
*/

// This OnDragOver event handler permits the list box to
// accept a dropped label:
void __fastcall TForm1::ListBox1DragOver(TObject *Sender, TObject *Source, int X, int Y,
TDragState State, bool &Accept)
{
   Accept = Source->ClassNameIs("TLabel");
}

/*
This OnDragDrop event handler implements the drop behavior.
*/
void __fastcall TForm1::ListBox1DragDrop(TObject *Sender, TObject *Source, int X, int Y)
{
  if (Sender->ClassNameIs("TListBox") && Source->ClassNameIs("TLabel"))
  {
    TListBox *DestList = dynamic_cast<TListBox *>(Sender);
    DestList->Font = (dynamic_cast<TLabel *>(Source))->Font;
    DestList->Color = (dynamic_cast<TLabel *>(Source))->Color;
    DestList->DoubleBuffered = true;
    DestList->Color = clWindow;
  }
}
```

```
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  ListBox1->Items->Add("Not");
  ListBox1->Items->Add("In");
  ListBox1->Items->Add("Alphabetical");
  ListBox1->Items->Add("Order");

}
```

Delphi Examples:

```
{
This code requires a list box and three labels, each with a
different font and color.  The DragMode property for each of
the labels is dmAutomatic.  The user can select a label and
drag it to a list box and drop it. When the label is dropped,
the items in the list box assume the color and font of the
dropped label.
}

procedure TForm1.FormCreate(Sender: TObject);
begin
  ListBox1.Items.Add('Not');
  ListBox1.Items.Add('In');
  ListBox1.Items.Add('Alphabetical');
  ListBox1.Items.Add('Order');
end;

// This OnDragOver event handler permits the list box to
// accept a dropped label:

procedure TForm1.ListBox1DragOver(Sender, Source: TObject; X, Y: Integer;
  State: TDragState; var Accept: Boolean);
begin
  Accept := Source is TLabel;
end;

// This OnDragDrop event handler implements the drop behavior.

procedure TForm1.ListBox1DragDrop(Sender, Source: TObject; X, Y: Integer);
begin
  if (Sender is TListBox) and (Source is TLabel) then
  begin
    with Sender as TListBox do
    begin
      Font := (Source as TLabel).Font;
      Color := (Source as TLabel).Color;
      DoubleBuffered := true;
      Color := clWindow;
    end;
  end;
end;
```

50.1.2.5.15 TValueListEditor.DragCursor Property

Indicates the image used to represent the mouse pointer when the control is being dragged.

Pascal

```
property DragCursor;
```

C++

```
__property DragCursor;
```

Description

Use the DragCursor property to change the cursor image presented when the control is being dragged.

Note: To make a custom cursor available for the DragCursor property, see the Cursor property.

See Also

Cursor

DragKind

DragMode

50.1.2.5.16 TValueListEditor.DragKind Property

Specifies whether the control is being dragged normally or for docking.

Pascal

```
property DragKind;
```

C++

```
__property DragKind;
```

Description

Use DragKind to get or set whether the control participates in drag-and-drop operations, or drag-and-dock operations.

See Also

DragCursor

DragMode

50.1.2.5.17 TValueListEditor.DragMode Property

Determines how the control initiates drag-and-drop or drag-and-dock operations.

Pascal

```
property DragMode;
```

C++

```
__property DragMode;
```

Description

Use DragMode to control when the user can drag the control. Disable the drag-and-drop or drag-and-dock capability at runtime by setting the DragMode property value to dmManual. Enable automatic dragging by setting DragMode to dmAutomatic.

C++ Examples:

```
/*
The following code uses GetNodeAt to add a dragged node as a
child of the node under the mouse when it is dropped.  This
example requires a populated TreeView.  Also, the TTreeView
DragMode property set to dmAutomatic, and the TTreeView
```

```
  OnDragOver event handler must be implemented to accept the
  drop.
  */
  void __fastcall TForm1::TreeView1DragDrop(TObject *Sender, TObject *Source,
        int X, int Y)
  {
    if (Source != dynamic_cast<TObject *>(TreeView1) || TreeView1->Selected == NULL)
      return;
    THitTests HT = TreeView1->GetHitTestInfoAt(X, Y);
    TNodeAttachMode AttachMode;
    TTreeNode *Item = TreeView1->GetNodeAt(X, Y);
    if (HT.Contains(htOnItem) || HT.Contains(htOnIcon))
      AttachMode = naAddChild;
    else if (HT.Contains(htNowhere))
      AttachMode = naAdd;
    else if (HT.Contains(htOnIndent))
      AttachMode = naInsert;
    else
      return;
    TreeView1->Selected->MoveTo(Item, AttachMode);
  }

  void __fastcall TForm1::TreeView1DragOver(TObject *Sender, TObject *Source,
        int X, int Y, TDragState State, bool &Accept)
  {
    Accept = (Source == dynamic_cast<TObject *>(TreeView1));
  }
```

Delphi Examples:

```
  {
  The following code uses GetNodeAt to add a dragged node as a
  child of the node under the mouse when it is dropped.  This
  example requires a populated TreeView.  Also, the TTreeView
  DragMode property must be set to dmAutomatic, and the TTreeView
  OnDragOver event handler must be implemented to accept the
  drop.
  }
  procedure TForm1.TreeView1DragDrop(Sender, Source: TObject; X, Y: Integer);
  var
    AnItem: TTreeNode;
    AttachMode: TNodeAttachMode;
    HT: THitTests;
  begin
    if TreeView1.Selected = nil then Exit;
    HT := TreeView1.GetHitTestInfoAt(X, Y);
    AnItem := TreeView1.GetNodeAt(X, Y);
    if (HT - [htOnItem, htOnIcon, htNowhere, htOnIndent] <> HT) then
    begin
      if (htOnItem in HT) or (htOnIcon in HT) then
        AttachMode := naAddChild
      else if htNowhere in HT then AttachMode := naAdd
      else if htOnIndent in HT then AttachMode := naInsert;
      TreeView1.Selected.MoveTo(AnItem, AttachMode);
    end;
  end;

  procedure TForm1.TreeView1DragOver(Sender, Source: TObject; X, Y: Integer;
    State: TDragState; var Accept: Boolean);
  begin
    Accept := Source is TTreeView;
  end;

Arranging the Order of Persistent Columns

50.1.2.5.18 TValueListEditor.DropDownRows Property

Limits the length of the drop-down list that appears for values that use a pick list.

Pascal

```
property DropDownRows: Integer;
```

C++

```
__property int DropDownRows;
```

Description

Use DropDownRows to indicate the maximum height of the drop-down list that appears when the user clicks the drop-down button on values that have a pick list. DropDownRows is an upper limit: if the pick list has fewer entries that DropDownRows, the drop-down list includes only a line for every item in the list.

DropDownRows is ignored for values that do not have a pick list. To provide a value in the value list editor with a drop-down button and pick list, you do either of the following:

For the appropriate entry in the ItemProps (see page 4851) property, set the EditStyle property to esPickList and set the PickList property to the list of items.

Write (see page 3789) an OnGetPickList (see page 4889) event handler that supplies the items in the list.

50.1.2.5.19 TValueListEditor.EditList Property

Pascal

```
property EditList: TInplaceEditList;
```

C++

```
__property TInplaceEditList EditList;
```

Description

This is EditList, a member of class TValueListEditor.

50.1.2.5.20 TValueListEditor.Enabled Property

Controls whether the control responds to mouse, keyboard, and timer events.

Pascal

```
property Enabled;
```

C++

```
__property Enabled;
```

Description

Use Enabled to change the availability of the control to the user. To disable a control, set Enabled to false. Disabled controls appear dimmed. If Enabled is false, the control ignores mouse, keyboard, and timer events.

To re-enable a control, set Enabled to true. The control is no longer dimmed, and the user can use the control.

50.1.2.5.21 TValueListEditor.FixedColor Property

Specifies the background color of the fixed rows and columns in the grid.

Pascal

```
property FixedColor;
```

C++

```
__property FixedColor;
```

Description

Set FixedColor to specify the color for the nonscrolling cells in the grid. The scrolling region of the grid is drawn using the Color property.

See Also

Color

FixedCols

FixedRows

50.1.2.5.22 TValueListEditor.FixedCols Property

Specifies the number of columns on the left of the grid that cannot be scrolled.

Pascal

```
property FixedCols;
```

C++

```
__property FixedCols;
```

Description

Set FixedCols to create or get rid of nonscrolling columns. Nonscrolling columns appear at the left of the grid, and are always visible, even when the user scrolls the other columns in the grid. Use nonscrolling columns for displaying row titles or row numbers, or to implement a scroll lock that the user can set.

Nonscrolling columns are visually distinct from the scrollable columns in the grid. They are painted with a separate background color, and their cells have a raised, 3-D look.

Note: Grids must include at least one scrolling column. Do not set FixedCols to a value greater than ColCount - 1.

50.1.2.5.23 TValueListEditor.Font Property

Controls the attributes of text written on or in the control.

Pascal

```
property Font;
```

C++

```
__property Font;
```

Description

To change to a new font, specify a new TFont object. To modify a font, change the value of the Charset, Color, Height, Name, Pitch, Size, or Style of the TFont object.

C++ Examples:

```
/*
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
corresponding font name in the combo box.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < Screen->Fonts->Count; i++)
   ComboBox1->Items->Add(Screen->Fonts->Strings[i]);
//  ComboBox1->Items = Screen->Fonts;  // Another way to do it.
}

void __fastcall TForm1::ComboBox1Change(TObject *Sender)
{
  RichEdit1->Font->Name = ComboBox1->Text;
}
```

Delphi Examples:

```
{
To use this example, place a TComboBox and TRichEdit or
TMemo on a form.  During form creation, a list of font names
is loaded into the combo box. When the combo box is clicked,
the memo or Rich Edit control font is set to the
```

```
corresponding font name in the combo box.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  i : Integer;
begin
  for i := 0 to Screen.Fonts.Count - 1 do
   ComboBox1.Items.Add(Screen.Fonts.Strings[i]);
//  ComboBox1.Items := Screen.Fonts;  // Another way to do it.
  RichEdit1.Lines.Text := 'How is it to be you?';
end;

procedure TForm1.ComboBox1Click(Sender: TObject);
begin
  RichEdit1.Font.Name := ComboBox1.Text;
end;
```

Displaying and Editing Text in a Memo Control

50.1.2.5.24 TValueListEditor.GridLineWidth Property

Specifies the width (in pixels) of the lines that separate the cells of the grid.

Pascal

```
property GridLineWidth;
```

C++

```
__property GridLineWidth;
```

Description

Set GridLineWidth to make the lines that separate the cells in the grid heavier or lighter. When GridLineWidth is zero, no separators are drawn between the cells of the grid.

GridLineWidth will have no effect if the Options property does not include goFixedHorzLine, goFixedVertLine, goHorzLine, or goVertLine.

Note: Values greater than 3 pixels are not recommended for applications that run on Windows 9x or Windows ME because of distortions that can appear.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
*/
void __fastcall TForm1::Button1Click(TObject *Sender)
{
  if (DrawGrid1->DefaultColWidth > 90)
    DrawGrid1->GridLineWidth = 2;
```

```
  else
    DrawGrid1->GridLineWidth = 1;
}

void __fastcall TForm1::DrawGrid1DrawCell(TObject *Sender, int ACol, int ARow, TRect &Rect,
          TGridDrawState State)
{
  int index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  ImageList1->Draw(DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
  }
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow, bool
&CanSelect)

{
  CanSelect = True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
This example includes a draw grid on a form. When the
application runs and the form is created, the width of the
lines on the draw grid changes if the default column width of
the grid is over 90 pixels wide.  This example requires a
populated image list, or can just display an empty grid.
Set the drawgrid DefaultColWidth and GridLineWidth statically
to values the cause the button click to do something.
}
procedure TForm1.Button1Click(Sender: TObject);
begin
  if DrawGrid1.DefaultColWidth > 90 then
    DrawGrid1.GridLineWidth := 2
  else
    DrawGrid1.GridLineWidth := 1;
end;

procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clBackground;
  DrawGrid1.Canvas.FillRect(Rect);
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
  end;
end;

Options

50.1.2.5.25 TValueListEditor.ItemProps Property

Specifies various constraints on the way users can enter a value for each item in the list.

Pascal

```
property ItemProps [const KeyOrIndex: Variant]: TItemProp;
```

C++

```
__property TItemProp ItemProps[Variant const KeyOrIndex];
```

Description

Use ItemProps to indicate, for each item:

- Whether the item is read only.
- The maximum length of strings the user can enter.
- An edit mask that limits the strings the user can enter as a value.
- Whether the item lets users drop down a pick list or launch a dialog to enter values.
- A fixed set of values from which users select (a pick list).

OnGetPickList (see page 4889)

Values (see page 4865)

50.1.2.5.26 TValueListEditor.KeyOptions Property

Controls the way the value list editor responds to user keystrokes.

Pascal

```
property KeyOptions: TKeyOptions;
```

C++

```
__property TKeyOptions KeyOptions;
```

Description

Use KeyOptions to control how users can edit name/value pairs using the value list editor.

See Also

Keys (see page 4851)

Strings (see page 4863)

50.1.2.5.27 TValueListEditor.Keys Property

Lists the strings for each cell in the name (key) column.

Pascal

```
property Keys [Index: Integer]: string;
```

C++

```
__property UnicodeString Keys[int Index];
```

Description

Use Keys to access the name (or key) value for a particular row. That is, Keys assumes the strings in the associated string list have the form Name=Value, and returns the Name portion.

Index identifies the Row of the value list editor. It takes a value from 0 to the number of rows. When DisplayOptions (see page 4841) includes doColumnTitles, the value of Keys is the title of the first column when Index is 0, and is the Name portion of the string when Index is greater than 0. When DisplayOptions (see page 4841) does not include doColumnTitles, the value of Keys is the Name portion of the string in the specified row.

To access the strings in the value column, use the Values (see page 4865) property instead. To access the underlying string list, use the Strings (see page 4863) property.

See Also

Cells (see page 4836)

Values (see page 4865)

Names

50.1.2.5.28 TValueListEditor.Options Property

Specifies various display and behavioral properties of the grid.

Pascal

```
property Options: TGridOptions;
```

C++

```
__property TGridOptions Options;
```

Description

Set Options to include the desired properties for the grid. See the type Grids.TGridOptions for definitions of these properties.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
```

```
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;

50.1.2.5.29 TValueListEditor.ParentBiDiMode Property

Specifies whether the control uses its parent's BiDiMode.

Pascal

```
property ParentBiDiMode;
```

C++

```
__property ParentBiDiMode;
```

Description

Use ParentBiDiMode to get or set whether the control uses its parent's BiDiMode. When ParentBiDiMode is true, the control's BiDiMode property is always equal to that of its parent. If ParentBiDiMode is false, the control uses its own BiDiMode property.

Set ParentBiDiMode to true for all controls in a form in order to ensure that the entire user interface adjusts to Middle Eastern locales in a uniform manner.

When the value of the control's BiDiMode property changes, ParentBiDiMode becomes false automatically.

Parent

BiDiMode

50.1.2.5.30 TValueListEditor.ParentColor Property

Determines where a control looks for its color information.

Pascal

```
property ParentColor;
```

C++

```
__property ParentColor;
```

Description

To have a control use the same color as its parent control, set ParentColor to true. If ParentColor is false, the control uses its own Color property.

Set ParentColor to true for all controls in order to ensure that all the controls on a form have a uniform appearance. For example, if ParentColor is true for all controls in a form, changing the background color of the form to gray causes all the controls on the form to also have a gray background.

When the value of a control's Color property changes, ParentColor becomes false automatically.

50.1.2.5.31 TValueListEditor.ParentCtl3D Property

Determines where a component looks to determine if it should appear three dimensional.

Pascal

```
property ParentCtl3D;
```

C++

```
__property ParentCtl3D;
```

Description

ParentCtl3D is provided for backwards compatibility. It has no effect on 32-bit versions of Windows or NT 4.0 and later.

ParentCtl3D determines whether the control uses its parent's Ctl3D property.

See Also

Ctl3D

50.1.2.5.32 TValueListEditor.ParentDoubleBuffered Property

ParentDoubleBuffered defers the DoubleBuffered property of this component to the value of the parent's DoubleBuffered property.

Pascal

```
property ParentDoubleBuffered;
```

C++

```
__property ParentDoubleBuffered;
```

Description

ParentDoubleBuffered is a boolean indicating that the DoubleBuffered property of this component is overridden by the value of the parent's DoubleBuffered property.

50.1.2.5.33 TValueListEditor.ParentFont Property

Determines where a control looks for its font information.

Pascal

```
property ParentFont;
```

C++

```
__property ParentFont;
```

Description

To have a control use the same font as its parent control, set ParentFont to true. If ParentFont is false, the control uses its own Font property. Many controls default ParentFont to true so that all the controls in a form or other container present a uniform appearance. When the value of a control's Font property changes, ParentFont becomes false automatically.

When ParentFont is true for a form, the form uses the default font.

ParentShowHint

50.1.2.5.34 TValueListEditor.ParentShowHint Property

Determines where a control looks to find out if its Help Hint should be shown.

Pascal

```
property ParentShowHint;
```

C++

```
__property ParentShowHint;
```

Description

Use ParentShowHint to ensure that all the controls on a form either uniformly show their Help Hints or uniformly do not show them.

If ParentShowHint is true, the control uses the ShowHint property value of its parent. If ParentShowHint is false, the control uses the value of its own ShowHint property.

To provide Help Hints for only selected controls on a form, set the ShowHint property for those controls that should have Help Hints to true, and ParentShowHint becomes false automatically.

Note: Enable or disable all Help Hints for the entire application using the ShowHint property of the application object.

50.1.2.5.35 TValueListEditor.PopupMenu Property

Identifies the pop-up menu associated with the control.

Pascal

```
property PopupMenu;
```

C++

```
__property PopupMenu;
```

Description

Assign a value to PopupMenu to make a pop-up menu appear when the user selects the control and clicks the right mouse button. If the TPopupMenu's AutoPopup property is true, the pop-up menu appears automatically. If the menu's AutoPopup property is false, display the menu with a call to its Popup method from the control's OnContextPopup event handler.

C++ Examples:

```
/*
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  PopupMenu1->AutoPopup = true;
  Edit1->PopupMenu = PopupMenu1;
  Edit2->PopupMenu = PopupMenu1;
}

/*
These are the cut, copy, and paste OnClick events for the commands
```

```
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
*/
void __fastcall TForm1::Copy1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CopyToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Cut1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->CutToClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}

void __fastcall TForm1::Paste1Click(TObject *Sender)
{
  TComponent *pComponent = PopupMenu1->PopupComponent;
  if (pComponent)
  {
    if (pComponent->ClassNameIs("TEdit"))
      (dynamic_cast<TEdit *>(pComponent))->PasteFromClipboard();
    else
      MessageBeep(0);
  }
  else
    MessageBeep(0);
}
/*
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
*/
void __fastcall TForm1::AddButtonClick(TObject *Sender)
{
    // The owner (PopupMenu1) will cleanup this menu item.
    TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
    int index = PopupMenu1->Items->Count;
    PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
```

```
    NewItem->Caption = "Menu Item " + IntToStr(index);
    NewItem->Tag = index;
    NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
    TNotifyEvent();
}

void __fastcall TForm1::PopupMenuItemsClick(TObject *Sender)
{
    TMenuItem *ClickedItem = dynamic_cast<TMenuItem *>(Sender);
    if (ClickedItem)
    {
        switch (ClickedItem->Tag)
        {
            case 0:
            {
                ShowMessage("first item clicked");
                break;
            }
            case 1:
            {
                ShowMessage("second item clicked");
                break;
            }
            case 2:
            {
                ShowMessage("third item clicked");
                break;
            }
            case 3:
            {
                ShowMessage("fourth item clicked");
                break;
            }
        }
    }
}

/*
To edit or destroy an item, grab its pointer via the Items
property.
*/
void __fastcall TForm1::EditButtonClick(TObject *Sender)
{
    const int index = 1;
    TMenuItem *ItemToEdit = PopupMenu->Items->Items[index];
    ItemToEdit->Caption = "Changed Caption";
}

void __fastcall TForm1::DestroyButtonClick(TObject *Sender)
{
    const int index = 2;
    TMenuItem *ItemToDelete = PopupMenu->Items->Items[index];
    delete ItemToDelete;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
    const int num_items = 4;
    for (int index = 0; index < num_items; ++index)
    {
        // The owner (PopupMenu1) will cleanup this menu item.
        TMenuItem *NewItem = new TMenuItem(PopupMenu1); // create the new item
        PopupMenu1->Items->Add(NewItem);// add it to the Popupmenu
        NewItem->Caption = "Menu Item " + IntToStr(index);
        NewItem->Tag = index;
        NewItem->OnClick = PopupMenuItemsClick;// assign it an event handler
```

```
        TNotifyEvent();
    }
}
```

Delphi Examples:

```
{
This example uses two edit boxes and one pop-up menu on a form.
The pop-up menu contains Cut, Copy, and Paste commands. This code
makes the pop-up menu available to both edit boxes:
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  PopupMenu1.AutoPopup := True;
  Edit1.PopupMenu := PopupMenu1;
  Edit2.PopupMenu := PopupMenu1;
end;

{
These are the cut, copy, and paste OnClick events for the commands
on the pop-up menu. Double click on the pop-up menu and add three
TMenuItems.  Then set the captions to "Cut", "Copy" and "Paste".
The names will be automatically set to "Cut1", "Copy1", and
"Paste1".  Then double click on the OnClick events and they will
be named "Cut1Click", "Copy1Click" and "Paste1Click" respectively.
Note: only the selected portion of the string in the edit box will
be copied, cut or replaced.
}
procedure TForm1.Copy1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
   Edit1.CopyToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CopyToClipboard
  else
    Beep;
end;

procedure TForm1.Cut1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.CutToClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.CutToClipboard
  else
    Beep;
end;

procedure TForm1.Paste1Click(Sender: TObject);
begin
  if PopupMenu1.PopupComponent = Edit1 then
    Edit1.PasteFromClipboard
  else if PopupMenu1.PopupComponent = Edit2 then
    Edit2.PasteFromClipboard
  else
    Beep;
end;
{
This example demonstrates how to add and delete menu items
to a popup menu at runtime and assign an event handler to
the OnClick event.  Place a TPopupMenu and three buttons on
the form named "AddButton", "EditButton",  and
"DestroyButton" and add OnClick events to all three buttons.
Put the TPopupMenu in the PopupMenu property of the form.
Place the PopupMenuItemsClick procedure in the TForm1 type
declaration so that it can be used as the method call for
the menu item OnClick event.
```

```

50.1.2.5.36 TValueListEditor.RowCount Property

Indicates the number of rows in the value list editor.

Pascal

```
property RowCount: Integer;
```

C++

```
__property int RowCount;
```

Description

TValueListEditor (see page 4814) redeclares the RowCount property, which it inherits from TCustomGrid, to change it to a read-only property. The value of RowCount is the number of strings in the Strings (see page 4863) property plus the number of fixed rows (typically one, for the column titles).

See Also

Strings (see page 4863)

ColCount (see page 4836)

FixedRows

50.1.2.5.37 TValueListEditor.ScrollBars Property

Specifies whether the grid includes horizontal and vertical scroll bars.

Pascal

```
property ScrollBars;
```

C++

```
__property ScrollBars;
```

Description

Use ScrollBars to give the grid horizontal or vertical scroll bars.

Note: If all the cells in the grid fit in the ClientWidth, no horizontal scroll bar appears, even if ScrollBars is ssHorizontal or ssBoth. If all the cells fit in the ClientHeight, no vertical scroll bar appears, even if ScrollBars is ssVertical or ssBoth.

See Also

ClientHeight

ClientWidth

50.1.2.5.38 TValueListEditor.ShowHint Property

Determines whether the control displays a Help Hint when the mouse pointer rests momentarily on the control.

Pascal

```
property ShowHint;
```

C++

```
__property ShowHint;
```

Description

The Help Hint is the value of the Hint property, which is displayed in a box just beneath the control. Use ShowHint to determine whether a Help Hint appears for the control.

To enable Help Hint for a particular control, the application ShowHint property must be true and either

the control's own ShowHint property must be true, or

the control's ParentShowHint property must be true and its parent's ShowHint property must be true.

For example, imagine a check box within a group box. If the ShowHint property of the group box is true and the ParentShowHint property of the check box is true, but the ShowHint property of the check box is false, the check box still displays its Help Hint.

Changing the ShowHint value automatically sets the ParentShowHint property to false.

C++ Examples:

```
/*
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  Edit1->Hint = "Enter your name";
  Edit1->ShowHint = true;

  char string[10];
  char index[3];
  for(int i = 1; i <= 10; i++)
  {
    strcpy(string, "Item");
    itoa(i, index, 10);
    strcat(string, index);
    ListBox1->Items->Add(string);
  }
```

```
  ListBox1->Hint = "Select an item";
  ListBox1->ShowHint = true;
  Application->ShowHint = true;
}
/*
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
*/
```

Delphi Examples:

```
{
This example uses an edit box and a list box on a form.
Items are added to the list box and a Help Hint is assigned
to both controls. The last statement enables the Help Hints
for the entire application.
}
procedure TForm1.FormCreate(Sender: TObject);
var
  I: Integer;
begin
  Edit1.Hint := 'Enter your name';
  Edit1.ShowHint := True;
  with ListBox1 do
  begin
    for I := 1 to 10 do
      Items.Add('Item ' + IntToStr(I));
    Hint := 'Select an item';
    ShowHint := True;
  end;
  Application.ShowHint := True;
end;
{
Note: To see an example that displays the hints of controls
in some place other than in a Help Hint box, see the OnHint
example.
}

Displaying Fly-over Help

50.1.2.5.39 TValueListEditor.Strings Property

Provides access to the string list that is being edited.

Pascal

```
property Strings: TStrings;
```

C++

```
__property TStrings Strings;
```

Description

Use Strings to access the string list that the value list editor displays. Strings should be a TStrings descendant that contains strings of the form Name=Value.

At design time, add values to the Strings property using the string list editor. At runtime, you can use the methods of TStrings to

add strings to the list one by one, or assign an existing TStrings descendant to the Strings property. When you set Strings at runtime, TValueListEditor (see page 4814) copies the strings from the TStrings object you assign: it does not take ownership of the object itself.

When Strings is assigned, the value list editor displays the name portion (TStrings . ::Names) of the strings in its key column and the value portion (TStrings . ::Values (see page 4865)) in the value column.

Names

Values

KeyOptions (see page 4851)

50.1.2.5.40 TValueListEditor.TabOrder Property

Indicates the position of the control in its parent's tab order.

Pascal

```
property TabOrder;
```

C++

```
__property TabOrder;
```

Description

TabOrder is the order in which child windows are visited when the user presses the Tab key. The control with the TabOrder value of 0 is the control that has the focus when the form first appears.

Initially, the tab order is always the order in which the controls were added to the form. The first control added to the form has a TabOrder value of 0, the second is 1, the third is 2, and so on. Change this by changing the TabOrder property.

Each control has a unique tab-order value within its parent. If you change the TabOrder property value of one control to be the same as the value of a second control, the TabOrder value for all the other controls changes. For example, suppose a control is sixth in the tab order. If you change the control's TabOrder property value to 3 (making the control fourth in the tab order), the control that was originally fourth in the tab order now becomes fifth, and the control that was fifth becomes sixth.

Assigning TabOrder a value greater than the number of controls contained in the parent control moves the control to the end of the tab order. The control does not take on the assigned value of TabOrder, but instead is given the number that assures the control is the last in the tab order.

Note: TabOrder is meaningful only if the TabStop property is true and if the control has a parent. (The TabOrder property of a form is not used unless the form is the child of another form.) A control with a TabOrder of -1 has no parent, and therefore cannot be reached by pressing the Tab key. To remove a parented control from the Tab order, set its TabStop property to false.

FindNextControl

TabStop

50.1.2.5.41 TValueListEditor.TitleCaptions Property

Specifies the captions that label the columns of the value list editor.

Pascal

```
property TitleCaptions: TStrings;
```

C++

```
__property TStrings TitleCaptions;
```

Description

Use TitleCaptions to provide titles for the columns of the value list editor. TitleCaptions is a TStrings descendant that contains two strings: the first string labels the name (key) column, and the second string labels the value column. If TitleCaptions contains less than two strings, missing captions are treated as empty strings. If TitleCaptions contains more than two strings, all strings except the first two are ignored.

Note: TitleCaptions is only used when the DisplayOptions (see page 4841) property includes doColumnTitles.

See Also

DisplayOptions (see page 4841)

50.1.2.5.42 TValueListEditor.Values Property

Lists the strings for each value from the value column.

Pascal

```
property Values [const Key: string]: string;
```

C++

```
__property UnicodeString Values[UnicodeString const Key];
```

Description

Use Values to access the value associated with a specified name from the first (key) column. Key specifies a string that appears in the first column of the value list editor. Values is the corresponding string from the second (value) column.

To access the strings in the key column, use the Keys (see page 4851) property instead. To access the underlying string list, use the Strings (see page 4863) property.

Note: Setting Values with Key set to a name that is not in the list adds a new string to Strings (see page 4863) and a new row to the value list editor.

See Also

Cells (see page 4836)

Keys (see page 4851)

Strings (see page 4863)

Values

50.1.2.5.43 TValueListEditor.Visible Property

Determines whether the component appears onscreen.

Pascal

```
property Visible;
```

C++

```
__property Visible;
```

Description

Use the Visible property to control the visibility of the control at runtime. If Visible is true, the control appears. If Visible is false,

the control is not visible.

Calling the Show method sets the control's Visible property to true. Calling the Hide method sets it to false.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
```

```
        begin
          Parent := PageControl1.Pages[i];
          Left := Random(PageControl1.ActivePage.ClientWidth - Width);
          Top := Random(PageControl1.ActivePage.ClientHeight - Height);
        end;
      end;
      PageControl1Change(Sender);
  end;

50.1.2.5.44 TValueListEditor.VisibleColCount Property

Indicates the number of scrollable columns visible in the grid.

Pascal

```
property VisibleColCount;
```

C++

```
__property VisibleColCount;
```

Description

Use VisibleColCount to determine the number of scrollable columns fully visible in the grid. VisibleColCount does not include the fixed columns counted by the FixedCols property. It does not include any partially visible columns on the right edge of the grid.

50.1.2.6 TValueListEditor Events

The events of the TValueListEditor class are listed here.

Published Events

	Name	Description
	OnClick (see page 4868)	Occurs when the user clicks the control.
	OnContextPopup (see page 4870)	Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).
	OnDblClick (see page 4871)	Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.
	OnDragDrop (see page 4871)	Occurs when the user drops an object being dragged.
	OnDragOver (see page 4874)	Occurs when the user drags an object over a control.
	OnDrawCell (see page 4878)	Occurs when a cell in the grid needs to be drawn.
	OnEditButtonClick (see page 4879)	Occurs when the user click the ellipsis button on a cell in the values column or types Ctrl+Enter while focus is on a value cell with an ellipsis button.
	OnEndDock (see page 4880)	Occurs when the dragging of an object ends, either by docking the object or by canceling the dragging.
	OnEndDrag (see page 4880)	Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.
	OnEnter (see page 4881)	Occurs when a control receives the input focus.
	OnExit (see page 4883)	Occurs when the input focus shifts away from one control to another.
	OnGetEditMask (see page 4886)	Occurs when the in-place editor requests an edit mask.
	OnGetEditText (see page 4887)	Occurs when the in-place editor requests the value of a cell.
	OnGetPickList (see page 4889)	Supplies a pick list for values associated with a particular key.
	OnKeyDown (see page 4889)	Occurs when a user presses any key while the control has focus.
	OnKeyPress (see page 4893)	Occurs when a key is pressed.
	OnKeyUp (see page 4894)	Occurs when the user releases a key that has been pressed.
	OnMouseActivate (see page 4896)	Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.
	OnMouseDown (see page 4897)	Occurs when the user presses a mouse button with the mouse pointer over a control.
	OnMouseEnter (see page 4899)	Occurs when the user moves the mouse into a control.
	OnMouseLeave (see page 4899)	Occurs when the user moves the mouse outside of a control.
	OnMouseMove (see page 4899)	Occurs when the user moves the mouse pointer while the mouse pointer is over a control.
	OnMouseUp (see page 4902)	Occurs when the user releases a mouse button that was pressed with the mouse pointer over a component.
	OnMouseWheelDown (see page 4904)	Occurs when the mouse wheel is rotated downward.
	OnMouseWheelUp (see page 4904)	Occurs when the mouse wheel is rotated upward.
	OnRowMoved (see page 4905)	Occurs immediately after the position of a row changes.
	OnSelectCell (see page 4906)	Occurs before a cell in the grid is selected.
	OnSetEditText (see page 4908)	Occurs when the user edits the value of a cell.
	OnStartDock (see page 4908)	Occurs when the user begins to drag a control with a DragKind of dkDock.
	OnStartDrag (see page 4909)	Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.
	OnStringsChange (see page 4909)	Occurs immediately after the names or values in the string list change.
	OnStringsChanging (see page 4910)	Occurs immediately before the names or values in the string list change.
	OnTopLeftChanged (see page 4910)	Occurs immediately after the TopRow property or the LeftCol property changes.
	OnValidate (see page 4910)	Occurs when focus shifts away from a cell in the value list editor.

50.1.2.6.1 TValueListEditor.OnClick Event

Occurs when the user clicks the control.

Pascal

```
property OnClick;
```

C++

```
__property OnClick;
```

Description

Use the OnClick event handler to respond when the user clicks the control. If the control has an associated action, and that action has an OnExecute method, the action's OnExecute method responds to click events unless it is superseded by an OnClick event handler.

Usually OnClick occurs when the user presses and releases the left mouse button with the mouse pointer over the control. This event can also occur when:

- The user selects an item in a grid, outline, list, or combo box by pressing an arrow key.
- The user presses Spacebar while a button or check box has focus.
- The user presses Enter when the active form has a default button (specified by the Default property).
- The user presses Esc when the active form has a cancel button (specified by the Cancel property).
- The user presses the accelerator key for a button or check box. For example, if the value of the Caption property of a check box is '&Bold', the B is underlined at runtime and the OnClick event of the check box is triggered when the user presses Alt+B. However, focus does not move to the control in these instances.
- The Checked property of a radio button is set to true.
- The value of the Checked property of a check box is changed.
- The Click method of a menu item is called.

For a form, an OnClick event occurs when the user clicks a blank area of the form or on a disabled component.

C++ Examples:

```
/*
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
*/
void __fastcall TForm1::PageControl1Change(TObject *Sender)
{
  CheckBox1->Checked = PageControl1->ActivePage->Visible;
}

void __fastcall TForm1::CheckBox1Click(TObject *Sender)
{
  PageControl1->ActivePage->Visible = CheckBox1->Checked;
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  for (int i = 0; i < 10; i++)
  {
    TTabSheet *pPage = new TTabSheet(this); // The owner will clean this up.
    pPage->PageControl = PageControl1;
    pPage->Caption = AnsiString("Page") + IntToStr(i);
    TEdit *pEdit = new TEdit(this); // The owner will clean this up.
    pEdit->Parent = pPage;
    pEdit->Left = random(pPage->ClientWidth - pEdit->Width);
    pEdit->Top = random(pPage->ClientHeight - pEdit->Height);
  }
  PageControl1Change(Sender);
```

```
}
```

Delphi Examples:

```
{
This examples requires a TPageControl and a TCheckBox.  The
form OnCreate event handler populates each sheet with an
edit control placed somewhere on the client area of the
sheet.  Unchecking the checkbox will cause the client area
(not the tab area) of the Tab Control to become invisible.
}
procedure TForm1.CheckBox1Click(Sender: TObject);
begin
  PageControl1.ActivePage.Visible := CheckBox1.Checked;
end;

procedure TForm1.PageControl1Change(Sender: TObject);
begin
  CheckBox1.Checked := PageControl1.ActivePage.Visible;
end;

procedure TForm1.FormCreate(Sender: TObject);
var
  i: Integer;
begin
  for i := 0 to 9 do
    with TTabSheet.Create(Self) do
    begin
      PageControl := PageControl1;
      Caption := 'TabSheet' + IntToStr(i);
      with TEdit.Create(Self) do
      begin
        Parent := PageControl1.Pages[i];
        Left := Random(PageControl1.ActivePage.ClientWidth - Width);
        Top := Random(PageControl1.ActivePage.ClientHeight - Height);
      end;
    end;
    PageControl1Change(Sender);
end;

50.1.2.6.2 TValueListEditor.OnContextPopup Event

Occurs when the user right-clicks the control or otherwise invokes the popup menu (such as using the keyboard).

Pascal

```
property OnContextPopup;
```

C++

```
__property OnContextPopup;
```

Description

The OnContextPopup handler is called when the user uses the mouse or keyboard to request a popup menu. The OnContextPopup event is generated by a WM_CONTEXTMENU message, which is itself generated by the user clicking the right mouse button or by pressing SHIFT+F10 or the Applications key.

This event is especially useful when the control does not have an associated popup menu (the PopupMenu property is not set) or if the AutoPopup property of the control's associated popup menu is false. However, the OnContextPopup can also be used to override the automatic context menu that appears when the control has an associated popup menu with an AutoPopup property of true. In this last case, if the event handler displays its own menu, it should set the Handled parameter to true to suppress the default context menu.

The handler's MousePos parameter indicates the position of the mouse, in client coordinates.. If the event was not generated by a mouse click, MousePos is (-1,-1).

Note: Parent controls receive an OnContextPopup event before their child controls. In addition, for many child controls, the default window procedure causes the parent control to receive an OnContextPopup event after the child control. As a result, when parent controls do not set Handled to true in an OnContextPopup event handler, the event handler may be called multiple times for each context menu invocation.

50.1.2.6.3 TValueListEditor.OnDblClick Event

Occurs when the user double-clicks the left mouse button when the mouse pointer is over the control.

Pascal

```
property OnDblClick;
```

C++

```
__property OnDblClick;
```

Description

Use the OnDblClick event to respond to mouse double-clicks.

OnClick

Responding to User Actions at Runtime

50.1.2.6.4 TValueListEditor.OnDragDrop Event

Occurs when the user drops an object being dragged.

Pascal

```
property OnDragDrop;
```

C++

```
__property OnDragDrop;
```

Description

Use the OnDragDrop event handler to specify what happens when the user drops an object. The Source parameter of the OnDragDrop event is the object being dropped, and the Sender is the control the object is being dropped on. The X and Y parameters are the coordinates of the mouse positioned over the control.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

{
  reinterpret_cast<TForm1 *>(Source)->Left = X;
  reinterpret_cast<TForm1 *>(Source)->Top = Y;
}

void __fastcall TForm1::FormDragOver(TObject *Sender, TObject *Source, int X, int Y,
          TDragState State, bool &Accept)
{

50.1.2.6.5 TValueListEditor.OnDragOver Event

Occurs when the user drags an object over a control.

Pascal

```
property OnDragOver;
```

C++

```
__property OnDragOver;
```

Description

Use an OnDragOver event to signal that the control can accept a dragged object so the user can drop or dock it.

Within the OnDragOver event handler, change the Accept parameter to false to reject the dragged object. Leave Accept as true to allow the user to drop or dock the dragged object on the control.

To change the shape of the cursor, indicating that the control can accept the dragged object, change the value of the DragCursor property for the control before the OnDragOver event occurs.

The Source is the object being dragged, the Sender is the potential drop or dock site, and X and Y are screen coordinates in pixels. The State parameter specifies how the dragged object is moving over the control.

Note: Within the OnDragOver event handler, the Accept parameter defaults to true. However, if an OnDragOver event handler is not supplied, the control rejects the dragged object, as if the Accept parameter were changed to false.

C++ Examples:

```
/*
This code is an OnDragOver event handler that won't allow a
label control to be dropped on a panel control and stops the
dragging of the label as soon as the user drags the label
onto the panel:
Note: Set the label's DragMode property to dmAutomatic.
*/
void __fastcall TForm1::FormDragDrop(TObject *Sender, TObject *Source, int X, int Y)

50.1.2.6.6 TValueListEditor.OnDrawCell Event

Occurs when a cell in the grid needs to be drawn.

Pascal

```
property OnDrawCell;
```

C++

```
__property OnDrawCell;
```

Description

Write an OnDrawCell event handler to draw the contents of all the cells in the grid. Draw on the cell using the methods of the Canvas property. The Rect parameter indicates the location of the cell on the canvas. The Col and Row parameters indicate the column and row indexes of the cell that should be drawn. The State parameter indicates whether the cell has input focus, whether the cell is selected, and whether the cell is a fixed (nonscrolling) cell.

If the OnDrawCell event handler is not assigned, all cells in the draw grid will appear empty. If the DefaultDrawing property is true, the draw grid paints the background color of the cell before the OnDrawCell event, and draws a focus rectangle around the selected cell after the OnDrawCell event handler finishes drawing the contents of the cell. If the DefaultDrawing property is false, the OnDrawCell event handler should paint the background of the cell and provide all visual indication of selection and focus.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}

void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
```

```
  must implemented to return true.
  }
  procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
    Rect: TRect; State: TGridDrawState);
  var
    index: Integer;
  begin
    index := ARow * DrawGrid1.ColCount + ACol;
    DrawGrid1.Canvas.Brush.Color := clWhite;
    DrawGrid1.Canvas.FillRect(Rect);
    if (gdFocused in State) then
    begin
      DrawGrid1.Canvas.DrawFocusRect(Rect);
      Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
    end;
    ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
  end;

  procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
    var CanSelect: Boolean);
  begin
    CanSelect:= True;
  end;

50.1.2.6.7 TValueListEditor.OnEditButtonClick Event

Occurs when the user click the ellipsis button on a cell in the values column or types Ctrl+Enter while focus is on a value cell with an ellipsis button.

Pascal

```
property OnEditButtonClick: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnEditButtonClick;
```

Description

Write (see page 3789) an OnEditButtonClick to display a dialog that lets users edit a value in the Values (see page 4865) column. This event only occurs for items for which the ItemProps (see page 4851) property has an EditStyle of esEllipsis.

In the event handler, you can use the Row property to identify the row that the user is editing. The event handler (or the dialog that the event handler displays) can use the Keys (see page 4851) property to identify the current key value, and use that to get and set the corresponding entry in the Values (see page 4865) property that is being edited.

50.1.2.6.9 TValueListEditor.OnEndDrag Event

Occurs when the dragging of an object ends, either by dropping the object or by canceling the dragging.

Pascal

```
property OnEndDrag;
```

C++

```
__property OnEndDrag;
```

Description

Use the OnEndDrag event handler to specify any special processing that occurs when dragging stops.

C++ Examples:

```
/*
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
*/
void __fastcall TForm1::Label1EndDrag(TObject *Sender, TObject *Target, int X,
      int Y)
{
  if (Sender->ClassNameIs("TLabel"))
  {
    AnsiString S = (dynamic_cast<TLabel *>(Sender))->Name + " was dropped and ";
    if (Target)
      S = S + "accepted!";
    else
      S = S + "rejected.";
    Status->Caption = S;
  }
}
```

Delphi Examples:

```
{
```

```
This code displays a message in a label named Status. The
message displayed depends on whether the dragged label
control was successfully dropped into and accepted by a
another control.
}
procedure TForm1.Label1EndDrag(Sender, Target: TObject; X, Y: Integer);
var
  S: string;
begin
  S := (Sender as TLabel).Name + ' was dropped... and ';
  if Target <> nil then
    S := S + 'accepted!'
  else
    S := S + 'rejected!';
  Status.Caption := S;
end;
```

50.1.2.6.10 TValueListEditor.OnEnter Event

Occurs when a control receives the input focus.

Pascal

```
property OnEnter;
```

C++

```
__property OnEnter;
```

Description

Use the OnEnter event handler to cause any special processing to occur when a control becomes active.

The OnEnter event does not occur when switching between forms or between another application and the application that includes the control.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnEnter event occurs for the container before the OnEnter event of the contained control.

Similarly, an OnExit event of the container occurs after the OnExit event of the control in a container when focus moves to another control outside the container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

C++ Examples:

```
/*
This example takes an edit control, a button, and a rich
edit control on a form.  When the user presses the button, a
Font dialog appears.  When the user clicks the Apply (not OK)
button in the Font dialog, the currently selected font is
```

```
applied to the active control. Clicking the button sets the
ActiveControl to the button.  That is why we need to save
the ActiveControl in a shared OnEnter procedure.  In the rich
edit, only the text selected converts.
*/

50.1.2.6.11 TValueListEditor.OnExit Event

Occurs when the input focus shifts away from one control to another.

Pascal

```
property OnExit;
```

C++

```
__property OnExit;
```

Description

Use the OnExit event handler to provide special processing when the control ceases to be active.

The OnExit event does not occur when switching between forms or between another application and your application.

When switching between controls in separate container controls such as the TPanel and the TGroupBox controls, an OnExit event occurs for the control inside the container before the OnExit event of the container.

Similarly, an OnEnter event of the container occurs before the OnEnter event of the control in a container when focus moves to a control inside a container.

For example, consider a form with an OK button and a group box that contains three radio buttons, where focus is currently on the OK button. When the user clicks one of the radio buttons, an OnExit event of the button occurs, followed by an OnEnter event on the group box, and finally an OnEnter event on the radio button that was clicked. If the user then clicks on the OK button, an OnExit event for the radio button occurs followed by an OnExit event for the group box, and then the button's OnEnter event occurs.

Note: In some control classes the ActiveControl property updates before the OnExit event occurs.

C++ Examples:

```
/*
This example uses an edit box and a memo control on a form.
When either the edit box or the memo is the active control,
it is colored yellow. When the active control becomes
inactive, the color of the control returns to the Windows
system color for a window.  These event handlers could also
be shared.
*/
void __fastcall TForm1::Edit1Enter(TObject *Sender)
{
  Edit1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Edit1Exit(TObject *Sender)
{
  Edit1->Color = clWindow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Enter(TObject *Sender)
{
  Memo1->Color = clYellow;
}
//---------------------------------------------------------------------------
void __fastcall TForm1::Memo1Exit(TObject *Sender)
{
  Memo1->Color = clWindow;
}
```

Delphi Examples:

```
{
This example uses three mask edit components on a form,
where the third mask edit box is set to be read only.
When the application runs, it initializes the mask edit boxes
```

```
  to contain the empty string, to use the Courier font and to
  use a particular mask, corresponding to IP address coding convetions.
  The mask edit boxes display the IP address, the subnet mask
  and the subnet address correspondingly. When the user exits the
  subnet mask edit box, the subnet address is automatically calculated
  using bit-wise AND operations and displayed in the third mask edit box.
  An additional test is made to assure that the values in the IP address
  and in the subnet mask are in the interval from 0 to 255,
  as this validation test cannot be accomplished
  using the edit mask property alone.
  }
  procedure TForm1.FormCreate(Sender: TObject);
  begin
    { initialize the maskedit boxes to contain the empty string }
    MaskEdit1.Text := '';
    MaskEdit2.Text := '';
    MaskEdit3.Text := '';

    { use the Courier font in the maskedit boxes }
    MaskEdit1.Font.Name := 'Courier';
    MaskEdit2.Font.Name := 'Courier';
    MaskEdit3.Font.Name := 'Courier';

    {
    initialize the mask of each maskedit box
    according to IP address coding conventions
    }
    MaskEdit1.EditMask := '!099.099.099.099;1; ';
    MaskEdit2.EditMask := '!099.099.099.099;1; ';
    MaskEdit3.EditMask := '!099.099.099.099;1; ';

    MaskEdit2.OnExit := MaskEdit2Exit;
  end;

  procedure TForm1.MaskEdit2Exit(Sender: TObject);
  var
    net1, net2, host1, host2,
    netmask1, netmask2, hostmask1, hostmask2,
    sub_net1, sub_net2, sub_host1, sub_host2: Integer;

    IP, mask: String;

  begin
    // extract the net and host address from the IP
    IP := MaskEdit1.Text;
    net1 := StrToInt(TrimRight(Copy(IP, 0, 3)));
    net2 := StrToInt(TrimRight(Copy(IP, 5, 3)));
    host1 := StrToInt(TrimRight(Copy(IP, 9, 3)));
    host2 := StrToInt(TrimRight(Copy(IP, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((net1 < 0) Or (net1 > 255) Or
        (net2 < 0) Or (net2 > 255) Or
        (host1 < 0) Or (host1 > 255) Or
        (host2 < 0) Or (host2 > 255)) then
      raise EArgumentException.Create('Not a valid IP address.');

    // extract the net and host mask from the subnet mask
    mask := MaskEdit2.Text;
    netmask1 := StrToInt(TrimRight(Copy(mask, 0, 3)));
    netmask2 := StrToInt(TrimRight(Copy(mask, 5, 3)));
    hostmask1 := StrToInt(TrimRight(Copy(mask, 9, 3)));
    hostmask2 := StrToInt(TrimRight(Copy(mask, 13, 3)));

    // a range test that you cannot validate through edit masks
    if ((netmask1 < 0) Or (netmask1 > 255) Or
```

```
        (netmask2 < 0) Or (netmask2 > 255) Or
        (hostmask1 < 0) Or (hostmask1 > 255) Or
        (hostmask2 < 0) Or (hostmask2 > 255)) then
      raise EArgumentException.Create('Not a valid subnet mask.');

    // compute the subnet address using bit-wise AND
    sub_net1 := net1 And netmask1;
    sub_net2 := net2 And netmask2;
    sub_host1 := host1 And hostmask1;
    sub_host2 := host2 And hostmask2;

    // display the subnet address
    MaskEdit3.Text :=
      IntToStr(sub_net1) + '.' + IntToStr(sub_net2) + '.' +
      IntToStr(sub_host1) + '.' + IntToStr(sub_host2);
  end;
  {
  This example uses an edit box and a memo control on a form.
  When either the edit box or the memo is the active control,
  it is colored yellow. When the active control becomes
  inactive, the color of the control returns to the Windows
  system color for a window.  These event handlers could also
  be shared.
  }
  procedure TForm1.Edit1Enter(Sender: TObject);
  begin
    Edit1.Color := clYellow;
  end;

  procedure TForm1.Edit1Exit(Sender: TObject);
  begin
    Edit1.Color := clWindow;
  end;

  procedure TForm1.Memo1Enter(Sender: TObject);
  begin
    Memo1.Color := clYellow;
  end;

  procedure TForm1.Memo1Exit(Sender: TObject);
  begin
    Memo1.Color := clWindow;
  end;
```

ActiveControl

50.1.2.6.12 TValueListEditor.OnGetEditMask Event

Occurs when the in-place editor requests an edit mask.

Pascal

```
property OnGetEditMask;
```

C++

```
__property OnGetEditMask;
```

Description

Write an OnGetEditMask event handler to provide the in-place editor with an edit mask that describes the valid input strings a user can type into a cell. Set the Value parameter to the string that describes the edit mask for the cell specified by the ACol and

ARow parameters. If the cell does not have an edit mask, set the Value parameter to an empty string.

OnGetEditMask does not occur unless the Options property includes goEditing.

C++ Examples:

```
/*
This example specifies an edit mask in a string grid to
limit the cells that contain telephone numbers, as indicated
by a label cell in the first row.  Include goEditing in the
TStringGrid Options property.  Set the title of one of the
columns to 'Phone Number'.  Set the DefaultColWidth large
enough to see a phone number.
*/
void __fastcall TForm1::FormCreate(TObject *Sender)
{
  StringGrid1->Cells[2][0] = "Phone Number";
}

void __fastcall TForm1::StringGrid1GetEditMask(TObject *Sender, int ACol, int ARow,
          UnicodeString &Value)
{
  if (StringGrid1->Cells[ACol][0] == "Phone Number")
    Value =  "!\(999\)000-0000;1";
}
```

Delphi Examples:

```
{
This example specifies an edit mask in a string grid to
limit the cells that contain telephone numbers, as indicated
by a label cell in the first row.  Include goEditing in the
TStringGrid Options property.  Set the title of one of the
columns to 'Phone Number'.  Set the DefaultColWidth large
enough to see a phone number.
}
procedure TForm1.FormCreate(Sender: TObject);
begin
  StringGrid1.Cells[2, 0]:= 'Phone Number';
end;

procedure TForm1.StringGrid1GetEditMask(Sender: TObject; ACol, ARow: Longint; var Value:
string);
begin
  if StringGrid1.Cells[ACol, 0] = 'Phone Number' then
    Value :=  '!\(999\)000-0000;1';
end;
```

Options

EditMask

50.1.2.6.13 TValueListEditor.OnGetEditText Event

Occurs when the in-place editor requests the value of a cell.

Pascal

```
property OnGetEditText;
```

C++

```
__property OnGetEditText;
```

Description

Write an OnGetEditText event handler to provide the in-place editor with a string representing the contents of the cell. Set the Value parameter to the string for the cell specified by the ACol and ARow parameters. When the cell enters edit mode, the contents of the cell are drawn as the Value string returned by the OnGetEditText event handler. This image need not match the appearance of the cell when it is not in edit mode, which is drawn using the OnDrawCell event handler.

OnGetEditText does not occur unless the Options property includes goEditing.

C++ Examples:

```
/*
The following code lowercases the text for a string grid
cell when the user begins to edit it.
*/
void __fastcall TForm1::StringGrid1GetEditText(TObject *Sender, int ACol, int ARow,
          UnicodeString &Value)
{
  Value = AnsiLowerCase(Value);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  StringGrid1->Cells[2][0] = "Phone Number";
  StringGrid1->Cells[2][1] = "(408)984-1234";
  StringGrid1->Cells[2][2] = "(415)434-6789";
  StringGrid1->Cells[2][3] = "(650)696-2345";
  StringGrid1->Cells[2][4] = "(831)431-2422";
  StringGrid1->Cells[2][5] = "(408)506-9876";
  StringGrid1->Cells[1][0] = "Name";
  StringGrid1->Cells[1][1] = "Clem Myers";
  StringGrid1->Cells[1][2] = "Ed Satchel";
  StringGrid1->Cells[1][3] = "Johanna Mills";
  StringGrid1->Cells[1][4] = "Stella Gables";
  StringGrid1->Cells[1][5] = "Ted Thompson";
  StringGrid1->Cells[3][0] = "POB";
  StringGrid1->Cells[3][1] = "Detroit";
  StringGrid1->Cells[3][2] = "Memphis";
  StringGrid1->Cells[3][3] = "New Orleans";
  StringGrid1->Cells[3][4] = "Lander";
  StringGrid1->Cells[3][5] = "Round Pond";
  StringGrid1->Cells[4][0] = "State";
  StringGrid1->Cells[4][1] = "Michigan";
  StringGrid1->Cells[4][2] = "Tennessee";
  StringGrid1->Cells[4][3] = "Lousiana";
  StringGrid1->Cells[4][4] = "Wyoming";
  StringGrid1->Cells[4][5] = "Maine";
  StringGrid1->Cells[5][0] = "Last Graduated";
  StringGrid1->Cells[5][1] = "Michigan State";
  StringGrid1->Cells[5][2] = "Univ-> Colorado";
  StringGrid1->Cells[5][3] = "Univ-> Washington";
  StringGrid1->Cells[5][4] = "USC";
  StringGrid1->Cells[5][5] = "Bowdoin";
}
```

Delphi Examples:

```
{
The following code lowercases the text for a string grid
cell when the user begins to edit it.
}
procedure TForm1.StringGrid1GetEditText(Sender: TObject; ACol, ARow: Longint; var Value:
string);
begin
  Value := AnsiLowerCase(Value);
end;
```

OnSetEditText

50.1.2.6.14 TValueListEditor.OnGetPickList Event

Supplies a pick list for values associated with a particular key.

Pascal

```
property OnGetPickList: TGetPickListEvent;
```

C++

```
__property TGetPickListEvent OnGetPickList;
```

Description

Write (see page 3789) an OnGetPickList event handler to provide a drop-down list of values for specific names from the first (key) column. OnGetPickList is called when the value column gets focus and the name (key) column contains the string specified by KeyName.

If the ItemProps (see page 4851) property has an EditStyle of esPickList for this item, The Values (see page 4865) parameter of the event handler is initialized to the value of its PickList property for this item. Otherwise, Values (see page 4865) is initialized to an empty list. In either case, the event handler can change the list of values that appear in the drop-down pick list.

If the OnGetPickList event handler exits with a non-empty string list as the value of the Values (see page 4865) parameter, a drop-down arrow appears in the value column. The user can click this arrow button to display the pick list you supplied as the value of Values (see page 4865). This makes the Value column behave like a drop-down combo box: the user can select items from the list or type in an entirely different value.

50.1.2.6.15 TValueListEditor.OnKeyDown Event

Occurs when a user presses any key while the control has focus.

Pascal

```
property OnKeyDown;
```

C++

```
__property OnKeyDown;
```

Description

Use the OnKeyDown event handler to specify special processing to occur when a key is pressed. The OnKeyDown handler can respond to keyboard keys, including function keys and keys combined with the `Shift`, `Alt`, and `Ctrl` keys, and pressed mouse

buttons.

Note: TCheckBox does not fire OnKeyDown events for arrow keys.

The TKeyEvent type points to a method that handles keyboard events.

The Key parameter is the key on the keyboard. For non-alphanumeric keys, use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
/*
The following code aborts a print job if the user presses

OnKeyPress

OnKeyUp

50.1.2.6.16 TValueListEditor.OnKeyPress Event

Occurs when a key is pressed.

Pascal

```
property OnKeyPress;
```

C++

```
__property OnKeyPress;
```

Description

Use the OnKeyPress event handler to make something happen as a result of a single character key press.

The Key parameter in the OnKeyPress event handler is of type Char; therefore, the OnKeyPress event registers the ASCII character of the key pressed. Keys that don't correspond to an ASCII Char value (Shift or F1, for example) don't generate an OnKeyPress event. Key combinations (such as Shift+A), generate only one OnKeyPress event (for this example, Shift+A results in a Key value of "A" if Caps Lock is off). To respond to non-ASCII keys or key combinations, use the OnKeyDown or OnKeyUp event handlers.

An application gets Windows WM_KEYDOWN messages for all keys when the user presses a key. These messages indirectly fire the OnKeyDown event. If you set the Key to 0 there you prevent only any further processing of this message. But for keys that generate characters Windows also produces WM_CHAR. At the time your OnKeyDown event fires, the WM_CHAR message for the key will already be in the message queue. Setting Key to 0 does not stop it from being delivered, so it fires the OnKeyPress event. You must set the Key to #0 to prevent the control from intercepting the WM_CHAR message.

This method of organizing key processing has advantages. Code that only deals with characters, including control characters like #13 for carriage return, #3 for Ctrl-C and so on, should go into the OnKeyPress event. Code that deals with keys that do not generate characters should be put into the OnKeyDown event.

C++ Examples:

```
/*
This event handler displays a message dialog box specifying
which key was pressed:
*/
```

```
void __fastcall TForm1::FormKeyPress(TObject *Sender, char &Key)
{
  char keyString[25];
  keyString[0] = Key;
  strcpy(&keyString[1], " Was Pressed");
  TMsgDlgButtons() << mbOK;
  MessageDlg(AnsiString(keyString), TMsgDlgType(mtInformation), TMsgDlgButtons() << mbOK, 0);
}
```

Delphi Examples:

```
{
This event handler displays a message dialog box specifying
which key was pressed:
}
procedure TForm1.FormKeyPress(Sender: TObject; var Key: Char);
begin
  MessageDlg(Key + ' has been pressed', mtInformation, [mbOK], 0)
end;
```

OnKeyDown

OnKeyUp

KeyPreview

50.1.2.6.17 TValueListEditor.OnKeyUp Event

Occurs when the user releases a key that has been pressed.

Pascal

```
property OnKeyUp;
```

C++

```
__property OnKeyUp;
```

Description

Use the OnKeyUp event handler to provide special processing that occurs when a key is released. The OnKeyUp handler can respond to all keyboard keys, including function keys and keys combined with the Shift, Alt, and Ctrl keys.

The TKeyEvent type points to a method that handles keyboard events. The Key parameter is the key on the keyboard. For non-alphanumeric keys, you must use virtual key codes to determine the key pressed. For more information, see Virtual Key codes.

The Shift parameter indicates whether the Shift, Alt, or Ctrl keys are combined with the keystroke.

C++ Examples:

```
/*
This example changes a form's color to aqua when the user
presses the F1 key, even when a control on the form has the
focus. When the user releases the key, the form returns to
its original color.  Set the KeyPreview on the form to True.
Set the OnKeyDown event to FormKeyDown and set the OnKeyUp
event to FormKeyUp.  Set the KeyPreview on the form to True.
Behavior is dependent on keyboard driver(USB, serial, etc).
*/
void __fastcall TForm1::FormKeyDown(TObject *Sender, WORD &Key,
      TShiftState Shift)
{
  if (Key == VK_F1)
  {
```

```
    FormColor = Form1->Color;
    Form1->Color = clAqua;
    if (ComboBox1->Text == "KeyDown")
      ComboBox1->Text = "KeyDown2";
    else
      ComboBox1->Text = "KeyDown";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}

void __fastcall TForm1::FormKeyUp(TObject *Sender, WORD &Key, TShiftState Shift)
{
  if (Key == VK_F1)
  {
    Form1->Color = FormColor;
    if (ComboBox1->Text == "KeyUp")
      ComboBox1->Text = "KeyUp2";
    else
      ComboBox1->Text = "KeyUp";
    Form1->Refresh();
    Memo1->Lines->Add(ComboBox1->Text);
  }
}
```

Delphi Examples:

OnKeyDown

OnKeyPress

50.1.2.6.18 TValueListEditor.OnMouseActivate Event

Occurs when the user presses a mouse button with the mouse pointer over a control and the parent form is not active.

Pascal

```
property OnMouseActivate;
```

C++

```
__property OnMouseActivate;
```

Description

Use the OnMouseActivate event handler to implement any special processing that should occur as a result of pressing a mouse button on a control when the parent top-level form is not active.

The event type is:

```
TMouseActivateEvent = procedure (Sender: TObject; Button: TMouseButton; ShiftState:
TShiftState;
X, Y: Integer; HitTest: Integer; var MouseActivate: TMouseActivate) of object;
```

When you click on a control and the parent top-level form is not active, this event fires on the control that the mouse cursor is over. MouseActivate is a protected virtual function in TControl. MouseActivate can be overridden in custom control descendants to provide special built-in processing of the OnMouseActivate events. If you leave the default value of MouseActivate as maDefault, the parent control fires the OnMouseActivate event and repeats the process all the way up to the top-level form. If no control in the chain sets the value of MouseActivate, the behavior is the same as if a control set TMouseActivate to maActivate. At any point, a control can set the value of TMouseActivate and the parent processing stops.

Some controls set focus to themselves when they get a button down message so, in some cases, setting maNoActivate appears to have no effect. For instance, a TButton control sets focus to itself in the WM_LBUTTONDOWN message regardless of whether or not TMouseActivate is set to maNoActivate. In this case, setting maNoActivateAndEat will work because the top-level form is not activated and the WM_LBUTTONDOWN message is suppressed.

The HitTest parameter is the hit test value obtained from the WM_NCHITTEST message. See Windows.pas for valid values and their meanings. In most cases this value will be HTCLIENT, which means that the user clicked in the client area of a control. However, in the case of a top-level form, this can take other values such as HTCAPTION, or HTBOTTOM. This allows the code to decide which value to set for MouseActivate, based on the HitTest code. For example, the following code in the OnMouseActivate event handler for a TForm forces the user to click into a non-client area to activate the form:

```
if HitTest = HTCLIENT then
    MouseActivate := maNoActivateAndEat;
```

Even though this event is tied to how Windows processes WM_MOUSEACTIVATE, the actual handling of the message is done at the TControl level, which is the point in the VCL hierarchy where the control has no window handle. The OnMouseActivate event is then simulated since the all TControl descendants also have OnMouseDown, OnMouseMove, and OnMouseUp events. This information is applicable to both VCL Win32 and VCL.NET.

MouseCapture

50.1.2.6.19 TValueListEditor.OnMouseDown Event

Occurs when the user presses a mouse button with the mouse pointer over a control.

Pascal

```
property OnMouseDown;
```

C++

```
__property OnMouseDown;
```

Description

Use the OnMouseDown event handler to implement any special processing that should occur as a result of pressing a mouse button.

The OnMouseDown event handler can respond to left, right, or center mouse button presses and shift key plus mouse-button combinations. Shift keys are the Shift, Ctrl, and Alt keys. X and Y are the pixel coordinates of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150
before running this example).  When the user presses a mouse
button, moves the mouse, and releases the mouse button, a
rectangle is drawn on the form. When the mouse button is
released, the rectangle appears on the form's canvas. Its
top-left and bottom-right corners are defined by the
location of the mouse pointer when the user pressed and
released the mouse button.  While the user drags the mouse,
the location of the top, left, bottom, and right sides of
the rectangle are displayed in the status bar.
*/
int StartX, StartY; // Declare at the top of the form's unit
// Use this code as the OnMouseDown event handler of the form:
void __fastcall TForm1::FormMouseDown(TObject *Sender, TMouseButton Button, TShiftState Shift,

50.1.2.6.20 TValueListEditor.OnMouseEnter Event

Occurs when the user moves the mouse into a control.

Pascal

```
property OnMouseEnter;
```

C++

```
__property OnMouseEnter;
```

Description

Use the OnMouseEnter event handler to implement any special processing that should occur as a result of moving the mouse into a control when the parent top-level form is not active.

50.1.2.6.21 TValueListEditor.OnMouseLeave Event

Occurs when the user moves the mouse outside of a control.

Pascal

```
property OnMouseLeave;
```

C++

```
__property OnMouseLeave;
```

Description

Use the OnMouseLeave event handler to implement any special processing that should occur as a result of moving the mouse outside of a control when the parent top-level form is not active.

50.1.2.6.22 TValueListEditor.OnMouseMove Event

Occurs when the user moves the mouse pointer while the mouse pointer is over a control.

Pascal

```
property OnMouseMove;
```

C++

```
__property OnMouseMove;
```

Description

Use the OnMouseMove event handler to respond when the mouse pointer moves after the control has captured the mouse.

Use the Shift parameter of the OnMouseDown event handler, to determine to the state of the shift keys and mouse buttons. Shift keys are the Shift, Ctrl, and Alt keys or shift key-mouse button combinations. X and Y are pixel coordinates of the new location of the mouse pointer in the client area of the Sender.

C++ Examples:

```
/*
The following example requires a form with a four-paneled
status bar.  (Set the Width of the status panels to 150

      begin
      StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(StartY);
```

```
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(Y);
        end
      else
        begin
        StatusBar1.Panels[0].Text := 'Top: ' + IntToStr(Y);
        StatusBar1.Panels[2].Text := 'Bottom: ' + IntToStr(StartY);
        end;
      if X > StartX then
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(StartX);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(X);
        end
      else
        begin
        StatusBar1.Panels[1].Text := 'Left: ' + IntToStr(X);
        StatusBar1.Panels[3].Text := 'Right: ' + IntToStr(StartX);
        end;
    end;
  end;
```

50.1.2.6.24 TValueListEditor.OnMouseWheelDown Event

Occurs when the mouse wheel is rotated downward.

Pascal

```
property OnMouseWheelDown;
```

C++

```
__property OnMouseWheelDown;
```

Description

Write code in the OnMouseWheelDown event handler to perform actions when the mouse wheel is rotated downward. OnMouseWheelDown occurs only if the message is not already handled in an OnMouseWheel event handler.

See Also

OnMouseWheel

OnMouseWheelUp

50.1.2.6.25 TValueListEditor.OnMouseWheelUp Event

Occurs when the mouse wheel is rotated upward.

Pascal

```
property OnMouseWheelUp;
```

C++

```
__property OnMouseWheelUp;
```

Description

Write code in the OnMouseWheelUp event handler to perform actions when the mouse wheel is rotated upward. OnMouseWheelUp occurs only if the message is not already handled in an OnMouseWheel event handler.

OnMouseWheelDown

OnMouseWheel

50.1.2.6.26 TValueListEditor.OnRowMoved Event

Occurs immediately after the position of a row changes.

Pascal

```
property OnRowMoved;
```

C++

```
__property OnRowMoved;
```

Description

Write an OnRowMoved event handler to provide special processing whenever a row in the grid changes position. Rows can be moved programmatically or by user manipulation. OnRowMoved does not occur unless the Options property includes goRowMoving.

C++ Examples:

```
/*
The following code displays the number of rows a row was
moved in the first cell of the row.  To move rows in a
TStringGrid, goRowMoving must be included in the Options property.
*/
void __fastcall TForm1::StringGrid1RowMoved(TObject *Sender, int FromIndex, int ToIndex)

{
  int delta = (FromIndex > ToIndex) ? (FromIndex-ToIndex) : (ToIndex-FromIndex);
  StringGrid1->Cells[0][ToIndex] = IntToStr(delta);
}

void __fastcall TForm1::FormCreate(TObject *Sender)
{
  StringGrid1->Cells[2][0] = "Phone Number";
  StringGrid1->Cells[2][1] = "(408)984-1234";
  StringGrid1->Cells[2][2] = "(415)434-6789";
  StringGrid1->Cells[2][3] = "(650)696-2345";
  StringGrid1->Cells[2][4] = "(831)431-2422";
  StringGrid1->Cells[2][5] = "(408)506-9876";
  StringGrid1->Cells[1][0] = "Name";
  StringGrid1->Cells[1][1] = "Clem Myers";
  StringGrid1->Cells[1][2] = "Ed Satchel";
  StringGrid1->Cells[1][3] = "Johanna Mills";
  StringGrid1->Cells[1][4] = "Stella Gables";
  StringGrid1->Cells[1][5] = "Ted Thompson";
  StringGrid1->Cells[3][0] = "POB";
  StringGrid1->Cells[3][1] = "Detroit";
  StringGrid1->Cells[3][2] = "Memphis";
  StringGrid1->Cells[3][3] = "New Orleans";
  StringGrid1->Cells[3][4] = "Lander";
  StringGrid1->Cells[3][5] = "Round Pond";
  StringGrid1->Cells[4][0] = "State";
  StringGrid1->Cells[4][1] = "Michigan";
  StringGrid1->Cells[4][2] = "Tennessee";
  StringGrid1->Cells[4][3] = "Lousiana";
  StringGrid1->Cells[4][4] = "Wyoming";
  StringGrid1->Cells[4][5] = "Maine";
  StringGrid1->Cells[5][0] = "Last Graduated";
  StringGrid1->Cells[5][1] = "Michigan State";
```

```
  StringGrid1->Cells[5][2] = "Univ-> Colorado";
  StringGrid1->Cells[5][3] = "Univ-> Washington";
  StringGrid1->Cells[5][4] = "USC";
  StringGrid1->Cells[5][5] = "Bowdoin";
}
```

Delphi Examples:

```
{
The following code displays the number of rows a row was
moved in a label.  To move rows in a TStringGrid, goRowMoving
must be included in the Options property.
}
procedure TForm1.StringGrid1RowMoved(Sender: TObject; FromIndex, ToIndex: Longint);
begin
  Label1.Caption := IntToStr(Abs(FromIndex-ToIndex));
end;
```

OnColumnMoved

Options

50.1.2.6.27 TValueListEditor.OnSelectCell Event

Occurs before a cell in the grid is selected.

Pascal

```
property OnSelectCell;
```

C++

```
__property OnSelectCell;
```

Description

Write an OnSelectCell event handler to specify whether any particular cell in the grid can be selected. The Col and Row parameters indicate the column and row indexes of the cell that is about to be selected. Set the CanSelect parameter to false to prevent the cell being selected.

C++ Examples:

```
/*
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
*/
void __fastcall TForm1::DrawGrid1DrawCell(
  TObject *Sender, int ACol, int ARow, TRect &Rect, TGridDrawState State)
{
  long index = ARow * DrawGrid1->ColCount + ACol;
  DrawGrid1->Canvas->Brush->Color = clBackground;
  DrawGrid1->Canvas->FillRect(Rect);
  if (State.Contains(gdFocused))
  {
    DrawGrid1->Canvas->DrawFocusRect(Rect);
    Label1->Caption = "Cell " + IntToStr(int(index)) + " has the focus.";
  }
  ImageList1->Draw(
    DrawGrid1->Canvas, Rect.Left, Rect.Top, index, True);
}
```

```
void __fastcall TForm1::DrawGrid1SelectCell(TObject *Sender, int ACol, int ARow,
      bool &CanSelect)
{
  CanSelect= True;
}
/*
The following code ensures that the user cannot select a cell
unless it is empty.
*/
void __fastcall TForm1::StringGrid1SelectCell(TObject *Sender, int ACol, int ARow,
          bool &CanSelect)
{
  CanSelect = (StringGrid1->Cells[ACol][ARow]== "");
}
```

Delphi Examples:

```
{
The following code uses the bitmaps in an image list
component to draw the contents of each cell in a draw grid.
It draws a focus rectangle around the cell that has focus.
goDrawFocusSelect in the DrawGrid Options parameter must be
True to set focus on a cell.  The ImageList Draw method must
be called after DrawFocusRect. The OnSelectCell event handler
must implemented to return true.
}
procedure TForm1.DrawGrid1DrawCell(Sender: TObject; ACol, ARow: Integer;
  Rect: TRect; State: TGridDrawState);
var
  index: Integer;
begin
  index := ARow * DrawGrid1.ColCount + ACol;
  DrawGrid1.Canvas.Brush.Color := clWhite;
  DrawGrid1.Canvas.FillRect(Rect);
  if (gdFocused in State) then
  begin
    DrawGrid1.Canvas.DrawFocusRect(Rect);
    Label1.Caption:= 'Cell ' + InttoStr(index) + ' has the focus.';
  end;
  ImageList1.Draw(DrawGrid1.Canvas,Rect.Left,Rect.Top,index, True);
end;

procedure TForm1.DrawGrid1SelectCell(Sender: TObject; ACol, ARow: Integer;
  var CanSelect: Boolean);
begin
  CanSelect:= True;
end;
{
The following code ensures that the user cannot select a cell
unless it is empty.
}
procedure TForm1.StringGrid1SelectCell(Sender: TObject; ACol, ARow: Longint; var CanSelect:
Boolean);
begin
  CanSelect := (StringGrid1.Cells[ACol, ARow]='')
end;
```

50.1.2.6.28 TValueListEditor.OnSetEditText Event

Occurs when the user edits the value of a cell.

Pascal

```
property OnSetEditText;
```

C++

```
__property OnSetEditText;
```

Description

Write an OnSetEditText event handler to perform any special processing of the text edited by the user in an in-place editor. For example, use the OnSetEditText event to retrieve and store the value of a cell so that it can be displayed in an OnDrawCell event handler. OnSetEditText occurs every time the user changes the text.

The Value parameter is the new value for the cell specified by the ACol and ARow parameters.

OnSetEditText does not occur unless the Options property includes goEditing.

OnDrawCell

OnGetEditText

Options

50.1.2.6.29 TValueListEditor.OnStartDock Event

Occurs when the user begins to drag a control with a DragKind of dkDock.

Pascal

```
property OnStartDock;
```

C++

```
__property OnStartDock;
```

Description

Use the OnStartDock event handler to implement special processing when the user starts a drag-and-dock operation by dragging the control.

The OnStartDock event handler can create a TDragDockObjectEx object for the DragObject parameter to specify the appearance of the dragging rectangle and how the dragged control interacts with potential docking sites. If you return TDragDockObjectEx as the drag object, there is no need to call the Free method for the DragObject when dragging is over. If you use TDragDockObject, your application is responsible for freeing the drag object.

If the OnStartDock event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragDockObject object is automatically created.

Note: This information applies to Win32 applications only.

See Also

OnEndDock

TDragDockObjectEx

DragKind

OnDragOver

OnDockDrop

50.1.2.6.30 TValueListEditor.OnStartDrag Event

Occurs when the user begins to drag the control or an object it contains by left-clicking on the control and holding the mouse button down.

Pascal

```
property OnStartDrag;
```

C++

```
__property OnStartDrag;
```

Description

Use the OnStartDrag event handler to implement special processing when the user starts to drag the control or an object it contains. OnStartDrag only occurs if DragKind is dkDrag.

Sender is the control that is about to be dragged, or that contains the object about to be dragged.

The OnStartDrag event handler can create a TDragControlObjectEx instance for the DragObject parameter to specify the drag cursor, or, optionally, a drag image list. If you create a TDragControlObjectEx instance, there is no need to call the Free method for the DragObject when dragging is over. If you create, instead, a TDragControlObject instance, your application is responsible for freeing the drag object instance.

If the OnStartDrag event handler sets the DragObject parameter to nil (Delphi) or NULL (C++), a TDragControlObject object is automatically created and dragging begins on the control itself.

Note: On some controls, such as TRichEdit, the underlying Windows control handles internal drag operations. For these controls, there are no OnStartDrag or OnEndDrag events for drag operations within the control.

50.1.2.6.31 TValueListEditor.OnStringsChange Event

Occurs immediately after the names or values in the string list change.

Pascal

```
property OnStringsChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnStringsChange;
```

Description

Write (see page 3789) an OnStringsChange event handler to respond when the strings in the list change. For example, you can use the OnStringsChange event to update your display to reflect the new values of the strings in the value list editor.

OnStringsChange occurs after the change is complete. The properties of the value list editor reflect the new values of the strings.

See Also

OnStringsChanging (see page 4910)

Strings (see page 4863)

OnSetEditText

50.1.2.6.32 TValueListEditor.OnStringsChanging Event

Occurs immediately before the names or values in the string list change.

Pascal

```
property OnStringsChanging: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnStringsChanging;
```

Description

Write (see page 3789) an OnStringsChanging event handler to prepare for changes in the list of strings. For example, you can use the OnStringsChanging event to disable repaints until the OnStringsChange (see page 4909) event when the list has finished changing..

OnStringsChanging occurs before the change occurs. The properties of the value list editor reflect the old values of the strings.

See Also

OnStringsChange (see page 4909)

Strings (see page 4863)

OnSetEditText

50.1.2.6.33 TValueListEditor.OnTopLeftChanged Event

Occurs immediately after the TopRow property or the LeftCol property changes.

Pascal

```
property OnTopLeftChanged;
```

C++

```
__property OnTopLeftChanged;
```

Description

Use OnTopLeftChanged to perform special processing when the non-fixed cells in the grid are scrolled.

See Also

LeftCol

TopRow

50.1.2.6.34 TValueListEditor.OnValidate Event

Occurs when focus shifts away from a cell in the value list editor.

Pascal

```
property OnValidate: TOnValidateEvent;
```

C++

```
__property TOnValidateEvent OnValidate;
```

Description

Write (see page 3789) an OnValidate event handler to validate any edits the user enters in a cell before focus leaves it. OnValidate gives applications an opportunity to provide more validation than the EditMask property of the corresponding TItemProp (see page 4808) object can supply.

OnValidate only occurs if the user edited the value of the cell that is about to lose focus. The OnValidate event handler can verify the value the user supplied, and if it is not acceptable, raise an exception.

50.1.3 TValueListStrings Class

Class Hierarchy

Pascal

```
TValueListStrings = class(TStringList);
```

C++

```
class TValueListStrings : public TStringList;
```

File

ValEdit

Description

This is class ValEdit.TValueListStrings.

50.1.3.1 TValueListStrings Members

The following tables list the members exposed by TValueListStrings.

Protected Methods

	Name	Description
	Changed (see page 4916)	This is Changed, a member of class TValueListStrings.
	Changing (see page 4916)	This is Changing, a member of class TValueListStrings.
	FindItemProp (see page 4918)	This is FindItemProp, a member of class TValueListStrings.
	InsertItem (see page 4918)	This is InsertItem, a member of class TValueListStrings.
	Put (see page 4919)	This is Put, a member of class TValueListStrings.

Protected Properties

	Name	Description
	UpdateCount (see page 4919)	Indicates the number of calls to BeginUpdate that have not been matched by a call to EndUpdate.

Public Methods

	Name	Description
	Assign (see page 4913)	Sets the strings in the list, and possibly associated objects, from a source object.
	Clear (see page 4916)	Deletes all the strings from the list.
	Create (see page 4912)	This is Create, a member of class TValueListStrings.
	CustomSort (see page 4916)	Sorts the strings in the list in a customized order.
	Delete (see page 4917)	Removes the string specified by the Index parameter.
	Destroy (see page 4912)	Destroys an instance of TStringList.
	Exchange (see page 4917)	Swaps the position of two strings in the list.
	KeyIsValid (see page 4918)	This is KeyIsValid, a member of class TValueListStrings.

Public Properties

	Name	Description
	ItemProps (see page 4919)	This is ItemProps, a member of class TValueListStrings.

50.1.3.2 TValueListStrings.Create Constructor

Pascal

```
constructor Create(AEditor: TValueListEditor); reintroduce;
```

C++

```
__fastcall TValueListStrings(TValueListEditor AEditor);
```

Description

This is Create, a member of class TValueListStrings.

50.1.3.3 TValueListStrings.Destroy Destructor

Destroys an instance of TStringList.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TValueListStrings();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TStringList reference is not nil and only then calls Destroy.

Destroy frees the memory allocated to hold the list of strings and object references before calling the inherited destructor.

See Also

System::TObject::Free (see page 3382)

50.1.3.4 TValueListStrings Methods

The methods of the TValueListStrings class are listed here.

Protected Methods

	Name	Description
	Changed (see page 4916)	This is Changed, a member of class TValueListStrings.
	Changing (see page 4916)	This is Changing, a member of class TValueListStrings.
	FindItemProp (see page 4918)	This is FindItemProp, a member of class TValueListStrings.
	InsertItem (see page 4918)	This is InsertItem, a member of class TValueListStrings.
	Put (see page 4919)	This is Put, a member of class TValueListStrings.

Public Methods

	Name	Description
	Assign (see page 4913)	Sets the strings in the list, and possibly associated objects, from a source object.
	Clear (see page 4916)	Deletes all the strings from the list.
	CustomSort (see page 4916)	Sorts the strings in the list in a customized order.
	Delete (see page 4917)	Removes the string specified by the Index parameter.
	Exchange (see page 4917)	Swaps the position of two strings in the list.
	KeyIsValid (see page 4918)	This is KeyIsValid, a member of class TValueListStrings.

50.1.3.4.1 TValueListStrings.Assign Method

Sets the strings in the list, and possibly associated objects, from a source object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use Assign to set the value of the TStrings object from another object. If Source is of type TStrings, the list is set to the list of the source TStrings object, and if associated objects are supported, any associated objects are copied from the Source as well.

If Source is not of type TStrings, the inherited Assign will set the value of the list from any object that supports TStrings in its AssignTo method.

C++ Examples:

```
/*
This example uses a tab control to display the contents of
several files. To run the example, place a tab control on a
form and add a memo control that fits into its client area.
Be sure to leave enough room for the tabs when they appear.
Then add an OpenDialog and a button to the form.  The
"Add a file" button adds a single file to the tabcontrol.
The "Assign files" button removes previous files and can be
used to assign multiple files.  To assign multiple files,
use CNTL Select or SHIFT Select to select files in the
OpenDialog.
*/
void __fastcall TForm1::Add_a_fileClick(TObject *Sender)
{
  OpenDialog1->Options << ofAllowMultiSelect << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
```

```
    int index = TabControl1->Tabs->Add(OpenDialog1->FileName);
    Memo1->Lines->LoadFromFile(TabControl1->Tabs->Strings[index]);
    TabControl1Change(Sender);
  }
}

void __fastcall TForm1::Assign_filesClick(TObject *Sender)
{
  OpenDialog1->Options << ofAllowMultiSelect << ofFileMustExist << ofHideReadOnly;
  if (OpenDialog1->Execute())
  {
    TabControl1->Tabs->Assign(OpenDialog1->Files);
    Memo1->Lines->LoadFromFile(TabControl1->Tabs->Strings[TabControl1->TabIndex]);
  }
}
/*
Place the following code in the tab control's OnChange event
handler:
*/
void __fastcall TForm1::TabControl1Change(TObject *Sender)
{
    Memo1->Lines->LoadFromFile(
      TabControl1->Tabs->Strings[TabControl1->TabIndex]);
}
/*
This example creates a stringlist, adds elements to it and
assigns the strings to items of a combo box.
*/

#include <memory>       //for STL auto_ptr class

void __fastcall TForm1::Button1Click(TObject *Sender)
{
  std::auto_ptr<TStrings> StringList(new TStringList());
  StringList->Add("This example uses A string List. ");
  StringList->Add("It is the easiest way to add strings");
  StringList->Add("to a combobox's list of strings. ");
  StringList->Add("Always remember TStrings is abstract,");
  StringList->Add("So create a TStringList instead.");
  ComboBox1->Width = 210;
  ComboBox1->Items->Assign(StringList.get());
  ComboBox1->ItemIndex = 0;
}
```

Delphi Examples:

```
{
This example uses a tab control to display the contents of
several files. To run the example, place a tab control on a
form and add a memo control that fits into its client area.
Be sure to leave enough room for the tabs when they appear.
Then add an OpenDialog and a button to the form.  The
"Add a file" button adds a single file to the tabcontrol.
The "Assign files" button removes previous files and can be
used to assign multiple files.  To assign multiple files,
use CNTL Select or SHIFT Select to select files in the
OpenDialog.
}
procedure TForm1.Add_a_fileClick(Sender: TObject);
var index : integer;
begin
  OpenDialog1.Options :=
    [ofAllowMultiSelect, ofFileMustExist, ofHideReadOnly];
  if OpenDialog1.Execute then
  begin
    index:= TabControl1.Tabs.Add(OpenDialog1.FileName);
    Memo1.Lines.LoadFromFile(TabControl1.Tabs[index]);
```

```
    TabControl1Change(Sender);
  end;
end;

procedure TForm1.Assign_filesClick(Sender: TObject);
var index : integer;
begin
  OpenDialog1.Options :=
    [ofAllowMultiSelect, ofFileMustExist, ofHideReadOnly];
  if OpenDialog1.Execute then
  begin
    TabControl1.Tabs.Assign(OpenDialog1.Files);
    Memo1.Lines.LoadFromFile(
      TabControl1.Tabs[TabControl1.TabIndex]);
  end;
end;

{
Place the following code in the tab control's OnChange event
handler:
}
procedure TForm1.TabControl1Change(Sender: TObject);
begin
  with TabControl1 do
    Memo1.Lines.LoadFromFile(Tabs[TabIndex]);
end;
{
This example creates a stringlist, adds elements to it and
assigns the strings to items of a combo box.
}
procedure TForm1.Button1Click(Sender: TObject);
var
  StringList: TStringList;
begin
  StringList := TStringList.Create;
  try
    with StringList do begin
      Add('This example uses A string List.');
      Add('It is the easiest way to add strings');
      Add('to a combobox''s list of strings.');
      Add('Always remember TStrings.Create method');
      Add('is abstract; So use TStringList.Create');
      Add('method instead.');
    end;
    with ComboBox1 do begin
      Width := 210;
      Items.Assign(StringList);
      ItemIndex := 0;
    end;
  finally
    StringList.free;
  end;
end;
```

50.1.3.4.2 TValueListStrings.Changed Method

Pascal

```
procedure Changed; override;
```

C++

```
virtual __fastcall Changed();
```

Description

This is Changed, a member of class TValueListStrings.

50.1.3.4.3 TValueListStrings.Changing Method

Pascal

```
procedure Changing; override;
```

C++

```
virtual __fastcall Changing();
```

Description

This is Changing, a member of class TValueListStrings.

50.1.3.4.4 TValueListStrings.Clear Method

Deletes all the strings from the list.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Call clear to empty the list of strings. All references to associated objects are also removed. However, the objects themselves are not freed.

See Also

Delete

Objects

Strings

50.1.3.4.5 TValueListStrings.CustomSort Method

Sorts the strings in the list in a customized order.

Pascal

```
procedure CustomSort(Compare: TStringListSortCompare); override;
```

C++

```
virtual __fastcall CustomSort(TStringListSortCompare Compare);
```

Description

Use CustomSort to sort the strings in the list, where the sort order is defined by the Compare parameter.

Supply a value for the Compare function that compares two strings in the string list. The List parameter provides access to the string list, while the Index1 and Index2 parameters identify the strings to be compared.

Do not pass nil (Delphi) or NULL (C++) as the value of the Compare parameter.

Note: You must explicitly call the CustomSort method. Setting the Sorted property only sorts strings using ANSI (Windows) or UTF-8 (Linux) order, as implemented in the Sort method.

See Also

Sort

Strings

Sorted

50.1.3.4.6 TValueListStrings.Delete Method

Removes the string specified by the Index parameter.

Pascal

```
procedure Delete(Index: Integer); override;
```

C++

```
virtual __fastcall Delete(int Index);
```

Description

Call Delete to remove a single string from the list. If an object is associated with the string, the reference to the object is removed as well. Index gives the position of the string, where 0 is the first string, 1 is the second string, and so on.

See Also

Add

AddObject

Clear

IndexOf

InsertObject

Objects

Strings

50.1.3.4.7 TValueListStrings.Exchange Method

Swaps the position of two strings in the list.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); override;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

Call Exchange to rearrange the strings in the list. The strings are specified by their index values in the Index1 and Index2 parameters. Indexes are zero-based, so the first string in the list has an index value of 0, the second has an index value of 1, and so on.

If either string has an associated object, Exchange changes the index of the object as well.

Warning: Do not call Exchange on a sorted list except to swap two identical strings with different associated objects. Exchange does not check whether the list is sorted, and can destroy the sort order of a sorted list.

50.1.3.4.8 TValueListStrings.FindItemProp Method

Pascal

```
function FindItemProp(const KeyOrIndex: Variant; Create: Boolean = False): TItemProp;
```

C++

```
__fastcall TItemProp FindItemProp(const Variant KeyOrIndex, Boolean Create = False);
```

Description

This is FindItemProp, a member of class TValueListStrings.

50.1.3.4.9 TValueListStrings.InsertItem Method

Pascal

```
procedure InsertItem(Index: Integer; const S: string; AObject: TObject); override;
```

C++

```
virtual __fastcall InsertItem(int Index, const UnicodeString S, TObject * AObject);
```

Description

This is InsertItem, a member of class TValueListStrings.

50.1.3.4.10 TValueListStrings.KeyIsValid Method

Pascal

```
function KeyIsValid(const Key: string; RaiseError: Boolean = True): Boolean;
```

C++

```
__fastcall Boolean KeyIsValid(const UnicodeString Key, Boolean RaiseError = True);
```

Description

This is KeyIsValid, a member of class TValueListStrings.

50.1.3.4.11 TValueListStrings.Put Method

Pascal

```
procedure Put(Index: Integer; const S: String); override;
```

C++

```
virtual __fastcall Put(int Index, const UnicodeString S);
```

Description

This is Put, a member of class TValueListStrings.

50.1.3.5 TValueListStrings Properties

The properties of the TValueListStrings class are listed here.

Protected Properties

	Name	Description
	UpdateCount (see page 4919)	Indicates the number of calls to BeginUpdate that have not been matched by a call to EndUpdate.

Public Properties

	Name	Description
	ItemProps (see page 4919)	This is ItemProps, a member of class TValueListStrings.

50.1.3.5.1 TValueListStrings.ItemProps Property

Pascal

```
property ItemProps [const KeyOrIndex: Variant]: TItemProp;
```

C++

```
__property TItemProp ItemProps[Variant const KeyOrIndex];
```

Description

This is ItemProps, a member of class TValueListStrings.

50.1.3.5.2 TValueListStrings.UpdateCount Property

Indicates the number of calls to BeginUpdate that have not been matched by a call to EndUpdate.

Pascal

```
property UpdateCount;
```

C++

```
__property UpdateCount;
```

Description

TStrings uses UpdateCount to keep track of calls to the BeginUpdate and EndUpdate methods. Every time a call is made to BeginUpdate, TStrings increments the value of UpdateCount. Every call to EndUpdate causes TStrings to decrement UpdateCount.

When UpdateCount changes from 0 to 1, TStrings calls the SetUpdateState method with a parameter of true. When UpdateCount changes from 1 to 0, TStrings calls the SetUpdateState method with a parameter of false. This allows descendant

classes to perform optimizations when handling multiple updates.

SetUpdateState

50.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TDisplayOption (see page 4921)	TDisplayOption and TDisplayOptions (see page 4923) control the appearance of a value list editor.
	TKeyOption (see page 4922)	TKeyOption and TKeyOptions (see page 4924) indicate the response of a value list editor to certain keystrokes.

50.2.1 ValEdit.TDisplayOption Enumeration

TDisplayOption and TDisplayOptions (see page 4923) control the appearance of a value list editor.

Pascal

```
TDisplayOption = (
  doColumnTitles,
  doAutoColResize,
  doKeyColFixed
);
```

C++

```
enum TDisplayOption {
  doColumnTitles,
  doAutoColResize,
  doKeyColFixed
};
```

File

ValEdit

Description

TDisplayOption is a set of TDisplayOptions (see page 4923) values. The possible values of TDisplayOptions (see page 4923) are

Option	Meaning
doColumnTitles	The first row of the value list editor is a fixed (nonscrolling) row that displays the captions specified by the TitleCaptions property.
doAutoColResize	When the editor is resized, the column widths automatically adjust so that they completely fill the new width of the editor. If DisplayOptions does not include doKeyColFixed, each column has a width equal to half the width of the editor. Otherwise, the value column takes up any space left over after the fixed (key) column.
doKeyColFixed	The first (key) column of the value list editor is fixed in width. When the value list editor is resized, only the second (value) column resizes. This option is only used when DisplayOptions includes doAutoColResize.

50.2.2 ValEdit.TKeyOption Enumeration

TKeyOption and TKeyOptions (see page 4924) indicate the response of a value list editor to certain keystrokes.

Pascal

```
TKeyOption = (
  keyEdit,
  keyAdd,
  keyDelete,
  keyUnique
);
```

C++

```
enum TKeyOption {
  keyEdit,
  keyAdd,
  keyDelete,
  keyUnique
};
```

File

ValEdit

Description

TKeyOption is a set of TKeyOptions (see page 4924) values. The possible values of TKeyOptions (see page 4924) are

Option	Meaning
keyEdit	The user can select and edit values in the first (key) column. That is, the user can specify the name in a name/value pair.
keyAdd	The user can add new name/value pairs. When included, the user can create new entries by pressing the Insert (see page 3698) key or using the down arrow key when positioned on the last name/value pair. keyAdd requires that keyEdit is also included.
keyDelete	The user can delete the selected name/value pair by pressing the Delete (see page 3653) key.
keyUnique	The user can't create name/value pairs where the name portion is the same as the name in another name/value pair. Attempting to add a duplicate name causes the value list editor to raise an exception. keyUnique requires that keyEdit is also included.

50.3 Types

The following table lists types in this documentation.

Types

Name	Description
TDisplayOptions (see page 4923)	This is type ValEdit.TDisplayOptions.
TGetPickListEvent (see page 4923)	This is type ValEdit.TGetPickListEvent.
TItemProps (see page 4924)	This is type ValEdit.TItemProps.
TKeyOptions (see page 4924)	This is type ValEdit.TKeyOptions.
TOnValidateEvent (see page 4924)	This is type ValEdit.TOnValidateEvent.

50.3.1 ValEdit.TDisplayOptions Type

Pascal

```
TDisplayOptions = set of TDisplayOption;
```

C++

```
TDisplayOption TDisplayOptions;
```

File

ValEdit

Description

This is type ValEdit.TDisplayOptions.

50.3.2 ValEdit.TGetPickListEvent Type

Pascal

```
TGetPickListEvent = procedure (Sender: TObject; const KeyName: string; Values: TStrings) of
object;
```

C++

```
(Sender: TObject; const KeyName: string; Values: TStrings) ( TGetPickListEvent)();
```

File

ValEdit

Description

This is type ValEdit.TGetPickListEvent.

50.3.3 ValEdit.TItemProps Type

Pascal

```
TItemProps = array of TItemProp;
```

C++

```
array of TItemProp TItemProps;
```

File

ValEdit

Description

This is type ValEdit.TItemProps.

50.3.4 ValEdit.TKeyOptions Type

Pascal

```
TKeyOptions = set of TKeyOption;
```

C++

```
TKeyOption TKeyOptions;
```

File

ValEdit

Description

This is type ValEdit.TKeyOptions.

50.3.5 ValEdit.TOnValidateEvent Type

Pascal

```
TOnValidateEvent = procedure (Sender: TObject; ACol, ARow: Longint; const KeyName, KeyValue:
string) of object;
```

C++

```
(Sender: TObject; ACol, ARow: Longint; const KeyName, KeyValue: string) ( TOnValidateEvent)();
```

File

ValEdit

Description

This is type ValEdit.TOnValidateEvent.

51 VarCmplx Namespace

This is namespace VarCmplx.

Topics

Name	Description
Functions (see page 4927)	The following table lists functions in this documentation.
Variables (see page 4971)	The following table lists variables in this documentation.

Functions

	Name	Description
	VarAsComplex (see page 4928)	Casts an arbitrary Variant (see page 3430) so that it is a custom Variant (see page 3430) representing a complex number.
	VarComplex (see page 4929)	Returns the Variant (see page 3430) type code for custom Variants (see page 4997) that represent complex numbers.
	VarComplexAbs (see page 4929)	Returns the absolute value of a complex number.
	VarComplexAbsSqr (see page 4930)	Returns the square of the absolute value of a complex number.
	VarComplexAngle (see page 4931)	Returns the angle made by a complex number.
	VarComplexArcCos (see page 4931)	Returns the inverse cosine of a complex number.
	VarComplexArcCosH (see page 4932)	Returns the hyperbolic inverse cosine of a complex number.
	VarComplexArcCot (see page 4933)	Returns the inverse cotangent of a complex number.
	VarComplexArcCotH (see page 4934)	Returns the hyperbolic inverse cotangent of a complex number.
	VarComplexArcCsc (see page 4935)	Returns the inverse cosecant of a complex number.
	VarComplexArcCscH (see page 4937)	Returns the hyperbolic inverse cosecant of a complex number.
	VarComplexArcSec (see page 4938)	Returns the inverse secant of a complex number.
	VarComplexArcSecH (see page 4939)	Returns the hyperbolic inverse secant of a complex number.
	VarComplexArcSin (see page 4940)	Returns the inverse sine of a complex number.
	VarComplexArcSinH (see page 4941)	Returns the hyperbolic inverse sine of a complex number.
	VarComplexArcTan (see page 4942)	Returns the inverse tangent of a complex number.
	VarComplexArcTanH (see page 4943)	Returns the hyperbolic inverse tangent of a complex number.
	VarComplexConjugate (see page 4944)	Returns the conjugate of a complex number.
	VarComplexCos (see page 4945)	Returns the cosine of a complex number.
	VarComplexCosH (see page 4946)	Returns the hyperbolic cosine of a complex number.
	VarComplexCot (see page 4947)	Returns the cotangent of a complex number.
	VarComplexCotH (see page 4948)	Returns the hyperbolic cotangent of a complex number.
	VarComplexCreate (see page 4949)	Returns a custom Variant (see page 3430) that represents a complex number.
	VarComplexCreate (see page 4949)	Returns a custom Variant (see page 3430) that represents a complex number.

	VarComplexCreate (see page 4949)	Returns a custom Variant (see page 3430) that represents a complex number.
	VarComplexCreate (see page 4949)	Returns a custom Variant (see page 3430) that represents a complex number.
	VarComplexCsc (see page 4950)	Returns the cosecant of a complex number.
	VarComplexCscH (see page 4951)	Returns the hyperbolic cosecant of a complex number.
	VarComplexExp (see page 4952)	Returns the exponential of a complex number.
	VarComplexFromPolar (see page 4953)	Converts a set of polar coordinates to a complex number.
	VarComplexInverse (see page 4954)	Returns the inverse of a complex number.
	VarComplexLn (see page 4954)	Returns the natural log of a complex number.
	VarComplexLog10 (see page 4955)	Returns the log base 10 of a complex number.
	VarComplexLog2 (see page 4956)	Returns the log base 2 of a complex number.
	VarComplexLogN (see page 4956)	Returns the log base N of a complex number.
	VarComplexPower (see page 4957)	Returns the value of a complex number raised to a specified power.
	VarComplexSec (see page 4958)	Returns the secant of a complex number.
	VarComplexSecH (see page 4959)	Returns the hyperbolic secant of a complex number.
	VarComplexSign (see page 4960)	This is function VarCmplx.VarComplexSign.
	VarComplexSimplify (see page 4960)	Reduces a Variant (see page 3430) that represents a complex number to one that represents a real value, if possible.
	VarComplexSin (see page 4961)	Returns the sine of a complex number.
	VarComplexSinH (see page 4962)	Returns the hyperbolic sine of a complex number.
	VarComplexSqr (see page 4963)	Returns the square of a complex number.
	VarComplexSqrt (see page 4964)	Returns the square root of a complex number.
	VarComplexTan (see page 4964)	Returns the tangent of a complex number.
	VarComplexTanH (see page 4965)	Returns the hyperbolic tangent of a complex number.
	VarComplexTimesImaginary (see page 4967)	Returns the value of a complex number multiplied by an imaginary number.
	VarComplexTimesNegI (see page 4967)	Returns the value of a complex number multiplied by –i.
	VarComplexTimesPosI (see page 4968)	Returns the value of a complex number multiplied by i.
	VarComplexTimesReal (see page 4968)	Returns the value of a complex number multiplied by a real number.
	VarComplexToPolar (see page 4969)	Computes the polar coordinates that correspond to a custom Variant (see page 3430) that represents a complex number.
	VarIsComplex (see page 4969)	Indicates whether a Variant (see page 3430) stores its data internally as a complex number.

Variables

Name	Description
ComplexNumberDefuzzAtZero (see page 4971)	This is variable VarCmplx.ComplexNumberDefuzzAtZero.
ComplexNumberSymbol (see page 4971)	This is variable VarCmplx.ComplexNumberSymbol.
ComplexNumberSymbolBeforeImaginary (see page 4972)	This is variable VarCmplx.ComplexNumberSymbolBeforeImaginary.

51.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	VarAsComplex (see page 4928)	Casts an arbitrary Variant (see page 3430) so that it is a custom Variant (see page 3430) representing a complex number.
	VarComplex (see page 4929)	Returns the Variant (see page 3430) type code for custom Variants (see page 4997) that represent complex numbers.
	VarComplexAbs (see page 4929)	Returns the absolute value of a complex number.
	VarComplexAbsSqr (see page 4930)	Returns the square of the absolute value of a complex number.
	VarComplexAngle (see page 4931)	Returns the angle made by a complex number.
	VarComplexArcCos (see page 4931)	Returns the inverse cosine of a complex number.
	VarComplexArcCosH (see page 4932)	Returns the hyperbolic inverse cosine of a complex number.
	VarComplexArcCot (see page 4933)	Returns the inverse cotangent of a complex number.
	VarComplexArcCotH (see page 4934)	Returns the hyperbolic inverse cotangent of a complex number.
	VarComplexArcCsc (see page 4935)	Returns the inverse cosecant of a complex number.
	VarComplexArcCscH (see page 4937)	Returns the hyperbolic inverse cosecant of a complex number.
	VarComplexArcSec (see page 4938)	Returns the inverse secant of a complex number.
	VarComplexArcSecH (see page 4939)	Returns the hyperbolic inverse secant of a complex number.
	VarComplexArcSin (see page 4940)	Returns the inverse sine of a complex number.
	VarComplexArcSinH (see page 4941)	Returns the hyperbolic inverse sine of a complex number.
	VarComplexArcTan (see page 4942)	Returns the inverse tangent of a complex number.
	VarComplexArcTanH (see page 4943)	Returns the hyperbolic inverse tangent of a complex number.
	VarComplexConjugate (see page 4944)	Returns the conjugate of a complex number.
	VarComplexCos (see page 4945)	Returns the cosine of a complex number.
	VarComplexCosH (see page 4946)	Returns the hyperbolic cosine of a complex number.
	VarComplexCot (see page 4947)	Returns the cotangent of a complex number.
	VarComplexCotH (see page 4948)	Returns the hyperbolic cotangent of a complex number.
	VarComplexCreate (see page 4949)	Returns a custom Variant (see page 3430) that represents a complex number.
	VarComplexCreate (see page 4949)	Returns a custom Variant (see page 3430) that represents a complex number.
	VarComplexCreate (see page 4949)	Returns a custom Variant (see page 3430) that represents a complex number.
	VarComplexCreate (see page 4949)	Returns a custom Variant (see page 3430) that represents a complex number.
	VarComplexCsc (see page 4950)	Returns the cosecant of a complex number.
	VarComplexCscH (see page 4951)	Returns the hyperbolic cosecant of a complex number.
	VarComplexExp (see page 4952)	Returns the exponential of a complex number.
	VarComplexFromPolar (see page 4953)	Converts a set of polar coordinates to a complex number.
	VarComplexInverse (see page 4954)	Returns the inverse of a complex number.
	VarComplexLn (see page 4954)	Returns the natural log of a complex number.
	VarComplexLog10 (see page 4955)	Returns the log base 10 of a complex number.
	VarComplexLog2 (see page 4956)	Returns the log base 2 of a complex number.
	VarComplexLogN (see page 4956)	Returns the log base N of a complex number.
	VarComplexPower (see page 4957)	Returns the value of a complex number raised to a specified power.
	VarComplexSec (see page 4958)	Returns the secant of a complex number.
	VarComplexSecH (see page 4959)	Returns the hyperbolic secant of a complex number.
	VarComplexSign (see page 4960)	This is function VarCmplx.VarComplexSign.
	VarComplexSimplify (see page 4960)	Reduces a Variant (see page 3430) that represents a complex number to one that represents a real value, if possible.
	VarComplexSin (see page 4961)	Returns the sine of a complex number.
	VarComplexSinH (see page 4962)	Returns the hyperbolic sine of a complex number.

	VarComplexSqr (see page 4963)	Returns the square of a complex number.
	VarComplexSqrt (see page 4964)	Returns the square root of a complex number.
	VarComplexTan (see page 4964)	Returns the tangent of a complex number.
	VarComplexTanH (see page 4965)	Returns the hyperbolic tangent of a complex number.
	VarComplexTimesImaginary (see page 4967)	Returns the value of a complex number multiplied by an imaginary number.
	VarComplexTimesNegI (see page 4967)	Returns the value of a complex number multiplied by –i.
	VarComplexTimesPosI (see page 4968)	Returns the value of a complex number multiplied by i.
	VarComplexTimesReal (see page 4968)	Returns the value of a complex number multiplied by a real number.
	VarComplexToPolar (see page 4969)	Computes the polar coordinates that correspond to a custom Variant (see page 3430) that represents a complex number.
	VarIsComplex (see page 4969)	Indicates whether a Variant (see page 3430) stores its data internally as a complex number.

51.1.1 VarCmplx.VarAsComplex Function

Casts an arbitrary Variant (see page 3430) so that it is a custom Variant (see page 3430) representing a complex number.

Pascal

```
function VarAsComplex(const AValue: Variant): Variant;
```

C++

```
Variant VarAsComplex(const Variant AValue);
```

File

VarCmplx

Description

VarAsComplex converts the Variant (see page 3430) specified by AValue to a custom Variant (see page 3430) representing the corresponding complex number. It returns the custom Variant (see page 3430).

If VarAsComplex can't perform the conversion, it raises an EInvalidCast exception.

Complex Variants (see page 4997) are custom Variants (see page 4997) that represent complex numbers. The Variant (see page 3430) type supports direct manipulation using the addition, subtraction, multiplication, division (but not integer division), and negation operators. They have 5 published properties: Real, Imaginary, Radius, Theta, and FixedTheta. They can be cast to and from integer types, floating point types, string types, TDateTime (see page 3335) values, and boolean values. In addition, the VarCmplx (see page 4925) unit implements a number of global functions for operating on complex Variants (see page 4997).

VarComplexSimplify (see page 4960)

VarAsType

51.1.2 VarCmplx.VarComplex Function

Returns the Variant (see page 3430) type code for custom Variants (see page 4997) that represent complex numbers.

Pascal

```
function VarComplex: TVarType;
```

C++

```
TVarType VarComplex();
```

File

VarCmplx

Description

Use VarComplex to obtain the variant type code for custom Variants (see page 4997) that represent complex numbers. The Variant (see page 3430) type codes for custom Variants (see page 4997) are dynamically allocated when the application loads the unit that implements them. VarComplex allows the application to identify the Variant (see page 3430) type code that is currently used for custom Variants (see page 4997) that represent complex numbers. This type code, however, may not match the type code used by another application that uses a different set of custom Variant (see page 3430) types.

Complex Variants (see page 4997) are custom Variants (see page 4997) that represent complex numbers. The Variant (see page 3430) type supports direct manipulation using the addition, subtraction, multiplication, division (but not integer division), and negation operators. They have 5 published properties: Real, Imaginary, Radius, Theta, and FixedTheta. They can be cast to and from integer types, floating point types, string types, TDateTime (see page 3335) values, and boolean values. In addition, the VarCmplx (see page 4925) unit implements a number of global functions for operating on complex Variants (see page 4997).

VarType

51.1.3 VarCmplx.VarComplexAbs Function

Returns the absolute value of a complex number.

Pascal

```
function VarComplexAbs(const AValue: Variant): Double;
```

C++

```
Double VarComplexAbs(const Variant AValue);
```

File

VarCmplx

Description

Use VarComplexAbs to take the absolute value (length) of a complex number.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexAbs returns the absolute value of AValue.

See Also

VarComplexAbsSqr (see page 4930)

VarComplexAngle (see page 4931)

VarComplexConjugate (see page 4944)

VarComplexInverse (see page 4954)

VarComplexTimesPosI (see page 4968)

VarComplexTimesNegI (see page 4967)

51.1.4 VarCmplx.VarComplexAbsSqr Function

Returns the square of the absolute value of a complex number.

Pascal

```
function VarComplexAbsSqr(const AValue: Variant): Double;
```

C++

```
Double VarComplexAbsSqr(const Variant AValue);
```

File

VarCmplx

Description

Use VarComplexAbsSqr to obtain the square of a complex number's absolute value.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexAbs (see page 4929) returns the absolute value of AValue, squared.

See Also

VarComplexAbs (see page 4929)

VarComplexAngle (see page 4931)

VarComplexConjugate (see page 4944)

VarComplexInverse (see page 4954)

VarComplexSqrt (see page 4964)

VarComplexPower (see page 4957)

51.1.5 VarCmplx.VarComplexAngle Function

Returns the angle made by a complex number.

Pascal

```
function VarComplexAngle(const AValue: Variant): Double;
```

C++

```
Double VarComplexAngle(const Variant AValue);
```

File

VarCmplx

Description

Use VarComplexAngle to obtain the angle of a complex number.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexAbs (see page 4929) returns the angle that corresponds to AValue.

See Also

VarComplexToPolar (see page 4969)

VarComplexAbs (see page 4929)

51.1.6 VarCmplx.VarComplexArcCos Function

Returns the inverse cosine of a complex number.

Pascal

```
function VarComplexArcCos(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcCos(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcCos computes the inverse cosine of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcCos returns a Variant (see page 3430) whose value is the inverse cosine of AValue.

VarComplexSecH (see page 4959)
VarComplexSin (see page 4961)
VarComplexSinH (see page 4962)
VarComplexTan (see page 4964)
VarComplexTanH (see page 4965)

51.1.7 VarCmplx.VarComplexArcCosH Function

Returns the hyperbolic inverse cosine of a complex number.

Pascal

```
function VarComplexArcCosH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcCosH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcCosH computes the hyperbolic inverse cosine of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcCosH returns a Variant (see page 3430) whose value is the hyperbolic inverse cosine of AValue.

51.1.8 VarCmplx.VarComplexArcCot Function

Returns the inverse cotangent of a complex number.

Pascal

```
function VarComplexArcCot(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcCot(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcCot computes the inverse cotangent of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcCot returns a Variant (see page 3430) whose value is the inverse cotangent of AValue.

51.1.9 VarCmplx.VarComplexArcCotH Function

Returns the hyperbolic inverse cotangent of a complex number.

Pascal

```
function VarComplexArcCotH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcCotH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcCot (see page 4933) computes the hyperbolic inverse cotangent of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcCot (see page 4933) returns a Variant (see page 3430) whose value is the hyperbolic inverse cotangent of AValue.

51.1.10 VarCmplx.VarComplexArcCsc Function

Returns the inverse cosecant of a complex number.

Pascal

```
function VarComplexArcCsc(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcCsc(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcCsc computes the inverse cosecant of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcCsc returns a Variant (see page 3430) whose value is the inverse cosecant of AValue.

51.1.11 VarCmplx.VarComplexArcCscH Function

Returns the hyperbolic inverse cosecant of a complex number.

Pascal

```
function VarComplexArcCscH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcCscH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcCsc (see page 4935) computes the hyperbolic inverse cosecant of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcCsc (see page 4935) returns a Variant (see page 3430) whose value is the hyperbolic inverse cosecant of AValue.

51.1.12 VarCmplx.VarComplexArcSec Function

Returns the inverse secant of a complex number.

Pascal

```
function VarComplexArcSec(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcSec(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcSec computes the inverse secant of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcSec returns a Variant (see page 3430) whose value is the inverse secant of AValue.

51.1.13 VarCmplx.VarComplexArcSecH Function

Returns the hyperbolic inverse secant of a complex number.

Pascal

```
function VarComplexArcSecH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcSecH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcSec (see page 4938) computes the hyperbolic inverse secant of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcSec (see page 4938) returns a Variant (see page 3430) whose value is the hyperbolic inverse secant of AValue.

51.1.14 VarCmplx.VarComplexArcSin Function

Returns the inverse sine of a complex number.

Pascal

```
function VarComplexArcSin(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcSin(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcSin computes the inverse sine of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcSin returns a Variant (see page 3430) whose value is the inverse sine of AValue.

51.1.15 VarCmplx.VarComplexArcSinH Function

Returns the hyperbolic inverse sine of a complex number.

Pascal

```
function VarComplexArcSinH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcSinH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcSinH computes the hyperbolic inverse sine of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcSinH returns a Variant (see page 3430) whose value is the hyperbolic inverse sine of AValue.

51.1.16 VarCmplx.VarComplexArcTan Function

Returns the inverse tangent of a complex number.

Pascal

```
function VarComplexArcTan(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcTan(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcTan computes the inverse tangent of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcTan returns a Variant (see page 3430) whose value is the inverse tangent of AValue.

51.1.17 VarCmplx.VarComplexArcTanH Function

Returns the hyperbolic inverse tangent of a complex number.

Pascal

```
function VarComplexArcTanH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexArcTanH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexArcTanH computes the hyperbolic inverse tangent of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexArcTanH returns a Variant (see page 3430) whose value is the hyperbolic inverse tangent of AValue.

51.1.18 VarCmplx.VarComplexConjugate Function

Returns the conjugate of a complex number.

Pascal

```
function VarComplexConjugate(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexConjugate(const Variant AValue);
```

File

VarCmplx

Description

VarComplexConjugate returns the conjugate of a complex number. The conjugate is the value that has the same real part and the inverse of the imaginary part.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexConjugate returns a Variant (see page 3430) whose value is the conjugate of AValue.

51.1.19 VarCmplx.VarComplexCos Function

Returns the cosine of a complex number.

Pascal

```
function VarComplexCos(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexCos(const Variant AValue);
```

File

VarCmplx

Description

VarComplexCos computes the cosine of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexCos returns a Variant (see page 3430) whose value is the cosine of AValue.

51.1.20 VarCmplx.VarComplexCosH Function

Returns the hyperbolic cosine of a complex number.

Pascal

```
function VarComplexCosH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexCosH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexCosH computes the hyperbolic cosine of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexCosH returns a Variant (see page 3430) whose value is the hyperbolic cosine of AValue.

51.1.21 VarCmplx.VarComplexCot Function

Returns the cotangent of a complex number.

Pascal

```
function VarComplexCot(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexCot(const Variant AValue);
```

File

VarCmplx

Description

VarComplexCot computes the cotangent of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexCot returns a Variant (see page 3430) whose value is the cotangent of AValue.

51.1.22 VarCmplx.VarComplexCotH Function

Returns the hyperbolic cotangent of a complex number.

Pascal

```
function VarComplexCotH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexCotH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexCot (see page 4947) computes the hyperbolic cotangent of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexCot (see page 4947) returns a Variant (see page 3430) whose value is the hyperbolic cotangent of AValue.

51.1.23 VarCmplx.VarComplexCreate Function

Returns a custom Variant (see page 3430) that represents a complex number.

Pascal

```
function VarComplexCreate: Variant; overload;
function VarComplexCreate(const AReal: Double): Variant; overload;
function VarComplexCreate(const AReal: Double; const AImaginary: Double): Variant; overload;
function VarComplexCreate(const AText: string): Variant; overload;
```

C++

```
Variant VarComplexCreate();
Variant VarComplexCreate(const Double AReal);
Variant VarComplexCreate(const Double AReal, const Double AImaginary);
Variant VarComplexCreate(const UnicodeString AText);
```

File

VarCmplx

Description

Call VarComplexCreate to create a Variant (see page 3430) whose value is a complex number.

AReal is the real part of the complex number.

AImaginary is the imaginary part of the complex number.

Using the first three versions of the constructor, omitting AReal or AImaginary results in a real or imaginary part of 0.

Using the last syntax, AText is parsed using the ComplexNumberSymbol (see page 4971) and ComplexNumberSymbolBeforeImaginary (see page 4972) global variables and, if the string represents a complex value, that becomes the value of the new Variant (see page 3430). If the string can't be parsed into a complex number, VarComplexCreate raises an EConvertError exception.

Complex Variants (see page 4997) are custom Variants (see page 4997) that represent complex numbers. The Variant (see page 3430) type supports direct manipulation using the addition, subtraction, multiplication, division (but not integer division), and negation operators. They have 5 published properties: Real, Imaginary, Radius, Theta, and FixedTheta. They can be cast to and from integer types, floating point types, string types, TDateTime (see page 3335) values, and boolean values. In addition, the VarCmplx (see page 4925) unit implements a number of global functions for operating on complex Variants (see page 4997).

51.1.24 VarCmplx.VarComplexCsc Function

Returns the cosecant of a complex number.

Pascal

```
function VarComplexCsc(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexCsc(const Variant AValue);
```

File

VarCmplx

Description

VarComplexCsc computes the cosecant of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexCsc returns a Variant (see page 3430) whose value is the cosecant of AValue.

51.1.25 VarCmplx.VarComplexCscH Function

Returns the hyperbolic cosecant of a complex number.

Pascal

```
function VarComplexCscH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexCscH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexCsc (see page 4950) computes the hyperbolic cosecant of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexCsc (see page 4950) returns a Variant (see page 3430) whose value is the hyperbolic cosecant of AValue.

