GetSitePageModuleHelper is the protected read implementation of the SitePageModuleHelper (see page 6528) property.

See Also

SitePageModuleHelper (see page 6528)

66.1.6.5.3 TCustomWebPageModule.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TCustomWebPageModule (see page 6522) overrides this method to update the PageProducer (see page 6528) and DefaultAction (see page 6527) properties as appropriate.

See Also

PageProducer (see page 6528)

DefaultAction (see page 6527)

66.1.6.6 TCustomWebPageModule Properties

The properties of the TCustomWebPageModule class are listed here.

Protected Properties

	Name	Description
	SitePageModuleHelper (see page 6528)	References the helper object that assists in assembling the module's Web page.

Public Properties

	Name	Description
	DefaultAction (see page 6527)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6528)	Indicates the interface of the page producer that generates the content of the Web page.

66.1.6.6.1 TCustomWebPageModule.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TAdapterActionName;
```

C++

```
__property TAdapterActionName DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 6528)

66.1.6.6.2 TCustomWebPageModule.PageProducer Property

Indicates the interface of the page producer that generates the content of the Web page.

Pascal

```
property PageProducer: IProduceContent;
```

C++

```
__property IProduceContent PageProducer;
```

Description

PageProducer is the interface that supplies the content of the Web page this module creates. It is the interface of a page producer component that is included in the Web page module. If PageProducer is nil (Delphi) or NULL (C++), the Web page module can't produce a Web page.

TAdapterPageProducer (see page 1076)

TDataSetPagePRoducer

TXSLPagePRoducer

TPageProducer

TDataSetTableProducer

TQueryTableProducer

TInetXPageProducer

66.1.6.6.3 TCustomWebPageModule.SitePageModuleHelper Property

References the helper object that assists in assembling the module's Web page.

Pascal

```
property SitePageModuleHelper: TSitePageModuleHelper;
```

C++

```
__property TSitePageModuleHelper SitePageModuleHelper;
```

Description

Applications can't use the protected SitePageModuleHelper property. TCustomWebPageModule (see page 6522) uses this property internally to delegate tasks involved in assembling the content of its Web page and in interacting with editor views at design time.

66.1.6.7 TCustomWebPageModule Events

The events of the TCustomWebPageModule class are listed here.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 6529)	Occurs after the page module generates its Web page.
	OnAfterRedirectToPage (see page 6529)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6530)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnBeforeRedirectToPage (see page 6530)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

66.1.6.7.1 TCustomWebPageModule.OnAfterDispatchPage Event

Occurs after the page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write (see page 3789) an OnAfterDispatchPage event handler to take any final action after the page producer in the Web page module has generated its Web page. For example, the OnAfterDispatchPage event handler can make adjustments to the headers of the response message.

When OnAfterDispatchPage occurs, the Web page module has already added the content to the response message, but has not yet sent the response. This event does not occur if the BeforeDispatchPage event handler handles the request, bypassing the automatic use of the module's page producer.

Note: If the Web page module does not include a page producer, the OnAfterDispatchPage event still occurs, but the response message has no content.

See Also

OnBeforeDispatchPage (see page 6530)

PageProducer (see page 6528)

Response (see page 6520)

66.1.6.7.2 TCustomWebPageModule.OnAfterRedirectToPage Event

Occurs after the Web page module assembles a response message that represents a redirection to its Web page.

Pascal

```
property OnAfterRedirectToPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterRedirectToPage;
```

Description

Write (see page 3789) an OnAfterRedirectToPage event handler to take any final action before returns a response message that redirects the user to this Web page. For example, the OnAfterRedirectToPage event handler can make adjustments to the headers of the response message.

This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost) to this page.

See Also

OnBeforeRedirectToPage (see page 6530)

OnAfterDispatchPage (see page 6529)

RedirectOptions (see page 5464)

Response (see page 6520)

66.1.6.7.3 TCustomWebPageModule.OnBeforeDispatchPage Event

Occurs before the Web module calls on the page producer to generate the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write (see page 3789) an OnBeforeDispatchPage event handler to process an HTTP request message before the Web page module performs the default processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the Web page module from fetching the template file for the page and calling on the page producer to generate the page content.

If the event handler does not handle the request (for example, if it is merely initializing values that the page producer uses), it can leave the Handled parameter as false and the Web page module will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, use the Request (see page 6520) and Response (see page 6520) properties.

See Also

OnAfterDispatchPage (see page 6529)

Request (see page 6520)

Response (see page 6520)

PageProducer (see page 6528)

66.1.6.7.4 TCustomWebPageModule.OnBeforeRedirectToPage Event

Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Pascal

```
property OnBeforeRedirectToPage: TDispatchPageParamsHandledEvent;
```

C++

```
__property TDispatchPageParamsHandledEvent OnBeforeRedirectToPage;
```

Description

Write (see page 3789) an OnBeforeRedirectToPage event handler to perform any tasks necessary for redirecting a request to the associated Web page. For example, the OnBeforeRedirectToPage event handler can add parameters to the Params parameter so that they appear in the request that results from the redirection. This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost).

If the event handler sets Handled to true, the Web page module assumes it has handled the redirection and performs no further processing. Otherwise, after the event handler exits, the Web page module sets up the response message to encode the redirection parameters and calls SendRedirect.

See Also

OnAfterRedirectToPage (see page 6529)

OnBeforeDispatchPage (see page 6530)

SendRedirect

Request (see page 6520)

Response (see page 6520)

66.1.7 TSiteModuleHelper Class

TSiteModuleHelper manages common tasks for Web modules in a WebSnap application.

Class Hierarchy

Pascal

```
TSiteModuleHelper = class(TObject);
```

C++

```
class TSiteModuleHelper : public TObject;
```

File

WebModu

Description

Web modules create and use an instance of TSiteModuleHelper to keep track of WebSnap objects contained in the module and to generate OnActivate (see page 6539) and OnDeactivate (see page 6539) events when the Web module is activated and deactivated.

You should not need to work directly with TSiteModuleHelper instances. The Web module creates and uses this object.

See Also

TCustomWebDataModule (see page 6516)

TCustomWebDataModule (see page 6516)

TCustomWebDataModule (see page 6516)

66.1.7.1 TSiteModuleHelper Members

The following tables list the members exposed by TSiteModuleHelper.

Protected Methods

	Name	Description
	EndIterator (see page 6534)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 6534)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6535)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6535)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6535)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetVariable (see page 6535)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6535)	This is GetVariableCount, a member of class TSiteModuleHelper.
	NextIteration (see page 6536)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6536)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6536)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	StartIterator (see page 6537)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
R	Module (see page 6537)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 6539)	This is OnActivate, a member of class TSiteModuleHelper.
	OnDeactivate (see page 6539)	This is OnDeactivate, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 6533)	Creates and initializes an instance of TSiteModuleHelper (see page 6531).
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 6533)	Frees an instance of TSiteModuleHelper (see page 6531).
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.

	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 6536)	Responds to notifications that components are about to be inserted or removed.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Request (see page 6537)	Provides access to the current request object.
R	Response (see page 6538)	Provides access to the current response object.
R	Session (see page 6538)	Provides access to the current Web session.
R	WebModuleContext (see page 6538)	Keeps track of name/value pairs that store information for the Web module.

66.1.7.2 TSiteModuleHelper.Create Constructor

Creates and initializes an instance of TSiteModuleHelper (see page 6531).

Pascal

```
constructor Create(AModule: TComponent); virtual;
```

C++

```
virtual __fastcall TSiteModuleHelper(TComponent * AModule);
```

Description

Web modules call the TSiteModuleHelper (see page 6531) constructor from their own constructors.

AModule is the Web module that is using the TSiteModuleHelper (see page 6531) object to keep track of its components and activation events. The TSiteModuleHelper (see page 6531) object becomes the value of the module's SiteModuleHelper property.

See Also

SiteModuleHelper (see page 6521)

66.1.7.3 TSiteModuleHelper.Destroy Destructor

Frees an instance of TSiteModuleHelper (see page 6531).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSiteModuleHelper();
```

Description

Do not free TSiteModuleHelper (see page 6531) instances. This object is freed by the Web module that uses it.

See Also

System::TObject::Free (see page 3382)

66.1.7.4 TSiteModuleHelper Methods

The methods of the TSiteModuleHelper class are listed here.

Protected Methods

	Name	Description
	EndIterator (see page 6534)	This is EndIterator, a member of class TSiteModuleHelper.
	FindNamedVariable (see page 6534)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6535)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6535)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6535)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetVariable (see page 6535)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6535)	This is GetVariableCount, a member of class TSiteModuleHelper.
	NextIteration (see page 6536)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6536)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6536)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	StartIterator (see page 6537)	This is StartIterator, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
	Notification (see page 6536)	Responds to notifications that components are about to be inserted or removed.

66.1.7.4.1 TSiteModuleHelper.EndIterator Method

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

This is EndIterator, a member of class TSiteModuleHelper.

66.1.7.4.2 TSiteModuleHelper.FindNamedVariable Method

Pascal

```
function FindNamedVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * FindNamedVariable(const UnicodeString AName);
```

Description

This is FindNamedVariable, a member of class TSiteModuleHelper.

66.1.7.4.3 TSiteModuleHelper.FindVariable Method

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const UnicodeString AName);
```

Description

This is FindVariable, a member of class TSiteModuleHelper.

66.1.7.4.4 TSiteModuleHelper.FindVariableContainer Method

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const UnicodeString AName);
```

Description

This is FindVariableContainer, a member of class TSiteModuleHelper.

66.1.7.4.5 TSiteModuleHelper.GetCurrentObject Method

Pascal

```
function GetCurrentObject(OwnerData: Pointer): TObject;
```

C++

```
__fastcall TObject * GetCurrentObject(void * OwnerData);
```

Description

This is GetCurrentObject, a member of class TSiteModuleHelper.

66.1.7.4.6 TSiteModuleHelper.GetVariable Method

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

This is GetVariable, a member of class TSiteModuleHelper.

66.1.7.4.7 TSiteModuleHelper.GetVariableCount Method

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

This is GetVariableCount, a member of class TSiteModuleHelper.

66.1.7.4.8 TSiteModuleHelper.NextIteration Method

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

This is NextIteration, a member of class TSiteModuleHelper.

66.1.7.4.9 TSiteModuleHelper.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation);
```

C++

```
__fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TSiteModuleHelper (see page 6531) overrides this method to ensure that any WebSnap objects added to the associated module receive notifications when the module is activated or deactivated.

66.1.7.4.10 TSiteModuleHelper.NotifyActivate Method

Pascal

```
procedure NotifyActivate;
```

C++

```
__fastcall NotifyActivate();
```

Description

This is NotifyActivate, a member of class TSiteModuleHelper.

66.1.7.4.11 TSiteModuleHelper.NotifyDeactivate Method

Pascal

```
procedure NotifyDeactivate;
```

C++

```
__fastcall NotifyDeactivate();
```

Description

This is NotifyDeactivate, a member of class TSiteModuleHelper.

66.1.7.4.12 TSiteModuleHelper.StartIterator Method

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

This is StartIterator, a member of class TSiteModuleHelper.

66.1.7.5 TSiteModuleHelper Properties

The properties of the TSiteModuleHelper class are listed here.

Protected Properties

	Name	Description
	Module (see page 6537)	This is Module, a member of class TSiteModuleHelper.

Public Properties

	Name	Description
	Request (see page 6537)	Provides access to the current request object.
	Response (see page 6538)	Provides access to the current response object.
	Session (see page 6538)	Provides access to the current Web session.
	WebModuleContext (see page 6538)	Keeps track of name/value pairs that store information for the Web module.

66.1.7.5.1 TSiteModuleHelper.Module Property

Pascal

```
property Module: TComponent;
```

C++

```
__property TComponent * Module;
```

Description

This is Module, a member of class TSiteModuleHelper.

66.1.7.5.2 TSiteModuleHelper.Request Property

Provides access to the current request object.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Read (see page 3727) Request to obtain information about the current HTTP request message. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 6538)

66.1.7.5.3 TSiteModuleHelper.Response Property

Provides access to the current response object.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Read (see page 3727) Response to obtain information about or add to the response message that the application builds as a reply to the message that the Request (see page 6537) property specifies. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 6537)

66.1.7.5.4 TSiteModuleHelper.Session Property

Provides access to the current Web session.

Pascal