51.1.26 VarCmplx.VarComplexExp Function

Returns the exponential of a complex number.

Pascal

```
function VarComplexExp(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexExp(const Variant AValue);
```

File

VarCmplx

Description

VarComplexExp returns value of e raised to the power of a specified complex number, where e is the base of the natural logarithms.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexExp returns a Variant (see page 3430) whose value is the exponential of AValue.

See Also

VarComplexAbs (see page 4929)

VarComplexSqrt (see page 4964)

VarComplexPower (see page 4957)

51.1.27 VarCmplx.VarComplexFromPolar Function

Converts a set of polar coordinates to a complex number.

Pascal

```
function VarComplexFromPolar(const ARadius: Double; const ATheta: Double): Variant;
```

C++

```
Variant VarComplexFromPolar(const Double ARadius, const Double ATheta);
```

File

VarCmplx

Description

VarComplexFromPolar returns the complex number that corresponds to the radius (length) and angle specified by the ARadius and ATheta parameters, respectively. The result is returned as a Variant (see page 3430) whose value is the corresponding complex number.

See Also

VarComplexCreate (see page 4949)

VarComplexToPolar (see page 4969)

51.1.28 VarCmplx.VarComplexInverse Function

Returns the inverse of a complex number.

Pascal

```
function VarComplexInverse(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexInverse(const Variant AValue);
```

File

VarCmplx

Description

VarComplexInverse returns the inverse of a complex number. The inverse is the value that results when you divide 1 by the complex number.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexInverse returns a Variant (see page 3430) whose value is the inverse of AValue.

See Also

VarComplexAbs (see page 4929)

VarComplexAngle (see page 4931)

VarComplexAbsSqr (see page 4930)

VarComplexConjugate (see page 4944)

VarComplexSqr (see page 4963)

VarComplexSqrt (see page 4964)

VarComplexPower (see page 4957)

51.1.29 VarCmplx.VarComplexLn Function

Returns the natural log of a complex number.

Pascal

```
function VarComplexLn(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexLn(const Variant AValue);
```

File

VarCmplx

Description

VarComplexLn returns the natural logarithm of a complex number. The natural logarithm is the power to which you must raise e to get the complex number.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexLn returns a Variant (see page 3430) whose value is the natural log of AValue.

See Also

VarComplexAbs (see page 4929)

VarComplexAngle (see page 4931)

VarComplexAbsSqr (see page 4930)

VarComplexConjugate (see page 4944)

VarComplexSqr (see page 4963)

VarComplexSqrt (see page 4964)

VarComplexPower (see page 4957)

51.1.30 VarCmplx.VarComplexLog10 Function

Returns the log base 10 of a complex number.

Pascal

```
function VarComplexLog10(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexLog10(const Variant AValue);
```

File

VarCmplx

Description

VarComplexLog10 returns the base 10 logarithm of a complex number. The base 10 logarithm is the power to which you must raise 10 to get the complex number.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexLog10 returns a Variant (see page 3430) whose value is the log base 10 of AValue.

See Also

VarComplexLn (see page 4954)

VarComplexLog2 (see page 4956)

VarComplexLogN (see page 4956)

51.1.31 VarCmplx.VarComplexLog2 Function

Returns the log base 2 of a complex number.

Pascal

```
function VarComplexLog2(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexLog2(const Variant AValue);
```

File

VarCmplx

Description

VarComplexLog2 returns the base 2 logarithm of a complex number. The base 2 logarithm is the power to which you must raise 2 to get the complex number.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexLog2 returns a Variant (see page 3430) whose value is the log base 2 of AValue.

See Also

VarComplexLn (see page 4954)

VarComplexLog10 (see page 4955)

VarComplexLogN (see page 4956)

51.1.32 VarCmplx.VarComplexLogN Function

Returns the log base N of a complex number.

Pascal

```
function VarComplexLogN(const AValue: Variant; const X: Double): Variant;
```

C++

```
Variant VarComplexLogN(const Variant AValue, const Double X);
```

File

VarCmplx

Description

VarComplexLogN returns the base N logarithm of a complex number. The base N logarithm is the power to which you must raise an exponent N to get the complex number.

AValue is a Variant (see page 3430) whose value represents the complex number.

X is the logarithm exponent.

VarComplexLogN returns a Variant (see page 3430) whose value is the log base N of AValue.

See Also

VarComplexLn (see page 4954)

VarComplexLog2 (see page 4956)

VarComplexLog10 (see page 4955)

51.1.33 VarCmplx.VarComplexPower Function

Returns the value of a complex number raised to a specified power.

Pascal

```
function VarComplexPower(const AValue: Variant; const APower: Variant): Variant;
```

C++

```
Variant VarComplexPower(const Variant AValue, const Variant APower);
```

File

VarCmplx

Description

VarComplexPower returns the result of raising AValue to the power APower.

AValue is a Variant (see page 3430) whose value represents the complex number.

APower is a Variant (see page 3430) that specifies the power to which you want to raise AValue. It can also be a complex number.

VarComplexPower returns a Variant (see page 3430) whose value is AValue raised to the APower power.

See Also

VarComplexAbs (see page 4929)

VarComplexAngle (see page 4931)

VarComplexAbsSqr (see page 4930)

VarComplexConjugate (see page 4944)

VarComplexSqr (see page 4963)

VarComplexSqrt (see page 4964)

VarComplexLn (see page 4954)

51.1.34 VarCmplx.VarComplexSec Function

Returns the secant of a complex number.

Pascal

```
function VarComplexSec(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexSec(const Variant AValue);
```

File

VarCmplx

Description

VarComplexSec computes the secant of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexSec returns a Variant (see page 3430) whose value is the secant of AValue.

51.1.35 VarCmplx.VarComplexSecH Function

Returns the hyperbolic secant of a complex number.

Pascal

```
function VarComplexSecH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexSecH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexSec (see page 4958) computes the hyperbolic secant of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexSec (see page 4958) returns a Variant (see page 3430) whose value is the hyperbolic secant of AValue.

51.1.36 VarCmplx.VarComplexSign Function

Pascal

```
function VarComplexSign(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexSign(const Variant AValue);
```

File

VarCmplx

Description

This is function VarCmplx.VarComplexSign.

51.1.37 VarCmplx.VarComplexSimplify Function

Reduces a Variant (see page 3430) that represents a complex number to one that represents a real value, if possible.

Pascal

```
function VarComplexSimplify(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexSimplify(const Variant AValue);
```

File

VarCmplx

Description

Use VarComplexSimplify to convert a complex number to a real value when possible. VarComplexSimplify checks whether the Variant (see page 3430) specified by AValue represents a complex number that has no imaginary part. If so, it returns a Variant (see page 3430) whose value is simply a real number. If AValue does not represent a complex number, or if AValue represents a complex number with a nonzero imaginary part, VarComplexSimplify returns AValue.

51.1.38 VarCmplx.VarComplexSin Function

Returns the sine of a complex number.

Pascal

```
function VarComplexSin(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexSin(const Variant AValue);
```

File

VarCmplx

Description

VarComplexSin computes the sine of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexSin returns a Variant (see page 3430) whose value is the sine of AValue.

51.1.39 VarCmplx.VarComplexSinH Function

Returns the hyperbolic sine of a complex number.

Pascal

```
function VarComplexSinH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexSinH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexSinH computes the hyperbolic sine of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexSinH returns a Variant (see page 3430) whose value is the hyperbolic sine of AValue.

51.1.40 VarCmplx.VarComplexSqr Function

Returns the square of a complex number.

Pascal

```
function VarComplexSqr(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexSqr(const Variant AValue);
```

File

VarCmplx

Description

VarComplexSqr returns the square of AValue.

AValue is a Variant (see page 3430) whose value represents the complex number.

See Also

VarComplexAbs (see page 4929)

VarComplexAngle (see page 4931)

VarComplexAbsSqr (see page 4930)

51.1.41 VarCmplx.VarComplexSqrt Function

Returns the square root of a complex number.

Pascal

```
function VarComplexSqrt(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexSqrt(const Variant AValue);
```

File

VarCmplx

Description

VarComplexSqrt returns the square root of AValue.

AValue is a Variant (see page 3430) whose value represents the complex number.

See Also

VarComplexAbs (see page 4929)

VarComplexAngle (see page 4931)

51.1.42 VarCmplx.VarComplexTan Function

Returns the tangent of a complex number.

Pascal

```
function VarComplexTan(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexTan(const Variant AValue);
```

File

VarCmplx

Description

VarComplexTan computes the tangent of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexTan returns a Variant (see page 3430) whose value is the tangent of AValue.

51.1.43 VarCmplx.VarComplexTanH Function

Returns the hyperbolic tangent of a complex number.

Pascal

```
function VarComplexTanH(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexTanH(const Variant AValue);
```

File

VarCmplx

Description

VarComplexTanH computes the hyperbolic tangent of a complex number and returns the result.

AValue is a Variant (see page 3430) whose value represents the complex number.

VarComplexTanH returns a Variant (see page 3430) whose value is the hyperbolic tangent of AValue.

VarComplexTanH

51.1.44 VarCmplx.VarComplexTimesImaginary Function

Returns the value of a complex number multiplied by an imaginary number.

Pascal

```
function VarComplexTimesImaginary(const AValue: Variant; const AFactor: Double): Variant;
```

C++

```
Variant VarComplexTimesImaginary(const Variant AValue, const Double AFactor);
```

File

VarCmplx

Description

VarComplexTimesImaginary returns a complex value times an imaginary number.

AValue is a Variant (see page 3430) whose value represents the complex number.

AFactor is a real number that represents the imaginary number. That is, the imaginary number is AFactor times i.

VarComplexTimesImaginary returns a variant whose value is AValue times AFactor times i.

See Also

VarComplexTimesNegI (see page 4967)

VarComplexTimesPosI (see page 4968)

VarComplexTimesReal (see page 4968)

51.1.45 VarCmplx.VarComplexTimesNegI Function

Returns the value of a complex number multiplied by –i.

Pascal

```
function VarComplexTimesNegI(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexTimesNegI(const Variant AValue);
```

File

VarCmplx

Description

VarComplexTimesNegI returns AValue times –i.

AValue is a Variant (see page 3430) whose value represents the complex number.

See Also

VarComplexTimesImaginary (see page 4967)

VarComplexTimesPosI (see page 4968)

VarComplexTimesReal (see page 4968)

51.1.46 VarCmplx.VarComplexTimesPosI Function

Returns the value of a complex number multiplied by i.

Pascal

```
function VarComplexTimesPosI(const AValue: Variant): Variant;
```

C++

```
Variant VarComplexTimesPosI(const Variant AValue);
```

File

VarCmplx

Description

VarComplexTimesPosI returns AValue times i.

AValue is a Variant (see page 3430) whose value represents the complex number.

See Also

VarComplexTimesNegI (see page 4967)

VarComplexTimesImaginary (see page 4967)

VarComplexTimesReal (see page 4968)

51.1.47 VarCmplx.VarComplexTimesReal Function

Returns the value of a complex number multiplied by a real number.

Pascal

```
function VarComplexTimesReal(const AValue: Variant; const AFactor: Double): Variant;
```

C++

```
Variant VarComplexTimesReal(const Variant AValue, const Double AFactor);
```

File

VarCmplx

Description

VarComplexTimesReal returns a complex value times a real number.

AValue is a Variant (see page 3430) whose value represents the complex number.

AFactor is a real number.

VarComplexTimesReal returns a variant whose value is AValue times AFactor.

See Also

VarComplexTimesNegI (see page 4967)

VarComplexTimesPosI (see page 4968)

VarComplexTimesReal

51.1.48 VarCmplx.VarComplexToPolar Function

Computes the polar coordinates that correspond to a custom Variant (see page 3430) that represents a complex number.

Pascal

```
procedure VarComplexToPolar(const AValue: Variant; var ARadius: Double; var ATheta: Double;
AFixTheta: Boolean = True);
```

C++

```
VarComplexToPolar(const Variant AValue, Double ARadius, Double ATheta, Boolean AFixTheta =
True);
```

File

VarCmplx

Description

Call VarComplexToPolar to obtain the polar coordinates for a complex number.

AValue is a Variant (see page 3430) whose value represents the complex number.

ARadius returns the radius of the corresponding polar coordinates.

ATheta returns the angle (Theta) of the corresponding polar coordinates.

AFixTheta indicates whether VarComplexToPolar should normalize the angle (ATheta). When AFixTheta is true, VarComplexToPolar always returns an angle between – pi and pi.

See Also

VarComplexAngle (see page 4931)

VarComplexFromPolar (see page 4953)

VarComplexAbs (see page 4929)

51.1.49 VarCmplx.VarIsComplex Function

Indicates whether a Variant (see page 3430) stores its data internally as a complex number.

Pascal

```
function VarIsComplex(const AValue: Variant): Boolean;
```

C++

```
Boolean VarIsComplex(const Variant AValue);
```

File

VarCmplx

Description

VarIsComplex returns true if AValue represents a complex number (that is, if it has a VarType (see page 5101) of VarComplex (see page 4929)).

Complex Variants (see page 4997) are custom Variants (see page 4997) that represent complex numbers. The Variant (see page 3430) type supports direct manipulation using the addition, subtraction, multiplication, division (but not integer division),

and negation operators. They have 5 published properties: Real, Imaginary, Radius, Theta, and FixedTheta. They can be cast to and from integer types, floating point types, string types, TDateTime (see page 3335) values, and boolean values. In addition, the VarCmplx (see page 4925) unit implements a number of global functions for operating on complex Variants (see page 4997).

51.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
ComplexNumberDefuzzAtZero (see page 4971)	This is variable VarCmplx.ComplexNumberDefuzzAtZero.
ComplexNumberSymbol (see page 4971)	This is variable VarCmplx.ComplexNumberSymbol.
ComplexNumberSymbolBeforeImaginary (see page 4972)	This is variable VarCmplx.ComplexNumberSymbolBeforeImaginary.

51.2.1 VarCmplx.ComplexNumberDefuzzAtZero Variable

Pascal

```
ComplexNumberDefuzzAtZero: Boolean = True;
```

C++

```
Boolean ComplexNumberDefuzzAtZero = True;
```

File

VarCmplx

Description

This is variable VarCmplx.ComplexNumberDefuzzAtZero.

51.2.2 VarCmplx.ComplexNumberSymbol Variable

Pascal

```
ComplexNumberSymbol: string = 'i';
```

C++

```
UnicodeString ComplexNumberSymbol = 'i';
```

File

VarCmplx

Description

This is variable VarCmplx.ComplexNumberSymbol.

51.2.3 VarCmplx.ComplexNumberSymbolBeforeImaginary Variable

Pascal

```
ComplexNumberSymbolBeforeImaginary: Boolean = False;
```

C++

```
Boolean ComplexNumberSymbolBeforeImaginary = False;
```

File

VarCmplx

Description

This is variable VarCmplx.ComplexNumberSymbolBeforeImaginary.

52 VarConv Namespace

This is namespace VarConv.

Functions (see page 4974)	The following table lists functions in this documentation.

Functions

	Name	Description
	VarAsConvert (see page 4974)	Casts an arbitrary Variant (see page 3430) so that it is a custom Variant (see page 3430) representing a measurement.
	VarAsConvert (see page 4974)	Casts an arbitrary Variant (see page 3430) so that it is a custom Variant (see page 3430) representing a measurement.
	VarConvert (see page 4975)	Returns the Variant (see page 3430) type code for custom Variants (see page 4997) that represent measurements.
	VarConvertCreate (see page 4976)	Returns a custom Variant (see page 3430) that represents a measurement.
	VarConvertCreate (see page 4976)	Returns a custom Variant (see page 3430) that represents a measurement.
	VarIsConvert (see page 4977)	Indicates whether a Variant (see page 3430) is a custom Variant (see page 3430) that represents a measurement.

52.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	VarAsConvert (see page 4974)	Casts an arbitrary Variant (see page 3430) so that it is a custom Variant (see page 3430) representing a measurement.
	VarAsConvert (see page 4974)	Casts an arbitrary Variant (see page 3430) so that it is a custom Variant (see page 3430) representing a measurement.
	VarConvert (see page 4975)	Returns the Variant (see page 3430) type code for custom Variants (see page 4997) that represent measurements.
	VarConvertCreate (see page 4976)	Returns a custom Variant (see page 3430) that represents a measurement.
	VarConvertCreate (see page 4976)	Returns a custom Variant (see page 3430) that represents a measurement.
	VarIsConvert (see page 4977)	Indicates whether a Variant (see page 3430) is a custom Variant (see page 3430) that represents a measurement.

52.1.1 VarConv.VarAsConvert Function

Casts an arbitrary Variant (see page 3430) so that it is a custom Variant (see page 3430) representing a measurement.

Pascal

```
function VarAsConvert(const AValue: Variant): Variant; overload;
function VarAsConvert(const AValue: Variant; const AType: TConvType): Variant; overload;
```

C++

```
Variant VarAsConvert(const Variant AValue);
Variant VarAsConvert(const Variant AValue, const TConvType AType);
```

File

VarConv

Description

VarAsConvert converts the Variant (see page 3430) specified by AValue to a VarConvert (see page 4975) custom Variant (see page 3430).

Using the first syntax, AValue is interpreted as the numeric portion (the number of units), and AType identifies the units.

Using the second syntax, AValue should be a Variant (see page 3430) that can be parsed into a VarConv (see page 4973) custom Variant (see page 3430) (for example, a variant whose value is a string such as '1.5 miles').

If VarAsConvert can't perform the conversion, it raises an EInvalidCast (see page 4000) exception.

VarConvert (see page 4975) custom Variants (see page 4997) represent measurements (that is, a type of measurement units and the number of those units). The units must be registered measurement units such as those used by the ConvUtils unit. You can use the negation operator on VarConv (see page 4973) variants, and use the addition, subtraction, multiplication, division, and comparison operators on a VarConv (see page 4973) Variant (see page 3430) with a real number. You can use the addition, subtraction, division, and comparison operators on two VarConv (see page 4973) Variants (see page 4997). VarConv (see page 4973) custom Variants (see page 4997) also support the following properties:

Value is the numeric portion (the number of units). (read/write)

Type is units. (read-only)

TypeName is the name of the units. (read-only).

Family is the conversion family of the units (the thing measured). (read-only).

FamilyName is the name of the conversion family. (read-only)

Depending on the Family, each Variant (see page 3430) has a set of conversion properties with names of the form As<Unit>, where <Unit> is the name of another type of unit in the same conversion family.

See Also

EInvalidCast

VarIsConvert (see page 4977)

VarConvertCreate (see page 4976)

VarAsType

TVarData

52.1.2 VarConv.VarConvert Function

Returns the Variant (see page 3430) type code for custom Variants (see page 4997) that represent measurements.

Pascal

```
function VarConvert: TVarType;
```

C++

```
TVarType VarConvert();
```

File

VarConv

Description

Use VarConvert to obtain the variant type code for custom Variants (see page 4997) that represent measurements. The Variant (see page 3430) type codes for custom Variants (see page 4997) are dynamically allocated when the application loads the unit that implements them. VarConvert allows the application to identify the Variant (see page 3430) type code that is currently used for custom Variants (see page 4997) that represent VarConvert custom Variants (see page 4997). This type code, however, may not match the type code used by another application that uses a different set of custom Variant (see page 3430) types.

VarConvert custom Variants (see page 4997) represent measurements (that is, a type of measurement units and the number of those units). The units must be registered measurement units such as those used by the ConvUtils unit. You can use the negation operator on VarConv (see page 4973) variants, and use the addition, subtraction, multiplication, division, and comparison operators on a VarConv (see page 4973) Variant (see page 3430) with a real number. You can use the addition, subtraction, division, and comparison operators on two VarConv (see page 4973) Variants (see page 4997). VarConv (see page 4973) custom Variants (see page 4997) also support the following properties:

Value is the numeric portion (the number of units). (read/write)

Type is units. (read-only)

TypeName is the name of the units. (read-only).

Family is the conversion family of the units (the thing measured). (read-only).

FamilyName is the name of the conversion family. (read-only)

Depending on the Family, each Variant (see page 3430) has a set of conversion properties with names of the form As<Unit>, where <Unit> is the name of another type of unit in the same conversion family.

See Also

VarType

52.1.3 VarConv.VarConvertCreate Function

Returns a custom Variant (see page 3430) that represents a measurement.

Pascal

```
function VarConvertCreate(const AValue: Double; const AType: TConvType): Variant; overload;
function VarConvertCreate(const AValue: string): Variant; overload;
```

C++

```
Variant VarConvertCreate(const Double AValue, const TConvType AType);
Variant VarConvertCreate(const UnicodeString AValue);
```

File

VarConv

Description

Call VarConvertCreate to create a Variant (see page 3430) whose value is a measurement.

Using the first syntax, AType indicates the measurement units, and AValue is the number of those units. AType must represent a registered conversion unit.

Using the second syntax, AValue is a string that can be parsed by the TryStrToConvUnit function. (For example '1.5 liters'.)

If the string can't be parsed into a measurement, VarConvertCreate raises an EInvalidCast (see page 4000) exception.

VarConvert (see page 4975) custom Variants (see page 4997) represent measurements (that is, a type of measurement units and the number of those units). The units must be registered measurement units such as those used by the ConvUtils unit. You can use the negation operator on VarConv (see page 4973) variants, and use the addition, subtraction, multiplication, division, and comparison operators on a VarConv (see page 4973) Variant (see page 3430) with a real number. You can use the addition, subtraction, division, and comparison operators on two VarConv (see page 4973) Variants (see page 4997). VarConv (see page 4973) custom Variants (see page 4997) also support the following properties:

Value is the numeric portion (the number of units). (read/write)

Type is units. (read-only)

TypeName is the name of the units. (read-only).

Family is the conversion family of the units (the thing measured). (read-only).

FamilyName is the name of the conversion family. (read-only)

Depending on the Family, each Variant (see page 3430) has a set of conversion properties with names of the form As<Unit>, where <Unit> is the name of another type of unit in the same conversion family.

VarIsConvert (see page 4977)

VarAsConvert (see page 4974)

EInvalidCast

52.1.4 VarConv.VarIsConvert Function

Indicates whether a Variant (see page 3430) is a custom Variant (see page 3430) that represents a measurement.

Pascal

```
function VarIsConvert(const AValue: Variant): Boolean;
```

C++

```
Boolean VarIsConvert(const Variant AValue);
```

File

VarConv

Description

VarIsConvert returns true if AValue represents a measurement (that is, if it has a VarType (see page 5101) of VarConvert (see page 4975)).

VarConvert (see page 4975) custom Variants (see page 4997) represent measurements (that is, a type of measurement units and the number of those units). The units must be registered measurement units such as those used by the ConvUtils unit. You can use the negation operator on VarConv (see page 4973) variants, and use the addition, subtraction, multiplication, division, and comparison operators on a VarConv (see page 4973) Variant (see page 3430) with a real number. You can use the addition, subtraction, division, and comparison operators on two VarConv (see page 4973) Variants (see page 4997). VarConv (see page 4973) custom Variants (see page 4997) also support the following properties:

Value is the numeric portion (the number of units). (read/write)

Type is units. (read-only)

TypeName is the name of the units. (read-only).

Family is the conversion family of the units (the thing measured). (read-only).

FamilyName is the name of the conversion family. (read-only)

Depending on the Family, each Variant (see page 3430) has a set of conversion properties with names of the form As<Unit>, where <Unit> is the name of another type of unit in the same conversion family.

	VariantAdd (see page 4981)	Adds two Variants (see page 4997).
	VariantAdd2 (see page 4982)	Adds two Variants (see page 4997).
	VariantAnd (see page 4982)	Performs an **and** operation between two Variant (see page 3430) values.
	VariantAnd2 (see page 4983)	Performs an **and** operation between two Variants (see page 4997).
	VariantArrayRedim (see page 4983)	Resizes a Variant (see page 3430) array.
	VariantCast (see page 4984)	Performs a type-cast on a Variant (see page 3430).
	VariantClear (see page 4984)	Empties a Variant (see page 3430), so that it is unassigned.
	VariantCpy (see page 4985)	Copies a Variant (see page 3430).
	VariantDiv (see page 4985)	Divides two Variants (see page 4997).
	VariantDiv2 (see page 4986)	Divides two Variants (see page 4997).
	VariantFromUnicodeString (see page 4986)	Assigns an Unicode string to a Variant (see page 3430).
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantMod (see page 4988)	Returns the remainder on division of two Variants (see page 4997).
	VariantMod2 (see page 4988)	Returns the remainder on division of two Variants (see page 4997).
	VariantMul (see page 4989)	Multiplies two Variants (see page 4997).
	VariantMul2 (see page 4989)	Multiplies two Variants (see page 4997).
	VariantNeg (see page 4990)	Inverts the sign of a Variant (see page 3430).
	VariantNot (see page 4990)	Performs a **not** operation on a Variant (see page 3430).
	VariantOr (see page 4990)	Performs an **or** operation between two Variants (see page 4997).
	VariantOr2 (see page 4991)	Performs an **or** operation between two Variants (see page 4997).
	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.
	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.
	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.

	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.
	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.
	VariantShl (see page 4992)	This is function VarHlpr.VariantShl.
	VariantShl2 (see page 4993)	Performs an **shl** (shift left) operation between two Variants (see page 4997).
	VariantShr (see page 4993)	Performs an **shr** (shift right) operation between two Variants (see page 4997).
	VariantShr2 (see page 4994)	Performs an **shr** (shift right) operation between two Variants (see page 4997).
	VariantSub (see page 4994)	Subtracts two Variants (see page 4997).
	VariantSub2 (see page 4995)	Subtracts two Variants (see page 4997).
	VariantToUnicodeString (see page 4995)	Converts a Variant (see page 3430) to an Unicode string.
	VariantXor (see page 4996)	Performs a **xor** (exclusive or) operation between two Variants (see page 4997).
	VariantXor2 (see page 4996)	Performs a **xor** (exclusive or) operation between two Variants (see page 4997).

53.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	VariantAdd (see page 4981)	Adds two Variants (see page 4997).
	VariantAdd2 (see page 4982)	Adds two Variants (see page 4997).
	VariantAnd (see page 4982)	Performs an **and** operation between two Variant (see page 3430) values.
	VariantAnd2 (see page 4983)	Performs an **and** operation between two Variants (see page 4997).
	VariantArrayRedim (see page 4983)	Resizes a Variant (see page 3430) array.
	VariantCast (see page 4984)	Performs a type-cast on a Variant (see page 3430).
	VariantClear (see page 4984)	Empties a Variant (see page 3430), so that it is unassigned.
	VariantCpy (see page 4985)	Copies a Variant (see page 3430).
	VariantDiv (see page 4985)	Divides two Variants (see page 4997).
	VariantDiv2 (see page 4986)	Divides two Variants (see page 4997).
	VariantFromUnicodeString (see page 4986)	Assigns an Unicode string to a Variant (see page 3430).
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantGetElement (see page 4987)	Returns an element from a Variant (see page 3430) array.
	VariantMod (see page 4988)	Returns the remainder on division of two Variants (see page 4997).
	VariantMod2 (see page 4988)	Returns the remainder on division of two Variants (see page 4997).
	VariantMul (see page 4989)	Multiplies two Variants (see page 4997).
	VariantMul2 (see page 4989)	Multiplies two Variants (see page 4997).
	VariantNeg (see page 4990)	Inverts the sign of a Variant (see page 3430).
	VariantNot (see page 4990)	Performs a **not** operation on a Variant (see page 3430).
	VariantOr (see page 4990)	Performs an **or** operation between two Variants (see page 4997).
	VariantOr2 (see page 4991)	Performs an **or** operation between two Variants (see page 4997).
	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.
	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.
	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.
	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.
	VariantPutElement (see page 4992)	Sets the value of an element in a Variant (see page 3430) array.
	VariantShl (see page 4992)	This is function VarHlpr.VariantShl.
	VariantShl2 (see page 4993)	Performs an **shl** (shift left) operation between two Variants (see page 4997).
	VariantShr (see page 4993)	Performs an **shr** (shift right) operation between two Variants (see page 4997).
	VariantShr2 (see page 4994)	Performs an **shr** (shift right) operation between two Variants (see page 4997).
	VariantSub (see page 4994)	Subtracts two Variants (see page 4997).
	VariantSub2 (see page 4995)	Subtracts two Variants (see page 4997).
	VariantToUnicodeString (see page 4995)	Converts a Variant (see page 3430) to an Unicode string.
	VariantXor (see page 4996)	Performs a **xor** (exclusive or) operation between two Variants (see page 4997).
	VariantXor2 (see page 4996)	Performs a **xor** (exclusive or) operation between two Variants (see page 4997).

53.1.1 VarHlpr.VariantAdd Function

Adds two Variants (see page 4997).

Pascal

```
procedure VariantAdd(const src: Variant; var dst: Variant);
```

C++

```
VariantAdd(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantAdd adds **src** to **dst** and returns the result as **dst**.

The input values must have compatible types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantAdd2 (see page 4982)

VariantSub (see page 4994)

VariantSub2 (see page 4995)

53.1.2 VarHlpr.VariantAdd2 Function

Adds two Variants (see page 4997).

Pascal

```
function VariantAdd2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantAdd2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantAdd2 adds **V1** to **V2** and returns a new Variant (see page 3430) holding the result.

The input values must have compatible types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantAdd (see page 4981)

VariantSub (see page 4994)

VariantSub2 (see page 4995)

53.1.3 VarHlpr.VariantAnd Function

Performs an **and** operation between two Variant (see page 3430) values.

Pascal

```
procedure VariantAnd(const src: Variant; var dst: Variant);
```

C++

```
VariantAnd(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantAnd performs a bit-wise or a logical **and** operation between **src** and **dst** and returns the result as **dst**.

The input values must be convertible to numerical or boolean types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantAnd2 (see page 4983)

VariantOr (see page 4990)

VariantOr2 (see page 4991)

53.1.4 VarHlpr.VariantAnd2 Function

Performs an **and** operation between two Variants (see page 4997).

Pascal

```
function VariantAnd2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantAnd2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantAnd2 performs a bit-wise or a logical **and** operation between **V1** and **V2** and returns a new Variant (see page 3430) holding the result.

The input values must be convertible to numerical or boolean types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantAnd (see page 4982)

VariantOr (see page 4990)

VariantOr2 (see page 4991)

53.1.5 VarHlpr.VariantArrayRedim Function

Resizes a Variant (see page 3430) array.

Pascal

```
procedure VariantArrayRedim(var V: Variant; High: Integer);
```

C++

```
VariantArrayRedim(Variant V, int High);
```

File

VarHlpr

Description

VariantArrayRedim resizes the given Variant (see page 3430) array by changing the high bound of the rightmost dimension to the given value.

The input value must be a Variant (see page 3430) array; otherwise an EVariantInvalidArgError exception will be raised.

See Also

VariantGetElement (see page 4987)

VariantPutElement (see page 4992)

53.1.6 VarHlpr.VariantCast Function

Performs a type-cast on a Variant (see page 3430).

Pascal

```
procedure VariantCast(const src: Variant; var dst: Variant; vt: Integer);
```

C++

```
VariantCast(const Variant src, Variant dst, int vt);
```

File

VarHlpr

Description

VariantCast type-casts **src** to the desired type and returns the resulted Variant (see page 3430) as **dst**. **vt** is a value which identifies the type of the destination Variant (see page 3430).

An EVariantTypeCastError exception will be raised if the source cannot be type-casted to the desired type.

See Also

VariantClear (see page 4984)

VarCast

53.1.7 VarHlpr.VariantClear Function

Empties a Variant (see page 3430), so that it is unassigned.

Pascal

```
procedure VariantClear(var V: Variant);
```

C++

```
VariantClear(Variant V);
```

File

VarHlpr

Description

Calling VariantClear is equivalent to assigning the Unassigned constant to the Variant (see page 3430). After calling VariantClear, the VarIsEmpty function returns true, and the VarType function returns varEmpty (see page 3933). Using an unassigned variant in an expression causes an exception to be thrown. Likewise, if you attempt to convert an unassigned Variant (see page 3430) to another type (using VariantCast (see page 4984)), an exception is thrown.

Note: Do not confuse clearing a Variant (see page 3430), which leaves it unassigned, with assigning a Null value. A Null Variant (see page 3430) is still assigned, but has the value Null. Unlike unassigned Variants (see page 4997), Null Variants (see page 4997) can be used in expressions and can be converted to other types of Variants (see page 4997).

See Also

VariantCast (see page 4984)

VarClear (see page 3786)

53.1.8 VarHlpr.VariantCpy Function

Copies a Variant (see page 3430).

Pascal

```
procedure VariantCpy(const src: Variant; var dst: Variant);
```

C++

```
VariantCpy(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantCpy copies the Variant (see page 3430) value contained in **src** to **dst**.

See Also

VariantClear (see page 4984)

VariantCast (see page 4984)

53.1.9 VarHlpr.VariantDiv Function

Divides two Variants (see page 4997).

Pascal

```
procedure VariantDiv(const src: Variant; var dst: Variant);
```

C++

```
VariantDiv(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantDiv divides **src** to **dst** and returns the result as **dst**.

The input values must be convertible to numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantDiv2 (see page 4986)

VariantMul (see page 4989)

VariantMul2 (see page 4989)

53.1.10 VarHlpr.VariantDiv2 Function

Divides two Variants (see page 4997).

Pascal

```
function VariantDiv2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantDiv2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantDiv2 divides **V1** to **V2** and returns a new Variant (see page 3430) holding the result.

The input values must be convertible to numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantDiv (see page 4985)

VariantMul (see page 4989)

VariantMul2 (see page 4989)

53.1.11 VarHlpr.VariantFromUnicodeString Function

Assigns an Unicode string to a Variant (see page 3430).

Pascal

```
procedure VariantFromUnicodeString(var V: Variant; const Str: UnicodeString);
```

C++

```
VariantFromUnicodeString(Variant V, const UnicodeString Str);
```

File

VarHlpr

Description

VariantFromUnicodeString assigns an Unicode string to a given Variant (see page 3430) parameter. The old value, if there was one, of the Variant (see page 3430) will be lost.

See Also

VariantToUnicodeString (see page 4995)

VariantClear (see page 4984)

VariantCast (see page 4984)

53.1.12 VarHlpr.VariantGetElement Function

Returns an element from a Variant (see page 3430) array.

Pascal

```
function VariantGetElement(const V: Variant; i1: integer): Variant; overload;
function VariantGetElement(const V: Variant; i1: integer; i2: integer): Variant; overload;
function VariantGetElement(const V: Variant; i1: integer; i2: integer; i3: integer): Variant;
overload;
function VariantGetElement(const V: Variant; i1: integer; i2: integer; i3: integer; i4:
integer): Variant; overload;
function VariantGetElement(const V: Variant; i1: integer; i2: integer; i3: integer; i4:
integer; i5: integer): Variant; overload;
```

C++

```
Variant VariantGetElement(const Variant V, int i1);
Variant VariantGetElement(const Variant V, int i1, int i2);
Variant VariantGetElement(const Variant V, int i1, int i2, int i3);
Variant VariantGetElement(const Variant V, int i1, int i2, int i3, int i4);
Variant VariantGetElement(const Variant V, int i1, int i2, int i3, int i4, int i5);
```

File

VarHlpr

Description

VariantGetElement returns the Variant (see page 3430) value located at the specified indices in the Variant (see page 3430) array **V**.

This function comes in five forms. Each form accepts a Variant (see page 3430) array and a number of indices in that array, one for each dimension.

See Also

VariantPutElement (see page 4992)

VarArrayGet (see page 5079)

VarArrayPut (see page 5081)

53.1.13 VarHlpr.VariantMod Function

Returns the remainder on division of two Variants (see page 4997).

Pascal

```
procedure VariantMod(const src: Variant; var dst: Variant);
```

C++

```
VariantMod(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantMod calculates the remainder on division of **src** by **dst** and returns the result as **dst**.

The input values must be convertible to integer numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantMod2 (see page 4988)

VariantDiv (see page 4985)

VariantDiv2 (see page 4986)

53.1.14 VarHlpr.VariantMod2 Function

Returns the remainder on division of two Variants (see page 4997).

Pascal

```
function VariantMod2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantMod2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantMod2 calculates the remainder on division of **V1** by **V2** and returns a new Variant (see page 3430) holding the result.

The input values must be convertible to integer numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantMod (see page 4988)

VariantDiv (see page 4985)

VariantDiv2 (see page 4986)

53.1.15 VarHlpr.VariantMul Function

Multiplies two Variants (see page 4997).

Pascal

```
procedure VariantMul(const src: Variant; var dst: Variant);
```

C++

```
VariantMul(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantMul multiplies **src** to **dst** and returns the result as **dst**.

The input values must be convertible to numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantMul2 (see page 4989)

VariantDiv (see page 4985)

VariantDiv2 (see page 4986)

53.1.16 VarHlpr.VariantMul2 Function

Multiplies two Variants (see page 4997).

Pascal

```
function VariantMul2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantMul2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantMul2 multiplies **V1** to **V2** and returns a new Variant (see page 3430) holding the result.

The input values must be convertible to numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantMul (see page 4989)

VariantDiv (see page 4985)

VariantDiv2 (see page 4986)

53.1.17 VarHlpr.VariantNeg Function

Inverts the sign of a Variant (see page 3430).

Pascal

```
function VariantNeg(const V1: Variant): Variant;
```

C++

```
Variant VariantNeg(const Variant V1);
```

File

VarHlpr

Description

VariantNeg will invert the sign of **V1** from positive to negative and vice-versa.

The input parameter must be convertible to a numerical type; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantNot (see page 4990)

53.1.18 VarHlpr.VariantNot Function

Performs a **not** operation on a Variant (see page 3430).

Pascal

```
function VariantNot(const V1: Variant): Variant;
```

C++

```
Variant VariantNot(const Variant V1);
```

File

VarHlpr

Description

VariantNot performs a bit-wise or a logical **not** operation on **V1** and returns a new Variant (see page 3430) holding the result.

The input value must be convertible to a numerical or boolean type; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantNeg (see page 4990)

53.1.19 VarHlpr.VariantOr Function

Performs an **or** operation between two Variants (see page 4997).

Pascal

```
procedure VariantOr(const src: Variant; var dst: Variant);
```

C++

```
VariantOr(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantOr performs a bit-wise or a logical **or** operation between **src** and **dst** and returns the result as **dst**.

Given input values must be convertible to numerical or boolean types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantOr2 (see page 4991)

VariantAnd (see page 4982)

VariantAnd2 (see page 4983)

53.1.20 VarHlpr.VariantOr2 Function

Performs an **or** operation between two Variants (see page 4997).

Pascal

```
function VariantOr2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantOr2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantOr2 performs a bit-wise or a logical **or** operation between **V1** and **V2** and returns a new Variant (see page 3430) holding the result.

The input values must be convertible to numerical or boolean types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantOr (see page 4990)

VariantAnd (see page 4982)

VariantAnd2 (see page 4983)

53.1.21 VarHlpr.VariantPutElement Function

Sets the value of an element in a Variant (see page 3430) array.

Pascal

```
procedure VariantPutElement(var V: Variant; const data: Variant; i1: integer); overload;
procedure VariantPutElement(var V: Variant; const data: Variant; i1: integer; i2: integer);
overload;
procedure VariantPutElement(var V: Variant; const data: Variant; i1: integer; i2: integer; i3:
integer); overload;
procedure VariantPutElement(var V: Variant; const data: Variant; i1: integer; i2: integer; i3:
integer; i4: integer); overload;
procedure VariantPutElement(var V: Variant; const data: Variant; i1: integer; i2: integer; i3:
integer; i4: integer; i5: integer); overload;
```

C++

```
VariantPutElement(Variant V, const Variant data, int i1);
VariantPutElement(Variant V, const Variant data, int i1, int i2);
VariantPutElement(Variant V, const Variant data, int i1, int i2, int i3);
VariantPutElement(Variant V, const Variant data, int i1, int i2, int i3, int i4);
VariantPutElement(Variant V, const Variant data, int i1, int i2, int i3, int i4, int i5);
```

File

VarHlpr

Description

VariantPutElement sets the Variant (see page 3430) value located at the specified indices in the Variant (see page 3430) array **V**.

This function comes in five forms. Each form accepts a Variant (see page 3430) array, a Variant (see page 3430) value to assign, and a number of indices in that array, one for each dimension.

See Also

VariantGetElement (see page 4987)

VarArrayGet (see page 5079)

VarArrayPut (see page 5081)

53.1.22 VarHlpr.VariantShl Function

Pascal

```
procedure VariantShl(const src: Variant; var dst: Variant);
```

C++

```
VariantShl(const Variant src, Variant dst);
```

File

VarHlpr

Description

This is function VarHlpr.VariantShl.

53.1.23 VarHlpr.VariantShl2 Function

Performs an **shl** (shift left) operation between two Variants (see page 4997).

Pascal

```
function VariantShl2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantShl2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantShl2 performs a bit-wise **shl** (shift left) operation between **V1** and **V2** and returns a new Variant (see page 3430) holding the result.

The input values must be convertible to numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantShl (see page 4992)

VariantShr (see page 4993)

VariantShr2 (see page 4994)

53.1.24 VarHlpr.VariantShr Function

Performs an **shr** (shift right) operation between two Variants (see page 4997).

Pascal

```
procedure VariantShr(const src: Variant; var dst: Variant);
```

C++

```
VariantShr(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantShr performs a bit-wise **shr** (shift right) operation between **src** and **dst** and returns the result as **dst**.

The input values must be convertible to numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantShr2 (see page 4994)

VariantShl (see page 4992)

VariantShl2 (see page 4993)

53.1.25 VarHlpr.VariantShr2 Function

Performs an **shr** (shift right) operation between two Variants (see page 4997).

Pascal

```
function VariantShr2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantShr2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantShr2 performs a bit-wise **shr** (shift right) operation between **V1** and **V2** and returns a new Variant (see page 3430) holding the result.

The input values must be convertible to numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantShr (see page 4993)

VariantShl (see page 4992)

VariantShl2 (see page 4993)

53.1.26 VarHlpr.VariantSub Function

Subtracts two Variants (see page 4997).

Pascal

```
procedure VariantSub(const src: Variant; var dst: Variant);
```

C++

```
VariantSub(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantSub subtracts **src** from **dst** and returns the result as **dst**.

The input values must have compatible types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantSub2 (see page 4995)

VariantAdd (see page 4981)

VariantAdd2 (see page 4982)

53.1.27 VarHlpr.VariantSub2 Function

Subtracts two Variants (see page 4997).

Pascal

```
function VariantSub2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantSub2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantSub2 subtracts **V1** from **V2** and returns a new Variant (see page 3430) holding the result.

The input values must have compatible types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantSub (see page 4994)

VariantAdd (see page 4981)

VariantAdd2 (see page 4982)

53.1.28 VarHlpr.VariantToUnicodeString Function

Converts a Variant (see page 3430) to an Unicode string.

Pascal

```
procedure VariantToUnicodeString(const V: Variant; var Str: UnicodeString);
```

C++

```
VariantToUnicodeString(const Variant V, UnicodeString Str);
```

File

VarHlpr

Description

VariantToUnicodeString converts the parameter **V** to an Unicode string and places the result into **Str (see page 3764)**.

See Also

VariantFromUnicodeString (see page 4986)

VariantClear (see page 4984)

VariantCast (see page 4984)

53.1.29 VarHlpr.VariantXor Function

Performs a **xor** (exclusive or) operation between two Variants (see page 4997).

Pascal

```
procedure VariantXor(const src: Variant; var dst: Variant);
```

C++

```
VariantXor(const Variant src, Variant dst);
```

File

VarHlpr

Description

VariantXor performs a bit-wise **xor** (exclusive or) operation between **src** and **dst** and returns the result as **dst**.

The input values must be convertible to numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantXor2 (see page 4996)

VariantOr (see page 4990)

VariantOr2 (see page 4991)

53.1.30 VarHlpr.VariantXor2 Function

Performs a **xor** (exclusive or) operation between two Variants (see page 4997).

Pascal

```
function VariantXor2(const V1: Variant; const V2: Variant): Variant;
```

C++

```
Variant VariantXor2(const Variant V1, const Variant V2);
```

File

VarHlpr

Description

VariantXor2 performs a bit-wise **xor** (exclusive or) operation between **V1** and **V2** and returns a new Variant (see page 3430) holding the result.

The input values must be convertible to numerical types; otherwise an EVariantTypeCastError exception will be raised.

See Also

VariantXor (see page 4996)

VariantOr (see page 4990)

VariantOr2 (see page 4991)

54 Variants Namespace

This is namespace Variants.

Topics

Name	Description
Classes (see page 5002)	The following table lists classes in this documentation.
Interfaces (see page 5045)	The following table lists interfaces in this documentation.
Functions (see page 5048)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 5105)	The following table lists structs, records, enums in this documentation.
Types (see page 5108)	The following table lists types in this documentation.
Variables (see page 5110)	The following table lists variables in this documentation.

Classes

	Name	Description
	EVariantArrayCreateError (see page 5002)	EVariantArrayCreateError is the exception class for failure to create or resize a variant array.
	EVariantArrayLockedError (see page 5003)	EVariantArrayLockedError is the exception class for errors that occur because a variant array is locked or fixed.
	EVariantBadIndexError (see page 5004)	EVariantBadIndexError is the exception class for errors that occur because a variant array index is out of bounds.
	EVariantBadVarTypeError (see page 5004)	EVariantBadVarTypeError is the exception class for variant type errors.
	EVariantDispatchError (see page 5005)	EVariantDispatchError is the exception class for failed dispatch attempts.
	EVariantInvalidArgError (see page 5005)	EVariantInvalidArgError is the exception class for operations that fail due to invalid variant data.
	EVariantInvalidNullOpError (see page 5006)	EVariantInvalidNullOpError is the exception class for invalid Null (see page 5075) variant operations.
	EVariantInvalidOpError (see page 5007)	EVariantInvalidOpError is the exception class for invalid variant operations.
	EVariantNotAnArrayError (see page 5007)	EVariantNotAnArrayError is the exception class inappropriate variant array operations.
	EVariantNotImplError (see page 5008)	EVariantNotImplError is the exception class for unimplemented variant operations.
	EVariantOutOfMemoryError (see page 5008)	EVariantOutOfMemoryError is the exception class for variant operations that cannot allocate necessary memory.
	EVariantOverflowError (see page 5009)	EVariantOverflowError is the exception class for overflow in a variant operation.
	EVariantRangeCheckError (see page 5010)	EVariantRangeCheckError is the exception class for out-of-range errors in a variant operation.
	EVariantTypeCastError (see page 5010)	EVariantTypeCastError is the exception class for variant type cast errors.
	EVariantUnexpectedError (see page 5011)	EVariantUnexpectedError is the exception class for unexpected variant errors.

	TCustomVariantType (see page 5011)	TCustomVariantType is the base class for Delphi custom variant types.
	TInvokeableVariantType (see page 5037)	TInvokeableVariantType is the base class for custom Variant (see page 3430) types that implement custom Variants with properties and methods.

Functions

	Name	Description
	_DispInvoke (see page 5050)	This is function Variants._DispInvoke.
	_OleVarFromInt (see page 5051)	This is function Variants._OleVarFromInt.
	_OleVarFromInt64 (see page 5051)	This is function Variants._OleVarFromInt64.
	_OleVarFromLStr (see page 5051)	This is function Variants._OleVarFromLStr.
	_OleVarFromPStr (see page 5052)	This is function Variants._OleVarFromPStr.
	_OleVarFromUInt64 (see page 5052)	This is function Variants._OleVarFromUInt64.
	_OleVarFromUStr (see page 5052)	This is function Variants._OleVarFromUStr.
	_OleVarFromVar (see page 5053)	This is function Variants._OleVarFromVar.
	_VarAdd (see page 5053)	This is function Variants._VarAdd.
	_VarAddRef (see page 5053)	This is function Variants._VarAddRef.
	_VarAnd (see page 5054)	This is function Variants._VarAnd.
	_VarArrayGet (see page 5054)	This is function Variants._VarArrayGet.
	_VarArrayPut (see page 5054)	This is function Variants._VarArrayPut.
	_VarArrayRedim (see page 5055)	This is function Variants._VarArrayRedim.
	_VarCast (see page 5055)	This is function Variants._VarCast.
	_VarCastOle (see page 5055)	This is function Variants._VarCastOle.
	_VarClear (see page 5056)	This is function Variants._VarClear.
	_VarClr (see page 5056)	This is function Variants._VarClr.
	_VarCmpEQ (see page 5056)	This is function Variants._VarCmpEQ.
	_VarCmpGE (see page 5057)	This is function Variants._VarCmpGE.
	_VarCmpGT (see page 5057)	This is function Variants._VarCmpGT.
	_VarCmpLE (see page 5057)	This is function Variants._VarCmpLE.
	_VarCmpLT (see page 5058)	This is function Variants._VarCmpLT.
	_VarCmpNE (see page 5058)	This is function Variants._VarCmpNE.
	_VarCopy (see page 5058)	This is function Variants._VarCopy.
	_VarCopyNoInd (see page 5059)	This is function Variants._VarCopyNoInd.
	_VarDiv (see page 5059)	This is function Variants._VarDiv.
	_VarFromBool (see page 5059)	This is function Variants._VarFromBool.
	_VarFromCurr (see page 5060)	This is function Variants._VarFromCurr.
	_VarFromDisp (see page 5060)	This is function Variants._VarFromDisp.
	_VarFromDynArray (see page 5060)	This is function Variants._VarFromDynArray.
	_VarFromInt (see page 5061)	This is function Variants._VarFromInt.
	_VarFromInt64 (see page 5061)	This is function Variants._VarFromInt64.
	_VarFromIntf (see page 5061)	This is function Variants._VarFromIntf.
	_VarFromLStr (see page 5062)	This is function Variants._VarFromLStr.
	_VarFromPStr (see page 5062)	This is function Variants._VarFromPStr.
	_VarFromReal (see page 5062)	This is function Variants._VarFromReal.
	_VarFromTDateTime (see page 5063)	This is function Variants._VarFromTDateTime.
	_VarFromUInt64 (see page 5063)	This is function Variants._VarFromUInt64.
	_VarFromUStr (see page 5063)	This is function Variants._VarFromUStr.
	_VarFromWChar (see page 5064)	This is function Variants._VarFromWChar.
	_VarFromWStr (see page 5064)	This is function Variants._VarFromWStr.
	_VarMod (see page 5064)	This is function Variants._VarMod.
	_VarMul (see page 5065)	This is function Variants._VarMul.
	_VarNeg (see page 5065)	This is function Variants._VarNeg.
	_VarNot (see page 5065)	This is function Variants._VarNot.
	_VarOr (see page 5066)	This is function Variants._VarOr.
	_VarRDiv (see page 5066)	This is function Variants._VarRDiv.
	_VarShl (see page 5066)	This is function Variants._VarShl.

	_VarShr (see page 5067)	This is function Variants._VarShr.
	_VarSub (see page 5067)	This is function Variants._VarSub.
	_VarToBool (see page 5067)	This is function Variants._VarToBool.
	_VarToCurrency (see page 5068)	This is function Variants._VarToCurrency.
	_VarToDisp (see page 5068)	This is function Variants._VarToDisp.
	_VarToDynArray (see page 5068)	This is function Variants._VarToDynArray.
	_VarToInt64 (see page 5069)	This is function Variants._VarToInt64.
	_VarToInteger (see page 5069)	This is function Variants._VarToInteger.
	_VarToIntf (see page 5069)	This is function Variants._VarToIntf.
	_VarToLStr (see page 5070)	This is function Variants._VarToLStr.
	_VarToPStr (see page 5070)	This is function Variants._VarToPStr.
	_VarToReal (see page 5070)	This is function Variants._VarToReal.
	_VarToUInt64 (see page 5071)	This is function Variants._VarToUInt64.
	_VarToUStr (see page 5071)	This is function Variants._VarToUStr.
	_VarToWStr (see page 5071)	This is function Variants._VarToWStr.
	_VarXor (see page 5072)	This is function Variants._VarXor.
	DynArrayFromVariant (see page 5072)	Creates a dynamic array from a Variant (see page 3430).
	DynArrayToVariant (see page 5072)	Creates a Variant (see page 3430) array from a dynamic array.
	FindCustomVariantType (see page 5073)	Retrieves the object that implements a custom Variant (see page 3430) type.
	FindCustomVariantType (see page 5073)	Retrieves the object that implements a custom Variant (see page 3430) type.
	FindVarData (see page 5074)	Returns pointer to variant's data.
	HandleConversionException (see page 5074)	Handles exceptions during variant type conversions.
	Null (see page 5075)	Returns a Null variant.
	Unassigned (see page 5076)	Returns an "empty" variant.
	VarArrayAsPSafeArray (see page 5077)	This is function Variants.VarArrayAsPSafeArray.
	VarArrayCreate (see page 5077)	Creates a variant array.
	VarArrayCreateError (see page 5078)	Indicates an array creation error.
	VarArrayDimCount (see page 5078)	Returns number of dimensions of a variant array.
	VarArrayGet (see page 5079)	Returns a Variant (see page 3430) that represents a single value from a multi-dimensional Variant (see page 3430) array.
	VarArrayHighBound (see page 5079)	Returns high bound for a dimension in a variant array.
	VarArrayLock (see page 5080)	Locks a variant array and returns a pointer to the data.
	VarArrayLowBound (see page 5080)	Returns the low bound of a dimension in a variant array.
	VarArrayOf (see page 5081)	Creates and fills a one-dimensional variant array.
	VarArrayPut (see page 5081)	Sets the value of a single cell in a multi-dimensional Variant (see page 3430) array.
	VarArrayRef (see page 5082)	Returns a reference to the specified variant array.
	VarArrayUnlock (see page 5083)	Unlocks a variant array.
	VarAsError (see page 5083)	Converts a HRESULT (see page 3826) into an Error (see page 3662) variant.
	VarAsType (see page 5083)	Converts a variant to specified type.
	VarCastError (see page 5084)	Raises an EVariantTypeCastError (see page 5010) exception.
	VarCastError (see page 5084)	Raises an EVariantTypeCastError (see page 5010) exception.
	VarCheckEmpty (see page 5084)	Raises an exception if a specified variant's value is Unassigned (see page 5076).
	VarCompareValue (see page 5085)	Returns the relationship between Variants.
	VarCopyNoInd (see page 5086)	Copies a Variant (see page 3430).
	VarEnsureRange (see page 5086)	Returns a Variant (see page 3430) with a value in a specified range.
	VarFromDateTime (see page 5087)	Returns a variant containing a specified data and time.
	VarInRange (see page 5087)	Indicates whether a Variant (see page 3430)'s value is in a specified range.
	VarInvalidNullOp (see page 5088)	Indicate variant operation on null.
	VarInvalidOp (see page 5088)	Indicate invalid variant operation.
	VarIsArray (see page 5089)	Indicates whether the specified variant is an array.
	VarIsArray (see page 5089)	Indicates whether the specified variant is an array.
	VarIsByRef (see page 5089)	Indicates whether the specified variant's value is by reference.
	VarIsClear (see page 5090)	Indicates whether the specified variant has an undefined value.

	VarIsCustom (see page 5090)	Indicates whether the specified variant is a custom variant.
	VarIsEmpty (see page 5091)	Indicates whether the specified variant is unassigned.
	VarIsEmptyParam (see page 5092)	Indicates whether the specified variant represents an unassigned optional parameter.
	VarIsError (see page 5092)	Indicates whether the specified variant is an error variant; optionally converts variant back to HRESULT (see page 3826).
	VarIsError (see page 5092)	Indicates whether the specified variant is an error variant; optionally converts variant back to HRESULT (see page 3826).
	VarIsFloat (see page 5093)	Indicates whether the specified variant represents a floating-point value.
	VarIsNull (see page 5093)	Indicates whether the specified variant is Null (see page 5075).
	VarIsNumeric (see page 5094)	Indicates whether the specified variant represents a numeric value.
	VarIsOrdinal (see page 5094)	Indicates whether the specified variant represents an ordinal value.
	VarIsStr (see page 5095)	Indicates whether the specified variant represents a string value.
	VarIsType (see page 5095)	Indicates whether the specified variant represents a specified type.
	VarIsType (see page 5095)	Indicates whether the specified variant represents a specified type.
	VarOverflowError (see page 5096)	Raises an EVariantOverflowError (see page 5009) exception.
	VarRangeCheckError (see page 5096)	Raises an EVariantRangeCheckError (see page 5010) exception.
	VarResultCheck (see page 5097)	Raises variant exception based on HRESULT (see page 3826) value.
	VarResultCheck (see page 5097)	Raises variant exception based on HRESULT (see page 3826) value.
	VarSameValue (see page 5097)	Indicates whether two Variants have equivalent values.
	VarSupports (see page 5098)	Indicates whether the Variant (see page 3430)'s value is an interface that supports a specified interface.
	VarSupports (see page 5098)	Indicates whether the Variant (see page 3430)'s value is an interface that supports a specified interface.
	VarToDateTime (see page 5098)	Converts a specified variant to a TDateTime (see page 3335) value.
	VarToStr (see page 5099)	Converts a variant's value to a string.
	VarToStrDef (see page 5099)	Converts a variant's value to a string.
	VarToWideStr (see page 5100)	Converts a variant's value to a WideString (see page 3476).
	VarToWideStrDef (see page 5100)	Converts a variant's value to a WideString (see page 3476).
	VarType (see page 5101)	Returns the type code of a specified variant.
	VarTypeAsText (see page 5102)	Returns variant type descriptive string.
	VarTypeIsValidArrayType (see page 5103)	Indicates whether a Variant (see page 3430) type code represents a type that can be used for the elements in a Variant (see page 3430) array.
	VarTypeIsValidElementType (see page 5103)	Indicates whether a Variant (see page 3430) type code represents a type that can be used for the elements in a Variant (see page 3430) array.

Interfaces

	Name	Description
	IVarInstanceReference (see page 5045)	This is class Variants.IVarInstanceReference.
	IVarInvokeable (see page 5046)	This is class Variants.IVarInvokeable.

Structs, Records, Enums

	Name	Description
	TBooleanToStringRule (see page 5105)	TBooleanToStringRule enumerates possible rules for BooleanToStringRule (see page 5110).
	TNullCompareRule (see page 5105)	TNullCompareRule enumerates possible rules for comparing variant nulls with other values.
	TVarCompareResult (see page 5106)	This is record Variants.TVarCompareResult.
	TVariantRelationship (see page 5106)	TVariantRelationship describes the results of comparing two Variants.

Types

Name	Description
TAnyProc (see page 5108)	This is type Variants.TAnyProc.
TCustomVariantTypeClass (see page 5108)	This is type Variants.TCustomVariantTypeClass.
TVarDataArray (see page 5109)	This is type Variants.TVarDataArray.
TVarDispProc (see page 5109)	This is type Variants.TVarDispProc.

Variables

Name	Description
BooleanToStringRule (see page 5110)	Specifies rule fixing up Boolean values converted to strings.
ChangeAnyProc (see page 5111)	This is variable Variants.ChangeAnyProc.
ClearAnyProc (see page 5111)	This is variable Variants.ClearAnyProc.
EmptyParam (see page 5111)	Contains an OleVariant (see page 3281) that represents an unused optional parameter on a dual interface.
NullAsStringValue (see page 5112)	Specifies string value of Null (see page 5075) variants.
NullEqualityRule (see page 5112)	Specifies rule for Null (see page 5075) variant equality comparison.
NullMagnitudeRule (see page 5113)	Specifies rule for Null (see page 5075) variant magnitude comparison.
NullStrictConvert (see page 5114)	Specifies whether Null (see page 5075) conversion is an error.
OleVariantInt64AsDouble (see page 5114)	This is variable Variants.OleVariantInt64AsDouble.
PackVarCreation (see page 5115)	Specifies whether space-efficient Variant (see page 3430) Types (see page 4683) are preferred.
RefAnyProc (see page 5115)	This is variable Variants.RefAnyProc.
VarDispProc (see page 5115)	Provides the support for IDispatch (see page 3498)-based Automation.

54.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EVariantArrayCreateError (see page 5002)	EVariantArrayCreateError is the exception class for failure to create or resize a variant array.
	EVariantArrayLockedError (see page 5003)	EVariantArrayLockedError is the exception class for errors that occur because a variant array is locked or fixed.
	EVariantBadIndexError (see page 5004)	EVariantBadIndexError is the exception class for errors that occur because a variant array index is out of bounds.
	EVariantBadVarTypeError (see page 5004)	EVariantBadVarTypeError is the exception class for variant type errors.
	EVariantDispatchError (see page 5005)	EVariantDispatchError is the exception class for failed dispatch attempts.
	EVariantInvalidArgError (see page 5005)	EVariantInvalidArgError is the exception class for operations that fail due to invalid variant data.
	EVariantInvalidNullOpError (see page 5006)	EVariantInvalidNullOpError is the exception class for invalid Null (see page 5075) variant operations.
	EVariantInvalidOpError (see page 5007)	EVariantInvalidOpError is the exception class for invalid variant operations.
	EVariantNotAnArrayError (see page 5007)	EVariantNotAnArrayError is the exception class inappropriate variant array operations.
	EVariantNotImplError (see page 5008)	EVariantNotImplError is the exception class for unimplemented variant operations.
	EVariantOutOfMemoryError (see page 5008)	EVariantOutOfMemoryError is the exception class for variant operations that cannot allocate necessary memory.
	EVariantOverflowError (see page 5009)	EVariantOverflowError is the exception class for overflow in a variant operation.
	EVariantRangeCheckError (see page 5010)	EVariantRangeCheckError is the exception class for out-of-range errors in a variant operation.
	EVariantTypeCastError (see page 5010)	EVariantTypeCastError is the exception class for variant type cast errors.
	EVariantUnexpectedError (see page 5011)	EVariantUnexpectedError is the exception class for unexpected variant errors.
	TCustomVariantType (see page 5011)	TCustomVariantType is the base class for Delphi custom variant types.
	TInvokeableVariantType (see page 5037)	TInvokeableVariantType is the base class for custom Variant (see page 3430) types that implement custom Variants (see page 4997) with properties and methods.

54.1.1 EVariantArrayCreateError Class

EVariantArrayCreateError is the exception class for failure to create or resize a variant array.

Class Hierarchy

Pascal

```
EVariantArrayCreateError = class(EVariantError);
```

C++

```
class EVariantArrayCreateError : public EVariantError;
```

File

Variants

Description

EVariantArrayCreateError is raised when an attempt to create or resize a variant array fails. To raise this exception programmatically, call VarArrayCreateError (see page 5078)

See Also

VarArrayCreateError (see page 5078)

TVarData (see page 3813)

VarArrayCreate (see page 5077)

VarArrayOf (see page 5081)

VarArrayRedim

TCustomVariantType (see page 5011)

VarArrayCreateError (see page 5078)

54.1.2 EVariantArrayLockedError Class

EVariantArrayLockedError is the exception class for errors that occur because a variant array is locked or fixed.

Class Hierarchy

Pascal

```
EVariantArrayLockedError = class(EVariantError);
```

C++

```
class EVariantArrayLockedError : public EVariantError;
```

File

Variants

Description

EVariantArrayLockedError is raised when an operation on a variant array fails because the array is locked or fixed.

See Also

TVarData (see page 3813)

TVariantManager

VarAsType (see page 5083)

VarArrayLock (see page 5080)

VarArrayUnlock (see page 5083)

VarArrayOf (see page 5081)

VarArrayRedim

54.1.3 EVariantBadIndexError Class

EVariantBadIndexError is the exception class for errors that occur because a variant array index is out of bounds.

Class Hierarchy

Pascal

```
EVariantBadIndexError = class(EVariantError);
```

C++

```
class EVariantBadIndexError : public EVariantError;
```

File

Variants

Description

EVariantBadIndexError is raised when an operation on a variant array fails because an index value is out of bounds.

See Also

TVarData (see page 3813)

TVariantManager

VarAsType (see page 5083)

VarArrayCreate (see page 5077)

VarArrayHighBound (see page 5079)

VarArrayLowBound (see page 5080)

VarArrayOf (see page 5081)

VarArrayRedim

TCustomVariantType (see page 5011)

54.1.4 EVariantBadVarTypeError Class

EVariantBadVarTypeError is the exception class for variant type errors.

Class Hierarchy

Pascal

```
EVariantBadVarTypeError = class(EVariantError);
```

C++

```
class EVariantBadVarTypeError : public EVariantError;
```

File

Variants

Description

EVariantBadVarTypeError is raised when a variant operation fails because of a value that isn't a valid variant type.

See Also

TVarData (see page 3813)

TVariantManager

VarAsType (see page 5083)

TCustomVariantType (see page 5011)

54.1.5 EVariantDispatchError Class

EVariantDispatchError is the exception class for failed dispatch attempts.

Class Hierarchy

Pascal

```
EVariantDispatchError = class(EVariantError);
```

C++

```
class EVariantDispatchError : public EVariantError;
```

File

Variants

Description

EVariantDispatchError is raised when a variant type is unable to dispatch a method call. Do not directly instantiate EVariantDispatchError. Instead call the RaiseDispError method of TCustomVariant.

See Also

TVarData (see page 3813)

TVariantManager

TCustomVariantType (see page 5011)

TCustomVariantType (see page 5011)

54.1.6 EVariantInvalidArgError Class

EVariantInvalidArgError is the exception class for operations that fail due to invalid variant data.

Class Hierarchy

Pascal

```
EVariantInvalidArgError = class(EVariantError);
```

C++

```
class EVariantInvalidArgError : public EVariantError;
```

File

Variants

Description

EVariantInvalidArgError is raised when a variant operation fails because it was passed an inappropriate value.

See Also

TVarData (see page 3813)

TVariantManager

VarAsType (see page 5083)

TCustomVariantType (see page 5011)

54.1.7 EVariantInvalidNullOpError Class

EVariantInvalidNullOpError is the exception class for invalid Null (see page 5075) variant operations.

Class Hierarchy

Pascal

```
EVariantInvalidNullOpError = class(EVariantInvalidOpError);
```

C++

```
class EVariantInvalidNullOpError : public EVariantInvalidOpError;
```

File

Variants

Description

EVariantInvalidNullOpError is raised when a variant operation fails because the operation is not valid for Null (see page 5075) variants. To raise this exception programmatically, call VarInvalidNullOp (see page 5088).

Note: Do not raise EVariantInvalidNullOpError unless NullEqualityRule (see page 5112) or NullMagnitudeRule (see page 5113) is ncrError, and a corresponding operation has been attempted.

See Also

TVarData (see page 3813)

TVariantManager

TCustomVariantType (see page 5011)

VarInvalidNullOp (see page 5088)

Null (see page 5075)

NullEqualityRule (see page 5112)

NullMagnitudeRule (see page 5113)

54.1.8 EVariantInvalidOpError Class

EVariantInvalidOpError is the exception class for invalid variant operations.

Class Hierarchy

Pascal

```
EVariantInvalidOpError = class(EVariantError);
```

C++

```
class EVariantInvalidOpError : public EVariantError;
```

File

Variants

Description

EVariantInvalidOpError is raised when a variant operation fails because the operands are incompatible with the specific operation. To raise this exception programmatically, call VarInvalidOp (see page 5088).

See Also

TVarData (see page 3813)

TVariantManager

TCustomVariantType (see page 5011)

VarInvalidOp (see page 5088)

54.1.9 EVariantNotAnArrayError Class

EVariantNotAnArrayError is the exception class inappropriate variant array operations.

Class Hierarchy

Pascal

```
EVariantNotAnArrayError = class(EVariantError);
```

C++

```
class EVariantNotAnArrayError : public EVariantError;
```

File

Variants

Description

EVariantNotAnArrayError is raised when an array operation is attempted on a variant that does not contain an array.

See Also

VarArrayCreateError (see page 5078)

TVarData (see page 3813)

VarArrayCreate (see page 5077)

VarArrayOf (see page 5081)

VarArrayRedim

TCustomVariantType (see page 5011)

VarArrayCreateError (see page 5078)

54.1.10 EVariantNotImplError Class

EVariantNotImplError is the exception class for unimplemented variant operations.

Class Hierarchy

Pascal

```
EVariantNotImplError = class(EVariantError);
```

C++

```
class EVariantNotImplError : public EVariantError;
```

File

Variants

Description

EVariantNotImplError is raised when an operation is attempted on a variant type that does not implement that operation.

See Also

TVarData (see page 3813)

TVariantManager

TCustomVariantType (see page 5011)

54.1.11 EVariantOutOfMemoryError Class

EVariantOutOfMemoryError is the exception class for variant operations that cannot allocate necessary memory.

Class Hierarchy

Pascal

```
EVariantOutOfMemoryError = class(EVariantError);
```

C++

```
class EVariantOutOfMemoryError : public EVariantError;
```

File

Variants

Description

EVariantOutOfMemoryError is raised when a variant operation fails because of a failure to allocate necessary memory.

See Also

TVarData (see page 3813)

TVariantManager

VarArrayCreate (see page 5077)

VarArrayOf (see page 5081)

VarArrayRedim

VarToDateTime (see page 5098)

TCustomVariantType (see page 5011)

EOutOfMemory (see page 4008)

54.1.12 EVariantOverflowError Class

EVariantOverflowError is the exception class for overflow in a variant operation.

Class Hierarchy

Pascal

```
EVariantOverflowError = class(EVariantError);
```

C++

```
class EVariantOverflowError : public EVariantError;
```

File

Variants

Description

EVariantOverflowError is raised when a variant operation fails because the result was too large. To raise this exception programmatically, call VarOverflowError (see page 5096).

See Also

TVarData (see page 3813)

TVariantManager

VarAsType (see page 5083)

VarToDateTime (see page 5098)

TCustomVariantType (see page 5011)

VarOverflowError (see page 5096)

54.1.13 EVariantRangeCheckError Class

EVariantRangeCheckError is the exception class for out-of-range errors in a variant operation.

Class Hierarchy

Pascal

```
EVariantRangeCheckError = class(EVariantOverflowError);
```

C++

```
class EVariantRangeCheckError : public EVariantOverflowError;
```

File

Variants

Description

EVariantRangeCheckError is raised when a variant operation fails because the result is out-of-range for the destination variant type. To raise this exception programmatically, call VarRangeCheckError (see page 5096).

See Also

TVarData (see page 3813)

TVariantManager

VarAsType (see page 5083)

VarToDateTime (see page 5098)

TCustomVariantType (see page 5011)

VarRangeCheckError (see page 5096)

54.1.14 EVariantTypeCastError Class

EVariantTypeCastError is the exception class for variant type cast errors.

Class Hierarchy

Pascal

```
EVariantTypeCastError = class(EVariantError);
```

C++

```
class EVariantTypeCastError : public EVariantError;
```

File

Variants

Description

EVariantTypeCastError is raised when a variant operation fails because a value could not be cast to the destination variant type. To raise this exception programmatically, call VarCastError (see page 5084).

See Also

TVarData (see page 3813)

TVariantManager

VarAsType (see page 5083)

VarToDateTime (see page 5098)

TCustomVariantType (see page 5011)

VarOverflowError (see page 5096)

54.1.15 EVariantUnexpectedError Class

EVariantUnexpectedError is the exception class for unexpected variant errors.

Class Hierarchy

Pascal

```
EVariantUnexpectedError = class(EVariantError);
```

C++

```
class EVariantUnexpectedError : public EVariantError;
```

File

Variants

Description

EVariantUnexpectedError is raised when a variant operation generates an unexpected error.

See Also

TVarData (see page 3813)

TVariantManager

TCustomVariantType (see page 5011)

54.1.16 TCustomVariantType Class

TCustomVariantType is the base class for Delphi custom variant types.

Class Hierarchy

Pascal

```
TCustomVariantType = class(TObject, IInterface);
```

C++

```
class TCustomVariantType : public TObject, public IInterface;
```

File

Variants

Description

Use TCustomVariantType to define new data types for Delphi Variants (see page 4997). TCustomVariantType descendants do not represent the Variants (see page 4997) themselves. Rather, they act as utility classes that the custom Variants (see page 4997) call on to perform their operations.

To create a Variant (see page 3430) type,

1.Map the storage of the Variant (see page 3430)'s data on to the TVarData (see page 3813) record.

2.Write (see page 3789) a method that creates instances of your custom Variant (see page 3430). This fills in the Variant (see page 3430)'s data as defined in step 1.

3.Declare a class that descends from TCustomVariantType.

4.Implement all required behavior (including type conversion rules) in the new class. This involves overriding the appropriate virtual methods (typically BinaryOp (see page 5018), UnaryOp (see page 5029), CompareOp (see page 5021) or Compare (see page 5020), Cast (see page 5018), CastTo (see page 5019), Clear (see page 5019), Copy (see page 5022), IsClear (see page 5023), LeftPromotion (see page 5023), and RightPromotion (see page 5027)).

5.In the initialization section of the unit that defines your TCustomVariantType descendant, create an instance of your class. When you instantiate your object, it automatically registers itself with the Variant (see page 3430)-handling system so that the new Variant (see page 3430) type is enabled.

6.In the finalization section of the unit that defines your TCustomVariantType descendant, free the instance of your class. This automatically unregisters the Variant (see page 3430) type.

Note: C++ can use Custom Variant (see page 3430) types, but TCustomVariantType descendants must be implemented in Delphi.

For an example, see the FMTBcd unit, which implements a custom Variant (see page 3430) type for binary-coded decimal.

Tip: To create a custom Variant (see page 3430) that allows users to call methods or procedures and to get or set property values, use TInvokeableVariantType (see page 5037) as a base class instead.

See Also

IDH

TInvokeableVariantType (see page 5037)

Creating a Class to Enable the Custom Variant Type

54.1.16.1 TCustomVariantType Members

The following tables list the members exposed by TCustomVariantType.

Protected Methods

	Name	Description
	_AddRef (see page 5017)	Increments the reference count for this interface.

	_Release (see page 5017)	Decrements the reference count for this interface.
V	DispInvoke (see page 5022)	Invokes a method call when the Variant (see page 3430) supports such operations.
V	LeftPromotion (see page 5023)	Indicates whether the left argument to a binary operation should be coerced to a different type.
V	OlePromotion (see page 5024)	Indicates the type to which a Variant (see page 3430) value must be cast to make it Automation-compatible.
V	QueryInterface (see page 5025)	Returns a reference to a specified interface if the object supports that interface.
	RaiseCastError (see page 5025)	Generates a system error that indicates an invalid cast.
	RaiseDispError (see page 5026)	Generates a system error indicating an invalid dispatch attempt.
	RaiseInvalidOp (see page 5026)	Generates a system error indicating an invalid operation.
V	RightPromotion (see page 5027)	Indicates whether the right argument to a binary operation should be coerced to a different type.
	SimplisticClear (see page 5028)	Clears a TVarData (see page 3813) record by re-initializing it.
	SimplisticCopy (see page 5028)	Performs a simple block copy of one TVarData (see page 3813) record to another.
	VarDataCast (see page 5029)	Performs a cast from one Variant (see page 3430) type to another.
	VarDataCastTo (see page 5030)	This is the overview for the VarDataCastTo method overload.
	VarDataCastToOleStr (see page 5030)	Performs a cast to a Variant (see page 3430) type of varOleStr (see page 3936).
	VarDataClear (see page 5031)	Clears the data from a built-in Variant (see page 3430) type.
	VarDataCopy (see page 5031)	Copies the data from one built-in Variant (see page 3430) type to another.
	VarDataCopyNoInd (see page 5032)	Copies the data from one built-in Variant (see page 3430) type to another.
	VarDataFromOleStr (see page 5032)	Creates a TVarData (see page 3813) record to represent a Unicode string.
	VarDataFromStr (see page 5033)	Creates a TVarData (see page 3813) record to represent a string.
	VarDataInit (see page 5033)	Initializes a TVarData (see page 3813) record.
	VarDataIsArray (see page 5033)	Indicates whether a TVarData (see page 3813) record represents the data from a Variant (see page 3430) array.
	VarDataIsByRef (see page 5034)	Indicates whether a TVarData (see page 3813) record stores its data indirectly.
	VarDataIsEmptyParam (see page 5034)	Indicates whether a TVarData (see page 3813) record represents an unassigned optional parameter.
	VarDataIsFloat (see page 5034)	Indicates whether a TVarData (see page 3813) record represents a floating-point value.
	VarDataIsNumeric (see page 5035)	Indicates whether a TVarData (see page 3813) record represents a numeric value.
	VarDataIsOrdinal (see page 5035)	Indicates whether a TVarData (see page 3813) record represents a ordinal value.
	VarDataIsStr (see page 5036)	Indicates whether a TVarData (see page 3813) record represents a string (normal or Unicode).
	VarDataToStr (see page 5036)	Returns a string that represents the value from a TVarData (see page 3813) record.

Public Methods

	Name	Description
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
V	BinaryOp (see page 5018)	Implements any binary operations of which the custom Variant (see page 3430) type is capable.
V	Cast (see page 5018)	Converts the data from another Variant (see page 3430) type so that it represents this custom type's data format.
V	CastTo (see page 5019)	This is CastTo, a member of class TCustomVariantType.
V	CastToOle (see page 5019)	This is CastToOle, a member of class TCustomVariantType.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.

	Clear (see page 5019)	Sets the data for this custom Variant (see page 3430) type to a blank or unassigned value.
	Compare (see page 5020)	Implements comparisons that involve the custom Variant (see page 3430) type.
	CompareOp (see page 5021)	Implements any comparison operations of which the custom Variant (see page 3430) type is capable.
	Copy (see page 5022)	Copies the data from a Variant (see page 3430) of this custom type.
	Create (see page 5014)	This is the overview for the Create constructor overload.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 5015)	Frees an instance of TCustomVariantType (see page 5011).
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	IsClear (see page 5023)	Indicates whether the data from a custom Variant (see page 3430) represents a blank or unassigned value.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnaryOp (see page 5029)	Implements any unary operations of which the custom Variant (see page 3430) type is capable.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	VarType (see page 5037)	Indicates the Variant (see page 3430) type code for the custom Variant (see page 3430) type.

54.1.16.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TCustomVariantType.Create () (see page 5015)	Creates an instance of TCustomVariantType (see page 5011).
	TCustomVariantType.Create (TVarType) (see page 5015)	Creates an instance of TCustomVariantType (see page 5011).

54.1.16.2.1 TCustomVariantType.Create Constructor ()

Creates an instance of TCustomVariantType (see page 5011).

Pascal

```
constructor Create; overload;
constructor Create(RequestedVarType: TVarType); overload;
```

C++

```
__fastcall TCustomVariantType();
__fastcall TCustomVariantType(TVarType RequestedVarType);
```

Description

Call Create in the initialization section of the unit that defines your TCustomVariantType (see page 5011) descendant to instantiate a single instance of the custom Variant (see page 3430) type. This single instance automatically registers itself with the Variant (see page 3430) system so that the custom Variant (see page 3430) type is enabled in the application.

The RequestedVarType parameter specifies a type code for the new custom Variant (see page 3430) type. It must be in the range from $010F to $0FFF.

When called with no parameters, the constructor generates a new type code for the custom Variant (see page 3430) type.

The TCustomVariantType (see page 5011) constructor raises an exception if there is a problem with the new Variant (see page 3430) type code. Such problems include

The RequestedVarType parameter specifies a type code that is already used by another Variant (see page 3430) type.

The RequestedVarType parameter specifies a type code that is not in the valid range for custom Variants (see page 4997).

There are too many custom Variants (see page 4997) already defined to allow another one.

See Also

VarType (see page 5037)

54.1.16.3 TCustomVariantType.Destroy Destructor

Frees an instance of TCustomVariantType (see page 5011).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomVariantType();
```

Description

To free a TCustomVariantType (see page 5011) instance, use the Free method instead. Free checks that the instance is not already nil before calling Destroy.

Free the single instance of a TCustomVariantType (see page 5011) descendant from the finalization section of the unit that implements the class.

See Also

Create (see page 5015)

System::TObject::Free (see page 3382)

54.1.16.4 TCustomVariantType Methods

The methods of the TCustomVariantType class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 5017)	Increments the reference count for this interface.
	_Release (see page 5017)	Decrements the reference count for this interface.
V	DispInvoke (see page 5022)	Invokes a method call when the Variant (see page 3430) supports such operations.
V	LeftPromotion (see page 5023)	Indicates whether the left argument to a binary operation should be coerced to a different type.
V	OlePromotion (see page 5024)	Indicates the type to which a Variant (see page 3430) value must be cast to make it Automation-compatible.
V	QueryInterface (see page 5025)	Returns a reference to a specified interface if the object supports that interface.
	RaiseCastError (see page 5025)	Generates a system error that indicates an invalid cast.
	RaiseDispError (see page 5026)	Generates a system error indicating an invalid dispatch attempt.
	RaiseInvalidOp (see page 5026)	Generates a system error indicating an invalid operation.
V	RightPromotion (see page 5027)	Indicates whether the right argument to a binary operation should be coerced to a different type.
	SimplisticClear (see page 5028)	Clears a TVarData (see page 3813) record by re-initializing it.
	SimplisticCopy (see page 5028)	Performs a simple block copy of one TVarData (see page 3813) record to another.
	VarDataCast (see page 5029)	Performs a cast from one Variant (see page 3430) type to another.
	VarDataCastTo (see page 5030)	This is the overview for the VarDataCastTo method overload.
	VarDataCastToOleStr (see page 5030)	Performs a cast to a Variant (see page 3430) type of varOleStr (see page 3936).
	VarDataClear (see page 5031)	Clears the data from a built-in Variant (see page 3430) type.
	VarDataCopy (see page 5031)	Copies the data from one built-in Variant (see page 3430) type to another.
	VarDataCopyNoInd (see page 5032)	Copies the data from one built-in Variant (see page 3430) type to another.
	VarDataFromOleStr (see page 5032)	Creates a TVarData (see page 3813) record to represent a Unicode string.
	VarDataFromStr (see page 5033)	Creates a TVarData (see page 3813) record to represent a string.
	VarDataInit (see page 5033)	Initializes a TVarData (see page 3813) record.
	VarDataIsArray (see page 5033)	Indicates whether a TVarData (see page 3813) record represents the data from a Variant (see page 3430) array.
	VarDataIsByRef (see page 5034)	Indicates whether a TVarData (see page 3813) record stores its data indirectly.
	VarDataIsEmptyParam (see page 5034)	Indicates whether a TVarData (see page 3813) record represents an unassigned optional parameter.
	VarDataIsFloat (see page 5034)	Indicates whether a TVarData (see page 3813) record represents a floating-point value.
	VarDataIsNumeric (see page 5035)	Indicates whether a TVarData (see page 3813) record represents a numeric value.
	VarDataIsOrdinal (see page 5035)	Indicates whether a TVarData (see page 3813) record represents a ordinal value.
	VarDataIsStr (see page 5036)	Indicates whether a TVarData (see page 3813) record represents a string (normal or Unicode).
	VarDataToStr (see page 5036)	Returns a string that represents the value from a TVarData (see page 3813) record.

Public Methods

	Name	Description
V	BinaryOp (see page 5018)	Implements any binary operations of which the custom Variant (see page 3430) type is capable.
V	Cast (see page 5018)	Converts the data from another Variant (see page 3430) type so that it represents this custom type's data format.
V	CastTo (see page 5019)	This is CastTo, a member of class TCustomVariantType.
V	CastToOle (see page 5019)	This is CastToOle, a member of class TCustomVariantType.

	Clear (see page 5019)	Sets the data for this custom Variant (see page 3430) type to a blank or unassigned value.
	Compare (see page 5020)	Implements comparisons that involve the custom Variant (see page 3430) type.
	CompareOp (see page 5021)	Implements any comparison operations of which the custom Variant (see page 3430) type is capable.
	Copy (see page 5022)	Copies the data from a Variant (see page 3430) of this custom type.
	IsClear (see page 5023)	Indicates whether the data from a custom Variant (see page 3430) represents a blank or unassigned value.
	UnaryOp (see page 5029)	Implements any unary operations of which the custom Variant (see page 3430) type is capable.

54.1.16.4.1 TCustomVariantType._AddRef Method

Increments the reference count for this interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

The Delphi compiler automatically generates a call to __AddRef for every reference to this interface. For most implementations, __AddRef increments the reference count for the interface and returns the new reference count. When the caller is through with the interface, the compiler generates a call to the _Release method, which decrements the reference count. When the reference count drops to zero, the object is automatically freed.

Note: Implementation objects can implement __AddRef and _Release so that they do not perform any reference counting. For such objects, the reference count never drops to zero and the object is not automatically freed. In these cases, it is the application's responsibility to free the object.

See Also

_Release (see page 3504)

54.1.16.4.2 TCustomVariantType._Release Method

Decrements the reference count for this interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

The Delphi compiler automatically generates a call to __Release whenever a reference to this interface goes out of scope. For most implementations, __Release decrements the reference count for the interface and returns the new reference count. When the reference count drops to zero, the object is automatically freed.

Note: Implementation objects can implement __Release so that it does not perform any reference counting. For such objects, the reference count never drops to zero and the object is not automatically freed. In these cases, it is the application's responsibility to free the object.

See Also

_AddRef (see page 3504)

54.1.16.4.3 TCustomVariantType.BinaryOp Method

Implements any binary operations of which the custom Variant (see page 3430) type is capable.

Pascal

```
procedure BinaryOp(var Left: TVarData; const Right: TVarData; const Operator: TVarOp); virtual;
```

C++

```
virtual __fastcall BinaryOp(TVarData Left, const TVarData Right, const TVarOp Operator);
```

Description

Override BinaryOp to implement any binary operators the custom Variant (see page 3430) type supports.

Left is the value that appears to the left of the operator. BinaryOp changes this value to indicate the result of the operation.

Right is the value that appears to the right of the operator.

Operator identifies the operator that appears between Left and Right. It can be any of the following values:

Value	Operation
opAdd (see page 3917)	addition
opSubtract (see page 3926)	subtraction
opMultiply (see page 3923)	multiplication
opDivide (see page 3921)	floating-point division
opIntDivide (see page 3922)	integer division
opModulus (see page 3922)	remainder
opShiftLeft (see page 3925)	bitwise left shift
opShiftRight (see page 3925)	bitwise right shift
opAnd (see page 3917)	bitwise and
opOr (see page 3924)	bitwise or
opXor (see page 3926)	bitwise exclusive or

As implemented in TCustomVariantType (see page 5011), BinaryOp raises a system error indicating an invalid operation.

See Also

UnaryOp (see page 5029)

CompareOp (see page 5021)

LeftPromotion (see page 5023)

RightPromotion (see page 5027)

Implementing Binary Operations

54.1.16.4.4 TCustomVariantType.Cast Method

Converts the data from another Variant (see page 3430) type so that it represents this custom type's data format.

Pascal

```
procedure Cast(var Dest: TVarData; const Source: TVarData); virtual;
```

C++

```
virtual __fastcall Cast(TVarData Dest, const TVarData Source);
```

Description

Override Cast to enable other types of Variants (see page 4997) to be cast to this custom Variant (see page 3430) type.

Dest is a TVarData (see page 3813) record that returns the Variant (see page 3430)'s data stored in the format used by this custom Variant (see page 3430) type. The Cast method fills out this record from the information in Source.

Source is a TVarData (see page 3813) record that contains the data from another Variant (see page 3430) type. Check the VType field of Source to identify how it currently stores its data. Then use the other fields to fetch the data and convert it to the format used by this Variant (see page 3430) type.

As implemented in TCustomVariantType (see page 5011), Cast checks whether Source is another custom Variant (see page 3430) type. If so, it calls its CastTo (see page 5019) method, to convert it to this Variant (see page 3430) type. If not, it raises a system error indicating an invalid cast.

See Also

castto (see page 5019)

VarDataCast (see page 5029)

Enabling Casting

54.1.16.4.5 TCustomVariantType.CastTo Method

Pascal

```
procedure CastTo(var Dest: TVarData; const Source: TVarData; const AVarType: TVarType);
virtual;
```

C++

```
virtual __fastcall CastTo(TVarData Dest, const TVarData Source, const TVarType AVarType);
```

Description

This is CastTo, a member of class TCustomVariantType.

54.1.16.4.6 TCustomVariantType.CastToOle Method

Pascal

```
procedure CastToOle(var Dest: TVarData; const Source: TVarData); virtual;
```

C++

```
virtual __fastcall CastToOle(TVarData Dest, const TVarData Source);
```

Description

This is CastToOle, a member of class TCustomVariantType.

54.1.16.4.7 TCustomVariantType.Clear Method

Sets the data for this custom Variant (see page 3430) type to a blank or unassigned value.

Pascal

```
procedure Clear(var V: TVarData); virtual; abstract;
```

C++

```
virtual __fastcall Clear(TVarData V) = 0;
```

Description

Override Clear to implement the way this custom Variant (see page 3430) type represents a blank or unassigned value.

V is a TVarData (see page 3813) record that represents the data from a Variant (see page 3430) of this custom type that needs to be cleared.

In TCustomVariantType (see page 5011), Clear is an abstract method. Descendant classes must override this method to provide an implementation. If the custom Variant (see page 3430) type stores its data in a manner that includes memory that needs to be freed, Clear should free that memory. Once any memory is freed, Clear can call the SimplisticClear (see page 5028) method, which re-initializes the TVarData (see page 3813) record, or set the VType field to varEmpty (see page 3933).

See Also

Unassigned (see page 5076)

IsClear (see page 5023)

SimplisticClear (see page 5028)

VarDataClear (see page 5031)

Copying and Clearing Custom Variants

54.1.16.4.8 TCustomVariantType.Compare Method

Implements comparisons that involve the custom Variant (see page 3430) type.

Pascal

```
procedure Compare(const Left: TVarData; const Right: TVarData; var Relationship:
TVarCompareResult); virtual;
```

C++

```
virtual __fastcall Compare(const TVarData Left, const TVarData Right, TVarCompareResult
Relationship);
```

Description

Override Compare to implement any comparison operators the custom Variant (see page 3430) type supports. Descendants can implement comparison operators by overriding either the Compare or the CompareOp (see page 5021) method.

Left is the value that appears to the left of the operator.

Right is the value that appears to the right of the operator.

Relationship returns a value indicating the relationship between Left and Right, as indicated in the following table:

Value	Operation
crLessThan	Left is less than Right.
crEqual	Left is equal to Right.
crGreaterThan	Left is greater than Right.

As implemented in TCustomVariantType (see page 5011), CompareOp (see page 5021) raises a system error indicating an invalid operation.

Tip: For custom Variants (see page 4997) that support a test of inequality, but not ordering, it makes more sense to override the CompareOp (see page 5021) method instead.

See Also

CompareOp (see page 5021)

CompareValue

Implementing Comparison Operations

54.1.16.4.9 TCustomVariantType.CompareOp Method

Implements any comparison operations of which the custom Variant (see page 3430) type is capable.

Pascal

```
function CompareOp(const Left: TVarData; const Right: TVarData; const Operator: TVarOp):
Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CompareOp(const TVarData Left, const TVarData Right, const TVarOp
Operator);
```

Description

Override CompareOp to implement any comparison operators the custom Variant (see page 3430) type supports. Descendants can implement comparison operators by overriding either the Compare (see page 5020) or the CompareOp method.

Left is the value that appears to the left of the operator.

Right is the value that appears to the right of the operator.

Operator identifies the operator that appears between Left and Right. It can be any of the following values:

Value	Operation
opCmpEQ (see page 3918)	equality comparison
opCmpNE (see page 3920)	inequality comparison
opCmpLT (see page 3920)	less than
opCmpLE (see page 3919)	less than or equal
opCmpGT (see page 3919)	greater than
opCmpGE (see page 3918)	greater than or equal

CompareOp returns true if the comparison is true as specified. It returns false if the specified comparison does not hold true.

As implemented in TCustomVariantType (see page 5011), CompareOp raises a system error indicating an invalid operation.

See Also

UnaryOp (see page 5029)

BinaryOp (see page 5018)

LeftPromotion (see page 5023)

RightPromotion (see page 5027)

Compare (see page 5020)

Implementing Comparison Operations

54.1.16.4.10 TCustomVariantType.Copy Method

Copies the data from a Variant (see page 3430) of this custom type.

Pascal

```
procedure Copy(var Dest: TVarData; const Source: TVarData; const Indirect: Boolean); virtual;
abstract;
```

C++

```
virtual __fastcall Copy(TVarData Dest, const TVarData Source, const Boolean Indirect) = 0;
```

Description

Override Copy to enable the custom Variant (see page 3430) type to be copied (assigned) to another Variant (see page 3430).

Dest is the TVarData (see page 3813) record from the Variant (see page 3430) whose value is to be a copy of the source Variant (see page 3430).

Source is the TVarData (see page 3813) record from a Variant (see page 3430) of this custom type that is to be copied to Dest.

Indirect indicates whether the copy is direct or indirect. When Indirect is true, the source TVarData (see page 3813) record contains an indirect reference to its data (the VarDataIsByRef (see page 5034) method should return true for Source). When making an indirect copy, it is not necessary to reallocate records or objects, because the Variant (see page 3430) does not "own" the data, it merely points to it. When making a direct copy, Copy must allocate new memory for any allocated records or objects, so that Dest can "own" its own copy of the data.

In TCustomVariantType (see page 5011), Copy is an abstract method. Descendant classes must override this method to provide an implementation.

See Also

VarDataCopy (see page 5031)

VarDataCopyNoInd (see page 5032)

SimplisticCopy (see page 5028)

VarDataIsByRef (see page 5034)

Copying and Clearing Custom Variants

54.1.16.4.11 TCustomVariantType.DispInvoke Method

Invokes a method call when the Variant (see page 3430) supports such operations.

Pascal

```
procedure DispInvoke(Dest: PVarData; const Source: TVarData; CallDesc: PCallDesc; Params:
Pointer); virtual;
```

C++

```
virtual __fastcall DispInvoke(PVarData Dest, const TVarData Source, PCallDesc CallDesc, void *
Params);
```

Description

When the application tries to call a method, set a property, or read a property using a Variant (see page 3430) of the custom Variant (see page 3430) type, the system automatically generates a call to DispInvoke. TCustomVariantType (see page 5011) responds by generating a system error indicating an invalid dispatch attempt.

To create a custom Variant (see page 3430) type that allows applications to call methods or use properties, use TInvokeableVariantType (see page 5037) as a base class instead of TCustomVariantType (see page 5011). TInvokeableVariantType (see page 5037) introduces methods for executing method calls and implementing properties, and overrides the DispInvoke method so that it dispatches method calls to the appropriate methods.

Dest is a TVarData (see page 3813) record that receives the return value of any function calls.

Source is the TVarData (see page 3813) record that holds the data from the custom Variant (see page 3430) whose property or method was invoked.

CallDesc identifies the method that was called, including the type and number of its arguments.

Params points to an array of parameter values that were passed in the method call.

See Also

TInvokeableVariantType (see page 5037)

54.1.16.4.12 TCustomVariantType.IsClear Method

Indicates whether the data from a custom Variant (see page 3430) represents a blank or unassigned value.

Pascal

```
function IsClear(const V: TVarData): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsClear(const TVarData V);
```

Description

Override IsClear to identify when data from a Variant (see page 3430) of the custom Variant (see page 3430) type represents a blank or unassigned value. The global VarIsClear (see page 5090) method calls IsClear when given a custom Variant (see page 3430) of this type.

As Implemented in TCustomVariantType (see page 5011), IsClear always returns false. Override this method to return true for invalid values or special values set by the Clear (see page 5019) method.

See Also

Clear (see page 5019)

VarIsClear (see page 5090)

Copying and Clearing Custom Variants

54.1.16.4.13 TCustomVariantType.LeftPromotion Method

Indicates whether the left argument to a binary operation should be coerced to a different type.

Pascal

```
function LeftPromotion(const V: TVarData; const Operator: TVarOp; out RequiredVarType:
TVarType): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean LeftPromotion(const TVarData V, const TVarOp Operator, TVarType
RequiredVarType);
```

Description

Override LeftPromotion to indicate when the left argument for a binary or comparison operation should be implicitly cast to another type before performing the operation. LeftPromotion is called when the right-hand Variant (see page 3430) in a binary

or comparison operation is of this Variant (see page 3430) type and

The left-hand argument is a built-in Variant (see page 3430) type.

The left-hand argument is a custom Variant (see page 3430) type that does not indicate any problem with this Variant (see page 3430) type for the right-hand argument.

V is the TVarData (see page 3813) record for the left-hand argument of the operation.

Operator indicates the type of operation. It can be any of the operators in the following table:

Value	Operation
opAdd (see page 3917)	addition
opSubtract (see page 3926)	subtraction
opMultiply (see page 3923)	multiplication
opDivide (see page 3921)	floating-point division
opIntDivide (see page 3922)	integer division
opModulus (see page 3922)	remainder
opShiftLeft (see page 3925)	left shift
opShiftRight (see page 3925)	right shift
opAnd (see page 3917)	bitwise and
opOr (see page 3924)	bitwise or
opXor (see page 3926)	bitwise exclusive or
opCompare (see page 3921)	any comparison operation

RequiredVarType returns the Variant (see page 3430) type code for the type to which the left-hand argument should be cast before performing the operation. If the operation can proceed with the left-hand argument left as-is, RequiredVarType returns the VType field of V.

LeftPromotion returns true if the TCustomVariantType (see page 5011) descendant can perform the operation (using the BinaryOp (see page 5018), CompareOp (see page 5021), or Compare (see page 5020) method) assuming the left-hand argument can be cast to RequiredVarType. It returns false if the TCustomVariantType (see page 5011) descendant can't perform the operation.

As implemented in TCustomVariantType (see page 5011), LeftPromotion returns the VarType (see page 5037) property as RequiredVarType, and returns true.

See Also

BinaryOp (see page 5018)

CompareOp (see page 5021)

Compare (see page 5020)

VarType (see page 5037)

RightPromotion (see page 5027)

Implementing Binary Operations

54.1.16.4.14 TCustomVariantType.OlePromotion Method

Indicates the type to which a Variant (see page 3430) value must be cast to make it Automation-compatible.

Pascal

```
function OlePromotion(const V: TVarData; out RequiredVarType: TVarType): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean OlePromotion(const TVarData V, TVarType RequiredVarType);
```

Description

Override OlePromotion to indicate when a Variant (see page 3430) of this custom Variant (see page 3430) type must be cast to another type before it can be auto-marshaled using an Automation interface.

V is the TVarData (see page 3813) record for the custom Variant (see page 3430) that the application wants to marshal.

RequiredVarType returns the type to which V must be cast before it is Automation-compatible.

OlePromotion returns true if V can be cast to an Automation-compatible type, false if there is no type to which V can be cast.

As implemented in TCustomVariantType (see page 5011), OlePromotion sets RequiredVarType to varOleStr (see page 3936) and returns true if V does not already represent a Unicode string.

See Also

casttoole (see page 5019)

54.1.16.4.15 TCustomVariantType.QueryInterface Method

Returns a reference to a specified interface if the object supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the TCustomVariantType (see page 5011) object supports the interface specified by IID. If so, QueryInterface

increments the reference count.

sets the Obj parameter so that it points to an instance of the specified interface.

returns 0 to indicate success.

If the object does not support the interface, QueryInterface returns a nonzero error code such as E_NoInterface.

See Also

_addref (see page 5017)

_release (see page 5017)

54.1.16.4.16 TCustomVariantType.RaiseCastError Method

Generates a system error that indicates an invalid cast.

Pascal

```
procedure RaiseCastError;
```

C++

```
__fastcall RaiseCastError();
```

Description

Call RaiseCastError from the implementation of a TCustomVariantType (see page 5011) descendant when an operation fails because a Variant (see page 3430) value could not be cast to a necessary type.

See Also

Cast (see page 5018)

castto (see page 5019)

54.1.16.4.17 TCustomVariantType.RaiseDispError Method

Generates a system error indicating an invalid dispatch attempt.

Pascal

```
procedure RaiseDispError;
```

C++

```
__fastcall RaiseDispError();
```

Description

Call RaiseDispError from the implementation of a TCustomVariantType (see page 5011) descendant when an operation fails because the variant can't execute a method call. This raises EVariantDispatchError (see page 5005).

See Also

DispInvoke (see page 5022)

EVariantDispatchError (see page 5005)

54.1.16.4.18 TCustomVariantType.RaiseInvalidOp Method

Generates a system error indicating an invalid operation.

Pascal

```
procedure RaiseInvalidOp;
```

C++

```
__fastcall RaiseInvalidOp();
```

Description

Call RaiseInvalidOp from the implementation of a TCustomVariantType (see page 5011) descendant when it can't perform an operation.

See Also

BinaryOp (see page 5018)

UnaryOp (see page 5029)

CompareOp (see page 5021)

Compare (see page 5020)

54.1.16.4.19 TCustomVariantType.RightPromotion Method

Indicates whether the right argument to a binary operation should be coerced to a different type.

Pascal

```
function RightPromotion(const V: TVarData; const Operator: TVarOp; out RequiredVarType:
TVarType): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean RightPromotion(const TVarData V, const TVarOp Operator, TVarType
RequiredVarType);
```

Description

Override RightPromotion to indicate when the right-hand argument for a binary or comparison operation should be implicitly cast to another type before performing the operation. RightPromotion is called when the right-hand Variant (see page 3430) in a binary or comparison operation is of this Variant (see page 3430) type.

Note: In operations that involve two custom Variants (see page 4997), the left-hand argument's RightPromotion method is called first. The right-hand argument's LeftPromotion (see page 5023) method is then called only if the left-hand argument's RightPromotion method returns false.

V is the TVarData (see page 3813) record for the left-hand argument of the operation.

Operator indicates the type of operation. It can be any of the operators in the following table:

Value	Operation
opAdd (see page 3917)	addition
opSubtract (see page 3926)	subtraction
opMultiply (see page 3923)	multiplication
opDivide (see page 3921)	floating-point division
opIntDivide (see page 3922)	integer division
opModulus (see page 3922)	remainder
opShiftRight (see page 3925)	right shift
opShiftRight (see page 3925)	right shift
opAnd (see page 3917)	bitwise and
opOr (see page 3924)	bitwise or
opXor (see page 3926)	bitwise exclusive or
opCompare (see page 3921)	any comparison operation

RequiredVarType returns the Variant (see page 3430) type code for the type to which the right-hand argument should be cast before performing the operation. If the operation can proceed with the right-hand argument left as-is, RequiredVarType returns the VType field of V.

RightPromotion returns true if the TCustomVariantType (see page 5011) descendant can perform the operation (using the BinaryOp (see page 5018), CompareOp (see page 5021), or Compare (see page 5020) method) assuming the right-hand argument can be cast to RequiredVarType. It returns false if the TCustomVariantType (see page 5011) descendant can't perform the operation.

As implemented in TCustomVariantType (see page 5011), RightPromotion returns the VarType (see page 5037) property as RequiredVarType, and returns true.

See Also

BinaryOp (see page 5018)

CompareOp (see page 5021)

Compare (see page 5020)

VarType (see page 5037)

LeftPromotion (see page 5023)

Implementing Binary Operations

54.1.16.4.20 TCustomVariantType.SimplisticClear Method

Clears a TVarData (see page 3813) record by re-initializing it.

Pascal

```
procedure SimplisticClear(var V: TVarData);
```

C++

```
__fastcall SimplisticClear(TVarData V);
```

Description

Call SimplisticClear from the implementation of a TCustomVariantType (see page 5011) descendant to clear the TVarData (see page 3813) record of a Variant (see page 3430) of the custom type. This method should only be called if the TVarData (see page 3813) record does not contain any members that must be freed.

SimplisticClear simply calls the VarDataInit (see page 5033) method, which reinitializes the TVarData (see page 3813) record passed as V.

See Also

Clear (see page 5019)

VarDataClear (see page 5031)

VarDataInit (see page 5033)

54.1.16.4.21 TCustomVariantType.SimplisticCopy Method

Performs a simple block copy of one TVarData (see page 3813) record to another.

Pascal

```
procedure SimplisticCopy(var Dest: TVarData; const Source: TVarData; const Indirect: Boolean =
False);
```

C++

```
__fastcall SimplisticCopy(TVarData Dest, const TVarData Source, const Boolean Indirect =
False);
```

Description

Call SimplisticCopy from the implementation of a TCustomVariantType (see page 5011) descendant to block copy one TVarData (see page 3813) record to another.

Dest is the TVarData (see page 3813) record that receives the copy.

Source is the TVarData (see page 3813) record to copy.

Indirect indicates whether Source represents the data (false) or merely a reference to the data (true).

See Also

Copy (see page 5022)

VarDataCopy (see page 5031)

VarDataCopyNoInd (see page 5032)

Copying and Clearing Custom Variants

54.1.16.4.22 TCustomVariantType.UnaryOp Method

Implements any unary operations of which the custom Variant (see page 3430) type is capable.

Pascal

```
procedure UnaryOp(var Right: TVarData; const Operator: TVarOp); virtual;
```

C++

```
virtual __fastcall UnaryOp(TVarData Right, const TVarOp Operator);
```

Description

Override UnaryOp to implement any unary operators the custom Variant (see page 3430) type supports.

Right is the value that appears to the right of the operator. UnaryOp changes this value to indicate the result of the operation.

Operator identifies the operator that appears before Right. It can be any of the following values:

Value	Operation
opNegate (see page 3923)	unary minus
opNot (see page 3924)	logical negation

As implemented in TCustomVariantType (see page 5011), UnaryOp raises a system error indicating an invalid operation.

See Also

BinaryOp (see page 5018)

CompareOp (see page 5021)

Implementing Unary Operations

54.1.16.4.23 TCustomVariantType.VarDataCast Method

Performs a cast from one Variant (see page 3430) type to another.

Pascal

```
procedure VarDataCast(var Dest: TVarData; const Source: TVarData);
```

C++

```
__fastcall VarDataCast(TVarData Dest, const TVarData Source);
```

Description

Call VarDataCast from the implementation of a TCustomVariantType (see page 5011) descendant to perform casts on the data from another Variant (see page 3430) type to the type specified by the VarType (see page 5037) property. Do not use VarDataCast as the entire implementation of the Cast (see page 5018) method, as this will lead to a circular reference.

Dest returns the result of the cast.

Source is the TVarData (see page 3813) record of another Variant (see page 3430) type that is to be converted.

See Also

Cast (see page 5018)

castto (see page 5019)

VarDataCastTo (see page 5030)

VarType (see page 5037)

54.1.16.4.24 VarDataCastTo Method

This is the overview for the VarDataCastTo method overload.

Overload List

	Name	Description
	TCustomVariantType.VarDataCastTo (TVarData, TVarData, TVarType) (see page 5030)	Performs a cast from one Variant (see page 3430) type to another.
	TCustomVariantType.VarDataCastTo (TVarData, TVarType) (see page 5030)	Performs a cast from one Variant (see page 3430) type to another.

54.1.16.4.24.1 TCustomVariantType.VarDataCastTo Method (TVarData, TVarData, TVarType)

Performs a cast from one Variant (see page 3430) type to another.

Pascal

```
procedure VarDataCastTo(var Dest: TVarData; const Source: TVarData; const AVarType: TVarType);
overload;
procedure VarDataCastTo(var Dest: TVarData; const AVarType: TVarType); overload;
```

C++

```
__fastcall VarDataCastTo(TVarData Dest, const TVarData Source, const TVarType AVarType);
__fastcall VarDataCastTo(TVarData Dest, const TVarType AVarType);
```

Description

Call VarDataCastTo from the implementation of a TCustomVariantType (see page 5011) descendant to perform casts on the data from one Variant (see page 3430) type to another. Do not use VarDataCastTo as the entire implementation of the CastTo (see page 5019) method, as this will lead to a circular reference.

Dest returns the result of the cast. If VarDataCastTo is called with no Source parameter, it also provides the source data to be cast.

Source is the TVarData (see page 3813) record to be cast.

VarType (see page 5037) is the type code of the Variant (see page 3430) type to which the data should be cast.

See Also

castto (see page 5019)

54.1.16.4.25 TCustomVariantType.VarDataCastToOleStr Method

Performs a cast to a Variant (see page 3430) type of varOleStr (see page 3936).

Pascal

```
procedure VarDataCastToOleStr(var Dest: TVarData);
```

C++

```
__fastcall VarDataCastToOleStr(TVarData Dest);
```

Description

Call VarDataCastToOleStr from the implementation of a TCustomVariantType (see page 5011) descendant to perform casts to a TVarData (see page 3813) record with Variant (see page 3430) type code of varOleStr (see page 3936) (Unicode string).

Dest is the TVarData (see page 3813) record of a Variant (see page 3430), and returns the result of the cast.

See Also

VarDataFromOleStr (see page 5032)

VarDataToStr (see page 5036)

54.1.16.4.26 TCustomVariantType.VarDataClear Method

Clears the data from a built-in Variant (see page 3430) type.

Pascal

```
procedure VarDataClear(var Dest: TVarData);
```

C++

```
__fastcall VarDataClear(TVarData Dest);
```

Description

Call VarDataClear from the implementation of a TCustomVariantType (see page 5011) descendant to clear the data in the TVarData (see page 3813) record of a Variant (see page 3430). Do not use VarDataClear as the entire implementation of the Clear (see page 5019) method, as this will lead to a circular reference.

Dest is the TVarData (see page 3813) record of a Variant (see page 3430) type, and returns the result after clearing the data.

See Also

SimplisticClear (see page 5028)

Clear (see page 5019)

54.1.16.4.27 TCustomVariantType.VarDataCopy Method

Copies the data from one built-in Variant (see page 3430) type to another.

Pascal

```
procedure VarDataCopy(var Dest: TVarData; const Source: TVarData);
```

C++

```
__fastcall VarDataCopy(TVarData Dest, const TVarData Source);
```

Description

Call VarDataCopy from the implementation of a TCustomVariantType (see page 5011) descendant to clear the data from a destination Variant (see page 3430) and then copy the TVarData (see page 3813) record from another Variant (see page 3430). VarDataCopy can handle data that is stored indirectly (when the VType field includes varByRef (see page 3930)). Do not use VarDataCopy as the entire implementation of the Copy (see page 5022) method, as this will lead to a circular

reference.

Dest is the TVarData (see page 3813) record that receives the copy.

Source is the TVarData (see page 3813) record to be copied.

See Also

SimplisticCopy (see page 5028)

VarDataCopyNoInd (see page 5032)

Copy (see page 5022)

54.1.16.4.28 TCustomVariantType.VarDataCopyNoInd Method

Copies the data from one built-in Variant (see page 3430) type to another.

Pascal

```
procedure VarDataCopyNoInd(var Dest: TVarData; const Source: TVarData);
```

C++

```
__fastcall VarDataCopyNoInd(TVarData Dest, const TVarData Source);
```

Description

Call VarDataCopyNoInd from the implementation of a TCustomVariantType (see page 5011) descendant to clear the data from a destination Variant (see page 3430) and then copy the TVarData (see page 3813) record from another Variant (see page 3430). Unlike the VarDataCopy (see page 5031) method, it can't handle data that is stored indirectly (when the VType field includes varByRef (see page 3930)). However, it is often more efficient than VarDataCopy (see page 5031).

Dest is the TVarData (see page 3813) record that receives the copy.

Source is the TVarData (see page 3813) record to be copied.

See Also

VarDataCopy (see page 5031)

Copy (see page 5022)

54.1.16.4.29 TCustomVariantType.VarDataFromOleStr Method

Creates a TVarData (see page 3813) record to represent a Unicode string.

Pascal

```
procedure VarDataFromOleStr(var V: TVarData; const Value: WideString);
```

C++

```
__fastcall VarDataFromOleStr(TVarData V, const BSTR Value);
```

Description

Call VarDataCopy (see page 5031) from the implementation of a TCustomVariantType (see page 5011) descendant to fill out a TVarData (see page 3813) record so that it represents a specified Unicode string.

V is the TVarData (see page 3813) record to be filled out.

Value is a Unicode string that becomes the value of V.

See Also

VarDataCastToOleStr (see page 5030)

VarDataFromStr (see page 5033)

54.1.16.4.30 TCustomVariantType.VarDataFromStr Method

Creates a TVarData (see page 3813) record to represent a string.

Pascal

```
procedure VarDataFromStr(var V: TVarData; const Value: string);
```

C++

```
__fastcall VarDataFromStr(TVarData V, const UnicodeString Value);
```

Description

Call VarDataCopy (see page 5031) from the implementation of a TCustomVariantType (see page 5011) descendant to fill out a TVarData (see page 3813) record so that it represents a specified string.

V is the TVarData (see page 3813) record to be filled out.

Value is a string that becomes the value of V.

See Also

VarDataFromOleStr (see page 5032)

VarDataIsStr (see page 5036)

VarDataToStr (see page 5036)

54.1.16.4.31 TCustomVariantType.VarDataInit Method

Initializes a TVarData (see page 3813) record.

Pascal

```
procedure VarDataInit(var Dest: TVarData);
```

C++

```
__fastcall VarDataInit(TVarData Dest);
```

Description

Call VarDataInit from the implementation of a TCustomVariantType (see page 5011) descendant to initialize a newly-allocated TVarData (see page 3813) record.

See Also

VarDataClear (see page 5031)

54.1.16.4.32 TCustomVariantType.VarDataIsArray Method

Indicates whether a TVarData (see page 3813) record represents the data from a Variant (see page 3430) array.

Pascal

```
function VarDataIsArray(const V: TVarData): Boolean;
```

C++

```
__fastcall Boolean VarDataIsArray(const TVarData V);
```

Description

VarDataIsArray returns true if the VType field of V contains the varArray (see page 3929) bit.

See Also

VarDataIsByRef (see page 5034)

VarType (see page 5101)

54.1.16.4.33 TCustomVariantType.VarDataIsByRef Method

Indicates whether a TVarData (see page 3813) record stores its data indirectly.

Pascal

```
function VarDataIsByRef(const V: TVarData): Boolean;
```

C++

```
__fastcall Boolean VarDataIsByRef(const TVarData V);
```

Description

VarDataIsArray (see page 5033) returns true if the VType field of V contains the varByRef (see page 3930) bit.

See Also

VarDataIsArray (see page 5033)

VarType (see page 5101)

54.1.16.4.34 TCustomVariantType.VarDataIsEmptyParam Method

Indicates whether a TVarData (see page 3813) record represents an unassigned optional parameter.

Pascal

```
function VarDataIsEmptyParam(const V: TVarData): Boolean;
```

C++

```
__fastcall Boolean VarDataIsEmptyParam(const TVarData V);
```

Description

VarDataIsEmptyParam returns true if the given TVarData (see page 3813) record represents an unassigned optional parameter.

See Also

VarDataIsArray (see page 5033)

VarType (see page 5101)

54.1.16.4.35 TCustomVariantType.VarDataIsFloat Method

Indicates whether a TVarData (see page 3813) record represents a floating-point value.

Pascal

```
function VarDataIsFloat(const V: TVarData): Boolean;
```

C++

```
__fastcall Boolean VarDataIsFloat(const TVarData V);
```

Description

VarDataIsFloat returns true if the given TVarData (see page 3813) record comes from a built-in Variant (see page 3430) type that represents a floating-point value (Single, Double, or Currency (see page 3242)). VarDataIsFloat does not return true for data from Custom Variant (see page 3430) types.

See Also

VarDataIsNumeric (see page 5035)

VarType (see page 5101)

VarDataIsOrdinal (see page 5035)

VarDataIsStr (see page 5036)

54.1.16.4.36 TCustomVariantType.VarDataIsNumeric Method

Indicates whether a TVarData (see page 3813) record represents a numeric value.

Pascal

```
function VarDataIsNumeric(const V: TVarData): Boolean;
```

C++

```
__fastcall Boolean VarDataIsNumeric(const TVarData V);
```

Description

VarDataIsNumeric returns true if the given TVarData (see page 3813) record represents a numeric value of some sort. This can be either a floating-point value or an ordinal value. VarDataIsNumeric does not return true for data from Custom Variant (see page 3430) types.

See Also

VarDataIsFloat (see page 5034)

VarType (see page 5101)

VarDataIsOrdinal (see page 5035)

VarDataIsStr (see page 5036)

54.1.16.4.37 TCustomVariantType.VarDataIsOrdinal Method

Indicates whether a TVarData (see page 3813) record represents a ordinal value.

Pascal

```
function VarDataIsOrdinal(const V: TVarData): Boolean;
```

C++

```
__fastcall Boolean VarDataIsOrdinal(const TVarData V);
```

Description

VarDataIsOrdinal returns true if the given TVarData (see page 3813) record comes from a built-in Variant (see page 3430) type that represents a ordinal value (such as an integer or Boolean type). VarDataIsOrdinal does not return true for data from Custom Variant (see page 3430) types.

See Also

VarDataIsNumeric (see page 5035)

VarType (see page 5101)

VarDataIsFloat (see page 5034)

VarDataIsStr (see page 5036)

54.1.16.4.38 TCustomVariantType.VarDataIsStr Method

Indicates whether a TVarData (see page 3813) record represents a string (normal or Unicode).

Pascal

```
function VarDataIsStr(const V: TVarData): Boolean;
```

C++

```
__fastcall Boolean VarDataIsStr(const TVarData V);
```

Description

VarDataIsStr returns true if the given TVarData (see page 3813) record has a VType field of varString (see page 3938) or varOleStr (see page 3936).

See Also

VarDataIsNumeric (see page 5035)

VarType (see page 5101)

VarDataIsFloat (see page 5034)

VarDataIsStr

54.1.16.4.39 TCustomVariantType.VarDataToStr Method

Returns a string that represents the value from a TVarData (see page 3813) record.

Pascal