```
property Session: TAbstractWebSession;
```

C++

```
__property TAbstractWebSession Session;
```

Description

Read (see page 3727) Session to obtain information from or add information to the current Web session. All requests are assigned a Web session, although you can only use the session to store information about the current user if the WebSnap application includes a TSessionsService component. Web sessions persist over multiple calls from the same end user until they are terminated (for example, when the user logs out or when a time-out period elapses).

See Also

TSessionsService (see page 6722)

66.1.7.5.5 TSiteModuleHelper.WebModuleContext Property

Keeps track of name/value pairs that store information for the Web module.

Pascal

```
property WebModuleContext: TWebModuleContext;
```

C++

```
__property TWebModuleContext WebModuleContext;
```

Description

Use WebModuleContext to access the TWebModuleContext object. The TWebModuleContext object maintains a list of named variables that the components in the Web module can use.

See Also

WebModuleContext

66.1.7.6 TSiteModuleHelper Events

The events of the TSiteModuleHelper class are listed here.

Public Events

	Name	Description
	OnActivate (see page 6539)	This is OnActivate, a member of class TSiteModuleHelper.
	OnDeactivate (see page 6539)	This is OnDeactivate, a member of class TSiteModuleHelper.

66.1.7.6.1 TSiteModuleHelper.OnActivate Event

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

This is OnActivate, a member of class TSiteModuleHelper.

66.1.7.6.2 TSiteModuleHelper.OnDeactivate Event

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

This is OnDeactivate, a member of class TSiteModuleHelper.

66.1.8 TSitePageModuleHelper Class

TSitePageModuleHelper manages common tasks for Web page modules in a WebSnap application.

Class Hierarchy

Pascal

```
TSitePageModuleHelper = class(TSiteModuleHelper);
```

C++

```
class TSitePageModuleHelper : public TSiteModuleHelper;
```

File

WebModu

Description

Web page modules create and use an instance of TSitePageModuleHelper to assist in the following tasks:

Assembling the content of the associated Web page.

Interacting with editor views at design time.

Keeping track of WebSnap objects contained in the module.

Generating the events that occur when the Web module is activated or deactivated, and when it dispatches or redirects a request for a Web page.

You should not need to work directly with TSitePageModuleHelper instances. The Web page module creates and uses this object.

TCustomWebDataModule (see page 6516)

TCustomWebPageModule (see page 6522)

TCustomWebPageModule (see page 6522)

TCustomWebPageModule (see page 6522)

TCustomWebPageModule (see page 6522)

66.1.8.1 TSitePageModuleHelper Members

The following tables list the members exposed by TSitePageModuleHelper.

Protected Methods

	Name	Description
	DispatchPage (see page 6543)	This is DispatchPage, a member of class TSitePageModuleHelper.
	EndIterator (see page 6534)	This is EndIterator, a member of class TSiteModuleHelper.
	FindNamedVariable (see page 6534)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6535)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6535)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6535)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetDefaultAction (see page 6543)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
	GetPageProducer (see page 6544)	This is GetPageProducer, a member of class TSitePageModuleHelper.
	GetProducerComponent (see page 6544)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 6544)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 6544)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 6545)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetVariable (see page 6535)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6535)	This is GetVariableCount, a member of class TSiteModuleHelper.
	GetXMLData (see page 6545)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 6545)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 6545)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 6545)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 6546)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 6546)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 6546)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.

	ImplDispatchPage (see page 6546)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
	ImplIncludePage (see page 6547)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
	ImplRedirectToPage (see page 6547)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
	ImplSetWebContentOptions (see page 6547)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 6547)	This is IncludePage, a member of class TSitePageModuleHelper.
	NextIteration (see page 6536)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6536)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6536)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	RedirectToPage (see page 6547)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 6548)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 6548)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.
	StartIterator (see page 6537)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
	Module (see page 6537)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 6539)	This is OnActivate, a member of class TSiteModuleHelper.
	OnAfterDispatchPage (see page 6549)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 6549)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6550)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 6550)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 6539)	This is OnDeactivate, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6542)	Creates and initializes an instance of TSitePageModuleHelper (see page 6539).
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 6542)	Frees an instance of TSitePageModuleHelper (see page 6539).
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.

	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 6536)	Responds to notifications that components are about to be inserted or removed.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	DefaultAction (see page 6548)	Represents the adapter action associated with the Web page module.
R	Request (see page 6537)	Provides access to the current request object.
R	Response (see page 6538)	Provides access to the current response object.
R	Session (see page 6538)	Provides access to the current Web session.
R	WebModuleContext (see page 6538)	Keeps track of name/value pairs that store information for the Web module.

66.1.8.2 TSitePageModuleHelper.Create Constructor

Creates and initializes an instance of TSitePageModuleHelper (see page 6539).

Pascal

```
constructor Create(AModule: TComponent); override;
```

C++

```
virtual __fastcall TSitePageModuleHelper(TComponent * AModule);
```

Description

Web page modules call the TSitePageModuleHelper (see page 6539) constructor from their own constructors.

AModule is the Web page module that is using the TSitePageModuleHelper (see page 6539) object to generate events and help assemble its Web content. The TSitePageModuleHelper (see page 6539) object becomes the value of the module's SitePageModuleHelper property.

See Also

SitePageModuleHelper (see page 6528)

66.1.8.3 TSitePageModuleHelper.Destroy Destructor

Frees an instance of TSitePageModuleHelper (see page 6539).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSitePageModuleHelper();
```

Description

Do not free TSitePageModuleHelper (see page 6539) instances. This object is freed by the Web page module that uses it.

See Also

System::TObject::Free (see page 3382)

66.1.8.4 TSitePageModuleHelper Methods

The methods of the TSitePageModuleHelper class are listed here.

Protected Methods

	Name	Description
	DispatchPage (see page 6543)	This is DispatchPage, a member of class TSitePageModuleHelper.
	GetDefaultAction (see page 6543)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 6544)	This is GetPageProducer, a member of class TSitePageModuleHelper.
	GetProducerComponent (see page 6544)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 6544)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 6544)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 6545)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetXMLData (see page 6545)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 6545)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 6545)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 6545)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 6546)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 6546)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 6546)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 6546)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 6547)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 6547)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 6547)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 6547)	This is IncludePage, a member of class TSitePageModuleHelper.
	RedirectToPage (see page 6547)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 6548)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 6548)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.

66.1.8.4.1 TSitePageModuleHelper.DispatchPage Method

Pascal

```
function DispatchPage(const APageName: string; AWebResponse: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DispatchPage(const UnicodeString APageName, TWebResponse AWebResponse);
```

Description

This is DispatchPage, a member of class TSitePageModuleHelper.

66.1.8.4.2 TSitePageModuleHelper.GetDefaultAction Method

Pascal

```
function GetDefaultAction: TComponent;
```

C++

```
__fastcall TComponent * GetDefaultAction();
```

Description

This is GetDefaultAction, a member of class TSitePageModuleHelper.

66.1.8.4.3 TSitePageModuleHelper.GetPageProducer Method

Pascal

```
function GetPageProducer: IProduceContent; virtual;
```

C++

```
virtual __fastcall IProduceContent GetPageProducer();
```

Description

This is GetPageProducer, a member of class TSitePageModuleHelper.

66.1.8.4.4 TSitePageModuleHelper.GetProducerComponent Method

Pascal

```
function GetProducerComponent: TComponent;
```

C++

```
__fastcall TComponent * GetProducerComponent();
```

Description

This is GetProducerComponent, a member of class TSitePageModuleHelper.

66.1.8.4.5 TSitePageModuleHelper.GetRedirectParams Method

Pascal

```
procedure GetRedirectParams(const APageName: string; AParams: TStrings);
```

C++

```
__fastcall GetRedirectParams(const UnicodeString APageName, TStrings AParams);
```

Description

This is GetRedirectParams, a member of class TSitePageModuleHelper.

66.1.8.4.6 TSitePageModuleHelper.GetTemplateFileType Method

Pascal

```
function GetTemplateFileType: string;
```

C++

```
__fastcall UnicodeString GetTemplateFileType();
```

Description

This is GetTemplateFileType, a member of class TSitePageModuleHelper.

66.1.8.4.7 TSitePageModuleHelper.GetTemplateStream Method

Pascal

```
function GetTemplateStream(const APage: string; out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetTemplateStream(const UnicodeString APage, Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TSitePageModuleHelper.

66.1.8.4.8 TSitePageModuleHelper.GetXMLData Method

Pascal

```
function GetXMLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLData(Boolean Owned);
```

Description

This is GetXMLData, a member of class TSitePageModuleHelper.

66.1.8.4.9 TSitePageModuleHelper.GetXSLData Method

Pascal

```
function GetXSLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXSLData(Boolean Owned);
```

Description

This is GetXSLData, a member of class TSitePageModuleHelper.

66.1.8.4.10 TSitePageModuleHelper.HasHTMLBrowserView Method

Pascal

```
function HasHTMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasHTMLBrowserView();
```

Description

This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.

66.1.8.4.11 TSitePageModuleHelper.HasScriptView Method

Pascal

```
function HasScriptView: Boolean;
```

C++

```
__fastcall Boolean HasScriptView();
```

Description

This is HasScriptView, a member of class TSitePageModuleHelper.

66.1.8.4.12 TSitePageModuleHelper.HasXMLBrowserView Method

Pascal

```
function HasXMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXMLBrowserView();
```

Description

This is HasXMLBrowserView, a member of class TSitePageModuleHelper.

66.1.8.4.13 TSitePageModuleHelper.HasXSLBrowserView Method

Pascal

```
function HasXSLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXSLBrowserView();
```

Description

This is HasXSLBrowserView, a member of class TSitePageModuleHelper.

66.1.8.4.14 TSitePageModuleHelper.HTMLFromTemplate Method

Pascal

```
function HTMLFromTemplate(AStream: TStream): string;
```

C++

```
__fastcall UnicodeString HTMLFromTemplate(TStream AStream);
```

Description

This is HTMLFromTemplate, a member of class TSitePageModuleHelper.

66.1.8.4.15 TSitePageModuleHelper.ImplDispatchPage Method

Pascal

```
function ImplDispatchPage(const APageName: string; AWebResponse: TWebResponse): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ImplDispatchPage(const UnicodeString APageName, TWebResponse
AWebResponse);
```

Description

This is ImplDispatchPage, a member of class TSitePageModuleHelper.

66.1.8.4.16 TSitePageModuleHelper.ImplIncludePage Method

Pascal

```
function ImplIncludePage(const APageName: string; var AOwned: Boolean): TStream; virtual;
```

C++

```
virtual __fastcall TStream ImplIncludePage(const UnicodeString APageName, Boolean AOwned);
```

Description

This is ImplIncludePage, a member of class TSitePageModuleHelper.

66.1.8.4.17 TSitePageModuleHelper.ImplRedirectToPage Method

Pascal

```
function ImplRedirectToPage(const APageName: string; AParams: TStrings; AResponse:
TWebResponse): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplRedirectToPage(const UnicodeString APageName, TStrings AParams,
TWebResponse AResponse);
```

Description

This is ImplRedirectToPage, a member of class TSitePageModuleHelper.

66.1.8.4.18 TSitePageModuleHelper.ImplSetWebContentOptions Method

Pascal

```
procedure ImplSetWebContentOptions(AOptions: TWebContentOptions); virtual;
```

C++

```
virtual __fastcall ImplSetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.

66.1.8.4.19 TSitePageModuleHelper.IncludePage Method

Pascal

```
function IncludePage(const APageName: string; var AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream IncludePage(const UnicodeString APageName, Boolean AOwned);
```

Description

This is IncludePage, a member of class TSitePageModuleHelper.

66.1.8.4.20 TSitePageModuleHelper.RedirectToPage Method

Pascal

```
function RedirectToPage(const APageName: string; AParams: TStrings; AResponse: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean RedirectToPage(const UnicodeString APageName, TStrings AParams,
TWebResponse AResponse);
```

Description

This is RedirectToPage, a member of class TSitePageModuleHelper.

66.1.8.4.21 TSitePageModuleHelper.SetDefaultPageFileName Method

Pascal

```
procedure SetDefaultPageFileName(const AValue: string);
```

C++

```
__fastcall SetDefaultPageFileName(const UnicodeString AValue);
```

Description

This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.