```
function VarDataToStr(const V: TVarData): string;
```

C++

```
__fastcall UnicodeString VarDataToStr(const TVarData V);
```

Description

Call VarDataToStr from the implementation of a TCustomVariantType (see page 5011) descendant to extract a string that represents the value of a Variant (see page 3430).

V is the TVarData (see page 3813) record that represents the value of the Variant (see page 3430).

See Also

VarDataCastToOleStr (see page 5030)

VarDataFromStr (see page 5033)

54.1.16.5 TCustomVariantType Properties

The properties of the TCustomVariantType class are listed here.

Public Properties

	Name	Description
	VarType (see page 5037)	Indicates the Variant (see page 3430) type code for the custom Variant (see page 3430) type.

54.1.16.5.1 TCustomVariantType.VarType Property

Indicates the Variant (see page 3430) type code for the custom Variant (see page 3430) type.

Pascal

```
property VarType: TVarType;
```

C++

```
__property TVarType VarType;
```

Description

The VarType property provides read-only access to the type code that identifies a custom Variant (see page 3430) data type.

The value of VarType is set in the constructor. This can be an automatically generated value, or it can be a value explicitly passed to the constructor. Note that if the VarType is automatically-generated, it may not remain the same for every application that uses the custom Variant (see page 3430) type: its value will depend on the other custom Variants (see page 4997) also used in the application.

VarType (see page 5101)

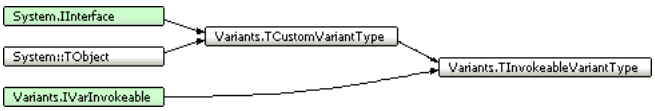
FindCustomVariantType (see page 5073)

Enabling Casting

54.1.17 TInvokeableVariantType Class

TInvokeableVariantType is the base class for custom Variant (see page 3430) types that implement custom Variants (see page 4997) with properties and methods.

Class Hierarchy



Pascal

```
TInvokeableVariantType = class(TCustomVariantType, IVarInvokeable);
```

C++

```
class TInvokeableVariantType : public TCustomVariantType, public IVarInvokeable;
```

File

Variants

Description

Use TInvokeableVariantType to define new data types for Delphi Variants (see page 4997) with properties and methods. TInvokeableVariantType descendants do not represent the Variants (see page 4997) themselves. Rather, they act as utility classes that the custom Variants (see page 4997) call on to perform their operations.

Note: Do not define TInvokeableVariantType descendants in C++. The logic for custom Variant (see page 3430) types must be defined in Delphi code.

To create a Variant (see page 3430) type that supports properties and methods,

1. Map the storage of the Variant (see page 3430)'s data on to the TVarData (see page 3813) record.
2. Write (see page 3789) a method that creates instances of your custom Variant (see page 3430). This fills in the Variant (see page 3430)'s data as defined in step 1.
3. Declare a class that descends from TInvokeableVariantType.
4. Implement all required behavior (including type conversion rules) in the new class. This involves overriding the appropriate virtual methods (typically DoFunction (see page 5041), DoProcedure (see page 5042), GetProperty (see page 5043), SetProperty (see page 5044), BinaryOp (see page 5018), UnaryOp (see page 5029), CompareOp (see page 5021) or Compare (see page 5020), Cast (see page 5018), CastTo (see page 5019), Clear (see page 5019), Copy (see page 5022), IsClear (see page 5023), LeftPromotion (see page 5023), and RightPromotion (see page 5027)).
5. In the initialization section of the unit that defines your TInvokeableVariantType descendant, create an instance of your class. When you instantiate your object, it automatically registers itself with the Variant (see page 3430)-handling system so that the new Variant (see page 3430) type is enabled.
6. In the finalization section of the unit that defines your TInvokeableVariantType descendant, free the instance of your class. This automatically unregisters the Variant (see page 3430) type.

For an example, see the VarConv (see page 4973) unit, which implements a custom Variant (see page 3430) type for measurements.

Tip: If the custom Variant (see page 3430) type uses an object instance to store its data, you can automatically implement the published properties of that object by deriving your custom Variant (see page 3430) type from TPublishableVariantType instead.

Supporting Properties and Methods in Custom Variants

54.1.17.1 TInvokeableVariantType Members

The following tables list the members exposed by TInvokeableVariantType.

Protected Methods

	Name	Description
	_AddRef (see page 5017)	Increments the reference count for this interface.
	_Release (see page 5017)	Decrements the reference count for this interface.
	DispInvoke (see page 5041)	Invokes a method call by dispatching it to the appropriate TInvokeableVariantType (see page 5037) method.
	FixupIdent (see page 5043)	Fixes up dispatch identifier.

	LeftPromotion (see page 5023)	Indicates whether the left argument to a binary operation should be coerced to a different type.
	OlePromotion (see page 5024)	Indicates the type to which a Variant (see page 3430) value must be cast to make it Automation-compatible.
	QueryInterface (see page 5025)	Returns a reference to a specified interface if the object supports that interface.
	RaiseCastError (see page 5025)	Generates a system error that indicates an invalid cast.
	RaiseDispError (see page 5026)	Generates a system error indicating an invalid dispatch attempt.
	RaiseInvalidOp (see page 5026)	Generates a system error indicating an invalid operation.
	RightPromotion (see page 5027)	Indicates whether the right argument to a binary operation should be coerced to a different type.
	SimplisticClear (see page 5028)	Clears a TVarData (see page 3813) record by re-initializing it.
	SimplisticCopy (see page 5028)	Performs a simple block copy of one TVarData (see page 3813) record to another.
	VarDataCast (see page 5029)	Performs a cast from one Variant (see page 3430) type to another.
	VarDataCastTo (see page 5030)	This is the overview for the VarDataCastTo method overload.
	VarDataCastToOleStr (see page 5030)	Performs a cast to a Variant (see page 3430) type of varOleStr (see page 3936).
	VarDataClear (see page 5031)	Clears the data from a built-in Variant (see page 3430) type.
	VarDataCopy (see page 5031)	Copies the data from one built-in Variant (see page 3430) type to another.
	VarDataCopyNoInd (see page 5032)	Copies the data from one built-in Variant (see page 3430) type to another.
	VarDataFromOleStr (see page 5032)	Creates a TVarData (see page 3813) record to represent a Unicode string.
	VarDataFromStr (see page 5033)	Creates a TVarData (see page 3813) record to represent a string.
	VarDataInit (see page 5033)	Initializes a TVarData (see page 3813) record.
	VarDataIsArray (see page 5033)	Indicates whether a TVarData (see page 3813) record represents the data from a Variant (see page 3430) array.
	VarDataIsByRef (see page 5034)	Indicates whether a TVarData (see page 3813) record stores its data indirectly.
	VarDataIsEmptyParam (see page 5034)	Indicates whether a TVarData (see page 3813) record represents an unassigned optional parameter.
	VarDataIsFloat (see page 5034)	Indicates whether a TVarData (see page 3813) record represents a floating-point value.
	VarDataIsNumeric (see page 5035)	Indicates whether a TVarData (see page 3813) record represents a numeric value.
	VarDataIsOrdinal (see page 5035)	Indicates whether a TVarData (see page 3813) record represents a ordinal value.
	VarDataIsStr (see page 5036)	Indicates whether a TVarData (see page 3813) record represents a string (normal or Unicode).
	VarDataToStr (see page 5036)	Returns a string that represents the value from a TVarData (see page 3813) record.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	BinaryOp (see page 5018)	Implements any binary operations of which the custom Variant (see page 3430) type is capable.
	Cast (see page 5018)	Converts the data from another Variant (see page 3430) type so that it represents this custom type's data format.
	CastTo (see page 5019)	This is CastTo, a member of class TCustomVariantType.
	CastToOle (see page 5019)	This is CastToOle, a member of class TCustomVariantType.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.

	Clear (see page 5019)	Sets the data for this custom Variant (see page 3430) type to a blank or unassigned value.
	Compare (see page 5020)	Implements comparisons that involve the custom Variant (see page 3430) type.
	CompareOp (see page 5021)	Implements any comparison operations of which the custom Variant (see page 3430) type is capable.
	Copy (see page 5022)	Copies the data from a Variant (see page 3430) of this custom type.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 5014)	This is the overview for the Create constructor overload.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 5015)	Frees an instance of TCustomVariantType (see page 5011).
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DoFunction (see page 5041)	Implements all methods that return values.
	DoProcedure (see page 5042)	Implements all methods that do not return values.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetProperty (see page 5043)	Returns the value for any property this Variant (see page 3430) type supports.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	IsClear (see page 5023)	Indicates whether the data from a custom Variant (see page 3430) represents a blank or unassigned value.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetProperty (see page 5044)	Sets the value for any property this Variant (see page 3430) type supports.
	ToString (see page 3391)	Returns a string containing the class name.
	UnaryOp (see page 5029)	Implements any unary operations of which the custom Variant (see page 3430) type is capable.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	VarType (see page 5037)	Indicates the Variant (see page 3430) type code for the custom Variant (see page 3430) type.

54.1.17.2 TInvokeableVariantType Methods

The methods of the TInvokeableVariantType class are listed here.

Protected Methods

	Name	Description
	DispInvoke (see page 5041)	Invokes a method call by dispatching it to the appropriate TInvokeableVariantType (see page 5037) method.

	FixupIdent (see page 5043)	Fixes up dispatch identifier.

Public Methods

	Name	Description
	DoFunction (see page 5041)	Implements all methods that return values.
	DoProcedure (see page 5042)	Implements all methods that do not return values.
	GetProperty (see page 5043)	Returns the value for any property this Variant (see page 3430) type supports.
	SetProperty (see page 5044)	Sets the value for any property this Variant (see page 3430) type supports.

54.1.17.2.1 TInvokeableVariantType.DispInvoke Method

Invokes a method call by dispatching it to the appropriate TInvokeableVariantType (see page 5037) method.

Pascal

```
procedure DispInvoke(Dest: PVarData; const Source: TVarData; CallDesc: PCallDesc; Params:
Pointer); override;
```

C++

```
virtual __fastcall DispInvoke(PVarData Dest, const TVarData Source, PCallDesc CallDesc, void *
Params);
```

Description

When the application tries to call a method, set a property, or read a property using a Variant (see page 3430) of the custom Variant (see page 3430) type, the system automatically generates a call to DispInvoke. TInvokeableVariantType (see page 5037) responds by generating a call to the GetProperty (see page 5043), SetProperty (see page 5044), DoProcedure (see page 5042), or DoFunction (see page 5041) method, as appropriate.

Dest is a TVarData (see page 3813) record that receives the return value of any function calls.

Source is the TVarData (see page 3813) record that holds the data from the custom Variant (see page 3430) whose property or method was invoked.

CallDesc identifies the method that was called, including the type and number of its arguments.

Params points to an array of parameter values that were passed in the method call.

See Also

GetProperty (see page 5043)

SetProperty (see page 5044)

DoProcedure (see page 5042)

DoFunction (see page 5041)

54.1.17.2.2 TInvokeableVariantType.DoFunction Method

Implements all methods that return values.

Pascal

```
function DoFunction(var Dest: TVarData; const V: TVarData; const Name: string; const
Arguments: TVarDataArray): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoFunction(TVarData Dest, const TVarData V, const UnicodeString
Name, const TVarDataArray Arguments);
```

Description

Override DoFunction to provide the implementation for method calls that return values. When the application invokes a Variant (see page 3430) member function (Delphi) or calls the Variant (see page 3430)'s Exec method (C++) a call is automatically generated to DoFunction.

Dest is a TVarData (see page 3813) record that receives the value that the function returns.

V is the TVarData (see page 3813) record from the Variant (see page 3430) instance that was used to call the function.

Name is the name of the function.

Arguments is a dynamic array of TVarData (see page 3813) records, where each one represents the value of an argument passed to the function.

DoFunction returns true if it executes the method call, false if it does not implement the specified function.

As implemented in TInvokeableVariant, DoFunction always returns false, because it does not implement any function calls.

GetProperty (see page 5043)

DoProcedure (see page 5042)

SetProperty (see page 5044)

Exec

Supporting Properties and Methods in Custom Variants

54.1.17.2.3 TInvokeableVariantType.DoProcedure Method

Implements all methods that do not return values.

Pascal

```
function DoProcedure(const V: TVarData; const Name: string; const Arguments: TVarDataArray):
Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoProcedure(const TVarData V, const UnicodeString Name, const
TVarDataArray Arguments);
```

Description

Override DoProcedure to provide the implementation for methods calls that do not return values. When the application invokes a Variant (see page 3430) member procedure (Delphi) or calls the Variant (see page 3430)'s Exec method (C++) a call is automatically generated to DoProcedure that allows the TInvokeableVariant descendant to implement the call.

V is the TVarData (see page 3813) record from the Variant (see page 3430) instance that was used to call the procedure.

Name is the name of the procedure.

Arguments is a dynamic array of TVarData (see page 3813) records, where each one represents the value of an argument passed to the procedure.

DoProcedure returns true if it executes the procedure call, false if it does not implement the specified procedure.

As implemented in TInvokeableVariant, DoProcedure always returns false, because it does not implement any procedure calls.

See Also

GetProperty (see page 5043)

DoFunction (see page 5041)

SetProperty (see page 5044)

Exec

Supporting Properties and Methods in Custom Variants

54.1.17.2.4 TInvokeableVariantType.FixupIdent Method

Fixes up dispatch identifier.

Pascal

```
function FixupIdent(const AText: string): string; virtual;
```

C++

```
virtual __fastcall UnicodeString FixupIdent(const UnicodeString AText);
```

Description

FixupIdent is called internally to determine the final fixup for the dispatch identifier. As defined in TInvokeableVariantType (see page 5037), this fixup consists of converting the identifier to all upper case.

54.1.17.2.5 TInvokeableVariantType.GetProperty Method

Returns the value for any property this Variant (see page 3430) type supports.

Pascal

```
function GetProperty(var Dest: TVarData; const V: TVarData; const Name: string): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean GetProperty(TVarData Dest, const TVarData V, const UnicodeString
Name);
```

Description

Override GetProperty to provide the read implementations for properties of instances of the Variant (see page 3430). When the application reads a Variant (see page 3430) property (Delphi) or calls the Variant (see page 3430)'s Exec method (C++) a call is automatically generated to GetProperty that allows the TInvokeableVariant descendant to implement the call.

Dest is a TVarData (see page 3813) record that receives the property value.

V is the TVarData (see page 3813) record from the Variant (see page 3430) instance whose property is being read.

Name is the name of the property.

GetProperty returns true if it returns a property value, false if it does not implement the specified property.

As implemented in TInvokeableVariant, GetProperty always returns false, because it does not implement any properties.

See Also

DoFunction (see page 5041)

DoProcedure (see page 5042)

SetProperty (see page 5044)

Exec

Supporting Properties and Methods in Custom Variants

54.1.17.2.6 TInvokeableVariantType.SetProperty Method

Sets the value for any property this Variant (see page 3430) type supports.

Pascal

```
function SetProperty(const V: TVarData; const Name: string; const Value: TVarData): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean SetProperty(const TVarData V, const UnicodeString Name, const
TVarData Value);
```

Description

Override SetProperty to provide the write implementation for the properties of instances of the invokeable Variant (see page 3430) type. When the application writes to a Variant (see page 3430) property (Delphi) or calls the Variant (see page 3430)'s Exec method (C++) a call is automatically generated to SetProperty that allows the TInvokeableVariant descendant to implement the call.

Name is the name of the property.

Value is a TVarData (see page 3813) record that contains the new property value.

GetProperty (see page 5043) returns true if it sets a property value, false if it does not implement the specified property or if the specified property is read-only.

As implemented in TInvokeableVariant, GetProperty (see page 5043) always returns false, because it does not implement any properties.

54.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IVarInstanceReference (see page 5045)	This is class Variants.IVarInstanceReference.
	IVarInvokeable (see page 5046)	This is class Variants.IVarInvokeable.

54.2.1 IVarInstanceReference Interface

Class Hierarchy

Pascal

```
IVarInstanceReference = interface;
```

C++

```
__interface IVarInstanceReference;
```

File

Variants

Description

This is class Variants.IVarInstanceReference.

54.2.1.1 IVarInstanceReference Members

The following tables list the members exposed by IVarInstanceReference.

Public Methods

	Name	Description
	GetInstance (see page 5046)	This is GetInstance, a member of class IVarInstanceReference.

54.2.1.2 IVarInstanceReference Methods

The methods of the IVarInstanceReference class are listed here.

Public Methods

	Name	Description
	GetInstance (see page 5046)	This is GetInstance, a member of class IVarInstanceReference.

54.2.1.2.1 IVarInstanceReference.GetInstance Method

Pascal

```
function GetInstance(const V: TVarData): TObject;
```

C++

```
__fastcall TObject * GetInstance(const TVarData V);
```

Description

This is GetInstance, a member of class IVarInstanceReference.

54.2.2 IVarInvokeable Interface

Class Hierarchy

Pascal

```
IVarInvokeable = interface;
```

C++

```
__interface IVarInvokeable;
```

File

Variants

Description

This is class Variants.IVarInvokeable.

54.2.2.1 IVarInvokeable Members

The following tables list the members exposed by IVarInvokeable.

Public Methods

	Name	Description
	DoFunction (see page 5047)	This is DoFunction, a member of class IVarInvokeable.
	DoProcedure (see page 5047)	This is DoProcedure, a member of class IVarInvokeable.
	GetProperty (see page 5047)	This is GetProperty, a member of class IVarInvokeable.
	SetProperty (see page 5047)	This is SetProperty, a member of class IVarInvokeable.

54.2.2.2 IVarInvokeable Methods

The methods of the IVarInvokeable class are listed here.

Public Methods

	Name	Description
	DoFunction (see page 5047)	This is DoFunction, a member of class IVarInvokeable.
	DoProcedure (see page 5047)	This is DoProcedure, a member of class IVarInvokeable.
	GetProperty (see page 5047)	This is GetProperty, a member of class IVarInvokeable.

	SetProperty (see page 5047)	This is SetProperty, a member of class IVarInvokeable.

54.2.2.2.1 IVarInvokeable.DoFunction Method

Pascal

```
function DoFunction(var Dest: TVarData; const V: TVarData; const Name: string; const
Arguments: TVarDataArray): Boolean;
```

C++

```
__fastcall Boolean DoFunction(TVarData Dest, const TVarData V, const UnicodeString Name, const
TVarDataArray Arguments);
```

Description

This is DoFunction, a member of class IVarInvokeable.

54.2.2.2.2 IVarInvokeable.DoProcedure Method

Pascal

```
function DoProcedure(const V: TVarData; const Name: string; const Arguments: TVarDataArray):
Boolean;
```

C++

```
__fastcall Boolean DoProcedure(const TVarData V, const UnicodeString Name, const TVarDataArray
Arguments);
```

Description

This is DoProcedure, a member of class IVarInvokeable.

54.2.2.2.3 IVarInvokeable.GetProperty Method

Pascal

```
function GetProperty(var Dest: TVarData; const V: TVarData; const Name: string): Boolean;
```

C++

```
__fastcall Boolean GetProperty(TVarData Dest, const TVarData V, const UnicodeString Name);
```

Description

This is GetProperty, a member of class IVarInvokeable.

54.2.2.2.4 IVarInvokeable.SetProperty Method

Pascal

```
function SetProperty(const V: TVarData; const Name: string; const Value: TVarData): Boolean;
```

C++

```
__fastcall Boolean SetProperty(const TVarData V, const UnicodeString Name, const TVarData
Value);
```

Description

This is SetProperty, a member of class IVarInvokeable.

54.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	_DispInvoke (see page 5050)	This is function Variants._DispInvoke.
	_OleVarFromInt (see page 5051)	This is function Variants._OleVarFromInt.
	_OleVarFromInt64 (see page 5051)	This is function Variants._OleVarFromInt64.
	_OleVarFromLStr (see page 5051)	This is function Variants._OleVarFromLStr.
	_OleVarFromPStr (see page 5052)	This is function Variants._OleVarFromPStr.
	_OleVarFromUInt64 (see page 5052)	This is function Variants._OleVarFromUInt64.
	_OleVarFromUStr (see page 5052)	This is function Variants._OleVarFromUStr.
	_OleVarFromVar (see page 5053)	This is function Variants._OleVarFromVar.
	_VarAdd (see page 5053)	This is function Variants._VarAdd.
	_VarAddRef (see page 5053)	This is function Variants._VarAddRef.
	_VarAnd (see page 5054)	This is function Variants._VarAnd.
	_VarArrayGet (see page 5054)	This is function Variants._VarArrayGet.
	_VarArrayPut (see page 5054)	This is function Variants._VarArrayPut.
	_VarArrayRedim (see page 5055)	This is function Variants._VarArrayRedim.
	_VarCast (see page 5055)	This is function Variants._VarCast.
	_VarCastOle (see page 5055)	This is function Variants._VarCastOle.
	_VarClear (see page 5056)	This is function Variants._VarClear.
	_VarClr (see page 5056)	This is function Variants._VarClr.
	_VarCmpEQ (see page 5056)	This is function Variants._VarCmpEQ.
	_VarCmpGE (see page 5057)	This is function Variants._VarCmpGE.
	_VarCmpGT (see page 5057)	This is function Variants._VarCmpGT.
	_VarCmpLE (see page 5057)	This is function Variants._VarCmpLE.
	_VarCmpLT (see page 5058)	This is function Variants._VarCmpLT.
	_VarCmpNE (see page 5058)	This is function Variants._VarCmpNE.
	_VarCopy (see page 5058)	This is function Variants._VarCopy.
	_VarCopyNoInd (see page 5059)	This is function Variants._VarCopyNoInd.
	_VarDiv (see page 5059)	This is function Variants._VarDiv.
	_VarFromBool (see page 5059)	This is function Variants._VarFromBool.
	_VarFromCurr (see page 5060)	This is function Variants._VarFromCurr.
	_VarFromDisp (see page 5060)	This is function Variants._VarFromDisp.
	_VarFromDynArray (see page 5060)	This is function Variants._VarFromDynArray.
	_VarFromInt (see page 5061)	This is function Variants._VarFromInt.
	_VarFromInt64 (see page 5061)	This is function Variants._VarFromInt64.
	_VarFromIntf (see page 5061)	This is function Variants._VarFromIntf.
	_VarFromLStr (see page 5062)	This is function Variants._VarFromLStr.
	_VarFromPStr (see page 5062)	This is function Variants._VarFromPStr.
	_VarFromReal (see page 5062)	This is function Variants._VarFromReal.
	_VarFromTDateTime (see page 5063)	This is function Variants._VarFromTDateTime.
	_VarFromUInt64 (see page 5063)	This is function Variants._VarFromUInt64.
	_VarFromUStr (see page 5063)	This is function Variants._VarFromUStr.
	_VarFromWChar (see page 5064)	This is function Variants._VarFromWChar.
	_VarFromWStr (see page 5064)	This is function Variants._VarFromWStr.
	_VarMod (see page 5064)	This is function Variants._VarMod.
	_VarMul (see page 5065)	This is function Variants._VarMul.

	_VarNeg (see page 5065)	This is function Variants._VarNeg.
	_VarNot (see page 5065)	This is function Variants._VarNot.
	_VarOr (see page 5066)	This is function Variants._VarOr.
	_VarRDiv (see page 5066)	This is function Variants._VarRDiv.
	_VarShl (see page 5066)	This is function Variants._VarShl.
	_VarShr (see page 5067)	This is function Variants._VarShr.
	_VarSub (see page 5067)	This is function Variants._VarSub.
	_VarToBool (see page 5067)	This is function Variants._VarToBool.
	_VarToCurrency (see page 5068)	This is function Variants._VarToCurrency.
	_VarToDisp (see page 5068)	This is function Variants._VarToDisp.
	_VarToDynArray (see page 5068)	This is function Variants._VarToDynArray.
	_VarToInt64 (see page 5069)	This is function Variants._VarToInt64.
	_VarToInteger (see page 5069)	This is function Variants._VarToInteger.
	_VarToIntf (see page 5069)	This is function Variants._VarToIntf.
	_VarToLStr (see page 5070)	This is function Variants._VarToLStr.
	_VarToPStr (see page 5070)	This is function Variants._VarToPStr.
	_VarToReal (see page 5070)	This is function Variants._VarToReal.
	_VarToUInt64 (see page 5071)	This is function Variants._VarToUInt64.
	_VarToUStr (see page 5071)	This is function Variants._VarToUStr.
	_VarToWStr (see page 5071)	This is function Variants._VarToWStr.
	_VarXor (see page 5072)	This is function Variants._VarXor.
	DynArrayFromVariant (see page 5072)	Creates a dynamic array from a Variant (see page 3430).
	DynArrayToVariant (see page 5072)	Creates a Variant (see page 3430) array from a dynamic array.
	FindCustomVariantType (see page 5073)	Retrieves the object that implements a custom Variant (see page 3430) type.
	FindCustomVariantType (see page 5073)	Retrieves the object that implements a custom Variant (see page 3430) type.
	FindVarData (see page 5074)	Returns pointer to variant's data.
	HandleConversionException (see page 5074)	Handles exceptions during variant type conversions.
	Null (see page 5075)	Returns a Null variant.
	Unassigned (see page 5076)	Returns an "empty" variant.
	VarArrayAsPSafeArray (see page 5077)	This is function Variants.VarArrayAsPSafeArray.
	VarArrayCreate (see page 5077)	Creates a variant array.
	VarArrayCreateError (see page 5078)	Indicates an array creation error.
	VarArrayDimCount (see page 5078)	Returns number of dimensions of a variant array.
	VarArrayGet (see page 5079)	Returns a Variant (see page 3430) that represents a single value from a multi-dimensional Variant (see page 3430) array.
	VarArrayHighBound (see page 5079)	Returns high bound for a dimension in a variant array.
	VarArrayLock (see page 5080)	Locks a variant array and returns a pointer to the data.
	VarArrayLowBound (see page 5080)	Returns the low bound of a dimension in a variant array.
	VarArrayOf (see page 5081)	Creates and fills a one-dimensional variant array.
	VarArrayPut (see page 5081)	Sets the value of a single cell in a multi-dimensional Variant (see page 3430) array.
	VarArrayRef (see page 5082)	Returns a reference to the specified variant array.
	VarArrayUnlock (see page 5083)	Unlocks a variant array.
	VarAsError (see page 5083)	Converts a HRESULT (see page 3826) into an Error (see page 3662) variant.
	VarAsType (see page 5083)	Converts a variant to specified type.
	VarCastError (see page 5084)	Raises an EVariantTypeCastError (see page 5010) exception.
	VarCastError (see page 5084)	Raises an EVariantTypeCastError (see page 5010) exception.
	VarCheckEmpty (see page 5084)	Raises an exception if a specified variant's value is Unassigned (see page 5076).
	VarCompareValue (see page 5085)	Returns the relationship between Variants (see page 4997).
	VarCopyNoInd (see page 5086)	Copies a Variant (see page 3430).
	VarEnsureRange (see page 5086)	Returns a Variant (see page 3430) with a value in a specified range.
	VarFromDateTime (see page 5087)	Returns a variant containing a specified data and time.
	VarInRange (see page 5087)	Indicates whether a Variant (see page 3430)'s value is in a specified range.
	VarInvalidNullOp (see page 5088)	Indicate variant operation on null.

	VarInvalidOp (see page 5088)	Indicate invalid variant operation.
	VarIsArray (see page 5089)	Indicates whether the specified variant is an array.
	VarIsArray (see page 5089)	Indicates whether the specified variant is an array.
	VarIsByRef (see page 5089)	Indicates whether the specified variant's value is by reference.
	VarIsClear (see page 5090)	Indicates whether the specified variant has an undefined value.
	VarIsCustom (see page 5090)	Indicates whether the specified variant is a custom variant.
	VarIsEmpty (see page 5091)	Indicates whether the specified variant is unassigned.
	VarIsEmptyParam (see page 5092)	Indicates whether the specified variant represents an unassigned optional parameter.
	VarIsError (see page 5092)	Indicates whether the specified variant is an error variant; optionally converts variant back to HRESULT (see page 3826).
	VarIsError (see page 5092)	Indicates whether the specified variant is an error variant; optionally converts variant back to HRESULT (see page 3826).
	VarIsFloat (see page 5093)	Indicates whether the specified variant represents a floating-point value.
	VarIsNull (see page 5093)	Indicates whether the specified variant is Null (see page 5075).
	VarIsNumeric (see page 5094)	Indicates whether the specified variant represents a numeric value.
	VarIsOrdinal (see page 5094)	Indicates whether the specified variant represents an ordinal value.
	VarIsStr (see page 5095)	Indicates whether the specified variant represents a string value.
	VarIsType (see page 5095)	Indicates whether the specified variant represents a specified type.
	VarIsType (see page 5095)	Indicates whether the specified variant represents a specified type.
	VarOverflowError (see page 5096)	Raises an EVariantOverflowError (see page 5009) exception.
	VarRangeCheckError (see page 5096)	Raises an EVariantRangeCheckError (see page 5010) exception.
	VarResultCheck (see page 5097)	Raises variant exception based on HRESULT (see page 3826) value.
	VarResultCheck (see page 5097)	Raises variant exception based on HRESULT (see page 3826) value.
	VarSameValue (see page 5097)	Indicates whether two Variants (see page 4997) have equivalent values.
	VarSupports (see page 5098)	Indicates whether the Variant (see page 3430)'s value is an interface that supports a specified interface.
	VarSupports (see page 5098)	Indicates whether the Variant (see page 3430)'s value is an interface that supports a specified interface.
	VarToDateTime (see page 5098)	Converts a specified variant to a TDateTime (see page 3335) value.
	VarToStr (see page 5099)	Converts a variant's value to a string.
	VarToStrDef (see page 5099)	Converts a variant's value to a string.
	VarToWideStr (see page 5100)	Converts a variant's value to a WideString (see page 3476).
	VarToWideStrDef (see page 5100)	Converts a variant's value to a WideString (see page 3476).
	VarType (see page 5101)	Returns the type code of a specified variant.
	VarTypeAsText (see page 5102)	Returns variant type descriptive string.
	VarTypeIsValidArrayType (see page 5103)	Indicates whether a Variant (see page 3430) type code represents a type that can be used for the elements in a Variant (see page 3430) array.
	VarTypeIsValidElementType (see page 5103)	Indicates whether a Variant (see page 3430) type code represents a type that can be used for the elements in a Variant (see page 3430) array.

54.3.1 Variants._DispInvoke Function

Pascal

```
procedure _DispInvoke(Dest: PVarData; const Source: TVarData; CallDesc: PCallDesc; Params:
Pointer); cdecl;
```

C++

```
__cdecl _DispInvoke(PVarData Dest, const TVarData Source, PCallDesc CallDesc, void * Params);
```

File

Variants

Description

This is function Variants._DispInvoke.

54.3.2 Variants._OleVarFromInt Function

Pascal

```
procedure _OleVarFromInt(var V: TVarData; const Value: Integer; const Range: ShortInt);
```

C++

```
_OleVarFromInt(TVarData V, const int Value, const ShortInt Range);
```

File

Variants

Description

This is function Variants._OleVarFromInt.

54.3.3 Variants._OleVarFromInt64 Function

Pascal

```
procedure _OleVarFromInt64(var V: TVarData; const Value: Int64);
```

C++

```
_OleVarFromInt64(TVarData V, const Int64 Value);
```

File

Variants

Description

This is function Variants._OleVarFromInt64.

54.3.4 Variants._OleVarFromLStr Function

Pascal

```
procedure _OleVarFromLStr(var V: TVarData; const Value: AnsiString);
```

C++

```
_OleVarFromLStr(TVarData V, const AnsiString Value);
```

File

Variants

Description

This is function Variants._OleVarFromLStr.

54.3.5 Variants._OleVarFromPStr Function

Pascal

```
procedure _OleVarFromPStr(var V: TVarData; const Value: ShortString);
```

C++

```
_OleVarFromPStr(TVarData V, const ShortString Value);
```

File

Variants

Description

This is function Variants._OleVarFromPStr.

54.3.6 Variants._OleVarFromUInt64 Function

Pascal

```
procedure _OleVarFromUInt64(var V: TVarData; const Value: UInt64);
```

C++

```
_OleVarFromUInt64(TVarData V, const UInt64 Value);
```

File

Variants

Description

This is function Variants._OleVarFromUInt64.

54.3.7 Variants._OleVarFromUStr Function

Pascal

```
procedure _OleVarFromUStr(var V: TVarData; const Value: UnicodeString);
```

C++

```
_OleVarFromUStr(TVarData V, const UnicodeString Value);
```

File

Variants

Description

This is function Variants._OleVarFromUStr.

54.3.8 Variants._OleVarFromVar Function

Pascal

```
procedure _OleVarFromVar(var Dest: TVarData; const Source: TVarData);
```

C++

```
_OleVarFromVar(TVarData Dest, const TVarData Source);
```

File

Variants

Description

This is function Variants._OleVarFromVar.

54.3.9 Variants._VarAdd Function

Pascal

```
procedure _VarAdd(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarAdd(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarAdd.

54.3.10 Variants._VarAddRef Function

Pascal

```
procedure _VarAddRef(var V: TVarData);
```

C++

```
_VarAddRef(TVarData V);
```

File

Variants

Description

This is function Variants._VarAddRef.

54.3.11 Variants._VarAnd Function

Pascal

```
procedure _VarAnd(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarAnd(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarAnd.

54.3.12 Variants._VarArrayGet Function

Pascal

```
function _VarArrayGet(var A: TVarData; IndexCount: Integer; const Indices:
TVarArrayCoorArray): TVarData; cdecl;
```

C++

```
__cdecl TVarData _VarArrayGet(TVarData A, int IndexCount, const TVarArrayCoorArray Indices);
```

File

Variants

Description

This is function Variants._VarArrayGet.

54.3.13 Variants._VarArrayPut Function

Pascal

```
procedure _VarArrayPut(var A: TVarData; const Value: TVarData; IndexCount: Integer; const
Indices: TVarArrayCoorArray); cdecl;
```

C++

```
__cdecl _VarArrayPut(TVarData A, const TVarData Value, int IndexCount, const
TVarArrayCoorArray Indices);
```

File

Variants

Description

This is function Variants._VarArrayPut.

54.3.14 Variants._VarArrayRedim Function

Pascal

```
procedure _VarArrayRedim(var A: TVarData; HighBound: Integer);
```

C++

```
_VarArrayRedim(TVarData A, int HighBound);
```

File

Variants

Description

This is function Variants._VarArrayRedim.

54.3.15 Variants._VarCast Function

Pascal

```
procedure _VarCast(var Dest: TVarData; const Source: TVarData; AVarType: Integer);
```

C++

```
_VarCast(TVarData Dest, const TVarData Source, int AVarType);
```

File

Variants

Description

This is function Variants._VarCast.

54.3.16 Variants._VarCastOle Function

Pascal

```
procedure _VarCastOle(var Dest: TVarData; const Source: TVarData; AVarType: Integer);
```

C++

```
_VarCastOle(TVarData Dest, const TVarData Source, int AVarType);
```

File

Variants

Description

This is function Variants._VarCastOle.

54.3.17 Variants._VarClear Function

Pascal

```
procedure _VarClear(var V: TVarData);
```

C++

```
_VarClear(TVarData V);
```

File

Variants

Description

This is function Variants._VarClear.

54.3.18 Variants._VarClr Function

Pascal

```
procedure _VarClr(var V: TVarData);
```

C++

```
_VarClr(TVarData V);
```

File

Variants

Description

This is function Variants._VarClr.

54.3.19 Variants._VarCmpEQ Function

Pascal

```
procedure _VarCmpEQ(const Left: TVarData; const Right: TVarData);
```

C++

```
_VarCmpEQ(const TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarCmpEQ.

54.3.20 Variants._VarCmpGE Function

Pascal

```
procedure _VarCmpGE(const Left: TVarData; const Right: TVarData);
```

C++

```
_VarCmpGE(const TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarCmpGE.

54.3.21 Variants._VarCmpGT Function

Pascal

```
procedure _VarCmpGT(const Left: TVarData; const Right: TVarData);
```

C++

```
_VarCmpGT(const TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarCmpGT.

54.3.22 Variants._VarCmpLE Function

Pascal

```
procedure _VarCmpLE(const Left: TVarData; const Right: TVarData);
```

C++

```
_VarCmpLE(const TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarCmpLE.

54.3.23 Variants._VarCmpLT Function

Pascal

```
procedure _VarCmpLT(const Left: TVarData; const Right: TVarData);
```

C++

```
_VarCmpLT(const TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarCmpLT.

54.3.24 Variants._VarCmpNE Function

Pascal

```
procedure _VarCmpNE(const Left: TVarData; const Right: TVarData);
```

C++

```
_VarCmpNE(const TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarCmpNE.

54.3.25 Variants._VarCopy Function

Pascal

```
procedure _VarCopy(var Dest: TVarData; const Source: TVarData);
```

C++

```
_VarCopy(TVarData Dest, const TVarData Source);
```

File

Variants

Description

This is function Variants._VarCopy.

54.3.26 Variants._VarCopyNoInd Function

Pascal

```
procedure _VarCopyNoInd(var Dest: TVarData; const Source: TVarData);
```

C++

```
_VarCopyNoInd(TVarData Dest, const TVarData Source);
```

File

Variants

Description

This is function Variants._VarCopyNoInd.

54.3.27 Variants._VarDiv Function

Pascal

```
procedure _VarDiv(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarDiv(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarDiv.

54.3.28 Variants._VarFromBool Function

Pascal

```
procedure _VarFromBool(var V: TVarData; const Value: Boolean);
```

C++

```
_VarFromBool(TVarData V, const Boolean Value);
```

File

Variants

Description

This is function Variants._VarFromBool.

54.3.29 Variants._VarFromCurr Function

Pascal

```
procedure _VarFromCurr;
```

C++

```
_VarFromCurr();
```

File

Variants

Description

This is function Variants._VarFromCurr.

54.3.30 Variants._VarFromDisp Function

Pascal

```
procedure _VarFromDisp(var V: TVarData; const Value: IDispatch);
```

C++

```
_VarFromDisp(TVarData V, const IDispatch Value);
```

File

Variants

Description

This is function Variants._VarFromDisp.

54.3.31 Variants._VarFromDynArray Function

Pascal

```
procedure _VarFromDynArray(var V: TVarData; const DynArray: Pointer; TypeInfo: Pointer);
```

C++

```
_VarFromDynArray(TVarData V, const void * DynArray, void * TypeInfo);
```

File

Variants

Description

This is function Variants._VarFromDynArray.

54.3.32 Variants._VarFromInt Function

Pascal

```
procedure _VarFromInt(var V: TVarData; const Value: Integer; const Range: ShortInt);
```

C++

```
_VarFromInt(TVarData V, const int Value, const ShortInt Range);
```

File

Variants

Description

This is function Variants._VarFromInt.

54.3.33 Variants._VarFromInt64 Function

Pascal

```
procedure _VarFromInt64(var V: TVarData; const Value: Int64);
```

C++

```
_VarFromInt64(TVarData V, const Int64 Value);
```

File

Variants

Description

This is function Variants._VarFromInt64.

54.3.34 Variants._VarFromIntf Function

Pascal

```
procedure _VarFromIntf(var V: TVarData; const Value: IInterface);
```

C++

```
_VarFromIntf(TVarData V, const IInterface Value);
```

File

Variants

Description

This is function Variants._VarFromIntf.

54.3.35 Variants._VarFromLStr Function

Pascal

```
procedure _VarFromLStr(var V: TVarData; const Value: AnsiString);
```

C++

```
_VarFromLStr(TVarData V, const AnsiString Value);
```

File

Variants

Description

This is function Variants._VarFromLStr.

54.3.36 Variants._VarFromPStr Function

Pascal

```
procedure _VarFromPStr(var V: TVarData; const Value: ShortString);
```

C++

```
_VarFromPStr(TVarData V, const ShortString Value);
```

File

Variants

Description

This is function Variants._VarFromPStr.

54.3.37 Variants._VarFromReal Function

Pascal

```
procedure _VarFromReal;
```

C++

```
_VarFromReal();
```

File

Variants

Description

This is function Variants._VarFromReal.

54.3.38 Variants._VarFromTDateTime Function

Pascal

```
procedure _VarFromTDateTime;
```

C++

```
_VarFromTDateTime();
```

File

Variants

Description

This is function Variants._VarFromTDateTime.

54.3.39 Variants._VarFromUInt64 Function

Pascal

```
procedure _VarFromUInt64(var V: TVarData; const Value: UInt64);
```

C++

```
_VarFromUInt64(TVarData V, const UInt64 Value);
```

File

Variants

Description

This is function Variants._VarFromUInt64.

54.3.40 Variants._VarFromUStr Function

Pascal

```
procedure _VarFromUStr(var V: TVarData; const Value: UnicodeString);
```

C++

```
_VarFromUStr(TVarData V, const UnicodeString Value);
```

File

Variants

Description

This is function Variants._VarFromUStr.

54.3.41 Variants._VarFromWChar Function

Pascal

```
procedure _VarFromWChar(var V: TVarData; const Value: WideChar);
```

C++

```
_VarFromWChar(TVarData V, const WideChar Value);
```

File

Variants

Description

This is function Variants._VarFromWChar.

54.3.42 Variants._VarFromWStr Function

Pascal

```
procedure _VarFromWStr(var V: TVarData; const Value: WideString);
```

C++

```
_VarFromWStr(TVarData V, const BSTR Value);
```

File

Variants

Description

This is function Variants._VarFromWStr.

54.3.43 Variants._VarMod Function

Pascal

```
procedure _VarMod(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarMod(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarMod.

54.3.44 Variants._VarMul Function

Pascal

```
procedure _VarMul(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarMul(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarMul.

54.3.45 Variants._VarNeg Function

Pascal

```
procedure _VarNeg(var Dest: TVarData);
```

C++

```
_VarNeg(TVarData Dest);
```

File

Variants

Description

This is function Variants._VarNeg.

54.3.46 Variants._VarNot Function

Pascal

```
procedure _VarNot(var Dest: TVarData);
```

C++

```
_VarNot(TVarData Dest);
```

File

Variants

Description

This is function Variants._VarNot.

54.3.47 Variants._VarOr Function

Pascal

```
procedure _VarOr(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarOr(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarOr.

54.3.48 Variants._VarRDiv Function

Pascal

```
procedure _VarRDiv(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarRDiv(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarRDiv.

54.3.49 Variants._VarShl Function

Pascal

```
procedure _VarShl(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarShl(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarShl.

54.3.50 Variants._VarShr Function

Pascal

```
procedure _VarShr(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarShr(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarShr.

54.3.51 Variants._VarSub Function

Pascal

```
procedure _VarSub(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarSub(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarSub.

54.3.52 Variants._VarToBool Function

Pascal

```
function _VarToBool(const V: TVarData): LongBool;
```

C++

```
LongBool _VarToBool(const TVarData V);
```

File

Variants

Description

This is function Variants._VarToBool.

54.3.53 Variants._VarToCurrency Function

Pascal

```
function _VarToCurrency(const V: TVarData): Currency;
```

C++

```
Currency _VarToCurrency(const TVarData V);
```

File

Variants

Description

This is function Variants._VarToCurrency.

54.3.54 Variants._VarToDisp Function

Pascal

```
procedure _VarToDisp(var Dispatch: IDispatch; const V: TVarData);
```

C++

```
_VarToDisp(IDispatch Dispatch, const TVarData V);
```

File

Variants

Description

This is function Variants._VarToDisp.

54.3.55 Variants._VarToDynArray Function

Pascal

```
procedure _VarToDynArray(var DynArray: Pointer; const V: TVarData; TypeInfo: Pointer);
```

C++

```
_VarToDynArray(void * DynArray, const TVarData V, void * TypeInfo);
```

File

Variants

Description

This is function Variants._VarToDynArray.

54.3.56 Variants._VarToInt64 Function

Pascal

```
function _VarToInt64(const V: TVarData): Int64;
```

C++

```
Int64 _VarToInt64(const TVarData V);
```

File

Variants

Description

This is function Variants._VarToInt64.

54.3.57 Variants._VarToInteger Function

Pascal

```
function _VarToInteger(const V: TVarData): Integer;
```

C++

```
int _VarToInteger(const TVarData V);
```

File

Variants

Description

This is function Variants._VarToInteger.

54.3.58 Variants._VarToIntf Function

Pascal

```
procedure _VarToIntf(var Intf: IInterface; const V: TVarData);
```

C++

```
_VarToIntf(IInterface Intf, const TVarData V);
```

File

Variants

Description

This is function Variants._VarToIntf.

54.3.59 Variants._VarToLStr Function

Pascal

```
procedure _VarToLStr(var S: AnsiString; const V: TVarData);
```

C++

```
_VarToLStr(AnsiString S, const TVarData V);
```

File

Variants

Description

This is function Variants._VarToLStr.

54.3.60 Variants._VarToPStr Function

Pascal

```
procedure _VarToPStr(var S; const V: TVarData);
```

C++

```
_VarToPStr( S, const TVarData V);
```

File

Variants

Description

This is function Variants._VarToPStr.

54.3.61 Variants._VarToReal Function

Pascal

```
function _VarToReal(const V: TVarData): Extended;
```

C++

```
Extended _VarToReal(const TVarData V);
```

File

Variants

Description

This is function Variants._VarToReal.

54.3.62 Variants._VarToUInt64 Function

Pascal

```
function _VarToUInt64(const V: TVarData): UInt64;
```

C++

```
UInt64 _VarToUInt64(const TVarData V);
```

File

Variants

Description

This is function Variants._VarToUInt64.

54.3.63 Variants._VarToUStr Function

Pascal

```
procedure _VarToUStr(var S: UnicodeString; const V: TVarData);
```

C++

```
_VarToUStr(UnicodeString S, const TVarData V);
```

File

Variants

Description

This is function Variants._VarToUStr.

54.3.64 Variants._VarToWStr Function

Pascal

```
procedure _VarToWStr(var S: WideString; const V: TVarData);
```

C++

```
_VarToWStr(BSTR S, const TVarData V);
```

File

Variants

Description

This is function Variants._VarToWStr.

54.3.65 Variants._VarXor Function

Pascal

```
procedure _VarXor(var Left: TVarData; const Right: TVarData);
```

C++

```
_VarXor(TVarData Left, const TVarData Right);
```

File

Variants

Description

This is function Variants._VarXor.

54.3.66 Variants.DynArrayFromVariant Function

Creates a dynamic array from a Variant (see page 3430).

Pascal

```
procedure DynArrayFromVariant(var DynArray: Pointer; const V: Variant; TypeInfo: Pointer);
```

C++

```
DynArrayFromVariant(void * DynArray, const Variant V, void * TypeInfo);
```

File

Variants

Description

Call DynArrayFromVariant to copy the contents of a variant (V) to an existing dynamic array variable (DynArray).

DynArray is a dynamic array variable whose value is assigned from the Variant (see page 3430).

V is the Variant (see page 3430) to copy. Its value must be an array.

TypeInfo points to the runtime type information that identifies the type of array elements. You can obtain this pointer using the TypeInfo function (Delphi) or the __delphirtti function (C++).

See Also

DynArrayToVariant (see page 5072)

TypeInfo

54.3.67 Variants.DynArrayToVariant Function

Creates a Variant (see page 3430) array from a dynamic array.

Pascal

```
procedure DynArrayToVariant(var V: Variant; const DynArray: Pointer; TypeInfo: Pointer);
```

C++

```
DynArrayToVariant(Variant V, const void * DynArray, void * TypeInfo);
```

File

Variants

Description

Call DynArrayToVariant to assign the contents of a dynamic array as the value of a Variant (see page 3430) variable.

V is the Variant (see page 3430) whose value is assigned by DynArrayToVariant.

DynArray is a dynamic array to copy.

TypeInfo points to the runtime type information that identifies the type of array elements. You can obtain this pointer using the TypeInfo function (Delphi) or the __delphirtti function (C++).

See Also

DynArrayFromVariant (see page 5072)

TypeInfo

54.3.68 Variants.FindCustomVariantType Function

Retrieves the object that implements a custom Variant (see page 3430) type.

Pascal

```
function FindCustomVariantType(const AVarType: TVarType; out CustomVariantType:
TCustomVariantType): Boolean; overload;
function FindCustomVariantType(const TypeName: string; out CustomVariantType:
TCustomVariantType): Boolean; overload;
```

C++

```
Boolean FindCustomVariantType(const TVarType AVarType, TCustomVariantType CustomVariantType);
Boolean FindCustomVariantType(const UnicodeString TypeName, TCustomVariantType
CustomVariantType);
```

File

Variants

Description

Use FindCustomVariantType to obtain a reference to the object that implements a custom Variant (see page 3430) type.

TypeName is the name of the TCustomVariantType (see page 5011) descendant class you want to retrieve.

AVarType is the type code of Variant (see page 3430) whose implementation class you want to retrieve. If you have an instance of a Variant (see page 3430) whose value is a custom Variant (see page 3430) Type, you can obtain a value for this parameter using the VarType (see page 5101) function.

CustomVariantType returns an instance of the TCustomVariantType (see page 5011) descendant that implements the indicated custom Variant (see page 3430) type.

See Also

VarType (see page 5101)

VarIsCustom (see page 5090)

54.3.69 Variants.FindVarData Function

Returns pointer to variant's data.

Pascal

```
function FindVarData(const V: Variant): PVarData;
```

C++

```
PVarData FindVarData(const Variant V);
```

File

Variants

Description

FindVarData returns a pointer to the Variant (see page 3430) data contained referenced by a Variant (see page 3430). If the Variant (see page 3430) contains another Variant (see page 3430), FindVarData follows the chain of references until it finds the actual data.

See Also

VarType (see page 5101)

54.3.70 Variants.HandleConversionException Function

Handles exceptions during variant type conversions.

Pascal

```
procedure HandleConversionException(const ASourceType: TVarType; const ADestType: TVarType);
```

C++

```
HandleConversionException(const TVarType ASourceType, const TVarType ADestType);
```

File

Variants

Description

HandleConversionException handles exceptions resulting from attempts to convert between variant types. Code that implements such conversions should call HandleConversionException when a conversion throws an exception.

ASourceType and ADestType indicate the variant types of the source and destination. HandleConversionException uses these to format an appropriate error string. If the current exception corresponds to a variant exception, HandleConversionException raises that exception. Otherwise, HandleConversionException simply re-raises the original exception.

See Also

VarResultCheck (see page 5097)

EVariantError

54.3.71 Variants.Null Function

Returns a Null variant.

Pascal

```
function Null: Variant;
```

C++

```
Variant Null();
```

File

Variants

Description

Use Null to obtain a Null variant that can indicate unknown or missing data. Null Variants (see page 4997) can be assigned to variant variables in an application that must contain a null value. Assigning Null to a variant variable does not cause an error, and Null can be returned from any function with a variant return value.

Assigning Null to a variable of any type other than Variant (see page 3430) causes either a compile-time error or raises an EVariantTypeMismatch exception. For example, in the following code the assignment of v, the Null variant, to variant q is successful; whereas the conversion of variant v, which is now Null, to the integer return type of the Test function, raises an exception.

function Test(v: Variant (see page 3430)): Integer;

```
var
  q: Variant;
  msg: string;
begin
  q := v; { this is ok, since q is a variant }
  if VarIsNull(q) then
    msg := 'q is a null variant'
  else
    msg := 'q is not a null variant';
  ShowMessage(msg);

  Result := v; { this raises an exception!!!}
end;
```

procedure TForm1.Button1Click(Sender: TObject (see page 3364));

```
begin
  Test(Null);
end;
```

int Test(Variant (see page 3430) v)

```
{
  Variant q = v; // this is ok, since q is a variant
  AnsiString msg;
  if (VarIsNull(q))
    msg = "q is a null variant";
  else
    msg = "q is not a null variant";
  ShowMessage(msg);

   return v; // this throws an exception!!!
```

```
}
void __fastcall TForm1::Button1Click(TObject (see page 3364) *Sender)
{
  Test(Null());
}
```

Except for comparisons, which always result in Boolean values, expressions involving Null variants always result in Null variants.

Note: The Null variant returned by the Null function is different from the nil constant in Delphi code and the NULL macro in C++ code. Neither nil nor NULL is a variant. The nil constant is an object reference that does not refer to any actual object. The NULL macro is a pointer that does not refer to any actual object or value.

See Also

Unassigned (see page 5076)

VarIsNull (see page 5093)

VarType (see page 5101)

NullEqualityRule (see page 5112)

NullMagnitudeRule (see page 5113)

54.3.72 Variants.Unassigned Function

Returns an "empty" variant.

Pascal

```
function Unassigned: Variant;
```

C++

```
Variant Unassigned();
```

File

Variants

Description

A variant variable can be "empty", meaning it has not yet been assigned to. The Unassigned function returns an empty variant, which can be assigned to a variant variable to restore the variable to its initial state.

Use the VarIsEmpty (see page 5091) function to test whether a variant is empty. When used on an empty variant, the VarType (see page 5101) standard function returns varEmpty (see page 3933).

If an empty variant is cast to another type (for example, by assigning to a non-variant variable or calling VarAsType (see page 5083)) the following conversions occur:

Destination	Conversion result
Numeric type	Zero
String type	Empty string
Boolean	False.

Note: Unassigned is useful with variants referencing OLE Automation Objects that you want to keep "alive" until another value is

assigned to the variant.

There's corresponding functionality under Linux. Should document when time permits.

See Also

Null (see page 5075)

VarIsEmpty (see page 5091)

VarType (see page 5101)

VarAsType (see page 5083)

54.3.73 Variants.VarArrayAsPSafeArray Function

Pascal

```
function VarArrayAsPSafeArray(const A: Variant): PVarArray;
```

C++

```
PVarArray VarArrayAsPSafeArray(const Variant A);
```

File

Variants

Description

This is function Variants.VarArrayAsPSafeArray.

54.3.74 Variants.VarArrayCreate Function

Creates a variant array.

Pascal

```
function VarArrayCreate(const Bounds: array of Integer; AVarType: TVarType): Variant;
```

C++

```
Variant VarArrayCreate(const array of Integer Bounds, TVarType AVarType);
```

File

Variants

Description

VarArrayCreate creates a variant array with the bounds given by Bounds (see page 4685) and the element type given by VarType (see page 5101).

The Bounds (see page 4685) parameter must contain an even number of values, where each pair of values specifies the upper and lower bounds of one dimension of the array.

Note: The Bounds_size parameter is the index of the last value in the Bounds (see page 4685) array. This is one less than the total number of values. Thus, Bounds_size must always be an odd number.

The element type of the array, given by the VarType (see page 5101) parameter, is a variant type code. This must be one of the constants defined in the System (see page 3165) unit. It cannot include the varArray (see page 3929) or varByRef (

see page 3930) bits. The element type cannot be varString (see page 3938) or a custom Variant (see page 3430) type. To create a variant array of strings use the varOleStr (see page 3936) type code. If the element type is varVariant (see page 3941), the elements of the array are themselves variants and can in turn contain variant arrays.

If VarArrayCreate is unable to create the array, an EVariantArrayCreateError (see page 5002) is raised.

Note: :Variant (see page 3430) arrays with an element type of varByte (see page 3931) are the preferred method of passing binary data between OLE Automation controllers and servers. Such arrays are subject to no translation of their data, and can be efficiently accessed using the VarArrayLock (see page 5080) and VarArrayUnlock (see page 5083) routines.

There's corresponding functionality under Linux. Should document when time permits.

See Also

VarArrayOf (see page 5081)

VarArrayLock (see page 5080)

VarArrayUnlock (see page 5083)

EVariantArrayCreateError (see page 5002)

54.3.75 Variants.VarArrayCreateError Function

Indicates an array creation error.

Pascal

```
procedure VarArrayCreateError;
```

C++

```
VarArrayCreateError();
```

File

Variants

See Also

EVariantArrayCreateError (see page 5002)

54.3.76 Variants.VarArrayDimCount Function

Returns number of dimensions of a variant array.

Pascal

```
function VarArrayDimCount(const A: Variant): Integer;
```

C++

```
int VarArrayDimCount(const Variant A);
```

File

Variants

Description

VarArrayDimCount returns the number of dimensions of the given variant. The resulting value is zero if the given variant is not a

variant array.

See Also

VarArrayHighBound (see page 5079)

VarArrayLowBound (see page 5080)

54.3.77 Variants.VarArrayGet Function

Returns a Variant (see page 3430) that represents a single value from a multi-dimensional Variant (see page 3430) array.

Pascal

```
function VarArrayGet(const A: Variant; const Indices: array of Integer): Variant;
```

C++

```
Variant VarArrayGet(const Variant A, const array of Integer Indices);
```

File

Variants

Description

Use VarArrayGet to obtain the value of a single cell from a multi-dimensional Variant (see page 3430) array.

A is the Variant (see page 3430) array that contains the desired value.

Indices is an array of index values, one for each dimension of the array.

Note: Indices_Size is the index of the last value in Indices (one less than the number of dimensions in the array).

If the values specified by Indices are out of bounds, VarArrayGet raises an EVariantBadIndexError (see page 5004).

See Also

VarArrayPut (see page 5081)

EVariantBadIndexError (see page 5004)

54.3.78 Variants.VarArrayHighBound Function

Returns high bound for a dimension in a variant array.

Pascal

```
function VarArrayHighBound(const A: Variant; Dim: Integer): Integer;
```

C++

```
int VarArrayHighBound(const Variant A, int Dim);
```

File

Variants

Description

VarArrayHighBound returns the high bound of the given dimension in the given variant array. The Dim parameter should be 1 for the leftmost dimension, 2 for the second leftmost dimension, and so on. An exception is raised if the variant given by A is not an

array (EVariantInvalidArgError (see page 5005)), or if the dimension specified by Dim does not exist (EVariantBadIndexError (see page 5004)).

See Also

VarArrayDimCount (see page 5078)

VarArrayLowBound (see page 5080)

EVariantInvalidArgError (see page 5005)

EVariantBadIndexError (see page 5004)

54.3.79 Variants.VarArrayLock Function

Locks a variant array and returns a pointer to the data.

Pascal

```
function VarArrayLock(const A: Variant): Pointer;
```

C++

```
void * VarArrayLock(const Variant A);
```

File

Variants

Description

VarArrayLock locks the given variant array and returns a pointer to the data stored in the array. While locked, a variant array can not be resized and any calls to VarArrayRedim (see page 3786) will fail. Once locked, a variant array must later be unlocked using VarArrayUnlock (see page 5083). An EVariantInvalidArgError (see page 5005) exception is raise if the variant given by A is not an array.

The pointer returned by VarArrayLock points to an array of elements in which the leftmost dimension increases first. In other words, the dimensions of the returned array pointer are reversed from the dimensions of the variant array.

Once it is verified that a variant array has the correct bounds and dimensions, VarArrayLock can be used to gain direct access to the array data, which results in improved performance.

See Also

VarArrayUnlock (see page 5083)

VarArrayRedim

54.3.80 Variants.VarArrayLowBound Function

Returns the low bound of a dimension in a variant array.

Pascal

```
function VarArrayLowBound(const A: Variant; Dim: Integer): Integer;
```

C++

```
int VarArrayLowBound(const Variant A, int Dim);
```

File

Variants

Description

VarArrayLowBound returns the low bound of the given dimension in the given variant array. The Dim parameter should be 1 for the leftmost dimension, 2 for the second leftmost dimension, and so on. An exception is raised if the variant given by A is not an array (EVariantInvalidArgError (see page 5005)), or if the dimension specified by Dim does not exist (EVariantBadIndexError (see page 5004))..

See Also

VarArrayDimCount (see page 5078)

VarArrayHighBound (see page 5079)

EVariantInvalidArgError (see page 5005)

EVariantBadIndexError (see page 5004)

54.3.81 Variants.VarArrayOf Function

Creates and fills a one-dimensional variant array.

Pascal

```
function VarArrayOf(const Values: array of Variant): Variant;
```

C++

```
Variant VarArrayOf(const array of Variant Values);
```

File

Variants

Description

VarArrayOf returns a one-dimensional variant array with the elements given by the Values parameter

Values is an array of Variant (see page 3430) values to convert into a Variant (see page 3430) array.

Note: Values_Size indicates the index of the last value in the Values array (one less than the number of values).

The low bound of the returned array is zero, the high bound is the number of values given by the Values parameter less one (Values_Size), and the element type is Variant (see page 3430).

See Also

VarArrayCreate (see page 5077)

54.3.82 Variants.VarArrayPut Function

Sets the value of a single cell in a multi-dimensional Variant (see page 3430) array.

Pascal

```
procedure VarArrayPut(var A: Variant; const Value: Variant; const Indices: array of Integer);
```

C++

```
VarArrayPut(Variant A, const Variant Value, const array of Integer Indices);
```

File

Variants

Description

Use VarArrayPut to set the value of a single cell in a multi-dimensional Variant (see page 3430) array.

A is the Variant (see page 3430) array that contains the cell to set.

Value is the value to assign to the specified cell.

Indices is an array of index values, one for each dimension of the array.

Note: Indices_Size is the index of the last value in Indices (one less than the number of dimensions in the array).

If the values specified by Indices are out of bounds, VarArrayPut raises an EVariantBadIndexError (see page 5004).

See Also

VarArrayGet (see page 5079)

EVariantBadIndexError (see page 5004)

54.3.83 Variants.VarArrayRef Function

Returns a reference to the specified variant array.

Pascal

```
function VarArrayRef(const A: Variant): Variant;
```

C++

```
Variant VarArrayRef(const Variant A);
```

File

Variants

Description

Use VarArrayRef to reference a variant array when a referenced variant array is expected in an API call. VarArrayRef creates a new variant array of the same type as A, but with an extra level of indirection if A does not include the varByRef (see page 3930) type bit. The returned variant includes the varByRef (see page 3930) type bit.

If A is not an array, VarArrayRef raises an EVariantInvalidArgError (see page 5005) exception.

See Also

VarArrayCreate (see page 5077)

TVarType

VarCopyNoInd (see page 5086)

EVariantInvalidArgError (see page 5005)

54.3.84 Variants.VarArrayUnlock Function

Unlocks a variant array.

Pascal

```
procedure VarArrayUnlock(const A: Variant);
```

C++

```
VarArrayUnlock(const Variant A);
```

File

Variants

Description

VarArrayUnlock unlocks a variant array that was previously locked by VarArrayLock (see page 5080). If the variant given by A is not an array, VarArrayUnlock raises an EVariantInvalidArtgError exception.

See Also

VarArrayLock (see page 5080)

54.3.85 Variants.VarAsError Function

Converts a HRESULT (see page 3826) into an Error (see page 3662) variant.

Pascal

```
function VarAsError(AResult: HRESULT): Variant;
```

C++

```
Variant VarAsError(HRESULT AResult);
```

File

Variants

Description

VarAsError converts an HRESULT (see page 3826) result code into an equivalent variant of type varError (see page 3934).

See Also

VarType (see page 5101)

54.3.86 Variants.VarAsType Function

Converts a variant to specified type.

Pascal

```
function VarAsType(const V: Variant; AVarType: TVarType): Variant;
```

C++

```
Variant VarAsType(const Variant V, TVarType AVarType);
```

File

Variants

Description

VarAsType converts a variant to a specified type and returns a new Variant (see page 3430) that has the specified type.

V is the Variant (see page 3430) to convert.

VarType (see page 5101) is a variant type code that indicates the type to which V should be converted. This can be one of the constants defined in the System (see page 3165) unit, or it can be the type code for a custom variant type. It cannot include the varArray (see page 3929) or varByRef (see page 3930) bits.

VarAsType raises an exception if the variant cannot be converted to the given type. This will be EVariantError (see page 4014) or one of its descendants, such as EVariantOverflowError (see page 5009) or EVariantTypeMismatchError.

See Also

VarType (see page 5101)

54.3.87 Variants.VarCastError Function

Raises an EVariantTypeCastError (see page 5010) exception.

Pascal

```
procedure VarCastError; overload;
procedure VarCastError(const ASourceType: TVarType; const ADestType: TVarType); overload;
```

C++

```
VarCastError();
VarCastError(const TVarType ASourceType, const TVarType ADestType);
```

File

Variants

Description

Call VarCastError to indicate that a variant operation has failed due to cast error. VarCastError raises EVariantTypeCastError (see page 5010). If no arguments are specified, the error string is a general error message. If ASourceType and ADestType are specified, the error string incorporates the names of the specified Variant (see page 3430) Types (see page 4683).

See Also

EVariantTypeCastError (see page 5010)

TVarData

VarType (see page 5101)

54.3.88 Variants.VarCheckEmpty Function

Raises an exception if a specified variant's value is Unassigned (see page 5076).

Pascal

```
procedure VarCheckEmpty(const V: Variant);
```

C++

```
VarCheckEmpty(const Variant V);
```

File

Variants

Description

Call VarCheckEmpty when your code requires that a Variant (see page 3430) have a value, and you want to raise an exception if it doesn't. VarCheckEmpty checks whether the Variant (see page 3430) specified by V has a value of Unassigned (see page 5076). If so, it raises an EVariantTypeMismatchError exception.

To check whether the Variant (see page 3430) is Unassigned (see page 5076) without raising an exception, use the VarIsEmpty (see page 5091) function instead. To check whether the Variant (see page 3430)'s value is undefined, use the VarIsClear (see page 5090) function instead.

Note: Do not confuse an Unassigned (see page 5076) variant with a Variant (see page 3430) whose value is Null (see page 5075). A Null (see page 5075) variant is still assigned, but has the value Null (see page 5075). Unlike unassigned variants, Null (see page 5075) variants can be used in expressions and can be converted to other types of variants.

See Also

VarIsEmpty (see page 5091)

Unassigned (see page 5076)

VarType (see page 5101)

VarIsNull (see page 5093)

VarIsClear (see page 5090)

EVariantTypeMismatchError

54.3.89 Variants.VarCompareValue Function

Returns the relationship between Variants (see page 4997).

Pascal

```
function VarCompareValue(const A: Variant; const B: Variant): TVariantRelationship;
```

C++

```
TVariantRelationship VarCompareValue(const Variant A, const Variant B);
```

File

Variants

Description

Call VarCompareValue to determine the relationship between two Variants (see page 4997).

A and B are the values to compare.

VarCompareValue returns a value that indicates whether A and B are equal (vrEqual), whether one is greater than the other (vrLessThan or vrGreaterThan), or whether the two values can't be ordered relative to each other (vrNotEqual).

See Also

VarSameValue (see page 5097)

CompareValue

54.3.90 Variants.VarCopyNoInd Function

Copies a Variant (see page 3430).

Pascal

```
procedure VarCopyNoInd(var Dest: Variant; const Source: Variant);
```

C++

```
VarCopyNoInd(Variant Dest, const Variant Source);
```

File

Variants

Description

VarCopyNoInd copies the variant given by Source into the variant given by Dest. Calling VarCopyNoInd in C++ or Delphi code is equivalent to a simple variant assignment in Delphi code.

Dest can be a Variant (see page 3430) or an OleVariant (see page 3281), and it must be possible to assign a value to it.

Source is defined as a Variant (see page 3430), but an OleVariant (see page 3281) is also allowed because it is a compatible type. However, Source can't have a VarType (see page 5101) that includes the varByRef (see page 3930) bit.

The following table lists the expected behavior when using Variant (see page 3430) and OleVariant (see page 3281) types as parameters:

Dest	Source	Behavior
Variant (see page 3430)	OleVariant (see page 3281)	Works as expected.
Variant (see page 3430)	Variant (see page 3430)	Works as expected.
OleVariant (see page 3281)	OleVariant (see page 3281)	Works as expected.
OleVariant (see page 3281)	Variant (see page 3430)	Source should be implicitly cast to an OleVariant (see page 3281).

54.3.91 Variants.VarEnsureRange Function

Returns a Variant (see page 3430) with a value in a specified range.

Pascal

```
function VarEnsureRange(const AValue: Variant; const AMin: Variant; const AMax: Variant):
Variant;
```

C++

```
Variant VarEnsureRange(const Variant AValue, const Variant AMin, const Variant AMax);
```

File

Variants

Description

VarEnsureRange returns a Variant (see page 3430) whose value is guaranteed to be within a specified range.

AValue is a Variant (see page 3430) with the value you want as long as it is in range. If AValue is in range, VarEnsureRange returns AValue.

AMin is a Variant (see page 3430) with the minimum acceptable value. If AValue is less than AMin, VarEnsureRange returns AMin.

AMax is a Variant (see page 3430) with the maximum acceptable value. If AValue is greater than AMax, VarEnsureRange returns AMax.

See Also

VarInRange (see page 5087)

54.3.92 Variants.VarFromDateTime Function

Returns a variant containing a specified data and time.

Pascal

```
function VarFromDateTime(const DateTime: TDateTime): Variant;
```

C++

```
Variant VarFromDateTime(const TDateTime DateTime);
```

File

Variants

Description

VarFromDateTime returns a Variant (see page 3430) that represents the date and time of the given TDateTime (see page 3335) value, DateTime. The type code of the resulting variant is varDate (see page 3932).

See Also

VarToDateTime (see page 5098)

VarType (see page 5101)

54.3.93 Variants.VarInRange Function

Indicates whether a Variant (see page 3430)'s value is in a specified range.

Pascal

```
function VarInRange(const AValue: Variant; const AMin: Variant; const AMax: Variant): Boolean;
```

C++

```
Boolean VarInRange(const Variant AValue, const Variant AMin, const Variant AMax);
```

File

Variants

Description

VarInRange checks whether a Variant (see page 3430) has a value in a specified range.

AValue is a Variant (see page 3430) to check.

AMin is a Variant (see page 3430) with the minimum acceptable value.

AMax is a Variant (see page 3430) with the maximum acceptable value.

VarInRange returns true if AValue is greater than or equal to AMin and less than or equal to AMax. Otherwise, it returns false.

See Also

VarEnsureRange (see page 5086)

54.3.94 Variants.VarInvalidNullOp Function

Indicate variant operation on null.

Pascal

```
procedure VarInvalidNullOp;
```

C++

```
VarInvalidNullOp();
```

File

Variants

See Also

EVariantInvalidOpError (see page 5007)

54.3.95 Variants.VarInvalidOp Function

Indicate invalid variant operation.

Pascal

```
procedure VarInvalidOp;
```

C++

```
VarInvalidOp();
```

File

Variants

See Also

EVariantInvalidOpError (see page 5007)

54.3.96 Variants.VarIsArray Function

Indicates whether the specified variant is an array.

Pascal

```
function VarIsArray(const A: Variant): Boolean; overload;
function VarIsArray(const A: Variant; AResolveByRef: Boolean): Boolean; overload;
```

C++

```
Boolean VarIsArray(const Variant A);
Boolean VarIsArray(const Variant A, Boolean AResolveByRef);
```

File

Variants

Description

VarIsArray returns true if the given variant is an array. Otherwise, the function result is false.

A is the Variant (see page 3430) to check.

AResolveByRef indicates how VarIsArray should handle the case when A is a reference to a Variant (see page 3430) (when the VarType (see page 5101) of A is varByRef (see page 3930) or varVariant (see page 3941)).When AResolveByRef is true, VarIsArray checks whether A is an array or A points to an array. When AResolveByRef is false, VarIsArray returns false when A has a VarType (see page 5101) of varByRef (see page 3930) or varVariant (see page 3941).

See Also

VarArrayCreate (see page 5077)

VarType (see page 5101)

VarIsType (see page 5095)

54.3.97 Variants.VarIsByRef Function

Indicates whether the specified variant's value is by reference.

Pascal

```
function VarIsByRef(const V: Variant): Boolean;
```

C++

```
Boolean VarIsByRef(const Variant V);
```

File

Variants

Description

VarIsByRef returns true if the given variant's type code includes the includes the varByRef (see page 3930) bit. Otherwise, the function result is false.

See Also

VarType (see page 5101)

VarIsType (see page 5095)

54.3.98 Variants.VarIsClear Function

Indicates whether the specified variant has an undefined value.

Pascal

```
function VarIsClear(const V: Variant): Boolean;
```

C++

```
Boolean VarIsClear(const Variant V);
```

File

Variants

Description

VarIsClear returns true if the given variant's value is undefined. The value can be undefined for any of several reasons:

The Variant (see page 3430) may have had its value set to Unassigned (see page 5076).

The Variant (see page 3430)'s value may be an interface type that has been set to nil (Delphi) or NULL (C++).

The Variant (see page 3430) may be a custom variant that returns true from its IsClear method.

In all other cases, the function result is false.

Note: Do not confuse an unassigned variant with a Null (see page 5075) variant. A Null (see page 5075) variant is still assigned, but has the value Null (see page 5075). Unlike unassigned variants, Null (see page 5075) variants can be used in expressions and can be converted to other types of variants.

See Also

Unassigned (see page 5076)

VarType (see page 5101)

VarCheckEmpty (see page 5084)

VarIsNull (see page 5093)

VarIsEmpty (see page 5091)

VarIsType (see page 5095)

TCustomVariantType (see page 5011)

54.3.99 Variants.VarIsCustom Function

Indicates whether the specified variant is a custom variant.

Pascal

```
function VarIsCustom(const V: Variant): Boolean;
```

C++

```
Boolean VarIsCustom(const Variant V);
```

File

Variants

Description

VarIsCustom returns true if the given variant represents a custom variant type. Otherwise, the function result is false.

See Also

VarType (see page 5101)

FindCustomVariantType (see page 5073)

VarIsType (see page 5095)

54.3.100 Variants.VarIsEmpty Function

Indicates whether the specified variant is unassigned.

Pascal

```
function VarIsEmpty(const V: Variant): Boolean;
```

C++

```
Boolean VarIsEmpty(const Variant V);
```

File

Variants

Description

VarIsEmpty returns true if the given variant contains the value Unassigned (see page 5076). If the variant contains any other value, the function result is false.

Note: VarIsEmpty does not indicate when a Variant (see page 3430) that represents an interface has had the interface pointer cleared or when a custom Variant (see page 3430) is clear. If either of these situations may exist, use the VarIsClear (see page 5090) method instead.

Note: Do not confuse an unassigned variant with a Null (see page 5075) variant. A Null (see page 5075) variant is still assigned, but has the value Null (see page 5075). Unlike unassigned variants, Null (see page 5075) variants can be used in expressions and can be converted to other types of variants.

See Also

Unassigned (see page 5076)

VarType (see page 5101)

VarCheckEmpty (see page 5084)

VarIsNull (see page 5093)

VarIsClear (see page 5090)

VarIsEmptyParam (see page 5092)

VarIsType (see page 5095)

54.3.101 Variants.VarIsEmptyParam Function

Indicates whether the specified variant represents an unassigned optional parameter.

Pascal

```
function VarIsEmptyParam(const V: Variant): Boolean;
```

C++

```
Boolean VarIsEmptyParam(const Variant V);
```

File

Variants

Description

VarIsEmptyParam returns true if the given variant represents an unassigned optional parameter. If the variant contains any other value, the function result is false.

See Also

VarIsClear (see page 5090)

VarIsEmpty (see page 5091)

VarIsNull (see page 5093)

EmptyParam (see page 5111)

VarIsType (see page 5095)

54.3.102 Variants.VarIsError Function

Indicates whether the specified variant is an error variant; optionally converts variant back to HRESULT (see page 3826).

Pascal

```
function VarIsError(const V: Variant; out AResult: HRESULT): Boolean; overload;
function VarIsError(const V: Variant): Boolean; overload;
```

C++

```
Boolean VarIsError(const Variant V, HRESULT AResult);
Boolean VarIsError(const Variant V);
```

File

Variants

Description

VarIsError returns true if the given variant is an Error (see page 3662) variant (type varError (see page 3934)). If AResult is specified, it is set to the corresponding result code.

See Also

VarType (see page 5101)

VarIsType (see page 5095)

54.3.103 Variants.VarIsFloat Function

Indicates whether the specified variant represents a floating-point value.

Pascal

```
function VarIsFloat(const V: Variant): Boolean;
```

C++

```
Boolean VarIsFloat(const Variant V);
```

File

Variants

Description

VarIsFloat returns true if the given variant represents a floating-point value (In Delphi: Single, Double, or Currency (see page 3242); In C++: float, double, or Currency (see page 3242)). If the variant contains any other type of value, the function result is false.

See Also

VarIsOrdinal (see page 5094)

VarIsNumeric (see page 5094)

VarIsStr (see page 5095)

VarType (see page 5101)

VarIsType (see page 5095)

54.3.104 Variants.VarIsNull Function

Indicates whether the specified variant is Null (see page 5075).

Pascal

```
function VarIsNull(const V: Variant): Boolean;
```

C++

```
Boolean VarIsNull(const Variant V);
```

File

Variants

Description

VarIsNull returns true if the given variant contains the value Null (see page 5075). If the variant contains any other value, the function result is false.

Note: Do not confuse a Null (see page 5075) variant with an unassigned variant. A Null (see page 5075) variant is still assigned, but has the value Null (see page 5075). Unlike unassigned variants, Null (see page 5075) variants can be used in expressions and can be converted to other types of variants.

See Also

Null (see page 5075)

VarType (see page 5101)

VarIsEmpty (see page 5091)

VarIsClear (see page 5090)

VarIsEmptyParam (see page 5092)

VarIsType (see page 5095)

54.3.105 Variants.VarIsNumeric Function

Indicates whether the specified variant represents a numeric value.

Pascal

```
function VarIsNumeric(const V: Variant): Boolean;
```

C++

```
Boolean VarIsNumeric(const Variant V);
```

File

Variants

Description

VarIsNumeric returns true if the given variant's type code indicates a numeric value of some sort. This can be either a floating-point value or an ordinal value. If the variant contains any other type of value, the function result is false.

See Also

VarIsOrdinal (see page 5094)

VarIsFloat (see page 5093)

VarIsStr (see page 5095)

VarType (see page 5101)

VarIsType (see page 5095)

54.3.106 Variants.VarIsOrdinal Function

Indicates whether the specified variant represents an ordinal value.

Pascal

```
function VarIsOrdinal(const V: Variant): Boolean;
```

C++

```
Boolean VarIsOrdinal(const Variant V);
```

File

Variants

Description

VarIsOrdinal returns true if the given variant represents an ordinal value (such as an integer or boolean type). If the variant contains any other type of value, the function result is false.

See Also

VarIsNumeric (see page 5094)

VarIsFloat (see page 5093)

VarIsStr (see page 5095)

VarType (see page 5101)

VarIsType (see page 5095)

54.3.107 Variants.VarIsStr Function

Indicates whether the specified variant represents a string value.

Pascal

```
function VarIsStr(const V: Variant): Boolean;
```

C++

```
Boolean VarIsStr(const Variant V);
```

File

Variants

Description

VarIsStr returns true if the given variant's type code is varString (see page 3938) or varOleStr (see page 3936). If the variant contains any other type of value, the function result is false.

See Also

VarIsNumeric (see page 5094)

VarIsFloat (see page 5093)

VarIsOrdinal (see page 5094)

VarType (see page 5101)

VarIsType (see page 5095)

54.3.108 Variants.VarIsType Function

Indicates whether the specified variant represents a specified type.

Pascal

```
function VarIsType(const V: Variant; AVarType: TVarType): Boolean; overload;
function VarIsType(const V: Variant; const AVarTypes: array of TVarType): Boolean; overload;
```

C++

```
Boolean VarIsType(const Variant V, TVarType AVarType);
Boolean VarIsType(const Variant V, const array of TVarType AVarTypes);
```

File

Variants

Description

VarIsType checks whether the type code for the Variant (see page 3430) specified by V matches the specified type code or one of the type codes in the specified array.

V is the Variant (see page 3430) to check.

AVarType is the type code against which to check V.

AVarTypes is an array of valid type codes against which to check V.

AVarTypes_size is the index of the last entry in AVarTypes (one less than the number of entries).

VarIsType returns true if the given variant's type code matches the supplied type code or codes, false otherwise.

See Also

VarType (see page 5101)

54.3.109 Variants.VarOverflowError Function

Raises an EVariantOverflowError (see page 5009) exception.

Pascal

```
procedure VarOverflowError(const ASourceType: TVarType; const ADestType: TVarType);
```

C++

```
VarOverflowError(const TVarType ASourceType, const TVarType ADestType);
```

File

Variants

Description

Call VarOverflowError to indicate that a variant operation has failed due to numeric overflow. ASourceType and ADestType should contain the variant type codes for the source and destination variant types. VarOverflowError uses this information to compose an error string and raise EVariantOverflowError (see page 5009).

See Also

EVariantOverflowError (see page 5009)

TVarType

54.3.110 Variants.VarRangeCheckError Function

Raises an EVariantRangeCheckError (see page 5010) exception.

Pascal

```
procedure VarRangeCheckError(const ASourceType: TVarType; const ADestType: TVarType);
```

C++

```
VarRangeCheckError(const TVarType ASourceType, const TVarType ADestType);
```

File

Variants

Description

Call VarRangeCheckError to indicate that a variant operation has failed because the result is not in the allowed range for the destination variant type. ASourceType and ADestType are the variant types of the source and destination.

See Also

EVariantRangeCheckError (see page 5010)

54.3.111 Variants.VarResultCheck Function

Raises variant exception based on HRESULT (see page 3826) value.

Pascal

```
procedure VarResultCheck(AResult: HRESULT); overload;
procedure VarResultCheck(AResult: HRESULT; ASourceType: TVarType; ADestType: TVarType);
overload;
```

C++

```
VarResultCheck(HRESULT AResult);
VarResultCheck(HRESULT AResult, TVarType ASourceType, TVarType ADestType);
```

File

Variants

Description

VarResultCheck examines the HRESULT (see page 3826) value returned by many variant routines. If AResult is S_OK (see page 3927), VarResultCheck does nothing. Otherwise, VarResultCheck attempts to map AResult to a variant exception and raise that exception. If VarResultCheck is unable to map AResult to a specific variant Exception (see page 4015), it raises EVariantError (see page 4014).

Specify ASourceType and ADestType when the operation involves conversion between two variant types.

See Also

EVariantError

54.3.112 Variants.VarSameValue Function

Indicates whether two Variants (see page 4997) have equivalent values.

Pascal

```
function VarSameValue(const A: Variant; const B: Variant): Boolean;
```

C++

```
Boolean VarSameValue(const Variant A, const Variant B);
```

File

Variants

Description

VarSameValue returns true when A has the same value as B, false if the two values are not equivalent.

If A and B can't be compared, VarSameValue raises an exception.

See Also

VarCompareValue (see page 5085)

SameValue

54.3.113 Variants.VarSupports Function

Indicates whether the Variant (see page 3430)'s value is an interface that supports a specified interface.

Pascal

```
function VarSupports(const V: Variant; const IID: TGUID; out Intf): Boolean; overload;
function VarSupports(const V: Variant; const IID: TGUID): Boolean; overload;
```

C++

```
Boolean VarSupports(const Variant V, const TGUID IID,  Intf);
Boolean VarSupports(const Variant V, const TGUID IID);
```

File

Variants

Description

VarSupports returns the lower twelve bits of a variant type code. These indicate the type of the variant. For a list of possible variant type codes, see VarType (see page 5101).

Call VarSupports to determine whether the Variant (see page 3430) represents an interface that supports the interface identified by the IID parameter. If V supports the interface, VarSupports returns the interface as the Intf parameter (if using the first syntax) and returns true (both versions). If the interface specified by IID is not supported, VarSupports returns false.

Unlike calling the QueryInterface method of the interface, VarSupports handles the case when the Variant (see page 3430)'s value is nil (Delphi) or NULL (C++).

See Also

Supports

54.3.114 Variants.VarToDateTime Function

Converts a specified variant to a TDateTime (see page 3335) value.

Pascal

```
function VarToDateTime(const V: Variant): TDateTime;
```

C++

```
TDateTime VarToDateTime(const Variant V);
```

File

Variants

Description

VarToDateTime converts the given variant to a TDateTime (see page 3335) value. VarToDateTime raises an exception if the conversion fails.

See Also

VarFromDateTime (see page 5087)

54.3.115 Variants.VarToStr Function

Converts a variant's value to a string.

Pascal

```
function VarToStr(const V: Variant): string;
```

C++

```
UnicodeString VarToStr(const Variant V);
```

File

Variants

Description

VarToStr converts the data in the variant V to a string and returns the result. If the variant has a null value, VarToStr returns an empty string.

See Also

VarToStrDef (see page 5099)

VarToWideStr (see page 5100)

VarToWideStrDef (see page 5100)

54.3.116 Variants.VarToStrDef Function

Converts a variant's value to a string.

Pascal

```
function VarToStrDef(const V: Variant; const ADefault: string): string;
```

C++

```
UnicodeString VarToStrDef(const Variant V, const UnicodeString ADefault);
```

File

Variants

Description

VarToStrDef converts the data in the variant V to a string and returns the result. If the variant has a null value, VarToStrDef returns ADefault.

See Also

VarToStr (see page 5099)

VarToWideStr (see page 5100)

VarToWideStrDef (see page 5100)

54.3.117 Variants.VarToWideStr Function

Converts a variant's value to a WideString (see page 3476).

Pascal

```
function VarToWideStr(const V: Variant): WideString;
```

C++

```
BSTR VarToWideStr(const Variant V);
```

File

Variants

Description

VarToWideStr converts the data in the variant V to a WideString (see page 3476) and returns the result. If the variant has a null value, VarToWideStr returns an empty string.

See Also

VarToStrDef (see page 5099)

VarToStr (see page 5099)

VarToWideStrDef (see page 5100)

54.3.118 Variants.VarToWideStrDef Function

Converts a variant's value to a WideString (see page 3476).

Pascal

```
function VarToWideStrDef(const V: Variant; const ADefault: WideString): WideString;
```

C++

```
BSTR VarToWideStrDef(const Variant V, const BSTR ADefault);
```

File

Variants

Description

VarToWideStrDef converts the data in the variant V to a WideString (see page 3476) and returns the result. If the variant has a

null value, VarToWideStrDef returns ADefault.

See Also

VarToStr (see page 5099)

VarToWideStr (see page 5100)

VarToStrDef (see page 5099)

54.3.119 Variants.VarType Function

Returns the type code of a specified variant.

Pascal

```
function VarType(const V: Variant): TVarType;
```

C++

```
TVarType VarType(const Variant V);
```

File

Variants

Description

VarType returns the type code of the given variant. The resulting value is either the type code for a custom Variant (see page 3430) type, or it is constructed from the constants declared in the System (see page 3165) unit.

The lower twelve bits of a variant type code (the bits defined by the varTypeMask (see page 3939) bit mask) define the type of the variant. The varArray (see page 3929) bit is set if the variant is an array of the given type. The varByRef (see page 3930) bit is set if the variant is a reference to a value of the given type as opposed to an actual value.

The following table describes the meaning of each of the variant type codes defined in the System (see page 3165) unit:

VarType	Contents of variant
varEmpty (see page 3933)	The variant is Unassigned (see page 5076).
varNull (see page 3936)	The variant is Null (see page 5075).
varSmallint (see page 3938)	16-bit signed integer (type Smallint in Delphi, short in C++).
varInteger (see page 3935)	32-bit signed integer (type Integer in Delphi, int in C++).
varSingle (see page 3937)	Single-precision floating-point value (type Single in Delphi, float in C++).
varDouble (see page 3933)	Double-precision floating-point value (type double).
varCurrency (see page 3931)	Currency (see page 3242) floating-point value (type Currency (see page 3242)).
varDate (see page 3932)	Date (see page 4151) and time value (type TDateTime (see page 3335)).
varOleStr (see page 3936)	Reference to a dynamically allocated UNICODE string.

varDispatch (see page 3932)	Reference to an Automation object (an IDispatch (see page 3498) interface pointer).
varError (see page 3934)	Operating system error code.
varBoolean (see page 3930)	16-bit boolean (type WordBool).
varVariant (see page 3941)	A variant.
varUnknown (see page 3940)	Reference to an unknown object (an IInterface (see page 3503) or IUnknown (see page 3828) interface pointer).
varShortInt (see page 3937)	8-bit signed integer (type ShortInt in Delphi or signed char in C++)
varByte (see page 3931)	A Byte
varWord (see page 3941)	unsigned 16-bit value (Word)
varLongWord (see page 3935)	unsigned 32-bit value (type LongWord in Delphi or unsigned long in C++)
varInt64 (see page 3934)	64-bit signed integer (Int64 in Delphi or __int64 in C++)
varStrArg (see page 3938)	COM-compatible string.
varString (see page 3938)	Reference to a dynamically allocated string (not COM compatible).

The value returned by VarType corresponds to the VType field of a TVarData (see page 3813) record.

The type of a variant can be changed using VarAsType (see page 5083).

See Also

TVarData

VarAsType (see page 5083)

VarTypeToDataType

VarTypeAsText (see page 5102)

54.3.120 Variants.VarTypeAsText Function

Returns variant type descriptive string.

Pascal

```
function VarTypeAsText(const AType: TVarType): string;
```

C++

```
UnicodeString VarTypeAsText(const TVarType AType);
```

File

Variants

Description

VarTypeAsText returns a short string that names the variant type indicated by AType.

See Also

TVarData

VarAsType (see page 5083)

VarTypeToDataType

VarType (see page 5101)

54.3.121 Variants.VarTypeIsValidArrayType Function

Indicates whether a Variant (see page 3430) type code represents a type that can be used for the elements in a Variant (see page 3430) array.

Pascal

```
function VarTypeIsValidArrayType(const AVarType: TVarType): Boolean;
```

C++

```
Boolean VarTypeIsValidArrayType(const TVarType AVarType);
```

File

Variants

Description

VarTypeIsValidArrayType indicates whether AVarType is the type code for a Variant (see page 3430) type that can represent the elements of a Variant (see page 3430) array. This function is only intended for use with built-in Variant (see page 3430) types. It returns false for custom Variant (see page 3430) types, although they can be used for the elements of Variant (see page 3430) arrays.

See Also

VarArrayCreate (see page 5077)

VarTypeIsValidElementType (see page 5103)

54.3.122 Variants.VarTypeIsValidElementType Function

Indicates whether a Variant (see page 3430) type code represents a type that can be used for the elements in a Variant (see page 3430) array.

Pascal

```
function VarTypeIsValidElementType(const AVarType: TVarType): Boolean;
```

C++

```
Boolean VarTypeIsValidElementType(const TVarType AVarType);
```

File

Variants

Description

VarTypeIsValidElementType indicates whether AVarType is the type code for a Variant (see page 3430) type that can represent the elements of a Variant (see page 3430) array. Unlike the VarTypeIsValidArrayType (see page 5103) function, this function returns true for custom Variant (see page 3430) types.

See Also

VarArrayCreate (see page 5077)

VarTypeIsValidArrayType (see page 5103)

54.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TBooleanToStringRule (see page 5105)	TBooleanToStringRule enumerates possible rules for BooleanToStringRule (see page 5110).
	TNullCompareRule (see page 5105)	TNullCompareRule enumerates possible rules for comparing variant nulls with other values.
	TVarCompareResult (see page 5106)	This is record Variants.TVarCompareResult.
	TVariantRelationship (see page 5106)	TVariantRelationship describes the results of comparing two Variants (see page 4997).

54.4.1 Variants.TBooleanToStringRule Enumeration

TBooleanToStringRule enumerates possible rules for BooleanToStringRule (see page 5110).

Pascal

```
TBooleanToStringRule = (
  bsrAsIs,
  bsrLower,
  bsrUpper
);
```

C++

```
enum TBooleanToStringRule {
  bsrAsIs,
  bsrLower,
  bsrUpper
};
```

File

Variants

Description

TBooleanToStringRule enumerates the values that can be assigned to the global variables NullEqualityRule (see page 5112) and NullMagnitudeRule (see page 5113).

54.4.2 Variants.TNullCompareRule Enumeration

TNullCompareRule enumerates possible rules for comparing variant nulls with other values.

Pascal

```
TNullCompareRule = (
  ncrError,
  ncrStrict,
  ncrLoose
);
```

C++

```
enum TNullCompareRule {
  ncrError,
  ncrStrict,
  ncrLoose
};
```

File

Variants

Description

TNullCompareRule enumerates the values that can be assigned to the global variables NullEqualityRule (see page 5112) and NullMagnitudeRule (see page 5113).

54.4.3 Variants.TVarCompareResult Enumeration

Pascal

```
TVarCompareResult = (
  crLessThan,
  crEqual,
  crGreaterThan
);
```

C++

```
enum TVarCompareResult {
  crLessThan,
  crEqual,
  crGreaterThan
};
```

File

Variants

Description

This is record Variants.TVarCompareResult.

54.4.4 Variants.TVariantRelationship Enumeration

TVariantRelationship describes the results of comparing two Variants (see page 4997).

Pascal

```
TVariantRelationship = (
  vrEqual,
  vrLessThan,
  vrGreaterThan,
  vrNotEqual
);
```

C++

```
enum TVariantRelationship {
  vrEqual,
  vrLessThan,
```

```
    vrGreaterThan,
    vrNotEqual
};
```

File

Variants

Description

TVariantRelationship describes the relationship between two Variant (see page 3430) values. The following table lists the possible values:

Value	Meaning
vrEqual	A is equivalent to B. Note that two NULL Variants (see page 4997) are considered equal, and two empty Variants (see page 4997) are considered equal, but a NULL Variant (see page 3430) does not equal an empty Variant (see page 3430).
vrLessThan	A is less than B.
vrGreaterThan	A is larger than B.
vrNotEqual	A and B are not equal, but the values are such that they can't be ordered relative to each other. For example, this describes the relationship when either A or B is empty or NULL, and the other one is not.

54.5 Types

The following table lists types in this documentation.

Types

Name	Description
TAnyProc (see page 5108)	This is type Variants.TAnyProc.
TCustomVariantTypeClass (see page 5108)	This is type Variants.TCustomVariantTypeClass.
TVarDataArray (see page 5109)	This is type Variants.TVarDataArray.
TVarDispProc (see page 5109)	This is type Variants.TVarDispProc.

54.5.1 Variants.TAnyProc Type

Pascal

```
TAnyProc = procedure (var V: TVarData);
```

C++

```
(var V: TVarData) ( TAnyProc)();
```

File

Variants

Description

This is type Variants.TAnyProc.

54.5.2 Variants.TCustomVariantTypeClass Type

Pascal

```
TCustomVariantTypeClass = class of TCustomVariantType;
```

C++

```
TCustomVariantType TCustomVariantTypeClass;
```

File

Variants

Description

This is type Variants.TCustomVariantTypeClass.

54.5.3 Variants.TVarDataArray Type

Pascal

```
TVarDataArray = array of TVarData;
```

C++

```
array of TVarData TVarDataArray;
```

File

Variants

Description

This is type Variants.TVarDataArray.

54.5.4 Variants.TVarDispProc Type

Pascal

```
TVarDispProc = procedure (Dest: PVariant; const Source: Variant; CallDesc: PCallDesc; Params:
Pointer);
```

C++

```
(Dest: PVariant; const Source: Variant; CallDesc: PCallDesc; Params: Pointer) (
TVarDispProc)();
```

File

Variants

Description

This is type Variants.TVarDispProc.

54.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
BooleanToStringRule (see page 5110)	Specifies rule fixing up Boolean values converted to strings.
ChangeAnyProc (see page 5111)	This is variable Variants.ChangeAnyProc.
ClearAnyProc (see page 5111)	This is variable Variants.ClearAnyProc.
EmptyParam (see page 5111)	Contains an OleVariant (see page 3281) that represents an unused optional parameter on a dual interface.
NullAsStringValue (see page 5112)	Specifies string value of Null (see page 5075) variants.
NullEqualityRule (see page 5112)	Specifies rule for Null (see page 5075) variant equality comparison.
NullMagnitudeRule (see page 5113)	Specifies rule for Null (see page 5075) variant magnitude comparison.
NullStrictConvert (see page 5114)	Specifies whether Null (see page 5075) conversion is an error.
OleVariantInt64AsDouble (see page 5114)	This is variable Variants.OleVariantInt64AsDouble.
PackVarCreation (see page 5115)	Specifies whether space-efficient Variant (see page 3430) Types (see page 4683) are preferred.
RefAnyProc (see page 5115)	This is variable Variants.RefAnyProc.
VarDispProc (see page 5115)	Provides the support for IDispatch (see page 3498)-based Automation.

54.6.1 Variants.BooleanToStringRule Variable

Specifies rule fixing up Boolean values converted to strings.

Pascal

```
BooleanToStringRule: TBooleanToStringRule = bsrAsIs;
```

C++

```
TBooleanToStringRule BooleanToStringRule = bsrAsIs;
```

File

Variants

Description

BooleanToStringRule determines the rule for fixing up the string generated by a conversion from Boolean to string.

Constant	Meaning
bsrAsIs	(Default.) The value obtained from the locale is left as is.
bsrUpper	The string is converted to all upper case.
bsrLower	The string is converted to all lower case.

54.6.2 Variants.ChangeAnyProc Variable

Pascal

```
ChangeAnyProc: TAnyProc;
```

C++

```
TAnyProc ChangeAnyProc;
```

File

Variants

Description

This is variable Variants.ChangeAnyProc.

54.6.3 Variants.ClearAnyProc Variable

Pascal

```
ClearAnyProc: TAnyProc;
```

C++

```
TAnyProc ClearAnyProc;
```

File

Variants

Description

This is variable Variants.ClearAnyProc.

54.6.4 Variants.EmptyParam Variable

Contains an OleVariant (see page 3281) that represents an unused optional parameter on a dual interface.

Pascal

```
EmptyParam: OleVariant;
```

C++

```
OleVariant EmptyParam;
```

File

Variants

Description

EmptyParam can be used for Variants (see page 4997) that represent optional parameters whose value is unassigned. This is useful when the code that marshals method calls requires a fixed number of parameters, even if some of them are optional.

When marshaling interface calls that include optional parameters, COM requires a value for those parameters even when they are not used. EmptyParam returns an OleVariant (see page 3281) you can pass as that value to indicate that the parameter is

not used.

Marshaling interfaces also exist under Linux, but we can't spare the resources to document them right now.

See Also

VarIsEmptyParam (see page 5092)

54.6.5 Variants.NullAsStringValue Variable

Specifies string value of Null (see page 5075) variants.

Pascal

```
NullAsStringValue: string = '';
```

C++

```
UnicodeString NullAsStringValue = '';
```

File

Variants

Description

NullAsStringValue specifies the string that is the result of a conversion from a Null (see page 5075) variant to a string type. By default, NullAsStringValue is the empty string.

NullAsStringValue is only used when the NullStrictConvert (see page 5114) global variable is set to false.

See Also

NullStrictConvert (see page 5114)

Null (see page 5075)

54.6.6 Variants.NullEqualityRule Variable

Specifies rule for Null (see page 5075) variant equality comparison.

Pascal

```
NullEqualityRule: TNullCompareRule = ncrLoose;
```

C++

```
TNullCompareRule NullEqualityRule = ncrLoose;
```

File

Variants

Description

NullEqualityRule determines the rule for handling equality comparisons (equals or not-equals) when one of the values compared is a variant containing a null value. NullEqualityRule can have the following values:

Constant	Meaning
ncrLoose	(Default.) A variant containing a null is treated as a unique value that is only equal to another variant containing a null.

ncrStrict	An equality comparison of a variant containing a null is always false, regardless of the other value.
ncrError	An equality comparison raises an EVariantInvalidNullOpError (see page 5006) if either value is a variant containing a null.

See Also

Null (see page 5075)

NullMagnitudeRule (see page 5113)

NullStrictConvert (see page 5114)

EVariantInvalidNullOpError (see page 5006)

54.6.7 Variants.NullMagnitudeRule Variable

Specifies rule for Null (see page 5075) variant magnitude comparison.

Pascal

```
NullMagnitudeRule: TNullCompareRule = ncrLoose;
```

C++

```
TNullCompareRule NullMagnitudeRule = ncrLoose;
```

File

Variants

Description

NullMagnitudeRule determines the rule for handling magnitude comparisons (one value is greater than, greater than or equals, less than, or less than or equals to another) when one of the values compared is a variant containing a null value. NullMagnitudeRule can have the following values:

Constant	Meaning
ncrLoose	(Default.) A variant containing a null is treated as a unique value that is less than any other value, but equal to another variant containing a null.
ncrStrict	A magnitude comparison of a variant containing a null is always false, regardless of the other value.
ncrError	A magnitude comparison raises an EVariantInvalidNullOpError (see page 5006) if either value is a variant containing a null.

See Also

Null (see page 5075)

NullMagnitudeRule

NullStrictConvert (see page 5114)

EVariantInvalidNullOpError (see page 5006)

54.6.8 Variants.NullStrictConvert Variable

Specifies whether Null (see page 5075) conversion is an error.

Pascal

```
NullStrictConvert: Boolean = True;
```

C++

```
Boolean NullStrictConvert = True;
```

File

Variants

Description

NullStrictConvert determines the outcome of attempts to convert Null (see page 5075) variants to other types. If NullStrictConvert is true (default), attempting to convert a Null (see page 5075) variant raises a EVariantTypeCastError (see page 5010), unless the conversion is to a custom variant that defines a conversion from Null (see page 5075). If NullStrictConvert is false, then conversion from Null (see page 5075) follows the following rules:

Destination	Conversion result
Numeric type	Zero
String type	Value of NullAsStringValue (see page 5112) global variable. (Default: empty string.)
Boolean	False.

See Also

TVarData

VarType (see page 5101)

NullAsStringValue (see page 5112)

EVariantTypeCastError (see page 5010)

54.6.9 Variants.OleVariantInt64AsDouble Variable

Pascal

```
OleVariantInt64AsDouble: Boolean = False;
```

C++

```
Boolean OleVariantInt64AsDouble = False;
```

File

Variants

Description

This is variable Variants.OleVariantInt64AsDouble.

54.6.10 Variants.PackVarCreation Variable

Specifies whether space-efficient Variant (see page 3430) Types (see page 4683) are preferred.

Pascal

```
PackVarCreation: Boolean = True;
```

C++

```
Boolean PackVarCreation = True;
```

File

Variants

Description

PackVarCreation controls the way Variant (see page 3430) Types (see page 4683) are chosen for newly-created Variants (see page 4997). If PackVarCreation is true (default), a new Variant (see page 3430) has the smallest possible Variant (see page 3430) Type. If PackVarCreation is false, a new Variant (see page 3430) has the Variant (see page 3430) Type that minimizes execution time.

See Also

TVarData

VarType (see page 5101)

54.6.11 Variants.RefAnyProc Variable

Pascal

```
RefAnyProc: TAnyProc;
```

C++

```
TAnyProc RefAnyProc;
```

File

Variants

Description

This is variable Variants.RefAnyProc.

54.6.12 Variants.VarDispProc Variable

Provides the support for IDispatch (see page 3498)-based Automation.

Pascal

```
VarDispProc: TVarDispProc;
```

C++

```
TVarDispProc VarDispProc;
```

File

Variants

Description

In Delphi, VarDispProc points to a routine that is called to execute methods (or access properties) of an interface that is assigned to a Variant (see page 3430). The Variants (see page 4997) unit assigns a procedure that generates error 222 or raises an EVariantDispatchError (see page 5005) exception. The ComObj unit reassigns this variable to a procedure that generates the appropriate COM IDispatch (see page 3498) calls.

To control how Variants (see page 4997) execute methods when they have a value that is an interface, assign your own procedure to VarDispProc.

The Linux implementation of IDispatch (see page 3498) is currently undocumented, due to resource constraints. When that changes, decolorize and revise this topic.

EVariantDispatchError (see page 5005)

55 VarUtils Namespace

This is namespace VarUtils.

Topics

Name	Description
Classes (see page 5120)	The following table lists classes in this documentation.
Functions (see page 5124)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 5134)	The following table lists structs, records, enums in this documentation.
Variables (see page 5135)	The following table lists variables in this documentation.
Constants (see page 5143)	The following table lists constants in this documentation.

Classes

	Name	Description
	ESafeArrayBoundsError (see page 5120)	This is class VarUtils.ESafeArrayBoundsError.
	ESafeArrayCreateError (see page 5120)	This is class VarUtils.ESafeArrayCreateError.
	ESafeArrayError (see page 5121)	This is class VarUtils.ESafeArrayError.
	ESafeArrayLockedError (see page 5123)	This is class VarUtils.ESafeArrayLockedError.

Constants

Name	Description
ARR_DISPATCH (see page 5143)	This is constant VarUtils.ARR_DISPATCH.
ARR_FIXEDSIZE (see page 5144)	This is constant VarUtils.ARR_FIXEDSIZE.
ARR_NONE (see page 5144)	This is constant VarUtils.ARR_NONE.
ARR_OLESTR (see page 5144)	This is constant VarUtils.ARR_OLESTR.
ARR_UNKNOWN (see page 5145)	This is constant VarUtils.ARR_UNKNOWN.
ARR_VARIANT (see page 5145)	This is constant VarUtils.ARR_VARIANT.
CMaxArrayVarType (see page 5145)	This is constant VarUtils.CMaxArrayVarType.
CMinArrayVarType (see page 5146)	This is constant VarUtils.CMinArrayVarType.
CVarTypeToElementInfo (see page 5146)	This is constant VarUtils.CVarTypeToElementInfo.
GenericOperations (see page 5147)	This is constant VarUtils.GenericOperations.
GenericSafeArrays (see page 5147)	This is constant VarUtils.GenericSafeArrays.
GenericSafeArrayUsesLibC (see page 5147)	This is constant VarUtils.GenericSafeArrayUsesLibC.
GenericVariants (see page 5148)	This is constant VarUtils.GenericVariants.
GenericVarUtils (see page 5148)	This is constant VarUtils.GenericVarUtils.
VAR_ARRAYISLOCKED (see page 5148)	This is constant VarUtils.VAR_ARRAYISLOCKED.
VAR_BADINDEX (see page 5149)	This is constant VarUtils.VAR_BADINDEX.

VAR_BADVARTYPE (see page 5149)	This is constant VarUtils.VAR_BADVARTYPE.
VAR_CMP_EQ (see page 5149)	This is constant VarUtils.VAR_CMP_EQ.
VAR_CMP_GT (see page 5150)	This is constant VarUtils.VAR_CMP_GT.
VAR_CMP_LT (see page 5150)	This is constant VarUtils.VAR_CMP_LT.
VAR_CMP_NULL (see page 5150)	This is constant VarUtils.VAR_CMP_NULL.
VAR_EXCEPTION (see page 5151)	This is constant VarUtils.VAR_EXCEPTION.
VAR_INVALIDARG (see page 5151)	This is constant VarUtils.VAR_INVALIDARG.
VAR_LOCALE_USER_DEFAULT (see page 5151)	This is constant VarUtils.VAR_LOCALE_USER_DEFAULT.
VAR_NOTIMPL (see page 5152)	This is constant VarUtils.VAR_NOTIMPL.
VAR_OK (see page 5152)	This is constant VarUtils.VAR_OK.
VAR_OUTOFMEMORY (see page 5152)	This is constant VarUtils.VAR_OUTOFMEMORY.
VAR_OVERFLOW (see page 5153)	This is constant VarUtils.VAR_OVERFLOW.
VAR_PARAMNOTFOUND (see page 5153)	This is constant VarUtils.VAR_PARAMNOTFOUND.
VAR_TYPEMISMATCH (see page 5153)	This is constant VarUtils.VAR_TYPEMISMATCH.
VAR_UNEXPECTED (see page 5154)	This is constant VarUtils.VAR_UNEXPECTED.

Functions

	Name	Description
	SafeArrayAccessData (see page 5124)	This is function VarUtils.SafeArrayAccessData.
	SafeArrayAllocData (see page 5125)	This is function VarUtils.SafeArrayAllocData.
	SafeArrayAllocDescriptor (see page 5125)	This is function VarUtils.SafeArrayAllocDescriptor.
	SafeArrayCheck (see page 5125)	This is function VarUtils.SafeArrayCheck.
	SafeArrayCopy (see page 5126)	This is function VarUtils.SafeArrayCopy.
	SafeArrayCopyData (see page 5126)	This is function VarUtils.SafeArrayCopyData.
	SafeArrayCreate (see page 5126)	This is function VarUtils.SafeArrayCreate.
	SafeArrayDestroy (see page 5127)	This is function VarUtils.SafeArrayDestroy.
	SafeArrayDestroyData (see page 5127)	This is function VarUtils.SafeArrayDestroyData.
	SafeArrayDestroyDescriptor (see page 5127)	This is function VarUtils.SafeArrayDestroyDescriptor.
	SafeArrayError (see page 5128)	This is function VarUtils.SafeArrayError.
	SafeArrayGetDim (see page 5128)	This is function VarUtils.SafeArrayGetDim.
	SafeArrayGetElement (see page 5128)	This is function VarUtils.SafeArrayGetElement.
	SafeArrayGetElemSize (see page 5129)	This is function VarUtils.SafeArrayGetElemSize.
	SafeArrayGetLBound (see page 5129)	This is function VarUtils.SafeArrayGetLBound.
	SafeArrayGetUBound (see page 5129)	This is function VarUtils.SafeArrayGetUBound.
	SafeArrayLock (see page 5130)	This is function VarUtils.SafeArrayLock.
	SafeArrayPtrOfIndex (see page 5130)	This is function VarUtils.SafeArrayPtrOfIndex.
	SafeArrayPutElement (see page 5130)	This is function VarUtils.SafeArrayPutElement.
	SafeArrayRedim (see page 5131)	This is function VarUtils.SafeArrayRedim.
	SafeArrayUnaccessData (see page 5131)	This is function VarUtils.SafeArrayUnaccessData.
	SafeArrayUnlock (see page 5131)	This is function VarUtils.SafeArrayUnlock.
	VarExceptionToResult (see page 5132)	This is function VarUtils.VarExceptionToResult.
	VariantChangeType (see page 5132)	This is function VarUtils.VariantChangeType.
	VariantClear (see page 5132)	This is function VarUtils.VariantClear.
	VariantCopy (see page 5133)	This is function VarUtils.VariantCopy.
	VariantCopyInd (see page 5133)	This is function VarUtils.VariantCopyInd.
	VariantInit (see page 5133)	This is function VarUtils.VariantInit.

Structs, Records, Enums

	Name	Description
	TVarTypeToElementInfo (see page 5134)	This is record VarUtils.TVarTypeToElementInfo.

Variables

Name	Description
VarAdd (see page 5135)	This is variable VarUtils.VarAdd.
VarAnd (see page 5136)	This is variable VarUtils.VarAnd.

VarBoolFromStr (see page 5136)	This is variable VarUtils.VarBoolFromStr.
VarBstrFromBool (see page 5136)	This is variable VarUtils.VarBstrFromBool.
VarBstrFromCy (see page 5137)	This is variable VarUtils.VarBstrFromCy.
VarBstrFromDate (see page 5137)	This is variable VarUtils.VarBstrFromDate.
VarCmp (see page 5137)	This is variable VarUtils.VarCmp.
VarCyFromStr (see page 5138)	This is variable VarUtils.VarCyFromStr.
VarDateFromStr (see page 5138)	This is variable VarUtils.VarDateFromStr.
VarDiv (see page 5138)	This is variable VarUtils.VarDiv.
VarI4FromStr (see page 5139)	This is variable VarUtils.VarI4FromStr.
VariantChangeTypeEx (see page 5139)	This is variable VarUtils.VariantChangeTypeEx.
VarIDiv (see page 5139)	This is variable VarUtils.VarIDiv.
VarMod (see page 5140)	This is variable VarUtils.VarMod.
VarMul (see page 5140)	This is variable VarUtils.VarMul.
VarNeg (see page 5140)	This is variable VarUtils.VarNeg.
VarNot (see page 5141)	This is variable VarUtils.VarNot.
VarOr (see page 5141)	This is variable VarUtils.VarOr.
VarR4FromStr (see page 5141)	This is variable VarUtils.VarR4FromStr.
VarR8FromStr (see page 5142)	This is variable VarUtils.VarR8FromStr.
VarSub (see page 5142)	This is variable VarUtils.VarSub.
VarXor (see page 5142)	This is variable VarUtils.VarXor.

55.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ESafeArrayBoundsError (see page 5120)	This is class VarUtils.ESafeArrayBoundsError.
	ESafeArrayCreateError (see page 5120)	This is class VarUtils.ESafeArrayCreateError.
	ESafeArrayError (see page 5121)	This is class VarUtils.ESafeArrayError.
	ESafeArrayLockedError (see page 5123)	This is class VarUtils.ESafeArrayLockedError.

55.1.1 ESafeArrayBoundsError Class

Class Hierarchy

Pascal

```
ESafeArrayBoundsError = class(ESafeArrayError);
```

C++

```
class ESafeArrayBoundsError : public ESafeArrayError;
```

File

VarUtils

Description

This is class VarUtils.ESafeArrayBoundsError.

55.1.2 ESafeArrayCreateError Class

Class Hierarchy

Pascal

```
ESafeArrayCreateError = class(ESafeArrayError);
```

C++

```
class ESafeArrayCreateError : public ESafeArrayError;
```

File

VarUtils

Description

This is class VarUtils.ESafeArrayCreateError.

55.1.3 ESafeArrayError Class

Class Hierarchy

Pascal

```
ESafeArrayError = class(Exception);
```

C++

```
class ESafeArrayError : public Exception;
```

File

VarUtils

Description

This is class VarUtils.ESafeArrayError.

55.1.3.1 ESafeArrayError Members

The following tables list the members exposed by ESafeArrayError.

Protected Methods

	Name	Description
	GetStackTrace (see page 4028)	This is GetStackTrace, a member of class Exception.
	RaisingException (see page 4028)	This is RaisingException, a member of class Exception.
	SetInnerException (see page 4028)	This is SetInnerException, a member of class Exception.
	SetStackInfo (see page 4029)	This is SetStackInfo, a member of class Exception.

Public Fields

	Name	Description
	CleanUpStackInfoProc (see page 4026)	This is CleanUpStackInfoProc, a member of class Exception.
	GetExceptionStackInfoProc (see page 4027)	This is GetExceptionStackInfoProc, a member of class Exception.
	GetStackInfoStringProc (see page 4027)	This is GetStackInfoStringProc, a member of class Exception.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 4018)	Instantiates an instance of an exception with a simple message string.
	CreateFmt (see page 4020)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 4021)	Instantiates an instance of an exception with a formatted message string and a help-context ID.

	CreateHelp (see page 4021)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateHResult (see page 5122)	This is CreateHResult, a member of class ESafeArrayError.
	CreateRes (see page 4022)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 4022)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 4023)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 4025)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 4026)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetBaseException (see page 4027)	This is GetBaseException, a member of class Exception.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RaiseOuterException (see page 4028)	This is RaiseOuterException, a member of class Exception.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ThrowOuterException (see page 4029)	This is ThrowOuterException, a member of class Exception.
V	ToString (see page 3391)	Returns a string containing the class name.
V	ToString (see page 4029)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	BaseException (see page 4030)	This is BaseException, a member of class Exception.
	ErrorCode (see page 5123)	This is ErrorCode, a member of class ESafeArrayError.
	HelpContext (see page 4030)	Indicates the context ID number for context-sensitive online help associated with the exception.
R	InnerException (see page 4031)	This is InnerException, a member of class Exception.
	Message (see page 4031)	Message contains the text string to display in the exception dialog box when the exception is raised.
R	StackInfo (see page 4031)	This is StackInfo, a member of class Exception.
R	StackTrace (see page 4032)	This is StackTrace, a member of class Exception.

55.1.3.2 ESafeArrayError.CreateHResult Constructor

Pascal

```
constructor CreateHResult(AResult: HRESULT; const AMessage: string = '');
```

C++

```
__fastcall ESafeArrayError(HRESULT AResult, const UnicodeString AMessage = '');
```

Description

This is CreateHResult, a member of class ESafeArrayError.

55.1.3.3 ESafeArrayError Properties

The properties of the ESafeArrayError class are listed here.

Public Properties

	Name	Description
	ErrorCode (see page 5123)	This is ErrorCode, a member of class ESafeArrayError.

55.1.3.3.1 ESafeArrayError.ErrorCode Property

Pascal

```
property ErrorCode: HRESULT;
```

C++

```
__property HRESULT ErrorCode;
```

Description

This is ErrorCode, a member of class ESafeArrayError.

55.1.4 ESafeArrayLockedError Class

Class Hierarchy

Pascal

```
ESafeArrayLockedError = class(ESafeArrayError);
```

C++

```
class ESafeArrayLockedError : public ESafeArrayError;
```

File

VarUtils

Description

This is class VarUtils.ESafeArrayLockedError.

55.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	SafeArrayAccessData (see page 5124)	This is function VarUtils.SafeArrayAccessData.
	SafeArrayAllocData (see page 5125)	This is function VarUtils.SafeArrayAllocData.
	SafeArrayAllocDescriptor (see page 5125)	This is function VarUtils.SafeArrayAllocDescriptor.
	SafeArrayCheck (see page 5125)	This is function VarUtils.SafeArrayCheck.
	SafeArrayCopy (see page 5126)	This is function VarUtils.SafeArrayCopy.
	SafeArrayCopyData (see page 5126)	This is function VarUtils.SafeArrayCopyData.
	SafeArrayCreate (see page 5126)	This is function VarUtils.SafeArrayCreate.
	SafeArrayDestroy (see page 5127)	This is function VarUtils.SafeArrayDestroy.
	SafeArrayDestroyData (see page 5127)	This is function VarUtils.SafeArrayDestroyData.
	SafeArrayDestroyDescriptor (see page 5127)	This is function VarUtils.SafeArrayDestroyDescriptor.
	SafeArrayError (see page 5128)	This is function VarUtils.SafeArrayError.
	SafeArrayGetDim (see page 5128)	This is function VarUtils.SafeArrayGetDim.
	SafeArrayGetElement (see page 5128)	This is function VarUtils.SafeArrayGetElement.
	SafeArrayGetElemSize (see page 5129)	This is function VarUtils.SafeArrayGetElemSize.
	SafeArrayGetLBound (see page 5129)	This is function VarUtils.SafeArrayGetLBound.
	SafeArrayGetUBound (see page 5129)	This is function VarUtils.SafeArrayGetUBound.
	SafeArrayLock (see page 5130)	This is function VarUtils.SafeArrayLock.
	SafeArrayPtrOfIndex (see page 5130)	This is function VarUtils.SafeArrayPtrOfIndex.
	SafeArrayPutElement (see page 5130)	This is function VarUtils.SafeArrayPutElement.
	SafeArrayRedim (see page 5131)	This is function VarUtils.SafeArrayRedim.
	SafeArrayUnaccessData (see page 5131)	This is function VarUtils.SafeArrayUnaccessData.
	SafeArrayUnlock (see page 5131)	This is function VarUtils.SafeArrayUnlock.
	VarExceptionToResult (see page 5132)	This is function VarUtils.VarExceptionToResult.
	VariantChangeType (see page 5132)	This is function VarUtils.VariantChangeType.
	VariantClear (see page 5132)	This is function VarUtils.VariantClear.
	VariantCopy (see page 5133)	This is function VarUtils.VariantCopy.
	VariantCopyInd (see page 5133)	This is function VarUtils.VariantCopyInd.
	VariantInit (see page 5133)	This is function VarUtils.VariantInit.

55.2.1 VarUtils.SafeArrayAccessData Function

Pascal

```
function SafeArrayAccessData(VarArray: PVarArray; out Data: Pointer): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayAccessData(PVarArray VarArray, void * Data);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayAccessData.