66.1.8.4.22 TSitePageModuleHelper.SetWebContentOptions Method

Pascal

```
procedure SetWebContentOptions(AOptions: TWebContentOptions);
```

C++

```
__fastcall SetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is SetWebContentOptions, a member of class TSitePageModuleHelper.

66.1.8.5 TSitePageModuleHelper Properties

The properties of the TSitePageModuleHelper class are listed here.

Public Properties

	Name	Description
	DefaultAction (see page 6548)	Represents the adapter action associated with the Web page module.

66.1.8.5.1 TSitePageModuleHelper.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TAdapterActionName;
```

C++

```
__property TAdapterActionName DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the

parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 6528)

66.1.8.6 TSitePageModuleHelper Events

The events of the TSitePageModuleHelper class are listed here.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 6549)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 6549)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6550)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 6550)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

66.1.8.6.1 TSitePageModuleHelper.OnAfterDispatchPage Event

Occurs after the Web page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

OnAfterDispatchPage uses the same event handler as that of the Web page module's OnAfterDispatchPage event. The TSitePageModuleHelper (see page 6539) object generates this event after the Web page module writes the content for its Web page to the response object.

See Also

ondeactivate (see page 6539)

OnAfterDispatchPage (see page 6529)

66.1.8.6.2 TSitePageModuleHelper.OnAfterRedirectToPage Event

Occurs after the Web page module assembles a response message that represents a redirection to its Web page.

Pascal

```
property OnAfterRedirectToPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterRedirectToPage;
```

Description

OnAfterRedirectToPage uses the same event handler as that of the Web page module's OnAfterRedirectToPage event. The TSitePageModuleHelper (see page 6539) object generates this event after the Web page module sends a response redirecting the caller to its Web page.

See Also

OnBeforeRedirectToPage (see page 6550)

OnAfterRedirectToPage (see page 6529)

66.1.8.6.3 TSitePageModuleHelper.OnBeforeDispatchPage Event

Occurs before the Web module generates the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

OnBeforeDispatchPage uses the same event handler as that of the Web page module's OnBeforeDispatchPage event. The TSitePageModuleHelper (see page 6539) object generates this event before the Web page module generates the content for its Web page.

See Also

OnAfterDispatchPage (see page 6549)

OnBeforeDispatchPage (see page 6530)

66.1.8.6.4 TSitePageModuleHelper.OnBeforeRedirectToPage Event

Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Pascal

```
property OnBeforeRedirectToPage: TDispatchPageParamsHandledEvent;
```

C++

```
__property TDispatchPageParamsHandledEvent OnBeforeRedirectToPage;
```

Description

OnBeforeRedirectToPage uses the same event handler as that of the Web page module's OnBeforeRedirectToPage event. The TSitePageModuleHelper (see page 6539) object generates this event before the Web page module assembles and sends a response redirecting the caller to its Web page.

See Also

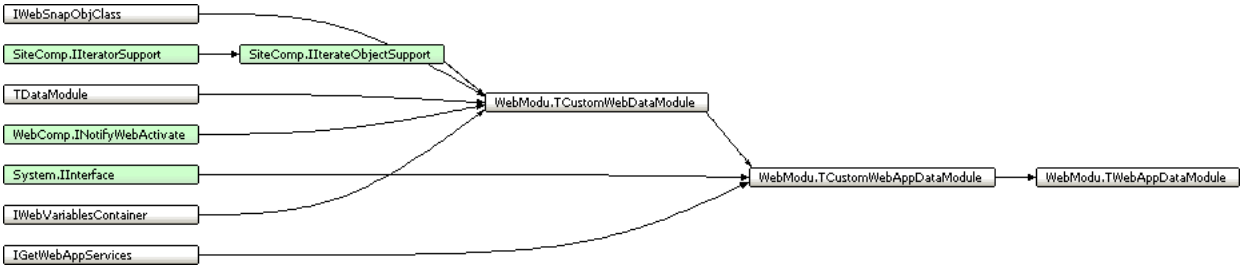
OnAfterRedirectToPage (see page 6549)

OnBeforeRedirectToPage (see page 6530)

66.1.9 TWebAppDataModule Class

TWebAppDataModule is used as the WebSnap application module when there is no need to generate a page.

Class Hierarchy



Pascal

```
TWebAppDataModule = class(TCustomWebAppDataModule);
```

C++

```
class TWebAppDataModule : public TCustomWebAppDataModule;
```

File

WebModu

Description

TWebAppDataModule is a container for WebSnap system components such as dispatchers, global adapters, user list, and session components. The WebSnap Application Wizard automatically adds system components to the TWebAppDataModule when it creates a TWebAppDataModule. System (see page 3165) components may be added or removed later. TWebAppComponents (see page 6217) is the component in a TWebAppDataModule that references all of the system components in use by the WebSnap application.

See Also

Web Modules

66.1.9.1 TWebAppDataModule Members

The following tables list the members exposed by TWebAppDataModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6519)	Returns the value of the SiteModuleHelper (see page 6521) property.
	GetWebAppServices (see page 6508)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
	GetWebSnapObjClass (see page 6519)	Returns the class type for this adapter field.
	Notification (see page 6509)	Responds to notifications that components are about to be inserted or removed.
	Notification (see page 6519)	Responds to notifications that components are about to be inserted or removed.
	QueryInterface (see page 6509)	Returns a reference to a specified interface if the module supports that interface.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6521)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6522) and OnDeactivate (see page 6522) events.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.

	_Release (see page 3504)	Decrements the reference count for this interface.
V	Create (see page 6507)	Creates a new TCustomWebAppDataModule (see page 6505) instance.
V	Create (see page 6517)	Creates and initializes an instance of TCustomWebDataModule (see page 6516).
V	CreateNew (see page 6507)	Creates a data module without using the associated form file to initialize it.
V	CreateNew (see page 6518)	Creates and initializes an instance of TCustomWebDataModule (see page 6516) without using an associated form file.
V	Destroy (see page 6508)	Frees a Web application data module instance.
V	Destroy (see page 6518)	Frees an instance of TCustomWebDataModule (see page 6516).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetCurrentObject (see page 993)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	NextIteration (see page 997)	Advances to the objects next item.
	NotifyActivate (see page 6061)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6061)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
R	Request (see page 6520)	Provides access to the current request object.
R	Response (see page 6520)	Provides access to the current response object.
R	Session (see page 6521)	Provides access to the current Web session.

Published Events

	Name	Description
	OnActivate (see page 6553)	Occurs when the Web module is activated.
	OnDeactivate (see page 6553)	Occurs when the Web module is deactivated.

Published Properties

	Name	Description
	AppServices (see page 6552)	Provides read and write access to the application services stored in this TCustomWebAppDataModule object.

66.1.9.2 TWebAppDataModule Properties

The properties of the TWebAppDataModule class are listed here.

Published Properties

	Name	Description
	AppServices (see page 6552)	Provides read and write access to the application services stored in this TCustomWebAppDataModule object.

66.1.9.2.1 TWebAppDataModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppDataModule object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects

on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents object.

See Also

TWebAppComponents (see page 6217)

WebContext (see page 5977)

66.1.9.3 TWebAppDataModule Events

The events of the TWebAppDataModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 6553)	Occurs when the Web module is activated.
	OnDeactivate (see page 6553)	Occurs when the Web module is deactivated.

66.1.9.3.1 TWebAppDataModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 6522)

CreateMode

66.1.9.3.2 TWebAppDataModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

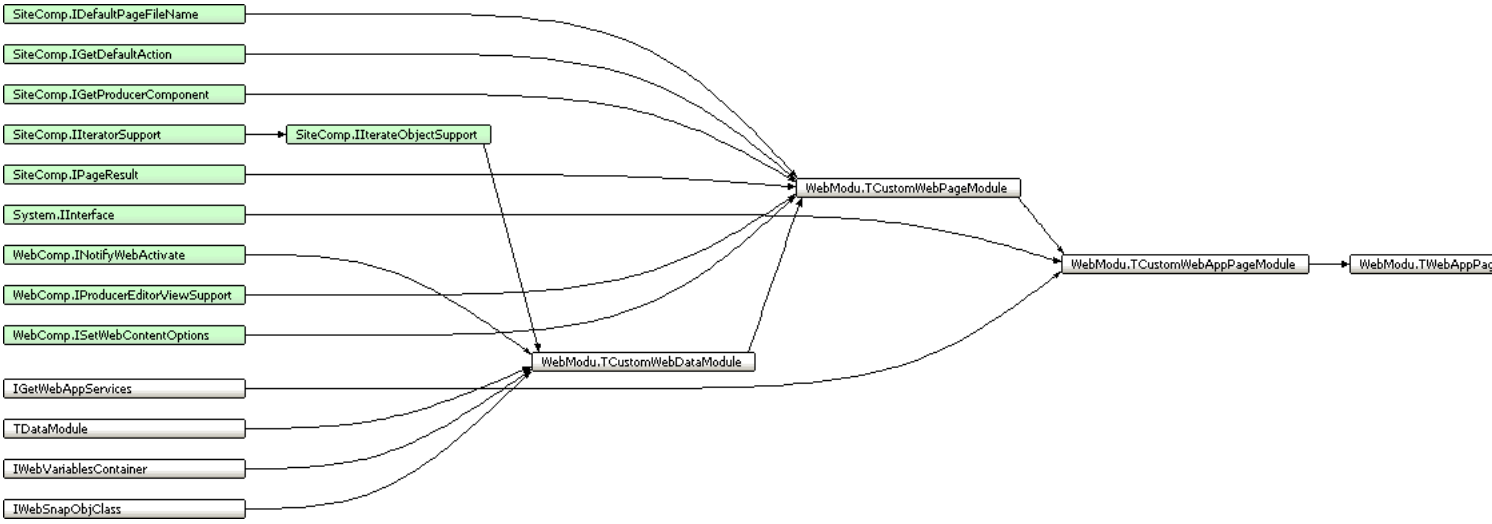
See Also

OnActivate (see page 6522)

66.1.10 TWebAppPageModule Class

TWebAppPageModule is used as the WebSnap application module when the application module generates a page.

Class Hierarchy



Pascal

```
TWebAppPageModule = class(TCustomWebAppPageModule);
```

C++

```
class TWebAppPageModule : public TCustomWebAppPageModule;
```

File

WebModu

Description

Like TWebAppDataModule (see page 6550), TWebAppPageModule is a container for WebSnap system components such as dispatchers, global adapters, user list, and session components. The WebSnap Application Wizard automatically adds system components to the TWebAppPageModule when it creates a TWebAppPageModule. System (see page 3165) components may be added or removed later. TWebAppComponents (see page 6217) is the component in a TWebAppPageModule that references all of the system components in use by the WebSnap application.

The WebAppPageModule is different from TWebAppDataModule (see page 6550) because it generates a page. The PageProducer (see page 6557) property references the producer component responsible for generating content. This property must not be nil (Delphi) or NULL (C++) or no content will be generated. The WebSnap Application Wizard automatically adds a page producer component when it creates a new TWebAppPageModule.

Web Modules

66.1.10.1 TWebAppPageModule Members

The following tables list the members exposed by TWebAppPageModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6519)	Returns the value of the SiteModuleHelper (see page 6521) property.
	GetSiteModuleHelper (see page 6526)	Returns the value of the SiteModuleHelper (see page 6521) property.
	GetSitePageModuleHelper (see page 6527)	Returns the value of the SitePageModuleHelper (see page 6528) property.
	GetWebAppServices (see page 6514)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
	GetWebSnapObjClass (see page 6519)	Returns the class type for this adapter field.
	Notification (see page 6514)	Responds to notifications that components are about to be inserted or removed.
	Notification (see page 6519)	Responds to notifications that components are about to be inserted or removed.
	Notification (see page 6527)	Responds to notifications that components are about to be inserted or removed.
	QueryInterface (see page 6514)	Returns a reference to a specified interface if the module supports that interface.
	SetAppServices (see page 6515)	Sets the value of the AppServices (see page 6515) property.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6521)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6522) and OnDeactivate (see page 6522) events.
	SitePageModuleHelper (see page 6528)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnAfterRedirectToPage (see page 6529)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeRedirectToPage (see page 6530)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	Create (see page 6512)	Creates and initializes an instance of TCustomWebAppPageModule (see page 6510).
	Create (see page 6517)	Creates and initializes an instance of TCustomWebDataModule (see page 6516).
	Create (see page 6525)	Creates and initializes an instance of TCustomWebPageModule (see page 6522).
	CreateNew (see page 6513)	Creates and initializes an instance of TCustomWebAppPageModule (see page 6510) without using an associated form file.
	CreateNew (see page 6518)	Creates and initializes an instance of TCustomWebDataModule (see page 6516) without using an associated form file.
	CreateNew (see page 6525)	Creates and initializes an instance of TCustomWebPageModule (see page 6522) without using an associated form file.
	Destroy (see page 6513)	Frees an instance of TCustomWebAppPageModule (see page 6510).
	Destroy (see page 6518)	Frees an instance of TCustomWebDataModule (see page 6516).
	Destroy (see page 6526)	Frees an instance of TCustomWebPageModule (see page 6522).
	DispatchPage (see page 1006)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetCurrentObject (see page 993)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultAction (see page 970)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetProducerComponent (see page 976)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 6063)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 6063)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 6063)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 6063)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 6063)	This is HasScriptView, a member of class IProducerEditorViewSupport.

	HasXMLBrowserView (see page 6064)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 6064)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 1007)	This is IncludePage, a member of class IPageResult.
	NextIteration (see page 997)	Advances to the objects next item.
	NotifyActivate (see page 6061)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6061)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RedirectToPage (see page 1007)	This is RedirectToPage, a member of class IPageResult.
	SetDefaultPageFileName (see page 957)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetWebContentOptions (see page 6065)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
R	Request (see page 6520)	Provides access to the current request object.
R	Response (see page 6520)	Provides access to the current response object.
R	Session (see page 6521)	Provides access to the current Web session.

Published Events

	Name	Description
	OnActivate (see page 6558)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6558)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 6559)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 6559)	Occurs when the Web module is deactivated.

Published Properties

	Name	Description
	AppServices (see page 6556)	Provides read and write access to the application services stored in this TCustomWebAppPageModule object.
	DefaultAction (see page 6557)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6557)	Indicates the interface of the page producer that generates the content of the Web page.

66.1.10.2 TWebAppPageModule Properties

The properties of the TWebAppPageModule class are listed here.

Published Properties

	Name	Description
	AppServices (see page 6556)	Provides read and write access to the application services stored in this TCustomWebAppPageModule object.
	DefaultAction (see page 6557)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6557)	Indicates the interface of the page producer that generates the content of the Web page.

66.1.10.2.1 TWebAppPageModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppPageModule object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents object.

See Also

TWebAppComponents (see page 6217)

WebContext (see page 5977)

66.1.10.2.2 TWebAppPageModule.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TComponent;
```