55.2.2 VarUtils.SafeArrayAllocData Function

Pascal

```
function SafeArrayAllocData(VarArray: PVarArray): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayAllocData(PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayAllocData.

55.2.3 VarUtils.SafeArrayAllocDescriptor Function

Pascal

```
function SafeArrayAllocDescriptor(DimCount: Integer; out VarArray: PVarArray): HRESULT;
stdcall;
```

C++

```
__stdcall HRESULT SafeArrayAllocDescriptor(int DimCount, PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayAllocDescriptor.

55.2.4 VarUtils.SafeArrayCheck Function

Pascal

```
procedure SafeArrayCheck(AResult: HRESULT);
```

C++

```
SafeArrayCheck(HRESULT AResult);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayCheck.

55.2.5 VarUtils.SafeArrayCopy Function

Pascal

```
function SafeArrayCopy(SourceArray: PVarArray; out TargetArray: PVarArray): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayCopy(PVarArray SourceArray, PVarArray TargetArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayCopy.

55.2.6 VarUtils.SafeArrayCopyData Function

Pascal

```
function SafeArrayCopyData(SourceArray: PVarArray; TargetArray: PVarArray): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayCopyData(PVarArray SourceArray, PVarArray TargetArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayCopyData.

55.2.7 VarUtils.SafeArrayCreate Function

Pascal

```
function SafeArrayCreate(VarType: Integer; DimCount: Integer; const Bounds:
TVarArrayBoundArray): PVarArray; stdcall;
```

C++

```
__stdcall PVarArray SafeArrayCreate(int VarType, int DimCount, const TVarArrayBoundArray
Bounds);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayCreate.

55.2.8 VarUtils.SafeArrayDestroy Function

Pascal

```
function SafeArrayDestroy(VarArray: PVarArray): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayDestroy(PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayDestroy.

55.2.9 VarUtils.SafeArrayDestroyData Function

Pascal

```
function SafeArrayDestroyData(VarArray: PVarArray): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayDestroyData(PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayDestroyData.

55.2.10 VarUtils.SafeArrayDestroyDescriptor Function

Pascal

```
function SafeArrayDestroyDescriptor(VarArray: PVarArray): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayDestroyDescriptor(PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayDestroyDescriptor.

55.2.11 VarUtils.SafeArrayError Function

Pascal

```
procedure SafeArrayError(AResult: HRESULT);
```

C++

```
SafeArrayError(HRESULT AResult);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayError.

55.2.12 VarUtils.SafeArrayGetDim Function

Pascal

```
function SafeArrayGetDim(VarArray: PVarArray): Integer; stdcall;
```

C++

```
__stdcall int SafeArrayGetDim(PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayGetDim.

55.2.13 VarUtils.SafeArrayGetElement Function

Pascal

```
function SafeArrayGetElement(VarArray: PVarArray; Indices: PVarArrayCoorArray; Data: Pointer):
HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayGetElement(PVarArray VarArray, PVarArrayCoorArray Indices, void *
Data);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayGetElement.

55.2.14 VarUtils.SafeArrayGetElemSize Function

Pascal

```
function SafeArrayGetElemSize(VarArray: PVarArray): LongWord; stdcall;
```

C++

```
__stdcall LongWord SafeArrayGetElemSize(PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayGetElemSize.

55.2.15 VarUtils.SafeArrayGetLBound Function

Pascal

```
function SafeArrayGetLBound(VarArray: PVarArray; Dim: Integer; out LBound: Integer): HRESULT;
stdcall;
```

C++

```
__stdcall HRESULT SafeArrayGetLBound(PVarArray VarArray, int Dim, int LBound);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayGetLBound.

55.2.16 VarUtils.SafeArrayGetUBound Function

Pascal

```
function SafeArrayGetUBound(VarArray: PVarArray; Dim: Integer; out UBound: Integer): HRESULT;
stdcall;
```

C++

```
__stdcall HRESULT SafeArrayGetUBound(PVarArray VarArray, int Dim, int UBound);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayGetUBound.

55.2.17 VarUtils.SafeArrayLock Function

Pascal

```
function SafeArrayLock(VarArray: PVarArray): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayLock(PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayLock.

55.2.18 VarUtils.SafeArrayPtrOfIndex Function

Pascal

```
function SafeArrayPtrOfIndex(VarArray: PVarArray; Indices: PVarArrayCoorArray; var Address:
Pointer): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayPtrOfIndex(PVarArray VarArray, PVarArrayCoorArray Indices, void *
Address);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayPtrOfIndex.

55.2.19 VarUtils.SafeArrayPutElement Function

Pascal

```
function SafeArrayPutElement(VarArray: PVarArray; Indices: PVarArrayCoorArray; const Data:
Pointer): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayPutElement(PVarArray VarArray, PVarArrayCoorArray Indices, const
void * Data);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayPutElement.

55.2.20 VarUtils.SafeArrayRedim Function

Pascal

```
function SafeArrayRedim(VarArray: PVarArray; const NewBound: TVarArrayBound): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayRedim(PVarArray VarArray, const TVarArrayBound NewBound);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayRedim.

55.2.21 VarUtils.SafeArrayUnaccessData Function

Pascal

```
function SafeArrayUnaccessData(VarArray: PVarArray): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayUnaccessData(PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayUnaccessData.

55.2.22 VarUtils.SafeArrayUnlock Function

Pascal

```
function SafeArrayUnlock(VarArray: PVarArray): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT SafeArrayUnlock(PVarArray VarArray);
```

File

VarUtils

Description

This is function VarUtils.SafeArrayUnlock.

55.2.23 VarUtils.VarExceptionToResult Function

Pascal

```
function VarExceptionToResult(const E: Exception): HRESULT;
```

C++

```
HRESULT VarExceptionToResult(const Exception E);
```

File

VarUtils

Description

This is function VarUtils.VarExceptionToResult.

55.2.24 VarUtils.VariantChangeType Function

Pascal

```
function VariantChangeType(var Dest: TVarData; const Source: TVarData; wFlags: Word; VarType:
Word): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT VariantChangeType(TVarData Dest, const TVarData Source, Word wFlags, Word
VarType);
```

File

VarUtils

Description

This is function VarUtils.VariantChangeType.

55.2.25 VarUtils.VariantClear Function

Pascal

```
function VariantClear(var V: TVarData): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT VariantClear(TVarData V);
```

File

VarUtils

Description

This is function VarUtils.VariantClear.

55.2.26 VarUtils.VariantCopy Function

Pascal

```
function VariantCopy(var Dest: TVarData; const Source: TVarData): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT VariantCopy(TVarData Dest, const TVarData Source);
```

File

VarUtils

Description

This is function VarUtils.VariantCopy.

55.2.27 VarUtils.VariantCopyInd Function

Pascal

```
function VariantCopyInd(var Dest: TVarData; const Source: TVarData): HRESULT; stdcall;
```

C++

```
__stdcall HRESULT VariantCopyInd(TVarData Dest, const TVarData Source);
```

File

VarUtils

Description

This is function VarUtils.VariantCopyInd.

55.2.28 VarUtils.VariantInit Function

Pascal

```
procedure VariantInit(var V: TVarData); stdcall;
```

C++

```
__stdcall VariantInit(TVarData V);
```

File

VarUtils

Description

This is function VarUtils.VariantInit.

55.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TVarTypeToElementInfo (see page 5134)	This is record VarUtils.TVarTypeToElementInfo.

55.3.1 VarUtils.TVarTypeToElementInfo Record

Pascal

```
TVarTypeToElementInfo = record
  ValidBase: Boolean;
  ValidElement: Boolean;
  Size: Integer;
  Flags: Word;
end;
```

C++

```
struct TVarTypeToElementInfo {
  Boolean ValidBase;
  Boolean ValidElement;
  int Size;
  Word Flags;
};
```

File

VarUtils

Description

This is record VarUtils.TVarTypeToElementInfo.

55.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
VarAdd (see page 5135)	This is variable VarUtils.VarAdd.
VarAnd (see page 5136)	This is variable VarUtils.VarAnd.
VarBoolFromStr (see page 5136)	This is variable VarUtils.VarBoolFromStr.
VarBstrFromBool (see page 5136)	This is variable VarUtils.VarBstrFromBool.
VarBstrFromCy (see page 5137)	This is variable VarUtils.VarBstrFromCy.
VarBstrFromDate (see page 5137)	This is variable VarUtils.VarBstrFromDate.
VarCmp (see page 5137)	This is variable VarUtils.VarCmp.
VarCyFromStr (see page 5138)	This is variable VarUtils.VarCyFromStr.
VarDateFromStr (see page 5138)	This is variable VarUtils.VarDateFromStr.
VarDiv (see page 5138)	This is variable VarUtils.VarDiv.
VarI4FromStr (see page 5139)	This is variable VarUtils.VarI4FromStr.
VariantChangeTypeEx (see page 5139)	This is variable VarUtils.VariantChangeTypeEx.
VarIDiv (see page 5139)	This is variable VarUtils.VarIDiv.
VarMod (see page 5140)	This is variable VarUtils.VarMod.
VarMul (see page 5140)	This is variable VarUtils.VarMul.
VarNeg (see page 5140)	This is variable VarUtils.VarNeg.
VarNot (see page 5141)	This is variable VarUtils.VarNot.
VarOr (see page 5141)	This is variable VarUtils.VarOr.
VarR4FromStr (see page 5141)	This is variable VarUtils.VarR4FromStr.
VarR8FromStr (see page 5142)	This is variable VarUtils.VarR8FromStr.
VarSub (see page 5142)	This is variable VarUtils.VarSub.
VarXor (see page 5142)	This is variable VarUtils.VarXor.

55.4.1 VarUtils.VarAdd Variable

Pascal

```
VarAdd: function(const Left, Right: TVarData; var AResult: TVarData): HRESULT;
```

C++

```
function(const Left, Right: TVarData; var AResult: TVarData): HRESULT VarAdd;
```

File

VarUtils

Description

This is variable VarUtils.VarAdd.

55.4.2 VarUtils.VarAnd Variable

Pascal

```
VarAnd: function(const Left, Right: TVarData; var AResult: TVarData): HRESULT;
```

C++

```
function(const Left, Right: TVarData; var AResult: TVarData): HRESULT VarAnd;
```

File

VarUtils

Description

This is variable VarUtils.VarAnd.

55.4.3 VarUtils.VarBoolFromStr Variable

Pascal

```
VarBoolFromStr: function(const strIn: WideString; LCID: Integer; dwFlags: Longint; out
boolOut: WordBool): HRESULT;
```

C++

```
function(const strIn: WideString; LCID: Integer; dwFlags: Longint; out boolOut: WordBool):
HRESULT VarBoolFromStr;
```

File

VarUtils

Description

This is variable VarUtils.VarBoolFromStr.

55.4.4 VarUtils.VarBstrFromBool Variable

Pascal

```
VarBstrFromBool: function(boolIn: WordBool; LCID: Integer; dwFlags: Longint; out bstrOut:
WideString): HRESULT;
```

C++

```
function(boolIn: WordBool; LCID: Integer; dwFlags: Longint; out bstrOut: WideString): HRESULT
VarBstrFromBool;
```

File

VarUtils

Description

This is variable VarUtils.VarBstrFromBool.

55.4.5 VarUtils.VarBstrFromCy Variable

Pascal

```
VarBstrFromCy: function(cyIn: Currency; LCID: Integer; dwFlags: Longint; out bstrOut:
WideString): HRESULT;
```

C++

```
function(cyIn: Currency; LCID: Integer; dwFlags: Longint; out bstrOut: WideString): HRESULT
VarBstrFromCy;
```

File

VarUtils

Description

This is variable VarUtils.VarBstrFromCy.

55.4.6 VarUtils.VarBstrFromDate Variable

Pascal

```
VarBstrFromDate: function(dateIn: TDateTime; LCID: Integer; dwFlags: Longint; out bstrOut:
WideString): HRESULT;
```

C++

```
function(dateIn: TDateTime; LCID: Integer; dwFlags: Longint; out bstrOut: WideString): HRESULT
VarBstrFromDate;
```

File

VarUtils

Description

This is variable VarUtils.VarBstrFromDate.

55.4.7 VarUtils.VarCmp Variable

Pascal

```
VarCmp: function(const Left, Right: TVarData; LCID: Integer; Flags: LongWord): HRESULT;
```

C++

```
function(const Left, Right: TVarData; LCID: Integer; Flags: LongWord): HRESULT VarCmp;
```

File

VarUtils

Description

This is variable VarUtils.VarCmp.

55.4.8 VarUtils.VarCyFromStr Variable

Pascal

```
VarCyFromStr: function(const strIn: WideString; LCID: DWORD; dwFlags: Longint; out cyOut:
Currency): HRESULT;
```

C++

```
function(const strIn: WideString; LCID: DWORD; dwFlags: Longint; out cyOut: Currency): HRESULT
VarCyFromStr;
```

File

VarUtils

Description

This is variable VarUtils.VarCyFromStr.

55.4.9 VarUtils.VarDateFromStr Variable

Pascal

```
VarDateFromStr: function(const strIn: WideString; LCID: DWORD; dwFlags: Longint; out dateOut:
TDateTime): HRESULT;
```

C++

```
function(const strIn: WideString; LCID: DWORD; dwFlags: Longint; out dateOut: TDateTime):
HRESULT VarDateFromStr;
```

File

VarUtils

Description

This is variable VarUtils.VarDateFromStr.

55.4.10 VarUtils.VarDiv Variable

Pascal

```
VarDiv: function(const Left, Right: TVarData; var AResult: TVarData): HRESULT;
```

C++

```
function(const Left, Right: TVarData; var AResult: TVarData): HRESULT VarDiv;
```

File

VarUtils

Description

This is variable VarUtils.VarDiv.

55.4.11 VarUtils.VarI4FromStr Variable

Pascal

```
VarI4FromStr: function(const strIn: WideString; LCID: Integer; dwFlags: Longint; out lOut:
Longint): HRESULT;
```

C++

```
function(const strIn: WideString; LCID: Integer; dwFlags: Longint; out lOut: Longint): HRESULT
VarI4FromStr;
```

File

VarUtils

Description

This is variable VarUtils.VarI4FromStr.

55.4.12 VarUtils.VariantChangeTypeEx Variable

Pascal

```
VariantChangeTypeEx: function(var Dest: TVarData; const Source: TVarData; LCID: Integer;
wFlags: Word; VarType: Word): HRESULT;
```

C++

```
function(var Dest: TVarData; const Source: TVarData; LCID: Integer; wFlags: Word; VarType:
Word): HRESULT VariantChangeTypeEx;
```

File

VarUtils

Description

This is variable VarUtils.VariantChangeTypeEx.

55.4.13 VarUtils.VarIDiv Variable

Pascal

```
VarIDiv: function(const Left, Right: TVarData; var AResult: TVarData): HRESULT;
```

C++

```
function(const Left, Right: TVarData; var AResult: TVarData): HRESULT VarIDiv;
```

File

VarUtils

Description

This is variable VarUtils.VarIDiv.

55.4.14 VarUtils.VarMod Variable

Pascal

```
VarMod: function(const Left, Right: TVarData; var AResult: TVarData): HRESULT;
```

C++

```
function(const Left, Right: TVarData; var AResult: TVarData): HRESULT VarMod;
```

File

VarUtils

Description

This is variable VarUtils.VarMod.

55.4.15 VarUtils.VarMul Variable

Pascal

```
VarMul: function(const Left, Right: TVarData; var AResult: TVarData): HRESULT;
```

C++

```
function(const Left, Right: TVarData; var AResult: TVarData): HRESULT VarMul;
```

File

VarUtils

Description

This is variable VarUtils.VarMul.

55.4.16 VarUtils.VarNeg Variable

Pascal

```
VarNeg: function(const Source: TVarData; var Dest: TVarData): HRESULT;
```

C++

```
function(const Source: TVarData; var Dest: TVarData): HRESULT VarNeg;
```

File

VarUtils

Description

This is variable VarUtils.VarNeg.

55.4.17 VarUtils.VarNot Variable

Pascal

```
VarNot: function(const Source: TVarData; var Dest: TVarData): HRESULT;
```

C++

```
function(const Source: TVarData; var Dest: TVarData): HRESULT VarNot;
```

File

VarUtils

Description

This is variable VarUtils.VarNot.

55.4.18 VarUtils.VarOr Variable

Pascal

```
VarOr: function(const Left, Right: TVarData; var AResult: TVarData): HRESULT;
```

C++

```
function(const Left, Right: TVarData; var AResult: TVarData): HRESULT VarOr;
```

File

VarUtils

Description

This is variable VarUtils.VarOr.

55.4.19 VarUtils.VarR4FromStr Variable

Pascal

```
VarR4FromStr: function(const strIn: WideString; LCID: Integer; dwFlags: Longint; out fltOut:
Single): HRESULT;
```

C++

```
function(const strIn: WideString; LCID: Integer; dwFlags: Longint; out fltOut: Single):
HRESULT VarR4FromStr;
```

File

VarUtils

Description

This is variable VarUtils.VarR4FromStr.

55.4.20 VarUtils.VarR8FromStr Variable

Pascal

```
VarR8FromStr: function(const strIn: WideString; LCID: Integer; dwFlags: Longint; out dblOut:
Double): HRESULT;
```

C++

```
function(const strIn: WideString; LCID: Integer; dwFlags: Longint; out dblOut: Double):
HRESULT VarR8FromStr;
```

File

VarUtils

Description

This is variable VarUtils.VarR8FromStr.

55.4.21 VarUtils.VarSub Variable

Pascal

```
VarSub: function(const Left, Right: TVarData; var AResult: TVarData): HRESULT;
```

C++

```
function(const Left, Right: TVarData; var AResult: TVarData): HRESULT VarSub;
```

File

VarUtils

Description

This is variable VarUtils.VarSub.

55.4.22 VarUtils.VarXor Variable

Pascal

```
VarXor: function(const Left, Right: TVarData; var AResult: TVarData): HRESULT;
```

C++

```
function(const Left, Right: TVarData; var AResult: TVarData): HRESULT VarXor;
```

File

VarUtils

Description

This is variable VarUtils.VarXor.

55.5 Constants

The following table lists constants in this documentation.

Constants

Name	Description
ARR_DISPATCH (see page 5143)	This is constant VarUtils.ARR_DISPATCH.
ARR_FIXEDSIZE (see page 5144)	This is constant VarUtils.ARR_FIXEDSIZE.
ARR_NONE (see page 5144)	This is constant VarUtils.ARR_NONE.
ARR_OLESTR (see page 5144)	This is constant VarUtils.ARR_OLESTR.
ARR_UNKNOWN (see page 5145)	This is constant VarUtils.ARR_UNKNOWN.
ARR_VARIANT (see page 5145)	This is constant VarUtils.ARR_VARIANT.
CMaxArrayVarType (see page 5145)	This is constant VarUtils.CMaxArrayVarType.
CMinArrayVarType (see page 5146)	This is constant VarUtils.CMinArrayVarType.
CVarTypeToElementInfo (see page 5146)	This is constant VarUtils.CVarTypeToElementInfo.
GenericOperations (see page 5147)	This is constant VarUtils.GenericOperations.
GenericSafeArrays (see page 5147)	This is constant VarUtils.GenericSafeArrays.
GenericSafeArrayUsesLibC (see page 5147)	This is constant VarUtils.GenericSafeArrayUsesLibC.
GenericVariants (see page 5148)	This is constant VarUtils.GenericVariants.
GenericVarUtils (see page 5148)	This is constant VarUtils.GenericVarUtils.
VAR_ARRAYISLOCKED (see page 5148)	This is constant VarUtils.VAR_ARRAYISLOCKED.
VAR_BADINDEX (see page 5149)	This is constant VarUtils.VAR_BADINDEX.
VAR_BADVARTYPE (see page 5149)	This is constant VarUtils.VAR_BADVARTYPE.
VAR_CMP_EQ (see page 5149)	This is constant VarUtils.VAR_CMP_EQ.
VAR_CMP_GT (see page 5150)	This is constant VarUtils.VAR_CMP_GT.
VAR_CMP_LT (see page 5150)	This is constant VarUtils.VAR_CMP_LT.
VAR_CMP_NULL (see page 5150)	This is constant VarUtils.VAR_CMP_NULL.
VAR_EXCEPTION (see page 5151)	This is constant VarUtils.VAR_EXCEPTION.
VAR_INVALIDARG (see page 5151)	This is constant VarUtils.VAR_INVALIDARG.
VAR_LOCALE_USER_DEFAULT (see page 5151)	This is constant VarUtils.VAR_LOCALE_USER_DEFAULT.
VAR_NOTIMPL (see page 5152)	This is constant VarUtils.VAR_NOTIMPL.
VAR_OK (see page 5152)	This is constant VarUtils.VAR_OK.
VAR_OUTOFMEMORY (see page 5152)	This is constant VarUtils.VAR_OUTOFMEMORY.
VAR_OVERFLOW (see page 5153)	This is constant VarUtils.VAR_OVERFLOW.
VAR_PARAMNOTFOUND (see page 5153)	This is constant VarUtils.VAR_PARAMNOTFOUND.
VAR_TYPEMISMATCH (see page 5153)	This is constant VarUtils.VAR_TYPEMISMATCH.
VAR_UNEXPECTED (see page 5154)	This is constant VarUtils.VAR_UNEXPECTED.

55.5.1 VarUtils.ARR_DISPATCH Constant

Pascal

```
ARR_DISPATCH = $0400;
```

C++

```
ARR_DISPATCH = 0x0400;
```

File

VarUtils

Description

This is constant VarUtils.ARR_DISPATCH.

55.5.2 VarUtils.ARR_FIXEDSIZE Constant

Pascal

```
ARR_FIXEDSIZE = $0010;
```

C++

```
ARR_FIXEDSIZE = 0x0010;
```

File

VarUtils

Description

This is constant VarUtils.ARR_FIXEDSIZE.

55.5.3 VarUtils.ARR_NONE Constant

Pascal

```
ARR_NONE = $0000;
```

C++

```
ARR_NONE = 0x0000;
```

File

VarUtils

Description

This is constant VarUtils.ARR_NONE.

55.5.4 VarUtils.ARR_OLESTR Constant

Pascal

```
ARR_OLESTR = $0100;
```

C++

```
ARR_OLESTR = 0x0100;
```

File

VarUtils

Description

This is constant VarUtils.ARR_OLESTR.

55.5.5 VarUtils.ARR_UNKNOWN Constant

Pascal

```
ARR_UNKNOWN = $0200;
```

C++

```
ARR_UNKNOWN = 0x0200;
```

File

VarUtils

Description

This is constant VarUtils.ARR_UNKNOWN.

55.5.6 VarUtils.ARR_VARIANT Constant

Pascal

```
ARR_VARIANT = $0800;
```

C++

```
ARR_VARIANT = 0x0800;
```

File

VarUtils

Description

This is constant VarUtils.ARR_VARIANT.

55.5.7 VarUtils.CMaxArrayVarType Constant

Pascal

```
CMaxArrayVarType = varUInt64;
```

C++

```
CMaxArrayVarType = varUInt64;
```

File

VarUtils

Description

This is constant VarUtils.CMaxArrayVarType.

55.5.8 VarUtils.CMinArrayVarType Constant

Pascal

```
CMinArrayVarType = varEmpty;
```

C++

```
CMinArrayVarType = varEmpty;
```

File

VarUtils

Description

This is constant VarUtils.CMinArrayVarType.

55.5.9 VarUtils.CVarTypeToElementInfo Constant

Pascal

```
CVarTypeToElementInfo: array [CMinArrayVarType..CMaxArrayVarType] of TVarTypeToElementInfo = (
(ValidBase: False; ValidElement: True; Size: 0; Flags: ARR_NONE), (ValidBase: False;
ValidElement: True; Size: 0; Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 2;
Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 4; Flags: ARR_NONE), (ValidBase:
True; ValidElement: True; Size: 4; Flags: ARR_NONE), (ValidBase: True; ValidElement: True;
Size: 8; Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 8; Flags: ARR_NONE),
(ValidBase: True; ValidElement: True; Size: 8; Flags: ARR_NONE), (ValidBase: True;
ValidElement: True; Size: 4; Flags: ARR_OLESTR), (ValidBase: True; ValidElement: True; Size:
4; Flags: ARR_DISPATCH), (ValidBase: True; ValidElement: True; Size: 4; Flags: ARR_NONE),
(ValidBase: True; ValidElement: True; Size: 2; Flags: ARR_NONE), (ValidBase: True;
ValidElement: True; Size: 16; Flags: ARR_VARIANT), (ValidBase: True; ValidElement: True; Size:
4; Flags: ARR_UNKNOWN), (ValidBase: False; ValidElement: False; Size: 14; Flags: ARR_NONE),
(ValidBase: False; ValidElement: False; Size: 0; Flags: ARR_NONE), (ValidBase: True;
ValidElement: True; Size: 1; Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 1;
Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 2; Flags: ARR_NONE), (ValidBase:
True; ValidElement: True; Size: 4; Flags: ARR_NONE), (ValidBase: False; ValidElement: True;
Size: 8; Flags: ARR_NONE), (ValidBase: False; ValidElement: False; Size: 8; Flags: ARR_NONE));
```

C++

```
array [CMinArrayVarType..CMaxArrayVarType] of TVarTypeToElementInfo CVarTypeToElementInfo = (
(ValidBase: False; ValidElement: True; Size: 0; Flags: ARR_NONE), (ValidBase: False;
ValidElement: True; Size: 0; Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 2;
Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 4; Flags: ARR_NONE), (ValidBase:
True; ValidElement: True; Size: 4; Flags: ARR_NONE), (ValidBase: True; ValidElement: True;
Size: 8; Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 8; Flags: ARR_NONE),
(ValidBase: True; ValidElement: True; Size: 8; Flags: ARR_NONE), (ValidBase: True;
ValidElement: True; Size: 4; Flags: ARR_OLESTR), (ValidBase: True; ValidElement: True; Size:
4; Flags: ARR_DISPATCH), (ValidBase: True; ValidElement: True; Size: 4; Flags: ARR_NONE),
(ValidBase: True; ValidElement: True; Size: 2; Flags: ARR_NONE), (ValidBase: True;
ValidElement: True; Size: 16; Flags: ARR_VARIANT), (ValidBase: True; ValidElement: True; Size:
4; Flags: ARR_UNKNOWN), (ValidBase: False; ValidElement: False; Size: 14; Flags: ARR_NONE),
(ValidBase: False; ValidElement: False; Size: 0; Flags: ARR_NONE), (ValidBase: True;
ValidElement: True; Size: 1; Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 1;
Flags: ARR_NONE), (ValidBase: True; ValidElement: True; Size: 2; Flags: ARR_NONE), (ValidBase:
True; ValidElement: True; Size: 4; Flags: ARR_NONE), (ValidBase: False; ValidElement: True;
Size: 8; Flags: ARR_NONE), (ValidBase: False; ValidElement: False; Size: 8; Flags: ARR_NONE));
```

File

VarUtils

Description

This is constant VarUtils.CVarTypeToElementInfo.

55.5.10 VarUtils.GenericOperations Constant

Pascal

```
GenericOperations = GenericVariants;
```

C++

```
GenericOperations = GenericVariants;
```

File

VarUtils

Description

This is constant VarUtils.GenericOperations.

55.5.11 VarUtils.GenericSafeArrays Constant

Pascal

```
GenericSafeArrays = GenericVarUtils;
```

C++

```
GenericSafeArrays = GenericVarUtils;
```

File

VarUtils

Description

This is constant VarUtils.GenericSafeArrays.

55.5.12 VarUtils.GenericSafeArrayUsesLibC Constant

Pascal

```
GenericSafeArrayUsesLibC = FALSE;
```

C++

```
GenericSafeArrayUsesLibC = FALSE;
```

File

VarUtils

Description

This is constant VarUtils.GenericSafeArrayUsesLibC.

55.5.13 VarUtils.GenericVariants Constant

Pascal

```
GenericVariants = GenericVarUtils;
```

C++

```
GenericVariants = GenericVarUtils;
```

File

VarUtils

Description

This is constant VarUtils.GenericVariants.

55.5.14 VarUtils.GenericVarUtils Constant

Pascal

```
GenericVarUtils = False;
```

C++

```
GenericVarUtils = False;
```

File

VarUtils

Description

This is constant VarUtils.GenericVarUtils.

55.5.15 VarUtils.VAR_ARRAYISLOCKED Constant

Pascal

```
VAR_ARRAYISLOCKED = HRESULT($8002000D);
```

C++

```
VAR_ARRAYISLOCKED = HRESULT($8002000D);
```

File

VarUtils

Description

This is constant VarUtils.VAR_ARRAYISLOCKED.

55.5.16 VarUtils.VAR_BADINDEX Constant

Pascal

```
VAR_BADINDEX = HRESULT($8002000B);
```

C++

```
VAR_BADINDEX = HRESULT($8002000B);
```

File

VarUtils

Description

This is constant VarUtils.VAR_BADINDEX.

55.5.17 VarUtils.VAR_BADVARTYPE Constant

Pascal

```
VAR_BADVARTYPE = HRESULT($80020008);
```

C++

```
VAR_BADVARTYPE = HRESULT($80020008);
```

File

VarUtils

Description

This is constant VarUtils.VAR_BADVARTYPE.

55.5.18 VarUtils.VAR_CMP_EQ Constant

Pascal

```
VAR_CMP_EQ = 1;
```

C++

```
VAR_CMP_EQ = 1;
```

File

VarUtils

Description

This is constant VarUtils.VAR_CMP_EQ.

55.5.19 VarUtils.VAR_CMP_GT Constant

Pascal

```
VAR_CMP_GT = 2;
```

C++

```
VAR_CMP_GT = 2;
```

File

VarUtils

Description

This is constant VarUtils.VAR_CMP_GT.

55.5.20 VarUtils.VAR_CMP_LT Constant

Pascal

```
VAR_CMP_LT = 0;
```

C++

```
VAR_CMP_LT = 0;
```

File

VarUtils

Description

This is constant VarUtils.VAR_CMP_LT.

55.5.21 VarUtils.VAR_CMP_NULL Constant

Pascal

```
VAR_CMP_NULL = 3;
```

C++

```
VAR_CMP_NULL = 3;
```

File

VarUtils

Description

This is constant VarUtils.VAR_CMP_NULL.

55.5.22 VarUtils.VAR_EXCEPTION Constant

Pascal

```
VAR_EXCEPTION = HRESULT($80020009);
```

C++

```
VAR_EXCEPTION = HRESULT($80020009);
```

File

VarUtils

Description

This is constant VarUtils.VAR_EXCEPTION.

55.5.23 VarUtils.VAR_INVALIDARG Constant

Pascal

```
VAR_INVALIDARG = HRESULT($80070057);
```

C++

```
VAR_INVALIDARG = HRESULT($80070057);
```

File

VarUtils

Description

This is constant VarUtils.VAR_INVALIDARG.

55.5.24 VarUtils.VAR_LOCALE_USER_DEFAULT Constant

Pascal

```
VAR_LOCALE_USER_DEFAULT = $400;
```

C++

```
VAR_LOCALE_USER_DEFAULT = 0x400;
```

File

VarUtils

Description

This is constant VarUtils.VAR_LOCALE_USER_DEFAULT.

55.5.25 VarUtils.VAR_NOTIMPL Constant

Pascal

```
VAR_NOTIMPL = HRESULT($80004001);
```

C++

```
VAR_NOTIMPL = HRESULT($80004001);
```

File

VarUtils

Description

This is constant VarUtils.VAR_NOTIMPL.

55.5.26 VarUtils.VAR_OK Constant

Pascal

```
VAR_OK = HRESULT($00000000);
```

C++

```
VAR_OK = HRESULT($00000000);
```

File

VarUtils

Description

This is constant VarUtils.VAR_OK.

55.5.27 VarUtils.VAR_OUTOFMEMORY Constant

Pascal

```
VAR_OUTOFMEMORY = HRESULT($8007000E);
```

C++

```
VAR_OUTOFMEMORY = HRESULT($8007000E);
```

File

VarUtils

Description

This is constant VarUtils.VAR_OUTOFMEMORY.

55.5.28 VarUtils.VAR_OVERFLOW Constant

Pascal

```
VAR_OVERFLOW = HRESULT($8002000A);
```

C++

```
VAR_OVERFLOW = HRESULT($8002000A);
```

File

VarUtils

Description

This is constant VarUtils.VAR_OVERFLOW.

55.5.29 VarUtils.VAR_PARAMNOTFOUND Constant

Pascal

```
VAR_PARAMNOTFOUND = HRESULT($80020004);
```

C++

```
VAR_PARAMNOTFOUND = HRESULT($80020004);
```

File

VarUtils

Description

This is constant VarUtils.VAR_PARAMNOTFOUND.

55.5.30 VarUtils.VAR_TYPEMISMATCH Constant

Pascal

```
VAR_TYPEMISMATCH = HRESULT($80020005);
```

C++

```
VAR_TYPEMISMATCH = HRESULT($80020005);
```

File

VarUtils

Description

This is constant VarUtils.VAR_TYPEMISMATCH.

55.5.31 VarUtils.VAR_UNEXPECTED Constant

Pascal

```
VAR_UNEXPECTED = HRESULT($8000FFFF);
```

C++

```
VAR_UNEXPECTED = HRESULT($8000FFFF);
```

File

VarUtils

Description

This is constant VarUtils.VAR_UNEXPECTED.

56 VCLCom Namespace

This is namespace VCLCom.

Topics

Name	Description
Classes (see page 5156)	The following table lists classes in this documentation.

Classes

	Name	Description
	TComponentFactory (see page 5156)	TComponentFactory is the class factory for creating instances of components that support interfaces.

56.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TComponentFactory (see page 5156)	TComponentFactory is the class factory for creating instances of components that support interfaces.

56.1.1 TComponentFactory Class

TComponentFactory is the class factory for creating instances of components that support interfaces.

Class Hierarchy

Pascal

```
TComponentFactory = class(TAutoObjectFactory, IClassFactory);
```

C++

```
class TComponentFactory : public TAutoObjectFactory, public IClassFactory;
```

File

VCLCom

Description

TComponentFactory creates instances of component classes that implement interfaces. TComponentFactory supports the IClassFactory interface and inherits support for the IClassFactory2 interface.

Note: These components are actually created as contained objects of an automation object (aggregate).

56.1.1.1 TComponentFactory Members

The following tables list the members exposed by TComponentFactory.

Protected Methods

	Name	Description
	CreateInstance (see page 5158)	This is CreateInstance, a member of class TComponentFactory.

Public Methods

	Name	Description
	Create (see page 5157)	Instantiates an instance of a TComponentFactory (see page 5156) object.
	CreateComObject (see page 5157)	Instantiates a TComObject object.
	UpdateRegistry (see page 5158)	Registers the typed COM object class.

56.1.1.2 TComponentFactory.Create Constructor

Instantiates an instance of a TComponentFactory (see page 5156) object.

Pascal

```
constructor Create(ComServer: TComServerObject; ComponentClass: TComponentClass; const
ClassID: TGUID; Instancing: TClassInstancing; ThreadingModel: TThreadingModel = tmSingle);
```

C++

```
__fastcall TComponentFactory(TComServerObject ComServer, TComponentClass ComponentClass, const
TGUID ClassID, TClassInstancing Instancing, TThreadingModel ThreadingModel = tmSingle);
```

Description

Create allocates memory for a TComponentFactory (see page 5156) object, and calls the inherited Create, passing its parameters in the same order. The ComponentClass parameter is passed cast as a TAutoClass and passed to the AutoClass parameter.

See Also

Create

56.1.1.3 TComponentFactory Methods

The methods of the TComponentFactory class are listed here.

Protected Methods

	Name	Description
	CreateInstance (see page 5158)	This is CreateInstance, a member of class TComponentFactory.

Public Methods

	Name	Description
	CreateComObject (see page 5157)	Instantiates a TComObject object.
	UpdateRegistry (see page 5158)	Registers the typed COM object class.

56.1.1.3.1 TComponentFactory.CreateComObject Method

Instantiates a TComObject object.

Pascal

```
function CreateComObject(const Controller: IUnknown): TComObject; override;
```

C++

```
virtual __fastcall TComObject CreateComObject(const IUnknown Controller);
```

Description

CreateComObject is the method that instantiates the class type for which TComObjectFactory is the class factory. CreateComObject calls the CreateFromFactory constructor of the TComObject class to create a COM object. CreateComObject passes itself as the Factory parameter to CreateFromFactory.

CreateComClass creates a COM object based upon the value of the ComClass property. ComClass is the class identifier (CLSID) used by other applications to identify the COM class for which they request an object instance.

comclass

CreateFromFactory

TComObject

56.1.1.3.2 TComponentFactory.CreateInstance Method

Pascal

```
function CreateInstance(const UnkOuter: IUnknown; const IID: TGUID; out Obj): HResult; stdcall;
```

C++

```
__fastcall __stdcall HRESULT CreateInstance(const IUnknown UnkOuter, const TGUID IID,  Obj);
```

Description

This is CreateInstance, a member of class TComponentFactory.

56.1.1.3.3 TComponentFactory.UpdateRegistry Method

Registers the typed COM object class.

Pascal

```
procedure UpdateRegistry(Register: Boolean); override;
```

C++

```
virtual __fastcall UpdateRegistry(Boolean Register);
```

Description

UpdateRegistry is called for EXEs when the EXE is run, and for DLLs or EXEs when the routines are called to specifically register or unregister the server.

57 WebAdapt Namespace

This is namespace WebAdapt.

Topics

Name	Description
Classes (see page 5164)	The following table lists classes in this documentation.
Interfaces (see page 5860)	The following table lists interfaces in this documentation.
Functions (see page 5883)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 5887)	The following table lists structs, records, enums in this documentation.
Types (see page 5889)	The following table lists types in this documentation.
Variables (see page 5906)	The following table lists variables in this documentation.
Constants (see page 5907)	The following table lists constants in this documentation.

Classes

	Name	Description
	EAdapterException (see page 5166)	EAdapterException is raised by WebSnap adapter objects.
	EAdapterFieldException (see page 5167)	EAdapterFieldException is an exception class for errors by adapters using fields.
	TAbstractFieldValuesAdapter (see page 5169)	tabstractfieldvaluesadapter is the base class for adapters that have a single default field.
	TAdapter (see page 5179)	TAdapter defines a scriptable interface to event handlers that return data items or execute commands in your application.
	TAdapterAction (see page 5190)	TAdapterAction is a generic adapter action that relies on event handlers.
	TAdapterActions (see page 5198)	TAdapterActions manages the list of actions that belong to an adapter.
	TAdapterApplicationField (see page 5203)	TAdapterApplicationField is a base class for adapter field components that are children of a TApplicationAdapter (see page 5427) component.
	TAdapterApplicationTitleField (see page 5207)	TAdapterApplicationTitleField is an adapter field used to access the application title.
	TAdapterBooleanField (see page 5212)	TAdapterBooleanField is an event handler based adapter field that works with a Boolean value.
	TAdapterDefaultActions (see page 5220)	TAdapterDefaultActions manages the list of actions that belong to an adapter that supports a default set of actions.
	TAdapterDefaultFields (see page 5226)	TAdapterDefaultFields manages the list of fields that belong to an adapter that supports a default set of fields.
	TAdapterEndUserDisplayNameField (see page 5233)	TAdapterEndUserDisplayNameField is an adapter field used to access the end-user's name.
	TAdapterEndUserField (see page 5237)	TAdapterEndUserField is a base class for adapter field components that are children of an end-user adapter component.
	TAdapterEndUserLoggedInField (see page 5241)	TAdapterEndUserLoggedInField is an adapter field used to access the end-user logged in flag.

	TAdapterError (see page 5245)	TAdapterError is the implementation of IAdapterError (see page 934).
	TAdapterErrorsList (see page 5248)	TAdapterErrorsList keeps track of errors that an adapter encounters.
	TAdapterField (see page 5256)	TAdapterField is an event handler based adapter field that provides a single value.
	TAdapterFields (see page 5265)	TAdapterFields manages the list of fields that belong to an adapter.
	TAdapterFileField (see page 5270)	TAdapterFileField is an event handler based adapter field that can accept uploaded files.
	TAdapterGotoPageAction (see page 5280)	TAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 5733).
	TAdapterHiddenField (see page 5288)	This is class WebAdapt.TAdapterHiddenField.
	TAdapterHiddenFieldsList (see page 5290)	TAdapterHiddenFieldsList maintains a collection of name/value pairs that an adapter includes as hidden fields in an HTML form.
	TAdapterImageField (see page 5297)	TAdapterImageField is an event handler based adapter field that can provide the URL of an image file and also accept an uploaded image file.
	TAdapterLoginField (see page 5308)	TAdaperLoginField is a base class for adapter field components that are children of a TLoginFormAdapter (see page 5810) component.
	TAdapterMemoField (see page 5312)	TAdapterMemoField is an event handler based adapter field that supports a multi-line text value.
	TAdapterMultiValueField (see page 5320)	TAdapterMultiValueField is an event handler based adapter field that provides zero or more values.
	TAdapterNamedDisplayField (see page 5331)	The AdapterNamedDisplayField is a base class for adapter fields.
	TAdapterNamedField (see page 5339)	TAdapterNamedField is a based class for adapter field components.
	TAdapterNextPageAction (see page 5358)	TAdapterNextPageAction implements the next page command for TDefaultFieldsPagedAdapter (see page 5733).
	TAdapterNextPageField (see page 5367)	The TAdapterNextPageField navigates to the next page of data.
	TAdapterObjectErrorsList (see page 5375)	This is class WebAdapt.TAdapterObjectErrorsList.
	TAdapterPasswordField (see page 5379)	TAdapterPasswordField is an adapter field used to access the password entered by the end-user.
	TAdapterPrevPageAction (see page 5384)	TAdapterPrevPageAction implements the previous page command for TDefaultFieldsPagedAdapter (see page 5733).
	TAdapterSubComponent (see page 5394)	TAdapterSubComponent is the base class for objects that represent a collection of actions or fields that belong to an adapter.
	TAdapterUpdateField (see page 5407)	TAdapterUpdateField is a base class for adapter field components that support data entry into an HTML form.
	TAdapterUserNameField (see page 5422)	TAdapterUserNameField is an adapter field used to access the user name entered by the end-user.
	TApplicationAdapter (see page 5427)	TApplicationAdapter is a container for field and action components that are available through the Application script variable.
	TBaseAdapterAction (see page 5435)	TBaseAdapterAction is a based class for adapter action components.
	TBaseAdapterErrorsList (see page 5467)	TBaseAdapterErrorsList is the base class for adapter error object managers.
	TBaseAdapterMultiValueField (see page 5475)	TBaseAdapterMultiValueField is a base class for adapter fields that have zero or more values.
	TBaseEndUserAdapter (see page 5485)	TBaseEndUserAdapter contains user information.
	TBaseValuesListAdapter (see page 5504)	TBaseValuesListAdapter is a base class for adapters that provide a list of name/value pairs.
	TBaseValuesListField (see page 5515)	TBaseValuesListField is a base class for adapter field components that are children of a values list adapter component.
	TCustomAdapter (see page 5519)	TCustomAdapter is a base class for adapter components.
	TCustomAdapterAction (see page 5565)	TCustomAdapterAction is a base class for adapter actions.
	TCustomAdapterBooleanField (see page 5575)	tcustomadapterbooleanfield is a base class for adapter fields that provide a single Boolean value.
	TCustomAdapterField (see page 5583)	TCustomAdapterField is a base class for adapter fields that provide a single value.
	TCustomAdapterFileField (see page 5590)	TCustomAdapterFileField is a base class for adapter fields that can have associated files.
	TCustomAdapterGotoPageAction (see page 5600)	TCustomAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 5733).
	TCustomAdapterImageField (see page 5609)	TCustomAdapterImageField is a base class for adapter fields that have an associated image file.
	TCustomAdapterMemoField (see page 5624)	TCustomAdapterMemoField is a base class for adapter fields that have a multi-line text value.

	TCustomAdapterMultiValueField (see page 5632)	TCustomAdapterMultiValueField is a base class for adapter fields that have one or more values.
	TCustomAdapterPageAction (see page 5642)	TCustomPagedAdapterAction (see page 5708) is a base class for adapter actions that execute the next or previous page commands.
	TCustomApplicationAdapter (see page 5649)	TCustomApplicationAdapter is a base class for components that implement the server-side script Application object.
	TCustomApplicationAdapterAction (see page 5657)	TCustomApplicationAdapterAction is a base class for adapter actions that work with descendants of TCustomApplicationAdapter (see page 5649).
	TCustomEndUserAdapter (see page 5662)	TCustomEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TCustomEndUserAdapterAction (see page 5673)	TCustomEndUserAdapterAction is a base class for adapter actions that work with descendants of TCustomEndUserAdapter (see page 5662).
	TCustomEndUserSessionAdapter (see page 5678)	TCustomEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TCustomLoginFormAdapter (see page 5687)	TCustomLoginFormAdapter is the base class for adapters that manage the fields and actions of a login form.
	TCustomLoginFormAdapterAction (see page 5703)	TCustomEndUserAdapterAction (see page 5673) is a base class for adapter actions that work with descendants of TCustomLoginFormAdapter (see page 5687).
	TCustomPagedAdapter (see page 5707)	TCustomPagedAdapter is a base class for adapters that support paging.
	TCustomPagedAdapterAction (see page 5708)	TCustomPagedAdapterAction is a base class for adapter actions that work with descendants of TDefaultFieldsPagedAdapter (see page 5733).
	TCustomStringsValuesList (see page 5714)	TCustomStringsValuesList is a base class for a values list that defines it's name/value pairs using a string list.
	TDefaultFieldsAdapter (see page 5724)	TDefaultFieldsAdapter is a base class for adapters that automatically adds default fields and/or actions.
	TDefaultFieldsPagedAdapter (see page 5733)	TDefaultFieldsPagedAdapter is a base class for adapters that support paging.
	TEndUserAdapter (see page 5750)	TEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TEndUserAdapterLoginFormAction (see page 5762)	TEndUserAdapterLoginFormAction is an adapter action that displays a login form when executed.
	TEndUserAdapterLogoutAction (see page 5770)	TEndUserAdapterLogoutAction is an adapter action that logs the end-user out.
	TEndUserSessionAdapter (see page 5779)	TEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TFieldValuesAdapter (see page 5789)	TFieldValuesAdapter is an adapter that includes a single field value.
	TFieldValuesValueField (see page 5799)	TFieldValuesValueField is a adapter field child of TFieldValuesAdapter (see page 5789).
	TImplementedAdapterAction (see page 5803)	TImplementedAdapterAction is a base class for adapter actions.
	TLogicalPageList (see page 5805)	This is class WebAdapt.TLogicalPageList.
	TLoginFormAdapter (see page 5810)	TLoginFormAdapter contains the adapter fields and adapter actions used to generate a login form.
	TLoginFormAdapterLoginAction (see page 5821)	TLoginFormAdapterLoginAction executes the login command of a login form generated with TLoginFormAdapter (see page 5810).
	TPagedAdapter (see page 5830)	TPagedAdapter divides a large amount of data into several pages, each page displaying a portion of the data records.
	TStringsValuesList (see page 5843)	TStringsValuesList is an adapter component that provides a list of name/value pairs defined by items in a TStrings property.
	TUpdateFileList (see page 5850)	TUpdateFileList is a container for uploaded files.
	TValuesListNameField (see page 5852)	TValuesListNameField is an adapter field used to access the Name of the current list item of a values list adapter.
	TValuesListValueField (see page 5855)	TValuesListValueField is an adapter field used to access the Value (see page 5357) of the current list item of a values list adapter.

Constants

Name	Description
sActionRequestLong (see page 5907)	This is constant WebAdapt.sActionRequestLong.
sCurrentPage (see page 5907)	This is constant WebAdapt.sCurrentPage.
sGotoPageAction (see page 5908)	This is constant WebAdapt.sGotoPageAction.
sImageRequest (see page 5908)	This is constant WebAdapt.sImageRequest.
sLoginPassword (see page 5908)	This is constant WebAdapt.sLoginPassword.
sLoginUserName (see page 5909)	This is constant WebAdapt.sLoginUserName.

sNextPageAction (see page 5909)	This is constant WebAdapt.sNextPageAction.
sPrevPageAction (see page 5909)	This is constant WebAdapt.sPrevPageAction.

Functions

	Name	Description
	AddDefaultActions (see page 5883)	This is function WebAdapt.AddDefaultActions.
	AddDefaultFields (see page 5883)	This is function WebAdapt.AddDefaultFields.
	FindAdapterAction (see page 5884)	This is function WebAdapt.FindAdapterAction.
	FindAdapterField (see page 5884)	This is function WebAdapt.FindAdapterField.
	FindAdapterInParent (see page 5884)	This is function WebAdapt.FindAdapterInParent.
	MakeAdapterRequestIdentifier (see page 5885)	This is function WebAdapt.MakeAdapterRequestIdentifier.
	MakeValidAdapterFieldName (see page 5885)	This is function WebAdapt.MakeValidAdapterFieldName.
	RaiseFileUploadNotSupported (see page 5885)	This is function WebAdapt.RaiseFileUploadNotSupported.
	RaiseMultipleFilesException (see page 5886)	This is function WebAdapt.RaiseMultipleFilesException.
	RaiseMultipleValuesException (see page 5886)	This is function WebAdapt.RaiseMultipleValuesException.

Interfaces

	Name	Description
	IAdapterEditor (see page 5860)	This is class WebAdapt.IAdapterEditor.
	IAdapterNotifyAdapterChange (see page 5861)	This is class WebAdapt.IAdapterNotifyAdapterChange.
	ICheckOrigValue (see page 5862)	This is class WebAdapt.ICheckOrigValue.
	ICheckValueChange (see page 5863)	This is class WebAdapt.ICheckValueChange.
	IClearAdapterValues (see page 5864)	This is class WebAdapt.IClearAdapterValues.
	ICreateActionRequestContext (see page 5865)	This is class WebAdapt.ICreateActionRequestContext.
	IEchoActionFieldValue (see page 5866)	This is class WebAdapt.IEchoActionFieldValue.
	IEchoAdapterFieldValues (see page 5868)	This is class WebAdapt.IEchoAdapterFieldValues.
	IExecuteValue (see page 5869)	IExecuteValue is the interface for executing an adapter's fields with values passed in an HTTP request.
	IFullyQualifyInputNames (see page 5871)	This is class WebAdapt.IFullyQualifyInputNames.
	IGetAdapterErrorsList (see page 5872)	This is class WebAdapt.IGetAdapterErrorsList.
	IGetAdapterModeNames (see page 5873)	This is class WebAdapt.IGetAdapterModeNames.
	IGetRecordKeys (see page 5874)	This is class WebAdapt.IGetRecordKeys.
	IIdentifyAdapter (see page 5875)	This is class WebAdapt.IIdentifyAdapter.
	ISetSubComponents (see page 5875)	This is class WebAdapt.ISetSubComponents.
	ISetWebFieldValue (see page 5876)	This is class WebAdapt.ISetWebFieldValue.
	IUpdateValue (see page 5877)	This is class WebAdapt.IUpdateValue.
	IValidateValue (see page 5878)	This is class WebAdapt.IValidateValue.
	IWebActionsSubcomponent (see page 5879)	This is class WebAdapt.IWebActionsSubcomponent.
	IWebFieldsSubcomponent (see page 5879)	This is class WebAdapt.IWebFieldsSubcomponent.
	IWebGetFieldPrevValue (see page 5880)	This is class WebAdapt.IWebGetFieldPrevValue.

Structs, Records, Enums

	Name	Description
	TAdapterHiddenFieldOption (see page 5887)	This is record WebAdapt.TAdapterHiddenFieldOption.
	TIteratorMethod (see page 5887)	This is record WebAdapt.TIteratorMethod.

Types

Name	Description
IActionFieldValue (see page 5890)	This is type WebAdapt.IActionFieldValue.
IActionRequest (see page 5890)	This is type WebAdapt.IActionRequest.
TAbstractWebRequestFile (see page 5890)	This is type WebAdapt.TAbstractWebRequestFile.
TActionExecuteEvent (see page 5891)	This is type WebAdapt.TActionExecuteEvent.
TActionExecuteHandledEvent (see page 5891)	This is type WebAdapt.TActionExecuteHandledEvent.
TActionGetEnabledEvent (see page 5891)	This is type WebAdapt.TActionGetEnabledEvent.
TActionGetParamsEvent (see page 5892)	This is type WebAdapt.TActionGetParamsEvent.

TActionRequestFieldsEvent (see page 5892)	This is type WebAdapt.TActionRequestFieldsEvent.
TActionRequestFieldsHandledEvent (see page 5892)	This is type WebAdapt.TActionRequestFieldsHandledEvent.
TAdapterActionExecuteEvent (see page 5893)	This is type WebAdapt.TAdapterActionExecuteEvent.
TAdapterActionExecuteHandledEvent (see page 5893)	This is type WebAdapt.TAdapterActionExecuteHandledEvent.
TAdapterActionGetParamsEvent (see page 5893)	This is type WebAdapt.TAdapterActionGetParamsEvent.
TAdapterActionsClass (see page 5894)	This is type WebAdapt.TAdapterActionsClass.
TAdapterFieldBooleanValueEvent (see page 5894)	This is type WebAdapt.TAdapterFieldBooleanValueEvent.
TAdapterFieldFileEvent (see page 5894)	This is type WebAdapt.TAdapterFieldFileEvent.
TAdapterFieldFileListEvent (see page 5895)	This is type WebAdapt.TAdapterFieldFileListEvent.
TAdapterFieldGetBooleanEvent (see page 5895)	This is type WebAdapt.TAdapterFieldGetBooleanEvent.
TAdapterFieldGetMultiValueEvent (see page 5895)	This is type WebAdapt.TAdapterFieldGetMultiValueEvent.
TAdapterFieldGetMultiValueStringEvent (see page 5896)	This is type WebAdapt.TAdapterFieldGetMultiValueStringEvent.
TAdapterFieldGetStringEvent (see page 5896)	This is type WebAdapt.TAdapterFieldGetStringEvent.
TAdapterFieldGetValueCountEvent (see page 5896)	This is type WebAdapt.TAdapterFieldGetValueCountEvent.
TAdapterFieldGetValueEvent (see page 5897)	This is type WebAdapt.TAdapterFieldGetValueEvent.
TAdapterFieldHasValueEvent (see page 5897)	This is type WebAdapt.TAdapterFieldHasValueEvent.
TAdapterFieldsClass (see page 5897)	This is type WebAdapt.TAdapterFieldsClass.
TAdapterFieldStringEvent (see page 5898)	This is type WebAdapt.TAdapterFieldStringEvent.
TAdapterFieldStringsEvent (see page 5898)	This is type WebAdapt.TAdapterFieldStringsEvent.
TAdapterFieldValidateValueEvent (see page 5898)	This is type WebAdapt.TAdapterFieldValidateValueEvent.
TAdapterFieldValueEvent (see page 5899)	This is type WebAdapt.TAdapterFieldValueEvent.
TAdapterHiddenFieldOptions (see page 5899)	This is type WebAdapt.TAdapterHiddenFieldOptions.
TEndUserGetNameEvent (see page 5899)	This is type WebAdapt.TEndUserGetNameEvent.
TEndUserGetUserIDEvent (see page 5900)	This is type WebAdapt.TEndUserGetUserIDEvent.
TEndUserHandledEvent (see page 5900)	This is type WebAdapt.TEndUserHandledEvent.
TEndUserIsLoggedInEvent (see page 5900)	This is type WebAdapt.TEndUserIsLoggedInEvent.
TEndUserRightsEvent (see page 5901)	This is type WebAdapt.TEndUserRightsEvent.
TEndUserUserIDEvent (see page 5901)	This is type WebAdapt.TEndUserUserIDEvent.
TGetEOFEvent (see page 5901)	This is type WebAdapt.TGetEOFEvent.
TGetRecordCountEvent (see page 5902)	This is type WebAdapt.TGetRecordCountEvent.
TGetRecordEvent (see page 5902)	This is type WebAdapt.TGetRecordEvent.
TGetRecordIndexEvent (see page 5902)	This is type WebAdapt.TGetRecordIndexEvent.
THandledEvent (see page 5903)	This is type WebAdapt.THandledEvent.
TImageFieldGetHREFEvent (see page 5903)	This is type WebAdapt.TImageFieldGetHREFEvent.
TImageFieldGetImageEvent (see page 5903)	This is type WebAdapt.TImageFieldGetImageEvent.
TImageFieldGetParamsEvent (see page 5904)	This is type WebAdapt.TImageFieldGetParamsEvent.
TIterateRecordsEvent (see page 5904)	This is type WebAdapt.TIterateRecordsEvent.
TLoginUserIDEvent (see page 5904)	This is type WebAdapt.TLoginUserIDEvent.
TObjectList (see page 5905)	This is type WebAdapt.TObjectList.
TValidateAdapterFieldEvent (see page 5905)	This is type WebAdapt.TValidateAdapterFieldEvent.
TWebFormGetPageNameEvent (see page 5905)	This is type WebAdapt.TWebFormGetPageNameEvent.

Variables

Name	Description
NotifyPossibleHTMLChange (see page 5906)	This is variable WebAdapt.NotifyPossibleHTMLChange.

57.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EAdapterException (see page 5166)	EAdapterException is raised by WebSnap adapter objects.
	EAdapterFieldException (see page 5167)	EAdapterFieldException is an exception class for errors by adapters using fields.
	TAbstractFieldValuesAdapter (see page 5169)	tabstractfieldvaluesadapter is the base class for adapters that have a single default field.
	TAdapter (see page 5179)	TAdapter defines a scriptable interface to event handlers that return data items or execute commands in your application.
	TAdapterAction (see page 5190)	TAdapterAction is a generic adapter action that relies on event handlers.
	TAdapterActions (see page 5198)	TAdapterActions manages the list of actions that belong to an adapter.
	TAdapterApplicationField (see page 5203)	TAdapterApplicationField is a base class for adapter field components that are children of a TApplicationAdapter (see page 5427) component.
	TAdapterApplicationTitleField (see page 5207)	TAdapterApplicationTitleField is an adapter field used to access the application title.
	TAdapterBooleanField (see page 5212)	TAdapterBooleanField is an event handler based adapter field that works with a Boolean value.
	TAdapterDefaultActions (see page 5220)	TAdapterDefaultActions manages the list of actions that belong to an adapter that supports a default set of actions.
	TAdapterDefaultFields (see page 5226)	TAdapterDefaultFields manages the list of fields that belong to an adapter that supports a default set of fields.
	TAdapterEndUserDisplayNameField (see page 5233)	TAdapterEndUserDisplayNameField is an adapter field used to access the end-user's name.
	TAdapterEndUserField (see page 5237)	TAdapterEndUserField is a base class for adapter field components that are children of an end-user adapter component.
	TAdapterEndUserLoggedInField (see page 5241)	TAdapterEndUserLoggedInField is an adapter field used to access the end-user logged in flag.
	TAdapterError (see page 5245)	TAdapterError is the implementation of IAdapterError (see page 934).
	TAdapterErrorsList (see page 5248)	TAdapterErrorsList keeps track of errors that an adapter encounters.
	TAdapterField (see page 5256)	TAdapterField is an event handler based adapter field that provides a single value.
	TAdapterFields (see page 5265)	TAdapterFields manages the list of fields that belong to an adapter.
	TAdapterFileField (see page 5270)	TAdapterFileField is an event handler based adapter field that can accept uploaded files.
	TAdapterGotoPageAction (see page 5280)	TAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 5733).
	TAdapterHiddenField (see page 5288)	This is class WebAdapt.TAdapterHiddenField.
	TAdapterHiddenFieldsList (see page 5290)	TAdapterHiddenFieldsList maintains a collection of name/value pairs that an adapter includes as hidden fields in an HTML form.
	TAdapterImageField (see page 5297)	TAdapterImageField is an event handler based adapter field that can provide the URL of an image file and also accept an uploaded image file.
	TAdapterLoginField (see page 5308)	TAdaperLoginField is a base class for adapter field components that are children of a TLoginFormAdapter (see page 5810) component.
	TAdapterMemoField (see page 5312)	TAdapterMemoField is an event handler based adapter field that supports a multi-line text value.
	TAdapterMultiValueField (see page 5320)	TAdapterMultiValueField is an event handler based adapter field that provides zero or more values.
	TAdapterNamedDisplayField (see page 5331)	The AdapterNamedDisplayField is a base class for adapter fields.
	TAdapterNamedField (see page 5339)	TAdapterNamedField is a based class for adapter field components.
	TAdapterNextPageAction (see page 5358)	TAdapterNextPageAction implements the next page command for TDefaultFieldsPagedAdapter (see page 5733).
	TAdapterNextPageField (see page 5367)	The TAdapterNextPageField navigates to the next page of data.
	TAdapterObjectErrorsList (see page 5375)	This is class WebAdapt.TAdapterObjectErrorsList.

	TAdapterPasswordField (see page 5379)	TAdapterPasswordField is an adapter field used to access the password entered by the end-user.
	TAdapterPrevPageAction (see page 5384)	TAdapterPrevPageAction implements the previous page command for TDefaultFieldsPagedAdapter (see page 5733).
	TAdapterSubComponent (see page 5394)	TAdapterSubComponent is the base class for objects that represent a collection of actions or fields that belong to an adapter.
	TAdapterUpdateField (see page 5407)	TAdapterUpdateField is a base class for adapter field components that support data entry into an HTML form.
	TAdapterUserNameField (see page 5422)	TAdapterUserNameField is an adapter field used to access the user name entered by the end-user.
	TApplicationAdapter (see page 5427)	TApplicationAdapter is a container for field and action components that are available through the Application script variable.
	TBaseAdapterAction (see page 5435)	TBaseAdapterAction is a based class for adapter action components.
	TBaseAdapterErrorsList (see page 5467)	TBaseAdapterErrorsList is the base class for adapter error object managers.
	TBaseAdapterMultiValueField (see page 5475)	TBaseAdapterMultiValueField is a base class for adapter fields that have zero or more values.
	TBaseEndUserAdapter (see page 5485)	TBaseEndUserAdapter contains user information.
	TBaseValuesListAdapter (see page 5504)	TBaseValuesListAdapter is a base class for adapters that provide a list of name/value pairs.
	TBaseValuesListField (see page 5515)	TBaseValuesListField is a base class for adapter field components that are children of a values list adapter component.
	TCustomAdapter (see page 5519)	TCustomAdapter is a base class for adapter components.
	TCustomAdapterAction (see page 5565)	TCustomAdapterAction is a base class for adapter actions.
	TCustomAdapterBooleanField (see page 5575)	tcustomadapterbooleanfield is a base class for adapter fields that provide a single Boolean value.
	TCustomAdapterField (see page 5583)	TCustomAdapterField is a base class for adapter fields that provide a single value.
	TCustomAdapterFileField (see page 5590)	TCustomAdapterFileField is a base class for adapter fields that can have associated files.
	TCustomAdapterGotoPageAction (see page 5600)	TCustomAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 5733).
	TCustomAdapterImageField (see page 5609)	TCustomAdapterImageField is a base class for adapter fields that have an associated image file.
	TCustomAdapterMemoField (see page 5624)	TCustomAdapterMemoField is a base class for adapter fields that have a multi-line text value.
	TCustomAdapterMultiValueField (see page 5632)	TCustomAdapterMultiValueField is a base class for adapter fields that have one or more values.
	TCustomAdapterPageAction (see page 5642)	TCustomPagedAdapterAction (see page 5708) is a base class for adapter actions that execute the next or previous page commands.
	TCustomApplicationAdapter (see page 5649)	TCustomApplicationAdapter is a base class for components that implement the server-side script Application object.
	TCustomApplicationAdapterAction (see page 5657)	TCustomApplicationAdapterAction is a base class for adapter actions that work with descendants of TCustomApplicationAdapter (see page 5649).
	TCustomEndUserAdapter (see page 5662)	TCustomEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TCustomEndUserAdapterAction (see page 5673)	TCustomEndUserAdapterAction is a base class for adapter actions that work with descendants of TCustomEndUserAdapter (see page 5662).
	TCustomEndUserSessionAdapter (see page 5678)	TCustomEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TCustomLoginFormAdapter (see page 5687)	TCustomLoginFormAdapter is the base class for adapters that manage the fields and actions of a login form.
	TCustomLoginFormAdapterAction (see page 5703)	TCustomEndUserAdapterAction (see page 5673) is a base class for adapter actions that work with descendants of TCustomLoginFormAdapter (see page 5687).
	TCustomPagedAdapter (see page 5707)	TCustomPagedAdapter is a base class for adapters that support paging.
	TCustomPagedAdapterAction (see page 5708)	TCustomPagedAdapterAction is a base class for adapter actions that work with descendants of TDefaultFieldsPagedAdapter (see page 5733).
	TCustomStringsValuesList (see page 5714)	TCustomStringsValuesList is a base class for a values list that defines it's name/value pairs using a string list.
	TDefaultFieldsAdapter (see page 5724)	TDefaultFieldsAdapter is a base class for adapters that automatically adds default fields and/or actions.
	TDefaultFieldsPagedAdapter (see page 5733)	TDefaultFieldsPagedAdapter is a base class for adapters that support paging.

	TEndUserAdapter (see page 5750)	TEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TEndUserAdapterLoginFormAction (see page 5762)	TEndUserAdapterLoginFormAction is an adapter action that displays a login form when executed.
	TEndUserAdapterLogoutAction (see page 5770)	TEndUserAdapterLogoutAction is an adapter action that logs the end-user out.
	TEndUserSessionAdapter (see page 5779)	TEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.
	TFieldValuesAdapter (see page 5789)	TFieldValuesAdapter is an adapter that includes a single field value.
	TFieldValuesValueField (see page 5799)	TFieldValuesValueField is a adapter field child of TFieldValuesAdapter (see page 5789).
	TImplementedAdapterAction (see page 5803)	TImplementedAdapterAction is a base class for adapter actions.
	TLogicalPageList (see page 5805)	This is class WebAdapt.TLogicalPageList.
	TLoginFormAdapter (see page 5810)	TLoginFormAdapter contains the adapter fields and adapter actions used to generate a login form.
	TLoginFormAdapterLoginAction (see page 5821)	TLoginFormAdapterLoginAction executes the login command of a login form generated with TLoginFormAdapter (see page 5810).
	TPagedAdapter (see page 5830)	TPagedAdapter divides a large amount of data into several pages, each page displaying a portion of the data records.
	TStringsValuesList (see page 5843)	TStringsValuesList is an adapter component that provides a list of name/value pairs defined by items in a TStrings property.
	TUpdateFileList (see page 5850)	TUpdateFileList is a container for uploaded files.
	TValuesListNameField (see page 5852)	TValuesListNameField is an adapter field used to access the Name of the current list item of a values list adapter.
	TValuesListValueField (see page 5855)	TValuesListValueField is an adapter field used to access the Value (see page 5357) of the current list item of a values list adapter.

57.1.1 EAdapterException Class

EAdapterException is raised by WebSnap adapter objects.

Class Hierarchy

Pascal

```
EAdapterException = class(EWebBrokerException);
```

C++

```
class EAdapterException : public EWebBrokerException;
```

File

WebAdapt

Description

EAdapterException is raised when a WebSnap adapter object encounters an error. EAdapterException provides an ID (see page 5167) property to record application-defined errors.

57.1.1.1 EAdapterException Members

The following tables list the members exposed by EAdapterException.

Public Methods

	Name	Description
	CreateID (see page 5167)	Create exception object with error ID (see page 5167).

Public Properties

	Name	Description
	ID (see page 5167)	Application error ID.

57.1.1.2 EAdapterException.CreateID Constructor

Create exception object with error ID (see page 5167).

Pascal

```
constructor CreateID(const AMsg: string; AID: Integer; Reserved: Integer = 0);
```

C++

```
__fastcall EAdapterException(const UnicodeString AMsg, int AID, int Reserved = 0);
```

Description

CreateID creates an EAdapterException (see page 5166) object in the usual way, and also assigns AID to the ID (see page 5167) property.

Reserved is not implemented.

57.1.1.3 EAdapterException Properties

The properties of the EAdapterException class are listed here.

Public Properties

	Name	Description
	ID (see page 5167)	Application error ID.

57.1.1.3.1 EAdapterException.ID Property

Application error ID.

Pascal

```
property ID: Integer;
```

C++

```
__property int ID;
```

Description

The ID property returns an application-defined value relating to the error. To specify an ID value, create an EAdapterException (see page 5166) object using the CreateID (see page 5167) constructor (Delphi) or the constructor syntax that includes an ID as a parameter (C++). For exceptions raised by built-in WebSnap adapters, ID is always 0.

See Also

CreateID (see page 5167)

57.1.2 EAdapterFieldException Class

EAdapterFieldException is an exception class for errors by adapters using fields.

Class Hierarchy

Pascal

```
EAdapterFieldException = class(EAdapterException);
```

C++

```
class EAdapterFieldException : public EAdapterException;
```

File

WebAdapt

Description

EAdapterFieldException is raised when an adapter encounters an error using a field.

57.1.2.1 EAdapterFieldException Members

The following tables list the members exposed by EAdapterFieldException.

Public Methods

	Name	Description
	Create (see page 5168)	Create an EAdapterFieldException (see page 5167) instance.
	CreateID (see page 5167)	Create exception object with error ID (see page 5167).

Public Properties

	Name	Description
	FieldName (see page 5169)	FieldName contains the name of the field associated with the error.
	ID (see page 5167)	Application error ID.

57.1.2.2 EAdapterFieldException.Create Constructor

Create an EAdapterFieldException (see page 5167) instance.

Pascal

```
constructor Create(const AMsg: string; const AFieldName: string; AID: Integer = 0);
```

C++

```
__fastcall EAdapterFieldException(const UnicodeString AMsg, const UnicodeString AFieldName,
int AID = 0);
```

Description

Create instantiates an instance of EAdapterFieldException (see page 5167).

AMsg is the string containing the runtime error message to display in the exception dialog box. AMsg can be a hard-coded string, or can be a function call that returns a string.

AFieldName and AID are assigned to the FieldName (see page 5169) and ID (see page 5167) properties.

See Also

FieldName (see page 5169)

ID (see page 5167)

57.1.2.3 EAdapterFieldException Properties

The properties of the EAdapterFieldException class are listed here.

Public Properties

	Name	Description
	FieldName (see page 5169)	FieldName contains the name of the field associated with the error.

57.1.2.3.1 EAdapterFieldException.FieldName Property

FieldName contains the name of the field associated with the error.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;
```

Description

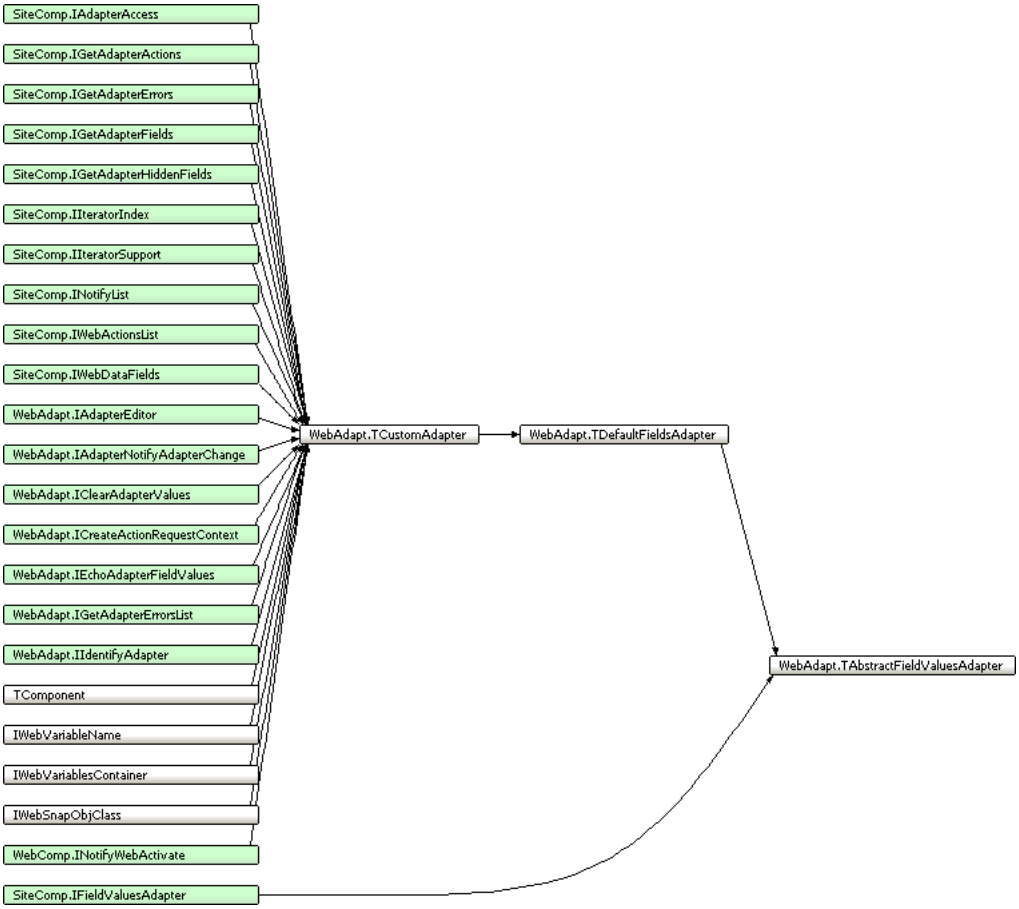
```
__property AnsiString FieldName = {read=FFieldName, write=FFieldName};
property FieldName: string;
```

FieldName contains the name of the field associated with the error.

57.1.3 TAbstractFieldValuesAdapter Class

tabstractfieldvaluesadapter is the base class for adapters that have a single default field.

Class Hierarchy



Pascal

```
TAbstractFieldValuesAdapter = class(TDefaultFieldsAdapter, IFieldValuesAdapter);
```

C++

```
class TAbstractFieldValuesAdapter : public TDefaultFieldsAdapter, public IFieldValuesAdapter;
```

File

WebAdapt

Description

Derive from tabstractfieldvaluesadapter to define adapter components that automatically include a single adapter field called ‘ValueField'.

Do not use TAbstractFieldValuesAdpter directly. It includes many abstract or, in C++ parlance, pure virtual methods, which must be implemented by a descendant class such as TFieldValuesAdapter (see page 5789).

See Also

TFieldValuesAdapter (see page 5789)

57.1.3.1 TAbstractFieldValuesAdapter Members

The following tables list the members exposed by TAbstractFieldValuesAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5526)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddDefaultActions (see page 5729)	Adds default action components to this adapter.
	AddDefaultFields (see page 5730)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5526)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5526)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5527)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5527)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5527)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 5528)	Clears adapter state information.
	ClearErrors (see page 5528)	Clears the content of the adapter's Errors (see page 5559) property.
	CreateActionRequestContext (see page 5528)	Creates an object that describes the adapter action parameters and adapter field values.
	CreateErrorsList (see page 5529)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5730)	Notifies other components of changes to the list of default actions or fields.
	EncodeActionParams (see page 5529)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5529)	Implements IIteratorSupport (see page 996)'s EndIterator method to support iterating over the data records of the adapter.
	ExtractRequestParams (see page 5530)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5530)	Returns an action component with a matching action name.
	FindField (see page 5530)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5531)	Finds an action with a matching variable name.
	FindNamedField (see page 5531)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 5531)	Finds a field or action with a matching variable name.
	FindVariable (see page 5532)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5532)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 5533)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 5730)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5533)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5533)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5534)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 5534)	<insert text here>
	GetAdapterFields (see page 5534)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5534)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5535)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildren (see page 5535)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5535)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 5731)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5536)	Returns the value of the echo flag.
	GetField (see page 5175)	Returns the object that represents the single field of this adapter.
	GetFieldsList (see page 5536)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5536)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5537)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method to support iterating over the data records of the adapter.

A	GetValueFieldClass (see page 5175)	Returns the class of the single adapter field this adapter includes.
	GetValueIndex (see page 5176)	Returns an index that identifies the current adapter field value.
	GetVariable (see page 5537)	Returns an action or field.
	GetVariableCount (see page 5538)	Returns the total count of actions and fields.
	GetVariableName (see page 5538)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5538)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 5538)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 5539)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5539)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 5539)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 5539)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5540)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5176)	Provides the underlying implementation for the CanAddFieldClass (see page 5527) method.
V	ImplClearAdapterValues (see page 5540)	Clears adapter state information.
V	ImplEndIterator (see page 5177)	Provides the underlying implementation for the EndIterator (see page 5529) method.
V	ImplFindVariable (see page 5541)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5541)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5542)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 5542)	Returns the value of the echo flag.
A	ImplGetField (see page 5177)	Provides the underlying implementation for the GetField (see page 5175) method.
V	ImplGetFieldsList (see page 5177)	Provides the underlying implementation for the GetFieldsList (see page 5536) method.
V	ImplGetIteratorIndex (see page 5543)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5537) method to support iterating over the data records of the adapter.
A	ImplGetValueIndex (see page 5178)	Provides the underlying implementation for the GetValueIndex (see page 5176) method.
V	ImplGetVariable (see page 5543)	Returns an action or field.
V	ImplGetVariableCount (see page 5544)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 5544)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 5544)	Returns a list of this adapter's action components.
V	ImplGetVisibleActions (see page 5731)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 5544)	Returns a list of this adapter's field components.
V	ImplGetVisibleFields (see page 5731)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 5545)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasModifyAccess (see page 5545)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasViewAccess (see page 5546)	This is ImplHasViewAccess, a member of class TCustomAdapter.
V	ImplInIterator (see page 5546)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5549) to support iterating over the data records of the adapter.
V	ImplNextIteration (see page 5178)	Provides the underlying implementation for the NextIteration (see page 5551) method.
V	ImplNotifyActivate (see page 5547)	Called when the web module is activated.
V	ImplNotifyDeactivate (see page 5547)	Called when the web module is deactivated.
V	ImplSetActions (see page 5547)	Initializes the Actions (see page 5558) property.
V	ImplSetActions (see page 5732)	Initializes the Actions (see page 5732) property.
V	ImplSetData (see page 5548)	Initializes the Data (see page 5558) property.
V	ImplSetData (see page 5732)	Initializes the Data (see page 5733) property.
V	ImplSetEchoActionFieldValues (see page 5548)	Sets the echo flag for this adapter's fields.
V	ImplStartIterator (see page 5179)	Provides the underlying implementation for the StartIterator (see page 5553) method.
	InIterator (see page 5549)	Implements IIteratorIndex (see page 994)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5549)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5549)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5550)	This is ListHiddenFields, a member of class TCustomAdapter.

	ListHiddenRecordFields (see page 5550)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5551)	Implements IIteratorSupport (see page 996)'s NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 5551)	Clears references to deleted components.
	NotifyActivate (see page 5551)	Called when the web module is activated.
	NotifyAdapterChange (see page 5551)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5552)	Called when the web module is deactivated.
	SetActions (see page 5552)	Initializes the Actions (see page 5558) property.
V	SetData (see page 5553)	Initializes the Data (see page 5558) property.
	SetEchoActionFieldValues (see page 5553)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5553)	Implements IIteratorSupport (see page 996)'s StartIterator method to support iterating over the records of the adapter.
V	UpdateFieldsExecuteValues (see page 5554)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 5554)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 5555)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 5555)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 5556)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 5557)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 5557)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5557)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
R	NotifyList (see page 5560)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5561)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 5561)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5561)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5562)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5562)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5563)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5563)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5563)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5564)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5564)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5564)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5565)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1000)	Registers an interest in change notifications.
	CanAddActionClass (see page 5861)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5861)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5865)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5523)	Constructor for TCustomAdapter (see page 5519).
	CreateActionRequestContext (see page 5866)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5523)	Destructor for TCustomAdapter (see page 5519).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	FindAction (see page 1018)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1023)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1018)	This is GetActionsList, a member of class IWebActionsList.

	GetAdapterActions (see page 960)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 962)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5872)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 963)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 964)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 964)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5869)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1024)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
	GetVisibleActions (see page 1019)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1024)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 924)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 924)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 924)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1019)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1024)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 997)	Advances to the objects next item.
	NotifyActivate (see page 6061)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5862)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6061)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1000)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5869)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
V	UpdateRecords (see page 5556)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5558)	Actions is the container for adapter actions components.
R	Actions (see page 5732)	Container for adapter actions components.
R	Data (see page 5558)	Data is the container for adapter field components.
R	Data (see page 5733)	Container for adapter field components.
	EchoActionFieldValues (see page 5869)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5559)	Modifies the adapter's echo flag.
R	Errors (see page 5559)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5560)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 995)	Indicates the index of the current item.
	ModifyAccess (see page 5560)	This is ModifyAccess, a member of class TCustomAdapter.
	ViewAccess (see page 5560)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1019)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1025)	This is VisibleFields, a member of class IWebDataFields.

57.1.3.2 TAbstractFieldValuesAdapter Methods

The methods of the TAbstractFieldValuesAdapter class are listed here.

Protected Methods

	Name	Description
	GetField (see page 5175)	Returns the object that represents the single field of this adapter.
A	GetValueFieldClass (see page 5175)	Returns the class of the single adapter field this adapter includes.
	GetValueIndex (see page 5176)	Returns an index that identifies the current adapter field value.
V	ImplCanAddFieldClass (see page 5176)	Provides the underlying implementation for the CanAddFieldClass (see page 5527) method.

	ImplEndIterator (see page 5177)	Provides the underlying implementation for the EndIterator (see page 5529) method.
	ImplGetField (see page 5177)	Provides the underlying implementation for the GetField (see page 5175) method.
	ImplGetFieldsList (see page 5177)	Provides the underlying implementation for the GetFieldsList (see page 5536) method.
	ImplGetValueIndex (see page 5178)	Provides the underlying implementation for the GetValueIndex (see page 5176) method.
	ImplNextIteration (see page 5178)	Provides the underlying implementation for the NextIteration (see page 5551) method.
	ImplStartIterator (see page 5179)	Provides the underlying implementation for the StartIterator (see page 5553) method.

57.1.3.2.1 TAbstractFieldValuesAdapter.GetField Method

Returns the object that represents the single field of this adapter.

Pascal

```
function GetField: TObject;
```

C++

```
__fastcall TObject * GetField();
```

Description

Call GetField to access the single field for this adapter. GetField returns an adapter field that is an instance of the class that the GetValueFieldClass (see page 5175) method returns.

GetField calls the abstract or, in C++ terminology, pure virtual ImplGetField (see page 5177) method to obtain the adapter field instance it returns. Descendant classes override ImplGetField (see page 5177) to provide the underlying implementation for GetField.

See Also

ImplGetField (see page 5177)

GetValueFieldClass (see page 5175)

57.1.3.2.2 TAbstractFieldValuesAdapter.GetValueFieldClass Method

Returns the class of the single adapter field this adapter includes.

Pascal

```
function GetValueFieldClass: TComponentClass; virtual; abstract;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass() = 0;
```

Description

GetValueFieldClass returns the class reference for the type of the single adapter field that the GetField (see page 5175) method returns. The return value must be a descendant of TComponent and is typically a descendant of TAdapterNamedField (see page 5339).

In TAbstractFieldValuesAdapter (see page 5169), GetValueFieldClass is abstract or, in C++ terminology, pure virtual. Descendant classes must override this method to indicate the type of field this adapter includes.

See Also

GetField (see page 5175)

TAdapterNamedField (see page 5339)

57.1.3.2.3 TAbstractFieldValuesAdapter.GetValueIndex Method

Returns an index that identifies the current adapter field value.

Pascal

```
function GetValueIndex: Integer;
```

C++

```
__fastcall int GetValueIndex();
```

Description

Although this adapter only includes a single adapter field, that field may have several values (for example, if it represents a column in a table). When the field has several values, GetValueIndex is the index of the current value. This index may be the same as the value that the GetIteratorIndex (see page 5537) method returns if the application is using the adapter's iteration support. However, TAbstractFieldValuesAdapter (see page 5169) introduces GetValueIndex as a separate method for descendants that support multiple values that change using some other mechanism.

GetValueIndex calls the abstract or, in C++ terminology, pure virtual ImplGetValueIndex (see page 5178) method to obtain the index of the current value. Descendant classes override ImplGetValueIndex (see page 5178) to provide the underlying implementation for GetValueIndex.

See Also

ImplGetValueIndex (see page 5178)

GetIteratorIndex (see page 5537)

57.1.3.2.4 TAbstractFieldValuesAdapter.ImplCanAddFieldClass Method

Provides the underlying implementation for the CanAddFieldClass (see page 5527) method.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddFieldClass (see page 5527) method calls ImplCanAddFieldClass to determine whether this adapter can include a field that is an instance of a specified class. This allows the adapter editor to indicate the available fields at design time.

AParent is an instance of this adapter class to which the field is to be added.

AClass is the class of the object that represents the adapter field.

ImplCanAddFieldClass returns true if AClass is the same as (or a descendant of) the class that the GetValueFieldClass (see page 5175) method returns, indicating that this is the only child field this adapter supports. It returns false for any other class.

See Also

CanAddFieldClass (see page 5527)

GetValueFieldClass (see page 5175)

57.1.3.2.5 TAbstractFieldValuesAdapter.ImplEndIterator Method

Provides the underlying implementation for the EndIterator (see page 5529) method.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

The EndIterator (see page 5529) method calls ImplEndIterator to stop the process of iterating through the adapter's field's possible values.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. Each adapter can interpret this value in its own way.

ImplEndIterator raises an exception, because this method should never be called at the TAbstractFieldValuesAdapter (see page 5169) level: The TAbstractFieldValuesAdapter (see page 5169) ImplStartIterator (see page 5179) method returns false, indicating that this adapter does not support iteration.

Descendant classes that implement support for iterating over field values override this method to end that iteration process.

See Also

EndIterator (see page 5529)

ImplStartIterator (see page 5179)

ImplNextIteration (see page 5178)

57.1.3.2.6 TAbstractFieldValuesAdapter.ImplGetField Method

Provides the underlying implementation for the GetField (see page 5175) method.

Pascal

```
function ImplGetField: TObject; virtual; abstract;
```

C++

```
virtual __fastcall TObject * ImplGetField() = 0;
```

Description

The GetField (see page 5175) method calls ImplGetField to obtain the object that represents this adapter's single field. Unlike the GetField (see page 5175) method, ImplGetField is virtual, so that descendant classes can override it to provide a class-specific mechanism for obtaining the adapter field object.

In TAbstractFieldValuesAdapter (see page 5169), ImplGetField is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the GetField (see page 5175) method.

See Also

GetField (see page 5175)

57.1.3.2.7 TAbstractFieldValuesAdapter.ImplGetFieldsList Method

Provides the underlying implementation for the GetFieldsList (see page 5536) method.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

The GetFieldsList (see page 5536) method calls ImplGetFieldsList to fill a string list with a list of all fields that the adapter includes. Each entry in the list is the name of one of the adapter's field, and has an associated object that is the class of the object that represents that adapter field. GetFieldsList (see page 5536) is part of the design-time support for editing adapters.

AList is an existing string list to fill with entries for all of the fields this adapter can include.

In TAbstractFieldValuesAdapter (see page 5169), ImplGetFieldsList clears AList and inserts a single entry for a field named 'ValueField'. It associates the class that the GetValueFieldClass (see page 5175) method returns with this field name.

See Also

GetValueFieldClass (see page 5175)

GetFieldsList (see page 5536)

57.1.3.2.8 TAbstractFieldValuesAdapter.ImplGetValueIndex Method

Provides the underlying implementation for the GetValueIndex (see page 5176) method.

Pascal

```
function ImplGetValueIndex: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int ImplGetValueIndex() = 0;
```

Description

The GetValueIndex (see page 5176) method calls ImplGetValueIndex to obtain the index of current value of this adapter's single field. Unlike the GetValueIndex (see page 5176) method, ImplGetValueIndex is virtual, so that descendant classes can override it to provide a class-specific mechanism for obtaining this index.

In TAbstractFieldValuesAdapter (see page 5169), ImplGetValueIndex is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the GetValueIndex (see page 5176) method.

See Also

GetValueIndex (see page 5176)

57.1.3.2.9 TAbstractFieldValuesAdapter.ImplNextIteration Method

Provides the underlying implementation for the NextIteration (see page 5551) method.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

The NextIteration (see page 5551) method calls ImplNextIteration when iterating over field values to determine whether there

is another field value after the current one and if so, to change the current value to the next one.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. On entry, this value is typically the same as the value returned by the last call to NextIteration (see page 5551) or to StartIterator (see page 5553).

In TAbstractFieldValuesAdapter (see page 5169), ImplNextIteration always returns false, because TAbstractFieldValuesAdapter (see page 5169) does not implement support for iteration. Descendant classes that support iterating over field values override this method to check whether their is a next value and if so, move to it.

See Also

NextIteration (see page 5551)

ImplStartIterator (see page 5179)

ImplEndIterator (see page 5177)

57.1.3.2.10 TAbstractFieldValuesAdapter.ImplStartIterator Method

Provides the underlying implementation for the StartIterator (see page 5553) method.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

The StartIterator (see page 5553) method calls ImplStartIterator to start the process of iterating through the adapter's field's possible values. The return value indicates whether the adapter's field has any values over which to iterate.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. Each adapter can interpret this value in its own way. Depending on the adapter, it may be supplied by the caller, or created by the ImplStartIterator method.

In TAbstractFieldValuesAdapter (see page 5169), ImplNextIteration (see page 5178) always returns false, because TAbstractFieldValuesAdapter (see page 5169) does not implement support for obtaining any field values. Descendant classes that override this method to check whether they can move to the first value in the field's set of values. If so, they move to the first value and return true. Otherwise they return false.

StartIterator (see page 5553)

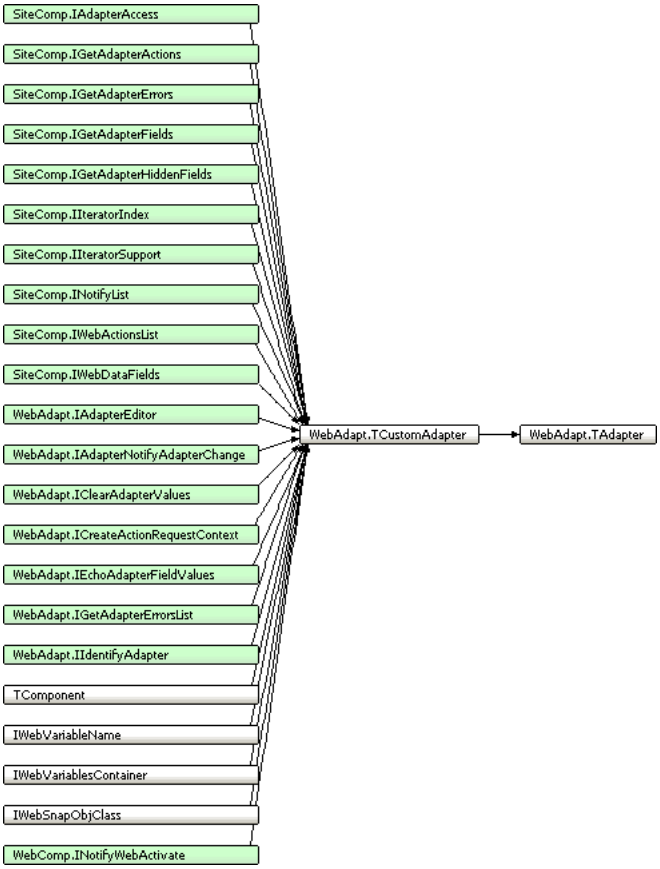
ImplEndIterator (see page 5177)

ImplNextIteration (see page 5178)

57.1.4 TAdapter Class

TAdapter defines a scriptable interface to event handlers that return data items or execute commands in your application.

Class Hierarchy



Pascal

```
TAdapter = class(TCustomAdapter);
```

C++

```
class TAdapter : public TCustomAdapter;
```

File

WebAdapt

Description

Use TAdapter to define a custom interface to application logic. Adapters contain field components and action components that represent data items and commands, respectively. Server-side script statements access the value of Adapter fields and the parameters of Adapter actions in order to build HTML forms and tables. Server-side script can be written by hand or automatically generated by the TAdapterPageProducer component. When an HTML form containing Adapter commands is submitted, the TAdapterDispatcher may automatically call an Adapter action component to execute the command. When an HTTP request for an adapter image field is received the TAdapterDispatcher may automatically call an Adapter field to retrieve the image.

For each field component added to TAdapter, you must implement an event handler to retrieve the data. For each action component added to TAdapter, you must implement an event handler to execute the command. Other adapter components, such as TDataSetAdapter and TLoginFormAdapter (see page 5810), have built in fields and actions that do not require events.

57.1.4.1 TAdapter Members

The following tables list the members exposed by TAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5526)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddOrigValueHiddenFields (see page 5526)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5526)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5527)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5527)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5527)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 5528)	Clears adapter state information.
	ClearErrors (see page 5528)	Clears the content of the adapter's Errors (see page 5559) property.
	CreateActionRequestContext (see page 5528)	Creates an object that describes the adapter action parameters and adapter field values.
	CreateErrorsList (see page 5529)	Creates the object used to manage errors associated with this adapter.
	EncodeActionParams (see page 5529)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5529)	Implements IIteratorSupport (see page 996)'s EndIterator method to support iterating over the data records of the adapter.
	ExtractRequestParams (see page 5530)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5530)	Returns an action component with a matching action name.
	FindField (see page 5530)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5531)	Finds an action with a matching variable name.
	FindNamedField (see page 5531)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 5531)	Finds a field or action with a matching variable name.
	FindVariable (see page 5532)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5532)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 5533)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5533)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5533)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5534)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 5534)	<insert text here>
	GetAdapterFields (see page 5534)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5534)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5535)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildren (see page 5535)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5535)	Specifies the class to create as a container for adapter fields components.
	GetEchoActionFieldValues (see page 5536)	Returns the value of the echo flag.
	GetFieldsList (see page 5536)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5536)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5537)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 5537)	Returns an action or field.
	GetVariableCount (see page 5538)	Returns the total count of actions and fields.
	GetVariableName (see page 5538)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5538)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 5538)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 5539)	Returns the class type for this adapter field.

	HasExecuteAccess (see page 5539)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 5539)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 5539)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5540)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5540)	Clears adapter state information.
V	ImplEndIterator (see page 5541)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5529) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5541)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5541)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5542)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 5542)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 5542)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5543)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5537) method to support iterating over the data records of the adapter.
V	ImplGetVariable (see page 5543)	Returns an action or field.
V	ImplGetVariableCount (see page 5544)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 5544)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 5544)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 5544)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 5545)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasModifyAccess (see page 5545)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasViewAccess (see page 5546)	This is ImplHasViewAccess, a member of class TCustomAdapter.
V	ImplInIterator (see page 5546)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5549) to support iterating over the data records of the adapter.
V	ImplNextIteration (see page 5546)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5551) method to support iterating over the records of the adapter.
V	ImplNotifyActivate (see page 5547)	Called when the web module is activated.
V	ImplNotifyDeactivate (see page 5547)	Called when the web module is deactivated.
V	ImplSetActions (see page 5547)	Initializes the Actions (see page 5558) property.
V	ImplSetData (see page 5548)	Initializes the Data (see page 5558) property.
V	ImplSetEchoActionFieldValues (see page 5548)	Sets the echo flag for this adapter's fields.
V	ImplStartIterator (see page 5548)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5553) method to support iterating over the records of the adapter.
	InIterator (see page 5549)	Implements IIteratorIndex (see page 994)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5549)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5549)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5550)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 5550)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5551)	Implements IIteratorSupport (see page 996)'s NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 5551)	Clears references to deleted components.
	NotifyActivate (see page 5551)	Called when the web module is activated.
	NotifyAdapterChange (see page 5551)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5552)	Called when the web module is deactivated.
	SetActions (see page 5552)	Initializes the Actions (see page 5558) property.
V	SetData (see page 5553)	Initializes the Data (see page 5558) property.
	SetEchoActionFieldValues (see page 5553)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5553)	Implements IIteratorSupport (see page 996)'s StartIterator method to support iterating over the records of the adapter.
V	UpdateFieldsExecuteValues (see page 5554)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 5554)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 5555)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 5555)	Validate the adapter's field values passed in the HTTP request.

	UpdateRecordsGetAnyChanges (see page 5556)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5557)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5557)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5557)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5560)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5561)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 5561)	This is VisibleFields, a member of class TCustomAdapter.

Public Methods

	Name	Description
	AddNotify (see page 1000)	Registers an interest in change notifications.
	CanAddActionClass (see page 5861)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5861)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5865)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5523)	Constructor for TCustomAdapter (see page 5519).
	CreateActionRequestContext (see page 5866)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	Destroy (see page 5523)	Destructor for TCustomAdapter (see page 5519).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	FindAction (see page 1018)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1023)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1018)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 960)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 962)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5872)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 963)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 964)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 964)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5869)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1024)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
	GetVisibleActions (see page 1019)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1024)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 924)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 924)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 924)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1019)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1024)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 997)	Advances to the objects next item.
	NotifyActivate (see page 6061)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5862)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6061)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1000)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5869)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
	UpdateRecords (see page 5556)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
	EchoActionFieldValues (see page 5869)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5559)	Modifies the adapter's echo flag.
R	Errors (see page 5559)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5560)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 995)	Indicates the index of the current item.
R	VisibleActions (see page 1019)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1025)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5186)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5186)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5187)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5187)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5187)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5188)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5188)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5189)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5189)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5189)	Occurs when the adapter needs to iterate over its data records.

Published Properties

	Name	Description
	Actions (see page 5184)	Actions is the container for adapter actions components.
	Data (see page 5185)	Data is the container for adapter field components.
	ModifyAccess (see page 5185)	This is ModifyAccess, a member of class TAdapter.
	ViewAccess (see page 5185)	Identifies the rights required to view this adapter's fields.

57.1.4.2 TAdapter Properties

The properties of the TAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 5184)	Actions is the container for adapter actions components.
	Data (see page 5185)	Data is the container for adapter field components.
	ModifyAccess (see page 5185)	This is ModifyAccess, a member of class TAdapter.
	ViewAccess (see page 5185)	Identifies the rights required to view this adapter's fields.

57.1.4.2.1 TAdapter.Actions Property

Actions is the container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion,

deletion, and lookup of adapter actions by name.

See Also

TAdapterActions (see page 5198)

57.1.4.2.2 TAdapter.Data Property

Data is the container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterFields (see page 5265)

57.1.4.2.3 TAdapter.ModifyAccess Property

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

This is ModifyAccess, a member of class TAdapter.

57.1.4.2.4 TAdapter.ViewAccess Property

Identifies the rights required to view this adapter's fields.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view fields of this adapter. When server-side script accesses the CanView property, the ViewAccess property value is checked against the end user's rights.

See Also

TWebUserList (see page 6759)

HasViewAccess (see page 5539)

implhasviewaccess (see page 5546)

57.1.4.3 TAdapter Events

The events of the TAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5186)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5186)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5187)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5187)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5187)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5188)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5188)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5189)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5189)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5189)	Occurs when the adapter needs to iterate over its data records.

57.1.4.3.1 TAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 5465)

OnBeforeExecuteAction (see page 5563)

57.1.4.3.2 TAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.4.3.3 TAdapter.OnAfterUpdateFields Event

Occurs after values in the HTTP request are used to update adapter fields.

Pascal

```
property OnAfterUpdateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterUpdateFields;
```

Description

Implement this event handler to perform custom updates. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record update errors.

See Also

UpdateFieldsUpdateValues (see page 5555)

OnBeforeUpdateFields (see page 5564)

Errors (see page 5559)

57.1.4.3.4 TAdapter.OnAfterValidateFields Event

Occurs after values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnAfterValidateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record validation errors.

See Also

UpdateFieldsValidateValues (see page 5555)

OnBeforeValidateFields (see page 5564)

Errors (see page 5559)

57.1.4.3.5 TAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 5465)

OnAfterExecuteAction (see page 5561)

57.1.4.3.6 TAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 5466)

OnAfterGetActionResponse (see page 5562)

57.1.4.3.7 TAdapter.OnBeforeUpdateFields Event

Occurs before values in the HTTP request are used to update adapter fields.

Pascal

```
property OnBeforeUpdateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeUpdateFields;
```

Description

Implement this event handler to perform custom updates of adapter fields. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further updates. Add update errors to the adapter's errors object.

See Also

UpdateFieldsUpdateValues (see page 5555)

OnAfterUpdateFields (see page 5562)

Errors (see page 5559)

57.1.4.3.8 TAdapter.OnBeforeValidateFields Event

Occurs before values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnBeforeValidateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further validation. Add validation errors to the adapter's errors object.

See Also

UpdateFieldsValidateValues (see page 5555)

OnAfterValidateFields (see page 5563)

Errors (see page 5559)

57.1.4.3.9 TAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 5466)

57.1.4.3.10 TAdapter.OnIterateRecords Event

Occurs when the adapter needs to iterate over its data records.

Pascal

```
property OnIterateRecords: TIterateRecordsEvent;
```

C++

```
__property TIterateRecordsEvent OnIterateRecords;
```

Description

Implement this event when the adapter supports multiple data records. This event handler is called when server-side script iterates over the records in adapter, such as when generating an HTML table displaying all records. The event handler must update an iteration pointer or cursor that adapter fields are also aware of. Adapter fields must use this iteration pointer when called to retrieve their value.

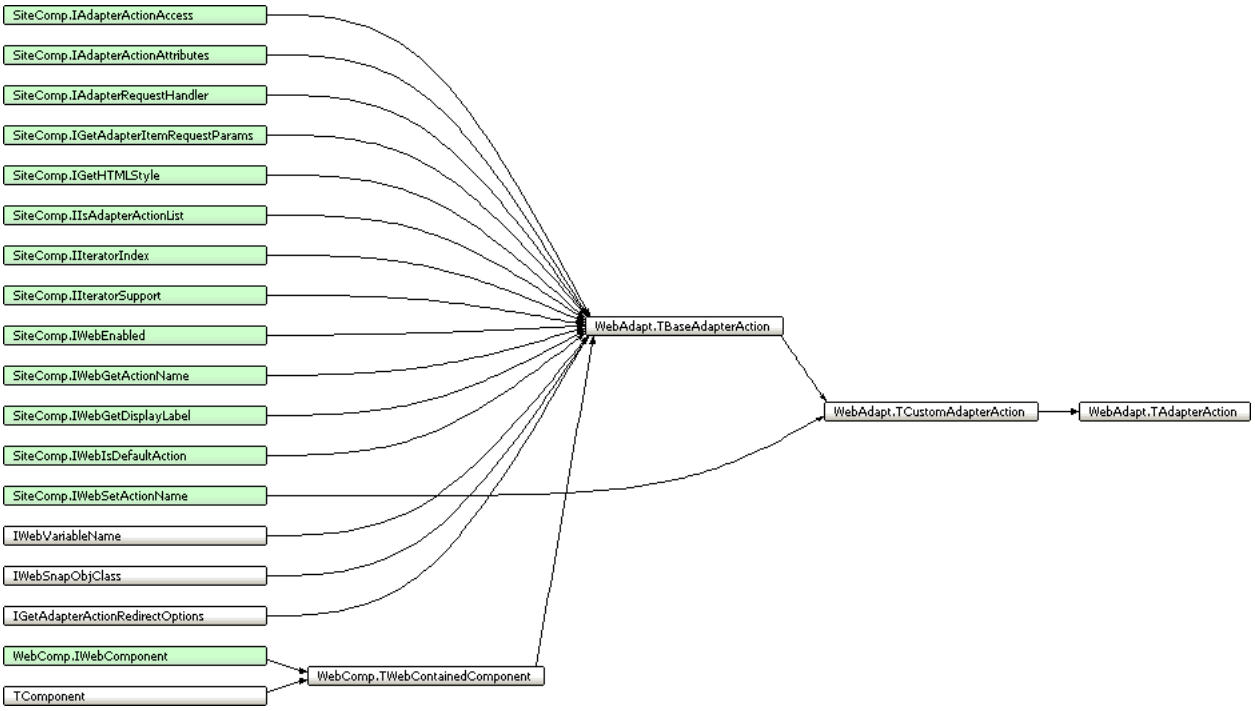
IIteratorSupport (see page 996)

57.1.5 TAdapterAction Class

TAdapterAction is a generic adapter action that relies on event handlers.

Class Hierarchy



Pascal

```
TAdapterAction = class(TCustomAdapterAction);
```

C++

```
class TAdapterAction : public TCustomAdapterAction;
```

File

WebAdapt

Description

TAdapterAction publishes the properties in TCustomAdapterAction (see page 5565). TCustomAdapterAction (see page 5565) calls event handlers to retrieve the adapter action's parameters, get the state of the action, and execute the adapter action. Add TAdapterAction to TAdapter (see page 5179) or other adapter components types when you need an adapter action that will be controlled by event handlers. Other adapter action components declare events but also have built-in logic to work with a particular type of adapter. For example, TAdapterNextPageAction (see page 5358) has built-in logic to take the end user to the next page provided by TPagedAdapter (see page 5830). TAdapterAction, on the other hand, does not have this sort of built-in logic.

TAdapterActions (see page 5198)

TAdapter (see page 5179)

TAdapterDispatcher (see page 6122)

57.1.5.1 TAdapterAction Members

The following tables list the members exposed by TAdapterAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5440)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5440)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5441)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5441)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5442)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5442)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5443)	Implements IIteratorSupport (see page 996)'s EndIterator method.
	ExecuteActionRequest (see page 5443)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5444)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5444)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5444)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5445)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5445)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5445)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5445)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5446)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5446)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 5446)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5447)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5447)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5448)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5448)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5448)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5449)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5449)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5450)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5450)	Suggests a view mode for this adapter action.
	GetVisible (see page 5450)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5451)	Returns the class type for this adapter field.
	HandleRequest (see page 5451)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5451)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5452)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5452)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5443) method.
V	ImplExecuteActionRequest (see page 5452)	Executes the adapter action using parameters passed in the HTTP request.

	ImplExecuteActionRequest (see page 5570)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 5453)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 5570)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 5453)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 5570)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5453)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 5454)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 5454)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5454)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5455)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5448) method.
	ImplGetSuccessOptions (see page 5455)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 5571)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5456)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5456)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5456)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5457)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5459) method.
	ImplIsDefaultAction (see page 5457)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5458)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5460) method.
	ImplSetActionName (see page 5571)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5458)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5461) method.
	ImplWebEnabled (see page 5458)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 5571)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5459)	Implements IIteratorIndex (see page 994)'s InIterator method.
	IsDefaultAction (see page 5459)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5460)	Implements IIteratorSupport (see page 996)'s NextIteration method.
	ParentChanged (see page 5460)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5572)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5460)	Set the value of the DisplayLabel (see page 5462) property.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	StartIterator (see page 5461)	Implements IIteratorSupport (see page 996)'s StartIterator method.
	WebEnabled (see page 5461)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5462)	Provides access to the parent adapter component.
	Errors (see page 5463)	This is Errors, a member of class TBaseAdapterAction.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.

R	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
V	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	CreateRequestContext (see page 955)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetActionName (see page 1029)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 966)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 991)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 926)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 955)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 925)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1042)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 997)	Advances to the objects next item.
	SetActionName (see page 1056)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
	WebEnabled (see page 1026)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 991)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5463)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5464)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 995)	Indicates the index of the current item.
R	Visible (see page 926)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 5196)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5196)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5197)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5197)	Called before the adapter action response is generated.

	OnExecute (see page 5197)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5198)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 5198)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	ActionName (see page 5194)	Identifies the name of this action when using server-side script.
	DisplayLabel (see page 5194)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5195)	Defines the rights required to execute this action.
	RedirectOptions (see page 5195)	Indicates whether to perform an HTTP redirect after successfully executing this action.

57.1.5.2 TAdapterAction Properties

The properties of the TAdapterAction class are listed here.

Published Properties

	Name	Description
	ActionName (see page 5194)	Identifies the name of this action when using server-side script.
	DisplayLabel (see page 5194)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5195)	Defines the rights required to execute this action.
	RedirectOptions (see page 5195)	Indicates whether to perform an HTTP redirect after successfully executing this action.

57.1.5.2.1 TAdapterAction.ActionName Property

Identifies the name of this action when using server-side script.

Pascal

```
property ActionName: string;
```

C++

```
__property UnicodeString ActionName;__property UnicodeString ActionName;__property
UnicodeString ActionName;
```

Description

The ActionName property defines the name used to access the adapter action with server-side script.

See Also

ImplGetActionName (see page 5570)

ImplSetActionName (see page 5571)

57.1.5.2.2 TAdapterAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 5453)

SetDisplayLabel (see page 5460)

57.1.5.2.3 TAdapterAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property UnicodeString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 6759)

hasexecuteaccess (see page 5539)

57.1.5.2.4 TAdapterAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect

57.1.5.3 TAdapterAction Events

The events of the TAdapterAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 5196)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5196)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5197)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5197)	Called before the adapter action response is generated.
	OnExecute (see page 5197)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5198)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 5198)	Specifies name/value pairs needed to execute this adapter action.

57.1.5.3.1 TAdapterAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 5441)

OnAfterExecuteAction (see page 5561)

OnBeforeExecute (see page 5465)

57.1.5.3.2 TAdapterAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.5.3.3 TAdapterAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 5442)

OnAfterExecute (see page 5465)

OnBeforeExecuteAction (see page 5563)

57.1.5.3.4 TAdapterAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.5.3.5 TAdapterAction.OnExecute Event

Called to execute this action using parameters passed in the HTTP request.

Pascal

```
property OnExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnExecute;
```

Description

Implement this event handler to execute this adapter action. Params contains the name/value pairs that were passed in the HTTP request. OnExecute is called by ImplExecuteActionRequest.

See Also

ImplExecuteActionRequest (see page 5570)

OnGetParams (see page 5466)

57.1.5.3.6 TAdapterAction.OnGetEnabled Event

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
property OnGetEnabled: TActionGetEnabledEvent;
```

C++

```
__property TActionGetEnabledEvent OnGetEnabled;
```

Description

ImplWebEnabled calls the OnGetEnabled event handler. Set the Enabled parameter to false to indicate that this adapter action should not be enabled.

See Also

ImplWebEnabled (see page 5571)

57.1.5.3.7 TAdapterAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

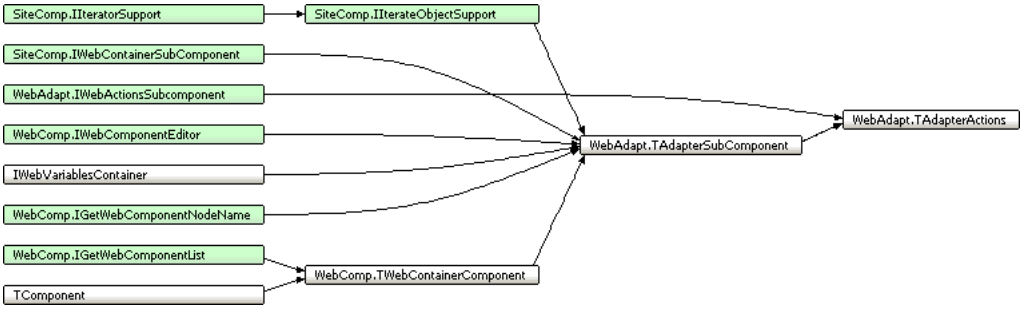
See Also

ImplGetAdapterItemRequestParams (see page 5453)

57.1.6 TAdapterActions Class

TAdapterActions manages the list of actions that belong to an adapter.

Class Hierarchy



Pascal

```
TAdapterActions = class(TAdapterSubComponent, IWebActionsSubcomponent);
```

C++

```
class TAdapterActions : public TAdapterSubComponent, public IWebActionsSubcomponent;
```

File

WebAdapt

Description

TAdapterActions is the type of the Actions property on an adapter component. It manages a list that contains all the actions that belong to the adapter. The action objects (TBaseAdapterAction (see page 5435) descendants) are available using the WebActions (see page 5203) property. TAdapterActions also includes support for associating the actions with variable names so that server-side script can execute the actions.

TAdapterActions represents the list of explicitly assigned actions. Adapters that include a set of default actions use a TAdapterDefaultActions (see page 5220) object instead.

See Also

TCustomAdapter (see page 5519)

TAdapterFields (see page 5265)

TAdapterDefaultActions (see page 5220)

TAdapterDefaultFields (see page 5226)

TBaseAdapterAction (see page 5435)

57.1.6.1 TAdapterActions Members

The following tables list the members exposed by TAdapterActions.

Protected Methods

	Name	Description
	AdapterCanAddClass (see page 5201)	Indicates whether the associated adapter supports a specified class of action component.
	CanAddClass (see page 5396)	Indicates whether an object of a specified type can be added to this collection.
	EndIterator (see page 5397)	Stops the TAdapterSubComponent (see page 5394) object from iterating over the Web items it lists.
	FindNamedVariable (see page 5397)	Returns the item from this list with a specified variable name.
	FindVariable (see page 5398)	Returns the item from this list with a specified variable name.

	FindVariableContainer (see page 5398)	Returns the Web module that contains a specified item from this list.
V	GetChildren (see page 6038)	Executes a callback for each child Web item.
	GetCurrentObject (see page 5399)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 5399)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
V	GetDefaultWebComponents (see page 6039)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetVariable (see page 5400)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 5401)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 5401)	Returns the value of the VariablesInUse (see page 5407) property.
	GetWebComponentNodeName (see page 5401)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 6039)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 5201)	Provides the underlying implementation for the CanAddClass (see page 5396) method.
V	ImplGetDefaultComponentList (see page 6039)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetWebComponentNodeName (see page 5202)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
	NextIteration (see page 5403)	Changes the current object to the next item that has a variable name.
	NotifyAdapterChange (see page 5404)	Notifies the associated adapter when the list of items changes.
V	SetChildOrder (see page 6040)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 5404)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	SetDefaultWebComponents (see page 6040)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	SetWebParent (see page 5202)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 5406)	Makes the first child item with a variable name the current object.

Protected Properties

	Name	Description
R	Adapter (see page 5406)	Indicates the adapter that uses this object to manage its fields or actions.
R	VariablesInUse (see page 5407)	Lists those fields or actions in the collection for which variables are defined.
R	WebContainerComponentHelper (see page 6041)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	CanAddClass (see page 6074)	Indicates whether a specified class can be used as a child Web item.
V	Create (see page 6037)	Creates and initializes an instance of TWebContainerComponent (see page 6036).
V	Destroy (see page 6038)	Frees an instance of TWebContainerComponent (see page 6036).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetComponentList (see page 6055)	This is GetComponentList, a member of class IGetWebComponentList.
	GetCurrentObject (see page 993)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultComponentList (see page 6055)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
V	GetParentComponent (see page 5400)	Returns the associated adapter.
	GetWebComponentNodeName (see page 6056)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.
V	HasParent (see page 5402)	Indicates whether this component has an associated adapter.
	NextIteration (see page 997)	Advances to the objects next item.
V	ReadState (see page 5404)	Reads the component's published properties, stored data, and owned components from a reader object.
V	SetParentComponent (see page 5405)	Sets the Adapter (see page 5406) property to be the same as this component's parent.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
	WebActions (see page 5203)	Lists the action components that this object manages.

57.1.6.2 TAdapterActions Methods

The methods of the TAdapterActions class are listed here.

Protected Methods

	Name	Description
	AdapterCanAddClass (see page 5201)	Indicates whether the associated adapter supports a specified class of action component.
	ImplCanAddClass (see page 5201)	Provides the underlying implementation for the CanAddClass (see page 5396) method.
	ImplGetWebComponentNodeName (see page 5202)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
	SetWebParent (see page 5202)	Introduces a method to associate this component with an adapter.

57.1.6.2.1 TAdapterActions.AdapterCanAddClass Method

Indicates whether the associated adapter supports a specified class of action component.

Pascal

```
function AdapterCanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean AdapterCanAddClass(TComponent * AParent, TClass AClass);
```

Description

TAdapterActions (see page 5198) uses this method internally as part of its implementation for the CanAddClass (see page 5396) method. This allows the TAdapterActions (see page 5198) object to indicate, at design time, which types of action components are valid as components in the WebActions (see page 5203) property list.

AParent is the instance of TAdapterActions (see page 5198) to which the child actions are to be added.

AClass describes the class of the child component to be added to AParent.

AdapterCanAddClass returns true if the adapter recognizes and supports AClass as a child action, false otherwise.

AdapterCanAddClass calls the CanAddActionClass method of its associated adapter to determine whether it accepts the specified action class.

See Also

WebActions (see page 5203)

Adapter (see page 5406)

ImplCanAddClass (see page 5201)

CanAddActionClass (see page 5527)

57.1.6.2.2 TAdapterActions.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 5396) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 5396) method calls ImplCanAddClass to determine whether an object of a specified type can be added to this collection.

AParent is the TAdapterActions (see page 5198) object to which the Web item will be added.

AClass is the class of the proposed child item.

ImplCanAddClass returns true if the TAdapterActions (see page 5198) object can include a child of type AClass, false otherwise.

ImplCanAddClass returns true if one of the following two conditions is met:

AClass is an adapter action class that the associated adapter recognizes and accepts.

AClass is a custom adapter action (a descendant of TCustomAdapterAction (see page 5565) that is not a descendant of TImplementedAdapterAction (see page 5803)).

See Also

CanAddClass (see page 5396)

AdapterCanAddClass (see page 5201)

TCustomAdapterAction (see page 5565)

TImplementedAdapterAction (see page 5803)

57.1.6.2.3 TAdapterActions.ImplGetWebComponentNodeName Method

Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.