C++

```
__property TAdapterActionName DefaultAction;__property TComponent * DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 6528)

66.1.10.2.3 TWebAppPageModule.PageProducer Property

Indicates the interface of the page producer that generates the content of the Web page.

Pascal

```
property PageProducer: IProduceContent;
```

C++

```
__property IProduceContent PageProducer;
```

Description

PageProducer is the interface that supplies the content of the Web page this module creates. It is the interface of a page producer component that is included in the Web page module. If PageProducer is nil (Delphi) or NULL (C++), the Web page module can't produce a Web page.

TXSLPagePRoducer

TPageProducer

TDataSetTableProducer

TQueryTableProducer

TInetXPageProducer

66.1.10.3 TWebAppPageModule Events

The events of the TWebAppPageModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 6558)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6558)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 6559)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 6559)	Occurs when the Web module is deactivated.

66.1.10.3.1 TWebAppPageModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 6522)

CreateMode

66.1.10.3.2 TWebAppPageModule.OnAfterDispatchPage Event

Occurs after the page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take any final action after the page producer in the Web page module has generated its Web page. For example, the OnAfterDispatchPage event handler can make adjustments to the headers of the response message.

When OnAfterDispatchPage occurs, the Web page module has already added the content to the response message, but has not yet sent the response. This event does not occur if the BeforeDispatchPage event handler handles the request, bypassing the automatic use of the module's page producer.

Note: If the Web page module does not include a page producer, the OnAfterDispatchPage event still occurs, but the response message has no content.

See Also

OnBeforeDispatchPage (see page 6530)

PageProducer (see page 6528)

Response (see page 6520)

66.1.10.3.3 TWebAppPageModule.OnBeforeDispatchPage Event

Occurs before the Web module calls on the page producer to generate the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the Web page module performs the default processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the Web page module from fetching the template file for the page and calling on the page producer to generate the page content.

If the event handler does not handle the request (for example, if it is merely initializing values that the page producer uses), it can leave the Handled parameter as false and the Web page module will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, use the Request and Response properties.

See Also

OnAfterDispatchPage (see page 6529)

Request (see page 6520)

Response (see page 6520)

PageProducer (see page 6528)

66.1.10.3.4 TWebAppPageModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 6522)

66.1.11 TWebAppPageModuleHelper Class

Class Hierarchy

Pascal

```
TWebAppPageModuleHelper = class(TSitePageModuleHelper);
```

C++

```
class TWebAppPageModuleHelper : public TSitePageModuleHelper;
```

File

WebModu

Description

This is class WebModu.TWebAppPageModuleHelper.

66.1.11.1 TWebAppPageModuleHelper Members

The following tables list the members exposed by TWebAppPageModuleHelper.

Protected Methods

	Name	Description
	DispatchPage (see page 6543)	This is DispatchPage, a member of class TSitePageModuleHelper.
	EndIterator (see page 6534)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 6534)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6535)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6535)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6535)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetDefaultAction (see page 6543)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 6562)	This is GetPageProducer, a member of class TWebAppPageModuleHelper.
	GetProducerComponent (see page 6544)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 6544)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 6544)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 6545)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetVariable (see page 6535)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6535)	This is GetVariableCount, a member of class TSiteModuleHelper.
	GetXMLData (see page 6545)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 6545)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 6545)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 6545)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 6546)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.

	HasXSLBrowserView (see page 6546)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 6546)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 6546)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 6547)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 6547)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 6547)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 6547)	This is IncludePage, a member of class TSitePageModuleHelper.
	NextIteration (see page 6536)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6536)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6536)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	RedirectToPage (see page 6547)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 6548)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 6548)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.
	StartIterator (see page 6537)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
R	Module (see page 6537)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 6539)	This is OnActivate, a member of class TSiteModuleHelper.
	OnAfterDispatchPage (see page 6549)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 6549)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6550)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 6550)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 6539)	This is OnDeactivate, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
V	Create (see page 6533)	Creates and initializes an instance of TSiteModuleHelper (see page 6531).
V	Create (see page 6542)	Creates and initializes an instance of TSitePageModuleHelper (see page 6539).
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 6533)	Frees an instance of TSiteModuleHelper (see page 6531).
V	Destroy (see page 6542)	Frees an instance of TSitePageModuleHelper (see page 6539).
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.

	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 6536)	Responds to notifications that components are about to be inserted or removed.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	DefaultAction (see page 6548)	Represents the adapter action associated with the Web page module.
	Request (see page 6537)	Provides access to the current request object.
	Response (see page 6538)	Provides access to the current response object.
	Session (see page 6538)	Provides access to the current Web session.
	WebModuleContext (see page 6538)	Keeps track of name/value pairs that store information for the Web module.

66.1.11.2 TWebAppPageModuleHelper Methods

The methods of the TWebAppPageModuleHelper class are listed here.

Protected Methods

	Name	Description
	GetPageProducer (see page 6562)	This is GetPageProducer, a member of class TWebAppPageModuleHelper.

66.1.11.2.1 TWebAppPageModuleHelper.GetPageProducer Method

Pascal