Pascal

```
function ImplGetWebComponentNodeName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetWebComponentNodeName();
```

Description

The GetWebComponentNodeName (see page 5401) method calls ImplGetWebComponentNodeName to obtain a label for the type of items in the collection.

ImplGetWebComponentNodeName returns the string 'Actions'.

See Also

GetWebComponentNodeName (see page 5401)

57.1.6.2.4 TAdapterActions.SetWebParent Method

Introduces a method to associate this component with an adapter.

Pascal

```
procedure SetWebParent(const Value: TComponent); override;
```

C++

```
virtual __fastcall SetWebParent(const TComponent * Value);
```

Description

TAdapterSubComponent introduces SetWebParent as a virtual method for setting the read-only Adapter property.

Value is the adapter component that acts as a parent to this collection.

In TAdapterSubComponent, SetWebParent does nothing. Descendant classes override this method to set the Adapter property and populate the list with actions or fields appropriate to that adapter.

See Also

Adapter (see page 5406)

57.1.6.3 TAdapterActions Properties

The properties of the TAdapterActions class are listed here.

Public Properties

	Name	Description
	WebActions (see page 5203)	Lists the action components that this object manages.

57.1.6.3.1 TAdapterActions.WebActions Property

Lists the action components that this object manages.

Pascal

```
property WebActions: TWebComponentList;
```

C++

```
__property TWebComponentList WebActions;
```

Description

Read (see page 3727) WebActions to access the list of action components. Each component in this list is a descendant of TBaseAdapterAction (see page 5435).

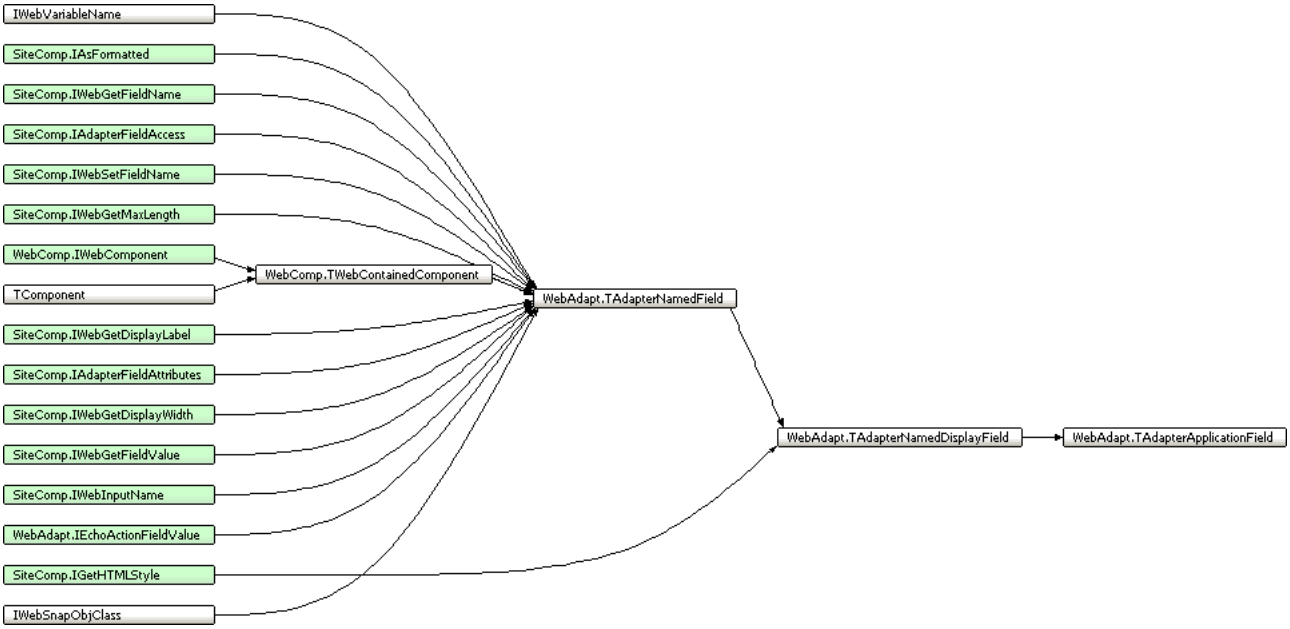
See Also

TBaseAdapterAction (see page 5435)

57.1.7 TAdapterApplicationField Class

TAdapterApplicationField is a base class for adapter field components that are children of a TApplicationAdapter (see page 5427) component.

Class Hierarchy



Pascal

```
TAdapterApplicationField = class(TAdapterNamedDisplayField);
```

C++

```
class TAdapterApplicationField : public TAdapterNamedDisplayField;
```

File

WebAdapt

Description

TAdapterApplicationField implements functionality useful to an adapter field that can be a child of TApplicationAdapter (see page 5427).

See Also

TApplicationAdapter (see page 5427)

TAdapterNamedDisplayField (see page 5331)

TAdapterApplicationTitleField (see page 5207)

57.1.7.1 TAdapterApplicationField Members

The following tables list the members exposed by TAdapterApplicationField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.

	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.

	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
R	Adapter (see page 5207)	Returns the parent adapter of this adapter field.
R	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
R	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
V	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
V	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
V	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.

	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.7.2 TAdapterApplicationField Properties

The properties of the TAdapterApplicationField class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 5207)	Returns the parent adapter of this adapter field.

57.1.7.2.1 TAdapterApplicationField.Adapter Property

Returns the parent adapter of this adapter field.

Pascal

```
property Adapter: TCustomApplicationAdapter;
```

C++

```
__property TCustomApplicationAdapter Adapter;
```

Description

Descendants use this property to access the parent adapter.

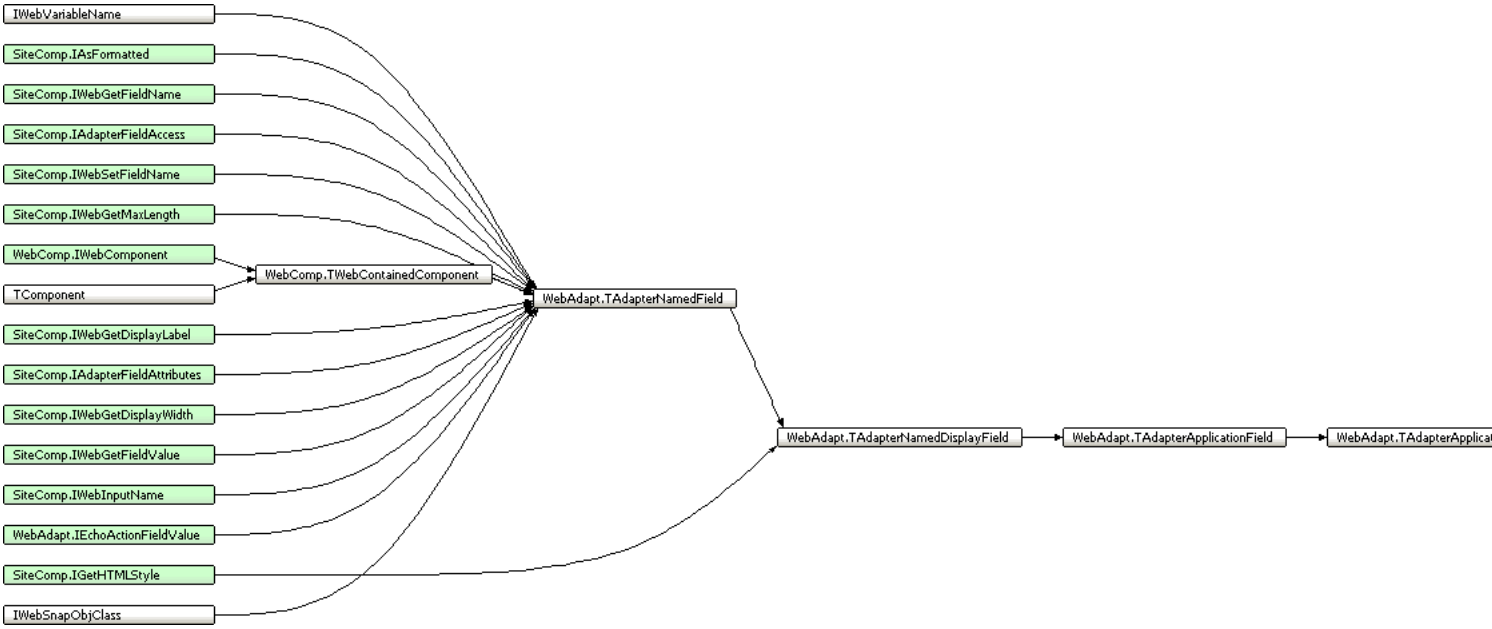
See Also

TCustomApplicationAdapter (see page 5649)

57.1.8 TAdapterApplicationTitleField Class

TAdapterApplicationTitleField is an adapter field used to access the application title.

Class Hierarchy



Pascal

```
TAdapterApplicationTitleField = class(TAdapterApplicationField);
```

C++

```
class TAdapterApplicationTitleField : public TAdapterApplicationField;
```

File

WebAdapt

Description

TAdapterApplicationTitleField is added to TApplicationAdapter (see page 5427).

See Also

TAdapterApplicationField (see page 5203)

TApplicationAdapter (see page 5427)

TCustomApplicationAdapter (see page 5649)

57.1.8.1 TAdapterApplicationTitleField Members

The following tables list the members exposed by TAdapterApplicationTitleField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.

	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5211)	Returns the name used to access this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5211)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
V	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
V	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
V	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
	Adapter (see page 5207)	Returns the parent adapter of this adapter field.
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.

	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.8.2 TAdapterApplicationTitleField Methods

The methods of the TAdapterApplicationTitleField class are listed here.

Protected Methods

	Name	Description
	GetDefaultFieldName (see page 5211)	Returns the name used to access this adapter field with server-side script.
	ImplGetValue (see page 5211)	Returns the value associated with this adapter field.

57.1.8.2.1 TAdapterApplicationTitleField.GetDefaultFieldName Method

Returns the name used to access this adapter field with server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'Title'. This allows server-side script to access this adapter field using the parent adapter's Title property.

57.1.8.2.2 TAdapterApplicationTitleField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the value of the parent adapter's Title property. Server-side script accesses the result of this function using the DisplayText property of this adapter field. Server-side script may use this value to display the application title on a Web page.

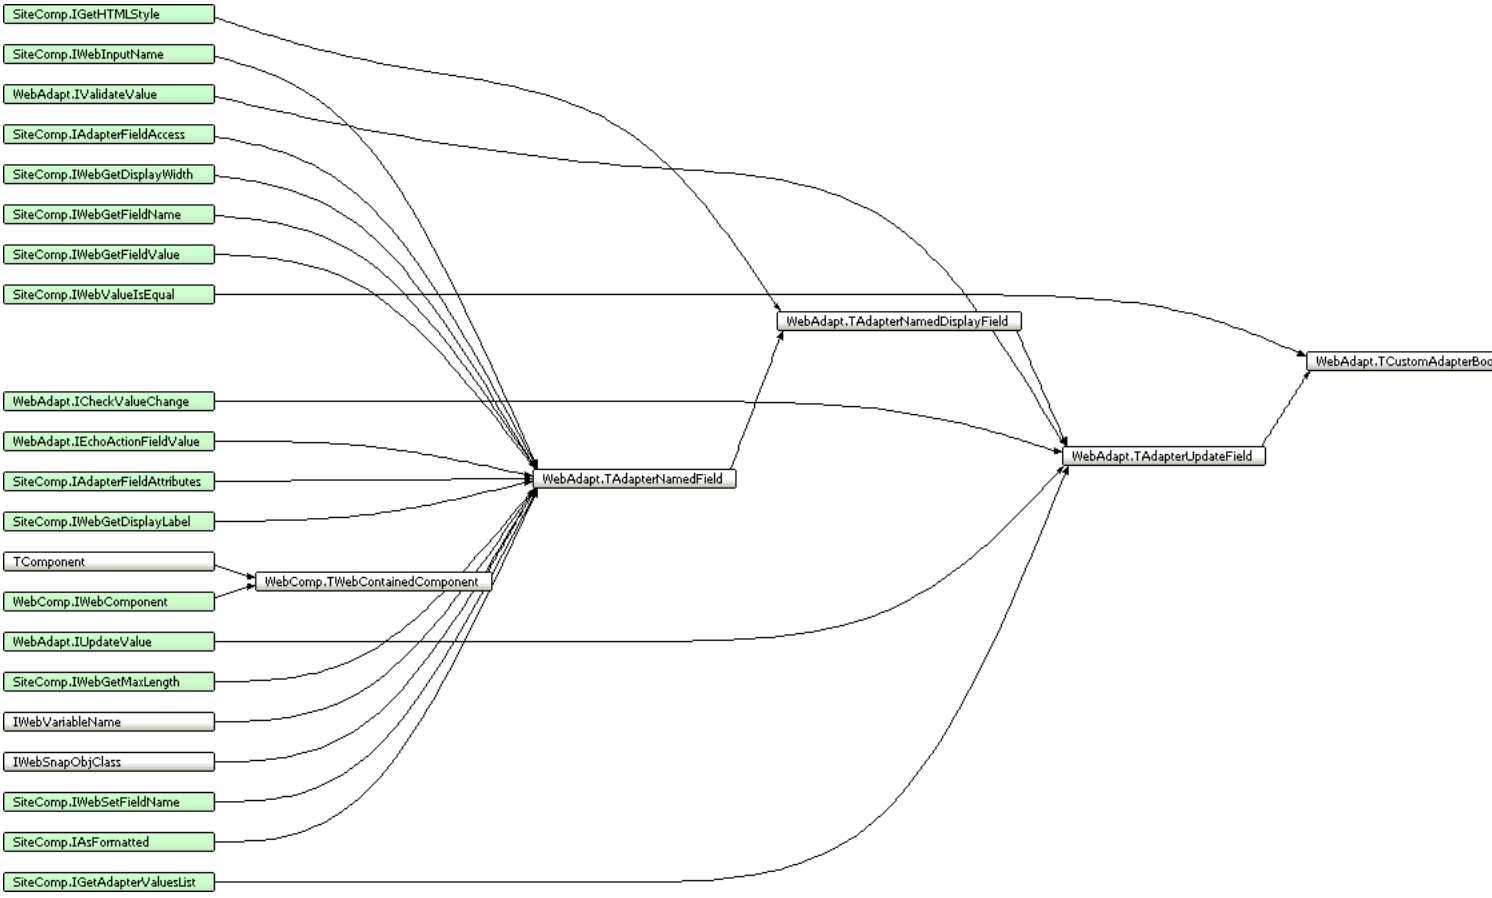
See Also

ApplicationTitle (see page 5657)

57.1.9 TAdapterBooleanField Class

TAdapterBooleanField is an event handler based adapter field that works with a Boolean value.

Class Hierarchy



Pascal

```
TAdapterBooleanField = class(TCustomAdapterBooleanField);
```

C++

```
class TAdapterBooleanField : public TCustomAdapterBooleanField;
```

File

WebAdapt

Description

TAdapterBooleanField publishes the properties in TCustomAdapterBooleanField (see page 5575). TCustomAdapterBooleanField (see page 5575) calls event handlers to retrieve the adapter field's value, validate a value entered by the end-user, and update the adapter field's value.

Add TAdapterBooleanField to TAdapter (see page 5179) or other adapter components types when you need an adapter field that works with a Boolean value. There are other adapter field components that use event handlers. They differ in the type and

number of values that are supported. See TAdapterField (see page 5256), TAdapterMultiValueField (see page 5320), TAdapterMemoField (see page 5312), TAdapterFileField (see page 5270) and TAdapterImageField (see page 5297).

See Also

TAdapter (see page 5179)

TAdapterField (see page 5256)

TAdapterMemoField (see page 5312)

TAdapterMultiValueField (see page 5320)

TAdapterFileField (see page 5270)

TAdapterImageField (see page 5297)

57.1.9.1 TAdapterBooleanField Members

The following tables list the members exposed by TAdapterBooleanField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5412)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5413)	Retrieves a value entered by the end-user.
V	ConvertValue (see page 5580)	Retrieves a Boolean value entered by the end-user.
V	ConvertValueCount (see page 5413)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5413)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5414)	Validates field values entered by the end-user.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5414)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
V	GetDisplayStyleType (see page 5580)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 5414)	Indicates the preferred HTML element to use when editing this adapter field's value.
V	GetInputStyleType (see page 5581)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).

	GetValueCount (see page 5415)	Provides the number of values associated with this adapter field.
	GetValues (see page 5415)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 5415)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5416)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 5416)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 5416)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 5417)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetValue (see page 5581)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5417)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplIsEqual (see page 5582)	Indicates whether the value of this field is equal to a particular Variant (see page 3430) value.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5417)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5417)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5418)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 5582)	Called to update the adapter field's value with a value entered by the end-user.
	ImplValidateValue (see page 5418)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsEqual (see page 5582)	Indicates whether the value of this field is equal to a particular Variant (see page 3430) value.
	IsMultiValueField (see page 5418)	Indicates whether this adapter field can support multiple values.
	Notification (see page 5419)	Clears references to a deleted component.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.

	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
V	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	UpdateValue (see page 5419)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5419)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
R	Adapter (see page 5356)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
R	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5421)	Event handler called to retrieve a string representation of the adapter field's value.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5864)	This is CheckValueChange, a member of class ICheckValueChange.
V	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
V	Create (see page 5411)	Creates an instance of TAdapterUpdateField (see page 5407).
V	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
V	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetAdapterValuesList (see page 969)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	IsEqual (see page 1060)	This is IsEqual, a member of class IWebValueIsEqual.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

	UpdateValue (see page 5878)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5879)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
R	Value (see page 5420)	Retrieves the value associated with this adapter field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetValue (see page 5219)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5219)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 5220)	Event handler called to validate value(s) entered by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 5217)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5217)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5217)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5218)	Identifies the rights required to update this field.
	ReadOnly (see page 5218)	Indicates whether this adapter field is read-only.
	ValuesList (see page 5218)	Associates a list of values with the adapter field.
	ViewAccess (see page 5219)	Identifies the rights required to view this field.

57.1.9.2 TAdapterBooleanField Properties

The properties of the TAdapterBooleanField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5217)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5217)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5217)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5218)	Identifies the rights required to update this field.
	ReadOnly (see page 5218)	Indicates whether this adapter field is read-only.
	ValuesList (see page 5218)	Associates a list of values with the adapter field.
	ViewAccess (see page 5219)	Identifies the rights required to view this field.

57.1.9.2.1 TAdapterBooleanField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.9.2.2 TAdapterBooleanField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.9.2.3 TAdapterBooleanField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.9.2.4 TAdapterBooleanField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

hasmodifyaccess (see page 5539)

57.1.9.2.5 TAdapterBooleanField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 5336)

57.1.9.2.6 TAdapterBooleanField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 1014)

TStringsValuesList (see page 5843)

TDataSetValuesList

57.1.9.2.7 TAdapterBooleanField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

HasViewAccess (see page 5539)

57.1.9.3 TAdapterBooleanField Events

The events of the TAdapterBooleanField class are listed here.

Published Events

	Name	Description
	OnGetValue (see page 5219)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5219)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 5220)	Event handler called to validate value(s) entered by the end-user.

57.1.9.3.1 TAdapterBooleanField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetBooleanEvent;
```

C++

```
__property TAdapterFieldGetBooleanEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 5581)

57.1.9.3.2 TAdapterBooleanField.OnUpdateValue Event

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldBooleanValueEvent;
```

C++

```
__property TAdapterFieldBooleanValueEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

See Also

ImplUpdateValue (see page 5582)

57.1.9.3.3 TAdapterBooleanField.OnValidateValue Event

Event handler called to validate value(s) entered by the end-user.

Pascal

```
property OnValidateValue: TAdapterFieldValidateValueEvent;
```

C++

```
__property TAdapterFieldValidateValueEvent OnValidateValue;
```

Description

This event handler is called by DoOnValidateValue to validate the value(s) entered by the end-user. The event handler must raise an exception to indicate that the value(s) are not valid.

See Also

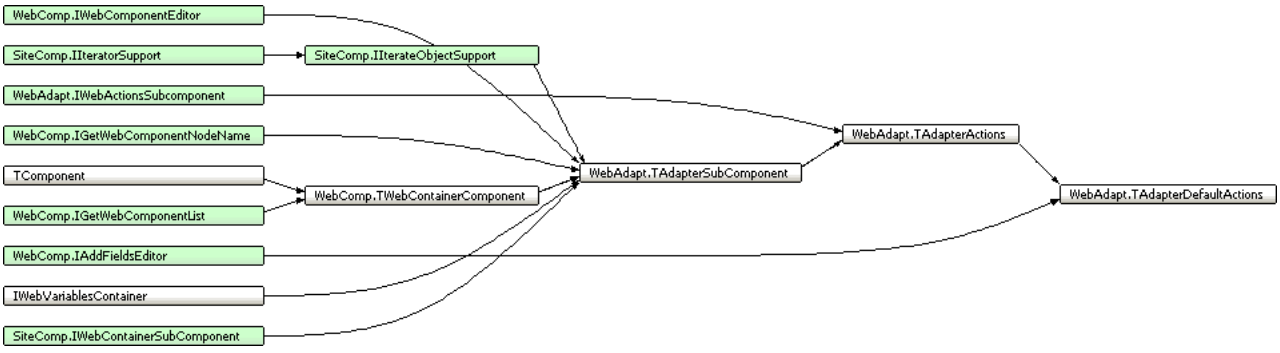
DoOnValidateValue (see page 5414)

IActionFieldValue

57.1.10 TAdapterDefaultActions Class

TAdapterDefaultActions manages the list of actions that belong to an adapter that supports a default set of actions.

Class Hierarchy



Pascal

```
TAdapterDefaultActions = class(TAdapterActions, IAddFieldsEditor);
```

C++

```
class TAdapterDefaultActions : public TAdapterActions, public IAddFieldsEditor;
```

File

WebAdapt

Description

TAdapterDefaultActions is the type of the Actions property on an adapter component. It manages two lists of actions (TBaseAdapterAction (see page 5435) descendants) that belong to the adapter: the list of actions that have been explicitly added to the adapter, and the list of actions that the adapter includes by default. The explicitly added action objects are available using the WebActions (see page 5203) property. The default actions are available using the DefaultWebComponents (see page 5226) property.

TDefaultFieldsAdapter (see page 5724)

TAdapterFields (see page 5265)

TAdapterActions (see page 5198)

TAdapterDefaultFields (see page 5226)

TBaseAdapterAction (see page 5435)

57.1.10.1 TAdapterDefaultActions Members

The following tables list the members exposed by TAdapterDefaultActions.

Protected Methods

	Name	Description
	AdapterCanAddClass (see page 5201)	Indicates whether the associated adapter supports a specified class of action component.
	CanAddClass (see page 5396)	Indicates whether an object of a specified type can be added to this collection.
	EndIterator (see page 5397)	Stops the TAdapterSubComponent (see page 5394) object from iterating over the Web items it lists.
V	FindNamedVariable (see page 5397)	Returns the item from this list with a specified variable name.
	FindVariable (see page 5398)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 5398)	Returns the Web module that contains a specified item from this list.
	GetAddAllFieldsItem (see page 5224)	This is GetAddAllFieldsItem, a member of class TAdapterDefaultActions.
	GetAddFieldsDlgCaption (see page 5224)	This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultActions.
	GetAddFieldsItem (see page 5224)	This is GetAddFieldsItem, a member of class TAdapterDefaultActions.
V	GetChildren (see page 6038)	Executes a callback for each child Web item.
	GetCurrentObject (see page 5399)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 5224)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetNewFieldPrefix (see page 5225)	This is GetNewFieldPrefix, a member of class TAdapterDefaultActions.
	GetVariable (see page 5400)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 5401)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 5225)	Returns the value of the VariablesInUse property.
	GetWebComponentNodeName (see page 5401)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 6039)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 5201)	Provides the underlying implementation for the CanAddClass (see page 5396) method.

	ImplCanAddClass (see page 5402)	Provides the underlying implementation for the CanAddClass (see page 5396) method.
	ImplGetDefaultComponentList (see page 6039)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	ImplGetWebComponentNodeName (see page 5202)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
	ImplGetWebComponentNodeName (see page 5403)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
	NextIteration (see page 5403)	Changes the current object to the next item that has a variable name.
	NotifyAdapterChange (see page 5404)	Notifies the associated adapter when the list of items changes.
	SetChildOrder (see page 6040)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 5225)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetWebParent (see page 5202)	Introduces a method to associate this component with an adapter.
	SetWebParent (see page 5405)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 5406)	Makes the first child item with a variable name the current object.

Protected Properties

	Name	Description
	Adapter (see page 5406)	Indicates the adapter that uses this object to manage its fields or actions.
	VariablesInUse (see page 5407)	Lists those fields or actions in the collection for which variables are defined.
	WebContainerComponentHelper (see page 6041)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	CanAddClass (see page 6074)	Indicates whether a specified class can be used as a child Web item.
	ClearDefaultComponents (see page 5223)	Empties the list of default actions that is the value of the DefaultWebComponents (see page 5226) property.
	Create (see page 6037)	Creates and initializes an instance of TWebContainerComponent (see page 6036).
	Destroy (see page 5222)	Frees an instance of TAdapterDefaultActions (see page 5220).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetComponentList (see page 6055)	This is GetComponentList, a member of class IGetWebComponentList.
	GetCurrentObject (see page 993)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultComponentList (see page 6055)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetParentComponent (see page 5400)	Returns the associated adapter.
	GetWebComponentNodeName (see page 6056)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.
	HasParent (see page 5402)	Indicates whether this component has an associated adapter.
	NextIteration (see page 997)	Advances to the objects next item.
	ReadState (see page 5404)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetParentComponent (see page 5405)	Sets the Adapter (see page 5406) property to be the same as this component's parent.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
	DefaultWebComponents (see page 5226)	Lists the action components that the associated adapter includes by default.
	WebActions (see page 5203)	Lists the action components that this object manages.

57.1.10.2 TAdapterDefaultActions.Destroy Destructor

Frees an instance of TAdapterDefaultActions (see page 5220).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterDefaultActions();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for a nil reference before calling Destroy.

See Also

System::TObject::Free (see page 3382)

57.1.10.3 TAdapterDefaultActions Methods

The methods of the TAdapterDefaultActions class are listed here.

Protected Methods

	Name	Description
	GetAddAllFieldsItem (see page 5224)	This is GetAddAllFieldsItem, a member of class TAdapterDefaultActions.
	GetAddFieldsDlgCaption (see page 5224)	This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultActions.
	GetAddFieldsItem (see page 5224)	This is GetAddFieldsItem, a member of class TAdapterDefaultActions.
	GetDefaultWebComponents (see page 5224)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetNewFieldPrefix (see page 5225)	This is GetNewFieldPrefix, a member of class TAdapterDefaultActions.
	GetVariablesInUse (see page 5225)	Returns the value of the VariablesInUse property.
	SetDefaultWebComponents (see page 5225)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Public Methods

	Name	Description
	ClearDefaultComponents (see page 5223)	Empties the list of default actions that is the value of the DefaultWebComponents (see page 5226) property.

57.1.10.3.1 TAdapterDefaultActions.ClearDefaultComponents Method

Empties the list of default actions that is the value of the DefaultWebComponents (see page 5226) property.

Pascal

```
procedure ClearDefaultComponents; virtual;
```

C++

```
virtual __fastcall ClearDefaultComponents();
```

Description

The associated adapter calls ClearDefaultComponents when it changes its set of default actions. After a call to ClearDefaultComponents, the adapter generates a new set of default components the next time the application reads the default actions.

See Also

DefaultWebComponents (see page 5226)

57.1.10.3.2 TAdapterDefaultActions.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class TAdapterDefaultActions.

57.1.10.3.3 TAdapterDefaultActions.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultActions.

57.1.10.3.4 TAdapterDefaultActions.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class TAdapterDefaultActions.

57.1.10.3.5 TAdapterDefaultActions.GetDefaultWebComponents Method

Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent, GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to return the list of default fields or actions.

See Also

GetWebComponents (see page 6039)

TAdapterDefaultActions (see page 5220)

TAdapterDefaultFields (see page 5226)

57.1.10.3.6 TAdapterDefaultActions.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall UnicodeString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class TAdapterDefaultActions.

57.1.10.3.7 TAdapterDefaultActions.GetVariablesInUse Method

Returns the value of the VariablesInUse property.

Pascal

```
function GetVariablesInUse: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetVariablesInUse();
```

Description

GetVariablesInUse is the protected read implementation for the VariablesInUse property.

In TAdapterSubComponent, GetVariablesInUse calls the GetWebComponents method to return a list of all the items in the list. Descendant classes can override this method to return only those items that meet a certain criterion.

See Also

VariablesInUse (see page 5407)

GetWebComponents (see page 6039)

57.1.10.3.8 TAdapterDefaultActions.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent, GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to return the list of default fields or actions.

SetDefaultWebComponents assigns the default set of child items for this component. As implemented in TWebContainerComponent, SetDefaultWebComponents does nothing because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and

TAdapterDefaultFields) override this method to store the list of default fields or actions.

See Also

GetDefaultWebComponents (see page 5399)

IsDefaultField (see page 6015)

57.1.10.4 TAdapterDefaultActions Properties

The properties of the TAdapterDefaultActions class are listed here.

Public Properties

	Name	Description
	DefaultWebComponents (see page 5226)	Lists the action components that the associated adapter includes by default.

57.1.10.4.1 TAdapterDefaultActions.DefaultWebComponents Property

Lists the action components that the associated adapter includes by default.

Pascal

```
property DefaultWebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList DefaultWebComponents;
```

Description

Read (see page 3727) DefaultWebComponents to access the list of action components that the adapter uses when you do not explicitly add any actions to this object. Each default action is a descendant of TAdapterNamedAction.

If you explicitly add action components to this object, the adapter uses the actions in the WebActions (see page 5203) property instead.

See Also

TBaseAdapterAction (see page 5435)

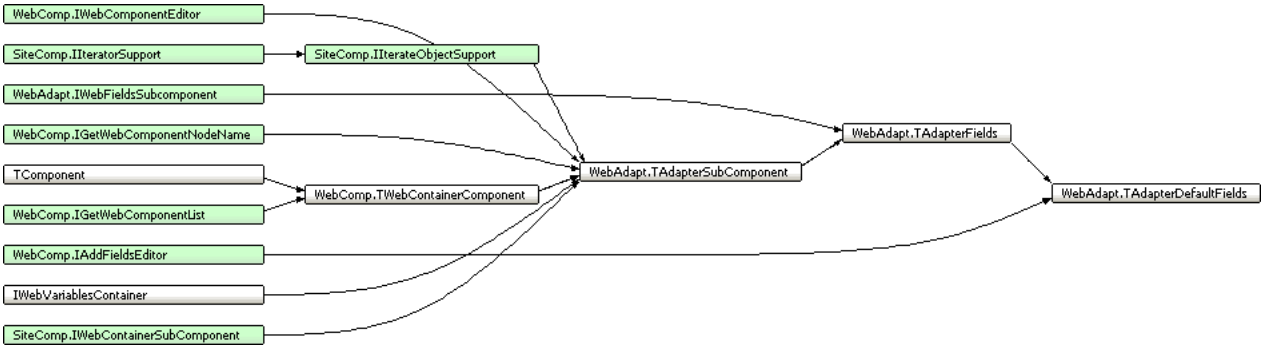
WebActions (see page 5203)

Adapter (see page 5406)

57.1.11 TAdapterDefaultFields Class

TAdapterDefaultFields manages the list of fields that belong to an adapter that supports a default set of fields.

Class Hierarchy



Pascal

```
TAdapterDefaultFields = class(TAdapterFields, IAddFieldsEditor);
```

C++

```
class TAdapterDefaultFields : public TAdapterFields, public IAddFieldsEditor;
```

File

WebAdapt

Description

TAdapterDefaultFields is the type of the Data property on an adapter component. It manages two lists of fields (TAdapterNamedField (see page 5339) descendants) that belong to the adapter: the list of fields that have been explicitly added to the adapter, and the list of fields that the adapter includes by default. The explicitly added field objects are available using the WebFields (see page 5270) property. The default fields are available using the DefaultWebComponents (see page 5232) property.

See Also

TDefaultFieldsAdapter (see page 5724)

TAdapterActions (see page 5198)

TAdapterDefaultActions (see page 5220)

TAdapterFields (see page 5265)

TAdapterNamedField (see page 5339)

57.1.11.1 TAdapterDefaultFields Members

The following tables list the members exposed by TAdapterDefaultFields.

Protected Methods

	Name	Description
	AdapterCanAddClass (see page 5267)	Indicates whether the associated adapter supports a specified class of field component.
	CanAddClass (see page 5396)	Indicates whether an object of a specified type can be added to this collection.
	EndIterator (see page 5397)	Stops the TAdapterSubComponent (see page 5394) object from iterating over the Web items it lists.
	FindNamedVariable (see page 5397)	Returns the item from this list with a specified variable name.
	FindVariable (see page 5398)	Returns the item from this list with a specified variable name.

	FindVariableContainer (see page 5398)	Returns the Web module that contains a specified item from this list.
	GetAddAllFieldsItem (see page 5230)	This is GetAddAllFieldsItem, a member of class TAdapterDefaultFields.
	GetAddFieldsDlgCaption (see page 5230)	This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultFields.
	GetAddFieldsItem (see page 5230)	This is GetAddFieldsItem, a member of class TAdapterDefaultFields.
V	GetChildren (see page 6038)	Executes a callback for each child Web item.
	GetCurrentObject (see page 5399)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 5230)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetNewFieldPrefix (see page 5231)	This is GetNewFieldPrefix, a member of class TAdapterDefaultFields.
	GetVariable (see page 5400)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 5401)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 5231)	Returns the value of the VariablesInUse property.
	GetWebComponentNodeName (see page 5401)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 6039)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 5268)	Provides the underlying implementation for the CanAddClass (see page 5396) method.
V	ImplCanAddClass (see page 5402)	Provides the underlying implementation for the CanAddClass (see page 5396) method.
V	ImplGetDefaultComponentList (see page 6039)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetWebComponentNodeName (see page 5269)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
V	ImplGetWebComponentNodeName (see page 5403)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
	NextIteration (see page 5403)	Changes the current object to the next item that has a variable name.
	NotifyAdapterChange (see page 5404)	Notifies the associated adapter when the list of items changes.
V	SetChildOrder (see page 6040)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 5231)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	SetWebParent (see page 5269)	Associates this component with an adapter.
V	SetWebParent (see page 5405)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 5406)	Makes the first child item with a variable name the current object.

Protected Properties

	Name	Description
R	Adapter (see page 5406)	Indicates the adapter that uses this object to manage its fields or actions.
R	VariablesInUse (see page 5407)	Lists those fields or actions in the collection for which variables are defined.
R	WebContainerComponentHelper (see page 6041)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	CanAddClass (see page 6074)	Indicates whether a specified class can be used as a child Web item.
V	ClearDefaultComponents (see page 5229)	Empties the list of default fields that is the value of the DefaultWebComponents (see page 5232) property.
V	Create (see page 6037)	Creates and initializes an instance of TWebContainerComponent (see page 6036).
V	Destroy (see page 5229)	Frees an instance of TAdapterDefaultFields (see page 5226).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetComponentList (see page 6055)	This is GetComponentList, a member of class IGetWebComponentList.
	GetCurrentObject (see page 993)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultComponentList (see page 6055)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
V	GetParentComponent (see page 5400)	Returns the associated adapter.
	GetWebComponentNodeName (see page 6056)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.
V	HasParent (see page 5402)	Indicates whether this component has an associated adapter.

	NextIteration (see page 997)	Advances to the objects next item.
V	ReadState (see page 5404)	Reads the component's published properties, stored data, and owned components from a reader object.
V	SetParentComponent (see page 5405)	Sets the Adapter (see page 5406) property to be the same as this component's parent.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
R	DefaultWebComponents (see page 5232)	Lists the field components that the associated adapter includes by default.
R	WebFields (see page 5270)	Lists the field components that this object manages.

57.1.11.2 TAdapterDefaultFields.Destroy Destructor

Frees an instance of TAdapterDefaultFields (see page 5226).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterDefaultFields();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for a nil reference before calling Destroy.

See Also

System::TObject::Free (see page 3382)

57.1.11.3 TAdapterDefaultFields Methods

The methods of the TAdapterDefaultFields class are listed here.

Protected Methods

	Name	Description
	GetAddAllFieldsItem (see page 5230)	This is GetAddAllFieldsItem, a member of class TAdapterDefaultFields.
	GetAddFieldsDlgCaption (see page 5230)	This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultFields.
	GetAddFieldsItem (see page 5230)	This is GetAddFieldsItem, a member of class TAdapterDefaultFields.
V	GetDefaultWebComponents (see page 5230)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetNewFieldPrefix (see page 5231)	This is GetNewFieldPrefix, a member of class TAdapterDefaultFields.
V	GetVariablesInUse (see page 5231)	Returns the value of the VariablesInUse property.
V	SetDefaultWebComponents (see page 5231)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Public Methods

	Name	Description
V	ClearDefaultComponents (see page 5229)	Empties the list of default fields that is the value of the DefaultWebComponents (see page 5232) property.

57.1.11.3.1 TAdapterDefaultFields.ClearDefaultComponents Method

Empties the list of default fields that is the value of the DefaultWebComponents (see page 5232) property.

Pascal

```
procedure ClearDefaultComponents; virtual;
```

C++

```
virtual __fastcall ClearDefaultComponents();
```

Description

The associated adapter calls ClearDefaultComponents when it changes its set of default fields. After a call to ClearDefaultComponents, the adapter generates a new set of default components the next time the application reads the default fields.

See Also

DefaultWebComponents (see page 5232)

57.1.11.3.2 TAdapterDefaultFields.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class TAdapterDefaultFields.

57.1.11.3.3 TAdapterDefaultFields.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class TAdapterDefaultFields.

57.1.11.3.4 TAdapterDefaultFields.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class TAdapterDefaultFields.

57.1.11.3.5 TAdapterDefaultFields.GetDefaultWebComponents Method

Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent, GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to return the list of default fields or actions.

See Also

GetWebComponents (see page 6039)

TAdapterDefaultActions (see page 5220)

TAdapterDefaultFields (see page 5226)

57.1.11.3.6 TAdapterDefaultFields.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall UnicodeString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class TAdapterDefaultFields.

57.1.11.3.7 TAdapterDefaultFields.GetVariablesInUse Method

Returns the value of the VariablesInUse property.

Pascal

```
function GetVariablesInUse: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetVariablesInUse();
```

Description

GetVariablesInUse is the protected read implementation for the VariablesInUse property.

In TAdapterSubComponent, GetVariablesInUse calls the GetWebComponents method to return a list of all the items in the list. Descendant classes can override this method to return only those items that meet a certain criterion.

See Also

VariablesInUse (see page 5407)

GetWebComponents (see page 6039)

57.1.11.3.8 TAdapterDefaultFields.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent, GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to return the list of default fields or actions.

SetDefaultWebComponents assigns the default set of child items for this component. As implemented in TWebContainerComponent, SetDefaultWebComponents does nothing because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions and TAdapterDefaultFields) override this method to store the list of default fields or actions.

See Also

GetDefaultWebComponents (see page 5399)

IsDefaultField (see page 6015)

57.1.11.4 TAdapterDefaultFields Properties

The properties of the TAdapterDefaultFields class are listed here.

Public Properties

	Name	Description
	DefaultWebComponents (see page 5232)	Lists the field components that the associated adapter includes by default.

57.1.11.4.1 TAdapterDefaultFields.DefaultWebComponents Property

Lists the field components that the associated adapter includes by default.

Pascal

```
property DefaultWebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList DefaultWebComponents;
```

Description

Read (see page 3727) DefaultWebComponents to access the list of field components that the adapter uses when you do not explicitly add any field components to this object. Each default field component is a descendant of TAdapterNamedField (see page 5339).

If you explicitly add field components to this object, the adapter uses the fields in the WebFields (see page 5270) property instead.

See Also

TAdapterNamedField (see page 5339)

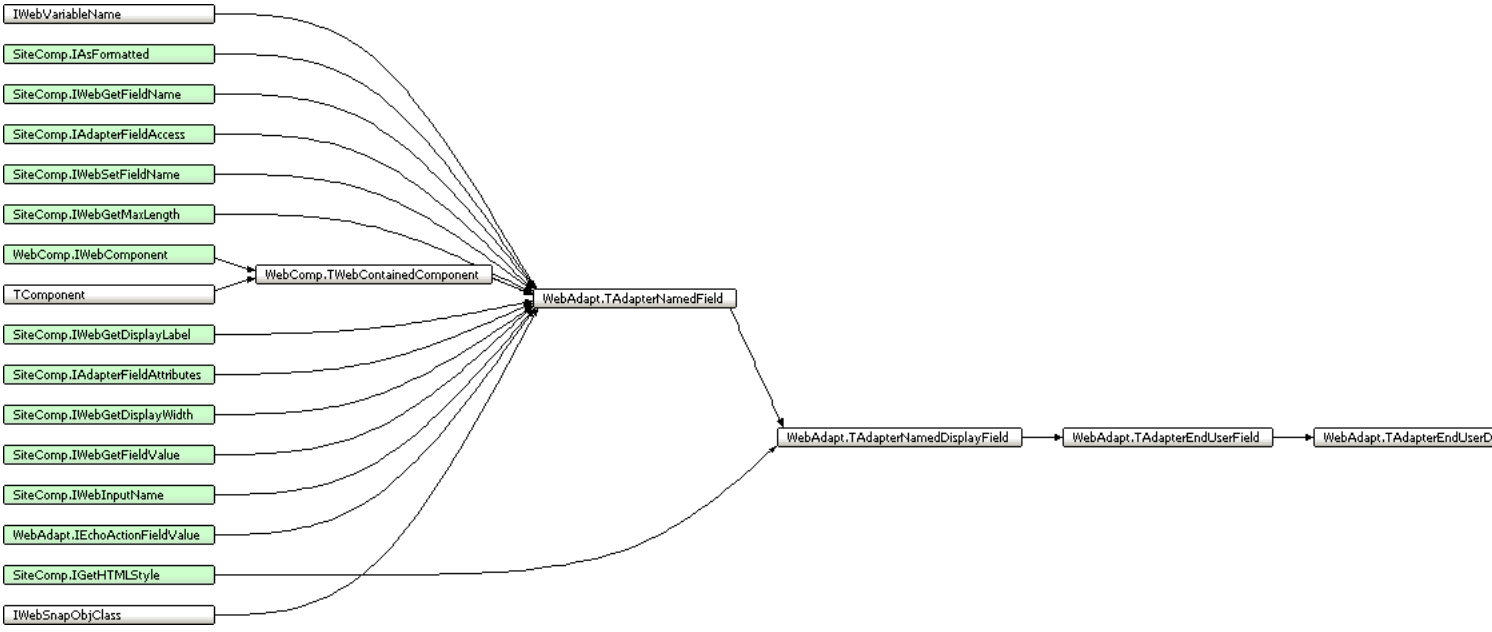
WebFields (see page 5270)

Adapter (see page 5406)

57.1.12 TAdapterEndUserDisplayNameField Class

TAdapterEndUserDisplayNameField is an adapter field used to access the end-user's name.

Class Hierarchy



Pascal

```
TAdapterEndUserDisplayNameField = class(TAdapterEndUserField);
```

C++

```
class TAdapterEndUserDisplayNameField : public TAdapterEndUserField;
```

File

WebAdapt

Description

TAdapterEndUserDisplayNameField is added to TApplicationAdapter (see page 5427).

See Also

TAdapterEndUserField (see page 5237)

TEndUserAdapter (see page 5750)

TEndUserSessionAdapter (see page 5779)

57.1.12.1 TAdapterEndUserDisplayNameField Members

The following tables list the members exposed by TAdapterEndUserDisplayNameField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5236)	Returns the name used to access this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5236)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
V	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.

	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
	Adapter (see page 5240)	Returns the parent adapter of this adapter field.
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.

	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.12.2 TAdapterEndUserDisplayNameField Methods

The methods of the TAdapterEndUserDisplayNameField class are listed here.

Protected Methods

	Name	Description
V	GetDefaultFieldName (see page 5236)	Returns the name used to access this adapter field with server-side script.
V	ImplGetValue (see page 5236)	Returns the value associated with this adapter field.

57.1.12.2.1 TAdapterEndUserDisplayNameField.GetDefaultFieldName Method

Returns the name used to access this adapter field with server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'DisplayName'. This allows server-side script to access this adapter field using the parent adapter's DisplayName property.

57.1.12.2.2 TAdapterEndUserDisplayNameField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the result of GetDisplayNameValue. Server-side script accesses the result of this function using the

DisplayText property of this adapter field. Server-side script may use this value to display the end-user's name on a Web page.

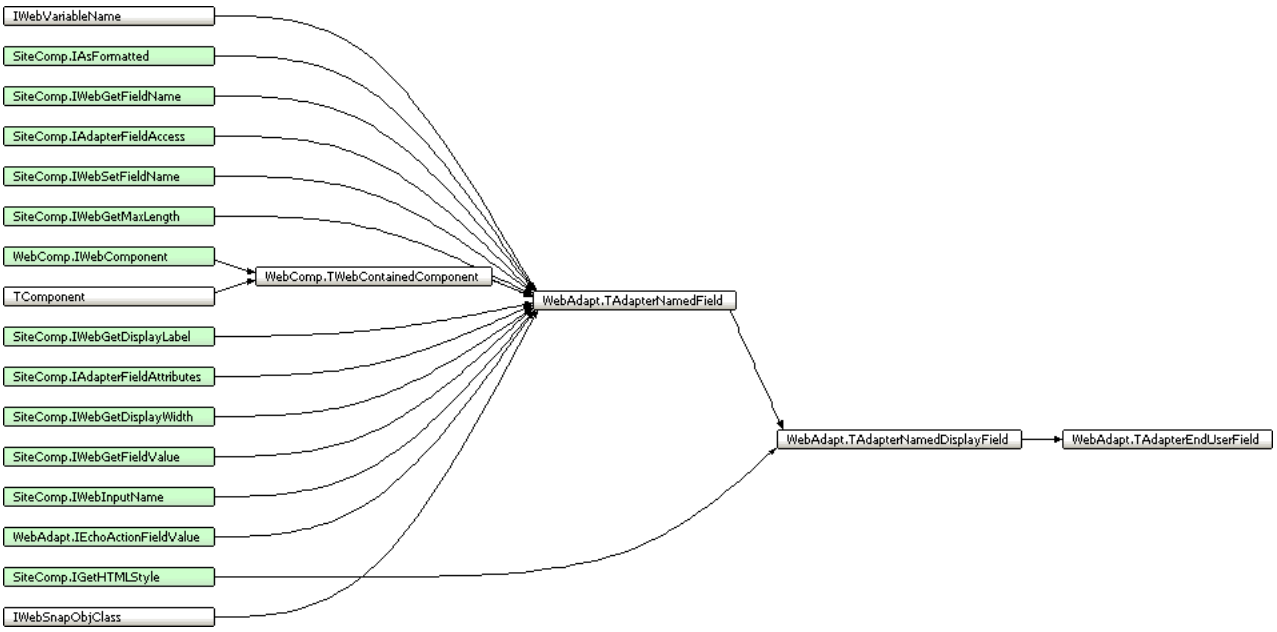
See Also

GetDisplayNameValue (see page 5494)

57.1.13 TAdapterEndUserField Class

TAdapterEndUserField is a base class for adapter field components that are children of an end-user adapter component.

Class Hierarchy



Pascal

```
TAdapterEndUserField = class(TAdapterNamedDisplayField);
```

C++

```
class TAdapterEndUserField : public TAdapterNamedDisplayField;
```

File

WebAdapt

Description

TAdapterEndUserField implements functionality useful to an adapter field that can be a child of TEndUserAdapter (see page 5750) or TEndUserSessionAdapter (see page 5779).

See Also

TAdapterNamedDisplayField (see page 5331)

TBaseEndUserAdapter (see page 5485)

TEndUserAdapter (see page 5750)

TEndUserSessionAdapter (see page 5779)

TAdapterEndUserLoggedInField (see page 5241)

TAdapterEndUserDisplayNameField (see page 5233)

57.1.13.1 TAdapterEndUserField Members

The following tables list the members exposed by TAdapterEndUserField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.

	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
	Adapter (see page 5240)	Returns the parent adapter of this adapter field.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.13.2 TAdapterEndUserField Properties

The properties of the TAdapterEndUserField class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 5240)	Returns the parent adapter of this adapter field.

57.1.13.2.1 TAdapterEndUserField.Adapter Property

Returns the parent adapter of this adapter field.

Pascal

```
property Adapter: TBaseEndUserAdapter;
```

C++

```
__property TBaseEndUserAdapter Adapter;
```

Description

Descendants use this property to access the parent adapter.

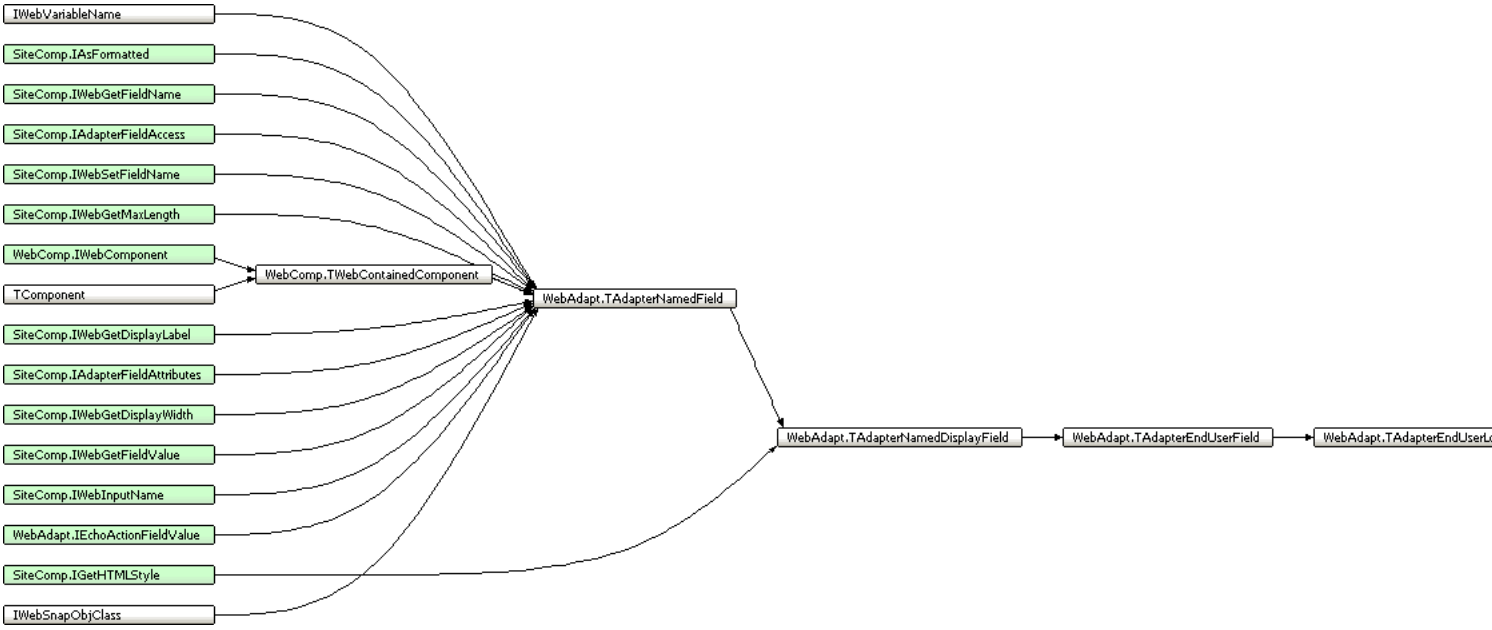
See Also

TBaseEndUserAdapter (see page 5485)

57.1.14 TAdapterEndUserLoggedInField Class

TAdapterEndUserLoggedInField is an adapter field used to access the end-user logged in flag.

Class Hierarchy



Pascal

```
TAdapterEndUserLoggedInField = class(TAdapterEndUserField);
```

C++

```
class TAdapterEndUserLoggedInField : public TAdapterEndUserField;
```

File

WebAdapt

Description

TAdapterEndUserLoggedInField is added to TApplicationAdapter (see page 5427). The logged-in flag indicates whether the user is logged-in. This value may be used by server-side script to conditionally generate HTML. For example, when the end-user is logged in, a logout hyperlink is displayed. When the end-user is not logged in, a logout hyperlink is not displayed.

See Also

TApplicationAdapter (see page 5427)

TEndUserAdapter (see page 5750)

TEndUserSessionAdapter (see page 5779)

57.1.14.1 TAdapterEndUserLoggedInField Members

The following tables list the members exposed by TAdapterEndUserLoggedInField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5244)	Returns the name used to access this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5244)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
V	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.

	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
	Adapter (see page 5240)	Returns the parent adapter of this adapter field.
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.

	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.14.2 TAdapterEndUserLoggedInField Methods

The methods of the TAdapterEndUserLoggedInField class are listed here.

Protected Methods

	Name	Description
V	GetDefaultFieldName (see page 5244)	Returns the name used to access this adapter field with server-side script.
V	ImplGetValue (see page 5244)	Returns the value associated with this adapter field.

57.1.14.2.1 TAdapterEndUserLoggedInField.GetDefaultFieldName Method

Returns the name used to access this adapter field with server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'LoggedIn'. This allows server-side script to access this adapter field using the parent adapter's LoggedIn property.

57.1.14.2.2 TAdapterEndUserLoggedInField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the result of GetLoggedInValue. Server-side script accesses the result of this function using the Value (

see page 5357) property of this adapter field. This value may be used by server-side script to conditionally generate HTML. For example, when the end-user is logged in, a logout hyperlink is displayed. When the end-user is not logged in, a logout hyperlink is not displayed.

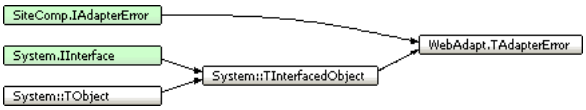
See Also

GetLoggedInValue (see page 5495)

57.1.15 TAdapterError Class

TAdapterError is the implementation of IAdapterError (see page 934).

Class Hierarchy



Pascal

```
TAdapterError = class(TInterfacedObject, IAdapterError);
```

C++

```
class TAdapterError : public TInterfacedObject, public IAdapterError;
```

File

WebAdapt

Description

TAdapterError is the implementation class for IAdapterError (see page 934).

See Also

IAdapterError (see page 934)

57.1.15.1 TAdapterError Members

The following tables list the members exposed by TAdapterError.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	GetErrorText (see page 5247)	Returns the value of the ErrorText property.
	GetField (see page 5247)	Returns the value of the Field property.
	GetID (see page 5248)	Returns the value of the ID property.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5247)	Create instantiates an instance of TAdapterError (see page 5245). Do not call this constructor in application code. The adapter errors list object instantiates adapter error objects as needed.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	ErrorText (see page 936)	Returns text describing the error.
R	Field (see page 936)	Returns text describing the error.
R	ID (see page 936)	Returns error ID.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

57.1.15.2 TAdapterError.Create Constructor

Create instantiates an instance of TAdapterError (see page 5245). Do not call this constructor in application code. The adapter errors list object instantiates adapter error objects as needed.

Pascal

```
constructor Create(AErrors: TAdapterErrorsList; AIndex: Integer);
```

C++

```
__fastcall TAdapterError(TAdapterErrorsList AErrors, int AIndex);
```

Description

```
constructor Create(AErrors: TAdapterErrorsListTAdapterErrorsList; AIndex: Integer); public;
```

Create instantiates an instance of TAdapterError (see page 5245). Do not call this constructor in application code. The adapter errors list object instantiates adapter error objects as needed.

AErrors is the adapter errors list object that creates this TAdapterError (see page 5245) object.

AIndex is the index of this adapter error in the list that AErrors maintains.

57.1.15.3 TAdapterError Methods

The methods of the TAdapterError class are listed here.

Protected Methods

	Name	Description
	GetErrorText (see page 5247)	Returns the value of the ErrorText property.
	GetField (see page 5247)	Returns the value of the Field property.
	GetID (see page 5248)	Returns the value of the ID property.

57.1.15.3.1 TAdapterError.GetErrorText Method

Returns the value of the ErrorText property.

Pascal

```
function GetErrorText: string;
```

C++

```
__fastcall UnicodeString GetErrorText();
```

Description

GetErrorText is the read implementation of the ErrorText property.

See Also

ErrorText (see page 936)

57.1.15.3.2 TAdapterError.GetField Method

Returns the value of the Field property.

Pascal

```
function GetField: TComponent;
```

C++

```
__fastcall TComponent * GetField();
```

Description

GetField is the read implementation of the Field property.

See Also

Field (see page 936)

57.1.15.3.3 TAdapterError.GetID Method

Returns the value of the ID property.

Pascal

```
function GetID: integer;
```

C++

```
__fastcall int GetID();
```

Description

GetID is the read implementation of the ID property.

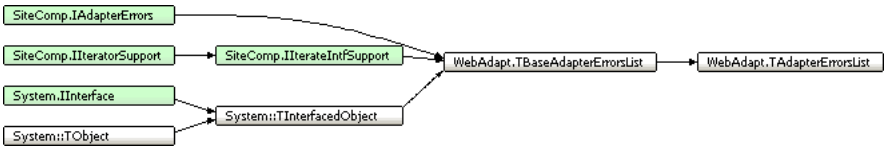
See Also

ID (see page 936)

57.1.16 TAdapterErrorsList Class

TAdapterErrorsList keeps track of errors that an adapter encounters.

Class Hierarchy



Pascal

```
TAdapterErrorsList = class(TBaseAdapterErrorsList);
```

C++

```
class TAdapterErrorsList : public TBaseAdapterErrorsList;
```

File

WebAdapt

Description

TAdapterErrorsList acts as a repository for all the errors an adapter (or any of its subcomponents) encounters while processing an HTTP request message. Adapter components create an instance of this class to implement their Errors (see page 5475) property. Server-side scripts can use the Errors (see page 5475) property to access the errors in this list. The usual purpose of such a script is to display error messages to the end user.

To add new error objects to the list, call the AddError (see page 5252) method. To access the errors in the list, read its Errors (see page 5475) property. Errors (see page 5475) lists the IAdapterError (see page 934) interfaces of adapter error objects (TAdapterError (see page 5245)) that represent each error in the list. You can also access the individual properties of those error objects using the FieldNames (see page 5255), IDs (see page 5255), and Messages (see page 5255) properties of the TAdapterErrorsList instance.

TAdapterErrorsList implements the IAdapterErrorsList interface.

Note: Do not confuse TAdapterErrorsList with TAdapterErrorList. TAdapterErrorsList stores the errors that the WebSnap application encounters when using an adapter. TAdapterErrorList is a display component that displays the errors from a TAdapterErrorsList object.

See Also

TAdapterErrorList (see page 6365)

TCustomAdapter (see page 5519)

TAdapterError (see page 5245)

IAdapterErrors (see page 937)

IAdapterError (see page 934)

57.1.16.1 TAdapterErrorsList Members

The following tables list the members exposed by TAdapterErrorsList.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	EndIterator (see page 5471)	This is EndIterator, a member of class TBaseAdapterErrorsList.
	GetCurrentIntf (see page 5471)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 5471)	Returns a particular error.
	GetErrorCount (see page 5471)	Return the number of errors in the errors list.
	GetObjectErrors (see page 5472)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 5472)	Indicates whether the errors list contains objects associated with a particular adapter field.
	ImplClearErrors (see page 5253)	This is ImplClearErrors, a member of class TAdapterErrorsList.
	ImplDefineLabel (see page 5253)	This is ImplDefineLabel, a member of class TAdapterErrorsList.
	ImplGetError (see page 5253)	This is ImplGetError, a member of class TAdapterErrorsList.
	ImplGetErrorCount (see page 5254)	This is ImplGetErrorCount, a member of class TAdapterErrorsList.
	ImplGetObjectErrors (see page 5254)	This is ImplGetObjectErrors, a member of class TAdapterErrorsList.
	ImplHasObjectErrors (see page 5254)	This is ImplHasObjectErrors, a member of class TAdapterErrorsList.
	NextIteration (see page 5474)	Advances to the objects next item.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	StartIterator (see page 5474)	This is StartIterator, a member of class TBaseAdapterErrorsList.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddError (see page 5252)	This is the overview for the AddError method overload.
	AddError (see page 5469)	This is the overview for the AddError method overload.
	AfterConstruction (see page 3358)	Responds after the last constructor executes.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearErrors (see page 938)	Clears the errors list.
	ClearErrors (see page 5470)	Clear error list.
	Create (see page 5251)	Creates and initializes an instance of TAdapterErrorsList (see page 5248).
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	DefineLabel (see page 938)	Associates a label with all errors associated with a particular adapter field.
	DefineLabel (see page 5470)	Define error label for field.
	Destroy (see page 5251)	Frees an instance of TAdapterErrorsList (see page 5248).
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetCurrentIntf (see page 992)	This is GetCurrentIntf, a member of class IIterateIntfSupport.
	GetError (see page 938)	Returns a particular error.
	GetErrorCount (see page 939)	Return the number of errors in the errors list.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetObjectErrors (see page 939)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 939)	Indicates whether the errors list contains objects associated with a particular adapter field.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 997)	Advances to the objects next item.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.

	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	ErrorCount (see page 940)	Returns the number of errors in the errors list.
	ErrorCount (see page 5474)	Number of error objects contained.
	Errors (see page 940)	Returns an error from the list.
	Errors (see page 5475)	Access to error objects.
	FieldNames (see page 5255)	Lists the names of the objects that encountered the errors in the list.
	IDs (see page 5255)	Lists the error codes of the errors in the list.
	Messages (see page 5255)	Lists the error messages for the errors in the list.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

57.1.16.2 TAdapterErrorsList.Create Constructor

Creates and initializes an instance of TAdapterErrorsList (see page 5248).

Pascal

```
constructor Create(AAdapter: TObject);
```

C++

```
__fastcall TAdapterErrorsList(TObject * AAdapter);
```

Description

Typically, WebSnap applications do not create their own instances of TAdapterErrorsList (see page 5248). Adapter objects instantiate this class to implement their Errors (see page 5475) property.

AAdapter is the adapter component that uses this object to implement its Errors (see page 5475) property.

See Also

Errors (see page 5559)

57.1.16.3 TAdapterErrorsList.Destroy Destructor

Frees an instance of TAdapterErrorsList (see page 5248).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterErrorsList();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the reference to the errors list is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3382)

57.1.16.4 TAdapterErrorsList Methods

The methods of the TAdapterErrorsList class are listed here.

Protected Methods

	Name	Description
	ImplClearErrors (see page 5253)	This is ImplClearErrors, a member of class TAdapterErrorsList.
	ImplDefineLabel (see page 5253)	This is ImplDefineLabel, a member of class TAdapterErrorsList.
	ImplGetError (see page 5253)	This is ImplGetError, a member of class TAdapterErrorsList.
	ImplGetErrorCount (see page 5254)	This is ImplGetErrorCount, a member of class TAdapterErrorsList.
	ImplGetObjectErrors (see page 5254)	This is ImplGetObjectErrors, a member of class TAdapterErrorsList.
	ImplHasObjectErrors (see page 5254)	This is ImplHasObjectErrors, a member of class TAdapterErrorsList.

Public Methods

	Name	Description
	AddError (see page 5252)	This is the overview for the AddError method overload.

57.1.16.4.1 AddError Method

This is the overview for the AddError method overload.

Overload List

	Name	Description
	TAdapterErrorsList.AddError (Exception, string) (see page 5252)	Adds an error to the list.
	TAdapterErrorsList.AddError (Exception, TObject) (see page 5252)	Adds an error to the list.
	TAdapterErrorsList.AddError (string, string, Integer) (see page 5252)	Adds an error to the list.
	TAdapterErrorsList.AddError (string, TObject, Integer) (see page 5252)	Adds an error to the list.

57.1.16.4.1.1 TAdapterErrorsList.AddError Method (Exception, TObject)

Adds an error to the list.

Pascal

```
procedure AddError(AException: Exception; const AObjectName: string = ''); override;
procedure AddError(const AMessage: string; const AObjectName: string = ''; AID: Integer = 0);
override;
procedure AddError(const AMessage: string; AObject: TObject; AID: Integer = 0); override;
procedure AddError(AException: Exception; AObject: TObject); override;
```

C++

```
virtual __fastcall AddError(Exception AException, const UnicodeString AObjectName = '');
virtual __fastcall AddError(const UnicodeString AMessage, const UnicodeString AObjectName =
'', int AID = 0);
virtual __fastcall AddError(const UnicodeString AMessage, TObject * AObject, int AID = 0);
virtual __fastcall AddError(Exception AException, TObject * AObject);
```

Description

AddError adds an error to the object's internal list. An error is described by three pieces of information:

An error message string. You can specify this string directly with the AMessage parameter, or using an Exception (see page 4015) object (with the AException parameter). If you specify an Exception (see page 4015) object, the object's Message property becomes the message string.

The name of an object (Variable) related to the error. You can specify this value as a string (with the AObjectName parameter) or as an object reference (with the AObject parameter). If you omit both these parameters, but supply an EAdapterFieldException (see page 5167) object as the AException parameter, TAdapterErrorsList (see page 5248) uses the FieldName property of that exception object. If you do not supply an AObject parameter, an AObjectName parameter, or an EAdapterFIeldException object as the AException parameter, TAdapterErrorsList (see page 5248) uses an empty string.

An error ID value. You can specify this value using the AID parameter. If you do not supply a value for AID but specify an EAdapterException (see page 5166) object as the AException parameter, TAdapterErrorsList (see page 5248) uses the ID property of that exception object. If you do not supply an AID parameter or an EAdapterException (see page 5166) object, TAdapterErrorsList (see page 5248) uses 0.

See Also

FieldName (see page 5169)

ID (see page 5167)

Messages (see page 5255)

FieldNames (see page 5255)

IDs (see page 5255)

57.1.16.4.2 TAdapterErrorsList.ImplClearErrors Method

Pascal

```
procedure ImplClearErrors; override;
```

C++

```
virtual __fastcall ImplClearErrors();
```

Description

This is ImplClearErrors, a member of class TAdapterErrorsList.

57.1.16.4.3 TAdapterErrorsList.ImplDefineLabel Method

Pascal

```
procedure ImplDefineLabel(const AName: string; const ALabel: string); override;
```

C++

```
virtual __fastcall ImplDefineLabel(const UnicodeString AName, const UnicodeString ALabel);
```

Description

This is ImplDefineLabel, a member of class TAdapterErrorsList.

57.1.16.4.4 TAdapterErrorsList.ImplGetError Method

Pascal

```
function ImplGetError(I: Integer): IAdapterError; override;
```

C++

```
virtual __fastcall IAdapterError ImplGetError(int I);
```

Description

This is ImplGetError, a member of class TAdapterErrorsList.

57.1.16.4.5 TAdapterErrorsList.ImplGetErrorCount Method

Pascal

```
function ImplGetErrorCount: Integer; override;
```

C++

```
virtual __fastcall int ImplGetErrorCount();
```

Description

This is ImplGetErrorCount, a member of class TAdapterErrorsList.

57.1.16.4.6 TAdapterErrorsList.ImplGetObjectErrors Method

Pascal

```
function ImplGetObjectErrors(const AName: string): TObject; override;
```

C++

```
virtual __fastcall TObject * ImplGetObjectErrors(const UnicodeString AName);
```

Description

This is ImplGetObjectErrors, a member of class TAdapterErrorsList.

57.1.16.4.7 TAdapterErrorsList.ImplHasObjectErrors Method

Pascal

```
function ImplHasObjectErrors(const AName: string): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHasObjectErrors(const UnicodeString AName);
```

Description

This is ImplHasObjectErrors, a member of class TAdapterErrorsList.

57.1.16.5 TAdapterErrorsList Properties

The properties of the TAdapterErrorsList class are listed here.

Public Properties

	Name	Description
	FieldNames (see page 5255)	Lists the names of the objects that encountered the errors in the list.
	IDs (see page 5255)	Lists the error codes of the errors in the list.
	Messages (see page 5255)	Lists the error messages for the errors in the list.

57.1.16.5.1 TAdapterErrorsList.FieldNames Property

Lists the names of the objects that encountered the errors in the list.

Pascal

```
property FieldNames [I: Integer]: string;
```

C++

```
__property UnicodeString FieldNames[int I];
```

Description

Use FieldNames to access the name of the object associated with a specified error. FieldNames values typically reflect the name of an adapter field that was the cause of the error. However, they can be any object reference for which there is a defined Variable that can be accessed from server-side script. If there is no object associated with an error, the value of FieldNames is an empty string.

I is the index of the error in the list, where 0 specifies the first error, 1 specifies the second error, and so on.

The value of FieldNames for an error is set by the AddError (see page 5252) method when the error is added to the list.

See Also

AddError (see page 5252)

Field (see page 936)

FieldName (see page 5169)

57.1.16.5.2 TAdapterErrorsList.IDs Property

Lists the error codes of the errors in the list.

Pascal

```
property IDs [I: Integer]: integer;
```

C++

```
__property int IDs[int I];
```

Description

Use IDs to access the ID (error code) of a specified error in the list. If the error has no error code, the value of IDs is 0.

I is the index of the error in the list, where 0 specifies the first error, 1 specifies the second error, and so on.

The value of IDs for an error is set by the AddError (see page 5252) method when the error is added to the list.

See Also

AddError (see page 5252)

ID (see page 936)

ID (see page 5167)

57.1.16.5.3 TAdapterErrorsList.Messages Property

Lists the error messages for the errors in the list.

Pascal

```
property Messages [I: Integer]: string;
```

C++

```
__property UnicodeString Messages[int I];
```

Description

Use Messages to access the error message for a specified error in the list.

I is the index of the error in the list, where 0 specifies the first error, 1 specifies the second error, and so on.

The value of Messages for an error is set by the AddError (see page 5252) method when the error is added to the list.

See Also

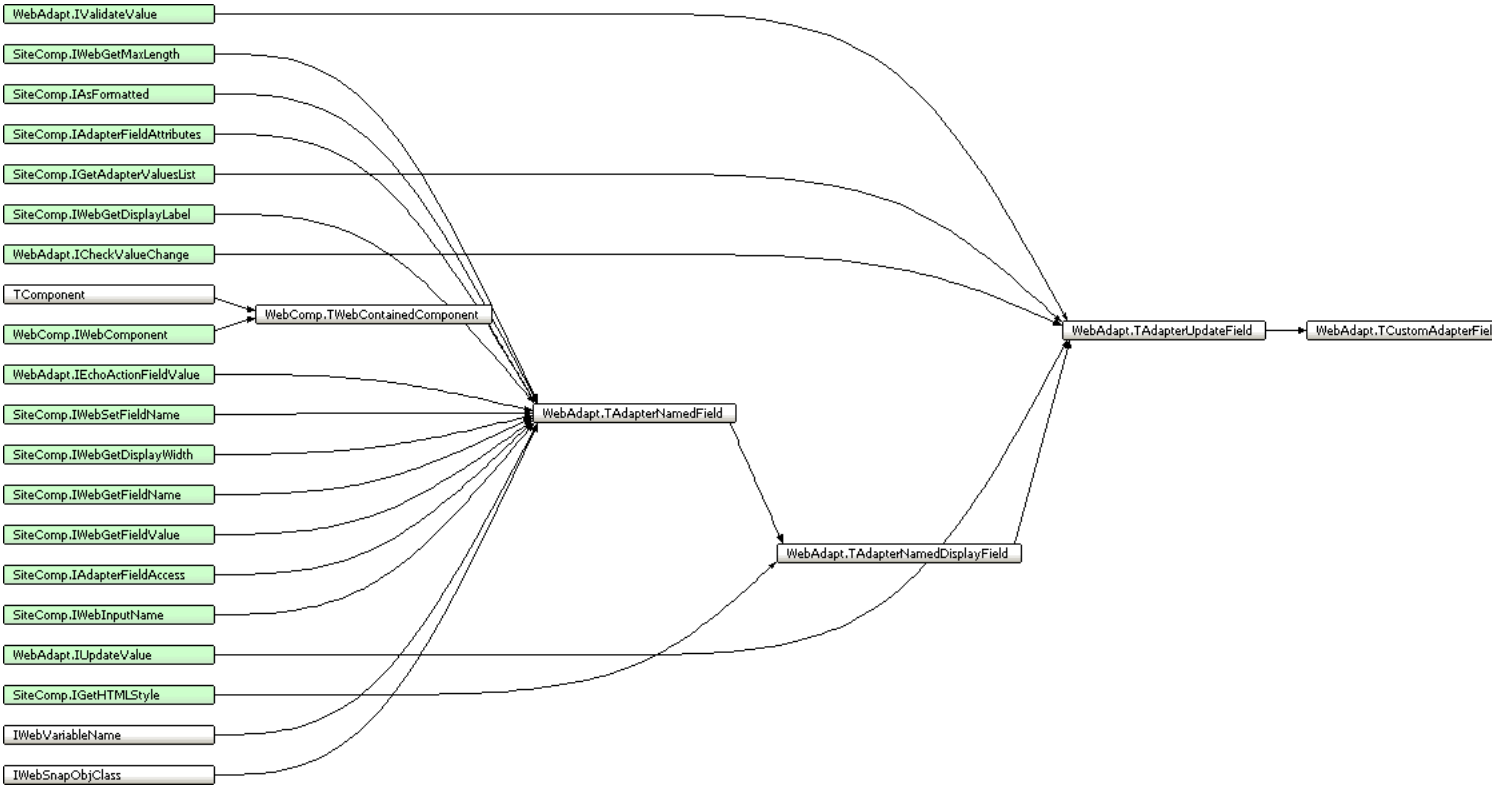
AddError (see page 5252)

ErrorText (see page 936)

57.1.17 TAdapterField Class

TAdapterField is an event handler based adapter field that provides a single value.

Class Hierarchy



Pascal

```
TAdapterField = class(TCustomAdapterField);
```

C++

```
class TAdapterField : public TCustomAdapterField;
```

File

WebAdapt

Description

TAdapterField publishes the properties in TCustomAdapterField (see page 5583). TCustomAdapterField (see page 5583) calls event handlers to retrieve the adapter field's value, validate a value entered by the end-user, and update the adapter field's value.

Add TAdapterField to TAdapter (see page 5179) or other adapter components types when you need an adapter field that supports a single value using event handlers. Event handlers are used to provide the adapter field value(s), validate a value entered by the end-user, and update the adapter field with a value entered by the end-user.

There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. For example, TAdapterMultiValue field is used when the end-user can enter multiple values using a group of check boxes or a multiple selection select list. TAdapterFileField (see page 5270), TAdapterMemoField (see page 5312), TAdapterBooleanField (see page 5212) and TAdapterImageField (see page 5297) are other event driven adapter fields.

See Also

TAdapterUpdateField (see page 5407)

TCustomAdapterField (see page 5583)

TAdapter (see page 5179)

TAdapterMultiValueField (see page 5320)

TAdapterMemoField (see page 5312)

TAdapterFileField (see page 5270)

TAdapterBooleanField (see page 5212)

TAdapterImageField (see page 5297)

57.1.17.1 TAdapterField Members

The following tables list the members exposed by TAdapterField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5412)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5413)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5413)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5413)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5414)	Validates field values entered by the end-user.
V	DoOnValidateValue (see page 5588)	Validates a single value entered by the end-user.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.

	GetAdapterValuesList (see page 5414)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 5414)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
V	GetValueCount (see page 5415)	Provides the number of values associated with this adapter field.
V	GetValues (see page 5415)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 5415)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 5416)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayLabel (see page 5416)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetDisplayWidth (see page 5416)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
V	ImplGetEchoActionFieldValue (see page 5417)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
V	ImplGetValue (see page 5588)	Returns the value of this adapter field as a variant.
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVariableName (see page 5417)	Gets the name used to access this adapter field with server-side script.
V	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.

	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5417)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5417)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5418)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 5589)	Called to update the adapter field's value with a value entered by the end-user.
	ImplValidateValue (see page 5418)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5418)	Indicates whether this adapter field can support multiple values.
	Notification (see page 5419)	Clears references to a deleted component.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	UpdateValue (see page 5419)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5419)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5864)	This is CheckValueChange, a member of class ICheckValueChange.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 5411)	Creates an instance of TAdapterUpdateField (see page 5407).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetAdapterValuesList (see page 969)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.

	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	UpdateValue (see page 5878)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5879)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
R	Value (see page 5420)	Retrieves the value associated with this adapter field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetDisplayText (see page 5264)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 5264)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5264)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 5265)	Event handler called to validate value(s) entered by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 5261)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5261)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5261)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5262)	Identifies the rights required to update this field.
	ReadOnly (see page 5262)	Indicates whether this adapter field is read-only.
	Required (see page 5262)	Indicates whether the end-user must enter a value for this adapter field.
	ValuesList (see page 5263)	Associates a list of values with the adapter field.
	ViewAccess (see page 5263)	Identifies the rights required to view this field.

57.1.17.2 TAdapterField Properties

The properties of the TAdapterField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5261)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5261)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5261)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5262)	Identifies the rights required to update this field.
	ReadOnly (see page 5262)	Indicates whether this adapter field is read-only.
	Required (see page 5262)	Indicates whether the end-user must enter a value for this adapter field.
	ValuesList (see page 5263)	Associates a list of values with the adapter field.
	ViewAccess (see page 5263)	Identifies the rights required to view this field.

57.1.17.2.1 TAdapterField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.17.2.2 TAdapterField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.17.2.3 TAdapterField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.17.2.4 TAdapterField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

hasmodifyaccess (see page 5539)

57.1.17.2.5 TAdapterField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 5336)

57.1.17.2.6 TAdapterField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 5347)

57.1.17.2.7 TAdapterField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 1014)

TStringsValuesList (see page 5843)

TDataSetValuesList

57.1.17.2.8 TAdapterField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

HasViewAccess (see page 5539)

57.1.17.3 TAdapterField Events

The events of the TAdapterField class are listed here.

Published Events

	Name	Description
	OnGetDisplayText (see page 5264)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 5264)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5264)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 5265)	Event handler called to validate value(s) entered by the end-user.

57.1.17.3.1 TAdapterField.OnGetDisplayText Event

Event handler called to retrieve a string representation of the adapter field's value.

Pascal

```
property OnGetDisplayText: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetDisplayText;
```

Description

The OnGetDisplayText event handler is called to retrieve a string representation an adapter field's value appropriate for a read-only display. If OnGetDisplayText is nil (Delphi) or NULL (C++), then the value of the adapter field will be used (after conversion to a string).

See Also

ImplAsFormatted (see page 5415)

57.1.17.3.2 TAdapterField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetValueEvent;
```

C++

```
__property TAdapterFieldGetValueEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 5588)

57.1.17.3.3 TAdapterField.OnUpdateValue Event

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldValueEvent;
```

C++

```
__property TAdapterFieldValueEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

57.1.17.3.4 TAdapterField.OnValidateValue Event

Event handler called to validate value(s) entered by the end-user.

Pascal

```
property OnValidateValue: TAdapterFieldValidateValueEvent;
```

C++

```
__property TAdapterFieldValidateValueEvent OnValidateValue;
```

Description

This event handler is called by DoOnValidateValue to validate the value(s) entered by the end-user. The event handler must raise an exception to indicate that the value(s) are not valid.

See Also

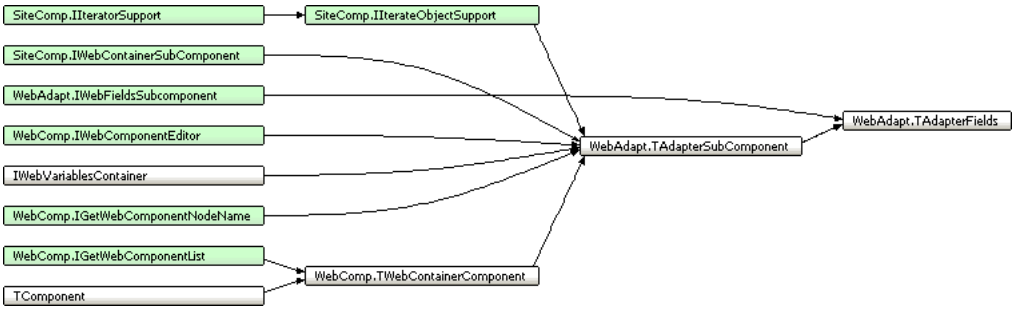
DoOnValidateValue (see page 5414)

IActionFieldValue

57.1.18 TAdapterFields Class

TAdapterFields manages the list of fields that belong to an adapter.

Class Hierarchy



Pascal

```
TAdapterFields = class(TAdapterSubComponent, IWebFieldsSubcomponent);
```

C++

```
class TAdapterFields : public TAdapterSubComponent, public IWebFieldsSubcomponent;
```

File

WebAdapt

Description

TAdapterFields is the type of the Data property on an adapter component. It manages a list that contains all the fields that belong to the adapter. The field objects (TAdapterNamedField (see page 5339) descendants) are available using the WebFields (see page 5270) property. TAdapterFields also includes support for associating the fields with variable names so that server-side script can use the field values.

TAdapterFields represents the list of explicitly assigned fields. Adapters that include a set of default fields use a TAdapterDefaultFields (see page 5226) object instead.

See Also

TCustomAdapter (see page 5519)

TAdapterActions (see page 5198)

TAdapterDefaultActions (see page 5220)

TAdapterDefaultFields (see page 5226)

TAdapterNamedField (see page 5339)

57.1.18.1 TAdapterFields Members

The following tables list the members exposed by TAdapterFields.

Protected Methods

	Name	Description
	AdapterCanAddClass (see page 5267)	Indicates whether the associated adapter supports a specified class of field component.
	CanAddClass (see page 5396)	Indicates whether an object of a specified type can be added to this collection.
	EndIterator (see page 5397)	Stops the TAdapterSubComponent (see page 5394) object from iterating over the Web items it lists.
V	FindNamedVariable (see page 5397)	Returns the item from this list with a specified variable name.
	FindVariable (see page 5398)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 5398)	Returns the Web module that contains a specified item from this list.
V	GetChildren (see page 6038)	Executes a callback for each child Web item.
	GetCurrentObject (see page 5399)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 5399)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
V	GetDefaultWebComponents (see page 6039)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetVariable (see page 5400)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 5401)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 5401)	Returns the value of the VariablesInUse (see page 5407) property.
	GetWebComponentNodeName (see page 5401)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 6039)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 5268)	Provides the underlying implementation for the CanAddClass (see page 5396) method.
V	ImplGetDefaultComponentList (see page 6039)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetWebComponentNodeName (see page 5269)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
	NextIteration (see page 5403)	Changes the current object to the next item that has a variable name.
	NotifyAdapterChange (see page 5404)	Notifies the associated adapter when the list of items changes.
V	SetChildOrder (see page 6040)	Positions a child component in the list of child Web items.

	SetDefaultWebComponents (see page 5404)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetDefaultWebComponents (see page 6040)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetWebParent (see page 5269)	Associates this component with an adapter.
	StartIterator (see page 5406)	Makes the first child item with a variable name the current object.

Protected Properties

	Name	Description
	Adapter (see page 5406)	Indicates the adapter that uses this object to manage its fields or actions.
	VariablesInUse (see page 5407)	Lists those fields or actions in the collection for which variables are defined.
	WebContainerComponentHelper (see page 6041)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	CanAddClass (see page 6074)	Indicates whether a specified class can be used as a child Web item.
	Create (see page 6037)	Creates and initializes an instance of TWebContainerComponent (see page 6036).
	Destroy (see page 6038)	Frees an instance of TWebContainerComponent (see page 6036).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetComponentList (see page 6055)	This is GetComponentList, a member of class IGetWebComponentList.
	GetCurrentObject (see page 993)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultComponentList (see page 6055)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetParentComponent (see page 5400)	Returns the associated adapter.
	GetWebComponentNodeName (see page 6056)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.
	HasParent (see page 5402)	Indicates whether this component has an associated adapter.
	NextIteration (see page 997)	Advances to the objects next item.
	ReadState (see page 5404)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetParentComponent (see page 5405)	Sets the Adapter (see page 5406) property to be the same as this component's parent.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
	WebFields (see page 5270)	Lists the field components that this object manages.

57.1.18.2 TAdapterFields Methods

The methods of the TAdapterFields class are listed here.

Protected Methods

	Name	Description
	AdapterCanAddClass (see page 5267)	Indicates whether the associated adapter supports a specified class of field component.
	ImplCanAddClass (see page 5268)	Provides the underlying implementation for the CanAddClass (see page 5396) method.
	ImplGetWebComponentNodeName (see page 5269)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
	SetWebParent (see page 5269)	Associates this component with an adapter.

57.1.18.2.1 TAdapterFields.AdapterCanAddClass Method

Indicates whether the associated adapter supports a specified class of field component.

Pascal

```
function AdapterCanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean AdapterCanAddClass(TComponent * AParent, TClass AClass);
```

Description

TAdapterActions (see page 5198) uses this method internally as part of its implementation for the CanAddClass (see page 5396) method. This allows the TAdapterFields (see page 5265) object to indicate, at design time, which types of components are valid as members of the WebFields (see page 5270) property list.

AParent is the instance of TAdapterFields (see page 5265) to which the child fields are to be added.

AClass describes the class of the child component to be added to AParent.

AdapterCanAddClass returns true if the adapter recognizes and supports AClass as a child field, false otherwise.

AdapterCanAddClass calls the CanAddFieldClass method of its associated adapter to determine whether it accepts the specified field class.

See Also

WebFields (see page 5270)

Adapter (see page 5406)

ImplCanAddClass (see page 5268)

CanAddFieldClass (see page 5527)

57.1.18.2.2 TAdapterFields.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 5396) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 5396) method calls ImplCanAddClass to determine whether an object of a specified type can be added to this collection.

AParent is the TAdapterFields (see page 5265) object to which the Web item will be added.

AClass is the class of the proposed child item.

ImplCanAddClass returns true if the TAdapterFields (see page 5265) object can include a child of type AClass, false otherwise.

ImplCanAddClass returns true if one of the following two conditions is met:

AClass is an adapter field class that the associated adapter recognizes and accepts.

AClass is a data entry field (a descendant of TAdapterUpdateField (see page 5407)).

See Also

CanAddClass (see page 5396)

AdapterCanAddClass (see page 5267)

TAdapterUpdateField (see page 5407)

57.1.18.2.3 TAdapterFields.ImplGetWebComponentNodeName Method

Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.

Pascal

```
function ImplGetWebComponentNodeName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetWebComponentNodeName();
```

Description

The GetWebComponentNodeName (see page 5401) method calls ImplGetWebComponentNodeName to obtain a label for the type of items in the collection.

ImplGetWebComponentNodeName returns the string 'Fields'.

See Also

GetWebComponentNodeName (see page 5401)

57.1.18.2.4 TAdapterFields.SetWebParent Method

Associates this component with an adapter.

Pascal

```
procedure SetWebParent(const Value: TComponent); override;
```

C++

```
virtual __fastcall SetWebParent(const TComponent * Value);
```

Description

SetWebParent sets up the association between this component and its parent adapter.

Value is the adapter component that acts as a parent to this collection.

SetWebParent assigns Value to the protected Adapter (see page 5406) property and replaces that adapter's Data property with this TAdapterFields (see page 5265) instance.

See Also

Data (see page 5558)

Adapter (see page 5406)

57.1.18.3 TAdapterFields Properties

The properties of the TAdapterFields class are listed here.

Public Properties

	Name	Description
	WebFields (see page 5270)	Lists the field components that this object manages.

57.1.18.3.1 TAdapterFields.WebFields Property

Lists the field components that this object manages.

Pascal

```
property WebFields: TWebComponentList;
```

C++

```
__property TWebComponentList WebFields;
```

Description

Read (see page 3727) WebFields to access the list of field components. Each component in this list is a descendant of TAdapterNamedField (see page 5339).

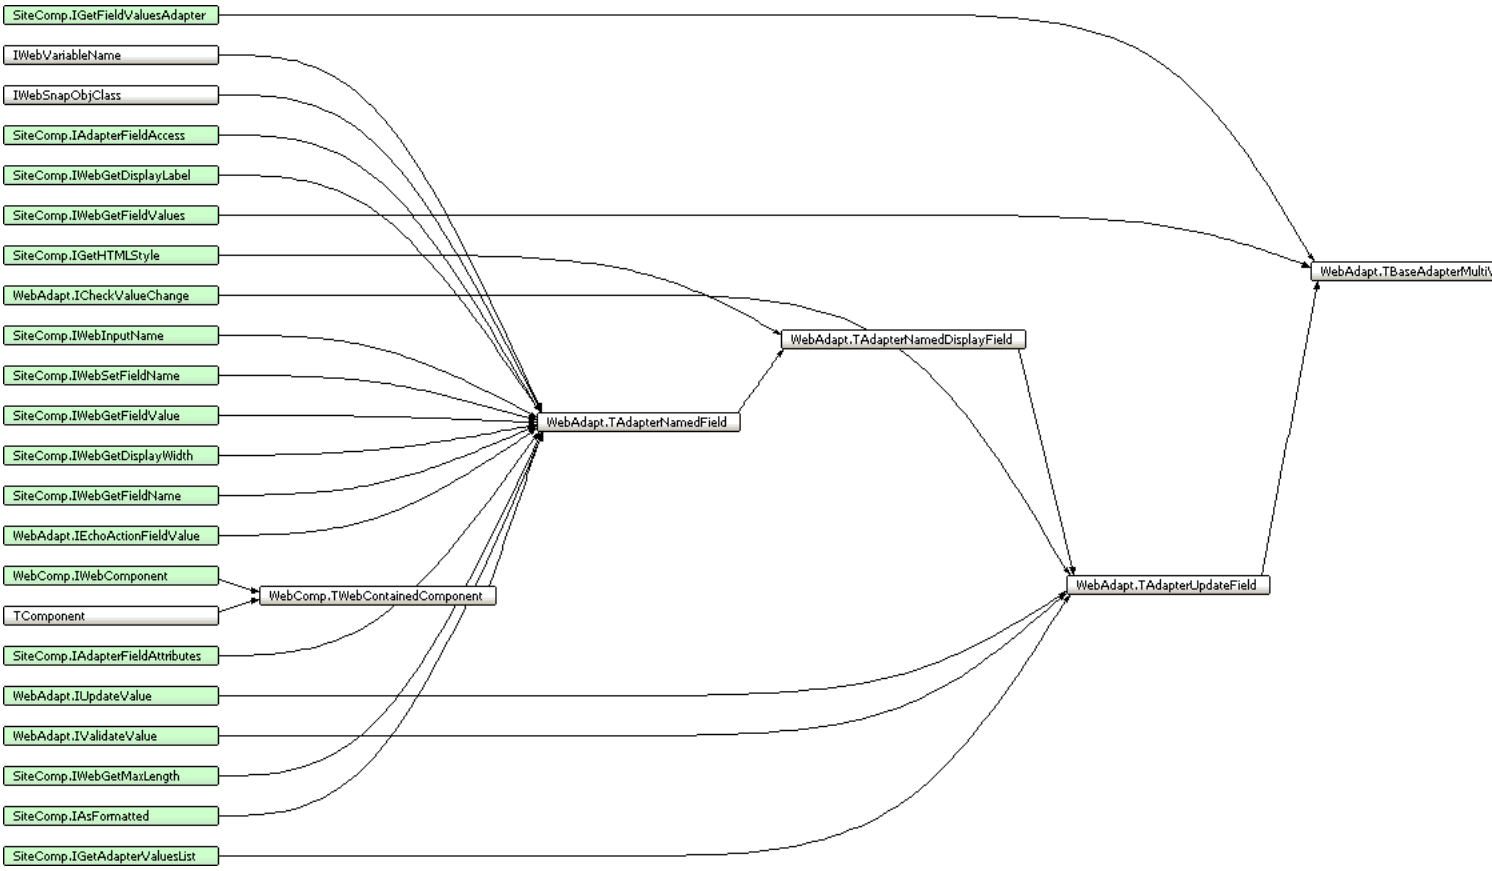
See Also

TAdapterNamedField (see page 5339)

57.1.19 TAdapterFileField Class

TAdapterFileField is an event handler based adapter field that can accept uploaded files.

Class Hierarchy



Pascal

```
TAdapterFileField = class(TCustomAdapterFileField);
```

C++

```
class TAdapterFileField : public TCustomAdapterFileField;
```

File

WebAdapt

Description

TAdapterFileField publishes the properties in TCustomAdapterFileField (see page 5590). TCustomAdapterFileField (see page 5590) calls event handlers to retrieve the adapter field's filenames, validate files uploaded by the end-user, and update the adapter field's files.

Add TAdapterFileField to TAdapter (see page 5179) or other adapter components types when you need an adapter field that supports files using event handlers. There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. See TAdapterField (see page 5256), TAdapterMultiValueField (see page 5320), TAdapterMemoField (see page 5312), TAdapterBooleanField (see page 5212) and TAdapterImageField (see page 5297).

See Also

TCustomAdapterFileField (see page 5590)

TAdapter (see page 5179)

TAdapterField (see page 5256)

TAdapterMemoField (see page 5312)

TAdapterMultiValueField (see page 5320)

TAdapterBooleanField (see page 5212)

TAdapterImageField (see page 5297)

57.1.19.1 TAdapterFileField Members

The following tables list the members exposed by TAdapterFileField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5412)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5413)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5413)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5413)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5414)	Validates field values entered by the end-user.
V	DoOnValidateValue (see page 5595)	Validates files uploaded by the end-user.
	EndValueIterator (see page 5481)	Completes iteration.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5414)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 5481)	Implements IWebGetFieldValues (see page 1034)' GetCurrentValue.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
V	GetDisplayStyleType (see page 5595)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 5482)	Returns the adapter object that implements the Values property.
	GetFileNames (see page 5596)	Returns the count of files associated with this adapter field.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 5414)	Indicates the preferred HTML element to use when editing this adapter field's value.
V	GetInputStyleType (see page 5596)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
V	GetValueCount (see page 5415)	Provides the number of values associated with this adapter field.
V	GetValueCount (see page 5482)	Returns the number of values associated with this adapter field.

	GetValueCount (see page 5596)	Returns the number of values associated with this adapter field.
	GetValues (see page 5415)	Returns one of the values provided by this adapter field.
	GetValues (see page 5482)	Returns one of the values associated with the adapter field.
	GetValues (see page 5597)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 5483)	Implements IWebGetFieldValues (see page 1034)' HasValue method.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 5415)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5416)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplCheckValueChange (see page 5597)	Indicates whether the end-user may have uploaded new files for this adapter field.
	ImplGetCurrentValue (see page 5483)	Implements IWebGetFieldValues (see page 1034)' GetCurrentValue (see page 5481) method.
	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 5416)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 5416)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 5417)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetFieldValuesAdapter (see page 5483)	Returns the adapter object that implements the Values property.
	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5417)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasValue (see page 5484)	Implements IWebGetFieldValues (see page 1034)' HasValue (see page 5483) method.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5417)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5417)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5418)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 5597)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 5418)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5418)	Indicates whether this adapter field can support multiple values.
	NextValueIteration (see page 5484)	Implements IWebGetFieldValues (see page 1034)' NextValueIteration method.

	Notification (see page 5419)	Clears references to a deleted component.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	StartValueIterator (see page 5484)	Implements IWebGetFieldValues (see page 1034)' StartValueIterator method.
	UpdateValue (see page 5419)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5419)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5421)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5421)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5864)	This is CheckValueChange, a member of class ICheckValueChange.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 5411)	Creates an instance of TAdapterUpdateField (see page 5407).
	Create (see page 5480)	Constructor for TBaseAdapterMultiValueField (see page 5475).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 5480)	Destructor for TBaseAdapterMultiValueField (see page 5475).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	EndValueIterator (see page 1035)	Indicate the iteration is finished.
	GetAdapterValuesList (see page 969)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetCurrentValue (see page 1035)	Retrieves the current value as a variant.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetFieldValuesAdapter (see page 972)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.

	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasValue (see page 1035)	Indicates whether the adapter field has a matching value.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	NextValueIteration (see page 1036)	Position the iteration pointer on the next value.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	StartValueIterator (see page 1036)	Reset (see page 3734) the iteration pointer to the first item.
	UpdateValue (see page 5878)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5879)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FileCount (see page 5598)	Returns one of the filenames associated with this adapter field.
R	FileNames (see page 5598)	Returns a file associated with this adapter field.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
R	Value (see page 5420)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5420)	Associates a list of values with the adapter field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetFileCount (see page 5278)	Returns the number of values associated with this adapter field.
	OnGetFileNames (see page 5279)	Returns one of the filenames associated with the adapter field.
	OnUploadFiles (see page 5279)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateFiles (see page 5279)	Validates values entered by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 5276)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5276)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5277)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5277)	Identifies the rights required to update this field.
	ReadOnly (see page 5277)	Indicates whether this adapter field is read-only.
	Required (see page 5278)	Indicates whether the end-user must enter a value for this adapter field.
	ViewAccess (see page 5278)	Identifies the rights required to view this field.

57.1.19.2 TAdapterFileField Properties

The properties of the TAdapterFileField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5276)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5276)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5277)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5277)	Identifies the rights required to update this field.
	ReadOnly (see page 5277)	Indicates whether this adapter field is read-only.
	Required (see page 5278)	Indicates whether the end-user must enter a value for this adapter field.
	ViewAccess (see page 5278)	Identifies the rights required to view this field.

57.1.19.2.1 TAdapterFileField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.19.2.2 TAdapterFileField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.19.2.3 TAdapterFileField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.19.2.4 TAdapterFileField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

hasmodifyaccess (see page 5539)

57.1.19.2.5 TAdapterFileField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 5336)

57.1.19.2.6 TAdapterFileField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 5347)

57.1.19.2.7 TAdapterFileField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

HasViewAccess (see page 5539)

57.1.19.3 TAdapterFileField Events

The events of the TAdapterFileField class are listed here.

Published Events

	Name	Description
	OnGetFileCount (see page 5278)	Returns the number of values associated with this adapter field.
	OnGetFileNames (see page 5279)	Returns one of the filenames associated with the adapter field.
	OnUploadFiles (see page 5279)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateFiles (see page 5279)	Validates values entered by the end-user.

57.1.19.3.1 TAdapterFileField.OnGetFileCount Event

Returns the number of values associated with this adapter field.

Pascal

```
property OnGetFileCount: TAdapterFieldGetValueCountEvent;
```

C++

```
__property TAdapterFieldGetValueCountEvent OnGetFileCount;
```

Description

Write an OnGetFileCount event handler to indicate the number of filenames associated with this adapter field.

See Also

GetValueCount (see page 5596)

57.1.19.3.2 TAdapterFileField.OnGetFileNames Event

Returns one of the filenames associated with the adapter field.

Pascal

```
property OnGetFileNames: TAdapterFieldGetMultiValueStringEvent;
```

C++

```
__property TAdapterFieldGetMultiValueStringEvent OnGetFileNames;
```

Description

Write an OnGetFileNames event handler to provide the names of files associated with this adapter field.

See Also

GetFileNames (see page 5596)

57.1.19.3.3 TAdapterFileField.OnUploadFiles Event

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
property OnUploadFiles: TAdapterFieldFileListEvent;
```

C++

```
__property TAdapterFieldFileListEvent OnUploadFiles;
```

Description

OnUploadFiles is called by ImplUpdateValue. Write an OnUploadFiles event handler to accept files uploaded by the end-user. Raise an exception to indicate an error.

See Also

ImplUpdateValue (see page 5597)

TUpdateFileList (see page 5850)

57.1.19.3.4 TAdapterFileField.OnValidateFiles Event

Validates values entered by the end-user.

Pascal

```
property OnValidateFiles: TAdapterFieldFileListEvent;
```

C++

```
__property TAdapterFieldFileListEvent OnValidateFiles;
```

Description

OnValidateFiles is called by DoOnValidateValue. Implement this event handler to validate files uploaded by the end-user. Raise an exception to indicate a validation error.

See Also

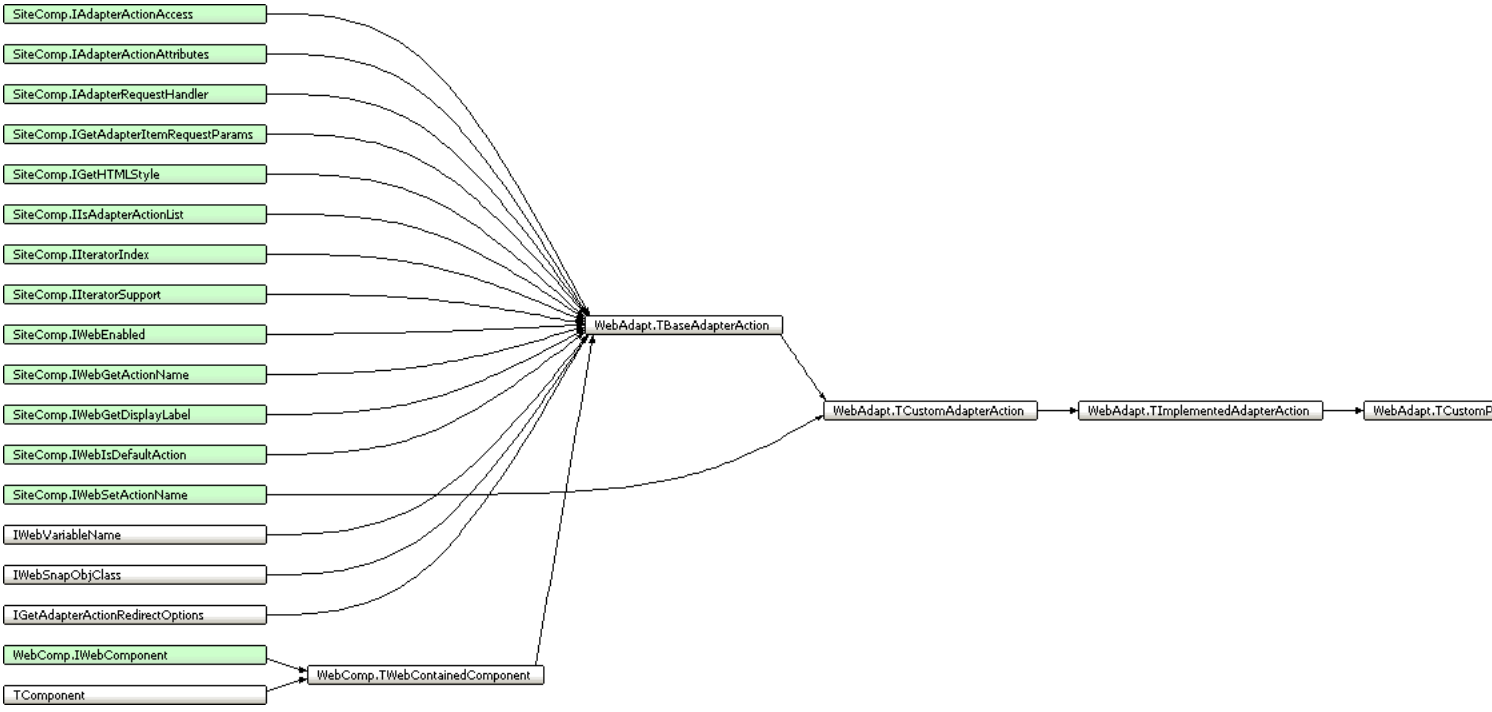
DoOnValidateValue (see page 5595)

TUpdateFileList (see page 5850)

57.1.20 TAdapterGotoPageAction Class

TAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 5733).

Class Hierarchy



Pascal

```
TAdapterGotoPageAction = class(TCustomAdapterGotoPageAction);
```

C++

```
class TAdapterGotoPageAction : public TCustomAdapterGotoPageAction;
```

File

WebAdapt

Description

TAdapterGotoPageAction is an adapter action that has a list of commands. Each command has a parameter that identifies a page in the parent adapter. When executed, TAdapterGotoPageAction changes the current page in the parent adapter. TAdapterGotoPageAction publishes the properties of TCustomAdapterGotoPageAction (see page 5600). Add TAdapterGotoPageAction to a descendant class of TDefaultFieldsPagedAdapter (see page 5733) such as TPagedAdapter (see page 5830).

See Also

TCustomAdapterGotoPageAction (see page 5600)

TDefaultFieldsPagedAdapter (see page 5733)

TPagedAdapter (see page 5830)

TAdapterNextPageAction (see page 5358)

TAdapterPrevPageAction (see page 5384)

57.1.20.1 TAdapterGotoPageAction Members

The following tables list the members exposed by TAdapterGotoPageAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5440)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5440)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5441)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5441)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5442)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5442)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5443)	Implements IIteratorSupport (see page 996)'s EndIterator method.
	ExecuteActionRequest (see page 5443)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5444)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5444)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 5713)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 5444)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5445)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultActionName (see page 5605)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5445)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5445)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5445)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5446)	Suggests an HTML display type for this adapter action.
V	GetDisplayStyleType (see page 5605)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5446)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 5446)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5447)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5447)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5448)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5448)	Returns the number of commands defined by this adapter action.
V	GetItemCount (see page 5606)	Returns the number of commands defined by this adapter action.

	GetIteratorIndex (see page 5448)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5449)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5449)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5450)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5450)	Suggests a view mode for this adapter action.
	GetVisible (see page 5450)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5451)	Returns the class type for this adapter field.
	HandleRequest (see page 5451)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5451)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5452)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5452)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5443) method.
V	ImplExecuteActionRequest (see page 5452)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplExecuteActionRequest (see page 5570)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplExecuteActionRequest (see page 5606)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5453)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 5570)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5453)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 5570)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 5606)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5453)	Returns the suggested display label for this adapter action.
V	ImplGetDisplayLabel (see page 5607)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5454)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 5454)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 5454)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIsAdapterActionList (see page 5607)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 5455)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5448) method.
V	ImplGetSuccessOptions (see page 5455)	Indicates whether to perform an HTTP redirect after successfully executing this action.
V	ImplGetSuccessOptions (see page 5571)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 5456)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	ImplHandleRequest (see page 5456)	Executes the adapter action and generates a response.
V	ImplHasExecuteAccess (see page 5456)	Checks the end-user's right to execute this adapter action.
V	ImplInIterator (see page 5457)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5459) method.
V	ImplIsDefaultAction (see page 5457)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	ImplIsDefaultAction (see page 5608)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5458)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5460) method.
	ImplSetActionName (see page 5571)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5458)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5461) method.
V	ImplWebEnabled (see page 5458)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	ImplWebEnabled (see page 5571)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	ImplWebEnabled (see page 5608)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5459)	Implements IIteratorIndex (see page 994)'s InIterator method.

	IsDefaultAction (see page 5459)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5460)	Implements IIteratorSupport (see page 996)'s NextIteration method.
V	ParentChanged (see page 5460)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
V	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5572)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5460)	Set the value of the DisplayLabel (see page 5462) property.
V	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	StartIterator (see page 5461)	Implements IIteratorSupport (see page 996)'s StartIterator method.
	WebEnabled (see page 5461)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
R	Adapter (see page 5462)	Provides access to the parent adapter component.
R	Adapter (see page 5713)	Returns the parent adapter of this adapter action.
R	Errors (see page 5463)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
R	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 5574)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5575)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
V	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	CreateRequestContext (see page 955)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetActionName (see page 1029)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 966)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 991)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 926)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 955)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 925)	This is HasExecuteAccess, a member of class IAdapterActionAccess.

V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1042)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 997)	Advances to the objects next item.
	SetActionName (see page 1056)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
	WebEnabled (see page 1026)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 1029)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 5462)	Identifies the name of this action when using server-side script.
	ActionName (see page 5572)	Identifies the name of this action when using server-side script.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5462)	Suggests a display label for this adapter action.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 991)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5463)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5464)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 995)	Indicates the index of the current item.
R	Visible (see page 926)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 5286)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5286)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5286)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5287)	Called before the adapter action response is generated.
	OnGetPageName (see page 5287)	Provides the display labels for each goto page command.
	OnGetParams (see page 5288)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	ExecuteAccess (see page 5285)	Defines the rights required to execute this action.
	RedirectOptions (see page 5285)	Indicates whether to perform an HTTP redirect after successfully executing this action.

57.1.20.2 TAdapterGotoPageAction Properties

The properties of the TAdapterGotoPageAction class are listed here.

Published Properties

	Name	Description
	ExecuteAccess (see page 5285)	Defines the rights required to execute this action.
	RedirectOptions (see page 5285)	Indicates whether to perform an HTTP redirect after successfully executing this action.

57.1.20.2.1 TAdapterGotoPageAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property UnicodeString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 6759)

hasexecuteaccess (see page 5539)

57.1.20.2.2 TAdapterGotoPageAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect

57.1.20.3 TAdapterGotoPageAction Events

The events of the TAdapterGotoPageAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 5286)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5286)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5286)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5287)	Called before the adapter action response is generated.
	OnGetPageName (see page 5287)	Provides the display labels for each goto page command.
	OnGetParams (see page 5288)	Specifies name/value pairs needed to execute this adapter action.

57.1.20.3.1 TAdapterGotoPageAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 5441)

OnAfterExecuteAction (see page 5561)

OnBeforeExecute (see page 5465)

57.1.20.3.2 TAdapterGotoPageAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.20.3.3 TAdapterGotoPageAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 5442)

OnAfterExecute (see page 5465)

OnBeforeExecuteAction (see page 5563)

57.1.20.3.4 TAdapterGotoPageAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.20.3.5 TAdapterGotoPageAction.OnGetPageName Event

Provides the display labels for each goto page command.

Pascal

```
property OnGetPageName: TWebFormGetPageNameEvent;
```

C++

```
__property TWebFormGetPageNameEvent OnGetPageName;
```

Description

Implement this event handler to specify display labels for the commands that goto pages in the parent adapter. APageIndex is the zero-based index of the page to goto.

See Also

ImplGetDisplayLabel (see page 5607)

57.1.20.3.6 TAdapterGotoPageAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

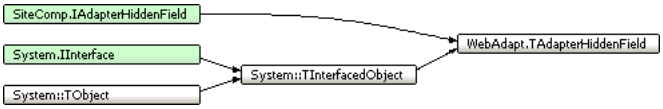
Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

ImplGetAdapterItemRequestParams (see page 5453)

57.1.21 TAdapterHiddenField Class

Class Hierarchy



Pascal

```
TAdapterHiddenField = class(TInterfacedObject, IAdapterHiddenField);
```

C++

```
class TAdapterHiddenField : public TInterfacedObject, public IAdapterHiddenField;
```

File

WebAdapt

Description

This is class WebAdapt.TAdapterHiddenField.

57.1.21.1 TAdapterHiddenField Members

The following tables list the members exposed by TAdapterHiddenField.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.

	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	GetName (see page 5290)	This is GetName, a member of class TAdapterHiddenField.
	GetValue (see page 5290)	This is GetValue, a member of class TAdapterHiddenField.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5290)	This is Create, a member of class TAdapterHiddenField.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Name (see page 945)	This is Name, a member of class IAdapterHiddenField.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

	Value (see page 945)	This is Value, a member of class IAdapterHiddenField.

57.1.21.2 TAdapterHiddenField.Create Constructor

Pascal

```
constructor Create(AHiddenFields: TAdapterHiddenFieldsList; AIndex: Integer);
```

C++

```
__fastcall TAdapterHiddenField(TAdapterHiddenFieldsList AHiddenFields, int AIndex);
```

Description

This is Create, a member of class TAdapterHiddenField.

57.1.21.3 TAdapterHiddenField Methods

The methods of the TAdapterHiddenField class are listed here.

Protected Methods

	Name	Description
	GetName (see page 5290)	This is GetName, a member of class TAdapterHiddenField.
	GetValue (see page 5290)	This is GetValue, a member of class TAdapterHiddenField.

57.1.21.3.1 TAdapterHiddenField.GetName Method

Pascal

```
function GetName: string;
```

C++

```
__fastcall UnicodeString GetName();
```

Description

This is GetName, a member of class TAdapterHiddenField.

57.1.21.3.2 TAdapterHiddenField.GetValue Method

Pascal

```
function GetValue: string;
```

C++

```
__fastcall UnicodeString GetValue();
```

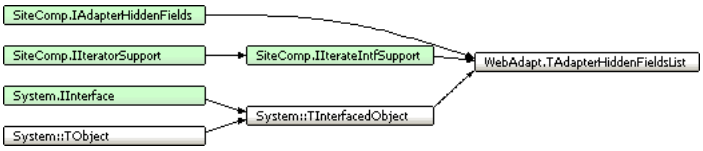
Description

This is GetValue, a member of class TAdapterHiddenField.

57.1.22 TAdapterHiddenFieldsList Class

TAdapterHiddenFieldsList maintains a collection of name/value pairs that an adapter includes as hidden fields in an HTML form.

Class Hierarchy



Pascal

```
TAdapterHiddenFieldsList = class(TInterfacedObject, IAdapterHiddenFields, IIterateIntfSupport);
```

C++

```
class TAdapterHiddenFieldsList : public TInterfacedObject, public IAdapterHiddenFields, public
IIterateIntfSupport;
```

File

WebAdapt

Description

Adapter components create instances of TAdapterHiddenFieldsList to store the name/value pairs they include as hidden fields in HTML forms. Each entry in the list has a field name and a value for that field. The adapter uses the methods of TAdapterHiddenFieldsList to add name/value pairs to the list, based on its hidden field options. When an adapter page producer generates a form using the adapter, it includes hidden fields for every name/value pair in the list. Those hidden fields are then included in any request that originates from the resulting HTML form, so that the adapter and its subcomponents can access those values to respond to the request.

For example, dataset adapters that have a Mode property that indicates whether the form is used for read-only browsing, inserting a new record, editing an existing record, or generating a query. The adapter includes the current mode as a hidden field. When the WebSnap application receives a message from the HTML form with that hidden field, the adapter can reestablish the correct mode for processing the request.

57.1.22.1 TAdapterHiddenFieldsList Members

The following tables list the members exposed by TAdapterHiddenFieldsList.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.

	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	EndIterator (see page 5295)	This is EndIterator, a member of class TAdapterHiddenFieldsList.
	GetCurrentIntf (see page 5295)	This is GetCurrentIntf, a member of class TAdapterHiddenFieldsList.
	GetField (see page 5295)	This is GetField, a member of class TAdapterHiddenFieldsList.
	GetFieldCount (see page 5295)	This is GetFieldCount, a member of class TAdapterHiddenFieldsList.
	NextIteration (see page 5295)	Advances to the objects next item.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	StartIterator (see page 5296)	This is StartIterator, a member of class TAdapterHiddenFieldsList.

Protected Properties

	Name	Description
R	FieldCount (see page 5296)	This is FieldCount, a member of class TAdapterHiddenFieldsList.
R	Fields (see page 5296)	This is Fields, a member of class TAdapterHiddenFieldsList.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	Add (see page 5294)	Adds a name/value pair to the list.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 5294)	Clears the list of all the name/value pairs it currently holds.
	Create (see page 5293)	Creates and initializes a TAdapterHiddenFieldsList (see page 5290) object.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 5293)	Frees an instance of TAdapterHiddenFieldsList (see page 5290).
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.

	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

57.1.22.2 TAdapterHiddenFieldsList.Create Constructor

Creates and initializes a TAdapterHiddenFieldsList (see page 5290) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAdapterHiddenFieldsList();
```

Description

Typically, applications have no need to create TAdapterHiddenFieldsList (see page 5290) instances. The adapter component creates and maintains its own internal TAdapterHiddenFieldsList (see page 5290) objects, which it uses to store the hidden fields it needs to add to HTML forms.

See Also

listhiddenfields (see page 5550)

ListHiddenRecordFields (see page 5550)

57.1.22.3 TAdapterHiddenFieldsList.Destroy Destructor

Frees an instance of TAdapterHiddenFieldsList (see page 5290).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterHiddenFieldsList();
```

Description

Do not use the Destroy method directly to free a TAdapterHiddenFieldsList (see page 5290) instance. Instead, use the Free method, which checks that the TAdapterHiddenFieldsList (see page 5290) reference is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3382)

57.1.22.4 TAdapterHiddenFieldsList Methods

The methods of the TAdapterHiddenFieldsList class are listed here.

Protected Methods

	Name	Description
	EndIterator (see page 5295)	This is EndIterator, a member of class TAdapterHiddenFieldsList.
	GetCurrentIntf (see page 5295)	This is GetCurrentIntf, a member of class TAdapterHiddenFieldsList.
	GetField (see page 5295)	This is GetField, a member of class TAdapterHiddenFieldsList.
	GetFieldCount (see page 5295)	This is GetFieldCount, a member of class TAdapterHiddenFieldsList.
	NextIteration (see page 5295)	Advances to the objects next item.
	StartIterator (see page 5296)	This is StartIterator, a member of class TAdapterHiddenFieldsList.

Public Methods

	Name	Description
	Add (see page 5294)	Adds a name/value pair to the list.
	Clear (see page 5294)	Clears the list of all the name/value pairs it currently holds.

57.1.22.4.1 TAdapterHiddenFieldsList.Add Method

Adds a name/value pair to the list.

Pascal

```
procedure Add(const AName: string; const AValue: string);
```

C++

```
__fastcall Add(const UnicodeString AName, const UnicodeString AValue);
```

Description

Call Add to add a new name/value pair to the list of hidden fields that the adapter maintains.

AName is the name of the field.

AValue is the value of the field.

See Also

Clear (see page 5294)

57.1.22.4.2 TAdapterHiddenFieldsList.Clear Method

Clears the list of all the name/value pairs it currently holds.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the TAdapterHiddenFieldsList (see page 5290) object. Clear discards any name/value pairs that have been added previously by a call to the Add (see page 5294) method.

See Also

Add (see page 5294)

57.1.22.4.3 TAdapterHiddenFieldsList.EndIterator Method

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

This is EndIterator, a member of class TAdapterHiddenFieldsList.

57.1.22.4.4 TAdapterHiddenFieldsList.GetCurrentIntf Method

Pascal

```
function GetCurrentIntf(OwnerData: Pointer): IUnknown;
```

C++

```
__fastcall IUnknown GetCurrentIntf(void * OwnerData);
```

Description

This is GetCurrentIntf, a member of class TAdapterHiddenFieldsList.

57.1.22.4.5 TAdapterHiddenFieldsList.GetField Method

Pascal

```
function GetField(I: Integer): IAdapterHiddenField;
```

C++

```
__fastcall IAdapterHiddenField GetField(int I);
```

Description

This is GetField, a member of class TAdapterHiddenFieldsList.

57.1.22.4.6 TAdapterHiddenFieldsList.GetFieldCount Method

Pascal

```
function GetFieldCount: Integer;
```

C++

```
__fastcall int GetFieldCount();
```

Description

This is GetFieldCount, a member of class TAdapterHiddenFieldsList.

57.1.22.4.7 TAdapterHiddenFieldsList.NextIteration Method

Advances to the objects next item.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Server-side script calls NextIteration to move to the next item.

OwnerData is a pointer to information that the object can use to influence the iteration process. Each object stores and uses this information in its own way. This information is first supplied by the initial call to the StartIterator method. NextIteration can modify the information, after which it is supplied to the next call to the NextIteration or EndIterator method.

NextIteration returns true if it successfully moves to the next item, false if there were no more items.

startiterator (see page 998)

enditerator (see page 997)

57.1.22.4.8 TAdapterHiddenFieldsList.StartIterator Method

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

This is StartIterator, a member of class TAdapterHiddenFieldsList.

57.1.22.5 TAdapterHiddenFieldsList Properties

The properties of the TAdapterHiddenFieldsList class are listed here.

Protected Properties

	Name	Description
R	FieldCount (see page 5296)	This is FieldCount, a member of class TAdapterHiddenFieldsList.
R	Fields (see page 5296)	This is Fields, a member of class TAdapterHiddenFieldsList.

57.1.22.5.1 TAdapterHiddenFieldsList.FieldCount Property

Pascal

```
property FieldCount: Integer;
```

C++

```
__property int FieldCount;
```

Description

This is FieldCount, a member of class TAdapterHiddenFieldsList.

57.1.22.5.2 TAdapterHiddenFieldsList.Fields Property

Pascal

```
property Fields [I: Integer]: IAdapterHiddenField;
```

C++

```
__property IAdapterHiddenField Fields[int I];
```

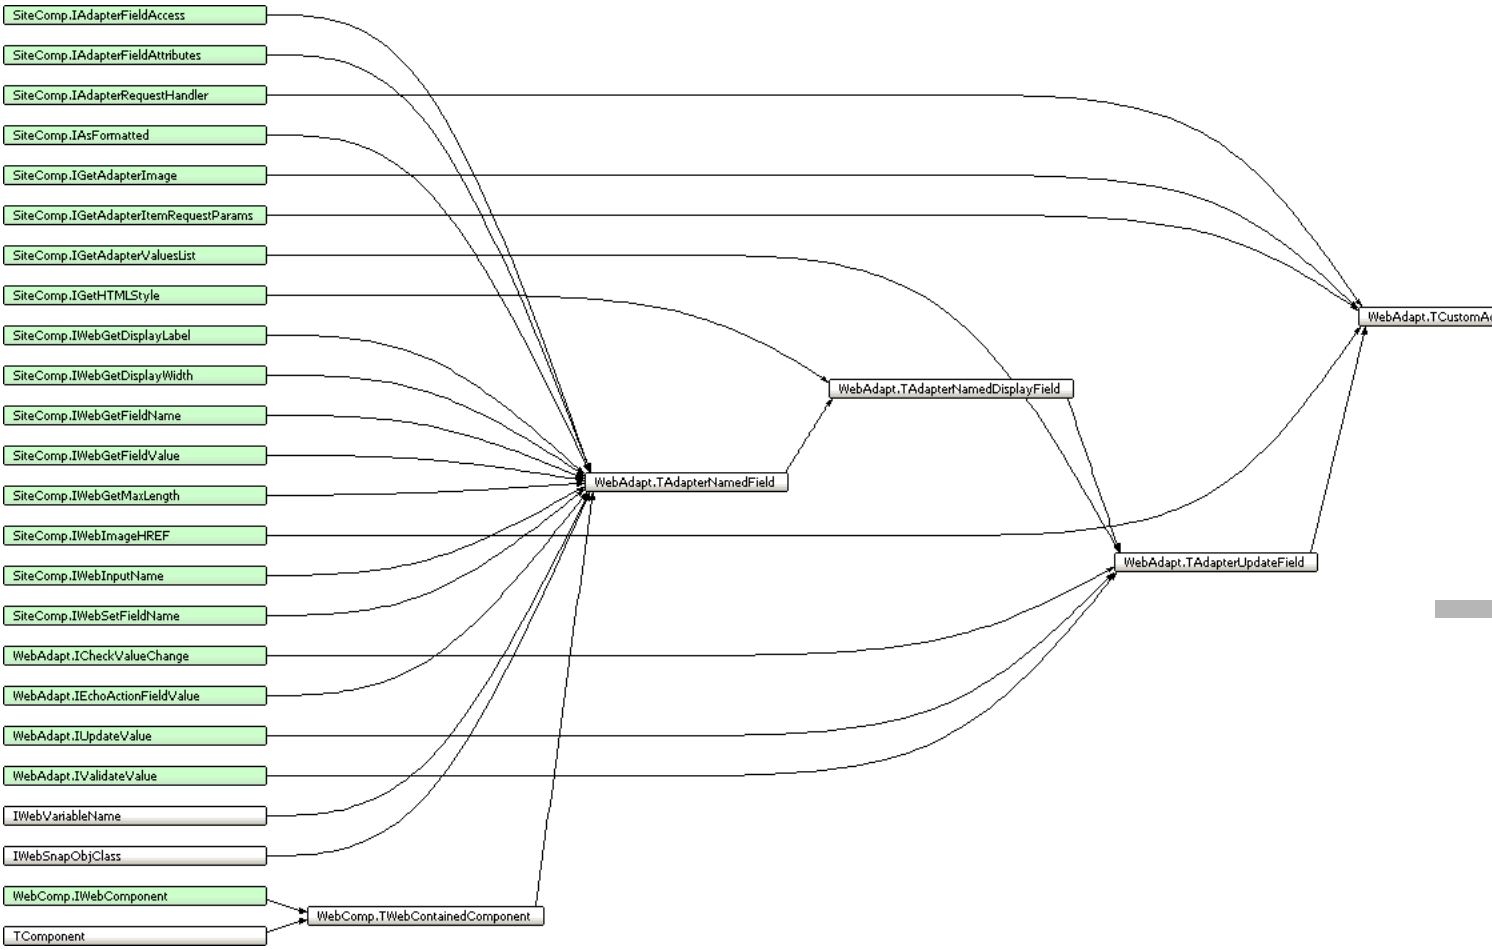
Description

This is Fields, a member of class TAdapterHiddenFieldsList.

57.1.23 TAdapterImageField Class

TAdapterImageField is an event handler based adapter field that can provide the URL of an image file and also accept an uploaded image file.

Class Hierarchy



Pascal

```
TAdapterImageField = class(TCustomAdapterImageField);
```

C++

```
class TAdapterImageField : public TCustomAdapterImageField;
```

File

WebAdapt

Description

TAdapterImageField publishes the properties in TCustomAdapterImageField (see page 5609). TCustomAdapterImageField (see page 5609) calls event handlers to retrieve the adapter field's image file name, image file, and image file URL. It also defines event handler that are called to validate files uploaded by the end-user, and update the adapter field's image file.

Add TAdapterFileField (see page 5270) to TAdapter (see page 5179) or other adapter components types when you need an adapter field that supports an image using event handlers. There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. See TAdapterField (see page 5256), TAdapterMultiValueField (see page 5320), TAdapterMemoField (see page 5312), TAdapterBooleanField (see page 5212) and TAdapterFileField (see page 5270).

See Also

TAdapterMultiValueField (see page 5320)

TAdapterBooleanField (see page 5212)

TAdapterFileField (see page 5270)

57.1.23.1 TAdapterImageField Members

The following tables list the members exposed by TAdapterImageField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5412)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5413)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5413)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5413)	Retrieves a value entered by the end-user.
	CreateRequestContext (see page 5614)	Creates AdapterRequest and AdapterResponse objects.
V	DoOnValidateValue (see page 5414)	Validates field values entered by the end-user.
V	DoOnValidateValue (see page 5614)	Validates files uploaded by the end-user.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetAdapterImage (see page 5615)	Provides an object that can be used to access the image properties of this adapter field.
	GetAdapterItemRequestParams (see page 5615)	Provides a unique identifier and a set of name/value pairs that will be used to create a URL and also be used later when a request is received to generate the adapter field's image file.
	GetAdapterValuesList (see page 5414)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.

	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
V	GetDisplayStyleType (see page 5616)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 5414)	Indicates the preferred HTML element to use when editing this adapter field's value.
V	GetInputStyleType (see page 5616)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
V	GetValueCount (see page 5415)	Provides the number of values associated with this adapter field.
V	GetValues (see page 5415)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HandleRequest (see page 5616)	Handles a request for the image file associated with this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 5415)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 5416)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplCheckValueChange (see page 5617)	Indicates whether the end-user may have uploaded a new image file for this adapter field.
	ImplCreateRequestContext (see page 5617)	Creates AdapterRequest and AdapterResponse objects.
V	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayLabel (see page 5416)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetDisplayWidth (see page 5416)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
V	ImplGetEchoActionFieldValue (see page 5417)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
V	ImplGetValue (see page 5618)	Returns the name of the image file associated with this adapter field.
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.

	ImplGetVariableName (see page 5417)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHandleRequest (see page 5618)	Handles a request for the image file associated with this adapter field.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5417)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5417)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5418)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 5619)	Updates the adapter field with value entered by the end-user.
	ImplValidateValue (see page 5418)	Validates values(s) entered by the end-user.
	ImplWebImageHREF (see page 5619)	Returns a URL that can be used to access the image file associated with this adapter field.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5418)	Indicates whether this adapter field can support multiple values.
	Notification (see page 5419)	Clears references to a deleted component.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	RenderAdapterImage (see page 5619)	Responds to a request for an image file by providing a stream containing the image.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	UpdateValue (see page 5419)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5419)	Validates values(s) entered by the end-user.
	WebImageHREF (see page 5620)	Returns a URL that can be used to access the image file associated with this adapter field.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5421)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5421)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5864)	This is CheckValueChange, a member of class ICheckValueChange.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 5411)	Creates an instance of TAdapterUpdateField (see page 5407).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).

	CreateRequestContext (see page 955)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetAdapterImage (see page 965)	This is GetAdapterImage, a member of class IGetAdapterImage.
	GetAdapterItemRequestParams (see page 966)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetAdapterValuesList (see page 969)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HandleRequest (see page 955)	Executes the adapter action and generates a response.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	UpdateValue (see page 5878)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5879)	This is ValidateValue, a member of class IValidateValue.
	WebImageHREF (see page 1040)	Retrieves a URL for an external image file.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
R	Value (see page 5420)	Retrieves the value associated with this adapter field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetHREF (see page 5306)	Provides the URL of an external image file associated with this adapter field.

	OnGetImage (see page 5306)	Retrieves a stream containing the image file associated with this adapter field.
	OnGetImageName (see page 5306)	Returns the name of the image file associated with this adapter field.
	OnGetParams (see page 5307)	Provides name/value pairs that identify this adapter field's image.
	OnUploadFile (see page 5307)	Updates this adapter field with an image file uploaded by the end-user.
	OnValidateFile (see page 5307)	Used to validate files uploaded by the end user.

Published Properties

	Name	Description
	DisplayLabel (see page 5302)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5303)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5303)	Identifies the name of this field when using server-side script.
	HREF (see page 5303)	Defines a URL that references the image associated with the adapter field.
	ModifyAccess (see page 5304)	Identifies the rights required to update this field.
	ReadOnly (see page 5304)	Indicates whether this adapter field is read-only.
	Required (see page 5304)	Indicates whether the end-user must enter a value for this adapter field.
	ValuesList (see page 5305)	Associates a list of values with the adapter field.
	ViewAccess (see page 5305)	Identifies the rights required to view this field.

57.1.23.2 TAdapterImageField Properties

The properties of the TAdapterImageField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5302)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5303)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5303)	Identifies the name of this field when using server-side script.
	HREF (see page 5303)	Defines a URL that references the image associated with the adapter field.
	ModifyAccess (see page 5304)	Identifies the rights required to update this field.
	ReadOnly (see page 5304)	Indicates whether this adapter field is read-only.
	Required (see page 5304)	Indicates whether the end-user must enter a value for this adapter field.
	ValuesList (see page 5305)	Associates a list of values with the adapter field.
	ViewAccess (see page 5305)	Identifies the rights required to view this field.

57.1.23.2.1 TAdapterImageField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.23.2.2 TAdapterImageField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.23.2.3 TAdapterImageField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.23.2.4 TAdapterImageField.HREF Property

Defines a URL that references the image associated with the adapter field.

Pascal

```
property HREF: string;
```

C++

```
__property UnicodeString HREF;
```

Description

Use the HREF property when this adapter field is associated with an external image file URL. Use the OnGetHREF event to dynamically define an external image file URL. If the image file will be dynamically generated, use the OnGetImage and OnGetImageParams event handlers instead of the HREF property or the OnGetHREF event handler.

See Also

ImplWebImageHREF (see page 5619)

OnGetHREF (see page 5621)

OnGetImage (see page 5622)

OnGetImageName (see page 5622)

57.1.23.2.5 TAdapterImageField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

hasmodifyaccess (see page 5539)

57.1.23.2.6 TAdapterImageField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 5336)

57.1.23.2.7 TAdapterImageField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 5347)

57.1.23.2.8 TAdapterImageField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 1014)

TStringsValuesList (see page 5843)

TDataSetValuesList

57.1.23.2.9 TAdapterImageField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

HasViewAccess (see page 5539)

57.1.23.3 TAdapterImageField Events

The events of the TAdapterImageField class are listed here.

Published Events

	Name	Description
	OnGetHREF (see page 5306)	Provides the URL of an external image file associated with this adapter field.
	OnGetImage (see page 5306)	Retrieves a stream containing the image file associated with this adapter field.
	OnGetImageName (see page 5306)	Returns the name of the image file associated with this adapter field.

	OnGetParams (see page 5307)	Provides name/value pairs that identify this adapter field's image.
	OnUploadFile (see page 5307)	Updates this adapter field with an image file uploaded by the end-user.
	OnValidateFile (see page 5307)	Used to validate files uploaded by the end user.

57.1.23.3.1 TAdapterImageField.OnGetHREF Event

Provides the URL of an external image file associated with this adapter field.

Pascal

```
property OnGetHREF: TImageFieldGetHREFEvent;
```

C++

```
__property TImageFieldGetHREFEvent OnGetHREF;
```

Description

Implement OnGetHREF to dynamically identify the URL of an external image file associated with this adapter field. When OnGetHREF is called, the HREF parameter will contain the value of the HREF property. To dynamically generate an image file for this adapter file, implement the OnGetImage event handler instead.

See Also

ImplWebImageHREF (see page 5619)

HREF (see page 5620)

OnGetImage (see page 5622)

57.1.23.3.2 TAdapterImageField.OnGetImage Event

Retrieves a stream containing the image file associated with this adapter field.

Pascal

```
property OnGetImage: TImageFieldGetImageEvent;
```

C++

```
__property TImageFieldGetImageEvent OnGetImage;
```

Description

Implement OnGetImage to dynamically generate an image file associated with this adapter field. Don't implement OnGetImage if the image file is external. Instead implement OnGetHREF event handler or use the HREF property to specify the URL of an external image.

See Also

RenderAdapterImage (see page 5619)

OnGetParams (see page 5622)

OnGetHREF (see page 5621)

HREF (see page 5620)

57.1.23.3.3 TAdapterImageField.OnGetImageName Event

Returns the name of the image file associated with this adapter field.

Pascal

```
property OnGetImageName: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetImageName;
```

Description

Implement this event handler to identify the name of the image file associated with this adapter field.

See Also

ImplGetValue (see page 5618)

57.1.23.3.4 TAdapterImageField.OnGetParams Event

Provides name/value pairs that identify this adapter field's image.

Pascal

```
property OnGetParams: TImageFieldGetParamsEvent;
```

C++

```
__property TImageFieldGetParamsEvent OnGetParams;
```

Description

Implement this event handler to provide name/value pairs that are needed to identify this adapter field's image file. OnGetParams is called while generating an HTML page with a URL reference to this adapter field's image. The parameters returned by OnGetParams will be passed to OnGetImage when the image file is requested.

See Also

GetAdapterItemRequestParams (see page 5615)

OnGetImage (see page 5622)

57.1.23.3.5 TAdapterImageField.OnUploadFile Event

Updates this adapter field with an image file uploaded by the end-user.

Pascal

```
property OnUploadFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnUploadFile;
```

Description

This event handler is called by ImplUpdateValue. This event handler should store the uploaded image file. Raise an exception to indicate an error.

See Also

ImplUpdateValue (see page 5619)

TAbstractWebRequestFile

57.1.23.3.6 TAdapterImageField.OnValidateFile Event

Used to validate files uploaded by the end user.

Pascal

```
property OnValidateFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnValidateFile;
```

Description

Validates the file uploaded by the end-user. Raise an exception to indicate an error. For example, it raises an exception if the Mime type of the file is not supported.

See Also

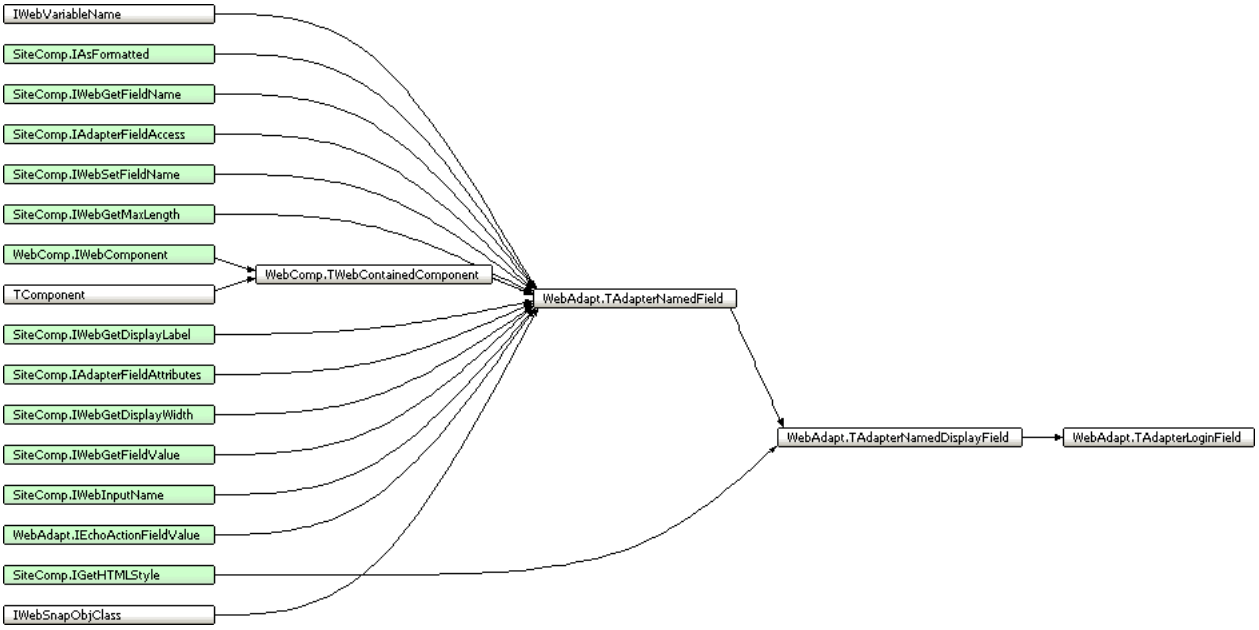
DoOnValidateValue (see page 5614)

TAbstractWebRequestFile

57.1.24 TAdapterLoginField Class

TAdaperLoginField is a base class for adapter field components that are children of a TLoginFormAdapter (see page 5810) component.

Class Hierarchy



Pascal

```
TAdapterLoginField = class(TAdapterNamedDisplayField);
```

C++

```
class TAdapterLoginField : public TAdapterNamedDisplayField;
```

File

WebAdapt

Description

TAdapterLoginField implements functionality that is used by an adapter field that is a child of TLoginFormAdapter (see page 5810).

See Also

TLoginFormAdapter (see page 5810)

TAdapterNamedDisplayField (see page 5331)

TAdapterUserNameField (see page 5422)

TAdapterPasswordField (see page 5379)

57.1.24.1 TAdapterLoginField Members

The following tables list the members exposed by TAdapterLoginField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.

	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.

V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
R	Adapter (see page 5311)	Returns the parent adapter of this adapter field.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.24.2 TAdapterLoginField Properties

The properties of the TAdapterLoginField class are listed here.

Public Properties

	Name	Description
R	Adapter (see page 5311)	Returns the parent adapter of this adapter field.

57.1.24.2.1 TAdapterLoginField.Adapter Property

Returns the parent adapter of this adapter field.

Pascal

```
property Adapter: TCustomLoginFormAdapter;
```

C++

```
__property TCustomLoginFormAdapter Adapter;
```

Description

Descendants use this property to access the parent adapter. GetAdapter (see page 5344) implements this property.

See Also

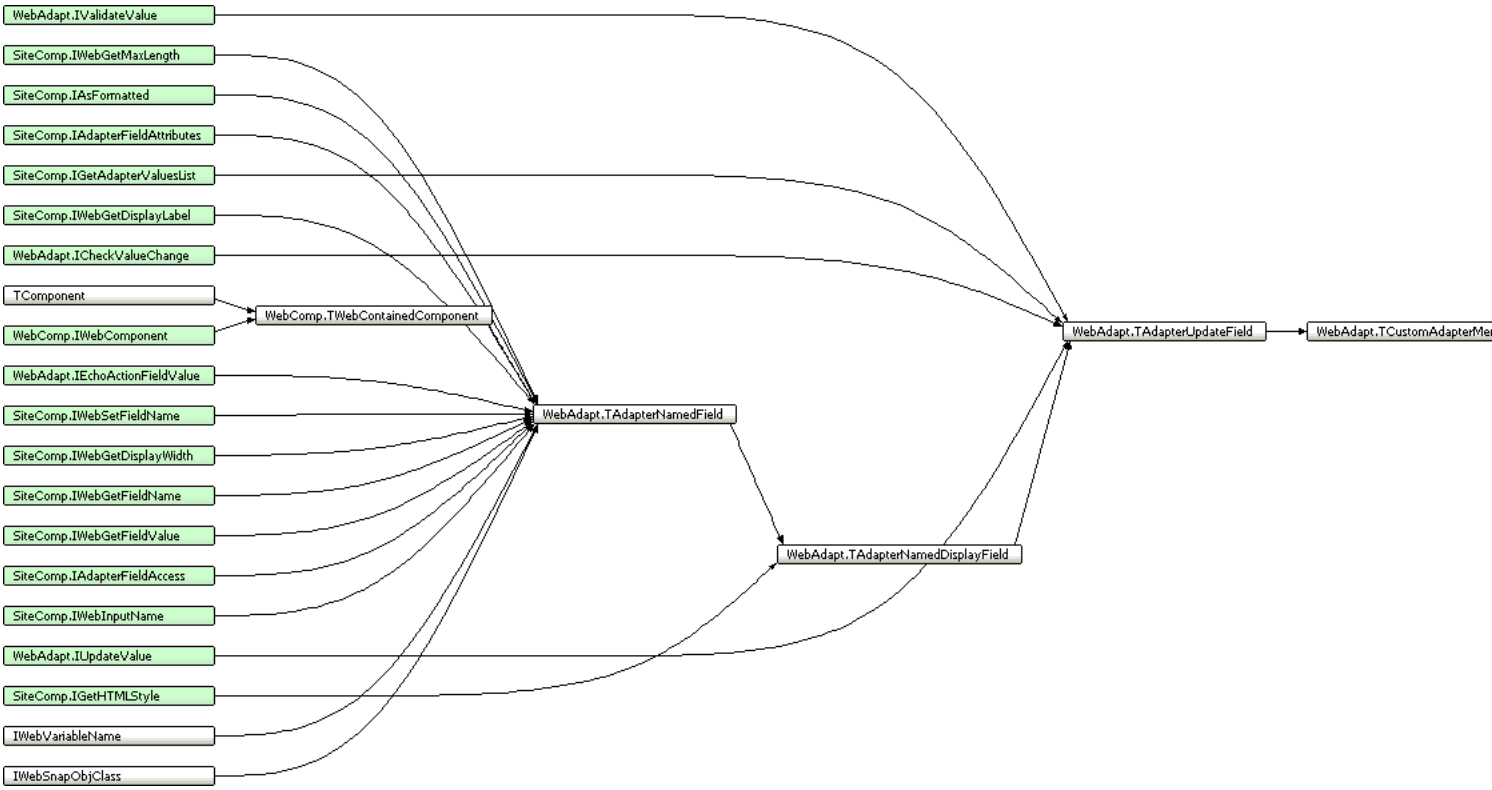
TCustomLoginFormAdapter (see page 5687)

GetAdapter

57.1.25 TAdapterMemoField Class

TAdapterMemoField is an event handler based adapter field that supports a multi-line text value.

Class Hierarchy



Pascal

```
TAdapterMemoField = class(TCustomAdapterMemoField);
```

C++

```
class TAdapterMemoField : public TCustomAdapterMemoField;
```

File

WebAdapt

Description

TAdapterMemoField publishes the properties in TCustomAdapterMemoField (see page 5624). TCustomAdapterMemoField (see page 5624) calls event handlers to retrieve the adapter field's text value, validate a value entered end-user, and update the

adapter field's value.

Add TAdapterMemoField to TAdapter (see page 5179) or other adapter components types when you need an adapter field that supports a multi-line text value. There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. See TAdapterField (see page 5256), TAdapterMultiValueField (see page 5320), TAdapterFileField (see page 5270), TAdapterBooleanField (see page 5212) and TAdapterImageField (see page 5297).

See Also

TCustomAdapterMemoField (see page 5624)

TAdapter (see page 5179)

TAdapterField (see page 5256)

TAdapterFileField (see page 5270)

TAdapterMultiValueField (see page 5320)

TAdapterBooleanField (see page 5212)

TAdapterImageField (see page 5297)

57.1.25.1 TAdapterMemoField Members

The following tables list the members exposed by TAdapterMemoField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5412)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5413)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5413)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5413)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5414)	Validates field values entered by the end-user.
V	DoOnValidateValue (see page 5628)	Validates a value entered by the end user.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5414)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
V	GetDisplayStyleType (see page 5628)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.

	GetInputStyleType (see page 5414)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetInputStyleType (see page 5629)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetValueCount (see page 5415)	Provides the number of values associated with this adapter field.
	GetValues (see page 5415)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 5415)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5416)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplCheckValueChange (see page 5629)	Indicates whether the end-user may have entered a new value for this adapter field.
	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 5416)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 5416)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 5417)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetValue (see page 5630)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5417)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5417)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5417)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5418)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 5630)	Updates the adapter field with value entered by the end-user.
	ImplValidateValue (see page 5418)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5418)	Indicates whether this adapter field can support multiple values.

	Notification (see page 5419)	Clears references to a deleted component.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	UpdateValue (see page 5419)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5419)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5421)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5421)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5864)	This is CheckValueChange, a member of class ICheckValueChange.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 5411)	Creates an instance of TAdapterUpdateField (see page 5407).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetAdapterValuesList (see page 969)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.

	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	UpdateValue (see page 5878)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5879)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
R	Value (see page 5420)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5420)	Associates a list of values with the adapter field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetValue (see page 5319)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5319)	Called to update the adapter field's value with a text value entered by the end-user.
	OnUploadFile (see page 5320)	Called to update the adapter field's value with a file uploaded by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 5317)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5317)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5317)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5318)	Identifies the rights required to update this field.
	ReadOnly (see page 5318)	Indicates whether this adapter field is read-only.
	Required (see page 5318)	Indicates whether the end-user must enter a value for this adapter field.
	ViewAccess (see page 5319)	Identifies the rights required to view this field.

57.1.25.2 TAdapterMemoField Properties

The properties of the TAdapterMemoField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5317)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5317)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5317)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5318)	Identifies the rights required to update this field.
	ReadOnly (see page 5318)	Indicates whether this adapter field is read-only.

	Required (see page 5318)	Indicates whether the end-user must enter a value for this adapter field.
	ViewAccess (see page 5319)	Identifies the rights required to view this field.

57.1.25.2.1 TAdapterMemoField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.25.2.2 TAdapterMemoField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.25.2.3 TAdapterMemoField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.25.2.4 TAdapterMemoField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

hasmodifyaccess (see page 5539)

57.1.25.2.5 TAdapterMemoField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 5336)

57.1.25.2.6 TAdapterMemoField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 5347)

57.1.25.2.7 TAdapterMemoField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

HasViewAccess (see page 5539)

57.1.25.3 TAdapterMemoField Events

The events of the TAdapterMemoField class are listed here.

Published Events

	Name	Description
	OnGetValue (see page 5319)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5319)	Called to update the adapter field's value with a text value entered by the end-user.
	OnUploadFile (see page 5320)	Called to update the adapter field's value with a file uploaded by the end-user.

57.1.25.3.1 TAdapterMemoField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 5630)

57.1.25.3.2 TAdapterMemoField.OnUpdateValue Event

Called to update the adapter field's value with a text value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldStringEvent;
```

C++

```
__property TAdapterFieldStringEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

See Also

ImplUpdateValue (see page 5630)

57.1.25.3.3 TAdapterMemoField.OnUploadFile Event

Called to update the adapter field's value with a file uploaded by the end-user.

Pascal

```
property OnUploadFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnUploadFile;
```

Description

OnUploadFile is called when an action request contains an uploaded file for this adapter field. If this event handler is not implemented, the file uploaded by the end-user will be ignored.

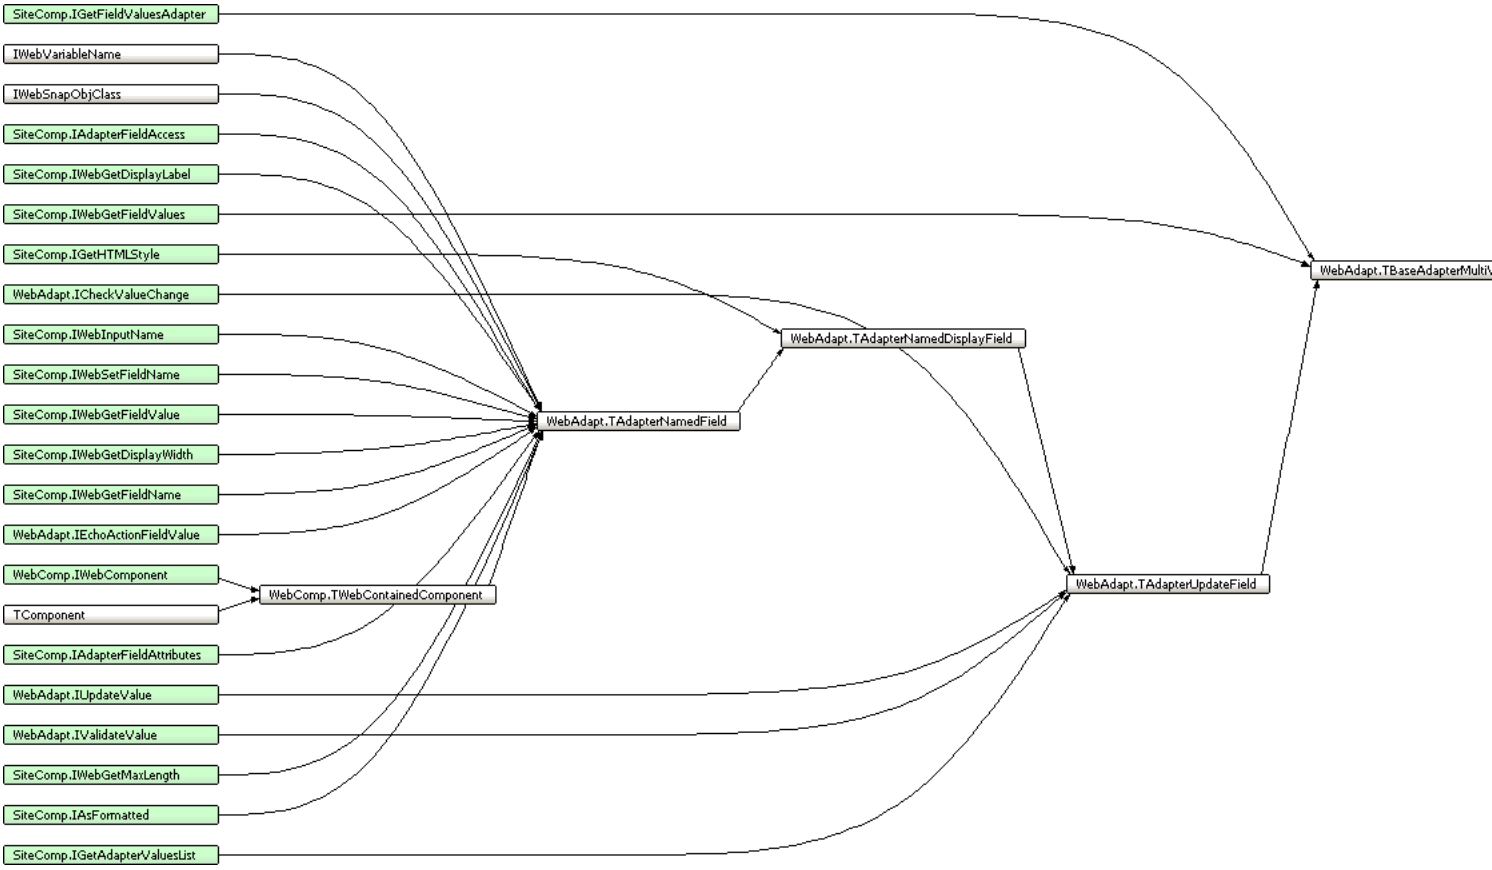
See Also

ImplUpdateValue (see page 5630)

57.1.26 TAdapterMultiValueField Class

TAdapterMultiValueField is an event handler based adapter field that provides zero or more values.

Class Hierarchy



Pascal

```
TAdapterMultiValueField = class(TCustomAdapterMultiValueField);
```

C++

```
class TAdapterMultiValueField : public TCustomAdapterMultiValueField;
```

File

WebAdapt

Description

TAdapterMultiValueField publishes the properties in TCustomAdapterMultiValueField (see page 5632). TCustomAdapterMultiValueField (see page 5632) calls event handlers to retrieve the adapter field's values, validate values entered by the end-user, and update the adapter field's values.

Add TAdapterMultiValueField to TAdapter (see page 5179) or other adapter components types when you need an adapter field that supports a multiple values using event handlers. There are other adapter field components that use event handlers. They differ in the type and number of values that are supported. See TAdapterField (see page 5256), TAdapterFileField (see page 5270), TAdapterMemoField (see page 5312), TAdapterBooleanField (see page 5212) and TAdapterImageField (see page 5297).

See Also

TCustomAdapterMultiValueField (see page 5632)

TAdapter (see page 5179)

TAdapterField (see page 5256)

TAdapterMemoField (see page 5312)

TAdapterFileField (see page 5270)

TAdapterBooleanField (see page 5212)

TAdapterImageField (see page 5297)

57.1.26.1 TAdapterMultiValueField Members

The following tables list the members exposed by TAdapterMultiValueField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5412)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5413)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5413)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5413)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5414)	Validates field values entered by the end-user.
V	DoOnValidateValue (see page 5637)	Validates values entered by the end-user.
	EndValueIterator (see page 5481)	Completes iteration.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5414)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 5481)	Implements IWebGetFieldValues (see page 1034)' GetCurrentValue.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
V	GetDisplayStyleType (see page 5637)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 5482)	Returns the adapter object that implements the Values property.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 5414)	Indicates the preferred HTML element to use when editing this adapter field's value.
V	GetInputStyleType (see page 5637)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
V	GetValueCount (see page 5415)	Provides the number of values associated with this adapter field.

	GetValueCount (see page 5482)	Returns the number of values associated with this adapter field.
	GetValueCount (see page 5638)	Returns the number of values associated with this adapter field.
	GetValues (see page 5415)	Returns one of the values provided by this adapter field.
	GetValues (see page 5482)	Returns one of the values associated with the adapter field.
	GetValues (see page 5638)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 5483)	Implements IWebGetFieldValues (see page 1034)' HasValue method.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 5415)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5416)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetCurrentValue (see page 5483)	Implements IWebGetFieldValues (see page 1034)' GetCurrentValue (see page 5481) method.
	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 5416)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 5416)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 5417)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetFieldValuesAdapter (see page 5483)	Returns the adapter object that implements the Values property.
	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5417)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasValue (see page 5484)	Implements IWebGetFieldValues (see page 1034)' HasValue (see page 5483) method.
	ImplHasValue (see page 5639)	Implements IWebGetFieldValues (see page 1034)' HasValue (see page 5483) method.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5417)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5417)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5418)	Updates the adapter field with value(s) entered by the end-user.
	ImplUpdateValue (see page 5639)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 5418)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

	IsMultiValueField (see page 5418)	Indicates whether this adapter field can support multiple values.
	NextValueIteration (see page 5484)	Implements IWebGetFieldValues (see page 1034)' NextValueIteration method.
	Notification (see page 5419)	Clears references to a deleted component.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	StartValueIterator (see page 5484)	Implements IWebGetFieldValues (see page 1034)' StartValueIterator method.
	UpdateValue (see page 5419)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5419)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5421)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5421)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5864)	This is CheckValueChange, a member of class ICheckValueChange.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 5411)	Creates an instance of TAdapterUpdateField (see page 5407).
	Create (see page 5480)	Constructor for TBaseAdapterMultiValueField (see page 5475).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 5480)	Destructor for TBaseAdapterMultiValueField (see page 5475).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	EndValueIterator (see page 1035)	Indicate the iteration is finished.
	GetAdapterValuesList (see page 969)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetCurrentValue (see page 1035)	Retrieves the current value as a variant.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetFieldValuesAdapter (see page 972)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.

	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasValue (see page 1035)	Indicates whether the adapter field has a matching value.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	NextValueIteration (see page 1036)	Position the iteration pointer on the next value.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	StartValueIterator (see page 1036)	Reset (see page 3734) the iteration pointer to the first item.
	UpdateValue (see page 5878)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5879)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
R	Value (see page 5420)	Retrieves the value associated with this adapter field.
R	ValueCount (see page 5639)	Returns the number of values associated with this adapter field.
R	Values (see page 5640)	Returns one of the values associated with the adapter field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

Published Events

	Name	Description
	OnGetValueCount (see page 5329)	Responsible for returning the count of values associated with the adapter field.
	OnGetValues (see page 5329)	Responsible for returning one of the values associated with the adapter field.
	OnHasValue (see page 5330)	Indicates whether a particular value is associated with this adapter field.
	OnUpdateValues (see page 5330)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateValues (see page 5330)	Validates field values entered by the end-user.

Published Properties

	Name	Description
	DisplayLabel (see page 5326)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5326)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5327)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5327)	Identifies the rights required to update this field.
	ReadOnly (see page 5327)	Indicates whether this adapter field is read-only.
	Required (see page 5328)	Indicates whether the end-user must enter a value for this adapter field.
	ValuesList (see page 5328)	Associates a list of values with the adapter field.

	ViewAccess (see page 5328)	Identifies the rights required to view this field.

57.1.26.2 TAdapterMultiValueField Properties

The properties of the TAdapterMultiValueField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5326)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5326)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5327)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5327)	Identifies the rights required to update this field.
	ReadOnly (see page 5327)	Indicates whether this adapter field is read-only.
	Required (see page 5328)	Indicates whether the end-user must enter a value for this adapter field.
	ValuesList (see page 5328)	Associates a list of values with the adapter field.
	ViewAccess (see page 5328)	Identifies the rights required to view this field.

57.1.26.2.1 TAdapterMultiValueField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.26.2.2 TAdapterMultiValueField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.26.2.3 TAdapterMultiValueField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.26.2.4 TAdapterMultiValueField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

hasmodifyaccess (see page 5539)

57.1.26.2.5 TAdapterMultiValueField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 5336)

57.1.26.2.6 TAdapterMultiValueField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

See Also

GetRequired (see page 5347)

57.1.26.2.7 TAdapterMultiValueField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 1014)

TStringsValuesList (see page 5843)

TDataSetValuesList

57.1.26.2.8 TAdapterMultiValueField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

HasViewAccess (see page 5539)

57.1.26.3 TAdapterMultiValueField Events

The events of the TAdapterMultiValueField class are listed here.

Published Events

	Name	Description
	OnGetValueCount (see page 5329)	Responsible for returning the count of values associated with the adapter field.
	OnGetValues (see page 5329)	Responsible for returning one of the values associated with the adapter field.
	OnHasValue (see page 5330)	Indicates whether a particular value is associated with this adapter field.
	OnUpdateValues (see page 5330)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateValues (see page 5330)	Validates field values entered by the end-user.

57.1.26.3.1 TAdapterMultiValueField.OnGetValueCount Event

Responsible for returning the count of values associated with the adapter field.

Pascal

```
property OnGetValueCount: TAdapterFieldGetValueCountEvent;
```

C++

```
__property TAdapterFieldGetValueCountEvent OnGetValueCount;
```

Description

Implement this event handler to provide the count of values associated with an adapter field. Also implement OnGetValues to provide the individual values.

See Also

GetValueCount (see page 5638)

OnGetValues (see page 5641)

57.1.26.3.2 TAdapterMultiValueField.OnGetValues Event

Responsible for returning one of the values associated with the adapter field.

Pascal

```
property OnGetValues: TAdapterFieldGetMultiValueEvent;
```

C++

```
__property TAdapterFieldGetMultiValueEvent OnGetValues;
```

Description

Implement this event handler to provide the values associated with an adapter field. The Index parameter is zero-based. Also implement OnGetValueCount to provide the count of values associated with this adapter field.

See Also

GetValues (see page 5638)

OnGetValueCount (see page 5640)

57.1.26.3.3 TAdapterMultiValueField.OnHasValue Event

Indicates whether a particular value is associated with this adapter field.

Pascal

```
property OnHasValue: TAdapterFieldHasValueEvent;
```

C++

```
__property TAdapterFieldHasValueEvent OnHasValue;
```

Description

ImplHasValue calls this event handler. Implement this event handler to lookup a matching value. Implementation of this event handler is optional. If OnHasValue is nil, ImplHasValue will search for a matching value the Values and ValueCount properties.

See Also

ImplHasValue (see page 5639)

ValueCount (see page 5639)

Values (see page 5640)

57.1.26.3.4 TAdapterMultiValueField.OnUpdateValues Event

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
property OnUpdateValues: TAdapterFieldStringsEvent;
```

C++

```
__property TAdapterFieldStringsEvent OnUpdateValues;
```

Description

Implement this event handler to process values entered by the end-user. Raise an exception if an error occurs.

See Also

OnValidateValues (see page 5642)

ImplUpdateValue (see page 5639)

57.1.26.3.5 TAdapterMultiValueField.OnValidateValues Event

Validates field values entered by the end-user.

Pascal

```
property OnValidateValues: TAdapterFieldStringsEvent;
```

C++

```
__property TAdapterFieldStringsEvent OnValidateValues;
```

Description

Implement this event handler to validate values entered by the end-user. Raise an exception if an error occurs.

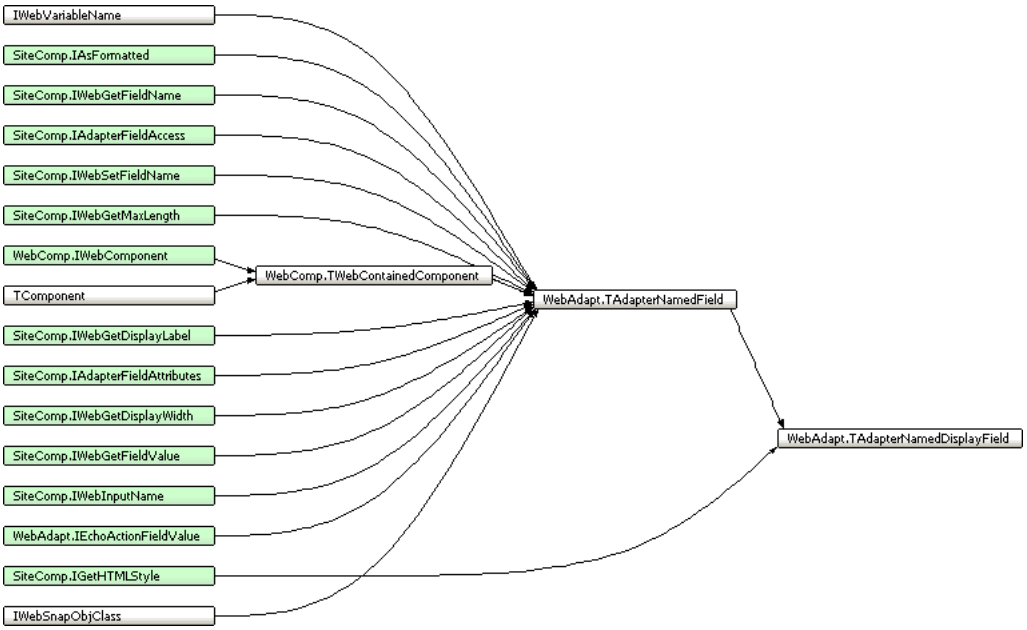
See Also

OnValidateValues (see page 5642)

57.1.27 TAdapterNamedDisplayField Class

The AdapterNamedDisplayField is a base class for adapter fields.

Class Hierarchy



Pascal

```
TAdapterNamedDisplayField = class(TAdapterNamedField, IGetHTMLStyle);
```

C++

```
class TAdapterNamedDisplayField : public TAdapterNamedField, public IGetHTMLStyle;
```

File

WebAdapt

Description

TAdapterNameDisplayField implements the IGetHTMLStyle (see page 973) interface used to inquire how this adapter field should be displayed in an HTML form. For example, IGetHTMLStyle (see page 973)'s GetInputStyle (see page 5335) method may indicate that this field should be displayed using a select list. TAdapterNamedField (see page 5339) also declares properties that may be modified at design-time to control how the adapter field should be displayed. For example, the DisplayLabel (see page 5338) property is used to suggest display label for this adapter field.

See Also

TAdapterNamedField (see page 5339)

TCustomAdapter (see page 5519)

TAdapter (see page 5179)

IGetHTMLStyle (see page 973)

57.1.27.1 TAdapterNamedDisplayField Members

The following tables list the members exposed by TAdapterNamedDisplayField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.

	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.

	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.27.2 TAdapterNamedDisplayField.Create Constructor

Creates an instance of TAdapterNamedDisplayField (see page 5331).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterNamedDisplayField(TComponent * AOwner);
```

Description

Do not call Create. It will be called automatically when the TAdapterNamedDisplayField (see page 5331) object is created

57.1.27.3 TAdapterNamedDisplayField Methods

The methods of the TAdapterNamedDisplayField class are listed here.

Protected Methods

	Name	Description
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
V	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
V	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
V	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.

57.1.27.3.1 TAdapterNamedDisplayField.GetDisplayStyle Method

Returns a string value to suggest an HTML display style for this adapter field.

Pascal

```
function GetDisplayStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetDisplayStyle(const UnicodeString AAdapterMode);
```

Description

GetDisplayStyle implements IGetHTMLStyle (see page 973)'s GetDisplayStyle by translating the result value of GetDisplayStyleType (see page 5335) into a string.

See Also

GetDisplayStyle (see page 974)

GetDisplayStyleType (see page 5335)

57.1.27.3.2 TAdapterNamedDisplayField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
virtual;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const UnicodeString
AAdapterMode);
```

Description

GetDisplayStyleType returns htmldText, indicating that this adapter field should be displayed by simple text. Descendant classes may override this method to suggest other HTML display types.

See Also

GetDisplayStyle (see page 5334)

57.1.27.3.3 TAdapterNamedDisplayField.GetInputStyle Method

Returns a string value to suggest an HTML input style for this adapter field.

Pascal

```
function GetInputStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetInputStyle(const UnicodeString AAdapterMode);
```

Description

GetInputStyle implements IGetHTMLStyle (see page 973)'s GetInputType method by translating the result value of GetInputStyleType (see page 5335) into a string.

See Also

GetInputStyle (see page 974)

GetInputStyleType (see page 5335)

57.1.27.3.4 TAdapterNamedDisplayField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; virtual;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType returns htmliTextInput, indicating that this adapter field should be edited by a single line input field. Descendant classes may override this method to suggest a different HTML input type.

See Also

GetInputStyle (see page 5335)

57.1.27.3.5 TAdapterNamedDisplayField.GetViewMode Method

Returns a string value to suggest a view mode for this adapter field.

Pascal

```
function GetViewMode(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetViewMode(const UnicodeString AAdapterMode);
```

Description

GetViewMode implements IGetHTMLStyle (see page 973)'s GetViewMode method by translating the result value of GetViewModeType (see page 5336) into a string.

See Also

GetViewMode (see page 975)

GetViewModeType (see page 5336)

57.1.27.3.6 TAdapterNamedDisplayField.GetViewModeType Method

Suggests a view mode for this adapter field.

Pascal

```
function GetViewModeType(const AAdapterMode: string): TAdapterDisplayViewModeType; virtual;
```

C++

```
virtual __fastcall TAdapterDisplayViewModeType GetViewModeType(const UnicodeString
AAdapterMode);
```

Description

GetViewModeType returns htmlvmDisplay if the ReadOnly (see page 5339) property is true. Otherwise, htmlvmInput is returned.

See Also

ReadOnly (see page 5339)

GetViewMode (see page 5336)

57.1.27.3.7 TAdapterNamedDisplayField.ImplGetDisplayLabel Method

Implements interface access to the DisplayLabel (see page 5338) property.

Pascal

```
function ImplGetDisplayLabel: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the value of the DisplayLabel (see page 5338) property.

See Also

DisplayLabel (see page 5338)

57.1.27.3.8 TAdapterNamedDisplayField.ImplGetDisplayWidth Method

Implements interface access to the DisplayWidth (see page 5338) property.

Pascal

```
function ImplGetDisplayWidth: Integer; override;
```

C++

```
virtual __fastcall int ImplGetDisplayWidth();
```

Description

ImplGetDisplayWidth returns the value of the DisplayWidth (see page 5338) property.

See Also

DisplayWidth (see page 5338)

57.1.27.3.9 TAdapterNamedDisplayField.ImplGetRequired Method

Implements interface access to the Required (see page 5339) property.

Pascal

```
function ImplGetRequired: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetRequired();
```

Description

ImplGetRequired returns the value of the Required (see page 5339) property.

See Also

Required (see page 5339)

57.1.27.3.10 TAdapterNamedDisplayField.SetDisplayLabel Method

SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.

Pascal

```
procedure SetDisplayLabel(const AValue: string);
```

C++

```
__fastcall SetDisplayLabel(const UnicodeString AValue);
```

Description

Use SetDisplayLabel to set the value of the DisplayLabel (see page 5338) property to AValue.

See Also

DisplayLabel (see page 5338)

57.1.27.4 TAdapterNamedDisplayField Properties

The properties of the TAdapterNamedDisplayField class are listed here.

Public Properties

	Name	Description
	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.

57.1.27.4.1 TAdapterNamedDisplayField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.27.4.2 TAdapterNamedDisplayField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this

adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.27.4.3 TAdapterNamedDisplayField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode (see page 5336) which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 5336)

57.1.27.4.4 TAdapterNamedDisplayField.Required Property

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

Use this property to indicate whether a value must be entered by the end user before submitting a form. Typically, an exception is raised when a required adapter field is not found when processing an adapter action.

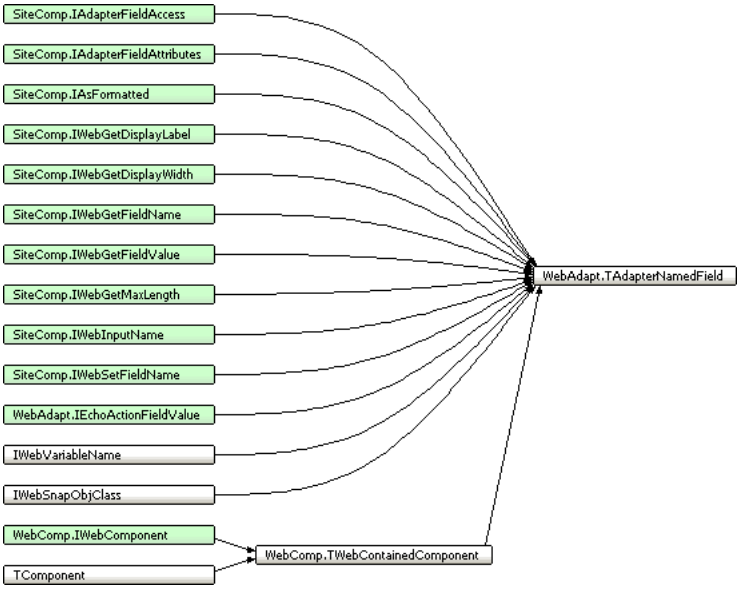
See Also

GetRequired (see page 5347)

57.1.28 TAdapterNamedField Class

TAdapterNamedField is a based class for adapter field components.

Class Hierarchy



Pascal

```
TAdapterNamedField = class(TWebContainedComponent, IWebVariableName, IWebInputName,
IWebGetFieldValue, IEchoActionFieldValue, IAsFormatted, IWebGetFieldName, IWebSetFieldName,
IWebGetDisplayWidth, IWebGetDisplayLabel, IWebGetMaxLength, IWebSnapObjClass,
IAdapterFieldAccess, IAdapterFieldAttributes);
```

C++

```
class TAdapterNamedField : public TWebContainedComponent, public IWebVariableName, public
IWebInputName, public IWebGetFieldValue, public IEchoActionFieldValue, public IAsFormatted,
public IWebGetFieldName, public IWebSetFieldName, public IWebGetDisplayWidth, public
IWebGetDisplayLabel, public IWebGetMaxLength, public IWebSnapObjClass, public
IAdapterFieldAccess, public IAdapterFieldAttributes;
```

File

WebAdapt

Description

TAdapterNamedField implements interfaces used to access an adapter field's properties using server-side script. Most of the interface implementation methods call virtual functions. When defining new derived classes, override these virtual functions to customize the behavior of the adapter field class.

See Also

TAdapterNamedDisplayField (see page 5331)

TAdapter (see page 5179)

57.1.28.1 TAdapterNamedField Members

The following tables list the members exposed by TAdapterNamedField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
V	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
V	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
V	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
R	Adapter (see page 5356)	Returns the parent adapter component.

R	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
R	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
V	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
V	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.28.2 TAdapterNamedField Methods

The methods of the TAdapterNamedField class are listed here.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.

	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
V	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.

57.1.28.2.1 TAdapterNamedField.AsFormatted Method

Returns text used to generate a representation of the adapter field value.

Pascal

```
function AsFormatted: string;
```

C++

```
__fastcall UnicodeString AsFormatted();
```

Description

This function returns a text that is typically used when generating a read-only representation of the adapter field value. The value returned by this function can be accessed with server-side script using the DisplayText property.

See Also

ImplAsFormatted (see page 5349)

57.1.28.2.2 TAdapterNamedField.CheckModifyAccess Method

Checks end-user rights to modify the adapter field value.

Pascal

```
procedure CheckModifyAccess;
```

C++

```
__fastcall CheckModifyAccess();
```

Description

This procedure is called to verify that the current user has rights to modify this field. An exception will be raised if access is denied.

See Also

ModifyAccess (see page 5357)

HasModifyAccess (see page 5349)

57.1.28.2.3 TAdapterNamedField.CheckViewAccess Method

Checks end-user rights to view the adapter field value.

Pascal

```
procedure CheckViewAccess;
```

C++

```
__fastcall CheckViewAccess();
```

Description

This procedure is called to verify that the current user has rights to view this field. An exception will be raised if access is denied.

See Also

ViewAccess (see page 5358)

HasModifyAccess (see page 5349)

57.1.28.2.4 TAdapterNamedField.FullyQualifyInputName Method

Indicates whether the HTML input names must be qualified with the name of the adapter.

Pascal

```
function FullyQualifyInputName: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean FullyQualifyInputName();
```

Description

This functions returns true if, when generating an HTML input referencing this adapter field, the name of the HTML input must be qualified with the name of the adapter component. Input (see page 3895) names must be fully qualified when a single HTML form is used to input values for multiple adapters.

See Also

MasterAdapter

57.1.28.2.5 TAdapterNamedField.GetAdapter Method

GetAdapter returns the parent adapter component.

Pascal

```
function GetAdapter: TCustomAdapter;
```

C++

```
__fastcall TCustomAdapter GetAdapter();
```

Description

To improve the efficiency of this function, a reference to the parent adapter component is cached in an instance variable.

57.1.28.2.6 TAdapterNamedField.GetDefaultDisplayLabel Method

Provides the default display label for this adapter field.

Pascal

```
function GetDefaultDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDefaultDisplayLabel();
```

Description

When the display label for the field matches this value then the display label property does not need to be stored in the form file.

57.1.28.2.7 TAdapterNamedField.GetDefaultFieldName Method

Gets the default name used to reference this adapter field with server-side script.

Pascal

```
function GetDefaultFieldName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDefaultFieldName();
```

Description

This function returns the default field name for the field. This name will be used when a field name has not be set using ImplSetFieldName (see page 5354). GetDefaultFieldName returns the name of the adapter field component. Descendants may override this function.

See Also

ImplGetVariableName (see page 5352)

ImplSetFieldName (see page 5354)

57.1.28.2.8 TAdapterNamedField.GetDisplayLabel Method

Returns the suggested display label for this adapter field.

Pascal

```
function GetDisplayLabel: string;
```

C++

```
__fastcall UnicodeString GetDisplayLabel();
```

Description

GetDisplayLabel provides label that may be used when generating HTML to display the value of this adapter field. The value

returned by this function can be accessed with server-side script using the DisplayLabel property. GetDisplayLabel calls ImplGetDisplayLabel (see page 5349).

See Also

ImplGetDisplayLabel (see page 5349)

57.1.28.2.9 TAdapterNamedField.GetDisplayWidth Method

Returns the suggested display width for this adapter field.

Pascal

```
function GetDisplayWidth: Integer;
```

C++

```
__fastcall int GetDisplayWidth();
```

Description

This function returns the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. The value returned by this function can be accessed with server-side script using the DisplayWidth property. GetDisplayWidth calls ImplGetDisplayWidth (see page 5350).

See Also

ImplGetDisplayWidth (see page 5350)

57.1.28.2.10 TAdapterNamedField.GetEchoActionFieldValue Method

Returns the value of the echo flag.

Pascal

```
function GetEchoActionFieldValue: Boolean;
```

C++

```
__fastcall Boolean GetEchoActionFieldValue();
```

Description

EchoActionFieldValue (see page 5356) calls ImplEchoActionFieldValue.

See Also

EchoActionFieldValue (see page 5356)

57.1.28.2.11 TAdapterNamedField.GetInputName Method

Identifies the name to use when generating an HTML input for this adapter field.

Pascal

```
function GetInputName: string;
```

C++

```
__fastcall UnicodeString GetInputName();
```

Description

This functions returns the name used for an HTML input associated with this adapter field. This value is accessed with server-side script using the InputName property. GetInputName calls ImplGetInputName (see page 5350).

See Also

ImplGetInputName (see page 5350)

57.1.28.2.12 TAdapterNamedField.GetMaxLength Method

Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.

Pascal

```
function GetMaxLength: Integer;
```

C++

```
__fastcall int GetMaxLength();
```

Description

The value returned by this function can be accessed with server-side script using the MaxLength property. Server-side script may use this value to define HTML elements that limit the number of characters that can be entered by the end-user. GetMaxLength calls ImplGetMaxLength (see page 5351).

See Also

ImplGetMaxLength (see page 5351)

57.1.28.2.13 TAdapterNamedField.GetRequired Method

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
function GetRequired: Boolean;
```

C++

```
__fastcall Boolean GetRequired();
```

Description

This function returns true or false to indicate whether a value must be entered by the end user before submitting a form. The value returned by this function can be accessed with server-side script using the Required property. Typically, this function is called while executing an adapter action that validates field values. The adapter action component will raise an exception if the value of the submitted field is empty. GetRequired calls ImplGetRequired (see page 5351).

See Also

ImplGetRequired (see page 5351)

57.1.28.2.14 TAdapterNamedField.GetValue Method

Gets the value of this adapter field as a Variant (see page 3430).

Pascal

```
function GetValue: Variant;
```

C++

```
__fastcall Variant GetValue();
```

Description

GetValue returns the result of ImplGetValue (see page 5351).

See Also

Value (see page 5357)

ImplGetValue (see page 5351)

57.1.28.2.15 TAdapterNamedField.GetVariableName Method

Gets the name used to reference this adapter field with server-side script.

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall UnicodeString GetVariableName();
```

Description

GetVariableName is called to retrieve the name used to access this adapter field with server-side script. GetVariableName calls ImplGetVariableName (see page 5352).

See Also

ImplGetVariableName (see page 5352)

57.1.28.2.16 TAdapterNamedField.GetVisible Method

Indicates whether the value of this adapter field should be displayed to the end-user.

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

The value returned by this function can be accessed with server-side script using the Visible property. GetVisible calls ImplGetVisible (see page 5352).

See Also

ImplGetVisible (see page 5352)

57.1.28.2.17 TAdapterNamedField.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

57.1.28.2.18 TAdapterNamedField.HasModifyAccess Method

Checks the end-user's right to modify this adapter field.

Pascal

```
function HasModifyAccess: Boolean;
```

C++

```
__fastcall Boolean HasModifyAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanModify property. HasModifyAccess calls ImplHasModifyAccess (see page 5353).

See Also

ImplHasModifyAccess (see page 5353)

57.1.28.2.19 TAdapterNamedField.HasViewAccess Method

Checks the end-user's right to view this adapter field.

Pascal

```
function HasViewAccess: Boolean;
```

C++

```
__fastcall Boolean HasViewAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanView property. HasViewAccess calls ImplHasViewAccess (see page 5353).

See Also

ImplHasViewAccess (see page 5353)

57.1.28.2.20 TAdapterNamedField.ImplAsFormatted Method

Returns text used to generate a representation of the adapter field value.

Pascal

```
function ImplAsFormatted: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplAsFormatted();
```

Description

ImplAsFormatted is called by AsFormatted (see page 5343).

See Also

AsFormatted (see page 5343)

57.1.28.2.21 TAdapterNamedField.ImplGetDisplayLabel Method

Returns the suggested display label for this adapter field.

Pascal

```
function ImplGetDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel is called by GetDisplayLabel (see page 5345). ImplGetDisplayLabel returns the result of GetDefaultDisplayLabel (see page 5345). Descendants may override this function.

See Also

GetDisplayLabel (see page 5345)

GetDefaultDisplayLabel (see page 5345)

57.1.28.2.22 TAdapterNamedField.ImplGetDisplayWidth Method

Returns the suggested display width for this adapter field.

Pascal

```
function ImplGetDisplayWidth: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetDisplayWidth();
```

Description

This function is called by GetDisplayWidth (see page 5346) to retrieve the suggested display width for this adapter field. ImplGetDisplayWidth returns –1 to indicate an undefined display width. Descendants may override this function.

See Also

GetDisplayWidth (see page 5346)

57.1.28.2.23 TAdapterNamedField.ImplGetEchoActionFieldValue Method

Returns the value of the echo flag.

Pascal

```
function ImplGetEchoActionFieldValue: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValue();
```

Description

This function is called by GetEchoActionFieldValue (see page 5346).

See Also

EchoActionFieldValue (see page 5356)

GetEchoActionFieldValue (see page 5346)

57.1.28.2.24 TAdapterNamedField.ImplGetInputName Method

Identifies the name to use when generating the HTML input for this adapter field.

Pascal

```
function ImplGetInputName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetInputName();
```

Description

When an action request is received, the name/value pairs in the HTTP are searched for adapter field values. For each adapter field value found, an IActionFieldValue (see page 5890) implementation is created. In order for the HTTP request to be interpreted properly, the HTML input fields must have names that correspond to the adapter fields they represent.

See Also

GetInputName (see page 5346)

IActionFieldValue

57.1.28.2.25 TAdapterNamedField.ImplGetMaxLength Method

Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.

Pascal

```
function ImplGetMaxLength: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetMaxLength();
```

Description

ImplGetMaxLength is called by GetMaxLength (see page 5347). ImplGetMaxLength returns –1 to indicate an undefined maximum length. Descendants may override this function.

See Also

GetMaxLength (see page 5347)

57.1.28.2.26 TAdapterNamedField.ImplGetRequired Method

Indicates whether the end-user must enter a value for this adapter field.

Pascal

```
function ImplGetRequired: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetRequired();
```

Description

ImplGetRequired returns False. Descendants may override this function.

See Also

GetRequired (see page 5347)

57.1.28.2.27 TAdapterNamedField.ImplGetValue Method

Gets the value of this adapter field as a Variant (see page 3430).

Pascal

```
function ImplGetValue: Variant; virtual;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

This function is called by GetValue (see page 5347). ImplGetValue returns Unassigned. Descendants override this function.

See Also

Value (see page 5357)

GetValue (see page 5347)

57.1.28.2.28 TAdapterNamedField.ImplGetVariableName Method

Gets the name used to reference this adapter field with server-side script.

Pascal

```
function ImplGetVariableName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetVariableName();
```

Description

This function is called by GetVariableName (see page 5348). GetVariableName (see page 5348) returns the field name set by ImplSetFieldName (see page 5354) unless this name is blank. If the field name is blank, the result of GetDefaultFieldName (see page 5345) is returned.

See Also

GetVariableName (see page 5348)

ImplSetFieldName (see page 5354)

GetDefaultFieldName (see page 5345)

57.1.28.2.29 TAdapterNamedField.ImplGetVisible Method

Indicates whether the value of this adapter field should be displayed to the end-user.

Pascal

```
function ImplGetVisible: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetVisible();
```

Description

This function returns true to indicate that the field should be displayed to the end user. Descendants may override this method.

See Also

GetVisible (see page 5348)

57.1.28.2.30 TAdapterNamedField.ImplHasModifyAccess Method

Checks the end-user's right to modify this adapter field.

Pascal

```
function ImplHasModifyAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasModifyAccess();
```

Description

This function is called by HasModifyAccess (see page 5349) to check the end-user's right to modify the adapter field. If the ModifyAccess (see page 5357) property is not blank, this function calls the EndUserAdapter HasModifyRights function, passing the ModifyAccess (see page 5357) property value.

See Also

hasmodifyaccess (see page 5539)

ModifyAccess (see page 5357)

HasModifyAccess (see page 5349)

57.1.28.2.31 TAdapterNamedField.ImplHasViewAccess Method

Checks the end-user's right to view this adapter field.

Pascal

```
function ImplHasViewAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasViewAccess();
```

Description

This function is called by HasViewAccess (see page 5349) to check the end-user's right to view the adapter field. If the ViewAccess (see page 5358) property is not blank, this function calls the EndUserAdapter's HasViewRights function, passing the ViewAccess (see page 5358) property value.

See Also

HasViewAccess (see page 5539)

ViewAccess (see page 5358)

HasViewAccess (see page 5349)

57.1.28.2.32 TAdapterNamedField.ImplSetEchoActionFieldValue Method

Sets the echo flag for this adapter field.

Pascal

```
procedure ImplSetEchoActionFieldValue(AValue: Boolean); virtual;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValue(Boolean AValue);
```

Description

ImplEchoActionFieldValue is called by SetEchoActionFieldValue (see page 5354). ImplEchoActionFieldValue is a placeholder. Descendants may override this method.

See Also

EchoActionFieldValue (see page 5356)

SetEchoActionFieldValue (see page 5354)

57.1.28.2.33 TAdapterNamedField.ImplSetFieldName Method

Sets the name that is used to reference this adapter field with server-side script.

Pascal

```
procedure ImplSetFieldName(const Value: string); virtual;
```

C++

```
virtual __fastcall ImplSetFieldName(const UnicodeString Value);
```

Description

ImplSetFieldName is called by SetFieldName (see page 5355). ImplSetFieldName stores the name in an instance variable. This method may be overridden by descendants.

See Also

SetFieldName (see page 5355)

57.1.28.2.34 TAdapterNamedField.ParentChanged Method

Handles movement of the component to a different parent.

Pascal

```
procedure ParentChanged; override;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

ParentChanged is called when the parent component is changed. TAdapterNamedField (see page 5339) clears its cached reference to the parent adapter.

57.1.28.2.35 TAdapterNamedField.SetEchoActionFieldValue Method

Sets the echo flag for this adapter field.

Pascal

```
procedure SetEchoActionFieldValue(AValue: Boolean);
```

C++

```
__fastcall SetEchoActionFieldValue(Boolean AValue);
```

Description

SetEchoActionFieldValue calls ImplSetActionFieldValue.

See Also

EchoActionFieldValue (see page 5356)

ImplSetEchoActionFieldValue (see page 5353)

57.1.28.2.36 TAdapterNamedField.SetFieldName Method

Sets the name that is used to reference this adapter field with server-side script.

Pascal

```
procedure SetFieldName(const AName: string);
```

C++

```
__fastcall SetFieldName(const UnicodeString AName);
```

Description

SetFieldName is typically called at design time to set the field name of a new adapter field. SetFieldName calls ImplSetFieldName (see page 5354).

See Also

ImplSetFieldName (see page 5354)

57.1.28.3 TAdapterNamedField Properties

The properties of the TAdapterNamedField class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 5356)	Returns the parent adapter component.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.

57.1.28.3.1 TAdapterNamedField.ActionOrigValue Property

Retrieve the original value of this adapter field.

Pascal

```
property ActionOrigValue: IActionFieldValue;
```

C++

```
__property IActionFieldValue ActionOrigValue;
```

Description

Some adapter fields will include their original value as a hidden field in an HTML form. The original value can be compared with

the current value to verify that the current value hasn't been changed by another user between the time that the HTML form was generated and the HTML form was submitted. Use this property when executing an adapter action to retrieve the original value for this adapter field at the time that the HTML form was generated.

See Also

FieldFlags

57.1.28.3.2 TAdapterNamedField.ActionValue Property

Retrieve the value for this adapter field entered by the end-user.

Pascal

```
property ActionValue: IActionFieldValue;
```

C++

```
__property IActionFieldValue ActionValue;
```

Description

The ActionValue property retrieves the value(s) entered by the end-user and passed in the HTTP request when an HTML form is submitted. When executing an adapter action, use this property to retrieve the value(s) entered by the end-user.

57.1.28.3.3 TAdapterNamedField.Adapter Property

Returns the parent adapter component.

Pascal

```
property Adapter: TCustomAdapter;
```

C++

```
__property TCustomAdapter Adapter;
```

Description

Use this property to access the parent adapter component. The type of this class is TComponent because adapter components are not required to descend from a common adapter base class. Typically the adapter component is accessed through interfaces.

57.1.28.3.4 TAdapterNamedField.EchoActionFieldValue Property

Used to echo the value(s) entered by the end-user when generating an HTML form.

Pascal

```
property EchoActionFieldValue: Boolean;
```

C++

```
__property Boolean EchoActionFieldValue;
```

Description

The EchoActionFieldValue property is used to alter the source of the adapter fields value. When this flag is set, the adapter field retrieves it's value from the HTTP request. When this flag is clear, the adapter field retrieves it's current value. Typically, this flag is set after an error occurs while processing an adapter action. Setting this flag results in generated HTML that displays values entered by the end-user. This allows the end-user to make corrections and resubmit the form.

See Also

SetEchoActionFieldValue (see page 5354)

57.1.28.3.5 TAdapterNamedField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.28.3.6 TAdapterNamedField.ModifyAccess Property

Identifies the rights required to update this field.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this field. When server-side script accesses the CanModify property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to updates an adapter field that does not allow access.

See Also

TWebUserList (see page 6759)

hasmodifyaccess (see page 5539)

57.1.28.3.7 TAdapterNamedField.Value Property

Provides the value of an adapter field as a variant.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

The Value property returns the value of an adapter field as a Variant (see page 3430). Server-side script can access this value using the Value property. Note that descendant adapter fields support multiple values per field, files and images. For these fields, the Value property will not correctly represent the value of the adapter field.

See Also

GetValueCount (see page 5415)

GetValues (see page 5415)

57.1.28.3.8 TAdapterNamedField.ViewAccess Property

Identifies the rights required to view this field.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view this field. When server-side script accesses the CanView property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to view an adapter field that does not allow access.

See Also

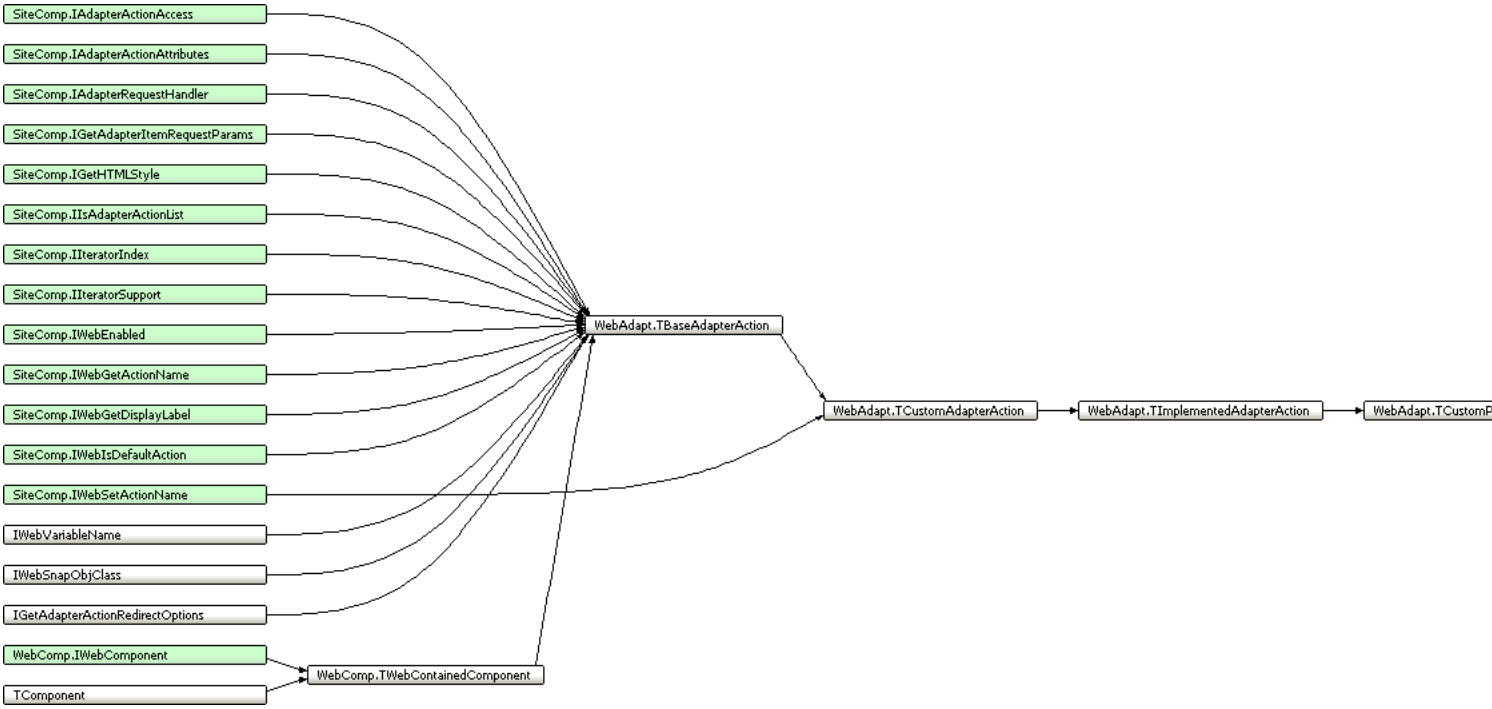
TWebUserList (see page 6759)

HasViewAccess (see page 5539)

57.1.29 TAdapterNextPageAction Class

TAdapterNextPageAction implements the next page command for TDefaultFieldsPagedAdapter (see page 5733).

Class Hierarchy



Pascal

```
TAdapterNextPageAction = class(TCustomAdapterPageAction);
```

C++

```
class TAdapterNextPageAction : public TCustomAdapterPageAction;
```

File

WebAdapt

Description

Add TAdapterNextPageAction to a descendant class of TDefaultFieldsPagedAdapter (see page 5733) such as TPagedAdapter (see page 5830).

See Also

TCustomAdapterPageAction (see page 5642)

TDefaultFieldsPagedAdapter (see page 5733)

TAdapterPrevPageAction (see page 5384)

TAdapterGotoPageAction (see page 5280)

TPagedAdapter (see page 5830)

TDefaultFieldsPagedAdapter (see page 5733)

57.1.29.1 TAdapterNextPageAction Members

The following tables list the members exposed by TAdapterNextPageAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5440)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5440)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5441)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5441)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5442)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5442)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5443)	Implements IIteratorSupport (see page 996)'s EndIterator method.
	ExecuteActionRequest (see page 5443)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5444)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5444)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 5713)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 5444)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5363)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5363)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5445)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5445)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5446)	Suggests an HTML display type for this adapter action.
V	GetDisplayStyleType (see page 5647)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5446)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 5446)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5447)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5447)	Returns a string value to suggest an HTML display style for this adapter action.

	GetIsAdapterActionList (see page 5448)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 5448)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5448)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method.
	GetNewPage (see page 5363)	Indicates the page to display when this action is executed.
	GetSuccessOptions (see page 5449)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5449)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5450)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 5450)	Suggests a view mode for this adapter action.
	GetVisible (see page 5450)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 5451)	Returns the class type for this adapter field.
	HandleRequest (see page 5451)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5451)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5452)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5452)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5443) method.
	ImplExecuteActionRequest (see page 5452)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 5570)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 5648)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 5453)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 5570)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 5453)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 5570)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 5648)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5453)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 5454)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 5454)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5454)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5455)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5448) method.
	ImplGetSuccessOptions (see page 5455)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 5571)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5456)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5456)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5456)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5457)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5459) method.
	ImplIsDefaultAction (see page 5457)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplIsDefaultAction (see page 5649)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5458)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5460) method.
	ImplSetActionName (see page 5571)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5458)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5461) method.
	ImplWebEnabled (see page 5458)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 5571)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 5649)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5459)	Implements IIteratorIndex (see page 994)'s InIterator method.

	IsDefaultAction (see page 5459)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5460)	Implements IIteratorSupport (see page 996)'s NextIteration method.
V	ParentChanged (see page 5460)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
V	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5572)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5460)	Set the value of the DisplayLabel (see page 5462) property.
V	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	StartIterator (see page 5461)	Implements IIteratorSupport (see page 996)'s StartIterator method.
	WebEnabled (see page 5461)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
R	Adapter (see page 5462)	Provides access to the parent adapter component.
R	Adapter (see page 5713)	Returns the parent adapter of this adapter action.
R	Errors (see page 5463)	This is Errors, a member of class TBaseAdapterAction.
R	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
R	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 5574)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5575)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
V	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	CreateRequestContext (see page 955)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetActionName (see page 1029)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 966)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 991)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 926)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 955)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 925)	This is HasExecuteAccess, a member of class IAdapterActionAccess.

	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1042)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 997)	Advances to the objects next item.
	SetActionName (see page 1056)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
	WebEnabled (see page 1026)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 1029)	This is ActionName, a member of class IWebGetActionName.
	ActionName (see page 5462)	Identifies the name of this action when using server-side script.
	ActionName (see page 5572)	Identifies the name of this action when using server-side script.
	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
	IsAdapterActionList (see page 991)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
	ItemCount (see page 5463)	Returns the number of items defined by an adapter action.
	ItemIndex (see page 5464)	Returns the index of the current item of an adapter action.
	IteratorIndex (see page 995)	Indicates the index of the current item.
	Visible (see page 926)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 5365)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5366)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5366)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5366)	Called before the adapter action response is generated.
	OnGetParams (see page 5367)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 5364)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5364)	Defines the rights required to execute this action.
	RedirectOptions (see page 5365)	Indicates whether to perform an HTTP redirect after successfully executing this action.

57.1.29.2 TAdapterNextPageAction Methods

The methods of the TAdapterNextPageAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 5363)	Gets the name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 5363)	Provides the default display label for this adapter action.
	GetNewPage (see page 5363)	Indicates the page to display when this action is executed.

57.1.29.2.1 TAdapterNextPageAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultActionName();
```

Description

GetDefaultActionName returns "NextPage".

See Also

GetActionName (see page 5444)

GetDefaultActionName (see page 5445)

57.1.29.2.2 TAdapterNextPageAction.GetDefaultDisplayLabel Method

Provides the default display label for this adapter action.

Pascal

```
function GetDefaultDisplayLabel: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultDisplayLabel();
```

Description

GetDefaultDisplayLabel returns ">>". This displays as '>>' in the browser.

See Also

DisplayLabel (see page 5462)

57.1.29.2.3 TAdapterNextPageAction.GetNewPage Method

Indicates the page to display when this action is executed.

Pascal

```
function GetNewPage(var AValue: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean GetNewPage(int AValue);
```

Description

GetNewPage determines whether the current page can be incremented. If so, the AValue parameter is modified and true is returned. Otherwise, false is returned.

See Also

GetNewPage (see page 5647)

RecordCount (see page 5747)

PageSize (see page 5747)

CurrentPage (see page 5746)

57.1.29.3 TAdapterNextPageAction Properties

The properties of the TAdapterNextPageAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5364)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5364)	Defines the rights required to execute this action.
	RedirectOptions (see page 5365)	Indicates whether to perform an HTTP redirect after successfully executing this action.

57.1.29.3.1 TAdapterNextPageAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 5453)

SetDisplayLabel (see page 5460)

57.1.29.3.2 TAdapterNextPageAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property UnicodeString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 6759)

hasexecuteaccess (see page 5539)

57.1.29.3.3 TAdapterNextPageAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect

57.1.29.4 TAdapterNextPageAction Events

The events of the TAdapterNextPageAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 5365)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5366)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5366)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5366)	Called before the adapter action response is generated.
	OnGetParams (see page 5367)	Specifies name/value pairs needed to execute this adapter action.

57.1.29.4.1 TAdapterNextPageAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 5441)

OnAfterExecuteAction (see page 5561)

OnBeforeExecute (see page 5465)

57.1.29.4.2 TAdapterNextPageAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.29.4.3 TAdapterNextPageAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 5442)

OnAfterExecute (see page 5465)

OnBeforeExecuteAction (see page 5563)

57.1.29.4.4 TAdapterNextPageAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.29.4.5 TAdapterNextPageAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

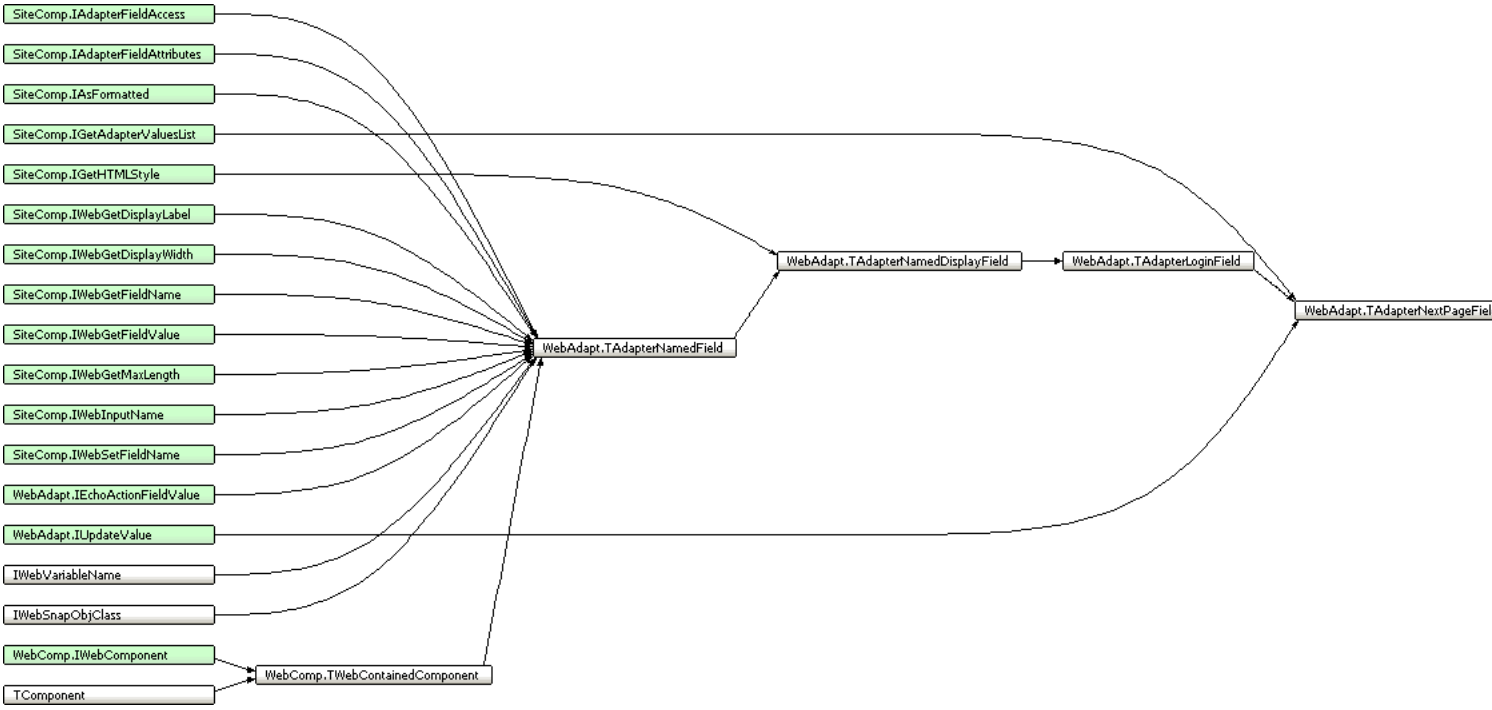
See Also

ImplGetAdapterItemRequestParams (see page 5453)

57.1.30 TAdapterNextPageField Class

The TAdapterNextPageField navigates to the next page of data.

Class Hierarchy



Pascal

```
TAdapterNextPageField = class(TAdapterLoginField, IGetAdapterValuesList, IUpdateValue);
```

C++

```
class TAdapterNextPageField : public TAdapterLoginField, public IGetAdapterValuesList, public
IUpdateValue;
```

File

WebAdapt

Description

TAdapterNextPageField is one of the components that is used by TPagedAdapter (see page 5830) along with the TAdapterNextPageAction (see page 5358) to navigate to the next page of data.

The TPagedAdapter (see page 5830) PageSize property indicates the number of rows displayed on a page. When the PageSize is not 0, the TPagedAdapter (see page 5830) component automatically adds built-in actions for moving between pages. These actions are TAdapterGotoPageAction (see page 5280), TAdapterPrevPageAction (see page 5384), and TAdapterNextPageAction (see page 5358). The TAdapterPageProducer can be used to generate HTML hyperlinks or buttons for these actions.

See Also

TPagedAdapter (see page 5830)

TAdapterPrevPageAction (see page 5384)

TAdapterGotoPageAction (see page 5280)

TCustomAdapterNextPageAction

TCustomAdapterPageAction (see page 5642)

57.1.30.1 TAdapterNextPageField Members

The following tables list the members exposed by TAdapterNextPageField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5372)	Returns a values list adapter containing the names of the published pages.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5372)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5372)	Returns the echo flag for this adapter field.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5373)	Returns the page name to be displayed after login.
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5373)	Sets the echo flag for this adapter field.

	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	UpdateValue (see page 5374)	Updates the parent adapter's next page property with the value entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 5371)	Frees an instance of TAdapterNextPageField (see page 5367).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
R	Adapter (see page 5311)	Returns the parent adapter of this adapter field.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	DisplayLabel (see page 5374)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5374)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5375)	Identifies the name of this field when using server-side script.

57.1.30.2 TAdapterNextPageField.Destroy Destructor

Frees an instance of TAdapterNextPageField (see page 5367).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterNextPageField();
```

Description

Destroy removes this component from its parent's list of components that generate HTML before freeing the memory used by TAdapterNextPageField (see page 5367).

57.1.30.3 TAdapterNextPageField Methods

The methods of the TAdapterNextPageField class are listed here.

Protected Methods

	Name	Description
	GetAdapterValuesList (see page 5372)	Returns a values list adapter containing the names of the published pages.
V	GetInputStyleType (see page 5372)	Suggests an HTML input type for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5372)	Returns the echo flag for this adapter field.
V	ImplGetValue (see page 5373)	Returns the page name to be displayed after login.

	ImplSetEchoActionFieldValue (see page 5373)	Sets the echo flag for this adapter field.
	UpdateValue (see page 5374)	Updates the parent adapter's next page property with the value entered by the end-user.

57.1.30.3.1 TAdapterNextPageField.GetAdapterValuesList Method

Returns a values list adapter containing the names of the published pages.

Pascal

```
function GetAdapterValuesList: IValuesListAdapter;
```

C++

```
__fastcall IValuesListAdapter GetAdapterValuesList();
```

Description

GetAdapterValuesList returns a reference to TLogicalPageList (see page 5805). This function will be called when server-side script references the ValuesList property of this adapter field. Typically, server-side script uses the ValuesList property to populate an HTML select list with the names of published pages. The end-user may select one of these pages to go to after login.

See Also

IValuesListAdapter (see page 1014)

57.1.30.3.2 TAdapterNextPageField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType. GetInputStyleType returns htmliSelect indicating that a single selection list HTML element should be used to input a value for this adapter field.

See Also

GetInputStyleType (see page 5335)

TAdapterInputHTMLElementType

57.1.30.3.3 TAdapterNextPageField.ImplGetEchoActionFieldValue Method

Returns the echo flag for this adapter field.

Pascal

```
function ImplGetEchoActionFieldValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValue();
```

Description

ImplGetEchoActionFieldValue returns the value of an instance variable.

See Also

ImplGetEchoActionFieldValue (see page 5350)

EchoActionFieldValue (see page 5356)

ImplGetValue (see page 5373)

ImplSetEchoActionFieldValue (see page 5373)

57.1.30.3.4 TAdapterNextPageField.ImplGetValue Method

Returns the page name to be displayed after login.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

If the EchoActionFieldValue (see page 5356) property is true, then the page name selected or entered by end-user is returned. If the EchoActionFieldValue (see page 5356) property is false then the parent adapter's NextPage property is returned. The value returned by ImplGetValue is used when server-side script references the EditText property of this adapter field while generating the login form.

See Also

EchoActionFieldValue (see page 5356)

ActionValue (see page 5356)

NextPage (see page 5699)

57.1.30.3.5 TAdapterNextPageField.ImplSetEchoActionFieldValue Method

Sets the echo flag for this adapter field.

Pascal

```
procedure ImplSetEchoActionFieldValue(AValue: Boolean); override;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValue(Boolean AValue);
```

Description

ImplSetEchoActionFieldValue sets an internal variable to true. The echo flag is typically set by an adapter action when an error occurs while processing an HTTP request. The purpose of the echo flag is to preserve the value entered by the end-user. When the echo flag is true, ImplGetValue (see page 5373) returns the value entered by the end-user rather than the value of the adapter field.

See Also

ImplSetEchoActionFieldValue (see page 5353)

EchoActionFieldValue (see page 5356)

ImplGetValue (see page 5373)

ImplGetEchoActionFieldValue (see page 5372)

57.1.30.3.6 TAdapterNextPageField.UpdateValue Method

Updates the parent adapter's next page property with the value entered by the end-user.

Pascal

```
procedure UpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall UpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

Typically a single selection list HTML element is displayed on the login form. The list contains all of the published pages. The HTTP request will contain the page name selected by the end-user.

See Also

NextPage (see page 5699)

IActionRequest

57.1.30.4 TAdapterNextPageField Properties

The properties of the TAdapterNextPageField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5374)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5374)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5375)	Identifies the name of this field when using server-side script.

57.1.30.4.1 TAdapterNextPageField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.30.4.2 TAdapterNextPageField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.30.4.3 TAdapterNextPageField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

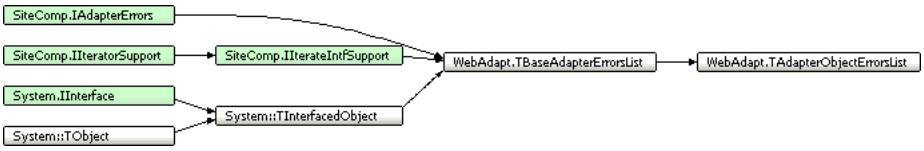
```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.31 TAdapterObjectErrorsList Class

Class Hierarchy



Pascal

```
TAdapterObjectErrorsList = class(TBaseAdapterErrorsList);
```

C++

```
class TAdapterObjectErrorsList : public TBaseAdapterErrorsList;
```

File

WebAdapt

Description

This is class WebAdapt.TAdapterObjectErrorsList.

57.1.31.1 TAdapterObjectErrorsList Members

The following tables list the members exposed by TAdapterObjectErrorsList.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	EndIterator (see page 5471)	This is EndIterator, a member of class TBaseAdapterErrorsList.
	GetCurrentIntf (see page 5471)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 5471)	Returns a particular error.
	GetErrorCount (see page 5471)	Return the number of errors in the errors list.
	GetObjectErrors (see page 5472)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 5472)	Indicates whether the errors list contains objects associated with a particular adapter field.
V	ImplClearErrors (see page 5472)	This is ImplClearErrors, a member of class TBaseAdapterErrorsList.
V	ImplDefineLabel (see page 5378)	This is ImplDefineLabel, a member of class TAdapterObjectErrorsList.
V	ImplGetError (see page 5378)	This is ImplGetError, a member of class TAdapterObjectErrorsList.
V	ImplGetErrorCount (see page 5378)	This is ImplGetErrorCount, a member of class TAdapterObjectErrorsList.
V	ImplGetObjectErrors (see page 5473)	This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.
V	ImplHasObjectErrors (see page 5473)	This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.
	NextIteration (see page 5474)	Advances to the objects next item.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	StartIterator (see page 5474)	This is StartIterator, a member of class TBaseAdapterErrorsList.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
V	AddError (see page 5469)	This is the overview for the AddError method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearErrors (see page 938)	Clears the errors list.
	ClearErrors (see page 5470)	Clear error list.
	Create (see page 5377)	This is Create, a member of class TAdapterObjectErrorsList.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.

	DefineLabel (see page 938)	Associates a label with all errors associated with a particular adapter field.
	DefineLabel (see page 5470)	Define error label for field.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetCurrentIntf (see page 992)	This is GetCurrentIntf, a member of class IIterateIntfSupport.
	GetError (see page 938)	Returns a particular error.
	GetErrorCount (see page 939)	Return the number of errors in the errors list.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetObjectErrors (see page 939)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 939)	Indicates whether the errors list contains objects associated with a particular adapter field.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextIteration (see page 997)	Advances to the objects next item.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	ErrorCount (see page 940)	Returns the number of errors in the errors list.
R	ErrorCount (see page 5474)	Number of error objects contained.
R	Errors (see page 940)	Returns an error from the list.
R	Errors (see page 5475)	Access to error objects.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

57.1.31.2 TAdapterObjectErrorsList.Create Constructor

Pascal

```
constructor Create(AErrors: TAdapterErrorsList; const AName: string);
```

C++

```
__fastcall TAdapterObjectErrorsList(TAdapterErrorsList AErrors, const UnicodeString AName);
```

Description

This is Create, a member of class TAdapterObjectErrorsList.

57.1.31.3 TAdapterObjectErrorsList Methods

The methods of the TAdapterObjectErrorsList class are listed here.

Protected Methods

	Name	Description
	ImplDefineLabel (see page 5378)	This is ImplDefineLabel, a member of class TAdapterObjectErrorsList.
	ImplGetError (see page 5378)	This is ImplGetError, a member of class TAdapterObjectErrorsList.
	ImplGetErrorCount (see page 5378)	This is ImplGetErrorCount, a member of class TAdapterObjectErrorsList.

57.1.31.3.1 TAdapterObjectErrorsList.ImplDefineLabel Method

Pascal

```
procedure ImplDefineLabel(const AName: string; const ALabel: string); override;
```

C++

```
virtual __fastcall ImplDefineLabel(const UnicodeString AName, const UnicodeString ALabel);
```

Description

This is ImplDefineLabel, a member of class TAdapterObjectErrorsList.

57.1.31.3.2 TAdapterObjectErrorsList.ImplGetError Method

Pascal

```
function ImplGetError(I: Integer): IAdapterError; override;
```

C++

```
virtual __fastcall IAdapterError ImplGetError(int I);
```

Description

This is ImplGetError, a member of class TAdapterObjectErrorsList.

57.1.31.3.3 TAdapterObjectErrorsList.ImplGetErrorCount Method

Pascal

```
function ImplGetErrorCount: Integer; override;
```

C++

```
virtual __fastcall int ImplGetErrorCount();
```

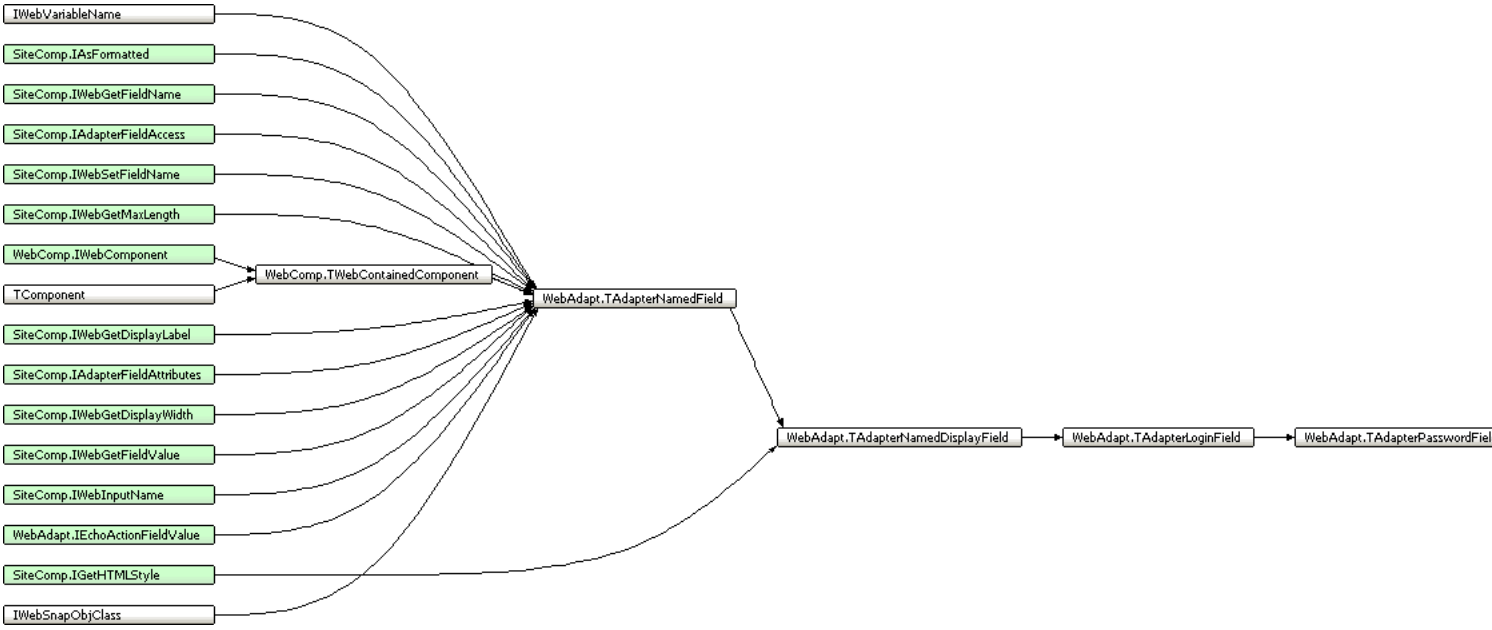
Description

This is ImplGetErrorCount, a member of class TAdapterObjectErrorsList.

57.1.32 TAdapterPasswordField Class

TAdapterPasswordField is an adapter field used to access the password entered by the end-user.

Class Hierarchy



Pascal

```
TAdapterPasswordField = class(TAdapterLoginField);
```

C++

```
class TAdapterPasswordField : public TAdapterLoginField;
```

File

WebAdapt

Description

TAdapterPasswordField is added to TLoginFormAdapter (see page 5810). TAdapterUserNameField (see page 5422), TAdapterPasswordField, TLoginFormAdapterLoginAction (see page 5821) and TAdapterNextPageField (see page 5367) are used with TLoginFormAdapter (see page 5810) to generate an HTML login form. When the HTML form is submitted, TAdapterPasswordField is used to extract the end user's password from the HTTP request.

See Also

TAdapterLoginField (see page 5308)

TLoginFormAdapter (see page 5810)

TAdapterUserNameField (see page 5422)

TAdapterNextPageField (see page 5367)

TLoginFormAdapterLoginAction (see page 5821)

57.1.32.1 TAdapterPasswordField Members

The following tables list the members exposed by TAdapterPasswordField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5382)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5383)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.

	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.

R	Adapter (see page 5311)	Returns the parent adapter of this adapter field.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	DisplayLabel (see page 5383)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5383)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5384)	Identifies the name of this field when using server-side script.

57.1.32.2 TAdapterPasswordField Methods

The methods of the TAdapterPasswordField class are listed here.

Protected Methods

	Name	Description
V	GetInputStyleType (see page 5382)	Suggests an HTML input type for this adapter field.
V	ImplGetValue (see page 5383)	Returns the value associated with this adapter field.

57.1.32.2.1 TAdapterPasswordField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetInputStyleType returns htmliPassword indicating that a password input HTML element should be used to input a value for this adapter field.

See Also

GetInputStyleType (see page 5335)

TAdapterInputHTMLElementType

57.1.32.2.2 TAdapterPasswordField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns an empty string. Server-side script accesses the result of this function using the EditText or Value (see page 5357) property of the adapter field. These server-side script properties may be used to generate the HTML login form. ImplGetValue returns an empty string so that the generated login form's password field will be blank. When the login form is submitted, the ActionValue (see page 5356) property can be used to access the password entered by the end-user.

See Also

ActionValue (see page 5356)

57.1.32.3 TAdapterPasswordField Properties

The properties of the TAdapterPasswordField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5383)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5383)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5384)	Identifies the name of this field when using server-side script.

57.1.32.3.1 TAdapterPasswordField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.32.3.2 TAdapterPasswordField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.32.3.3 TAdapterPasswordField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

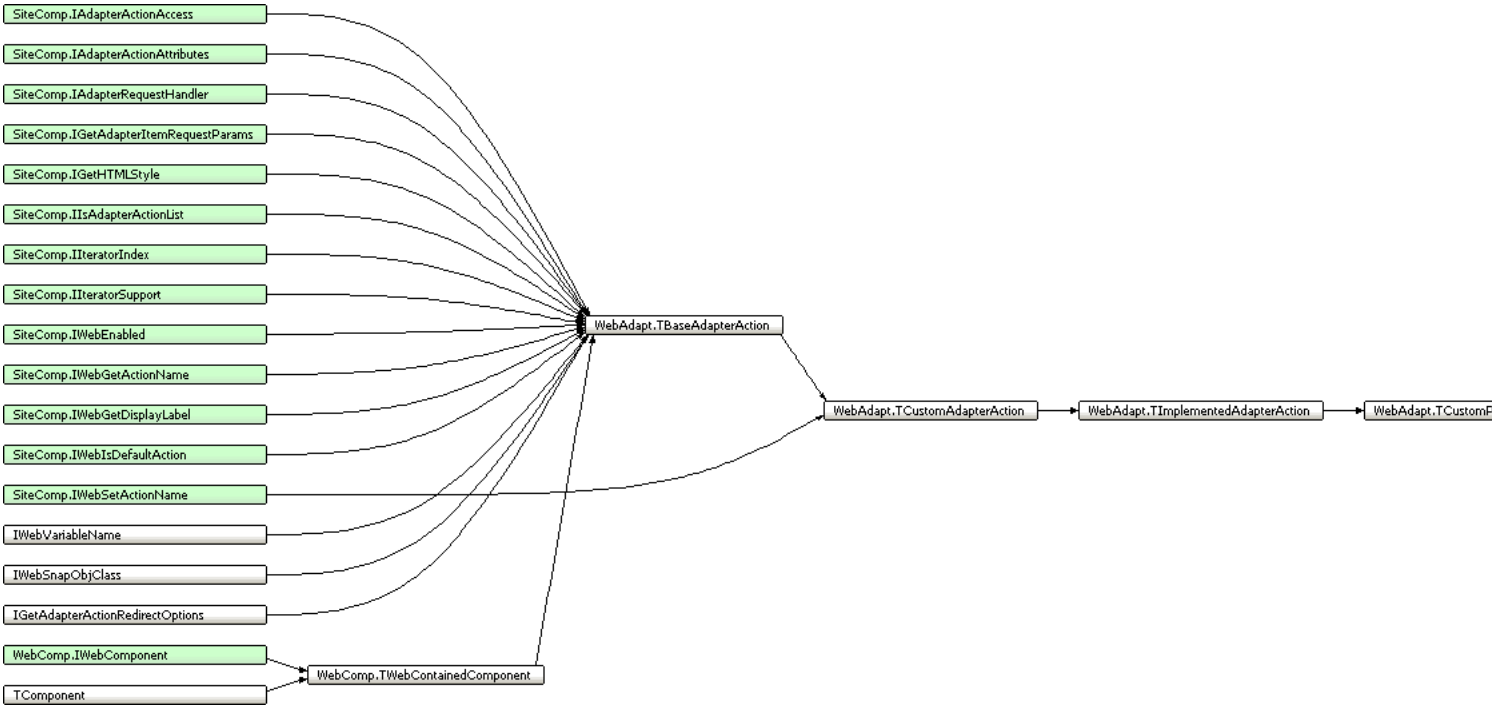
Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.33 TAdapterPrevPageAction Class

TAdapterPrevPageAction implements the previous page command for TDefaultFieldsPagedAdapter (see page 5733).

Class Hierarchy



Pascal

```
TAdapterPrevPageAction = class(TCustomAdapterPageAction);
```

C++

```
class TAdapterPrevPageAction : public TCustomAdapterPageAction;
```

File

WebAdapt

Description

Add TAdapterPrevPageAction to a descendant class of TDefaultFieldsPagedAdapter (see page 5733) such as TPagedAdapter (see page 5830).

See Also

TCustomAdapterPageAction (see page 5642)

TDefaultFieldsPagedAdapter (see page 5733)

TAdapterNextPageAction (see page 5358)

TAdapterGotoPageAction (see page 5280)

TPagedAdapter (see page 5830)

TDefaultFieldsPagedAdapter (see page 5733)

57.1.33.1 TAdapterPrevPageAction Members

The following tables list the members exposed by TAdapterPrevPageAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5440)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5440)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5441)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5441)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5442)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5442)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5443)	Implements IIteratorSupport (see page 996)'s EndIterator method.
	ExecuteActionRequest (see page 5443)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5444)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5444)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 5713)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 5444)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5389)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5389)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5445)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5445)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5446)	Suggests an HTML display type for this adapter action.
V	GetDisplayStyleType (see page 5647)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5446)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 5446)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5447)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5447)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5448)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5448)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5448)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method.
V	GetNewPage (see page 5390)	Indicates the page to display when this action is executed.
	GetSuccessOptions (see page 5449)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5449)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5450)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5450)	Suggests a view mode for this adapter action.
	GetVisible (see page 5450)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5451)	Returns the class type for this adapter field.
	HandleRequest (see page 5451)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5451)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5452)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5452)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5443) method.
V	ImplExecuteActionRequest (see page 5452)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplExecuteActionRequest (see page 5570)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplExecuteActionRequest (see page 5648)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5453)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 5570)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5453)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 5570)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 5648)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5453)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5454)	Generates a response after the adapter action has been executed.

	ImplGetFailureOptions (see page 5454)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5454)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5455)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5448) method.
	ImplGetSuccessOptions (see page 5455)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 5571)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5456)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5456)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5456)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5457)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5459) method.
	ImplIsDefaultAction (see page 5457)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplIsDefaultAction (see page 5649)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5458)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5460) method.
	ImplSetActionName (see page 5571)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5458)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5461) method.
	ImplWebEnabled (see page 5458)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 5571)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 5649)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5459)	Implements IIteratorIndex (see page 994)'s InIterator method.
	IsDefaultAction (see page 5459)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5460)	Implements IIteratorSupport (see page 996)'s NextIteration method.
	ParentChanged (see page 5460)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5572)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5460)	Set the value of the DisplayLabel (see page 5462) property.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	StartIterator (see page 5461)	Implements IIteratorSupport (see page 996)'s StartIterator method.
	WebEnabled (see page 5461)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5462)	Provides access to the parent adapter component.
	Adapter (see page 5713)	Returns the parent adapter of this adapter action.
	Errors (see page 5463)	This is Errors, a member of class TBaseAdapterAction.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 5574)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5575)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
V	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	CreateRequestContext (see page 955)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetActionName (see page 1029)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 966)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 991)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 926)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 955)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 925)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1042)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 997)	Advances to the objects next item.
	SetActionName (see page 1056)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
	WebEnabled (see page 1026)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 1029)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 5462)	Identifies the name of this action when using server-side script.
	ActionName (see page 5572)	Identifies the name of this action when using server-side script.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 991)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5463)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5464)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 995)	Indicates the index of the current item.
R	Visible (see page 926)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 5392)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5392)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5392)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5393)	Called before the adapter action response is generated.
	OnGetParams (see page 5393)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 5390)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5391)	Defines the rights required to execute this action.
	RedirectOptions (see page 5391)	Indicates whether to perform an HTTP redirect after successfully executing this action.

57.1.33.2 TAdapterPrevPageAction Methods

The methods of the TAdapterPrevPageAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 5389)	Gets the name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 5389)	Provides the default display label for this adapter action.
	GetNewPage (see page 5390)	Indicates the page to display when this action is executed.

57.1.33.2.1 TAdapterPrevPageAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultActionName();
```

Description

GetDefaultActionName returns "PrevPage".

See Also

GetActionName (see page 5444)

GetDefaultActionName (see page 5445)

57.1.33.2.2 TAdapterPrevPageAction.GetDefaultDisplayLabel Method

Provides the default display label for this adapter action.

Pascal

```
function GetDefaultDisplayLabel: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultDisplayLabel();
```

Description

GetDefaultDisplayLabel returns "<<". This displays as '<<' in the browser.

See Also

DisplayLabel (see page 5462)

57.1.33.2.3 TAdapterPrevPageAction.GetNewPage Method

Indicates the page to display when this action is executed.

Pascal

```
function GetNewPage(var AValue: Integer): Boolean; override;
```

C++

```
virtual __fastcall Boolean GetNewPage(int AValue);
```

Description

GetNewPage determines whether the current page can be incremented. If so, the AValue parameter is modified and true is returned. Otherwise, false is returned.

See Also

GetNewPage (see page 5647)

RecordCount (see page 5747)

PageSize (see page 5747)

CurrentPage (see page 5746)

57.1.33.3 TAdapterPrevPageAction Properties

The properties of the TAdapterPrevPageAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5390)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5391)	Defines the rights required to execute this action.
	RedirectOptions (see page 5391)	Indicates whether to perform an HTTP redirect after successfully executing this action.

57.1.33.3.1 TAdapterPrevPageAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side

script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 5453)

SetDisplayLabel (see page 5460)

57.1.33.3.2 TAdapterPrevPageAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property UnicodeString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 6759)

hasexecuteaccess (see page 5539)

57.1.33.3.3 TAdapterPrevPageAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect

57.1.33.4 TAdapterPrevPageAction Events

The events of the TAdapterPrevPageAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 5392)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5392)	Called after the adapter action response is generated.

	OnBeforeExecute (see page 5392)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5393)	Called before the adapter action response is generated.
	OnGetParams (see page 5393)	Specifies name/value pairs needed to execute this adapter action.

57.1.33.4.1 TAdapterPrevPageAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 5441)

OnAfterExecuteAction (see page 5561)

OnBeforeExecute (see page 5465)

57.1.33.4.2 TAdapterPrevPageAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.33.4.3 TAdapterPrevPageAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 5442)

OnAfterExecute (see page 5465)

OnBeforeExecuteAction (see page 5563)

57.1.33.4.4 TAdapterPrevPageAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.33.4.5 TAdapterPrevPageAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

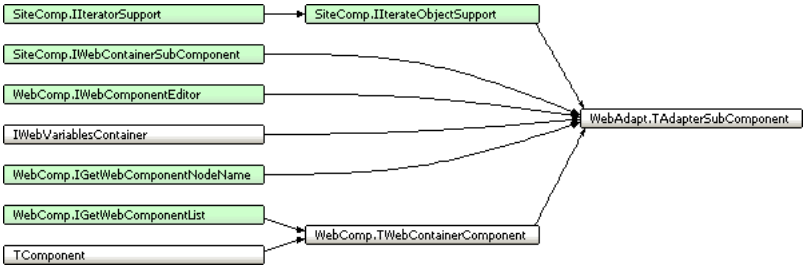
See Also

ImplGetAdapterItemRequestParams (see page 5453)

57.1.34 TAdapterSubComponent Class

TAdapterSubComponent is the base class for objects that represent a collection of actions or fields that belong to an adapter.

Class Hierarchy



Pascal

```
TAdapterSubComponent = class(TWebContainerComponent, IWebContainerSubComponent,
IWebComponentEditor, IWebVariablesContainer, IGetWebComponentNodeName, IIterateObjectSupport);
```

C++

```
class TAdapterSubComponent : public TWebContainerComponent, public IWebContainerSubComponent,
public IWebComponentEditor, public IWebVariablesContainer, public IGetWebComponentNodeName,
public IIterateObjectSupport;
```

File

WebAdapt

Description

Adapter (see page 5406) components use a TAdapterSubComponent descendant to represent the list of actions they can execute or the list of fields whose values they support. Each TAdapterSubComponent is specialized for a specific type of object (actions or fields), and represents either the set of explicitly assigned actions or fields, or the set that the adapter contains by default.

TAdapterSubComponent introduces support for:

Associating the collection with an adapter component.

Assigning variable names to the child items in the collection. These are the names of variables that server-side script can use to refer to the actions or fields.

Letting server-side script use an enumerator to iterate over all the child items in the collection.

Working with the WebSnap designers at design time.

See Also

TAdapterActions (see page 5198)

TAdapterFields (see page 5265)

TAdapterDefaultActions (see page 5220)

TAdapterDefaultFields (see page 5226)

57.1.34.1 TAdapterSubComponent Members

The following tables list the members exposed by TAdapterSubComponent.

Protected Methods

	Name	Description
	CanAddClass (see page 5396)	Indicates whether an object of a specified type can be added to this collection.
	EndIterator (see page 5397)	Stops the TAdapterSubComponent (see page 5394) object from iterating over the Web items it lists.
V	FindNamedVariable (see page 5397)	Returns the item from this list with a specified variable name.
	FindVariable (see page 5398)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 5398)	Returns the Web module that contains a specified item from this list.
V	GetChildren (see page 6038)	Executes a callback for each child Web item.
	GetCurrentObject (see page 5399)	Returns the current field or action from the list when an enumerator is iterating over child items.
V	GetDefaultWebComponents (see page 5399)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetVariable (see page 5400)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 5401)	Indicates the number of items in this list that can be accessed from server-side script.
V	GetVariablesInUse (see page 5401)	Returns the value of the VariablesInUse (see page 5407) property.
	GetWebComponentNodeName (see page 5401)	Returns a string that indicates the type of items in this collection.
	GetWebComponents (see page 6039)	Returns the list of Web items that this item manages.
V	ImplCanAddClass (see page 5402)	Provides the underlying implementation for the CanAddClass (see page 5396) method.
V	ImplGetDefaultComponentList (see page 6039)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	ImplGetWebComponentNodeName (see page 5403)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
	NextIteration (see page 5403)	Changes the current object to the next item that has a variable name.
	NotifyAdapterChange (see page 5404)	Notifies the associated adapter when the list of items changes.
V	SetChildOrder (see page 6040)	Positions a child component in the list of child Web items.
V	SetDefaultWebComponents (see page 5404)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
V	SetWebParent (see page 5405)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 5406)	Makes the first child item with a variable name the current object.

Protected Properties

	Name	Description
R	Adapter (see page 5406)	Indicates the adapter that uses this object to manage its fields or actions.
R	VariablesInUse (see page 5407)	Lists those fields or actions in the collection for which variables are defined.
R	WebContainerComponentHelper (see page 6041)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
V	Create (see page 6037)	Creates and initializes an instance of TWebContainerComponent (see page 6036).
V	Destroy (see page 6038)	Frees an instance of TWebContainerComponent (see page 6036).
	GetComponentList (see page 6055)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 6055)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
V	GetParentComponent (see page 5400)	Returns the associated adapter.
V	HasParent (see page 5402)	Indicates whether this component has an associated adapter.
V	ReadState (see page 5404)	Reads the component's published properties, stored data, and owned components from a reader object.

	SetParentComponent (see page 5405)	Sets the Adapter (see page 5406) property to be the same as this component's parent.

57.1.34.2 TAdapterSubComponent Methods

The methods of the TAdapterSubComponent class are listed here.

Protected Methods

	Name	Description
	CanAddClass (see page 5396)	Indicates whether an object of a specified type can be added to this collection.
	EndIterator (see page 5397)	Stops the TAdapterSubComponent (see page 5394) object from iterating over the Web items it lists.
	FindNamedVariable (see page 5397)	Returns the item from this list with a specified variable name.
	FindVariable (see page 5398)	Returns the item from this list with a specified variable name.
	FindVariableContainer (see page 5398)	Returns the Web module that contains a specified item from this list.
	GetCurrentObject (see page 5399)	Returns the current field or action from the list when an enumerator is iterating over child items.
	GetDefaultWebComponents (see page 5399)	Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.
	GetVariable (see page 5400)	Returns a child item from this list, given its position in the list of child items with variable names.
	GetVariableCount (see page 5401)	Indicates the number of items in this list that can be accessed from server-side script.
	GetVariablesInUse (see page 5401)	Returns the value of the VariablesInUse (see page 5407) property.
	GetWebComponentNodeName (see page 5401)	Returns a string that indicates the type of items in this collection.
	ImplCanAddClass (see page 5402)	Provides the underlying implementation for the CanAddClass (see page 5396) method.
	ImplGetWebComponentNodeName (see page 5403)	Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.
	NextIteration (see page 5403)	Changes the current object to the next item that has a variable name.
	NotifyAdapterChange (see page 5404)	Notifies the associated adapter when the list of items changes.
	SetDefaultWebComponents (see page 5404)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetWebParent (see page 5405)	Introduces a method to associate this component with an adapter.
	StartIterator (see page 5406)	Makes the first child item with a variable name the current object.

Public Methods

	Name	Description
	GetParentComponent (see page 5400)	Returns the associated adapter.
	HasParent (see page 5402)	Indicates whether this component has an associated adapter.
	ReadState (see page 5404)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetParentComponent (see page 5405)	Sets the Adapter (see page 5406) property to be the same as this component's parent.

57.1.34.2.1 TAdapterSubComponent.CanAddClass Method

Indicates whether an object of a specified type can be added to this collection.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The IDE calls CanAddClass to determine what Web items can be added to this list. This method allows the IDE to limit the

actions or fields in the collection to those that are appropriate for the associated adapter.

AParent is the TAdapterSubComponent (see page 5394) descendant to which the Web item will be added.

AClass is the class of the proposed child item.

CanAddClass returns true if the TAdapterSubComponent (see page 5394) descendant can include a child of type AClass, false otherwise.

CanAddClass calls the virtual ImplCanAddClass (see page 5402) method to determine whether a class of Web item is valid.

See Also

ImplCanAddClass (see page 5402)

Adapter (see page 5406)

57.1.34.2.2 TAdapterSubComponent.EndIterator Method

Stops the TAdapterSubComponent (see page 5394) object from iterating over the Web items it lists.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

EndIterator is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method is called when the enumeration stops. In TAdapterSubComponent (see page 5394), EndIterator does nothing. This method exists only as a backstop for the standard call made from server-side script.

OwnerData is a pointer to object-specific information returned by the last call to the StartIterator (see page 5406) or NextIteration (see page 5403) method. TAdapterSubComponent (see page 5394) does not use the OwnerData parameter.

See Also

StartIterator (see page 5406)

NextIteration (see page 5403)

GetCurrentObject (see page 5399)

57.1.34.2.3 TAdapterSubComponent.FindNamedVariable Method

Returns the item from this list with a specified variable name.

Pascal

```
function FindNamedVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * FindNamedVariable(const UnicodeString AName);
```

Description

FindNamedVariable searches the list of child items that have variable names (the VariablesInUse (see page 5407) property) to find one with the specified name. The associated adapter component calls this method from its FindNamedField or FindNamedAction method to look up a field or action with a specified name.

AName is a variable name. Typically, this comes from server-side script that is looking for a child of an adapter with this name.

FindNamedVariable returns the item from the list with the specified variable name. If none of the items in the list have the name AName, FindNamedVariable returns nil (Delphi) or NULL (C++).

See Also

VariablesInUse (see page 5407)

FindVariable (see page 5398)

GetVariable (see page 5400)

GetVariableCount (see page 5401)

FindVariableContainer (see page 5398)

FindNamedField (see page 5531)

FindNamedAction (see page 5531)

57.1.34.2.4 TAdapterSubComponent.FindVariable Method

Returns the item from this list with a specified variable name.

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const UnicodeString AName);
```

Description

FindVariable method is called from server-side script to locate a field or action with a specified name. This method is identical to the FindNamedVariable (see page 5397) method, except that it is not virtual. Instead, FindVariable calls the virtual FindNamedVariable (see page 5397) method.

AName is a variable name.

FindNamedVariable (see page 5397) returns the item from the list with the specified variable name. If none of the items in the list have the name AName, FindNamedVariable (see page 5397) returns nil (Delphi) or NULL (C++).

See Also

VariablesInUse (see page 5407)

FindNamedVariable (see page 5397)

GetVariable (see page 5400)

GetVariableCount (see page 5401)

FindVariableContainer (see page 5398)

57.1.34.2.5 TAdapterSubComponent.FindVariableContainer Method

Returns the Web module that contains a specified item from this list.

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const UnicodeString AName);
```

Description

FindVariableContainer searches the list of child items that have variable names (the VariablesInUse (see page 5407) property) to find one with the specified name. It then returns the Web module that contains the component it located.

AName is the name of the action or field to locate.

FindVariableContainer returns the Web module that containse the specified item. If there is no item in the list with the name AName, FindVariableContainer returns nil (Delphi) or NULL (C++). If FindVariableContainer includes an item with the specified name, but is unable to determine what Web module contains that item, FindVariableContainer raises an EAdapterException (see page 5166) exception.

See Also

VariablesInUse (see page 5407)

FindNamedVariable (see page 5397)

GetVariable (see page 5400)

GetVariableCount (see page 5401)

EAdapterException (see page 5166)

57.1.34.2.6 TAdapterSubComponent.GetCurrentObject Method

Returns the current field or action from the list when an enumerator is iterating over child items.

Pascal

```
function GetCurrentObject(OwnerData: Pointer): TObject;
```

C++

```
__fastcall TObject * GetCurrentObject(void * OwnerData);
```

Description

GetCurrentObject is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method returns the current child item.

OwnerData is a pointer to object-specific information returned by the last call to the StartIterator (see page 5406) or NextIteration (see page 5403) method. TAdapterSubComponent (see page 5394) does not use the OwnerData parameter.

See Also

StartIterator (see page 5406)

NextIteration (see page 5403)

EndIterator (see page 5397)

57.1.34.2.7 TAdapterSubComponent.GetDefaultWebComponents Method

Returns a list of actions or fields that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TAdapterSubComponent (see page 5394), GetDefaultWebComponents always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions (see page 5220) and TAdapterDefaultFields (see page 5226)) override this method to return the list of default fields or actions.

See Also

GetWebComponents (see page 6039)

TAdapterDefaultActions (see page 5220)

TAdapterDefaultFields (see page 5226)

57.1.34.2.8 TAdapterSubComponent.GetParentComponent Method

Returns the associated adapter.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

TAdapterSubComponent (see page 5394) overrides the GetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It returns the value of the Adapter (see page 5406) property (the adapter that uses this component to represent the set of its fields or actions).

See Also

GetParentComponent

HasParent (see page 5402)

Adapter (see page 5406)

57.1.34.2.9 TAdapterSubComponent.GetVariable Method

Returns a child item from this list, given its position in the list of child items with variable names.

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

FindNamedVariable (see page 5397) indexes into the list of child items that have variable names (the VariablesInUse (see page 5407) property) and returns the item in the specified position.

I is the index of the child item, where 0 is the first item that can be reference from server-side script, 1 is the second item, and so on. The GetVariableCount (see page 5401) method returns an upper limit for this index.

See Also

VariablesInUse (see page 5407)

FindNamedVariable (see page 5397)

FindVariable (see page 5398)

GetVariableCount (see page 5401)

57.1.34.2.10 TAdapterSubComponent.GetVariableCount Method

Indicates the number of items in this list that can be accessed from server-side script.

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

GetVariableCount returns the number of child items that have variable names. This is the number of items in the VariablesInUse (see page 5407) proprety. Use GetVariableCount as an upper bound to the I parameter of the GetVariable (see page 5400) method.

See Also

VariablesInUse (see page 5407)

GetVariable (see page 5400)

57.1.34.2.11 TAdapterSubComponent.GetVariablesInUse Method

Returns the value of the VariablesInUse (see page 5407) property.

Pascal

```
function GetVariablesInUse: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList GetVariablesInUse();
```

Description

GetVariablesInUse is the protected read implementation for the VariablesInUse (see page 5407) property.

In TAdapterSubComponent (see page 5394), GetVariablesInUse calls the GetWebComponents method to return a list of all the items in the list. Descendant classes can override this method to return only those items that meet a certain criterion.

See Also

VariablesInUse (see page 5407)

GetWebComponents (see page 6039)

57.1.34.2.12 TAdapterSubComponent.GetWebComponentNodeName Method

Returns a string that indicates the type of items in this collection.

Pascal

```
function GetWebComponentNodeName: string;
```

C++

```
__fastcall UnicodeString GetWebComponentNodeName();
```

Description

GetWebComponentNodeName returns the label for the type of items in the collection. For example, if the TAdapterSubComponent (see page 5394) descendant holds the fields belonging to an adapter, GetWebComponentNodeName returns the string 'Fields'. If the TAdapterSubComponent (see page 5394) descendant holds the actions belonging to an adapter, GetWebComponentNodeName returns the string 'Actions'.

GetWebComponentNodeName delegates the task of supplying a name to the virtual ImplGetWebComponentNodeName (see page 5403) method.

See Also

ImplGetWebComponentNodeName (see page 5403)

57.1.34.2.13 TAdapterSubComponent.HasParent Method

Indicates whether this component has an associated adapter.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TAdapterSubComponent (see page 5394) overrides the HasParent method that is introduced in TComponent for the streaming system that loads and saves components. It returns true if the Adapter (see page 5406) property is not nil (Delphi) or NULL (C++).

If the TAdapterSubComponent (see page 5394) object has a parent, that parent component is responsible for writing this component to a stream.

See Also

HasParent

GetParentComponent (see page 5400)

Adapter (see page 5406)

57.1.34.2.14 TAdapterSubComponent.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 5396) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 5396) method calls ImplCanAddClass to determine whether an object of a specified type can be added to this collection.

AParent is the TAdapterSubComponent (see page 5394) descendant to which the Web item will be added.

AClass is the class of the proposed child item.

ImplCanAddClass returns true if the TAdapterSubComponent (see page 5394) descendant can include a child of type AClass,

false otherwise.

In TAdapterSubComponent (see page 5394), ImplCanAddClass always returns false, disallowing any child items. Descendant classes override this method to conditionally allow those fields or actions that are appropriate to the associated adapter.

See Also

CanAddClass (see page 5396)

Adapter (see page 5406)

57.1.34.2.15 TAdapterSubComponent.ImplGetWebComponentNodeName Method

Provides the underlying implementation for the GetWebComponentNodeName (see page 5401) method.

Pascal

```
function ImplGetWebComponentNodeName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetWebComponentNodeName();
```

Description

The GetWebComponentNodeName (see page 5401) method calls ImplGetWebComponentNodeName to obtain a label for the type of items in the collection.

ImplGetWebComponentNodeName returns the name of the type of items in this list.

In TAdapterSubComponent (see page 5394), ImplGetWebComponentNodeName returns an empty string. Descendant classes created for specific types of elements override this method to return an appropriate string such as 'Fields' or 'Actions'.

See Also

GetWebComponentNodeName (see page 5401)

57.1.34.2.16 TAdapterSubComponent.NextIteration Method

Changes the current object to the next item that has a variable name.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

NextIteration is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method is called to move to the next item in the list. After a call to NextIteration, the GetCurrentObject (see page 5399) method returns the next item in the VariablesInUse (see page 5407) list.

OwnerData is a pointer to object-specific information returned by the last call to the StartIterator (see page 5406) or NextIteration method. TAdapterSubComponent (see page 5394) does not use the OwnerData parameter.

NextIteration returns true if it successfully moves to a new item, false if there was no addition item to which it could move.

See Also

StartIterator (see page 5406)

EndIterator (see page 5397)

GetCurrentObject (see page 5399)

VariablesInUse (see page 5407)

57.1.34.2.17 TAdapterSubComponent.NotifyAdapterChange Method

Notifies the associated adapter when the list of items changes.

Pascal

```
procedure NotifyAdapterChange;
```

C++

```
__fastcall NotifyAdapterChange();
```

Description

TAdapterSubComponent (see page 5394) descendants call NotifyAdapterChange internally when the items in this list change. NotifyAdapterChange passes this notification on to the associated adapter so that it can make any necessary adjustments.

See Also

Adapter (see page 5406)

NotifyAdapterChange (see page 5551)

57.1.34.2.18 TAdapterSubComponent.ReadState Method

Reads the component's published properties, stored data, and owned components from a reader object.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

ReadState is part of a sequence of calls used by the streaming system that loads and saves components. It reads the values of all the component's published properties, stored data, and owned components from the reader object passed in Reader. Do not call ReadState directly.

TAdapterSubComponent (see page 5394) overrides ReadState to obtain the parent component from the reader, which it assigns as the value of the Adapter (see page 5406) property.

Note: Any descendant classes overriding ReadState should end with a call to the inherited ReadState method.

See Also

GetParentComponent (see page 5400)

Adapter (see page 5406)

57.1.34.2.19 TAdapterSubComponent.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

GetDefaultWebComponents (see page 5399) supplies the default set of child items for this component. As implemented in TAdapterSubComponent (see page 5394), GetDefaultWebComponents (see page 5399) always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions (see page 5220) and TAdapterDefaultFields (see page 5226)) override this method to return the list of default fields or actions.

SetDefaultWebComponents assigns the default set of child items for this component. As implemented in TWebContainerComponent (see page 6036), SetDefaultWebComponents does nothing because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions (see page 5220) and TAdapterDefaultFields (see page 5226)) override this method to store the list of default fields or actions.

See Also

GetDefaultWebComponents (see page 5399)

IsDefaultField (see page 6015)

57.1.34.2.20 TAdapterSubComponent.SetParentComponent Method

Sets the Adapter (see page 5406) property to be the same as this component's parent.

Pascal

```
procedure SetParentComponent(AParent: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * AParent);
```

Description

TAdapterSubComponent (see page 5394) overrides the SetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It sets the Adapter (see page 5406) property to AParent, so that it is the same as the parent that loads and saves this component.

See Also

SetParentComponent

HasParent (see page 5402)

Adapter (see page 5406)

57.1.34.2.21 TAdapterSubComponent.SetWebParent Method

Introduces a method to associate this component with an adapter.

Pascal

```
procedure SetWebParent(const Value: TComponent); virtual;
```

C++

```
virtual __fastcall SetWebParent(const TComponent * Value);
```

Description

TAdapterSubComponent (see page 5394) introduces SetWebParent as a virtual method for setting the read-only Adapter (

see page 5406) property.

Value is the adapter component that acts as a parent to this collection.

In TAdapterSubComponent (see page 5394), SetWebParent does nothing. Descendant classes override this method to set the Adapter (see page 5406) property and populate the list with actions or fields appropriate to that adapter.

See Also

Adapter (see page 5406)

57.1.34.2.22 TAdapterSubComponent.StartIterator Method

Makes the first child item with a variable name the current object.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

StartIterator is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method is called to begin iterating over the items in the list. After a call to StartIterator, the GetCurrentObject (see page 5399) method returns the first item in the VariablesInUse (see page 5407) list.

OwnerData is a pointer to object-specific information returned that should be passed to the NextIteration (see page 5403) or EndIterator (see page 5397) method. TAdapterSubComponent (see page 5394) does not use the OwnerData parameter.

StartIterator returns true if it successfully moves to the first item, false if the VariablesInUse (see page 5407) property does not list any items.

See Also

NextIteration (see page 5403)

EndIterator (see page 5397)

GetCurrentObject (see page 5399)

VariablesInUse (see page 5407)

57.1.34.3 TAdapterSubComponent Properties

The properties of the TAdapterSubComponent class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 5406)	Indicates the adapter that uses this object to manage its fields or actions.
	VariablesInUse (see page 5407)	Lists those fields or actions in the collection for which variables are defined.

57.1.34.3.1 TAdapterSubComponent.Adapter Property

Indicates the adapter that uses this object to manage its fields or actions.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Read (see page 3727) Adapter to access the adapter component that uses this collection. This TAdapterSubComponent (see page 5394) object is the value of the adapter's Data or Actions property.

See Also

Actions (see page 5558)

Data (see page 5558)

Actions (see page 5732)

Data (see page 5733)

57.1.34.3.2 TAdapterSubComponent.VariablesInUse Property

Lists those fields or actions in the collection for which variables are defined.

Pascal

```
property VariablesInUse: TWebComponentList;
```

C++

```
__property TWebComponentList VariablesInUse;
```

Description

Read (see page 3727) VariablesInUse to access the child items (fields or actions) that can be addressed from server-side script.

TAdapterSubComponent (see page 5394) implements VariablesInUse to include all of the fields or actions that have been added to the list. Descendant classes can override this property to provide a different set of items, such as the default fields or actions of the associated adapter.

See Also

FindNamedVariable (see page 5397)

FindVariable (see page 5398)

GetVariable (see page 5400)

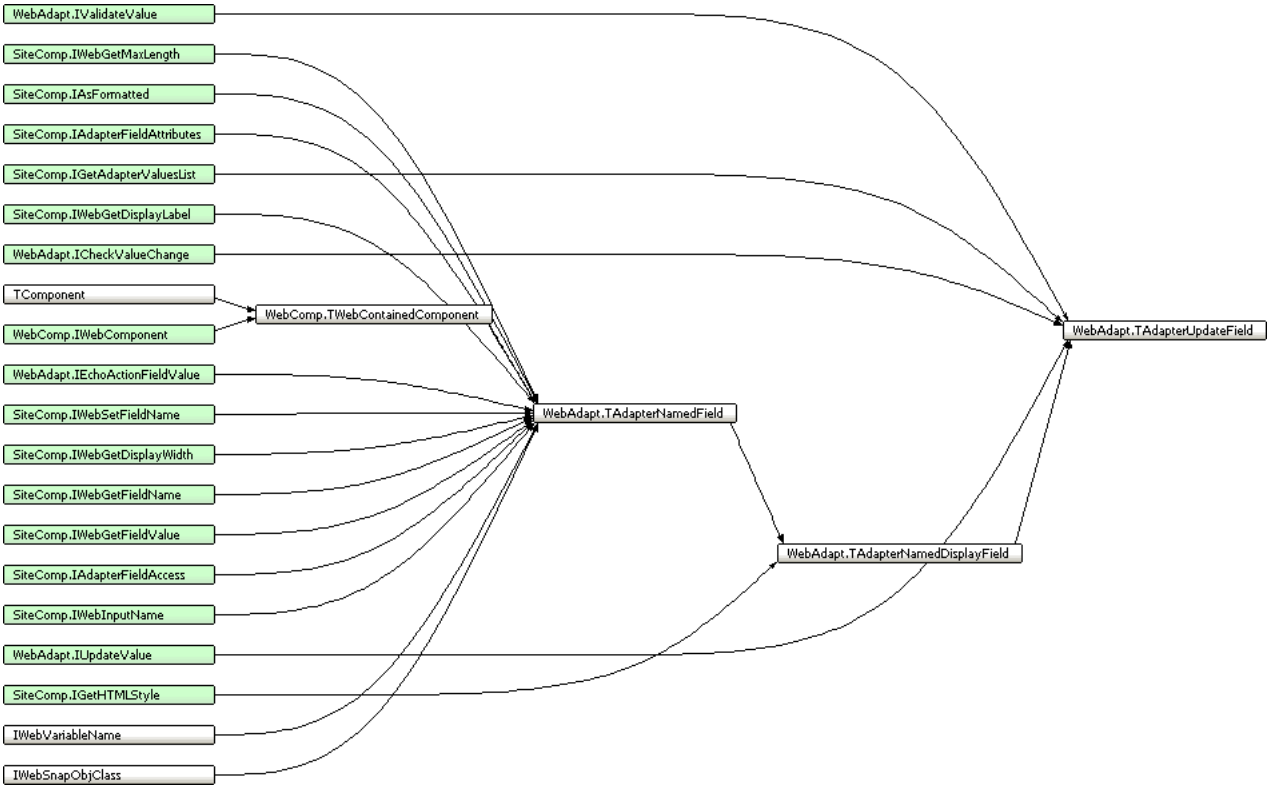
GetVariableCount (see page 5401)

FindVariableContainer (see page 5398)

57.1.35 TAdapterUpdateField Class

TAdapterUpdateField is a base class for adapter field components that support data entry into an HTML form.

Class Hierarchy



Pascal

```
TAdapterUpdateField = class(TAdapterNamedDisplayField, IGetAdapterValuesList, IUpdateValue,
IValidateValue, ICheckValueChange);
```

C++

```
class TAdapterUpdateField : public TAdapterNamedDisplayField, public IGetAdapterValuesList,
public IUpdateValue, public IValidateValue, public ICheckValueChange;
```

File

WebAdapt

Description

TAdapterUpdateField implements the interfaces necessary to support field validation and updating. Descendant classes support different types of data that can be entered by the user (for example, image upload, file upload, single value, multiple value, memo and Boolean).

See Also

TAdapterNamedDisplayField (see page 5331)

TCustomAdapterField (see page 5583)

TAdapter (see page 5179)

57.1.35.1 TAdapterUpdateField Members

The following tables list the members exposed by TAdapterUpdateField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5412)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
	ConvertValue (see page 5413)	Retrieves a value entered by the end-user.
	ConvertValueCount (see page 5413)	Retrieves the number of values entered by the end-user.
	ConvertValues (see page 5413)	Retrieves a value entered by the end-user.
	DoOnValidateValue (see page 5414)	Validates field values entered by the end-user.
	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5414)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 5414)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetValueCount (see page 5415)	Provides the number of values associated with this adapter field.
	GetValues (see page 5415)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5415)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5416)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetDisplayLabel (see page 5416)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5416)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5417)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.

	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetVariableName (see page 5417)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5417)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5417)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5418)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 5418)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5418)	Indicates whether this adapter field can support multiple values.
	Notification (see page 5419)	Clears references to a deleted component.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	UpdateValue (see page 5419)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5419)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5421)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5421)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5411)	Creates an instance of TAdapterUpdateField (see page 5407).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.

	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 5420)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5420)	Associates a list of values with the adapter field.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.35.2 TAdapterUpdateField.Create Constructor

Creates an instance of TAdapterUpdateField (see page 5407).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterUpdateField(TComponent * AOwner);
```

Description

Do not call TAdapterUpdateField (see page 5407). It will be called automatically when the TAdapterUpdateField (see page 5407) object is created.

See Also

Create_d

57.1.35.3 TAdapterUpdateField Methods

The methods of the TAdapterUpdateField class are listed here.

Protected Methods

	Name	Description
	CheckValueChange (see page 5412)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
V	ConvertValue (see page 5413)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5413)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5413)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5414)	Validates field values entered by the end-user.
	GetAdapterValuesList (see page 5414)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
V	GetInputStyleType (see page 5414)	Indicates the preferred HTML element to use when editing this adapter field's value.
V	GetValueCount (see page 5415)	Provides the number of values associated with this adapter field.
V	GetValues (see page 5415)	Returns one of the values provided by this adapter field.
V	ImplAsFormatted (see page 5415)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 5416)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplGetDisplayLabel (see page 5416)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 5416)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 5417)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplGetVariableName (see page 5417)	Gets the name used to access this adapter field with server-side script.
V	ImplSetEchoActionFieldValue (see page 5417)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplSetFieldName (see page 5417)	Sets the name used to access this adapter field with server-side script.
V	ImplUpdateValue (see page 5418)	Updates the adapter field with value(s) entered by the end-user.
V	ImplValidateValue (see page 5418)	Validates values(s) entered by the end-user.
V	IsMultiValueField (see page 5418)	Indicates whether this adapter field can support multiple values.
V	Notification (see page 5419)	Clears references to a deleted component.
	UpdateValue (see page 5419)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5419)	Validates values(s) entered by the end-user.

57.1.35.3.1 TAdapterUpdateField.CheckValueChange Method

Checks the value(s) entered by the end-user against the value associated with this adapter field.

Pascal

```
function CheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean CheckValueChange(IActionRequest AActionRequest, int AFieldIndex);
```

Description

CheckValueChange is called to determine whether the value(s) entered by the user is different from the value(s) provided by the adapter field. CheckValueChange calls the virtual function ImplCheckValueChange (see page 5416).

See Also

ImplCheckValueChange (see page 5416)

57.1.35.3.2 TAdapterUpdateField.ConvertValue Method

Retrieves a value entered by the end-user.

Pascal

```
function ConvertValue(AValue: IActionFieldValue): Variant; virtual;
```

C++

```
virtual __fastcall Variant ConvertValue(IActionFieldValue AValue);
```

Description

ConvertValue is called to retrieve, as a variant, the value entered by the user for this adapter field. ConvertValue using index 0 to retrieve a value from the IActionFieldValue (see page 5890) parameter. Typically, IActionFieldValue (see page 5890) will contain a string value. Descendants may override this function to caste the value into another type.

See Also

ConvertValue (see page 5580)

57.1.35.3.3 TAdapterUpdateField.ConvertValueCount Method

Retrieves the number of values entered by the end-user.

Pascal

```
function ConvertValueCount(AValue: IActionFieldValue): Integer; virtual;
```

C++

```
virtual __fastcall int ConvertValueCount(IActionFieldValue AValue);
```

Description

ConvertValueCount is called to retrieve the number of values entered by the user. ConvertValueCount returns 1. Descendants may override this method.

57.1.35.3.4 TAdapterUpdateField.ConvertValues Method

Retrieves a value entered by the end-user.

Pascal

```
function ConvertValues(AValue: IActionFieldValue; Index: Integer): Variant; virtual;
```

C++

```
virtual __fastcall Variant ConvertValues(IActionFieldValue AValue, int Index);
```

Description

ConvertValues is called to retrieve, as a variant, a particular value entered by the end-user for this adapter field.

57.1.35.3.5 TAdapterUpdateField.DoOnValidateValue Method

Validates field values entered by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); virtual;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue is called when the field value entered by the end-user is to be validated. DoOnValidateValue calls the OnValidateValue (see page 5421) event handler. DoOnValidateValue may be overridden by descendants.

See Also

OnValidateValue (see page 5421)

ImplValidateValue (see page 5418)

57.1.35.3.6 TAdapterUpdateField.GetAdapterValuesList Method

Provides an interface to a component that can be used to generate a list of possible values for this adapter field.

Pascal

```
function GetAdapterValuesList: IValuesListAdapter;
```

C++

```
__fastcall IValuesListAdapter GetAdapterValuesList();
```

Description

GetAdapterValuesList provides an interface to a component that can be used to generate a list of possible values for this adapter field. It does this by returning the value of the ValuesList (see page 5420) property.

See Also

IValuesListAdapter (see page 1014)

57.1.35.3.7 TAdapterUpdateField.GetInputStyleType Method

Indicates the preferred HTML element to use when editing this adapter field's value.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType returns htmliSelect if the ValuesList (see page 5420) property is not nil (Delphi) or NULL (C++). Otherwise, htmliTextInput is returned.

See Also

TAdapterInputHTMLElementType

ValuesList (see page 5420)

57.1.35.3.8 TAdapterUpdateField.GetValueCount Method

Provides the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount returns the number of values provided by this adapter field. GetValueCount returns 1. Descendant classes override this method.

See Also

TAdapterMultiValueField (see page 5320)

GetValueCount

57.1.35.3.9 TAdapterUpdateField.GetValues Method

Returns one of the values provided by this adapter field.

Pascal

```
function GetValues(I: Integer): Variant; virtual;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues returns one of the values provided by this adapter field. GetValues calls GetValue (see page 5347). Descendant classes override this method.

See Also

GetValues

TAdapterMultiValueField (see page 5320)

57.1.35.3.10 TAdapterUpdateField.ImplAsFormatted Method

Returns a string representation of the adapter field's value that is appropriate for a read-only display.

Pascal

```
function ImplAsFormatted: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplAsFormatted();
```

Description

ImplAsFormatted calls the OnGetDisplayText (see page 5421) event handler, if one is defined. Otherwise, ImplAsFormatted returns the adapter field's value converted to a string. Server-side script accesses the value returned by this function using the AsDisplayText property.

See Also

OnGetDisplayText (see page 5421)

GetValue (see page 5347)

57.1.35.3.11 TAdapterUpdateField.ImplCheckValueChange Method

Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

ImplCheckValueChange compares the number and content of values associated with the adapter field with the number and content of values entered by the end-user.

See Also

CheckValueChange (see page 5412)

57.1.35.3.12 TAdapterUpdateField.ImplGetDisplayLabel Method

Gets the preferred display label for this adapter field.

Pascal

```
function ImplGetDisplayLabel: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the value of the DisplayLabel (see page 5338) property.

See Also

DisplayLabel (see page 5338)

57.1.35.3.13 TAdapterUpdateField.ImplGetDisplayWidth Method

Returns the preferred display width for the HTML element used to edit or display this adapter field's value.

Pascal

```
function ImplGetDisplayWidth: Integer; override;
```

C++

```
virtual __fastcall int ImplGetDisplayWidth();
```

Description

ImplGetDisplayWidth returns the value of the DisplayWidth (see page 5338) property.

See Also

DisplayWidth (see page 5338)

57.1.35.3.14 TAdapterUpdateField.ImplGetEchoActionFieldValue Method

Gets a flag that causes the adapter field to return the value(s) entered by the end-user.

Pascal

```
function ImplGetEchoActionFieldValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValue();
```

Description

Gets a flag that causes the adapter field to return the value(s) entered by the end-user.

See Also

ImplSetEchoActionFieldValue (see page 5417)

57.1.35.3.15 TAdapterUpdateField.ImplGetVariableName Method

Gets the name used to access this adapter field with server-side script.

Pascal

```
function ImplGetVariableName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetVariableName();
```

Description

ImplGetVariableName returns the value of the FieldName (see page 5357) property.

See Also

FieldName (see page 5357)

57.1.35.3.16 TAdapterUpdateField.ImplSetEchoActionFieldValue Method

Sets a flag that causes the adapter field to return the value(s) entered by the end-user.

Pascal

```
procedure ImplSetEchoActionFieldValue(AValue: Boolean); override;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValue(Boolean AValue);
```

Description

ImplSetEchoActionFieldValue is typically called when an error occurs during the execution of an adapter action. It allows the page generated after the error to display the values entered by the user rather than the action adapter field values.

57.1.35.3.17 TAdapterUpdateField.ImplSetFieldName Method

Sets the name used to access this adapter field with server-side script.

Pascal

```
procedure ImplSetFieldName(const Value: string); override;
```

C++

```
virtual __fastcall ImplSetFieldName(const UnicodeString Value);
```

Description

ImplSetVariableName sets the value of the FieldName (see page 5357) property.

See Also

FieldName (see page 5357)

57.1.35.3.18 TAdapterUpdateField.ImplUpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplUpdateValue is a placeholder. Descendants override this method.

See Also

UpdateValue (see page 5419)

57.1.35.3.19 TAdapterUpdateField.ImplValidateValue Method

Validates values(s) entered by the end-user.

Pascal

```
procedure ImplValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall ImplValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplValidateValue calls the virtual function DoOnValidateValue (see page 5414) after extracting an IActionFieldValue (see page 5890) that contains the value(s) entered by the user. The AFieldIndex parameter identifies that location of the IActionFieldValue (see page 5890) in the AActionRequest.

See Also

ValidateValue (see page 5419)

DoOnValidateValue (see page 5414)

IActionRequest

57.1.35.3.20 TAdapterUpdateField.IsMultiValueField Method

Indicates whether this adapter field can support multiple values.

Pascal

```
function IsMultiValueField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsMultiValueField();
```

Description

IsMultiValueField return true to indicate that this adapter field can provide multiple values. IsMultiValueField returns false. Descendants may override this function.

See Also

GetValueCount (see page 5415)

GetValues (see page 5415)

TAdapterMultiValueField (see page 5320)

57.1.35.3.21 TAdapterUpdateField.Notification Method

Clears references to a deleted component.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called when a component is inserted or deleted. TAdapterUpdateField (see page 5407) clears the ValuesList (see page 5420) property when the associated component is deleted.

57.1.35.3.22 TAdapterUpdateField.UpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure UpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall UpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

UpdateValue calls the virtual method ImplUpdateValue (see page 5418).

See Also

ImplUpdateValue (see page 5418)

57.1.35.3.23 TAdapterUpdateField.ValidateValue Method

Validates values(s) entered by the end-user.

Pascal

```
procedure ValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall ValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ValidateValue calls the virtual function ImplValidateValue (see page 5418).

See Also

ImplValidateValue (see page 5418)

IActionRequest

57.1.35.4 TAdapterUpdateField Properties

The properties of the TAdapterUpdateField class are listed here.

Public Properties

	Name	Description
R	Value (see page 5420)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5420)	Associates a list of values with the adapter field.

57.1.35.4.1 TAdapterUpdateField.Value Property

Retrieves the value associated with this adapter field.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

GetValue (see page 5347) calls the GetValue (see page 5347) method to retrieve the value of the adapter field as a variant.

See Also

GetValue (see page 5347)

57.1.35.4.2 TAdapterUpdateField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 1014)

TStringsValuesList (see page 5843)

TDataSetValuesList

57.1.35.5 TAdapterUpdateField Events

The events of the TAdapterUpdateField class are listed here.

Public Events

	Name	Description
	OnGetDisplayText (see page 5421)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5421)	Event handler called to validate value(s) entered by the end-user.

57.1.35.5.1 TAdapterUpdateField.OnGetDisplayText Event

Event handler called to retrieve a string representation of the adapter field's value.

Pascal

```
property OnGetDisplayText: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetDisplayText;
```

Description

The OnGetDisplayText event handler is called to retrieve a string representation an adapter field's value appropriate for a read-only display. If OnGetDisplayText is nil (Delphi) or NULL (C++), then the value of the adapter field will be used (after conversion to a string).

See Also

ImplAsFormatted (see page 5415)

57.1.35.5.2 TAdapterUpdateField.OnValidateValue Event

Event handler called to validate value(s) entered by the end-user.

Pascal

```
property OnValidateValue: TAdapterFieldValidateValueEvent;
```

C++

```
__property TAdapterFieldValidateValueEvent OnValidateValue;
```

Description

This event handler is called by DoOnValidateValue (see page 5414) to validate the value(s) entered by the end-user. The event handler must raise an exception to indicate that the value(s) are not valid.

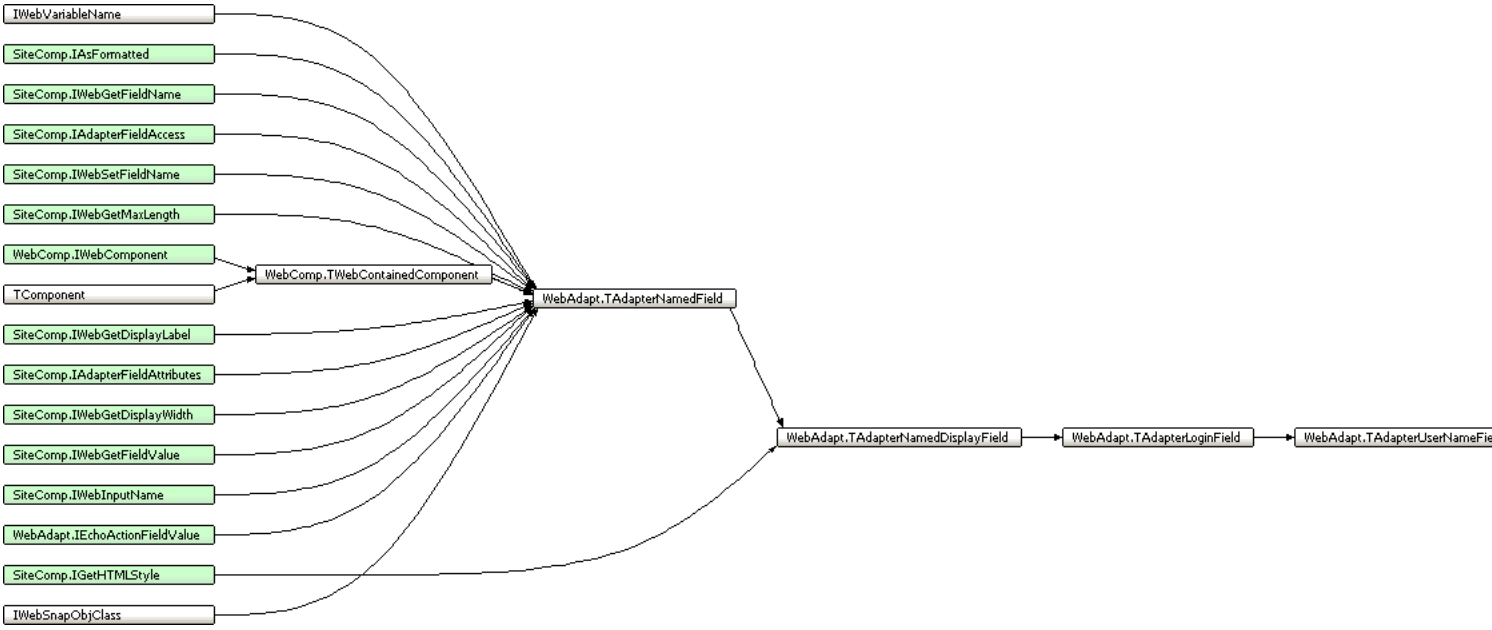
DoOnValidateValue (see page 5414)

IActionFieldValue

57.1.36 TAdapterUserNameField Class

TAdapterUserNameField is an adapter field used to access the user name entered by the end-user.

Class Hierarchy



Pascal

```
TAdapterUserNameField = class(TAdapterLoginField);
```

C++

```
class TAdapterUserNameField : public TAdapterLoginField;
```

File

WebAdapt

Description

TAdapterUserNameField is added to TLoginFormAdapter (see page 5810). TAdapterUserNameField, TAdapterPasswordField (see page 5379), TLoginFormAdapterLoginAction (see page 5821) and TAdapterNextPageField (see page 5367) are used with TLoginFormAdapter (see page 5810) to generate an HTML login form. When the HTML form is submitted, TAdapterUserNameField is used to extract the end user's name from the HTTP request.

See Also

TAdapterLoginField (see page 5308)

TLoginFormAdapter (see page 5810)

TAdapterPasswordField (see page 5379)

TAdapterNextPageField (see page 5367)

TLoginFormAdapterLoginAction (see page 5821)

57.1.36.1 TAdapterUserNameField Members

The following tables list the members exposed by TAdapterUserNameField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
V	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
V	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
V	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5425)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.

	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5334)	Creates an instance of TAdapterNamedDisplayField (see page 5331).
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.

R	Adapter (see page 5311)	Returns the parent adapter of this adapter field.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	DisplayLabel (see page 5426)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5426)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5426)	Identifies the name of this field when using server-side script.

57.1.36.2 TAdapterUserNameField Methods

The methods of the TAdapterUserNameField class are listed here.

Protected Methods

	Name	Description
V	ImplGetValue (see page 5425)	Returns the value associated with this adapter field.

57.1.36.2.1 TAdapterUserNameField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns an empty string. Server-side script accesses the result of this function using the EditText or Value (see page 5357) property of the adapter field. These server-side script properties may be used to generate the HTML login form. ImplGetValue returns an empty string so that the generated login form's user name field will be blank. When the login form is submitted, the ActionValue (see page 5356) property can be used to access the user name entered by the end-user.

See Also

ActionValue (see page 5356)

57.1.36.3 TAdapterUserNameField Properties

The properties of the TAdapterUserNameField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5426)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5426)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5426)	Identifies the name of this field when using server-side script.

57.1.36.3.1 TAdapterUserNameField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5345)

57.1.36.3.2 TAdapterUserNameField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5346)

57.1.36.3.3 TAdapterUserNameField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

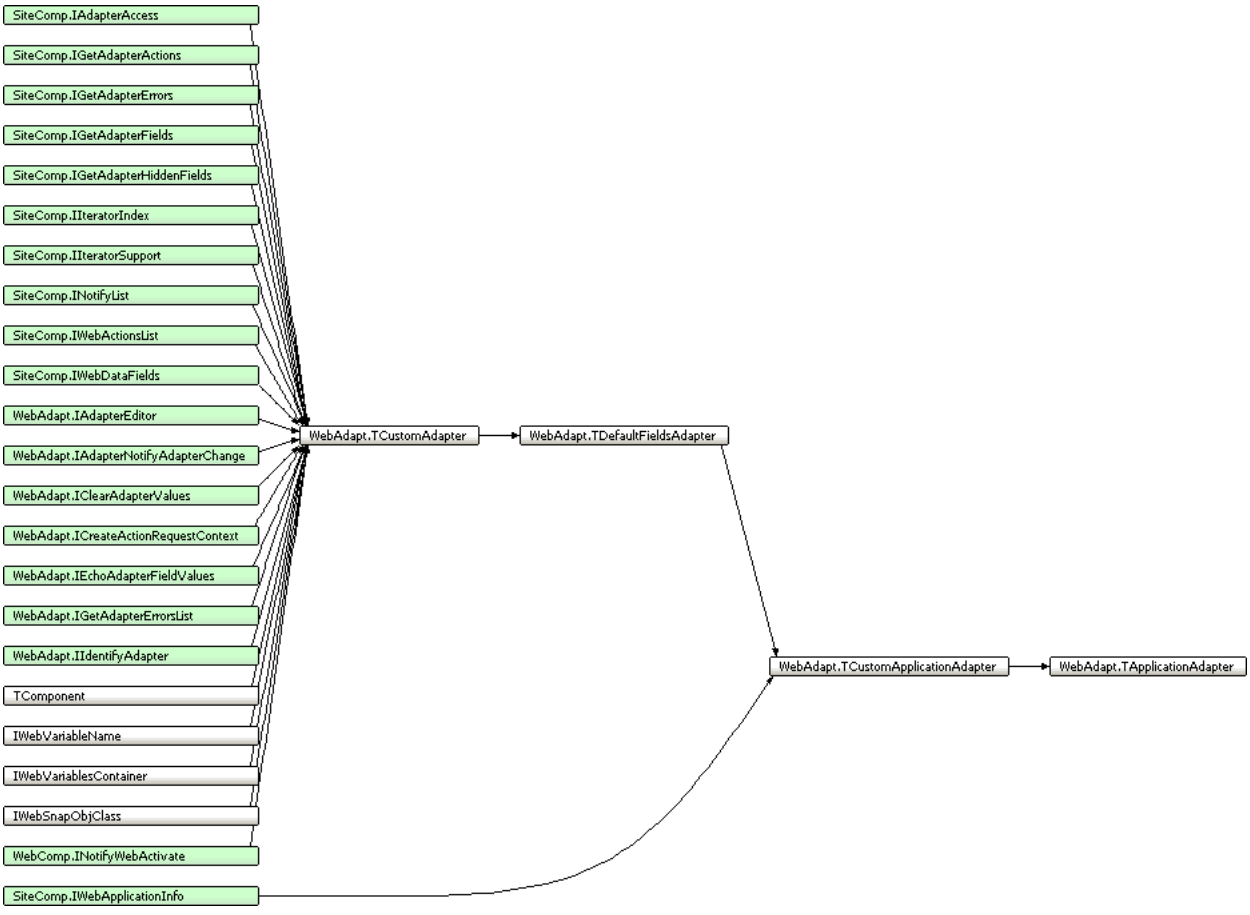
Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

57.1.37 TApplicationAdapter Class

TApplicationAdapter is a container for field and action components that are available through the Application script variable.

Class Hierarchy



Pascal

```
TApplicationAdapter = class(TCustomApplicationAdapter);
```

C++

```
class TApplicationAdapter : public TCustomApplicationAdapter;
```

File

WebAdapt

Description

By default, TApplicationAdapter contains a single field called Title that gets its value from the ApplicationTitle (see page 5432) property. The TApplicationAdapter can be customized by adding additional field and action components. When writing server-side script, use the Application variable to access fields and actions of the ApplicationAdapter. For example, <%= Application.Title %> writes the title of the application.

See Also

TAdapter (see page 5179)

TApplicationAdapter

57.1.37.1 TApplicationAdapter Members

The following tables list the members exposed by TApplicationAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5526)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5729)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5730)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5526)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5526)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5527)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5527)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5527)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 5528)	Clears adapter state information.
	ClearErrors (see page 5528)	Clears the content of the adapter's Errors (see page 5559) property.
	CreateActionRequestContext (see page 5528)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5529)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5730)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5529)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5529)	Implements IIteratorSupport (see page 996)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5530)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5530)	Returns an action component with a matching action name.
	FindField (see page 5530)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5531)	Finds an action with a matching variable name.
	FindNamedField (see page 5531)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5531)	Finds a field or action with a matching variable name.
	FindVariable (see page 5532)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5532)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5533)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5730)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5533)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5533)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5534)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 5534)	<insert text here>
	GetAdapterFields (see page 5534)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5534)	Returns a list of hidden fields that hold adapter state information.

	GetAdapterHiddenRecordFields (see page 5535)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetApplicationAdapter (see page 5655)	Implements IWebApplicationInfo (see page 1019)'s GetApplicationAdapter method.
	GetApplicationTitle (see page 5655)	Implements IWebApplicationInfo (see page 1019)'s GetApplicationTitle method.
	GetChildren (see page 5535)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5535)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 5731)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5536)	Returns the value of the echo flag.
	GetFieldsList (see page 5536)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5536)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5537)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 5537)	Returns an action or field.
	GetVariableCount (see page 5538)	Returns the total count of actions and fields.
	GetVariableName (see page 5538)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5538)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 5538)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 5539)	Returns the class type for this adapter field.
	GetWebSnapObjClass (see page 5655)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5539)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 5539)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 5539)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 5540)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddActionClass (see page 5655)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	ImplCanAddFieldClass (see page 5656)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 5540)	Clears adapter state information.
	ImplEndIterator (see page 5541)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5529) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5541)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5541)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5542)	Provides a list of action types that can be added to this adapter.
	ImplGetActionsList (see page 5656)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 5542)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5542)	Provides a list of field types that can be added to this adapter.
	ImplGetFieldsList (see page 5656)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 5543)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5537) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 5543)	Returns an action or field.
	ImplGetVariableCount (see page 5544)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5544)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5544)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5731)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5544)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5731)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5545)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5545)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5546)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 5546)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5549) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5546)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5551) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5547)	Called when the web module is activated.

	ImplNotifyDeactivate (see page 5547)	Called when the web module is deactivated.
	ImplSetActions (see page 5547)	Initializes the Actions (see page 5558) property.
	ImplSetActions (see page 5732)	Initializes the Actions (see page 5732) property.
	ImplSetData (see page 5548)	Initializes the Data (see page 5558) property.
	ImplSetData (see page 5732)	Initializes the Data (see page 5733) property.
	ImplSetEchoActionFieldValues (see page 5548)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5548)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5553) method to support iterating over the records of the adapter.
	InIterator (see page 5549)	Implements IIteratorIndex (see page 994)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5549)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5549)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5550)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 5550)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5551)	Implements IIteratorSupport (see page 996)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5551)	Clears references to deleted components.
	NotifyActivate (see page 5551)	Called when the web module is activated.
	NotifyAdapterChange (see page 5551)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5552)	Called when the web module is deactivated.
	SetActions (see page 5552)	Initializes the Actions (see page 5558) property.
	SetData (see page 5553)	Initializes the Data (see page 5558) property.
	SetEchoActionFieldValues (see page 5553)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5553)	Implements IIteratorSupport (see page 996)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5554)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5554)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5555)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5555)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5556)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5557)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5557)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5557)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5560)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5561)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 5561)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterUpdateFields (see page 5562)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5563)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeUpdateFields (see page 5564)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5564)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnIterateRecords (see page 5565)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1000)	Registers an interest in change notifications.
	CanAddActionClass (see page 5861)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5861)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5865)	This is ClearAdapterValues, a member of class IClearAdapterValues.

	Create (see page 5523)	Constructor for TCustomAdapter (see page 5519).
	CreateActionRequestContext (see page 5866)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	Destroy (see page 5523)	Destructor for TCustomAdapter (see page 5519).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	FindAction (see page 1018)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1023)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1018)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 960)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 962)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5872)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 963)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 964)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 964)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetApplicationAdapter (see page 1021)	Returns the value of the ApplicationAdapter (see page 1021) property.
	GetApplicationTitle (see page 1021)	Returns the value of the ApplicationTitle (see page 1022) property.
	GetEchoActionFieldValues (see page 5869)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1024)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
	GetVisibleActions (see page 1019)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1024)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 924)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 924)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 924)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1019)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1024)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 997)	Advances to the objects next item.
	NotifyActivate (see page 6061)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5862)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6061)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1000)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5869)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
	UpdateRecords (see page 5556)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
	ApplicationAdapter (see page 1021)	Provides access to the adapter that implements the fields and actions of the Application variable in server-side scripts.
	EchoActionFieldValues (see page 5869)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5559)	Modifies the adapter's echo flag.
	Errors (see page 5559)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5560)	This is ExecuteAccess, a member of class TCustomAdapter.
	IteratorIndex (see page 995)	Indicates the index of the current item.
	ModifyAccess (see page 5560)	This is ModifyAccess, a member of class TCustomAdapter.
	ViewAccess (see page 5560)	Identifies the rights required to view this adapter's fields.
	VisibleActions (see page 1019)	This is VisibleActions, a member of class IWebActionsList.
	VisibleFields (see page 1025)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5433)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5433)	Occurs after the adapter action response is generated.

	OnBeforeExecuteAction (see page 5434)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5434)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5435)	Supplies name/value pairs needed to execute an adapter action.

Published Properties

	Name	Description
	Actions (see page 5432)	Container for adapter actions components.
	ApplicationTitle (see page 5432)	Defines the title of the application.
	Data (see page 5433)	Container for adapter field components.

57.1.37.2 TApplicationAdapter Properties

The properties of the TApplicationAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 5432)	Container for adapter actions components.
	ApplicationTitle (see page 5432)	Defines the title of the application.
	Data (see page 5433)	Container for adapter field components.

57.1.37.2.1 TApplicationAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 5220)

57.1.37.2.2 TApplicationAdapter.ApplicationTitle Property

Defines the title of the application.

Pascal

```
property ApplicationTitle: string;
```

C++

```
__property UnicodeString ApplicationTitle;__property UnicodeString ApplicationTitle;
```

Description

Set this property to identify an application title that can be accessed with server-side script as the Application.Title property.

57.1.37.2.3 TApplicationAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 5226)

57.1.37.3 TApplicationAdapter Events

The events of the TApplicationAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5433)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5433)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 5434)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5434)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5435)	Supplies name/value pairs needed to execute an adapter action.

57.1.37.3.1 TApplicationAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 5465)

OnBeforeExecuteAction (see page 5563)

57.1.37.3.2 TApplicationAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.37.3.3 TApplicationAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 5465)

OnAfterExecuteAction (see page 5561)

57.1.37.3.4 TApplicationAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 5466)

OnAfterGetActionResponse (see page 5562)

57.1.37.3.5 TApplicationAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

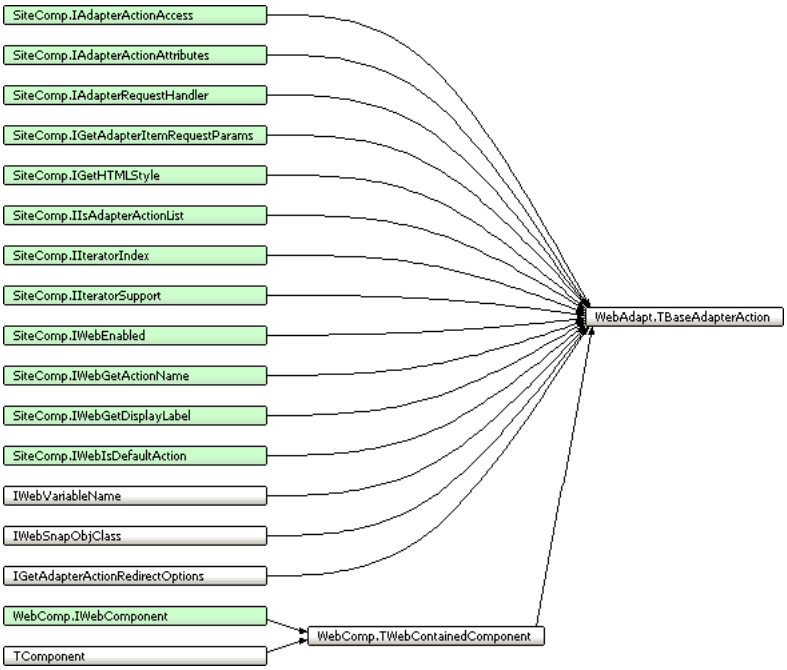
See Also

OnGetParams (see page 5466)

57.1.38 TBaseAdapterAction Class

TBaseAdapterAction is a based class for adapter action components.

Class Hierarchy



Pascal

```
TBaseAdapterAction = class(TWebContainedComponent, IWebVariableName, IWebEnabled,
IGetAdapterItemRequestParams, IWebGetActionName, IWebGetDisplayLabel, IWebSnapObjClass,
IAdapterActionAccess, IAdapterRequestHandler, IGetAdapterActionRedirectOptions, IGetHTMLStyle,
IAdapterActionAttributes, IIteratorSupport, IIteratorIndex, IIsAdapterActionList,
IWebIsDefaultAction);
```

C++

```
class TBaseAdapterAction : public TWebContainedComponent, public IWebVariableName, public
IWebEnabled, public IGetAdapterItemRequestParams, public IWebGetActionName, public
IWebGetDisplayLabel, public IWebSnapObjClass, public IAdapterActionAccess, public
IAdapterRequestHandler, public IGetAdapterActionRedirectOptions, public IGetHTMLStyle, public
IAdapterActionAttributes, public IIteratorSupport, public IIteratorIndex, public
IIsAdapterActionList, public IWebIsDefaultAction;
```

File

WebAdapt

Description

TBaseAdapterAction implements interfaces used to access an adapter action's properties using server-side script. Most of the interface implementation methods call virtual functions. When defining new derived classes, override these virtual functions to customize the behavior of the adapter action class.

See Also

TCustomAdapterAction (see page 5565)

TAdapter (see page 5179)

57.1.38.1 TBaseAdapterAction Members

The following tables list the members exposed by TBaseAdapterAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5440)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5440)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5441)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5441)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5442)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5442)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5443)	Implements IIteratorSupport (see page 996)'s EndIterator method.
	ExecuteActionRequest (see page 5443)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5444)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5444)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5444)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5445)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5445)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5445)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5445)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5446)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5446)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 5446)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5447)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5447)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5448)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5448)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5448)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method.

	GetSuccessOptions (see page 5449)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5449)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5450)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5450)	Suggests a view mode for this adapter action.
	GetVisible (see page 5450)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5451)	Returns the class type for this adapter field.
	HandleRequest (see page 5451)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5451)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5452)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5452)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5443) method.
V	ImplExecuteActionRequest (see page 5452)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5453)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5453)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5453)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5454)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 5454)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 5454)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 5455)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5448) method.
V	ImplGetSuccessOptions (see page 5455)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 5456)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	ImplHandleRequest (see page 5456)	Executes the adapter action and generates a response.
V	ImplHasExecuteAccess (see page 5456)	Checks the end-user's right to execute this adapter action.
V	ImplInIterator (see page 5457)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5459) method.
V	ImplIsDefaultAction (see page 5457)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5458)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5460) method.
	ImplStartIterator (see page 5458)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5461) method.
V	ImplWebEnabled (see page 5458)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5459)	Implements IIteratorIndex (see page 994)'s InIterator method.
	IsDefaultAction (see page 5459)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5460)	Implements IIteratorSupport (see page 996)'s NextIteration method.
V	ParentChanged (see page 5460)	Handles movement of the component to a different parent.
V	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5460)	Set the value of the DisplayLabel (see page 5462) property.
V	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	StartIterator (see page 5461)	Implements IIteratorSupport (see page 996)'s StartIterator method.
	WebEnabled (see page 5461)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
R	Adapter (see page 5462)	Provides access to the parent adapter component.

	Errors (see page 5463)	This is Errors, a member of class TBaseAdapterAction.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5465)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5465)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5465)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5466)	Called before the adapter action response is generated.
	OnGetParams (see page 5466)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
	ActionName (see page 5462)	Identifies the name of this action when using server-side script.
	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5462)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5463)	Defines the rights required to execute this action.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
	IsAdapterActionList (see page 991)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
	ItemCount (see page 5463)	Returns the number of items defined by an adapter action.
	ItemIndex (see page 5464)	Returns the index of the current item of an adapter action.
	IteratorIndex (see page 995)	Indicates the index of the current item.
	RedirectOptions (see page 5464)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Visible (see page 926)	This is Visible, a member of class IAdapterActionAttributes.

57.1.38.2 TBaseAdapterAction Methods

The methods of the TBaseAdapterAction class are listed here.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5440)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5440)	Creates an object that describes the adapter action parameters and adapter field values.
	DoAfterExecuteActionRequest (see page 5441)	Calls event handlers after the adapter action is executed.
	DoAfterGetExecuteActionResponse (see page 5441)	Calls event handlers after the adapter action response is formulated.

	DoBeforeExecuteActionRequest (see page 5442)	Calls event handlers before the adapter action is executed.
	DoBeforeGetExecuteActionResponse (see page 5442)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5443)	Implements IIteratorSupport (see page 996)'s EndIterator method.
	ExecuteActionRequest (see page 5443)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5444)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5444)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5444)	Provides the name/value pairs needed to execute this adapter action.
	GetDefaultActionName (see page 5445)	Gets the default name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 5445)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5445)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5445)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 5446)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5446)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 5446)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5447)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5447)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5448)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 5448)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5448)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5449)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5449)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5450)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 5450)	Suggests a view mode for this adapter action.
	GetVisible (see page 5450)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 5451)	Returns the class type for this adapter field.
	HandleRequest (see page 5451)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5451)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5452)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5452)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5443) method.
	ImplExecuteActionRequest (see page 5452)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 5453)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 5453)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5453)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 5454)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 5454)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5454)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5455)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5448) method.
	ImplGetSuccessOptions (see page 5455)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5456)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5456)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5456)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5457)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5459) method.
	ImplIsDefaultAction (see page 5457)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5458)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5460) method.

	ImplStartIterator (see page 5458)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5461) method.
V	ImplWebEnabled (see page 5458)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5459)	Implements IIteratorIndex (see page 994)'s InIterator method.
	IsDefaultAction (see page 5459)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	NextIteration (see page 5460)	Implements IIteratorSupport (see page 996)'s NextIteration method.
V	ParentChanged (see page 5460)	Handles movement of the component to a different parent.
	SetDisplayLabel (see page 5460)	Set the value of the DisplayLabel (see page 5462) property.
	StartIterator (see page 5461)	Implements IIteratorSupport (see page 996)'s StartIterator method.
	WebEnabled (see page 5461)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

57.1.38.2.1 TBaseAdapterAction.CheckExecuteAccess Method

Checks end-user rights to execute this adapter action.

Pascal

```
procedure CheckExecuteAccess;
```

C++

```
__fastcall CheckExecuteAccess();
```

Description

This procedure is called to verify that the current user has rights to execute this action. An exception will be raised if access is denied.

See Also

ExecuteAccess (see page 5463)

HasExecuteAccess (see page 5451)

ExecuteActionRequest (see page 5443)

57.1.38.2.2 TBaseAdapterAction.CreateRequestContext Method

Creates an object that describes the adapter action parameters and adapter field values.

Pascal

```
procedure CreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

The adapter dispatcher calls this function before calling HandleRequest (see page 5451). The result of this function is stored in the WebContext (see page 5977) variable. During the course of executing this action, the object returned by CreateRequestContext will be used to access the action parameters and field values that were passed in the HTTP request to execute this action.

See Also

ImplCreateRequestContext (see page 5452)

AdapterRequest (see page 5946)

TAdapterDispatcher (see page 6122)

HandleRequest (see page 5451)

57.1.38.2.3 TBaseAdapterAction.DoAfterExecuteActionRequest Method

Calls event handlers after the adapter action is executed.

Pascal

```
procedure DoAfterExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoAfterExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

DoAfterExecuteActionRequest is called by ExecuteActionRequest (see page 5443). DoAfterExecuteActionRrequest packages the action request parameters into TStrings and calls two event handlers. The parent adapter's OnAfterExecuteAction event handler is called first. If it does not handle the action request then the OnAfterExecute (see page 5465) event handler is called.

See Also

OnAfterExecute (see page 5465)

OnAfterExecuteAction (see page 5561)

DoAfterExecuteActionRequest

ExecuteActionRequest (see page 5443)

57.1.38.2.4 TBaseAdapterAction.DoAfterGetExecuteActionResponse Method

Calls event handlers after the adapter action response is formulated.

Pascal

```
procedure DoAfterGetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoAfterGetExecuteActionResponse(IActionRequest AActionRequest,
IActionResponse AActionResponse);
```

Description

DoAfterGetExecuteActionResponse is called by GetExecuteActionResponse (see page 5446). The parent adapter's OnAfterGetActionResponse event handler is called first. If it does not handle the action response then the OnAfterGetResponse (see page 5465) event handler is called.

See Also

OnAfterGetResponse (see page 5465)

OnAfterGetActionResponse (see page 5562)

DoBeforeGetExecuteActionResponse (see page 5442)

GetExecuteActionResponse (see page 5446)

57.1.38.2.5 TBaseAdapterAction.DoBeforeExecuteActionRequest Method

Calls event handlers before the adapter action is executed.

Pascal

```
procedure DoBeforeExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoBeforeExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

DoBeforeExecuteActionRequest is called by ExecuteActionRequest (see page 5443). DoBeforeExecuteActionRequest packages the action request parameters into TStrings and calls two event handlers. The parent adapter's OnBeforeExecuteAction event handler is called first. If it does not handle the action request then the OnBeforeExecute (see page 5465) event handler is called. If either event handler handles the request then the IActionRequest (see page 5890)'s Handled property is set to true.

See Also

OnBeforeExecute (see page 5465)

OnBeforeExecuteAction (see page 5563)

DoAfterExecuteActionRequest (see page 5441)

ExecuteActionRequest (see page 5443)

57.1.38.2.6 TBaseAdapterAction.DoBeforeGetExecuteActionResponse Method

Calls event handlers before the adapter action response is formulated.

Pascal

```
procedure DoBeforeGetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoBeforeGetExecuteActionResponse(IActionRequest AActionRequest,
IActionResponse AActionResponse);
```

Description

DoBeforeGetExecuteActionResponse is called by GetExecuteActionResponse (see page 5446). The parent adapter's OnBeforeGetActionResponse event handler is called first. If it does not handle the action response then the OnBeforeGetResponse (see page 5466) event handler is called. If either event handler handles the action response then the IActionResponse's Handled property is set to true.

See Also

OnBeforeGetResponse (see page 5466)

OnBeforeGetActionResponse (see page 5563)

DoAfterGetExecuteActionResponse (see page 5441)

GetExecuteActionResponse (see page 5446)

57.1.38.2.7 TBaseAdapterAction.EndIterator Method

Implements IIteratorSupport (see page 996)'s EndIterator method.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

IIteratorSupport (see page 996) is used to enumerate the list of commands supported by this adapter action. Most adapter actions have a single command. TAdapterGotoPageAction (see page 5280) is an example of an adapter action that supports multiple commands. EndIterator calls ImplNextIteration (see page 5458).

See Also

IIteratorSupport (see page 996)

IIteratorIndex (see page 994)

enditerator (see page 997)

ImplEndIterator (see page 5452)

57.1.38.2.8 TBaseAdapterAction.ExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse);
```

C++

```
__fastcall ExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ExecuteActionRequest is called by ImplHandleRequest (see page 5456) when a request to execute this adapter action is found in the HTTP request. ExecuteActionRequest first calls CheckExecuteAccess (see page 5440). CheckExecuteAccess (see page 5440) raises an exception if the end-user does not have execute rights. ExecuteActionRequest then calls, in turn, DoBeforeExecuteActionRequest (see page 5442), ImplExecuteActionRequest (see page 5452), and DoAfterExecuteActionRequest (see page 5441).

See Also

DoBeforeExecuteActionRequest (see page 5442)

DoAfterExecuteActionRequest (see page 5441)

CheckExecuteAccess (see page 5440)

ImplExecuteActionRequest (see page 5452)

ImplHandleRequest (see page 5456)

57.1.38.2.9 TBaseAdapterAction.GetActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetActionName: string;
```

C++

```
__fastcall UnicodeString GetActionName();
```

Description

GetActionName is called to retrieve the name used to access this adapter field with server-side script. GetActionName calls ImplGetActionName (see page 5453).

See Also

ActionName (see page 5462)

ImplGetActionName (see page 5453)

57.1.38.2.10 TBaseAdapterAction.GetAdapter Method

GetAdapter returns the parent adapter component.

Pascal

```
function GetAdapter: TCustomAdapter;
```

C++

```
__fastcall TCustomAdapter GetAdapter();
```

Description

To improve the efficiency of this function, a reference to the parent adapter component is cached in an instance variable.

See Also

Adapter (see page 5462)

57.1.38.2.11 TBaseAdapterAction.GetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure GetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(UnicodeString AIdentifier, IAdapterItemRequestParams
Params);
```

Description

The name/value pairs provided by this method will written to the HTTP response when the HTML page is generated and passed back in the HTTP request when this adapter action is to be executed. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted.

See Also

ImplGetAdapterItemRequestParams (see page 5453)

57.1.38.2.12 TBaseAdapterAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 5453)

57.1.38.2.13 TBaseAdapterAction.GetDefaultDisplayLabel Method

Provides the default display label for this adapter action.

Pascal

```
function GetDefaultDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDefaultDisplayLabel();
```

Description

When the display label for the action matches this value then the display label property does not need to be stored in the form file.

57.1.38.2.14 TBaseAdapterAction.GetDisplayLabel Method

Returns the suggested display label for this adapter action.

Pascal

```
function GetDisplayLabel: string;
```

C++

```
__fastcall UnicodeString GetDisplayLabel();
```

Description

GetDisplayLabel provides label that may be used when generating HTML to display a button or hyperlink for this adapter action. The value returned by this function can be accessed with server-side script using the DisplayLabel (see page 5462) property. GetDisplayLabel calls ImplGetDisplayLabel (see page 5453).

See Also

DisplayLabel (see page 5462)

ImplGetDisplayLabel (see page 5453)

57.1.38.2.15 TBaseAdapterAction.GetDisplayStyle Method

Returns a string value to suggest an HTML display style for this adapter action.

Pascal

```
function GetDisplayStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetDisplayStyle(const UnicodeString AAdapterMode);
```

Description

GetDisplayStyle implements IGetHTMLStyle (see page 973)'s GetDisplayStyle method by translating the result value of GetDisplayStyleType (see page 5446) into a string.

See Also

GetDisplayStyle (see page 974)

GetDisplayStyleType (see page 5446)

57.1.38.2.16 TBaseAdapterAction.GetDisplayStyleType Method

Suggests an HTML display type for this adapter action.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterActionHTMLElementType;
virtual;
```

C++

```
virtual __fastcall TAdapterActionHTMLElementType GetDisplayStyleType(const UnicodeString
AAdapterMode);
```

Description

GetDisplayStyleType returns htmlaButton, indicating that this adapter action should be displayed using a submit button. Descendant classes may override this method to suggest other HTML display types.

See Also

GetDisplayStyle (see page 5445)

57.1.38.2.17 TBaseAdapterAction.GetErrors Method

Pascal

```
function GetErrors: TBaseAdapterErrorsList;
```

C++

```
__fastcall TBaseAdapterErrorsList GetErrors();
```

Description

This is GetErrors, a member of class TBaseAdapterAction.

57.1.38.2.18 TBaseAdapterAction.GetExecuteActionResponse Method

Generates a response after the adapter action has been executed.

Pascal

```
procedure GetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse);
```

C++

```
__fastcall GetExecuteActionResponse(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

GetExecuteActionResponse is called by ImplHandleRequest (see page 5456) after executing an adapter action specified by the HTTP request. GetExecuteActionResponse calls, in turn, DoBeforeGetExecuteActionResponse (see page 5442), ImplGetExecuteActionResponse (see page 5454), and DoAfterGetExecuteActionResponse (see page 5441).

See Also

IActionRequest

IActionResponse

DoBeforeGetExecuteActionResponse (see page 5442)

DoAfterGetExecuteActionResponse (see page 5441)

ImplGetExecuteActionResponse (see page 5454)

ImplHandleRequest (see page 5456)

57.1.38.2.19 TBaseAdapterAction.GetFailureOptions Method

Indicates whether to perform an HTTP redirect after execution of this adapter action fails.

Pascal

```
function GetFailureOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetFailureOptions();
```

Description

Set RedirectOptions (see page 5464) when an HTTP redirect should be performed after execution of this adapter action fails. GetFailureOptions returns the result of ImplGetFailureOptions (see page 5454).

See Also

ImplGetFailureOptions (see page 5454)

GetSuccessOptions (see page 5449)

RedirectOptions (see page 5464)

57.1.38.2.20 TBaseAdapterAction.GetInputStyle Method

Returns a string value to suggest an HTML display style for this adapter action.

Pascal

```
function GetInputStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetInputStyle(const UnicodeString AAdapterMode);
```

Description

GetInputStyle implements IGetHTMLStyle (see page 973)'s GetInputType method by returning the result of GetDisplayStyle (see page 5445). This method must be implemented as part of IGetHTMLStyle (see page 973). GetInputStyle is treated as a

synonym of GetDisplayStyle (see page 5445).

See Also

GetInputStyle (see page 974)

GetDisplayStyle (see page 5445)

57.1.38.2.21 TBaseAdapterAction.GetIsAdapterActionList Method

Indicates whether this adapter action may have multiple commands.

Pascal

```
function GetIsAdapterActionList: Boolean;
```

C++

```
__fastcall Boolean GetIsAdapterActionList();
```

Description

An adapter action may have a list of commands. The TAdapterGotoPageAction (see page 5280) is an example of an adapter action with a list of commands. Each command goes to a different page in the parent TPagedAdapter (see page 5830). GetIsAdapterActionList calls ImplGetIsAdapterActionList (see page 5454).

See Also

ImplGetIsAdapterActionList (see page 5454)

TAdapterGotoPageAction (see page 5280)

57.1.38.2.22 TBaseAdapterAction.GetItemCount Method

Returns the number of commands defined by this adapter action.

Pascal

```
function GetItemCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetItemCount();
```

Description

An adapter action may have a list of commands. The TAdapterGotoPageAction (see page 5280) is an example of an adapter action with a list of commands. Each command goes to a different page in the parent TPagedAdapter (see page 5830). GetItemCount returns 1. GetItemCount may be overridden by a descendant class.

See Also

ItemCount (see page 5463)

ItemIndex (see page 5464)

TAdapterGotoPageAction (see page 5280)

GetIsAdapterActionList (see page 5448)

57.1.38.2.23 TBaseAdapterAction.GetIteratorIndex Method

Implements IIteratorIndex (see page 994)'s GetIteratorIndex method.

Pascal

```
function GetIteratorIndex: Integer;
```

C++

```
__fastcall int GetIteratorIndex();
```

Description

IIteratorIndex (see page 994) and IIteratorSupport (see page 996) are used to iterate through the commands supported by an adapter action. Most adapter actions support a single command. TAdapterActionGotoPage is adapter action that supports multiple commands. GetIteratorIndex returns the index of the current command. GetIteratorIndex calls ImplGetIteratorIndex (see page 5455).

See Also

IIteratorIndex (see page 994)

IIteratorSupport (see page 996)

GetIteratorIndex (see page 995)

ImplGetIteratorIndex (see page 5455)

57.1.38.2.24 TBaseAdapterAction.GetSuccessOptions Method

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
function GetSuccessOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetSuccessOptions();
```

Description

Set RedirectOptions (see page 5464) when an HTTP redirect should be performed after executing an action. GetSuccessOptions returns the result of ImplGetSuccessOptions (see page 5455).

See Also

ImplGetSuccessOptions (see page 5455)

GetFailureOptions (see page 5447)

RedirectOptions (see page 5464)

57.1.38.2.25 TBaseAdapterAction.GetVariableName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall UnicodeString GetVariableName();
```

Description

GetVariableName is called to retrieve the name used to access this adapter action with server-side script. GetVariableName calls ImplGetVariableName (see page 5455).

See Also

ImplGetVariableName (see page 5455)

57.1.38.2.26 TBaseAdapterAction.GetViewMode Method

Returns a string value to suggest a view mode for this adapter action.

Pascal

```
function GetViewMode(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetViewMode(const UnicodeString AAdapterMode);
```

Description

GetViewMode implements IGetHTMLStyle (see page 973)'s GetViewMode method by translating the result value of GetViewModeType (see page 5450) into a string.

See Also

GetViewMode (see page 975)

GetViewModeType (see page 5450)

57.1.38.2.27 TBaseAdapterAction.GetViewModeType Method

Suggests a view mode for this adapter action.

Pascal

```
function GetViewModeType(const AAdapterMode: string): TAdapterDisplayViewModeType; virtual;
```

C++

```
virtual __fastcall TAdapterDisplayViewModeType GetViewModeType(const UnicodeString
AAdapterMode);
```

Description

GetViewModeType returns htmlvmInput.

See Also

ReadOnly (see page 5339)

GetViewMode (see page 5336)

57.1.38.2.28 TBaseAdapterAction.GetVisible Method

Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

The state of the parent adapter may dictate whether a button or hyperlink for a particular adapter action should not be shown. For example, TDataSetAdapterApplyRowAction can be configured to return false when the parent TDataSetAdapter is in browse

mode. GetVisible calls ImplGetVisible (see page 5456). Server-side script can access the value returned by GetVisible using the Visible property of an adapter action object.

See Also

ImplGetVisible (see page 5456)

57.1.38.2.29 TBaseAdapterAction.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

57.1.38.2.30 TBaseAdapterAction.HandleRequest Method

Executes the adapter action and generates a response.

Pascal

```
function HandleRequest(DispatchParams: IAdapterDispatchParams): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

The adapter dispatcher calls HandleRequest to execute the adapter action and generate a response. HandleRequest calls ImplHandleRequest (see page 5456).

See Also

CreateRequestContext (see page 5440)

57.1.38.2.31 TBaseAdapterAction.HasExecuteAccess Method

Checks the end-user's right to execute this adapter action.

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanExecute property. HasExecuteAccess calls ImplHasExecuteAccess (see page 5456).

See Also

CheckExecuteAccess (see page 5440)

ImplHasExecuteAccess (see page 5456)

57.1.38.2.32 TBaseAdapterAction.ImplCreateRequestContext Method

Creates an object that describes the action parameters and field values.

Pascal

```
procedure ImplCreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall ImplCreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

ImplCreateRequestContext is called by CreateRequestContext (see page 5440). ImplCreateRequestContext returns the result of TCustomAdapter (see page 5519)'s CreateActionRequestContext method.

See Also

CreateRequestContext (see page 5440)

CreateActionRequestContext (see page 5528)

57.1.38.2.33 TBaseAdapterAction.ImplEndIterator Method

Implements IIteratorSupport (see page 996)'s EndIterator (see page 5443) method.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer);
```

C++

```
__fastcall ImplEndIterator(void * OwnerData);
```

Description

ImplEndIterator is called by EndIterator (see page 5443). ImplEndIterator resets internal variables.

See Also

IIteratorIndex (see page 994)

IIteratorSupport (see page 996)

EndIterator (see page 5443)

57.1.38.2.34 TBaseAdapterAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest is called by ExecuteActionRequest (see page 5443). ImplExecuteActionRequest must be

overridden by a descendant class.

See Also

IActionRequest

IActionResponse

ExecuteActionRequest (see page 5443)

57.1.38.2.35 TBaseAdapterAction.ImplGetActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function ImplGetActionName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetActionName();
```

Description

This function is called by GetActionName (see page 5444). ImplGetActionName returns the result of GetDefaultActionName (see page 5445). Descendants may override this function.

See Also

GetActionName (see page 5444)

GetDefaultActionName (see page 5445)

57.1.38.2.36 TBaseAdapterAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(UnicodeString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

ImplGetAdapterItemRequestParams is called by GetAdapterItemRequestParams (see page 5444). ImplGetAdapterItemRequestParams calls the OnGetActionParams event handler of the parent adapter and then calls the OnGetParams (see page 5466) event handler.

See Also

GetAdapterItemRequestParams (see page 5444)

OnGetActionParams (see page 5564)

OnGetParams (see page 5466)

57.1.38.2.37 TBaseAdapterAction.ImplGetDisplayLabel Method

Returns the suggested display label for this adapter action.

Pascal

```
function ImplGetDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the value of the DisplayLabel (see page 5462) property.

See Also

DisplayLabel (see page 5462)

57.1.38.2.38 TBaseAdapterAction.ImplGetExecuteActionResponse Method

Generates a response after the adapter action has been executed.

Pascal

```
procedure ImplGetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall ImplGetExecuteActionResponse(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplGetExecuteActionResponse is called by GetExecuteActionResponse (see page 5446). ImplGetExecuteActionResponse sets properties of IActionResponse to identify the response to this action request.

See Also

GetExecuteActionResponse (see page 5446)

57.1.38.2.39 TBaseAdapterAction.ImplGetFailureOptions Method

Indicates whether to perform an HTTP redirect after execution of this adapter action fails.

Pascal

```
function ImplGetFailureOptions: TAdapterActionRedirectOptions; virtual;
```

C++

```
virtual __fastcall TAdapterActionRedirectOptions ImplGetFailureOptions();
```

Description

ImplGetFailureOptions returns an empty set.

See Also

GetFailureOptions (see page 5447)

57.1.38.2.40 TBaseAdapterAction.ImplGetIsAdapterActionList Method

Indicates whether this adapter action may have multiple commands.

Pascal

```
function ImplGetIsAdapterActionList: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetIsAdapterActionList();
```

Description

ImplGetIsAdapterActionList is called by GetIsAdapterActionList (see page 5448). ImplGetIsAdapterActionList returns false. ImplGetIsAdapterActionList may be overridden by descendant classes.

See Also

GetIsAdapterActionList (see page 5448)

ImplGetIsAdapterActionList (see page 5607)

57.1.38.2.41 TBaseAdapterAction.ImplGetIteratorIndex Method

Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5448) method.

Pascal

```
function ImplGetIteratorIndex: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetIteratorIndex();
```

Description

ImplGetIteratorIndex is called by GetIteratorIndex (see page 5448). ImplGetIteratorIndex returns the value of an internal iteration index.

See Also

GetIteratorIndex (see page 995)

GetIteratorIndex (see page 5448)

57.1.38.2.42 TBaseAdapterAction.ImplGetSuccessOptions Method

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
function ImplGetSuccessOptions: TAdapterActionRedirectOptions; virtual;
```

C++

```
virtual __fastcall TAdapterActionRedirectOptions ImplGetSuccessOptions();
```

Description

ImplGetSuccessOptions returns the value of the RedirectOptions (see page 5464) property.

See Also

GetSuccessOptions (see page 5449)

RedirectOptions (see page 5464)

57.1.38.2.43 TBaseAdapterAction.ImplGetVariableName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function ImplGetVariableName: string;
```

C++

```
__fastcall UnicodeString ImplGetVariableName();
```

Description

This function is called by GetVariableName (see page 5449). GetVariableName (see page 5449) returns the result of GetActionName (see page 5444).

See Also

GetVariableName (see page 5449)

GetActionName (see page 5444)

57.1.38.2.44 TBaseAdapterAction.ImplGetVisible Method

Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

Pascal

```
function ImplGetVisible: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetVisible();
```

Description

ImplGetVisible is called by GetVisible (see page 5450). ImplGetVisible returns true. ImplGetVisible may be overridden by descendant components.

See Also

GetVisible (see page 5450)

57.1.38.2.45 TBaseAdapterAction.ImplHandleRequest Method

Executes the adapter action and generates a response.

Pascal

```
function ImplHandleRequest(DispatchParams: IAdapterDispatchParams): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

ImplHandleRequest is called by HandleRequest (see page 5451). ImplHandleRequest calls ExecuteActionRequest (see page 5443) followed by GetExecuteActionResponse (see page 5446).

See Also

ExecuteActionRequest (see page 5443)

GetExecuteActionResponse (see page 5446)

57.1.38.2.46 TBaseAdapterAction.ImplHasExecuteAccess Method

Checks the end-user's right to execute this adapter action.

Pascal

```
function ImplHasExecuteAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasExecuteAccess();
```

Description

This function is called by HasExecuteAccess (see page 5451) to check the end-user's right to execute the adapter action. First, the parent adapter's HasExecuteAccess (see page 5451) method is called. If the adapter allows execute access and the ExecuteAccess (see page 5463) property is not blank, this function calls the EndUserAdapter HasModifyRights function, passing the ExecuteAccess (see page 5463) property value.

See Also

HasExecuteRights (see page 5496)

ExecuteAccess (see page 5463)

HasExecuteAccess (see page 5451)

hasexecuteaccess (see page 5539)

57.1.38.2.47 TBaseAdapterAction.ImplInIterator Method

Implements IIteratorIndex (see page 994)'s InIterator (see page 5459) method.

Pascal

```
function ImplInIterator: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplInIterator();
```

Description

ImplInIterator is called by InIterator (see page 5459). ImplInIterator returns the value of an internal flag.

See Also

IIteratorIndex (see page 994)

IIteratorSupport (see page 996)

InIterator (see page 995)

ImplInIterator

57.1.38.2.48 TBaseAdapterAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction (see page 5459). ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 5459)

ImplIsDefaultAction (see page 5608)

57.1.38.2.49 TBaseAdapterAction.ImplNextIteration Method

Implements IIteratorSupport (see page 996)'s NextIteration (see page 5460) method.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

ImplNextIteration is called by NextIteration (see page 5460). ImplNextIteration increments an internal iteration index. true is returned if the iteration index is within the bounds defined by ItemCount (see page 5463).

See Also

IIteratorIndex (see page 994)

IIteratorSupport (see page 996)

NextIteration (see page 5460)

57.1.38.2.50 TBaseAdapterAction.ImplStartIterator Method

Implements IIteratorSupport (see page 996)'s StartIterator (see page 5461) method.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

ImplStartIterator is called by StartIterator (see page 5461). ImplStartIterator initializes the internal iteration index. ImplStartIterator returns true because it is assumed that there is at least one command associated with this adapter action.

See Also

IIteratorIndex (see page 994)

IIteratorSupport (see page 996)

startiterator (see page 998)

StartIterator (see page 5461)

57.1.38.2.51 TBaseAdapterAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled is called by WebEnabled (see page 5461). ImplWebEnabled returns true. Descendant classes may override this method.

See Also

WebEnabled (see page 5461)

57.1.38.2.52 TBaseAdapterAction.InIterator Method

Implements IIteratorIndex (see page 994)'s InIterator method.

Pascal

```
function InIterator: Boolean;
```

C++

```
__fastcall Boolean InIterator();
```

Description

IIteratorIndex (see page 994) and IIteratorSupport (see page 996) are used to iterate through the commands supported by an adapter action. Most adapter actions support a single command. TAdapterActionGotoPage is adapter action that supports multiple commands. InIterator calls ImplInIterator (see page 5457).

See Also

IIteratorIndex (see page 994)

IIteratorSupport (see page 996)

InIterator (see page 995)

ImplInIterator (see page 5457)

57.1.38.2.53 TBaseAdapterAction.IsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function IsDefaultAction(ADisplay: TObject): Boolean;
```

C++

```
__fastcall Boolean IsDefaultAction(TObject * ADisplay);
```

Description

Some adapter components have built in support for specific types of adapter actions. These actions are often added to the adapter component by default unless the developer explicitly adds one or more adapter actions. IsDefaultAction is called by the adapter while adding default actions to determine whether this adapter action should be added. ADisplay identifies characteristics of the adapter component. IsDefaultAction calls ImplIsDefaultAction (see page 5457).

See Also

ImplIsDefaultAction (see page 5457)

57.1.38.2.54 TBaseAdapterAction.NextIteration Method

Implements IIteratorSupport (see page 996)'s NextIteration method.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

IIteratorSupport (see page 996) is used to enumerate the list of commands supported by this adapter action. Most adapter actions have a single command. TAdapterGotoPageAction (see page 5280) is an example of an adapter action that supports multiple commands. NextIterations returns the result of ImplNextIteration (see page 5458).

See Also

IIteratorSupport (see page 996)

IIteratorIndex (see page 994)

ImplNextIteration (see page 5458)

NextIteration (see page 997)

57.1.38.2.55 TBaseAdapterAction.ParentChanged Method

Handles movement of the component to a different parent.

Pascal

```
procedure ParentChanged; override;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

ParentChanged is called when the parent component is changed. TBaseAdapterAction (see page 5435) clears its cached reference to the parent adapter.

57.1.38.2.56 TBaseAdapterAction.SetDisplayLabel Method

Set the value of the DisplayLabel (see page 5462) property.

Pascal

```
procedure SetDisplayLabel(const Value: string);
```

C++

```
__fastcall SetDisplayLabel(const UnicodeString Value);
```

Description

SetDisplayLabel sets the value of the DisplayLabel (see page 5462) property.

See Also

DisplayLabel (see page 5462)

57.1.38.2.57 TBaseAdapterAction.StartIterator Method

Implements IIteratorSupport (see page 996)'s StartIterator method.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

IIteratorIndex (see page 994) and IIteratorSupport (see page 996) are used to iterate through the commands supported by an adapter action. Most adapter actions support a single command. TAdapterActionGotoPage is adapter action that supports multiple commands. StartIterator calls ImplImplInIterator.

See Also

IIteratorIndex (see page 994)

IIteratorSupport (see page 996)

startiterator (see page 998)

ImplStartIterator (see page 5458)

57.1.38.2.58 TBaseAdapterAction.WebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function WebEnabled: Boolean;
```

C++

```
__fastcall Boolean WebEnabled();
```

Description

The state of the parent adapter may dictate when a button or hyperlink for a particular adapter action should not be enabled. For example, TDataSetAdapterPrevRowAction returns False when the dataset is positioned at BOF. WebEnabled calls ImplWebEnabled (see page 5458). Server-side script can access the value returned by WebEnabled using the Enabled property of an adapter action object.

See Also

ImplWebEnabled (see page 5458)

57.1.38.3 TBaseAdapterAction Properties

The properties of the TBaseAdapterAction class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 5462)	Provides access to the parent adapter component.
	Errors (see page 5463)	This is Errors, a member of class TBaseAdapterAction.

Public Properties

	Name	Description
	ActionName (see page 5462)	Identifies the name of this action when using server-side script.
	DisplayLabel (see page 5462)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5463)	Defines the rights required to execute this action.
	ItemCount (see page 5463)	Returns the number of items defined by an adapter action.
	ItemIndex (see page 5464)	Returns the index of the current item of an adapter action.
	RedirectOptions (see page 5464)	Indicates whether to perform an HTTP redirect after successfully executing this action.

57.1.38.3.1 TBaseAdapterAction.ActionName Property

Identifies the name of this action when using server-side script.

Pascal

```
property ActionName: string;
```

C++

```
__property UnicodeString ActionName;
```

Description

The ActionName property defines the name used to access the adapter action with server-side script.

See Also

GetActionName (see page 5444)

57.1.38.3.2 TBaseAdapterAction.Adapter Property

Provides access to the parent adapter component.

Pascal

```
property Adapter: TCustomAdapter;
```

C++

```
__property TCustomAdapter Adapter;
```

Description

Descendant classes use this property to access the parent adapter component.

57.1.38.3.3 TBaseAdapterAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 5453)

SetDisplayLabel (see page 5460)

57.1.38.3.4 TBaseAdapterAction.Errors Property

Pascal

```
property Errors: TBaseAdapterErrorsList;
```

C++

```
__property TBaseAdapterErrorsList Errors;
```

Description

This is Errors, a member of class TBaseAdapterAction.

57.1.38.3.5 TBaseAdapterAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property UnicodeString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 6759)

hasexecuteaccess (see page 5539)

57.1.38.3.6 TBaseAdapterAction.ItemCount Property

Returns the number of items defined by an adapter action.

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

An adapter action may have a list of commands. The ItemCount property is implemented by GetItemCount (see page 5448). The TAdapterGotoPageAction (see page 5280) is an example of an adapter action with a list of commands. Each command of TAdapterGotoPageAction (see page 5280) displays a different page of the parent TPagedAdapter (see page 5830).

See Also

GetItemCount (see page 5448)

ItemIndex (see page 5464)

TAdapterGotoPageAction (see page 5280)

GetIsAdapterActionList (see page 5448)

57.1.38.3.7 TBaseAdapterAction.ItemIndex Property

Returns the index of the current item of an adapter action.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

An adapter action may have a list of commands. The ItemIndex indicates the current item in the list. The TAdapterGotoPageAction (see page 5280) is an example of an adapter action with a list of commands. Each command of TAdapterGotoPageAction (see page 5280) displays a different page of the parent TPagedAdapter (see page 5830).

See Also

ItemCount (see page 5463)

TAdapterGotoPageAction (see page 5280)

GetIsAdapterActionList (see page 5448)

57.1.38.3.8 TBaseAdapterAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect

57.1.38.4 TBaseAdapterAction Events

The events of the TBaseAdapterAction class are listed here.

Public Events

	Name	Description
	OnAfterExecute (see page 5465)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5465)	Called after the adapter action response is generated.

	OnBeforeExecute (see page 5465)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5466)	Called before the adapter action response is generated.
	OnGetParams (see page 5466)	Specifies name/value pairs needed to execute this adapter action.

57.1.38.4.1 TBaseAdapterAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest (see page 5441).

See Also

DoAfterExecuteActionRequest (see page 5441)

OnAfterExecuteAction (see page 5561)

OnBeforeExecute (see page 5465)

57.1.38.4.2 TBaseAdapterAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse

OnBeforeGetActionResponse (see page 5563)

57.1.38.4.3 TBaseAdapterAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest (see page 5442).

See Also

DoBeforeExecuteActionRequest (see page 5442)

OnAfterExecute (see page 5465)

OnBeforeExecuteAction (see page 5563)

57.1.38.4.4 TBaseAdapterAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5442)

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.38.4.5 TBaseAdapterAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

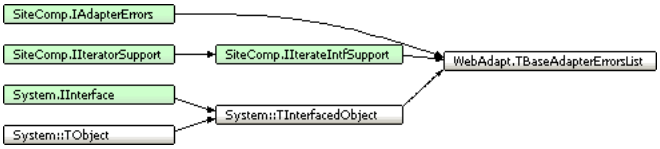
See Also

ImplGetAdapterItemRequestParams (see page 5453)

57.1.39 TBaseAdapterErrorsList Class

TBaseAdapterErrorsList is the base class for adapter error object managers.

Class Hierarchy



Pascal

```
TBaseAdapterErrorsList = class(TInterfacedObject, IAdapterErrors, IIterateIntfSupport);
```

C++

```
class TBaseAdapterErrorsList : public TInterfacedObject, public IAdapterErrors, public
IIterateIntfSupport;
```

File

WebAdapt

Description

TBaseAdapterErrorsList is the base class for objects that manage lists of adapter error objects. Do not instantiate TBaseAdapterErrorsList directly. Use TAdapterErrorsList (see page 5248).

See Also

TAdapterErrorsList (see page 5248)

IAdapterError (see page 934)

57.1.39.1 TBaseAdapterErrorsList Members

The following tables list the members exposed by TBaseAdapterErrorsList.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	EndIterator (see page 5471)	This is EndIterator, a member of class TBaseAdapterErrorsList.
	GetCurrentIntf (see page 5471)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 5471)	Returns a particular error.
	GetErrorCount (see page 5471)	Return the number of errors in the errors list.
	GetObjectErrors (see page 5472)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 5472)	Indicates whether the errors list contains objects associated with a particular adapter field.

	ImplClearErrors (see page 5472)	This is ImplClearErrors, a member of class TBaseAdapterErrorsList.
	ImplDefineLabel (see page 5472)	This is ImplDefineLabel, a member of class TBaseAdapterErrorsList.
	ImplGetError (see page 5473)	This is ImplGetError, a member of class TBaseAdapterErrorsList.
	ImplGetErrorCount (see page 5473)	This is ImplGetErrorCount, a member of class TBaseAdapterErrorsList.
	ImplGetObjectErrors (see page 5473)	This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.
	ImplHasObjectErrors (see page 5473)	This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.
	NextIteration (see page 5474)	Advances to the objects next item.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	StartIterator (see page 5474)	This is StartIterator, a member of class TBaseAdapterErrorsList.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddError (see page 5469)	This is the overview for the AddError method overload.
	AfterConstruction (see page 3358)	Responds after the last constructor executes.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearErrors (see page 5470)	Clear error list.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	DefineLabel (see page 5470)	Define error label for field.
	Destroy (see page 3366)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.

	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	ErrorCount (see page 5474)	Number of error objects contained.
	Errors (see page 5475)	Access to error objects.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

57.1.39.2 TBaseAdapterErrorsList Methods

The methods of the TBaseAdapterErrorsList class are listed here.

Protected Methods

	Name	Description
	EndIterator (see page 5471)	This is EndIterator, a member of class TBaseAdapterErrorsList.
	GetCurrentIntf (see page 5471)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 5471)	Returns a particular error.
	GetErrorCount (see page 5471)	Return the number of errors in the errors list.
	GetObjectErrors (see page 5472)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 5472)	Indicates whether the errors list contains objects associated with a particular adapter field.
	ImplClearErrors (see page 5472)	This is ImplClearErrors, a member of class TBaseAdapterErrorsList.
	ImplDefineLabel (see page 5472)	This is ImplDefineLabel, a member of class TBaseAdapterErrorsList.
	ImplGetError (see page 5473)	This is ImplGetError, a member of class TBaseAdapterErrorsList.
	ImplGetErrorCount (see page 5473)	This is ImplGetErrorCount, a member of class TBaseAdapterErrorsList.
	ImplGetObjectErrors (see page 5473)	This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.
	ImplHasObjectErrors (see page 5473)	This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.
	NextIteration (see page 5474)	Advances to the objects next item.
	StartIterator (see page 5474)	This is StartIterator, a member of class TBaseAdapterErrorsList.

Public Methods

	Name	Description
	AddError (see page 5469)	This is the overview for the AddError method overload.
	ClearErrors (see page 5470)	Clear error list.
	DefineLabel (see page 5470)	Define error label for field.

57.1.39.2.1 AddError Method

This is the overview for the AddError method overload.

Overload List

	Name	Description
	TBaseAdapterErrorsList.AddError (Exception, string) (see page 5470)	Add error to list.
	TBaseAdapterErrorsList.AddError (Exception, TObject) (see page 5470)	Add error to list.
	TBaseAdapterErrorsList.AddError (string, string, Integer) (see page 5470)	Add error to list.
	TBaseAdapterErrorsList.AddError (string, TObject, Integer) (see page 5470)	Add error to list.

57.1.39.2.1.1 TBaseAdapterErrorsList.AddError Method (Exception, TObject)

Add error to list.

Pascal

```
procedure AddError(AException: Exception; const AObjectName: string = ''); virtual; overload;
procedure AddError(const AMessage: string; const AObjectName: string = ''; AID: Integer = 0);
virtual; overload;
procedure AddError(const AMessage: string; AObject: TObject; AID: Integer = 0); virtual;
overload;
procedure AddError(AException: Exception; AObject: TObject); virtual; overload;
```

C++

```
virtual __fastcall AddError(Exception AException, const UnicodeString AObjectName = '');
virtual __fastcall AddError(const UnicodeString AMessage, const UnicodeString AObjectName =
'', int AID = 0);
virtual __fastcall AddError(const UnicodeString AMessage, TObject * AObject, int AID = 0);
virtual __fastcall AddError(Exception AException, TObject * AObject);
```

Description

AddError adds an error to the list maintained by the TBaseAdapterErrorsList (see page 5467) instance. As implemented in TBaseAdapterErrorsList (see page 5467), AddError does nothing. This method must be implemented by descendant classes.

See Also

AddError (see page 5252)

57.1.39.2.2 TBaseAdapterErrorsList.ClearErrors Method

Clear error list.

Pascal

```
procedure ClearErrors;
```

C++

```
__fastcall ClearErrors();
```

Description

Clear errors deletes all error information maintained by the TBaseAdapterErrorsList (see page 5467) instance.

See Also

AddError (see page 5252)

57.1.39.2.3 TBaseAdapterErrorsList.DefineLabel Method

Define error label for field.

Pascal

```
procedure DefineLabel(const AName: string; const ALabel: string);
```

C++

```
__fastcall DefineLabel(const UnicodeString AName, const UnicodeString ALabel);
```

Description

DefineLabel defines a string label that represents a dataset field in error message. AName is the the field name. ALabel is the label.

See Also

AddError (see page 5252)

57.1.39.2.4 TBaseAdapterErrorsList.EndIterator Method

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

This is EndIterator, a member of class TBaseAdapterErrorsList.

57.1.39.2.5 TBaseAdapterErrorsList.GetCurrentIntf Method

Pascal

```
function GetCurrentIntf(OwnerData: Pointer): IUnknown;
```

C++

```
__fastcall IUnknown GetCurrentIntf(void * OwnerData);
```

Description

This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.

57.1.39.2.6 TBaseAdapterErrorsList.GetError Method

Returns a particular error.

Pascal

```
function GetError(I: Integer): IAdapterError;
```

C++

```
__fastcall IAdapterError GetError(int I);
```

Description

I is a zero-based index.

See Also

IAdapterError (see page 934)

57.1.39.2.7 TBaseAdapterErrorsList.GetErrorCount Method

Return the number of errors in the errors list.

Pascal

```
function GetErrorCount: Integer;
```

C++

```
__fastcall int GetErrorCount();
```

Description

Return the number of errors in the errors list.

57.1.39.2.8 TBaseAdapterErrorsList.GetObjectErrors Method

Returns an object that is used to enumerate all errors associated with an adapter field.

Pascal

```
function GetObjectErrors(const AName: string): TObject;
```

C++

```
__fastcall TObject * GetObjectErrors(const UnicodeString AName);
```

Description

AName identifies an adapter field. nil (Delphi) or NULL (C++) is returned if there are no errors associated with the adapter field.

See Also

HasObjectErrors (see page 939)

57.1.39.2.9 TBaseAdapterErrorsList.HasObjectErrors Method

Indicates whether the errors list contains objects associated with a particular adapter field.

Pascal

```
function HasObjectErrors(const AName: string): Boolean;
```

C++

```
__fastcall Boolean HasObjectErrors(const UnicodeString AName);
```

Description

HasObjectErrors returns true if any errors are associated with the given adapter field. AName identifies an adapter field.

See Also

GetObjectErrors (see page 939)

57.1.39.2.10 TBaseAdapterErrorsList.ImplClearErrors Method

Pascal

```
procedure ImplClearErrors; virtual;
```

C++

```
virtual __fastcall ImplClearErrors();
```

Description

This is ImplClearErrors, a member of class TBaseAdapterErrorsList.

57.1.39.2.11 TBaseAdapterErrorsList.ImplDefineLabel Method

Pascal

```
procedure ImplDefineLabel(const AName: string; const ALabel: string); virtual;
```

C++

```
virtual __fastcall ImplDefineLabel(const UnicodeString AName, const UnicodeString ALabel);
```

Description

This is ImplDefineLabel, a member of class TBaseAdapterErrorsList.

57.1.39.2.12 TBaseAdapterErrorsList.ImplGetError Method

Pascal

```
function ImplGetError(I: Integer): IAdapterError; virtual;
```

C++

```
virtual __fastcall IAdapterError ImplGetError(int I);
```

Description

This is ImplGetError, a member of class TBaseAdapterErrorsList.

57.1.39.2.13 TBaseAdapterErrorsList.ImplGetErrorCount Method

Pascal

```
function ImplGetErrorCount: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetErrorCount();
```

Description

This is ImplGetErrorCount, a member of class TBaseAdapterErrorsList.

57.1.39.2.14 TBaseAdapterErrorsList.ImplGetObjectErrors Method

Pascal

```
function ImplGetObjectErrors(const AName: string): TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetObjectErrors(const UnicodeString AName);
```

Description

This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.

57.1.39.2.15 TBaseAdapterErrorsList.ImplHasObjectErrors Method

Pascal

```
function ImplHasObjectErrors(const AName: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasObjectErrors(const UnicodeString AName);
```

Description

This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.

57.1.39.2.16 TBaseAdapterErrorsList.NextIteration Method

Advances to the objects next item.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Server-side script calls NextIteration to move to the next item.

OwnerData is a pointer to information that the object can use to influence the iteration process. Each object stores and uses this information in its own way. This information is first supplied by the initial call to the StartIterator method. NextIteration can modify the information, after which it is supplied to the next call to the NextIteration or EndIterator method.

NextIteration returns true if it successfully moves to the next item, false if there were no more items.

See Also

startiterator (see page 998)

enditerator (see page 997)

57.1.39.2.17 TBaseAdapterErrorsList.StartIterator Method

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

This is StartIterator, a member of class TBaseAdapterErrorsList.

57.1.39.3 TBaseAdapterErrorsList Properties

The properties of the TBaseAdapterErrorsList class are listed here.

Public Properties

	Name	Description
R	ErrorCount (see page 5474)	Number of error objects contained.
R	Errors (see page 5475)	Access to error objects.

57.1.39.3.1 TBaseAdapterErrorsList.ErrorCount Property

Number of error objects contained.

Pascal

```
property ErrorCount: Integer;
```

C++

```
__property int ErrorCount;
```

Description

ErrorCount returns the number of error objects available.

See Also

Errors (see page 5475)

57.1.39.3.2 TBaseAdapterErrorsList.Errors Property

Access to error objects.

Pascal

```
property Errors [I: Integer]: IAdapterError;
```

C++

```
__property IAdapterError Errors[int I];
```

Description

Errors returns a specific error object.

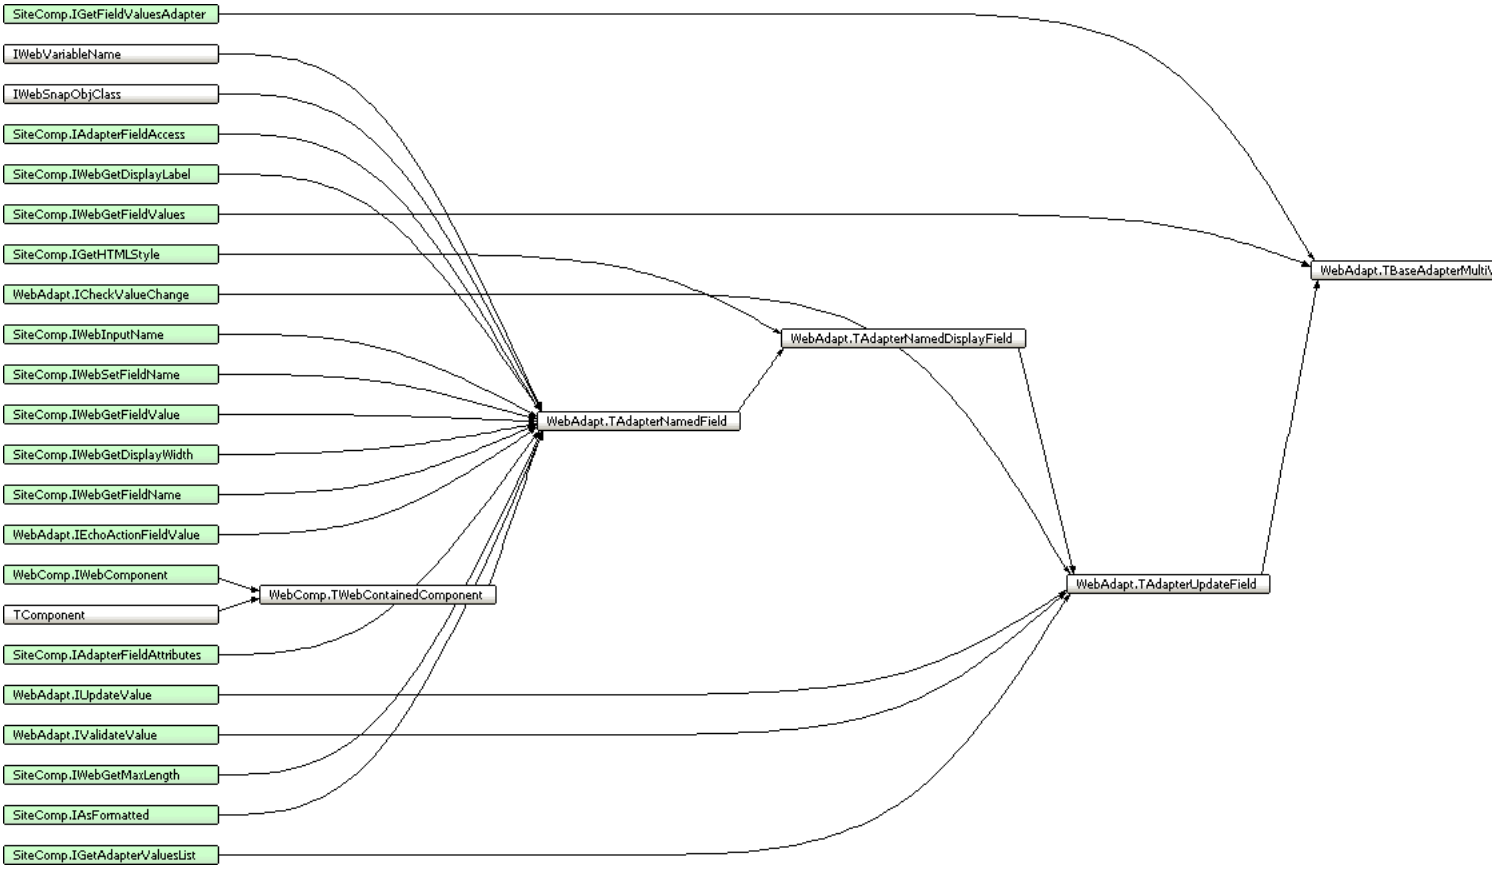
See Also

ErrorCount (see page 5474)

57.1.40 TBaseAdapterMultiValueField Class

TBaseAdapterMultiValueField is a base class for adapter fields that have zero or more values.

Class Hierarchy



Pascal

```
TBaseAdapterMultiValueField = class(TAdapterUpdateField, IGetFieldValuesAdapter,
IWebGetFieldValues);
```

C++

```
class TBaseAdapterMultiValueField : public TAdapterUpdateField, public IGetFieldValuesAdapter,
public IWebGetFieldValues;
```

File

WebAdapt

Description

TBaseAdapterMultiValueField is used to represent a data value that can have multiple values. Server-side script is used to generate a form displaying this field. Typically, the HTML form will contain group check boxes or a select list supporting multiple selection. When an Adapter (see page 5356) action is executed, TBaseAdapterMultiValueField is used to retrieve the submitted field value(s) from the HTTP request.

See Also

TCustomAdapterMultiValueField (see page 5632)

TCustomAdapterFileField (see page 5590)

57.1.40.1 TBaseAdapterMultiValueField Members

The following tables list the members exposed by TBaseAdapterMultiValueField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5412)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5413)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5413)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5413)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5414)	Validates field values entered by the end-user.
	EndValueIterator (see page 5481)	Completes iteration.
V	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5344)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5414)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 5481)	Implements IWebGetFieldValues (see page 1034)' GetCurrentValue.
V	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5334)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5335)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 5482)	Returns the adapter object that implements the Values property.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5335)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5335)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 5414)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
V	GetValueCount (see page 5482)	Returns the number of values associated with this adapter field.
V	GetValues (see page 5482)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5336)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5336)	Suggests a view mode for this adapter field.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 5483)	Implements IWebGetFieldValues (see page 1034)' HasValue method.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 5415)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.

	ImplCheckValueChange (see page 5416)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetCurrentValue (see page 5483)	Implements IWebGetFieldValues (see page 1034)' GetCurrentValue (see page 5481) method.
	ImplGetDisplayLabel (see page 5337)	Implements interface access to the DisplayLabel (see page 5338) property.
	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 5416)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5337)	Implements interface access to the DisplayWidth (see page 5338) property.
	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 5416)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 5417)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetFieldValuesAdapter (see page 5483)	Returns the adapter object that implements the Values property.
	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5337)	Implements interface access to the Required (see page 5339) property.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5417)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasValue (see page 5484)	Implements IWebGetFieldValues (see page 1034)' HasValue (see page 5483) method.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5417)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5417)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5418)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 5418)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5418)	Indicates whether this adapter field can support multiple values.
	NextValueIteration (see page 5484)	Implements IWebGetFieldValues (see page 1034)' NextValueIteration method.
	Notification (see page 5419)	Clears references to a deleted component.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5337)	SetDisplayLabel sets the value of the DisplayLabel (see page 5338) property.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	StartValueIterator (see page 5484)	Implements IWebGetFieldValues (see page 1034)' StartValueIterator method.
	UpdateValue (see page 5419)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5419)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5356)	Returns the parent adapter component.

R	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
R	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5421)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5421)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5864)	This is CheckValueChange, a member of class ICheckValueChange.
V	Create (see page 5480)	Constructor for TBaseAdapterMultiValueField (see page 5475).
V	Destroy (see page 5480)	Destructor for TBaseAdapterMultiValueField (see page 5475).
	GetAdapterValuesList (see page 969)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	UpdateValue (see page 5878)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5879)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5338)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5338)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.

	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	ReadOnly (see page 5339)	Indicates whether this adapter field is read-only.
R	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5339)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5357)	Provides the value of an adapter field as a variant.
R	Value (see page 5420)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5420)	Associates a list of values with the adapter field.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
R	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.40.2 TBaseAdapterMultiValueField.Create Constructor

Constructor for TBaseAdapterMultiValueField (see page 5475).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBaseAdapterMultiValueField(TComponent * AOwner);
```

Description

Creates an instance of TFieldValuesAdapter (see page 5789) and calls the inherited creator method. TFieldValuesAdapter (see page 5789) is used to implement the Values property used by server-side script.

See Also

TFieldValuesAdapter (see page 5789)

ImplGetFieldValuesAdapter (see page 5483)

Destroy (see page 5480)

57.1.40.3 TBaseAdapterMultiValueField.Destroy Destructor

Destructor for TBaseAdapterMultiValueField (see page 5475).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseAdapterMultiValueField();
```

Description

Destroys the instance of TFieldValuesAdapter (see page 5789) and calls the inherited destructor. TFieldValuesAdapter (see page 5789) is used to implement the Values property used by server-side script.

See Also

TFieldValuesAdapter (see page 5789)

ImplGetFieldValuesAdapter (see page 5483)

Create (see page 5480)

57.1.40.4 TBaseAdapterMultiValueField Methods

The methods of the TBaseAdapterMultiValueField class are listed here.

Protected Methods

	Name	Description
	EndValueIterator (see page 5481)	Completes iteration.
	GetCurrentValue (see page 5481)	Implements IWebGetFieldValues (see page 1034)' GetCurrentValue.
	GetFieldValuesAdapter (see page 5482)	Returns the adapter object that implements the Values property.
V	GetValueCount (see page 5482)	Returns the number of values associated with this adapter field.
V	GetValues (see page 5482)	Returns one of the values associated with the adapter field.
	HasValue (see page 5483)	Implements IWebGetFieldValues (see page 1034)' HasValue method.
V	ImplGetCurrentValue (see page 5483)	Implements IWebGetFieldValues (see page 1034)' GetCurrentValue (see page 5481) method.
V	ImplGetFieldValuesAdapter (see page 5483)	Returns the adapter object that implements the Values property.
V	ImplHasValue (see page 5484)	Implements IWebGetFieldValues (see page 1034)' HasValue (see page 5483) method.
	NextValueIteration (see page 5484)	Implements IWebGetFieldValues (see page 1034)' NextValueIteration method.
	StartValueIterator (see page 5484)	Implements IWebGetFieldValues (see page 1034)' StartValueIterator method.

57.1.40.4.1 TBaseAdapterMultiValueField.EndValueIterator Method

Completes iteration.

Pascal

```
procedure EndValueIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndValueIterator(void * OwnerData);
```

Description

The EndValueIterator procedure is called when iteration has completed.

See Also

NextValueIteration (see page 5484)

StartValueIterator (see page 5484)

57.1.40.4.2 TBaseAdapterMultiValueField.GetCurrentValue Method

Implements IWebGetFieldValues (see page 1034)' GetCurrentValue.

Pascal

```
function GetCurrentValue: Variant;
```

C++

```
__fastcall Variant GetCurrentValue();
```

Description

GetCurrentValue returns the result of ImplGetCurrentValue (see page 5483).

See Also

GetCurrentValue (see page 1035)

ImplGetCurrentValue (see page 5483)

57.1.40.4.3 TBaseAdapterMultiValueField.GetFieldValuesAdapter Method

Returns the adapter object that implements the Values property.

Pascal

```
function GetFieldValuesAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetFieldValuesAdapter();
```

Description

GetFieldValuesAdapter is called when server-side script references the Values property of this adapter field. GetFieldValuesAdapter calls ImplGetFieldValuesAdapter (see page 5483).

See Also

ImplGetFieldValuesAdapter (see page 5483)

57.1.40.4.4 TBaseAdapterMultiValueField.GetValueCount Method

Returns the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; override;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount returns 0. Descendants of TBaseAdapterMultiValueField (see page 5475) override this method. This method will be called when server-side script is used to iterate over field values using the Values property.

See Also

GetValues (see page 5482)

57.1.40.4.5 TBaseAdapterMultiValueField.GetValues Method

Returns one of the values associated with the adapter field.

Pascal

```
function GetValues(I: Integer): Variant; override;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues returns Unassigned. Descendants override this method. This method will be called when server-side script is used to iterate over field values using the Values property.

See Also

GetValueCount (see page 5482)

57.1.40.4.6 TBaseAdapterMultiValueField.HasValue Method

Implements IWebGetFieldValues (see page 1034)' HasValue method.

Pascal

```
function HasValue(const AValue: Variant): Boolean;
```

C++

```
__fastcall Boolean HasValue(const Variant AValue);
```

Description

HasValue returns the result of ImplHasValue (see page 5484).

See Also

HasValue (see page 1035)

ImplHasValue (see page 5484)

57.1.40.4.7 TBaseAdapterMultiValueField.ImplGetCurrentValue Method

Implements IWebGetFieldValues (see page 1034)' GetCurrentValue (see page 5481) method.

Pascal

```
function ImplGetCurrentValue: Variant; virtual;
```

C++

```
virtual __fastcall Variant ImplGetCurrentValue();
```

Description

ImplGetCurrentValue is called by GetCurrentValue (see page 5481). ImplGetCurrentValue calls GetValues (see page 5482) with the value of the internal iterator index.

See Also

GetCurrentValue (see page 5481)

GetValues (see page 5482)

57.1.40.4.8 TBaseAdapterMultiValueField.ImplGetFieldValuesAdapter Method

Returns the adapter object that implements the Values property.

Pascal

```
function ImplGetFieldValuesAdapter: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetFieldValuesAdapter();
```

Description

ImplGetFieldValuesAdapter returns an instance of TFieldValuesAdapter (see page 5789).

See Also

TFieldValuesAdapter (see page 5789)

GetFieldValuesAdapter (see page 5482)

Create (see page 5480)

Destroy (see page 5480)

57.1.40.4.9 TBaseAdapterMultiValueField.ImplHasValue Method

Implements IWebGetFieldValues (see page 1034)' HasValue (see page 5483) method.

Pascal

```
function ImplHasValue(const Value: Variant): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasValue(const Variant Value);
```

Description

ImplHasValue is called by HasValue (see page 5483). ImplHasValue returns False (indicating that there is no matching value). Descendants override this method.

See Also

HasValue (see page 5483)

57.1.40.4.10 TBaseAdapterMultiValueField.NextValueIteration Method

Implements IWebGetFieldValues (see page 1034)' NextValueIteration method.

Pascal

```
function NextValueIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextValueIteration(void * OwnerData);
```

Description

NextValueIteration increments an internal iterator index. false is returned if the iterator index is not less than the GetValueCount (see page 5482) .

See Also

NextValueIteration (see page 1036)

GetValueCount (see page 5482)

57.1.40.4.11 TBaseAdapterMultiValueField.StartValueIterator Method

Implements IWebGetFieldValues (see page 1034)' StartValueIterator method.

Pascal

```
function StartValueIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartValueIterator(void * OwnerData);
```

Description

StartValueIterator initializes an internal iterator index to zero. false is returned if GetValueCount (see page 5482) is zero.

See Also

StartValueIterator (see page 1036)

GetValueCount (see page 5482)

57.1.41 TBaseEndUserAdapter Class

TBaseEndUserAdapter contains user information.

Class Hierarchy

Pascal

```
TBaseEndUserAdapter = class(TDefaultFieldsAdapter, IWebEndUser);
```

C++

```
class TBaseEndUserAdapter : public TDefaultFieldsAdapter, public IWebEndUser;
```

File

WebAdapt

Description

TBaseEndUserAdapter contains information about a user such as their name, access rights, and whether they are logged in. TBaseEndUserAdapter has default fields to represent the end user's display name and login state. It has default actions for logging a user in and logging a user out. End user adapters are responsible validating end user access. For example, when the end user attempts to access a page, the end-user adapter is called to determine whether the end user has rights to access the page.

See Also

TEndUserAdapter (see page 5750)

TEndUserSessionAdapter (see page 5779)

57.1.41.1 TBaseEndUserAdapter Members

The following tables list the members exposed by TBaseEndUserAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5526)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5729)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5730)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5526)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5526)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5527)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5527)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 5491)	Determines if there is a static login page.
V	CanExecuteLogout (see page 5491)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 5492)	Determines whether there is a static login page or an automatically produced login page.
	CheckModifyAccess (see page 5527)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 5528)	Clears adapter state information.
	ClearErrors (see page 5528)	Clears the content of the adapter's Errors (see page 5559) property.
	CreateActionRequestContext (see page 5528)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5529)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5730)	Notifies other components of changes to the list of default actions or fields.
V	DoOnHasRights (see page 5492)	Determines whether the user has view rights.
V	EncodeActionParams (see page 5529)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5529)	Implements IIteratorSupport (see page 996)'s EndIterator method to support iterating over the data records of the adapter.
V	ExecuteLogin (see page 5492)	Starts the server-side login process.
V	ExecuteLoginForm (see page 5493)	Creates the HTML login page.
V	ExecuteLogout (see page 5493)	Performs server-side logout.
V	ExtractRequestParams (see page 5530)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5530)	Returns an action component with a matching action name.
	FindField (see page 5530)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5531)	Finds an action with a matching variable name.
	FindNamedField (see page 5531)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5531)	Finds a field or action with a matching variable name.
	FindVariable (see page 5532)	Finds an adapter action or adapter field with the given variable name.

	FindVariableContainer (see page 5532)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5533)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5730)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5533)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5533)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5534)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 5534)	<insert text here>
	GetAdapterFields (see page 5534)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5534)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5535)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5535)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5535)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5731)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 5493)	Retrieves the display name string.
V	GetDisplayNameValue (see page 5494)	Gets the display name of the end user.
	GetEchoActionFieldValues (see page 5536)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 5494)	Gets the end-user adapter.
	GetFieldsList (see page 5536)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5536)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5537)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 5495)	Determines if the user is logged in
V	GetLoggedInValue (see page 5495)	Determines if the user is logged in.
	GetLoginFormAction (see page 5495)	Gets the action component for the login form.
	GetLogoutAction (see page 5496)	Gets the action component for the logout form.
V	GetUserID (see page 5496)	Gets the UserID from this TBaseEndUserAdapter (see page 5485).
	GetVariable (see page 5537)	Returns an action or field.
	GetVariableCount (see page 5538)	Returns the total count of actions and fields.
	GetVariableName (see page 5538)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5538)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 5538)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 5539)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5539)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasExecuteRights (see page 5496)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5485).
	HasModifyAccess (see page 5539)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasModifyRights (see page 5497)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5485).
	HasViewAccess (see page 5539)	Checks the end-user's right to view this adapter's fields.
	HasViewRights (see page 5497)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 5485).
V	ImplCanAddActionClass (see page 5497)	Determines if the given action class can be added.
V	ImplCanAddFieldClass (see page 5498)	Determines if the given action class can be added.
V	ImplClearAdapterValues (see page 5540)	Clears adapter state information.
V	ImplEndIterator (see page 5541)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5529) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5541)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5541)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5498)	Lists supported end-user adapter actions.
V	ImplGetDisplayName (see page 5498)	Gets the display name for this TBaseEndUserAdapter (see page 5485).
V	ImplGetEchoActionFieldValues (see page 5542)	Returns the value of the echo flag.
V	ImplGetEndUserAdapter (see page 5499)	Returns this TBaseEndUserAdapter (see page 5485).
V	ImplGetFieldsList (see page 5499)	Obtains the list of all of the fields for the end-user adapter.

	ImplGetIteratorIndex (see page 5543)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5537) method to support iterating over the data records of the adapter.
	ImplGetLoggedIn (see page 5499)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 5499)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5485).
	ImplGetLogoutAction (see page 5500)	Gets the Logout action component for this TBaseEndUserAdapter (see page 5485).
	ImplGetVariable (see page 5543)	Returns an action or field.
	ImplGetVariableCount (see page 5544)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5544)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5544)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5731)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5544)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5731)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5545)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 5500)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 5545)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 5500)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 5546)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplHasViewRights (see page 5501)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 5546)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5549) to support iterating over the data records of the adapter.
	ImplLogIn (see page 5501)	Processes the login for the given user.
	ImplNextIteration (see page 5546)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5551) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5547)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5547)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 5501)	Generate the HTML login page.
	ImplSetActions (see page 5547)	Initializes the Actions (see page 5558) property.
	ImplSetActions (see page 5732)	Initializes the Actions (see page 5732) property.
	ImplSetData (see page 5548)	Initializes the Data (see page 5558) property.
	ImplSetData (see page 5732)	Initializes the Data (see page 5733) property.
	ImplSetEchoActionFieldValues (see page 5548)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5548)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5553) method to support iterating over the records of the adapter.
	InIterator (see page 5549)	Implements IIteratorIndex (see page 994)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5549)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5549)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5550)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 5550)	Specifies the HTML form hidden fields needed by the adapter.
	LogIn (see page 5502)	Logs in a specified user.
	NextIteration (see page 5551)	Implements IIteratorSupport (see page 996)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5551)	Clears references to deleted components.
	NotifyActivate (see page 5551)	Called when the web module is activated.
	NotifyAdapterChange (see page 5551)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5552)	Called when the web module is deactivated.
	ProduceLoginPage (see page 5502)	Generates the login page.
	SetActions (see page 5552)	Initializes the Actions (see page 5558) property.
	SetData (see page 5553)	Initializes the Data (see page 5558) property.
	SetEchoActionFieldValues (see page 5553)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5553)	Implements IIteratorSupport (see page 996)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5554)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5554)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5555)	Updates the adapter's fields with values passed in the HTTP request.

	UpdateFieldsValidateValues (see page 5555)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5556)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5557)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5557)	Validate the adapter's field values passed in the HTTP request.
	UserList (see page 5503)	Gets the user list.
	WebComponentsChange (see page 5557)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5560)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5561)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 5561)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5561)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5562)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5562)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5563)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5563)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5563)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5564)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5564)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5564)	Supplies name/value pairs needed to execute an adapter action.
	OnHasRights (see page 5503)	Determines if the user rights match the rights being queried.
	OnIterateRecords (see page 5565)	Occurs when the adapter needs to iterate over its data records.
	OnProduceLoginPage (see page 5504)	Allows implementation of a customized login page.

Public Methods

	Name	Description
	AddNotify (see page 1000)	Registers an interest in change notifications.
	CanAddActionClass (see page 5861)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5861)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5865)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5523)	Constructor for TCustomAdapter (see page 5519).
	CreateActionRequestContext (see page 5866)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	Destroy (see page 5523)	Destructor for TCustomAdapter (see page 5519).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	FindAction (see page 1018)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1023)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1018)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 960)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 962)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5872)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 963)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 964)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 964)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5869)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1024)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
	GetVisibleActions (see page 1019)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1024)	This is GetVisibleFields, a member of class IWebDataFields.

	HasExecuteAccess (see page 924)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 924)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 924)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1019)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1024)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 997)	Advances to the objects next item.
	NotifyActivate (see page 6061)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5862)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6061)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1000)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5869)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
V	UpdateRecords (see page 5556)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5558)	Actions is the container for adapter actions components.
R	Actions (see page 5732)	Container for adapter actions components.
R	Data (see page 5558)	Data is the container for adapter field components.
R	Data (see page 5733)	Container for adapter field components.
R	DisplayName (see page 5968)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 5869)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5559)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 5968)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 5559)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5560)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 995)	Indicates the index of the current item.
R	LoggedIn (see page 5968)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 5969)	Indicates the action component for the login form.
	LoginPage (see page 5503)	Specifies the name of the page that acts as the login page.
R	LogoutAction (see page 5970)	Indicates the action component for logging a user out.
	ModifyAccess (see page 5560)	This is ModifyAccess, a member of class TCustomAdapter.
	ViewAccess (see page 5560)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1019)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1025)	This is VisibleFields, a member of class IWebDataFields.

57.1.41.2 TBaseEndUserAdapter Methods

The methods of the TBaseEndUserAdapter class are listed here.

Protected Methods

	Name	Description
V	CanExecuteLoginForm (see page 5491)	Determines if there is a static login page.
V	CanExecuteLogout (see page 5491)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 5492)	Determines whether there is a static login page or an automatically produced login page.
V	DoOnHasRights (see page 5492)	Determines whether the user has view rights.
V	ExecuteLogin (see page 5492)	Starts the server-side login process.
V	ExecuteLoginForm (see page 5493)	Creates the HTML login page.
V	ExecuteLogout (see page 5493)	Performs server-side logout.
	GetDisplayName (see page 5493)	Retrieves the display name string.
V	GetDisplayNameValue (see page 5494)	Gets the display name of the end user.
	GetEndUserAdapter (see page 5494)	Gets the end-user adapter.

	GetLoggedIn (see page 5495)	Determines if the user is logged in
V	GetLoggedInValue (see page 5495)	Determines if the user is logged in.
	GetLoginFormAction (see page 5495)	Gets the action component for the login form.
	GetLogoutAction (see page 5496)	Gets the action component for the logout form.
V	GetUserID (see page 5496)	Gets the UserID from this TBaseEndUserAdapter (see page 5485).
	HasExecuteRights (see page 5496)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5485).
	HasModifyRights (see page 5497)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5485).
	HasViewRights (see page 5497)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 5485).
V	ImplCanAddActionClass (see page 5497)	Determines if the given action class can be added.
V	ImplCanAddFieldClass (see page 5498)	Determines if the given action class can be added.
V	ImplGetActionsList (see page 5498)	Lists supported end-user adapter actions.
V	ImplGetDisplayName (see page 5498)	Gets the display name for this TBaseEndUserAdapter (see page 5485).
V	ImplGetEndUserAdapter (see page 5499)	Returns this TBaseEndUserAdapter (see page 5485).
V	ImplGetFieldsList (see page 5499)	Obtains the list of all of the fields for the end-user adapter.
V	ImplGetLoggedIn (see page 5499)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 5499)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5485).
V	ImplGetLogoutAction (see page 5500)	Gets the Logout action component for this TBaseEndUserAdapter (see page 5485).
V	ImplHasExecuteRights (see page 5500)	Checks user rights and determines if the user has execute rights.
V	ImplHasModifyRights (see page 5500)	Checks user rights and determines if the user has modify rights.
V	ImplHasViewRights (see page 5501)	Checks user rights and determines if the user has view rights.
V	ImplLogIn (see page 5501)	Processes the login for the given user.
V	ImplProduceLoginPage (see page 5501)	Generate the HTML login page.
	LogIn (see page 5502)	Logs in a specified user.
	ProduceLoginPage (see page 5502)	Generates the login page.
	UserList (see page 5503)	Gets the user list.

57.1.41.2.1 TBaseEndUserAdapter.CanExecuteLoginForm Method

Determines if there is a static login page.

Pascal

```
function CanExecuteLoginForm: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanExecuteLoginForm();
```

Description

The CanExecuteLoginForm calls CanProduceLoginPage (see page 5492) to determine if there is a static login page, or if one can be generated. Then if the user is not already logged in, this function returns true. If the login page cannot be produced or the user is already logged in, then this function returns false.

See Also

CanProduceLoginPage (see page 5492)

57.1.41.2.2 TBaseEndUserAdapter.CanExecuteLogout Method

Determines if the user is logged in.

Pascal

```
function CanExecuteLogout: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanExecuteLogout();
```

Description

The CanExecuteLogout function calls ImplGetLoggedIn (see page 5499) to determine if the user is logged in. If the user is logged in, this function returns true.

See Also

ImplGetLoggedIn (see page 5499)

57.1.41.2.3 TBaseEndUserAdapter.CanProduceLoginPage Method

Determines whether there is a static login page or an automatically produced login page.

Pascal

```
function CanProduceLoginPage: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanProduceLoginPage();
```

Description

The CanProduceLoginPage returns true if there is a static login page, or if there is an event handler defined to automatically produce the login page.

See Also

OnProduceLoginPage (see page 5504)

57.1.41.2.4 TBaseEndUserAdapter.DoOnHasRights Method

Determines whether the user has view rights.

Pascal

```
function DoOnHasRights(AEvent: TEndUserRightsEvent; const ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoOnHasRights(TEndUserRightsEvent AEvent, const UnicodeString
ARights);
```

Description

The DoOnHasRights function is called from ImplHasViewRights (see page 5501). It matches the given access rights to the rights in the user list and returns true if the user has view rights.

AEvent is the event handler that DoOnHasRights should call first to check access rights.

ARights is a string that represents the rights the user needs.

See Also

ImplHasViewRights (see page 5501)

HasViewRights (see page 5497)

57.1.41.2.5 TBaseEndUserAdapter.ExecuteLogin Method

Starts the server-side login process.

Pascal

```
procedure ExecuteLogin(AUserID: Variant); virtual;
```

C++

```
virtual __fastcall ExecuteLogin(Variant AUserID);
```

Description

The ExecuteLogin function is called from sever-side script to start the login process. This base class version of the function is empty. A customized overridden version of this function can be written to do specific login processing for the application.

See Also

ImplProduceLoginPage (see page 5501)

57.1.41.2.6 TBaseEndUserAdapter.ExecuteLoginForm Method

Creates the HTML login page.

Pascal

```
procedure ExecuteLoginForm; virtual;
```

C++

```
virtual __fastcall ExecuteLoginForm();
```

Description

The ExecuteLoginForm function is called from server-side script to create the HTML login page. This function calls ImplProduceLoginPage (see page 5501) to make the page producer generate the login page.

See Also

ImplProduceLoginPage (see page 5501)

57.1.41.2.7 TBaseEndUserAdapter.ExecuteLogout Method

Performs server-side logout.

Pascal

```
procedure ExecuteLogout; virtual;
```

C++

```
virtual __fastcall ExecuteLogout();
```

Description

The ExecuteLogout function is called from server-side script to perform the logout process. This base class version of the function is empty. A customized overridden version of this function can be written to do specific logout processing for the application.

See Also

CanExecuteLogout (see page 5491)

57.1.41.2.8 TBaseEndUserAdapter.GetDisplayName Method

Retrieves the display name string.

Pascal

```
function GetDisplayName: string;
```

C++

```
__fastcall UnicodeString GetDisplayName();
```

Description

The GetDisplayName function is called from server-side script to get the display name string. It calls ImplGetDisplayName (see page 5498) to get the display name for this TBaseEndUserAdapter (see page 5485).

See Also

ImplGetDisplayName (see page 5498)

GetDisplayNameValue (see page 5494)

57.1.41.2.9 TBaseEndUserAdapter.GetDisplayNameValue Method

Gets the display name of the end user.

Pascal

```
function GetDisplayNameValue: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDisplayNameValue();
```

Description

The GetDisplayNameValue is called from server-side script to get the display name of the end user. This base class version of the function returns an empty string. A customized overridden version of this function could be written to return the display name for the end user in your application.

See Also

ImplGetDisplayName (see page 5498)

GetDisplayName (see page 5493)

57.1.41.2.10 TBaseEndUserAdapter.GetEndUserAdapter Method

Gets the end-user adapter.

Pascal

```
function GetEndUserAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetEndUserAdapter();
```

Description

The GetEndUserAdapter function is called from server-side script to get the end-user adapter. This function returns itself, that is, this TBaseEndUserAdapter (see page 5485).

See Also

ImplGetEndUserAdapter (see page 5499)

57.1.41.2.11 TBaseEndUserAdapter.GetLoggedIn Method

Determines if the user is logged in

Pascal

```
function GetLoggedIn: Boolean;
```

C++

```
__fastcall Boolean GetLoggedIn();
```

Description

The GetLoggedIn function is called from server-side script to determine if the user is logged in. This function calls ImplGetLoggedIn (see page 5499) to get the result.

See Also

ImplGetLoggedIn (see page 5499)

GetLoggedInValue (see page 5495)

57.1.41.2.12 TBaseEndUserAdapter.GetLoggedInValue Method

Determines if the user is logged in.

Pascal

```
function GetLoggedInValue: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetLoggedInValue();
```

Description

The GetLoggedInValue function is called from server-side script to determine if the user is logged in. This base class version of the function always returns false. A customized overridden version could be written specifically for your application.

See Also

ImplGetLoggedIn (see page 5499)

GetLoggedIn (see page 5495)

57.1.41.2.13 TBaseEndUserAdapter.GetLoginFormAction Method

Gets the action component for the login form.

Pascal

```
function GetLoginFormAction: TComponent;
```

C++

```
__fastcall TComponent * GetLoginFormAction();
```

Description

The GetLoginFormAction is called from server-side script to get the action component for the login form. This function calls ImplGetLoginFormAction (see page 5499) to get the action component.

See Also

ImplGetLoginFormAction (see page 5499)

57.1.41.2.14 TBaseEndUserAdapter.GetLogoutAction Method

Gets the action component for the logout form.

Pascal

```
function GetLogoutAction: TComponent;
```

C++

```
__fastcall TComponent * GetLogoutAction();
```

Description

The GetLogoutAction is called from server-side script to get the action component for the logout form. This function calls ImplGetLogoutFormAction to get the action component.

See Also

ImplGetLogoutAction (see page 5500)

57.1.41.2.15 TBaseEndUserAdapter.GetUserID Method

Gets the UserID from this TBaseEndUserAdapter (see page 5485).

Pascal

```
function GetUserID: Variant; virtual;
```

C++

```
virtual __fastcall Variant GetUserID();
```

Description

The GetUserID function is called from server-side script to get the UserID from this TBaseEndUserAdapter (see page 5485). This base class version of the function always returns Unassigned. A customized overridden version of this function could be written specifically for your application.

57.1.41.2.16 TBaseEndUserAdapter.HasExecuteRights Method

Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5485).

Pascal

```
function HasExecuteRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasExecuteRights(UnicodeString ARights);
```

Description

The HasExecuteRights function is called from server-side script to determine if the user has execute rights for the TBaseEndUserAdapter (see page 5485). This function calls ImplHasExecuteRights (see page 5500) to check the user rights.

See Also

ImplHasExecuteRights (see page 5500)

HasModifyRights (see page 5497)

HasViewRights (see page 5497)

57.1.41.2.17 TBaseEndUserAdapter.HasModifyRights Method

Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5485).

Pascal

```
function HasModifyRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasModifyRights(UnicodeString ARights);
```

Description

The HasModifyRights function is called from server-side script to determine if the user has modify rights for the TBaseEndUserAdapter (see page 5485). This function calls ImplHasModifyRights (see page 5500) to check the user rights.

See Also

ImplHasModifyRights (see page 5500)

HasModifyRights

HasViewRights (see page 5497)

57.1.41.2.18 TBaseEndUserAdapter.HasViewRights Method

Determine if the user has view rights to the TBaseEndUserAdapter (see page 5485).

Pascal

```
function HasViewRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasViewRights(UnicodeString ARights);
```

Description

The HasViewRights function is called from server-side script to determine if the user has view rights for the TBaseEndUserAdapter (see page 5485). This function calls ImplHasViewRights (see page 5501) to check the user rights.

See Also

ImplHasViewRights (see page 5501)

HasModifyRights (see page 5497)

HasViewRights

57.1.41.2.19 TBaseEndUserAdapter.ImplCanAddActionClass Method

Determines if the given action class can be added.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

The ImplCanAddActionClass function calls the base class to determine if the given action class can be added. In addition, it allows actions components to be added if they are derived from TCustomEndUserAdapterAction (see page 5673) at some

level. This function returns true if the action class is allowed to be added, or false otherwise.

See Also

ImplCanAddActionClass (see page 5540)

TCustomEndUserAdapterAction (see page 5673)

57.1.41.2.20 TBaseEndUserAdapter.ImplCanAddFieldClass Method

Determines if the given action class can be added.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

The ImplCanAddFieldClass function calls the base class to determine if the given action class can be added. In addition to that, it allows fields components to be added if they are derived from TAdapterEndUserField (see page 5237).

See Also

ImplCanAddFieldClass (see page 5540)

TAdapterEndUserField (see page 5237)

57.1.41.2.21 TBaseEndUserAdapter.ImplGetActionsList Method

Lists supported end-user adapter actions.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

The ImplGetActionsList procedure obtains the list of all supported actions for the end-user adapter.

57.1.41.2.22 TBaseEndUserAdapter.ImplGetDisplayName Method

Gets the display name for this TBaseEndUserAdapter (see page 5485).

Pascal

```
function ImplGetDisplayName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetDisplayName();
```

Description

The ImplGetDisplayName function is called from GetDisplayName (see page 5493) to get the display name for this TBaseEndUserAdapter (see page 5485). It gets the display name from the DisplayName field component.

See Also

GetDisplayName (see page 5493)

57.1.41.2.23 TBaseEndUserAdapter.ImplGetEndUserAdapter Method

Returns this TBaseEndUserAdapter (see page 5485).

Pascal

```
function ImplGetEndUserAdapter: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetEndUserAdapter();
```

Description

The ImplGetEndUserAdapter simply returns this TBaseEndUserAdapter (see page 5485).

See Also

GetEndUserAdapter (see page 5494)

57.1.41.2.24 TBaseEndUserAdapter.ImplGetFieldsList Method

Obtains the list of all of the fields for the end-user adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

The ImplGetFieldsList procedure obtains the list of all of the fields for the end-user adapter.

57.1.41.2.25 TBaseEndUserAdapter.ImplGetLoggedIn Method

Checks the value of the LoggedIn field.

Pascal

```
function ImplGetLoggedIn: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetLoggedIn();
```

Description

The ImplGetLoggedIn function is called from GetLoggedIn (see page 5495). It checks the value of the LoggedIn field component and returns the result.

See Also

GetLoggedIn (see page 5495)

57.1.41.2.26 TBaseEndUserAdapter.ImplGetLoginFormAction Method

Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5485).

Pascal

```
function ImplGetLoginFormAction: TComponent;
```

C++

```
__fastcall TComponent * ImplGetLoginFormAction();
```

Description

The ImplGetLoginFormAction function is called from GetLoginFormAction (see page 5495) to get the LoginForm action component for this TBaseEndUserAdapter (see page 5485).

See Also

GetLoginFormAction (see page 5495)

57.1.41.2.27 TBaseEndUserAdapter.ImplGetLogoutAction Method

Gets the Logout action component for this TBaseEndUserAdapter (see page 5485).

Pascal

```
function ImplGetLogoutAction: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetLogoutAction();
```

Description

The ImplGetLogoutAction function is called from GetLogoutAction (see page 5496) to get the Logout action component for this TBaseEndUserAdapter (see page 5485).

See Also

GetLogoutAction (see page 5496)

57.1.41.2.28 TBaseEndUserAdapter.ImplHasExecuteRights Method

Checks user rights and determines if the user has execute rights.

Pascal

```
function ImplHasExecuteRights(ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasExecuteRights(UnicodeString ARights);
```

Description

The ImplHasExecuteRights function is called from the HasExecuteRights (see page 5496) function. It calls the DoOnHasRights (see page 5492) function to check the user rights and determines if the user has execute rights.

See Also

OnHasRights (see page 5503)

57.1.41.2.29 TBaseEndUserAdapter.ImplHasModifyRights Method

Checks user rights and determines if the user has modify rights.

Pascal

```
function ImplHasModifyRights(ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasModifyRights(UnicodeString ARights);
```

Description

The ImplHasModifyRights function is called from the HasModifyRights (see page 5497) function. It calls the DoOnHasRights (see page 5492) function to check the user rights and determine if the user has modify rights.

See Also

OnHasRights (see page 5503)

57.1.41.2.30 TBaseEndUserAdapter.ImplHasViewRights Method

Checks user rights and determines if the user has view rights.

Pascal

```
function ImplHasViewRights(ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasViewRights(UnicodeString ARights);
```

Description

The ImplHasViewRights is called from the HasViewRights (see page 5497) function. It calls the DoOnHasRights (see page 5492) function to check the user rights and determine if the user has view rights.

See Also

DoOnHasRights (see page 5492)

57.1.41.2.31 TBaseEndUserAdapter.ImplLogIn Method

Processes the login for the given user.

Pascal

```
procedure ImplLogIn(AUserID: Variant); virtual;
```

C++

```
virtual __fastcall ImplLogIn(Variant AUserID);
```

Description

The ImplLogIn procedure is called from LogIn (see page 5502). This function calls ExecuteLogin (see page 5492) to process the login for the given user.

See Also

Login (see page 5502)

ExecuteLogin (see page 5492)

57.1.41.2.32 TBaseEndUserAdapter.ImplProduceLoginPage Method

Generate the HTML login page.

Pascal

```
function ImplProduceLoginPage: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplProduceLoginPage();
```

Description

The ImplProduceLoginPage is called to generate the HTML login page It first calls the OnProduceLoginPage (see page 5504) event handler to allow for a customized version. If no event handler is defined, it then has default code to generate the page using the page producer.

See Also

OnProduceLoginPage (see page 5504)

57.1.41.2.33 TBaseEndUserAdapter.LogIn Method

Logs in a specified user.

Pascal

```
procedure LogIn(AUserID: Variant);
```

C++

```
__fastcall LogIn(Variant AUserID);
```

Description

Call LogIn to record a user as logged in. Typically, LogIn is called in response to a message from the login page that ProduceLoginPage generates.

UserID is the identifier of the user that logged in. It is the value of the UserID property of the entry for the user in a WebUserList component, or, in applications that implement their own login scheme, any other Variant that identifies an end user.

See Also

LoggedIn (see page 5968)

ProduceLoginPage (see page 5967)

TWebUserList (see page 6759)

UserID (see page 6754)

TLoginFormAdapter (see page 5810)

57.1.41.2.34 TBaseEndUserAdapter.ProduceLoginPage Method

Generates the login page.

Pascal

```
function ProduceLoginPage: Boolean;
```

C++

```
__fastcall Boolean ProduceLoginPage();
```

Description

The ProduceLoginPage function is called from server-side script to generate the login page. This function calls ImplProduceLoginPage (see page 5501) to generate the page.

See Also

ImplProduceLoginPage (see page 5501)

57.1.41.2.35 TBaseEndUserAdapter.UserList Method

Gets the user list.

Pascal

```
function UserList: IWebUserList;
```

C++

```
__fastcall IWebUserList UserList();
```

Description

The UserList function is called from server-side script to get the user list. If the user list is not stored in this TBaseEndUserAdapter (see page 5485), it then attempts to retrieve the user list through the application module.

57.1.41.3 TBaseEndUserAdapter Properties

The properties of the TBaseEndUserAdapter class are listed here.

Public Properties

	Name	Description
	LoginPage (see page 5503)	Specifies the name of the page that acts as the login page.

57.1.41.3.1 TBaseEndUserAdapter.LoginPage Property

Specifies the name of the page that acts as the login page.

Pascal

```
property LoginPage: string;
```

C++

```
__property UnicodeString LoginPage;
```

Description

Use LoginPage to read or set the name of the login page for this TBaseEndUserAdapter (see page 5485). The name of the login page is the name of the Web page module that generates the login page.

57.1.41.4 TBaseEndUserAdapter Events

The events of the TBaseEndUserAdapter class are listed here.

Public Events

	Name	Description
	OnHasRights (see page 5503)	Determines if the user rights match the rights being queried.
	OnProduceLoginPage (see page 5504)	Allows implementation of a customized login page.

57.1.41.4.1 TBaseEndUserAdapter.OnHasRights Event

Determines if the user rights match the rights being queried.

Pascal

```
property OnHasRights: TEndUserRightsEvent;
```

C++

```
__property TEndUserRightsEvent OnHasRights;
```

Description

The OnHasRights event handler is called from DoOnHasRights (see page 5492) to determine if the user rights match the rights being queried. A customized event handler should be written to determine the rights for your specific application.

See Also

DoOnHasRights (see page 5492)

ImplHasExecuteRights (see page 5500)

ImplHasModifyRights (see page 5500)

ImplHasViewRights (see page 5501)

57.1.41.4.2 TBaseEndUserAdapter.OnProduceLoginPage Event

Allows implementation of a customized login page.

Pascal

```
property OnProduceLoginPage: TEndUserHandledEvent;
```

C++

```
__property TEndUserHandledEvent OnProduceLoginPage;
```

Description

The OnProduceLoginPage event is triggered in the ImplProduceLoginPage (see page 5501). If a customized login page is desired for your application, a customized event handler can be written for this event.

See Also

ImplProduceLoginPage (see page 5501)

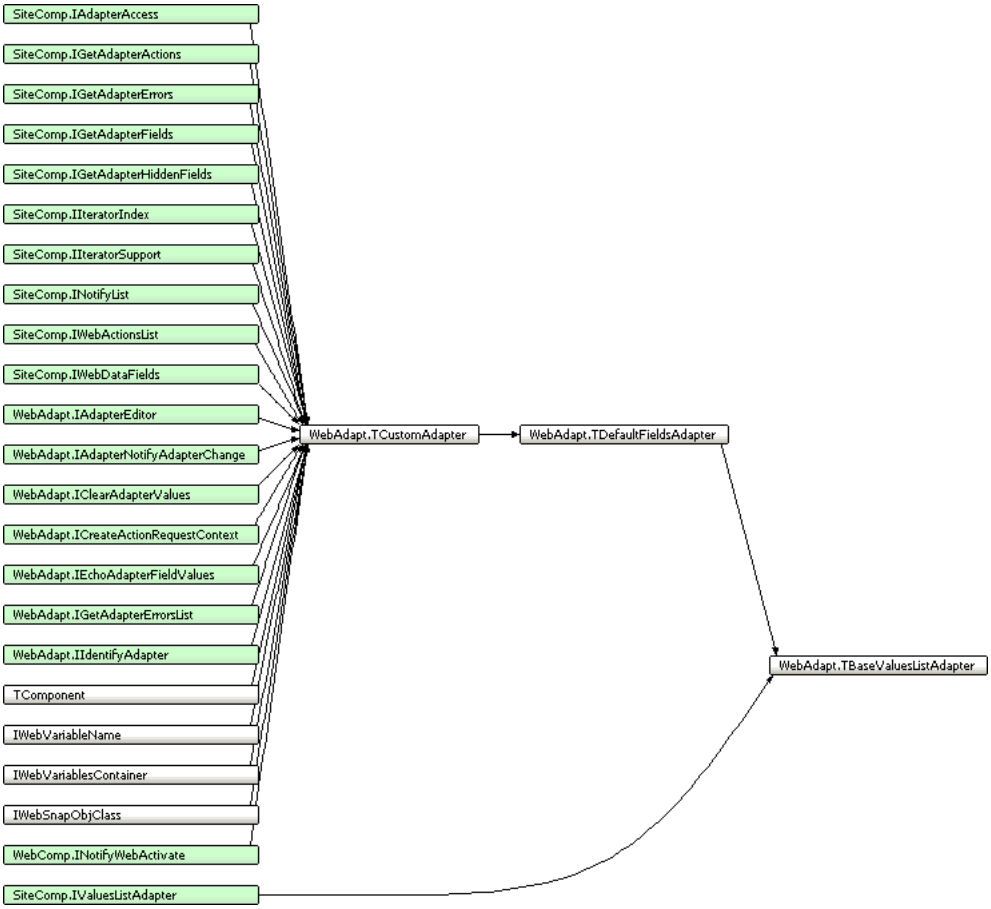
ProduceLoginPage (see page 5502)

CanProduceLoginPage (see page 5492)

57.1.42 TBaseValuesListAdapter Class

TBaseValuesListAdapter is a base class for adapters that provide a list of name/value pairs.

Class Hierarchy



Pascal

```
TBaseValuesListAdapter = class(TDefaultFieldsAdapter, IValuesListAdapter);
```

C++

```
class TBaseValuesListAdapter : public TDefaultFieldsAdapter, public IValuesListAdapter;
```

File

WebAdapt

Description

Descendants of TBaseValuesListAdapter (such as TStringsValuesList (see page 5843) and TDataSetValuesList) are used to provide name/value pairs for an adapter field. Adapter fields reference a values list adapter using the adapter field's ValuesList property. Typically, the list of name/value pairs is used by server-side scripts to populate <select>, <input type=checkbox>, or <input type=radio>.

TBaseValuesListAdapter has two default fields. One field is responsible for providing a value and the other for providing a name.

See Also

TStringsValuesList (see page 5843)

TDataSetValuesList

TAdapterUpdateField (see page 5407)

57.1.42.1 TBaseValuesListAdapter Members

The following tables list the members exposed by TBaseValuesListAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5526)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddDefaultActions (see page 5729)	Adds default action components to this adapter.
	AddDefaultFields (see page 5730)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5526)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5526)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5527)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5527)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5527)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 5528)	Clears adapter state information.
	ClearErrors (see page 5528)	Clears the content of the adapter's Errors (see page 5559) property.
	CreateActionRequestContext (see page 5528)	Creates an object that describes the adapter action parameters and adapter field values.
	CreateErrorsList (see page 5529)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5730)	Notifies other components of changes to the list of default actions or fields.
	EncodeActionParams (see page 5529)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5529)	Implements IIteratorSupport (see page 996)'s EndIterator method to support iterating over the data records of the adapter.
	ExtractRequestParams (see page 5530)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5530)	Returns an action component with a matching action name.
	FindField (see page 5530)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5531)	Finds an action with a matching variable name.
	FindNamedField (see page 5531)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 5531)	Finds a field or action with a matching variable name.
	FindVariable (see page 5532)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5532)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 5533)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 5730)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5533)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5533)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5534)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 5534)	<insert text here>
	GetAdapterFields (see page 5534)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5534)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5535)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildren (see page 5535)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5535)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 5731)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5536)	Returns the value of the echo flag.
	GetFieldsList (see page 5536)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5536)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5537)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 5510)	Returns an image associated with the current name/value pair.

	GetListImageOfValue (see page 5510)	Looks up an image for a value.
	GetListName (see page 5511)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 5511)	Looks up a name for a value.
	GetListValue (see page 5511)	Responsible for returning the value of the name/value pair.
V	GetNameFieldClass (see page 5512)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetValueFieldClass (see page 5512)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 5537)	Returns an action or field.
	GetVariableCount (see page 5538)	Returns the total count of actions and fields.
	GetVariableName (see page 5538)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5538)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 5538)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 5512)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5539)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 5539)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 5539)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5540)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5512)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5540)	Clears adapter state information.
V	ImplEndIterator (see page 5541)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5529) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5541)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5541)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5542)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 5542)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 5513)	Adds default field components to this adapter.
V	ImplGetIteratorIndex (see page 5543)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5537) method to support iterating over the data records of the adapter.
V	ImplGetListImage (see page 5513)	Responsible returning an image associated with the current name/value pair.
V	ImplGetListImageOfValue (see page 5513)	Looks up an image for a value.
V	ImplGetListName (see page 5514)	Responsible returning the name of the name/value pair.
V	ImplGetListNameOfValue (see page 5514)	Looks up a name for a value.
V	ImplGetListValue (see page 5514)	Responsible for returning the value of the name/value pair.
V	ImplGetVariable (see page 5543)	Returns an action or field.
V	ImplGetVariableCount (see page 5544)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 5544)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 5544)	Returns a list of this adapter's action components.
V	ImplGetVisibleActions (see page 5731)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 5544)	Returns a list of this adapter's field components.
V	ImplGetVisibleFields (see page 5731)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 5545)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasModifyAccess (see page 5545)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasViewAccess (see page 5546)	This is ImplHasViewAccess, a member of class TCustomAdapter.
V	ImplInIterator (see page 5546)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5549) to support iterating over the data records of the adapter.
V	ImplNextIteration (see page 5546)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5551) method to support iterating over the records of the adapter.
V	ImplNotifyActivate (see page 5547)	Called when the web module is activated.
V	ImplNotifyDeactivate (see page 5547)	Called when the web module is deactivated.
V	ImplSetActions (see page 5547)	Initializes the Actions (see page 5558) property.
V	ImplSetActions (see page 5732)	Initializes the Actions (see page 5732) property.
V	ImplSetData (see page 5548)	Initializes the Data (see page 5558) property.
V	ImplSetData (see page 5732)	Initializes the Data (see page 5733) property.
V	ImplSetEchoActionFieldValues (see page 5548)	Sets the echo flag for this adapter's fields.

	ImplStartIterator (see page 5548)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5553) method to support iterating over the records of the adapter.
	InIterator (see page 5549)	Implements IIteratorIndex (see page 994)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5549)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5549)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5550)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 5550)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5551)	Implements IIteratorSupport (see page 996)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5551)	Clears references to deleted components.
	NotifyActivate (see page 5551)	Called when the web module is activated.
	NotifyAdapterChange (see page 5551)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5552)	Called when the web module is deactivated.
	SetActions (see page 5552)	Initializes the Actions (see page 5558) property.
	SetData (see page 5553)	Initializes the Data (see page 5558) property.
	SetEchoActionFieldValues (see page 5553)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5553)	Implements IIteratorSupport (see page 996)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5554)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5554)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5555)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5555)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5556)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5557)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5557)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5557)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5560)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5561)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 5561)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5561)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5562)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5562)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5563)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5563)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5563)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5564)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5564)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5564)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5565)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1000)	Registers an interest in change notifications.
	CanAddActionClass (see page 5861)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5861)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5865)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5523)	Constructor for TCustomAdapter (see page 5519).

	CreateActionRequestContext (see page 5866)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5523)	Destructor for TCustomAdapter (see page 5519).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	FindAction (see page 1018)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1023)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1018)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 960)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 962)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5872)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 963)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 964)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 964)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5869)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1024)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
	GetVisibleActions (see page 1019)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1024)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 924)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 924)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 924)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1019)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1024)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 997)	Advances to the objects next item.
	NotifyActivate (see page 6061)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5862)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6061)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1000)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5869)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
V	UpdateRecords (see page 5556)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5558)	Actions is the container for adapter actions components.
R	Actions (see page 5732)	Container for adapter actions components.
R	Data (see page 5558)	Data is the container for adapter field components.
R	Data (see page 5733)	Container for adapter field components.
	EchoActionFieldValues (see page 5869)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5559)	Modifies the adapter's echo flag.
R	Errors (see page 5559)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5560)	This is ExecuteAccess, a member of class TCustomAdapter.
R	IteratorIndex (see page 995)	Indicates the index of the current item.
	ModifyAccess (see page 5560)	This is ModifyAccess, a member of class TCustomAdapter.
	ViewAccess (see page 5560)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1019)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1025)	This is VisibleFields, a member of class IWebDataFields.

57.1.42.2 TBaseValuesListAdapter Methods

The methods of the TBaseValuesListAdapter class are listed here.

Protected Methods

	Name	Description
	GetListImage (see page 5510)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 5510)	Looks up an image for a value.
	GetListName (see page 5511)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 5511)	Looks up a name for a value.
	GetListValue (see page 5511)	Responsible for returning the value of the name/value pair.
V	GetNameFieldClass (see page 5512)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetValueFieldClass (see page 5512)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
V	GetWebSnapObjClass (see page 5512)	Returns the class type for this adapter field.
V	ImplCanAddFieldClass (see page 5512)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplGetFieldsList (see page 5513)	Adds default field components to this adapter.
V	ImplGetListImage (see page 5513)	Responsible returning an image associated with the current name/value pair.
V	ImplGetListImageOfValue (see page 5513)	Looks up an image for a value.
V	ImplGetListName (see page 5514)	Responsible returning the name of the name/value pair.
V	ImplGetListNameOfValue (see page 5514)	Looks up a name for a value.
V	ImplGetListValue (see page 5514)	Responsible for returning the value of the name/value pair.

57.1.42.2.1 TBaseValuesListAdapter.GetListImage Method

Returns an image associated with the current name/value pair.

Pascal

```
function GetListImage: TComponent;
```

C++

```
__fastcall TComponent * GetListImage();
```

Description

GetListImage returns the result of ImplGetListImage (see page 5513).

See Also

ImplGetListImage (see page 5513)

57.1.42.2.2 TBaseValuesListAdapter.GetListImageOfValue Method

Looks up an image for a value.

Pascal

```
function GetListImageOfValue(Value: Variant): TComponent;
```

C++

```
__fastcall TComponent * GetListImageOfValue(Variant Value);
```

Description

GetListImageOfValue returns the result of ImplGetListImageOfValue (see page 5513).

See Also

ImplGetListImageOfValue (see page 5513)

57.1.42.2.3 TBaseValuesListAdapter.GetListName Method

Responsible returning the name of the name/value pair.

Pascal

```
function GetListName: string;
```

C++

```
__fastcall UnicodeString GetListName();
```

Description

GetListName returns the result of ImplGetListName (see page 5514).

See Also

GetListName

ImplGetListValue (see page 5514)

57.1.42.2.4 TBaseValuesListAdapter.GetListNameOfValue Method

Looks up a name for a value.

Pascal

```
function GetListNameOfValue(Value: Variant): string;
```

C++

```
__fastcall UnicodeString GetListNameOfValue(Variant Value);
```

Description

GetListNameOfValue returns the result of ImplGetListNameOfValue (see page 5514).

See Also

ImplGetListNameOfValue (see page 5514)

57.1.42.2.5 TBaseValuesListAdapter.GetListValue Method

Responsible for returning the value of the name/value pair.

Pascal

```
function GetListValue: Variant;
```

C++

```
__fastcall Variant GetListValue();
```

Description

GetListValue returns the result of ImplGetListValue (see page 5514).

See Also

GetListName (see page 5511)

ImplGetListValue (see page 5514)

57.1.42.2.6 TBaseValuesListAdapter.GetNameFieldClass Method

Returns the class of adapter field that is responsible for providing the value of the name/value pair.

Pascal

```
function GetNameFieldClass: TComponentClass; virtual;
```

C++

```
virtual __fastcall TComponentClass GetNameFieldClass();
```

Description

GetNameFieldClass returns nil (Delphi) or NULL (C++). Descendant classes must override this method.

See Also

GetValueFieldClass (see page 5512)

57.1.42.2.7 TBaseValuesListAdapter.GetValueFieldClass Method

Returns the class of adapter field that is responsible for providing the name of the name/value pair.

Pascal

```
function GetValueFieldClass: TComponentClass; virtual;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass();
```

Description

GetValueFieldClass returns nil (Delphi) or NULL (C++). Descendant classes must override this method.

See Also

GetNameFieldClass (see page 5512)

57.1.42.2.8 TBaseValuesListAdapter.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; override;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

57.1.42.2.9 TBaseValuesListAdapter.ImplCanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass check the field class by calling GetNameFieldClass (see page 5512), GetValueFieldClass (see page 5512), and TCustomAdapter (see page 5519)'s ImplCanAddFieldClass method.

See Also

GetNameFieldClass (see page 5512)

GetValueFieldClass (see page 5512)

ImplCanAddFieldClass (see page 5540)

57.1.42.2.10 TBaseValuesListAdapter.ImplGetFieldsList Method

Adds default field components to this adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetFieldsList adds a value field and a name field using the classes returned by GetNameFieldClass (see page 5512) and GetValueFieldClass (see page 5512).

See Also

GetNameFieldClass (see page 5512)

GetValueFieldClass (see page 5512)

57.1.42.2.11 TBaseValuesListAdapter.ImplGetListImage Method

Responsible returning an image associated with the current name/value pair.

Pascal

```
function ImplGetListImage: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetListImage();
```

Description

ImplGetListImage is a placeholder. Descendant adapters that support images must override this method.

See Also

GetListImage (see page 5510)

57.1.42.2.12 TBaseValuesListAdapter.ImplGetListImageOfValue Method

Looks up an image for a value.

Pascal

```
function ImplGetListImageOfValue(Value: Variant): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetListImageOfValue(Variant Value);
```

Description

ImplGetListImageOfValue is a placeholder. Descendant classes that support image lookups must override this function.

See Also

GetListImageOfValue (see page 5510)

57.1.42.2.13 TBaseValuesListAdapter.ImplGetListName Method

Responsible returning the name of the name/value pair.

Pascal

```
function ImplGetListName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetListName();
```

Description

ImplGetListName returns an empty string. ImplGetListName must be overridden by a descendant class.

See Also

GetListName (see page 5511)

57.1.42.2.14 TBaseValuesListAdapter.ImplGetListNameOfValue Method

Looks up a name for a value.

Pascal

```
function ImplGetListNameOfValue(Value: Variant): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetListNameOfValue(Variant Value);
```

Description

ImplGetListNameOfValue is a placeholder. Descendant classes that support name lookups must override this function.

See Also

GetListNameOfValue (see page 5511)

57.1.42.2.15 TBaseValuesListAdapter.ImplGetListValue Method

Responsible for returning the value of the name/value pair.

Pascal

```
function ImplGetListValue: Variant; virtual;
```

C++

```
virtual __fastcall Variant ImplGetListValue();
```

Description

ImplGetListValue is a placeholder. ImplGetListValue must be overriden by a descendant class.

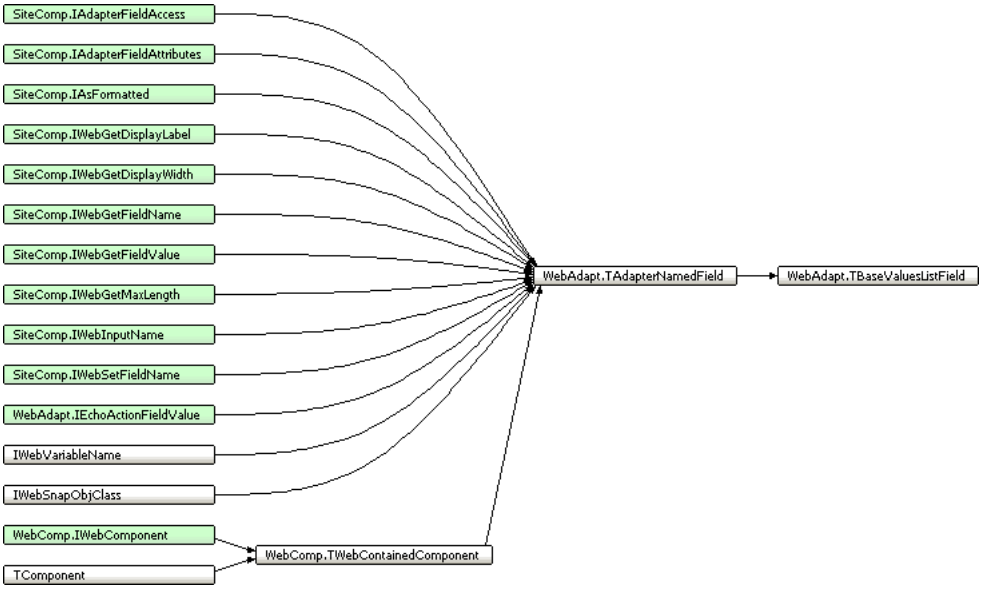
See Also

GetListValue (see page 5511)

57.1.43 TBaseValuesListField Class

TBaseValuesListField is a base class for adapter field components that are children of a values list adapter component.

Class Hierarchy



Pascal

```
TBaseValuesListField = class(TAdapterNamedField);
```

C++

```
class TBaseValuesListField : public TAdapterNamedField;
```

File

WebAdapt

Description

Derive from TBaseValuesListField to declare an adapter field that can be a child of TBaseValuesListAdapter (see page 5504).

See Also

TStringsValuesList (see page 5843)

TBaseValuesListAdapter (see page 5504)

TAdapterNamedField (see page 5339)

TValuesListNameField (see page 5852)

TValuesListValueField (see page 5855)

57.1.43.1 TBaseValuesListField Members

The following tables list the members exposed by TBaseValuesListField.

Protected Methods

	Name	Description
	AsFormatted (see page 5343)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5343)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5344)	Checks end-user rights to view the adapter field value.
	FullyQualifyInputName (see page 5344)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5518)	Retrieves the parent adapter component.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 5345)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5345)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5345)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 5346)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5346)	Returns the value of the echo flag.
	GetInputName (see page 5346)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 5347)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5347)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5347)	Gets the value of this adapter field as a Variant (see page 3430).
	GetVariableName (see page 5348)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 5348)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5348)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5349)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5349)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5349)	Returns text used to generate a representation of the adapter field value.
	ImplGetDisplayLabel (see page 5349)	Returns the suggested display label for this adapter field.
	ImplGetDisplayWidth (see page 5350)	Returns the suggested display width for this adapter field.
	ImplGetEchoActionFieldValue (see page 5350)	Returns the value of the echo flag.
	ImplGetInputName (see page 5350)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5351)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5351)	Gets the value of this adapter field as a Variant (see page 3430).
	ImplGetVariableName (see page 5352)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 5352)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5353)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5353)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5353)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 5354)	Sets the name that is used to reference this adapter field with server-side script.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 5354)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetEchoActionFieldValue (see page 5354)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5355)	Sets the name that is used to reference this adapter field with server-side script.

	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.

Protected Properties

	Name	Description
	Adapter (see page 5518)	Retrieves the parent adapter component.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 956)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).
	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 1031)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5867)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1032)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputName (see page 1041)	This is GetInputName, a member of class IWebInputName.
	GetMaxLength (see page 1037)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 942)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1033)	This is GetValue, a member of class IWebGetFieldValue.
	GetVisible (see page 942)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 941)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 941)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetEchoActionFieldValue (see page 5867)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1057)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.

Public Properties

	Name	Description
	ActionOrigValue (see page 5355)	Retrieve the original value of this adapter field.
	ActionValue (see page 5356)	Retrieve the value for this adapter field entered by the end-user.
	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5868)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5356)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldName (see page 1032)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5357)	Identifies the name of this field when using server-side script.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
	InputName (see page 1041)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5357)	Identifies the rights required to update this field.
	Required (see page 943)	This is Required, a member of class IAdapterFieldAttributes.
	Value (see page 1034)	This is Value, a member of class IWebGetFieldValue.

	Value (see page 5357)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5358)	Identifies the rights required to view this field.
	Visible (see page 943)	This is Visible, a member of class IAdapterFieldAttributes.

57.1.43.2 TBaseValuesListField Methods

The methods of the TBaseValuesListField class are listed here.

Protected Methods

	Name	Description
	GetAdapter (see page 5518)	Retrieves the parent adapter component.

57.1.43.2.1 TBaseValuesListField.GetAdapter Method

Retrieves the parent adapter component.

Pascal

```
function GetAdapter: TBaseValuesListAdapter;
```

C++

```
__fastcall TBaseValuesListAdapter GetAdapter();
```

Description

GetAdapter implements the Adapter (see page 5518) property.

See Also

Adapter (see page 5518)

TBaseValuesListAdapter (see page 5504)

57.1.43.3 TBaseValuesListField Properties

The properties of the TBaseValuesListField class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 5518)	Retrieves the parent adapter component.

57.1.43.3.1 TBaseValuesListField.Adapter Property

Retrieves the parent adapter component.

Pascal

```
property Adapter: TBaseValuesListAdapter;
```

C++

```
__property TBaseValuesListAdapter Adapter;
```

Description

The Adapter property is used by descendants to access the parent adapter component.

See Also

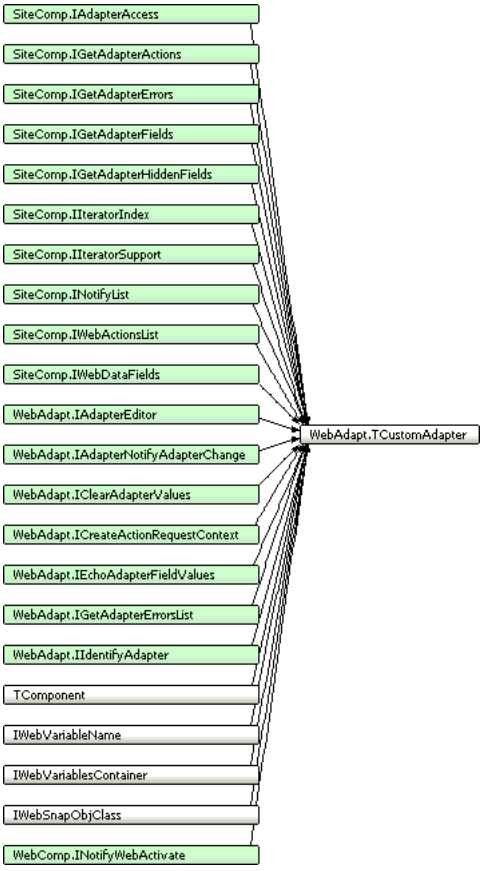
Adapter

TBaseValuesListAdapter (see page 5504)

57.1.44 TCustomAdapter Class

TCustomAdapter is a base class for adapter components.

Class Hierarchy



Pascal

```
TCustomAdapter = class(TComponent, IIdentifyAdapter, IWebVariableName, IWebVariablesContainer,
INotifyList, IWebSnapObjClass, IGetAdapterErrors, IGetAdapterErrorsList, INotifyWebActivate,
IAdapterEditor, IGetAdapterFields, IGetAdapterActions, IIteratorSupport, IClearAdapterValues,
IEchoAdapterFieldValues, IAdapterAccess, IGetAdapterHiddenFields, ICreateActionRequestContext,
IWebDataFields, IWebActionsList, IAdapterNotifyAdapterChange, IIteratorIndex);
```

C++

```
class TCustomAdapter : public TComponent, public IIdentifyAdapter, public IWebVariableName,
public IWebVariablesContainer, public INotifyList, public IWebSnapObjClass, public
IGetAdapterErrors, public IGetAdapterErrorsList, public INotifyWebActivate, public
IAdapterEditor, public IGetAdapterFields, public IGetAdapterActions, public IIteratorSupport,
public IClearAdapterValues, public IEchoAdapterFieldValues, public IAdapterAccess, public
IGetAdapterHiddenFields, public ICreateActionRequestContext, public IWebDataFields, public
```

```
IWebActionsList, public IAdapterNotifyAdapterChange, public IIteratorIndex;
```

File

WebAdapt

Description

TCustomAdapter implements interfaces used to access an adapter properties using server-side script. Most of the interface implementation methods call virtual functions. When defining new derived classes, override these virtual functions to customize the behavior of the adapter class.

See Also

TAdapter (see page 5179)

TEndUserAdapter (see page 5750)

TEndUserSessionAdapter (see page 5779)

TFieldValuesAdapter (see page 5789)

TDataSetValuesList

TStringsValuesList (see page 5843)

TApplicationAdapter (see page 5427)

TLoginFormAdapter (see page 5810)

TDataSetAdapter

TPagedAdapter (see page 5830)

57.1.44.1 TCustomAdapter Members

The following tables list the members exposed by TCustomAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5526)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddOrigValueHiddenFields (see page 5526)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5526)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5527)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5527)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5527)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 5528)	Clears adapter state information.
	ClearErrors (see page 5528)	Clears the content of the adapter's Errors (see page 5559) property.
	CreateActionRequestContext (see page 5528)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5529)	Creates the object used to manage errors associated with this adapter.
V	EncodeActionParams (see page 5529)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5529)	Implements IIteratorSupport (see page 996)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5530)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5530)	Returns an action component with a matching action name.
	FindField (see page 5530)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5531)	Finds an action with a matching variable name.
	FindNamedField (see page 5531)	Finds an adapter field with a matching variable name.

	FindNamedVariable (see page 5531)	Finds a field or action with a matching variable name.
	FindVariable (see page 5532)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5532)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 5533)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5533)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5533)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5534)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 5534)	<insert text here>
	GetAdapterFields (see page 5534)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5534)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5535)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildren (see page 5535)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5535)	Specifies the class to create as a container for adapter fields components.
	GetEchoActionFieldValues (see page 5536)	Returns the value of the echo flag.
	GetFieldsList (see page 5536)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5536)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5537)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 5537)	Returns an action or field.
	GetVariableCount (see page 5538)	Returns the total count of actions and fields.
	GetVariableName (see page 5538)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5538)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 5538)	This is GetVisibleFields, a member of class TCustomAdapter.
	GetWebSnapObjClass (see page 5539)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5539)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 5539)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 5539)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 5540)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 5540)	Clears adapter state information.
	ImplEndIterator (see page 5541)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5529) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5541)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5541)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5542)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 5542)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5542)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 5543)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5537) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 5543)	Returns an action or field.
	ImplGetVariableCount (see page 5544)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5544)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5544)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5544)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5545)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5545)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5546)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 5546)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5549) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5546)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5551) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5547)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5547)	Called when the web module is deactivated.

	ImplSetActions (see page 5547)	Initializes the Actions (see page 5558) property.
	ImplSetData (see page 5548)	Initializes the Data (see page 5558) property.
	ImplSetEchoActionFieldValues (see page 5548)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5548)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5553) method to support iterating over the records of the adapter.
	InIterator (see page 5549)	Implements IIteratorIndex (see page 994)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5549)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5549)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5550)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 5550)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5551)	Implements IIteratorSupport (see page 996)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5551)	Clears references to deleted components.
	NotifyActivate (see page 5551)	Called when the web module is activated.
	NotifyAdapterChange (see page 5551)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5552)	Called when the web module is deactivated.
	SetActions (see page 5552)	Initializes the Actions (see page 5558) property.
	SetData (see page 5553)	Initializes the Data (see page 5558) property.
	SetEchoActionFieldValues (see page 5553)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5553)	Implements IIteratorSupport (see page 996)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5554)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5554)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5555)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5555)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5556)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5557)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5557)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5557)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5560)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5561)	This is VisibleActions, a member of class TCustomAdapter.
	VisibleFields (see page 5561)	This is VisibleFields, a member of class TCustomAdapter.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5561)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5562)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5562)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5563)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5563)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5563)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5564)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5564)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5564)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5565)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1000)	Registers an interest in change notifications.
	Create (see page 5523)	Constructor for TCustomAdapter (see page 5519).

	Destroy (see page 5523)	Destructor for TCustomAdapter (see page 5519).
	RemoveNotify (see page 1000)	Unregisters interest in change notifications.
	UpdateRecords (see page 5556)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
	Actions (see page 5558)	Actions is the container for adapter actions components.
	Data (see page 5558)	Data is the container for adapter field components.
	EchoActionFieldValues (see page 5559)	Modifies the adapter's echo flag.
	Errors (see page 5559)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5560)	This is ExecuteAccess, a member of class TCustomAdapter.
	IteratorIndex (see page 995)	Indicates the index of the current item.
	ModifyAccess (see page 5560)	This is ModifyAccess, a member of class TCustomAdapter.
	ViewAccess (see page 5560)	Identifies the rights required to view this adapter's fields.

57.1.44.2 TCustomAdapter.Create Constructor

Constructor for TCustomAdapter (see page 5519).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapter(TComponent * AOwner);
```

Description

Creates instance variables that hold interfaces, object references used by TCustomAdapter (see page 5519).

See Also

Create_d

57.1.44.3 TCustomAdapter.Destroy Destructor

Destructor for TCustomAdapter (see page 5519).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapter();
```

Description

Frees objects used by TCustomAdapter (see page 5519).

See Also

System::TObject::Free (see page 3382)

57.1.44.4 TCustomAdapter Methods

The methods of the TCustomAdapter class are listed here.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5526)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddOrigValueHiddenFields (see page 5526)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5526)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5527)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5527)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5527)	This is CheckModifyAccess, a member of class TCustomAdapter.
	ClearAdapterValues (see page 5528)	Clears adapter state information.
	ClearErrors (see page 5528)	Clears the content of the adapter's Errors (see page 5559) property.
	CreateActionRequestContext (see page 5528)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5529)	Creates the object used to manage errors associated with this adapter.
V	EncodeActionParams (see page 5529)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5529)	Implements IIteratorSupport (see page 996)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5530)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5530)	Returns an action component with a matching action name.
	FindField (see page 5530)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5531)	Finds an action with a matching variable name.
	FindNamedField (see page 5531)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5531)	Finds a field or action with a matching variable name.
	FindVariable (see page 5532)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5532)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5533)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5533)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5533)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5534)	This is GetAdapterErrors, a member of class TCustomAdapter.
	GetAdapterErrorsList (see page 5534)	<insert text here>
	GetAdapterFields (see page 5534)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5534)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5535)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5535)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5535)	Specifies the class to create as a container for adapter fields components.
	GetEchoActionFieldValues (see page 5536)	Returns the value of the echo flag.
	GetFieldsList (see page 5536)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5536)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5537)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 5537)	Returns an action or field.
	GetVariableCount (see page 5538)	Returns the total count of actions and fields.
	GetVariableName (see page 5538)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5538)	This is GetVisibleActions, a member of class TCustomAdapter.
	GetVisibleFields (see page 5538)	This is GetVisibleFields, a member of class TCustomAdapter.
V	GetWebSnapObjClass (see page 5539)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5539)	This is HasExecuteAccess, a member of class TCustomAdapter.
	HasModifyAccess (see page 5539)	This is HasModifyAccess, a member of class TCustomAdapter.
	HasViewAccess (see page 5539)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5540)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.

	ImplClearAdapterValues (see page 5540)	Clears adapter state information.
	ImplEndIterator (see page 5541)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5529) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5541)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5541)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5542)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 5542)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5542)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 5543)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5537) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 5543)	Returns an action or field.
	ImplGetVariableCount (see page 5544)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5544)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5544)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5544)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5545)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5545)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5546)	This is ImplHasViewAccess, a member of class TCustomAdapter.
	ImplInIterator (see page 5546)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5549) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5546)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5551) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5547)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5547)	Called when the web module is deactivated.
	ImplSetActions (see page 5547)	Initializes the Actions (see page 5558) property.
	ImplSetData (see page 5548)	Initializes the Data (see page 5558) property.
	ImplSetEchoActionFieldValues (see page 5548)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5548)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5553) method to support iterating over the records of the adapter.
	InIterator (see page 5549)	Implements IIteratorIndex (see page 994)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5549)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5549)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5550)	This is ListHiddenFields, a member of class TCustomAdapter.
	ListHiddenRecordFields (see page 5550)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5551)	Implements IIteratorSupport (see page 996)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5551)	Clears references to deleted components.
	NotifyActivate (see page 5551)	Called when the web module is activated.
	NotifyAdapterChange (see page 5551)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5552)	Called when the web module is deactivated.
	SetActions (see page 5552)	Initializes the Actions (see page 5558) property.
	SetData (see page 5553)	Initializes the Data (see page 5558) property.
	SetEchoActionFieldValues (see page 5553)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5553)	Implements IIteratorSupport (see page 996)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5554)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5554)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5555)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5555)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5556)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5557)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5557)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5557)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Public Methods

	Name	Description
	UpdateRecords (see page 5556)	Updates the adapter's fields with the field values passed in an HTTP request.

57.1.44.4.1 TCustomAdapter.AddAdapterModeHiddenField Method

Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.

Pascal

```
procedure AddAdapterModeHiddenField(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall AddAdapterModeHiddenField(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Descendant adapters may support modes. For example, TDataSetAdapter supports Edit, Insert (see page 3698), and Browse modes. The hidden field defined by AddAdapterModeHiddenField is added to an HTML form using the server-side script method HiddenFields.WriteFields.

See Also

listhiddenfields (see page 5550)

57.1.44.4.2 TCustomAdapter.AddOrigValueHiddenFields Method

Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.

Pascal

```
procedure AddOrigValueHiddenFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall AddOrigValueHiddenFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

In order to ensure that the data associated with the adapter hasn't been changed by another user, descendant adapters may check that the current values of adapter fields are the same as the original values. For example, TDataSetAdapter raises an exception if the original values are not the same as the dataset's values. The hidden fields defined by AddOrigValueHiddenFields are added to an HTML form using the server-side script method HiddenRecordFields.WriteFields.

See Also

ListHiddenRecordFields (see page 5550)

57.1.44.4.3 TCustomAdapter.AddRecordKeysHiddenFields Method

Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.

Pascal

```
procedure AddRecordKeysHiddenFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall AddRecordKeysHiddenFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Descendant adapters may use key values to define the relationship between values in the HTTP request and adapter data

values. For example, TDataSetAdapter supports updates to multiple detail records by using hidden fields to identify the relationship between values in the HTTP request with dataset rows. The hidden fields defined by AddRecordKeysHiddenFields are added to an HTML form using the server-side script method HiddenRecordFields.WriteFields.

See Also

ListHiddenRecordFields (see page 5550)

57.1.44.4.4 TCustomAdapter.CanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function CanAddActionClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

CanAddActionClass is called at design-time when editing an adapter. CanAddActionClass returns the result of ImplCanAddActionClass (see page 5540).

See Also

ImplCanAddActionClass (see page 5540)

57.1.44.4.5 TCustomAdapter.CanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function CanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

CanAddFieldClass is called at design-time when editing an adapter. CanAddFieldClass returns the result of ImplCanAddFieldClass (see page 5540).

See Also

ImplCanAddFieldClass (see page 5540)

57.1.44.4.6 TCustomAdapter.CheckModifyAccess Method

Pascal

```
procedure CheckModifyAccess;
```

C++

```
__fastcall CheckModifyAccess();
```

Description

This is CheckModifyAccess, a member of class TCustomAdapter.

57.1.44.4.7 TCustomAdapter.ClearAdapterValues Method

Clears adapter state information.

Pascal

```
procedure ClearAdapterValues;
```

C++

```
__fastcall ClearAdapterValues();
```

Description

ClearAdapterValues calls ImplClearAdapterValues (see page 5540).

See Also

ImplNotifyDeactivate (see page 5547)

ImplClearAdapterValues (see page 5540)

57.1.44.4.8 TCustomAdapter.ClearErrors Method

Clears the content of the adapter's Errors (see page 5559) property.

Pascal

```
procedure ClearErrors;
```

C++

```
__fastcall ClearErrors();
```

Description

The errors are cleared when the web module is deactivated. This ensures that the errors encountered during the processing of an HTTP request will not affect another HTTP request.

See Also

Errors (see page 5559)

ClearErrors (see page 5470)

ImplNotifyDeactivate (see page 5547)

57.1.44.4.9 TCustomAdapter.CreateActionRequestContext Method

Creates an object that describes the adapter action parameters and adapter field values.

Pascal

```
procedure CreateActionRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateActionRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

Child adapter actions call this method.

See Also

IAdapterDispatchParams (see page 929)

CreateRequestContext (see page 5440)

WebContext (see page 5977)

57.1.44.4.10 TCustomAdapter.CreateErrorsList Method

Creates the object used to manage errors associated with this adapter.

Pascal

```
function CreateErrorsList: TBaseAdapterErrorsList; virtual;
```

C++

```
virtual __fastcall TBaseAdapterErrorsList CreateErrorsList();
```

Description

CreateErrorsList creates TAdapterErrorsList (see page 5248). Descendants may override this function to create a custom errors list.

See Also

Errors (see page 5559)

TAdapterErrorsList (see page 5248)

57.1.44.4.11 TCustomAdapter.EncodeActionParams Method

Writes name/value pairs that represent adapter state.

Pascal

```
procedure EncodeActionParams(AParams: IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall EncodeActionParams(IAdapterItemRequestParams AParams);
```

Description

EncodeActionParams is called by a child adapter actions when generating the name/value pairs that must be sent in the HTTP request when executing an action. For example, TDefaultFieldsPagedAdapter (see page 5733) writes the current page number as a name/value pair. ExtractRequestParams (see page 5530) and EncodeActionParams work together. ExtractRequestParams (see page 5530) reads name/value pairs that are written by EncodeActionParams.

See Also

EncodeActionParams (see page 5740)

ExtractRequestParams (see page 5530)

57.1.44.4.12 TCustomAdapter.EndIterator Method

Implements IIteratorSupport (see page 996)'s EndIterator method to support iterating over the data records of the adapter.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. EndIterator calls ImplEndIterator (see page 5541).

See Also

enditerator (see page 997)

ImplEndIterator (see page 5541)

57.1.44.4.13 TCustomAdapter.ExtractRequestParams Method

Reads name/value pairs from the HTTP request.

Pascal

```
procedure ExtractRequestParams(ARequest: IUnknown); virtual;
```

C++

```
virtual __fastcall ExtractRequestParams(IUnknown ARequest);
```

Description

ExtractRequestParams is called by a child adapter action before executing the action. This gives the adapter an opportunity to extract values from the HTTP request that are important to the behavior of the adapter. For example, TDefaultFieldsPagedAdapter (see page 5733) extracts the current page number from the request. ExtractRequestParams and EncodeActionParams (see page 5529) work together. ExtractRequestParams reads name/value pairs that are written by EncodeActionParams (see page 5529).

See Also

ExtractRequestParams (see page 5740)

EncodeActionParams (see page 5529)

57.1.44.4.14 TCustomAdapter.FindAction Method

Returns an action component with a matching action name.

Pascal

```
function FindAction(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindAction(const UnicodeString AName);
```

Description

The action name is used when a component property references an adapter action by name. Actions (see page 5558) also have a variable name that is used to reference the action with server-side script. The variable name and action name are usually the same. The only time that they need to be different is when the action name is not a valid server-side script identifier.

See Also

FindField (see page 5530)

57.1.44.4.15 TCustomAdapter.FindField Method

Returns an adapter field component with a matching field name.

Pascal

```
function FindField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindField(const UnicodeString AName);
```

Description

The field name is used when a component property references an adapter field by name. Adapter fields also have a variable name that is used to reference the field with server-side script. The variable name and field name are usually the same. The only time that they need to be different is when the field name is not a valid server-side script identifier.

See Also

FindField

57.1.44.4.16 TCustomAdapter.FindNamedAction Method

Finds an action with a matching variable name.

Pascal

```
function FindNamedAction(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindNamedAction(const UnicodeString AName);
```

Description

The AName parameter contains the name used when referencing an action with server-side script. This name may not be the same as the component name. For example, server-side script accesses actions in a TDataSetAdapter with using the command name (e.g.; DeleteRow) rather than the adapter action component name.

See Also

FindNamedVariable (see page 5531)

57.1.44.4.17 TCustomAdapter.FindNamedField Method

Finds an adapter field with a matching variable name.

Pascal

```
function FindNamedField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindNamedField(const UnicodeString AName);
```

Description

The AName parameter contains the name used when referencing a field with server-side script. This name may not be the same as the component name. For example, server-side script accesses fields in a TDataSetAdapter with using the dataset field name rather than the adapter field component name.

See Also

FindNamedVariable (see page 5531)

57.1.44.4.18 TCustomAdapter.FindNamedVariable Method

Finds a field or action with a matching variable name.

Pascal

```
function FindNamedVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * FindNamedVariable(const UnicodeString AName);
```

Description

FindNamedVariable calls FindNamedField (see page 5531) and FindNamedAction (see page 5531). The AName parameter contains the name used when referencing an action or field with server-side script. This name may not be the same as the component name. For example, server-side script references fields in a TDataSetAdapter using the dataset field name rather than the adapter field component name.

See Also

FindNamedAction (see page 5531)

FindNamedField (see page 5531)

57.1.44.4.19 TCustomAdapter.FindVariable Method

Finds an adapter action or adapter field with the given variable name.

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const UnicodeString AName);
```

Description

FindVariable is called when server side script references a property of an adapter object. FindVariable calls ImplFindVariable (see page 5541).

See Also

ImplFindVariable (see page 5541)

57.1.44.4.20 TCustomAdapter.FindVariableContainer Method

Finds an adapter action or adapter field that is a container for other scriptable objects.

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const UnicodeString AName);
```

Description

FindVariableContainer is called when server side script references a property of a property. FindVariableContainer returns the result of ImplFindVariableContainer (see page 5541).

See Also

FindVariable (see page 5532)

ImplFindVariableContainer (see page 5541)

57.1.44.4.21 TCustomAdapter.GetActionsClass Method

Specifies the class to create as a container for adapter actions components.

Pascal

```
function GetActionsClass: TAdapterActionsClass; virtual;
```

C++

```
virtual __fastcall TAdapterActionsClass GetActionsClass();
```

Description

Descendants override this method to specify a different adapter action container.

See Also

Actions (see page 5558)

57.1.44.4.22 TCustomAdapter.GetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure GetActionsList(AList: TStrings);
```

C++

```
__fastcall GetActionsList(TStrings AList);
```

Description

GetActionsList is called at design time to get a list containing names and objects. Each name identifies an action name to insert and each object identifies a class of adapter action component. When editing the adapter, these action names are displayed in the dialog box that is used to add new actions. For example, when editing a TDataSetAdapter a list of all of the dataset commands are displayed such as NextRow, PrevRow, DeleteRow, etc.

See Also

ImplGetActionsList (see page 5542)

57.1.44.4.23 TCustomAdapter.GetAdapterActions Method

Returns the adapter actions container object.

Pascal

```
function GetAdapterActions: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterActions();
```

Description

Returns the adapter actions container object.

See Also

Actions (see page 5558)

57.1.44.4.24 TCustomAdapter.GetAdapterErrors Method

Pascal

```
function GetAdapterErrors: TObject;
```

C++

```
__fastcall TObject * GetAdapterErrors();
```

Description

This is GetAdapterErrors, a member of class TCustomAdapter.

57.1.44.4.25 TCustomAdapter.GetAdapterErrorsList Method

<insert text here>

Pascal

```
function GetAdapterErrorsList: TBaseAdapterErrorsList;
```

C++

```
__fastcall TBaseAdapterErrorsList GetAdapterErrorsList();
```

Description

Returns an object used to track errors.

See Also

TBaseAdapterErrorsList (see page 5467)

Errors (see page 5559)

57.1.44.4.26 TCustomAdapter.GetAdapterFields Method

Returns the adapter fields container object.

Pascal

```
function GetAdapterFields: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterFields();
```

Description

Returns the adapter fields container object.

See Also

Data (see page 5558)

57.1.44.4.27 TCustomAdapter.GetAdapterHiddenFields Method

Returns a list of hidden fields that hold adapter state information.

Pascal

```
function GetAdapterHiddenFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenFields();
```

Description

GetAdapterHiddenFields populates a list by calling ListHiddenFields (see page 5550).

See Also

listhiddenfields (see page 5550)

57.1.44.4.28 TCustomAdapter.GetAdapterHiddenRecordFields Method

Returns a list of hidden fields that associate HTML form fields and adapter field.

Pascal

```
function GetAdapterHiddenRecordFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenRecordFields();
```

Description

GetAdapterHiddenRecordsFields populates a list by calling ListHiddenRecordFields (see page 5550). If the list is empty, nil (Delphi) or NULL (C++) is returned. Otherwise, the list is returned.

See Also

ListHiddenRecordFields (see page 5550)

57.1.44.4.29 TCustomAdapter.GetChildren Method

Provides the interface for a method that adapters use to return their child components.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

TCustomAdapter (see page 5519) overrides the GetChildren method that is introduced in TComponent for the streaming system that loads and saves components. It calls the Proc procedure passing the Actions (see page 5558) and Data (see page 5558) properties. This allows the adapter actions and adapter fields to be loaded and saved with the TCustomAdapter (see page 5519) object.

See Also

Actions (see page 5558)

Data (see page 5558)

57.1.44.4.30 TCustomAdapter.GetDataClass Method

Specifies the class to create as a container for adapter fields components.

Pascal

```
function GetDataClass: TAdapterFieldsClass; virtual;
```

C++

```
virtual __fastcall TAdapterFieldsClass GetDataClass();
```

Description

Descendants override this method to specify a different adapter fields container.

See Also

TAdapterField (see page 5256)

Data (see page 5558)

57.1.44.4.31 TCustomAdapter.GetEchoActionFieldValues Method

Returns the value of the echo flag.

Pascal

```
function GetEchoActionFieldValues: Boolean;
```

C++

```
__fastcall Boolean GetEchoActionFieldValues();
```

Description

EchoActionFieldValues (see page 5559) calls ImplEchoActionFieldValues.

See Also

EchoActionFieldValues (see page 5559)

ImplGetEchoActionFieldValues (see page 5542)

57.1.44.4.32 TCustomAdapter.GetFieldsList Method

Provides a list of field types that can be added to this adapter.

Pascal

```
procedure GetFieldsList(AList: TStrings);
```

C++

```
__fastcall GetFieldsList(TStrings AList);
```

Description

GetFieldsList is called at design time to get a list containing names and objects. Each name identifies a field name to insert and each object identifies a class of adapter field. When editing the adapter, these field names are displayed in the dialog box that is used to add new adapter fields. For example, when editing a TDataSetAdapter a list of all of the dataset's fields are displayed. GetFieldsList calls ImplGetFieldsList (see page 5542).

See Also

ImplGetFieldsList (see page 5542)

57.1.44.4.33 TCustomAdapter.GetHiddenFieldOptions Method

Indicates the types of hidden fields that this adapter requires in a submitted HTML form.

Pascal

```
function GetHiddenFieldOptions: TAdapterHiddenFieldOptions; virtual;
```

C++

```
virtual __fastcall TAdapterHiddenFieldOptions GetHiddenFieldOptions();
```

Description

An adapter may use hidden fields to pass state information down to the client with the HTTP response so that the state information is available when processing a resulting HTTP response. Descendant classes may override this method.

See Also

listhiddenfields (see page 5550)

ListHiddenRecordFields (see page 5550)

57.1.44.4.34 TCustomAdapter.GetIteratorIndex Method

Implements IIteratorIndex (see page 994)'s GetIteratorIndex method to support iterating over the data records of the adapter.

Pascal

```
function GetIteratorIndex: Integer;
```

C++

```
__fastcall int GetIteratorIndex();
```

Description

Adapters may support multiple data records. For example, TDataSetAdapter provides access to the records in a dataset. GetIteratorIndex calls ImplGetIteratorIndex (see page 5543).

See Also

GetIteratorIndex (see page 995)

ImplGetIteratorIndex (see page 5543)

57.1.44.4.35 TCustomAdapter.GetVariable Method

Returns an action or field.

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

GetVariableCount (see page 5538) and GetVariable is used to iterate over actions and fields in an adapter. The I parameter is a zero-based index that must be less than the result of GetVariableCount (see page 5538). GetVariable calls ImplGetVariable (see page 5543).

See Also

GetVariable

ImplGetVariable (see page 5543)

GetVariableCount (see page 5538)

57.1.44.4.36 TCustomAdapter.GetVariableCount Method

Returns the total count of actions and fields.

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

GetVariableCount and GetVariable (see page 5537) is used to iterate over the actions and fields in an adapter. GetVariableCount calls ImplGetVariableCount (see page 5544).

See Also

GetVariable (see page 5537)

ImplGetVariableCount (see page 5544)

57.1.44.4.37 TCustomAdapter.GetVariableName Method

Gets the name used to reference this adapter with server-side script.

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall UnicodeString GetVariableName();
```

Description

GetVariableName is called to retrieve the name used to access this adapter with server-side script. GetVariableName calls ImplGetVariableName (see page 5544).

See Also

ImplGetVariableName (see page 5544)

57.1.44.4.38 TCustomAdapter.GetVisibleActions Method

Pascal

```
function GetVisibleActions: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleActions();
```

Description

This is GetVisibleActions, a member of class TCustomAdapter.

57.1.44.4.39 TCustomAdapter.GetVisibleFields Method

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

This is GetVisibleFields, a member of class TCustomAdapter.

57.1.44.4.40 TCustomAdapter.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

57.1.44.4.41 TCustomAdapter.HasExecuteAccess Method

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

This is HasExecuteAccess, a member of class TCustomAdapter.

57.1.44.4.42 TCustomAdapter.HasModifyAccess Method

Pascal

```
function HasModifyAccess: Boolean;
```

C++

```
__fastcall Boolean HasModifyAccess();
```

Description

This is HasModifyAccess, a member of class TCustomAdapter.

57.1.44.4.43 TCustomAdapter.HasViewAccess Method

Checks the end-user's right to view this adapter's fields.

Pascal

```
function HasViewAccess: Boolean;
```

C++

```
__fastcall Boolean HasViewAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanView property. HasViewAccess calls ImplHasViewAccess (see page 5546).

See Also

ViewAccess (see page 5560)

57.1.44.4.44 TCustomAdapter.ImplCanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddActionClass returns false. This means that only TAdapterAction (see page 5190) can be added. Descendants override this method to allow additional field types.

See Also

CanAddActionClass (see page 5527)

ImplCanAddClass (see page 5201)

57.1.44.4.45 TCustomAdapter.ImplCanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass returns false. This means that only TAdapterField (see page 5256) can be added. Descendants override this method to allow additional field types.

See Also

CanAddFieldClass (see page 5527)

ImplCanAddClass (see page 5268)

57.1.44.4.46 TCustomAdapter.ImplClearAdapterValues Method

Clears adapter state information.

Pascal

```
procedure ImplClearAdapterValues; virtual;
```

C++

```
virtual __fastcall ImplClearAdapterValues();
```

Description

ClearAdapterValues (see page 5528) clears the echo flag.

See Also

ImplSetEchoActionFieldValues (see page 5548)

ClearAdapterValues (see page 5528)

57.1.44.4.47 TCustomAdapter.ImplEndIterator Method

Implements IIteratorSupport (see page 996)'s EndIterator (see page 5529) method to support iterating over the data records of the adapter.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); virtual;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplEndIterator sets the ItemIndex to 0 and the iterator flag to false.

See Also

enditerator (see page 997)

EndIterator (see page 5529)

57.1.44.4.48 TCustomAdapter.ImplFindVariable Method

Finds an adapter action or adapter field child with a matching variable name.

Pascal

```
function ImplFindVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplFindVariable(const UnicodeString AName);
```

Description

ImpFindVariable returns the result of FindNamedVariable (see page 5531).

See Also

FindVariable (see page 5532)

57.1.44.4.49 TCustomAdapter.ImplFindVariableContainer Method

Finds an adapter action or adapter field that is a container for other scriptable objects.

Pascal

```
function ImplFindVariableContainer(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplFindVariableContainer(const UnicodeString AName);
```

Description

FindVariableContainer (see page 5532) is called when server side script references a property of a property. ImplFindVariableContainer tries to find an adapter field or adapter action that is a container for other objects.

See Also

FindVariableContainer (see page 5532)

57.1.44.4.50 TCustomAdapter.ImplGetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); virtual;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

ImplGetActionsList is called by GetActionsList (see page 5533). ImplGetActionsList provides an empty list. ImplGetActionsList may be overridden by descendant classes.

See Also

GetActionsList (see page 5533)

57.1.44.4.51 TCustomAdapter.ImplGetEchoActionFieldValues Method

Returns the value of the echo flag.

Pascal

```
function ImplGetEchoActionFieldValues: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValues();
```

Description

ImplGetEchoActionFieldValues returns the value passed to ImplSetEchoActionFieldValues (see page 5548). If ImplSetEchoActionFieldValues (see page 5548) has not been processed during the current HTTP request then False is returned.

See Also

EchoActionFieldValues (see page 5559)

GetEchoActionFieldValues (see page 5536)

57.1.44.4.52 TCustomAdapter.ImplGetFieldsList Method

Provides a list of field types that can be added to this adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); virtual;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetFieldsList is called by GetFieldsList (see page 5536). ImplGetFieldsList provides an empty list. ImplGetFieldsList may be overridden by descendant classes.

See Also

GetFieldsList (see page 5536)

57.1.44.4.53 TCustomAdapter.ImplGetIteratorIndex Method

Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5537) method to support iterating over the data records of the adapter.

Pascal

```
function ImplGetIteratorIndex: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetIteratorIndex();
```

Description

ImplGetIteratorIndex returns the value ItemIndex. ItemIndex is modified by ImplStartIterator (see page 5548), ImplNextIteration (see page 5546), and ImplEndIterator (see page 5541).

See Also

GetIteratorIndex (see page 995)

GetIteratorIndex (see page 5537)

ImplStartIterator (see page 5548)

ImplNextIteration (see page 5546)

ImplEndIterator (see page 5541)

57.1.44.4.54 TCustomAdapter.ImplGetVariable Method

Returns an action or field.

Pascal

```
function ImplGetVariable(I: Integer): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetVariable(int I);
```

Description

ImplGetVariable is called by GetVariable (see page 5537). ImplGetVariable uses the I parameter to locate an adapter action or adapter field.

See Also

GetVariable (see page 5537)

57.1.44.4.55 TCustomAdapter.ImplGetVariableCount Method

Returns the total count of actions and fields.

Pascal

```
function ImplGetVariableCount: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetVariableCount();
```

Description

ImplGetVariableCount is called by GetVariableCount (see page 5538).

See Also

GetVariableCount (see page 5538)

57.1.44.4.56 TCustomAdapter.ImplGetVariableName Method

Gets the name used to reference this adapter with server-side script.

Pascal

```
function ImplGetVariableName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetVariableName();
```

Description

ImplGetVariableName returns the component name.

See Also

GetVariableName (see page 5538)

57.1.44.4.57 TCustomAdapter.ImplGetVisibleActions Method

Returns a list of this adapter's action components.

Pascal

```
function ImplGetVisibleActions: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleActions();
```

Description

ImplGetVisibleActions is called by GetVisibleActions (see page 5538). ImplGetVisibleActions may be overriden by descendant classes.

See Also

getvisibleactions (see page 5538)

57.1.44.4.58 TCustomAdapter.ImplGetVisibleFields Method

Returns a list of this adapter's field components.

Pascal

```
function ImplGetVisibleFields: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleFields();
```

Description

ImplGetVisibleFields is called by GetVisibleFields (see page 5538). ImplGetVisibleFields may be overridden by descendant classes.

See Also

getvisiblefields (see page 5538)

57.1.44.4.59 TCustomAdapter.ImplHasExecuteAccess Method

Checks the end-user's right to execute this adapter's actions.

Pascal

```
function ImplHasExecuteAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasExecuteAccess();
```

Description

This function is called by HasExecuteAccess (see page 5539) to check the end-user's right to execute the adapter's actions. If the ExecuteAccess (see page 5560) property is not blank, this function calls the EndUserAdapter's HasExecuteRights function, passing the ExecuteAccess (see page 5560) property value.

See Also

hasexecuteaccess (see page 5539)

executeaccess (see page 5560)

HasExecuteAccess (see page 5451)

57.1.44.4.60 TCustomAdapter.ImplHasModifyAccess Method

Checks the end-user's right to modify this adapter's fields.

Pascal

```
function ImplHasModifyAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasModifyAccess();
```

Description

This function is called by HasModifyAccess (see page 5539) to check the end-user's right to modify the adapter field. If the ModifyAccess (see page 5560) property is not blank, this function calls the EndUserAdapter HasModifyRights function, passing the ModifyAccess (see page 5560) property value.

See Also

hasmodifyaccess (see page 5539)

modifyaccess (see page 5560)

hasmodifyaccess (see page 5539)

57.1.44.4.61 TCustomAdapter.ImplHasViewAccess Method

Pascal

```
function ImplHasViewAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasViewAccess();
```

Description

This is ImplHasViewAccess, a member of class TCustomAdapter.

57.1.44.4.62 TCustomAdapter.ImplInIterator Method

Implements IIteratorIndex (see page 994)'s InIterator (see page 5549) to support iterating over the data records of the adapter.

Pascal

```
function ImplInIterator: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplInIterator();
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplGetInIterator returns the value of the iteration flag. The iteration flag is set to true by TCustomAdapter (see page 5519)'s ImplStartIterator (see page 5548) method.

See Also

InIterator (see page 995)

InIterator (see page 5549)

ImplStartIterator (see page 5548)

57.1.44.4.63 TCustomAdapter.ImplNextIteration Method

Implements IIteratorSupport (see page 996)'s NextIteration (see page 5551) method to support iterating over the records of the adapter.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplNextIteration increments ItemIndex and returns true if the iteration index is less than ItemCount.

See Also

NextIteration (see page 997)

NextIteration (see page 5551)

ImplStartIterator (see page 5548)

ImplEndIterator (see page 5541)

57.1.44.4.64 TCustomAdapter.ImplNotifyActivate Method

Called when the web module is activated.

Pascal

```
procedure ImplNotifyActivate; virtual;
```

C++

```
virtual __fastcall ImplNotifyActivate();
```

Description

A web module is activated when an HTTP request is received. ImplNotifyActivate is a placeholder. Descendant classes override this method to initialize the adapter before an HTTP request processed.

See Also

NotifyActivate (see page 5551)

57.1.44.4.65 TCustomAdapter.ImplNotifyDeactivate Method

Called when the web module is deactivated.

Pascal

```
procedure ImplNotifyDeactivate; virtual;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

A web module is deactivated after the HTTP request has been handled.. ImplNotifyDeactivate discards adapter state information including adapter errors, iteration flag, and iteration index.

See Also

NotifyDeactivate (see page 5552)

57.1.44.4.66 TCustomAdapter.ImplSetActions Method

Initializes the Actions (see page 5558) property.

Pascal

```
procedure ImplSetActions(const Value: TAdapterSubComponent); virtual;
```

C++

```
virtual __fastcall ImplSetActions(const TAdapterSubComponent Value);
```

Description

The Actions (see page 5558) property is the container for adapter action components. Descendants may override this method.

See Also

Actions (see page 5558)

SetActions (see page 5552)

57.1.44.4.67 TCustomAdapter.ImplSetData Method

Initializes the Data (see page 5558) property.

Pascal

```
procedure ImplSetData(const Value: TAdapterSubComponent); virtual;
```

C++

```
virtual __fastcall ImplSetData(const TAdapterSubComponent Value);
```

Description

The Data (see page 5558) property is the container for adapter field components. Descendants may override this method.

See Also

Data (see page 5558)

SetData (see page 5553)

57.1.44.4.68 TCustomAdapter.ImplSetEchoActionFieldValues Method

Sets the echo flag for this adapter's fields.

Pascal

```
procedure ImplSetEchoActionFieldValues(AValue: Boolean); virtual;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValues(Boolean AValue);
```

Description

ImplEchoActionFieldValues modified the EchoActionFieldValue property of the adapter's fields.

See Also

GetEchoActionFieldValues (see page 5536)

SetEchoActionFieldValues (see page 5553)

EchoActionFieldValue (see page 5356)

57.1.44.4.69 TCustomAdapter.ImplStartIterator Method

Implements IIteratorSupport (see page 996)'s StartIterator (see page 5553) method to support iterating over the records of the adapter.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplStartIterator sets ItemIndex to 0 and sets the iteration flag to true. true is returned.

See Also

startiterator (see page 998)

StartIterator (see page 5553)

ImplNextIteration (see page 5546)

ImplEndIterator (see page 5541)

57.1.44.4.70 TCustomAdapter.InIterator Method

Implements IIteratorIndex (see page 994)'s InIterator method to support iterating over the data records of the adapter.

Pascal

```
function InIterator: Boolean;
```

C++

```
__fastcall Boolean InIterator();
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. InIterator calls ImplInIterator (see page 5546).

See Also

InIterator (see page 995)

ImplInIterator (see page 5546)

57.1.44.4.71 TCustomAdapter.IsActionInUse Method

Indicates whether a particular action has been added to the adapter.

Pascal

```
function IsActionInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsActionInUse(const UnicodeString AName);
```

Description

IsActionInUse is called at design time to determine whether an action with a particular name has been added to the adapter. When editing the adapter, the names of actions in use are not displayed in the dialog box used to add new actions.

See Also

IsFieldInUse (see page 5549)

GetFieldsList (see page 5536)

57.1.44.4.72 TCustomAdapter.IsFieldInUse Method

Indicates whether a particular field has been added to the adapter.

Pascal

```
function IsFieldInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(const UnicodeString AName);
```

Description

IsFieldInUse is called at design time to determine whether a field with a particular name has been added to the adapter. When editing the adapter, the names of these fields if use are not displayed in the dialog box used to add new fields.

See Also

IsActionInUse (see page 5549)

GetFieldsList (see page 5536)

57.1.44.4.73 TCustomAdapter.ListHiddenFields Method

Pascal

```
procedure ListHiddenFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall ListHiddenFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

This is ListHiddenFields, a member of class TCustomAdapter.

57.1.44.4.74 TCustomAdapter.ListHiddenRecordFields Method

Specifies the HTML form hidden fields needed by the adapter.

Pascal

```
procedure ListHiddenRecordFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall ListHiddenRecordFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Some adapters may use hidden fields to define the relationship between input fields in the HTML form and data of the adapter. For example, an HTML form that contains an HTML table for updating 5 detail records of a TDataSetAdapter will have 5 sets of hidden fields. Each set provides state information needed by the adapter to determine the relationship between the input fields in the HTTP request and the dataset.

ListHiddenRecordFields may call AddOrigValueHiddenFields (see page 5526) and/or AddRecordKeysHiddenFields (see page 5526) depending on the flags returned by GetHiddenFieldOptions (see page 5536).

See Also

GetHiddenFieldOptions (see page 5536)

TAdapterHiddenFieldsList (see page 5290)

ListHiddenRecordFields

AddOrigValueHiddenFields (see page 5526)

AddRecordKeysHiddenFields (see page 5526)

GetAdapterHiddenRecordFields (see page 5535)

57.1.44.4.75 TCustomAdapter.NextIteration Method

Implements IIteratorSupport (see page 996)'s NextIteration method to support iterating over the data records of the adapter.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. NextIteration calls ImplNextIteration (see page 5546).

See Also

NextIteration (see page 997)

ImplNextIteration (see page 5546)

57.1.44.4.76 TCustomAdapter.Notification Method

Clears references to deleted components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called when a component is inserted or deleted.

57.1.44.4.77 TCustomAdapter.NotifyActivate Method

Called when the web module is activated.

Pascal

```
procedure NotifyActivate;
```

C++

```
__fastcall NotifyActivate();
```

Description

A web module is activated when an HTTP request is received. NotifyActivate calls ImplNotifyActivate (see page 5547).

See Also

ImplNotifyActivate (see page 5547)

NotifyDeactivate (see page 5552)

57.1.44.4.78 TCustomAdapter.NotifyAdapterChange Method

Notifies components that the adapter has changed in some way.

Pascal

```
procedure NotifyAdapterChange;
```

C++

```
__fastcall NotifyAdapterChange();
```

Description

NotifyAdapterChange calls components that have registered a notification callback to let them know that the adapter has changed. For example, TAdapterFieldGroup needs to know when an adapter field is added to the adapter component that the TAdapterFieldGroup references.

See Also

NotifyList (see page 5560)

57.1.44.4.79 TCustomAdapter.NotifyDeactivate Method

Called when the web module is deactivated.

Pascal

```
procedure NotifyDeactivate;
```

C++

```
__fastcall NotifyDeactivate();
```

Description

A web module is deactivated after the HTTP request has been handled.. NotifyDeactivate calls ImplNotifyDeactivate (see page 5547).

See Also

ImplNotifyDeactivate (see page 5547)

NotifyActivate (see page 5551)

57.1.44.4.80 TCustomAdapter.SetActions Method

Initializes the Actions (see page 5558) property.

Pascal

```
procedure SetActions(const Value: TAdapterSubComponent);
```

C++

```
__fastcall SetActions(const TAdapterSubComponent Value);
```

Description

The Actions (see page 5558) property is the container for adapter action components. SetActions calls ImplSetActions (see page 5547).

See Also

Actions (see page 5558)

ImplSetActions (see page 5547)

57.1.44.4.81 TCustomAdapter.SetData Method

Initializes the Data (see page 5558) property.

Pascal

```
procedure SetData(const Value: TAdapterSubComponent); virtual;
```

C++

```
virtual __fastcall SetData(const TAdapterSubComponent Value);
```

Description

The Data (see page 5558) property is the container for adapter field components. SetData calls ImplSetData (see page 5548).

See Also

Data (see page 5558)

ImplSetData (see page 5548)

57.1.44.4.82 TCustomAdapter.SetEchoActionFieldValues Method

Sets the echo flag for this adapter's fields.

Pascal

```
procedure SetEchoActionFieldValues(AValue: Boolean);
```

C++

```
__fastcall SetEchoActionFieldValues(Boolean AValue);
```

Description

SetEchoActionFieldValues calls ImplSetActionFieldValues.

See Also

EchoActionFieldValues (see page 5559)

ImplSetEchoActionFieldValues (see page 5548)

57.1.44.4.83 TCustomAdapter.StartIterator Method

Implements IIteratorSupport (see page 996)'s StartIterator method to support iterating over the records of the adapter.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. StartIterator calls ImplStartIterator (see page 5548).

See Also

startiterator (see page 998)

ImplStartIterator (see page 5548)

57.1.44.4.84 TCustomAdapter.UpdateFieldsExecuteValues Method

Executes the adapter's fields with values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsExecuteValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateFieldsExecuteValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsExecuteValues loops through the adapter fields passed in the AAdapterFields parameter, calling the ExecuteValue function. Adapter fields raise an exception to indicate an error. If an exception occurs, the exception message is added to the Errors (see page 5559) object and execution continues.

When a field is executable, the field value passed in the HTTP request is used to execute a command rather than update a value. For example, an HTML form may contain a table with a delete row checkbox on each row. When the form is submitted, the values in the HTTP request indicate whether to delete one or more rows. Executable adapter fields must implement the IExecuteValue (see page 5869) interface.

See Also

Errors (see page 5559)

IActionRequest

IExecuteValue (see page 5869)

57.1.44.4.85 TCustomAdapter.UpdateFieldsGetAnyChanges Method

Determines whether the values in the HTTP request change any adapter fields.

Pascal

```
function UpdateFieldsGetAnyChanges(AActionRequest: IActionRequest; AAdapterFields:
TObjectList): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UpdateFieldsGetAnyChanges(IActionRequest AActionRequest,
TObjectList AAdapterFields);
```

Description

TAdapterUpdateField (see page 5407)'s CheckValueChange method loops through the adapter fields passed in the AAdapterFields parameter, calling the CheckValueChange function. UpdateFieldsGetAnyChanges will return true if any adapter field returns true when its CheckValueChange method is called.

See Also

Errors (see page 5559)

ValidateValue (see page 5419)

IActionRequest

CheckValueChange (see page 5412)

57.1.44.4.86 TCustomAdapter.UpdateFieldsUpdateValues Method

Updates the adapter's fields with values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsUpdateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateFieldsUpdateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsUpdateValues loops through the adapter fields passed in the AAdapterFields parameter, calling the UpdateValue function. Adapter fields raise an exception to indicate a update error. If an exception occurs, the exception message is added to the Errors (see page 5559) object and updating continues. OnBeforeUpdateFields (see page 5564) and OnAfterUpdateFields (see page 5562) are at the beginning and end of this method.

See Also

OnBeforeUpdateFields (see page 5564)

OnAfterUpdateFields (see page 5562)

Errors (see page 5559)

UpdateValue (see page 5419)

IActionRequest

57.1.44.4.87 TCustomAdapter.UpdateFieldsValidateValues Method

Validate the adapter's field values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsValidateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateFieldsValidateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsValidateValues loops through the adapter fields passed in the AAdapterFields parameter, calling the ValidateValue function. Adapter fields raise an exception to indicate a validation error. When an exception occurs, th exception messages are added to the Errors (see page 5559) object and validation continues. OnBeforeValidateFields (see page 5564) and OnAfterValidateFields (see page 5563) are at the beginning and end of this method.

See Also

OnBeforeValidateFields (see page 5564)

OnAfterValidateFields (see page 5563)

Errors (see page 5559)

ValidateValue (see page 5419)

IActionRequest

57.1.44.4.88 TCustomAdapter.UpdateRecords Method

Updates the adapter's fields with the field values passed in an HTTP request.

Pascal

```
function UpdateRecords(AActionRequest: IActionRequest = nil): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UpdateRecords(IActionRequest AActionRequest = nil);
```

Description

Call UpdateRecords to update the adapter's fields with the field values passed in an HTTP request. Typically, UpdateRecords will be called by an adapter action that submits an HTML form. UpdatesRecords first verifies that the end-user has rights to modify the adapter by calling CheckModifyAccess (see page 5527). CheckModifyAccess (see page 5527) will raise an exception if access is denied. Next, UpdateRecordsGetAnyChanges (see page 5556) is called to determine whether the values in the HTTP request represent changes to the adapter fields. If there are changes then UpdateRecordsValidateValues (see page 5557) is called followed by UpdateRecordsUpdateValues (see page 5557). Exceptions raised during validation or update are added to the adapter's errors object. UpdateRecords returns true if the errors object contains no errors. The AActionRequest parameter is optional.

See Also

IActionRequest

checkmodifyaccess (see page 5527)

UpdateRecordsGetAnyChanges (see page 5556)

UpdateRecordsValidateValues (see page 5557)

UpdateRecordsUpdateValues (see page 5557)

Errors (see page 5559)

57.1.44.4.89 TCustomAdapter.UpdateRecordsGetAnyChanges Method

Determines whether values passed in the HTTP request will change any adapter fields.

Pascal

```
function UpdateRecordsGetAnyChanges(AActionRequest: IActionRequest; AAdapterFields:
TObjectList): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UpdateRecordsGetAnyChanges(IActionRequest AActionRequest,
TObjectList AAdapterFields);
```

Description

The HTTP request may contain values that are associated with multiple adapter records. For example, an HTML form that contains a grid with input fields on each row will generate an HTTP request to update multiple records. UpdateRecordsGetAnyChanges iterates all the records in the HTTP request, calling UpdateFieldsGetAnyChanges (see page 5554) for each record.

See Also

UpdateFieldsGetAnyChanges (see page 5554)

57.1.44.4.90 TCustomAdapter.UpdateRecordsUpdateValues Method

Updates adapter fields with values passed in the HTTP request.

Pascal

```
procedure UpdateRecordsUpdateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateRecordsUpdateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

The HTTP request may contain values that are associated with multiple adapter records. For example, an HTML form that contains a grid with input fields on each row will generate an HTTP request to update multiple records. UpdateRecordsUpdateValues iterates all the records in the HTTP request, calling UpdateFieldUpdateValues for each record.

See Also

UpdateFieldsUpdateValues (see page 5555)

57.1.44.4.91 TCustomAdapter.UpdateRecordsValidateValues Method

Validate the adapter's field values passed in the HTTP request.

Pascal

```
procedure UpdateRecordsValidateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateRecordsValidateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsValidateValues (see page 5555) loops through the adapter fields passed in the AAdapterFields parameter, calling the ValidateValue function. Adapter fields raise an exception to indicate a validation error. When an exception occurs, the exception message is added to the Errors (see page 5559) object and validation continues. OnBeforeValidateFields (see page 5564) and OnAfterValidateFields (see page 5563) are at the beginning and end of this method.

See Also

OnBeforeValidateFields (see page 5564)

OnAfterValidateFields (see page 5563)

Errors (see page 5559)

ValidateValue (see page 5419)

IActionRequest

57.1.44.4.92 TCustomAdapter.WebComponentsChange Method

WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Pascal

```
procedure WebComponentsChange(Sender: TObject);
```

C++

```
__fastcall WebComponentsChange(TObject * Sender);
```

Description

WebComponentsChange will be called, for example, when an adapter field is added to the adapter or when an adapter field is removed from the adapter. WebComponentsChange calls NotifyAdapterChange (see page 5551).

See Also

NotifyAdapterChange (see page 5551)

57.1.44.5 TCustomAdapter Properties

The properties of the TCustomAdapter class are listed here.

Protected Properties

	Name	Description
R	NotifyList (see page 5560)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5561)	This is VisibleActions, a member of class TCustomAdapter.
R	VisibleFields (see page 5561)	This is VisibleFields, a member of class TCustomAdapter.

Public Properties

	Name	Description
R	Actions (see page 5558)	Actions is the container for adapter actions components.
R	Data (see page 5558)	Data is the container for adapter field components.
	EchoActionFieldValues (see page 5559)	Modifies the adapter's echo flag.
R	Errors (see page 5559)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5560)	This is ExecuteAccess, a member of class TCustomAdapter.
	ModifyAccess (see page 5560)	This is ModifyAccess, a member of class TCustomAdapter.
	ViewAccess (see page 5560)	Identifies the rights required to view this adapter's fields.

57.1.44.5.1 TCustomAdapter.Actions Property

Actions is the container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterActions (see page 5198)

57.1.44.5.2 TCustomAdapter.Data Property

Data is the container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterFields (see page 5265)

57.1.44.5.3 TCustomAdapter.EchoActionFieldValues Property

Modifies the adapter's echo flag.

Pascal

```
property EchoActionFieldValues: Boolean;
```

C++

```
__property Boolean EchoActionFieldValues;
```

Description

The echo flag is used to alter the value returned by the adapter's fields. When this flag is set, the adapter's fields retrieves their value from the HTTP request. When this flag is clear, the adapter's fields retrieve their current value. Typically, this flag is set after an error occurs while executing an adapter action. Setting this flag results in generated HTML that displays values entered by the end-user. This allows the end-user to make corrections and resubmit the form.

See Also

SetEchoActionFieldValues (see page 5553)

GetEchoActionFieldValues (see page 5536)

57.1.44.5.4 TCustomAdapter.Errors Property

Returns an object used to track errors on behalf of this adapter.

Pascal

```
property Errors: TBaseAdapterErrorsList;
```

C++

```
__property TBaseAdapterErrorsList Errors;
```

Description

Adapter actions typically catch exceptions raised during execution and add the exception messages to the parent adapter's errors object. Server-side script may enumerate the errors recorded by the Errors property in order to write error messages to an HTML page.

See Also

GetAdapterErrorsList (see page 5534)

TBaseAdapterErrorsList (see page 5467)

TAdapterErrorsList (see page 5248)

57.1.44.5.5 TCustomAdapter.ExecuteAccess Property

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property UnicodeString ExecuteAccess;
```

Description

This is ExecuteAccess, a member of class TCustomAdapter.

57.1.44.5.6 TCustomAdapter.ModifyAccess Property

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

This is ModifyAccess, a member of class TCustomAdapter.

57.1.44.5.7 TCustomAdapter.NotifyList Property

Keeps track of components that are to be notified when the adapter is changed.

Pascal

```
property NotifyList: TNotifyList;
```

C++

```
__property TNotifyList NotifyList;
```

Description

Keeps track of components that are to be notified when the adapter is changed.

See Also

NotifyAdapterChange (see page 5551)

TNotifyList (see page 910)

57.1.44.5.8 TCustomAdapter.ViewAccess Property

Identifies the rights required to view this adapter's fields.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view fields of this adapter. When server-side script accesses the CanView property, the ViewAccess property value is checked against the end user's rights.

See Also

TWebUserList (see page 6759)

HasViewAccess (see page 5539)

implhasviewaccess (see page 5546)

57.1.44.5.9 TCustomAdapter.VisibleActions Property

Pascal

```
property VisibleActions: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleActions;
```

Description

This is VisibleActions, a member of class TCustomAdapter.

57.1.44.5.10 TCustomAdapter.VisibleFields Property

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

This is VisibleFields, a member of class TCustomAdapter.

57.1.44.6 TCustomAdapter Events

The events of the TCustomAdapter class are listed here.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5561)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5562)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5562)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5563)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5563)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5563)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5564)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5564)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5564)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5565)	Occurs when the adapter needs to iterate over its data records.

57.1.44.6.1 TCustomAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 5465)

OnBeforeExecuteAction (see page 5563)

57.1.44.6.2 TCustomAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 5465)

OnBeforeGetActionResponse (see page 5563)

57.1.44.6.3 TCustomAdapter.OnAfterUpdateFields Event

Occurs after values in the HTTP request are used to update adapter fields.

Pascal

```
property OnAfterUpdateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterUpdateFields;
```

Description

Implement this event handler to perform custom updates. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record update errors.

See Also

UpdateFieldsUpdateValues (see page 5555)

OnBeforeUpdateFields (see page 5564)

Errors (see page 5559)

57.1.44.6.4 TCustomAdapter.OnAfterValidateFields Event

Occurs after values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnAfterValidateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record validation errors.

See Also

UpdateFieldsValidateValues (see page 5555)

OnBeforeValidateFields (see page 5564)

Errors (see page 5559)

57.1.44.6.5 TCustomAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 5465)

OnAfterExecuteAction (see page 5561)

57.1.44.6.6 TCustomAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to

indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 5466)

OnAfterGetActionResponse (see page 5562)

57.1.44.6.7 TCustomAdapter.OnBeforeUpdateFields Event

Occurs before values in the HTTP request are used to update adapter fields.

Pascal

```
property OnBeforeUpdateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeUpdateFields;
```

Description

Implement this event handler to perform custom updates of adapter fields. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further updates. Add update errors to the adapter's errors object.

See Also

UpdateFieldsUpdateValues (see page 5555)

OnAfterUpdateFields (see page 5562)

Errors (see page 5559)

57.1.44.6.8 TCustomAdapter.OnBeforeValidateFields Event

Occurs before values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnBeforeValidateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further validation. Add validation errors to the adapter's errors object.

See Also

UpdateFieldsValidateValues (see page 5555)

OnAfterValidateFields (see page 5563)

Errors (see page 5559)

57.1.44.6.9 TCustomAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 5466)

57.1.44.6.10 TCustomAdapter.OnIterateRecords Event

Occurs when the adapter needs to iterate over its data records.

Pascal

```
property OnIterateRecords: TIterateRecordsEvent;
```

C++

```
__property TIterateRecordsEvent OnIterateRecords;
```

Description

Implement this event when the adapter supports multiple data records. This event handler is called when server-side script iterates over the records in adapter, such as when generating an HTML table displaying all records. The event handler must update an iteration pointer or cursor that adapter fields are also aware of. Adapter fields must use this iteration pointer when called to retrieve their value.

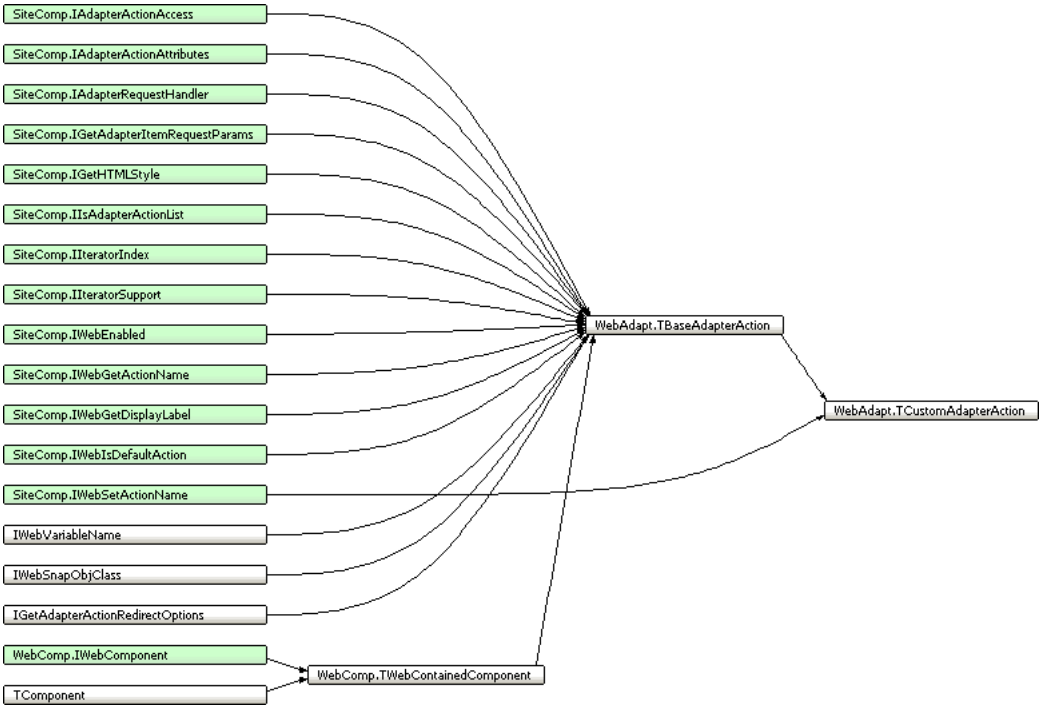
See Also

IIteratorSupport (see page 996)

57.1.45 TCustomAdapterAction Class

TCustomAdapterAction is a base class for adapter actions.

Class Hierarchy



Pascal

```
TCustomAdapterAction = class(TBaseAdapterAction, IWebSetActionName);
```

C++

```
class TCustomAdapterAction : public TBaseAdapterAction, public IWebSetActionName;
```

File

WebAdapt

Description

TCustomAdapterAction calls event handlers to retrieve the adapter action parameters and execute the adapter action. Derive from TCustomAdapterAction to define an adapter action component that can be added to any adapter. Derive from TImplementAdapterAction to define an adapter action component that works with specific adapter component types.

See Also

TBaseAdapterAction (see page 5435)

TAdapter (see page 5179)

TAdapterAction (see page 5190)

TImplementedAdapterAction (see page 5803)

57.1.45.1 TCustomAdapterAction Members

The following tables list the members exposed by TCustomAdapterAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5440)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5440)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5441)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5441)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5442)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5442)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5443)	Implements IIteratorSupport (see page 996)'s EndIterator method.
	ExecuteActionRequest (see page 5443)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5444)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5444)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5444)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6014)	Returns the TWebComponentList (see page 5999) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5445)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5445)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5445)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5445)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5446)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5446)	This is GetErrors, a member of class TBaseAdapterAction.
	GetExecuteActionResponse (see page 5446)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5447)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5447)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5448)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5448)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5448)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5449)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5449)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5450)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5450)	Suggests a view mode for this adapter action.
	GetVisible (see page 5450)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5451)	Returns the class type for this adapter field.
	HandleRequest (see page 5451)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5451)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5452)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5452)	Implements IIteratorSupport (see page 996)'s EndIterator (see page 5443) method.
V	ImplExecuteActionRequest (see page 5570)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5570)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5570)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5453)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5454)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 5454)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 5454)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 5455)	Implements IIteratorIndex (see page 994)'s GetIteratorIndex (see page 5448) method.
V	ImplGetSuccessOptions (see page 5571)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5455)	Gets the name used to reference this adapter action with server-side script.

	ImplGetVisible (see page 5456)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5456)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5456)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5457)	Implements IIteratorIndex (see page 994)'s InIterator (see page 5459) method.
	ImplIsDefaultAction (see page 5457)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5458)	Implements IIteratorSupport (see page 996)'s NextIteration (see page 5460) method.
	ImplSetActionName (see page 5571)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5458)	Implements IIteratorSupport (see page 996)'s StartIterator (see page 5461) method.
	ImplWebEnabled (see page 5571)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5459)	Implements IIteratorIndex (see page 994)'s InIterator method.
	IsDefaultAction (see page 5459)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6015)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5460)	Implements IIteratorSupport (see page 996)'s NextIteration method.
	ParentChanged (see page 5460)	Handles movement of the component to a different parent.
	ParentChanged (see page 6016)	Responds when the WebParent (see page 6018) property changes.
	ReadState (see page 6016)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5572)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5460)	Set the value of the DisplayLabel (see page 5462) property.
	SetParentComponent (see page 6017)	Sets the WebParent (see page 6018) property to be the same as this component's parent.
	SetWebParent (see page 6017)	Sets the value of the WebParent (see page 6018) property.
	StartIterator (see page 5461)	Implements IIteratorSupport (see page 996)'s StartIterator method.
	WebEnabled (see page 5461)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5462)	Provides access to the parent adapter component.
	Errors (see page 5463)	This is Errors, a member of class TBaseAdapterAction.
	WebContainedComponentHelper (see page 6018)	Provides access to the helper object that implements the IWebComponent (see page 6065) interface for this contained component.
	WebParent (see page 6018)	Indicates the component that uses this TWebContainedComponent (see page 6012) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5573)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5573)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5574)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5574)	Called before the adapter action response is generated.
	OnExecute (see page 5574)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5575)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 5466)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	Create (see page 6013)	Creates and initializes an instance of TWebContainedComponent (see page 6012).

	CreateRequestContext (see page 955)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6014)	Frees an instance of TWebContainedComponent (see page 6012).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetActionName (see page 1029)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 966)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6067)	Returns the value of the Container (see page 6069) property.
	GetDisplayLabel (see page 1030)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 974)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6067)	Returns the value of the Index (see page 6069) property.
	GetInputStyle (see page 974)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 991)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 995)	Returns the value of the IteratorIndex (see page 995) property.
V	GetParentComponent (see page 6015)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 975)	Returns the preferred mode of an adapter field.
	GetVisible (see page 926)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 955)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 925)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6015)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 995)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1042)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 997)	Advances to the objects next item.
	SetComponentList (see page 6067)	Sets the value of the ComponentList (see page 6068) property.
	SetContainer (see page 6067)	Sets the value of the Container (see page 6069) property.
	SetIndex (see page 6068)	Sets the value of the Index (see page 6069) property.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.
	WebEnabled (see page 1026)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 5572)	Identifies the name of this action when using server-side script.
W	ComponentList (see page 6068)	Indicates the component list that contains the Web item.
	Container (see page 6069)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5462)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5463)	Defines the rights required to execute this action.
	Index (see page 6069)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 991)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5463)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5464)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 995)	Indicates the index of the current item.
	RedirectOptions (see page 5464)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	Visible (see page 926)	This is Visible, a member of class IAdapterActionAttributes.

57.1.45.2 TCustomAdapterAction Methods

The methods of the TCustomAdapterAction class are listed here.

Protected Methods

	Name	Description
V	ImplExecuteActionRequest (see page 5570)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5570)	Gets the name used to reference this adapter action with server-side script.

	ImplGetAdapterItemRequestParams (see page 5570)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetSuccessOptions (see page 5571)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplSetActionName (see page 5571)	Sets the name that is used to reference this adapter action with server-side script.
	ImplWebEnabled (see page 5571)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	SetActionName (see page 5572)	Sets the name that is used to reference this adapter action with server-side script.

57.1.45.2.1 TCustomAdapterAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute (see page 5574) event handler.

See Also

ImplExecuteActionRequest (see page 5452)

OnExecute (see page 5574)

57.1.45.2.2 TCustomAdapterAction.ImplGetActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function ImplGetActionName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetActionName();
```

Description

Gets the name used to reference this adapter action with server-side script.

See Also

ActionName (see page 5572)

ImplGetActionName (see page 5453)

57.1.45.2.3 TCustomAdapterAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(UnicodeString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

When this adapter action is executed, it provides name/value pairs which will be written when the HTML page is generated and passed back in the HTTP request. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted. When the HTML page is generated a hyperlink or button is written that identifies the name and parameters of the action. When the hyperlink or button is clicked the name of the action and parameters are passed back to the web application in the HTTP request.

See Also

ImplGetAdapterItemRequestParams (see page 5453)

57.1.45.2.4 TCustomAdapterAction.ImplGetSuccessOptions Method

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
function ImplGetSuccessOptions: TAdapterActionRedirectOptions; override;
```

C++

```
virtual __fastcall TAdapterActionRedirectOptions ImplGetSuccessOptions();
```

Description

ImplGetSuccessOptions returns the value of the RedirectOptions (see page 5464) property.

See Also

RedirectOptions (see page 5464)

57.1.45.2.5 TCustomAdapterAction.ImplSetActionName Method

Sets the name that is used to reference this adapter action with server-side script.

Pascal

```
procedure ImplSetActionName(const Value: string);
```

C++

```
__fastcall ImplSetActionName(const UnicodeString Value);
```

Description

ImplSetActionName is called by SetActionName (see page 5572). ImplSetActionName stores the name in an instance variable.

See Also

SetActionName (see page 5572)

57.1.45.2.6 TCustomAdapterAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled calls the OnGetEnabled (see page 5575) event handler.

See Also

ImplWebEnabled (see page 5458)

OnGetEnabled (see page 5575)

57.1.45.2.7 TCustomAdapterAction.SetActionName Method

Sets the name that is used to reference this adapter action with server-side script.

Pascal

```
procedure SetActionName(const Value: string);
```

C++

```
__fastcall SetActionName(const UnicodeString Value);
```

Description