```
function GetPageProducer: IProduceContent; override;
```

C++

```
virtual __fastcall IProduceContent GetPageProducer();
```

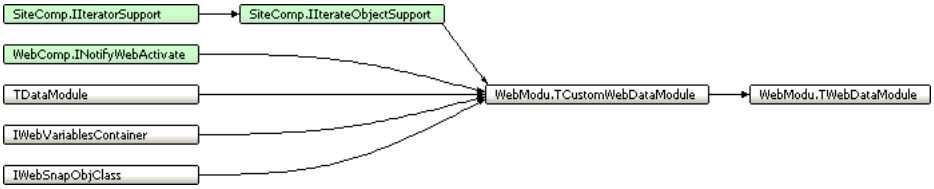
Description

This is GetPageProducer, a member of class TWebAppPageModuleHelper.

66.1.12 TWebDataModule Class

TWebDataModule is a container for components in a WebSnap application.

Class Hierarchy



Pascal

```
TWebDataModule = class(TCustomWebDataModule);
```

C++

```
class TWebDataModule : public TCustomWebDataModule;
```

File

WebModu

Description

Use TWebDataModule as a container for components that may be used by other modules in your WebSnap application. TWebDataModule is compatible with WebSnap applications. The initialization section of TWebDataModule registers a factory that is used by the WebSnap application to create the data module.

See Also

Web Modules

66.1.12.1 TWebDataModule Members

The following tables list the members exposed by TWebDataModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6519)	Returns the value of the SiteModuleHelper (see page 6521) property.
	GetWebSnapObjClass (see page 6519)	Returns the class type for this adapter field.
	Notification (see page 6519)	Responds to notifications that components are about to be inserted or removed.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6521)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6522) and OnDeactivate (see page 6522) events.

Public Methods

	Name	Description
	Create (see page 6517)	Creates and initializes an instance of TCustomWebDataModule (see page 6516).
	CreateNew (see page 6518)	Creates and initializes an instance of TCustomWebDataModule (see page 6516) without using an associated form file.
	Destroy (see page 6518)	Frees an instance of TCustomWebDataModule (see page 6516).
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetCurrentObject (see page 993)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	NextIteration (see page 997)	Advances to the objects next item.
	NotifyActivate (see page 6061)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6061)	This is NotifyDeactivate, a member of class INotifyWebActivate.

	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
R	Request (see page 6520)	Provides access to the current request object.
R	Response (see page 6520)	Provides access to the current response object.
R	Session (see page 6521)	Provides access to the current Web session.

Published Events

	Name	Description
	OnActivate (see page 6564)	Occurs when the Web module is activated.
	OnDeactivate (see page 6564)	Occurs when the Web module is deactivated.

66.1.12.2 TWebDataModule Events

The events of the TWebDataModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 6564)	Occurs when the Web module is activated.
	OnDeactivate (see page 6564)	Occurs when the Web module is deactivated.

66.1.12.2.1 TWebDataModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 6522)

CreateMode

66.1.12.2.2 TWebDataModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are

deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 6522)

66.1.13 TWebNotifyContainer Class

Class Hierarchy

Pascal

```
TWebNotifyContainer = class(TObject);
```

C++

```
class TWebNotifyContainer : public TObject;
```

File

WebModu

Description

This is class WebModu.TWebNotifyContainer.

66.1.13.1 TWebNotifyContainer Members

The following tables list the members exposed by TWebNotifyContainer.

Protected Fields

	Name	Description
	FList (see page 6567)	This is FList, a member of class TWebNotifyContainer.

Protected Methods

	Name	Description
	GetCount (see page 6568)	This is GetCount, a member of class TWebNotifyContainer.

Public Methods

	Name	Description
	Add (see page 6568)	This is Add, a member of class TWebNotifyContainer.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6566)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 6566)	Disposes of an object instance.

	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyWebActivate (see page 6568)	This is NotifyWebActivate, a member of class TWebNotifyContainer.
	NotifyWebDeactivate (see page 6568)	This is NotifyWebDeactivate, a member of class TWebNotifyContainer.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

66.1.13.2 TWebNotifyContainer.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebNotifyContainer();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

System::TObject::Free (see page 3382)

66.1.13.3 TWebNotifyContainer.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebNotifyContainer();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

66.1.13.4 TWebNotifyContainer Fields

The fields of the TWebNotifyContainer class are listed here.

Protected Fields

	Name	Description
	FList (see page 6567)	This is FList, a member of class TWebNotifyContainer.

66.1.13.4.1 TWebNotifyContainer.FList Field

Pascal

```
FList: TComponentList;
```

C++

```
TComponentList FList;
```

Description

This is FList, a member of class TWebNotifyContainer.

66.1.13.5 TWebNotifyContainer Methods

The methods of the TWebNotifyContainer class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 6568)	This is GetCount, a member of class TWebNotifyContainer.

Public Methods

	Name	Description
	Add (see page 6568)	This is Add, a member of class TWebNotifyContainer.
	NotifyWebActivate (see page 6568)	This is NotifyWebActivate, a member of class TWebNotifyContainer.
	NotifyWebDeactivate (see page 6568)	This is NotifyWebDeactivate, a member of class TWebNotifyContainer.

66.1.13.5.1 TWebNotifyContainer.Add Method

Pascal

```
procedure Add(AComponent: TComponent);
```

C++

```
__fastcall Add(TComponent * AComponent);
```

Description

This is Add, a member of class TWebNotifyContainer.

66.1.13.5.2 TWebNotifyContainer.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TWebNotifyContainer.

66.1.13.5.3 TWebNotifyContainer.NotifyWebActivate Method

Pascal

```
procedure NotifyWebActivate;
```

C++

```
__fastcall NotifyWebActivate();
```

Description

This is NotifyWebActivate, a member of class TWebNotifyContainer.

66.1.13.5.4 TWebNotifyContainer.NotifyWebDeactivate Method

Pascal

```
procedure NotifyWebDeactivate;
```

C++

```
__fastcall NotifyWebDeactivate();
```

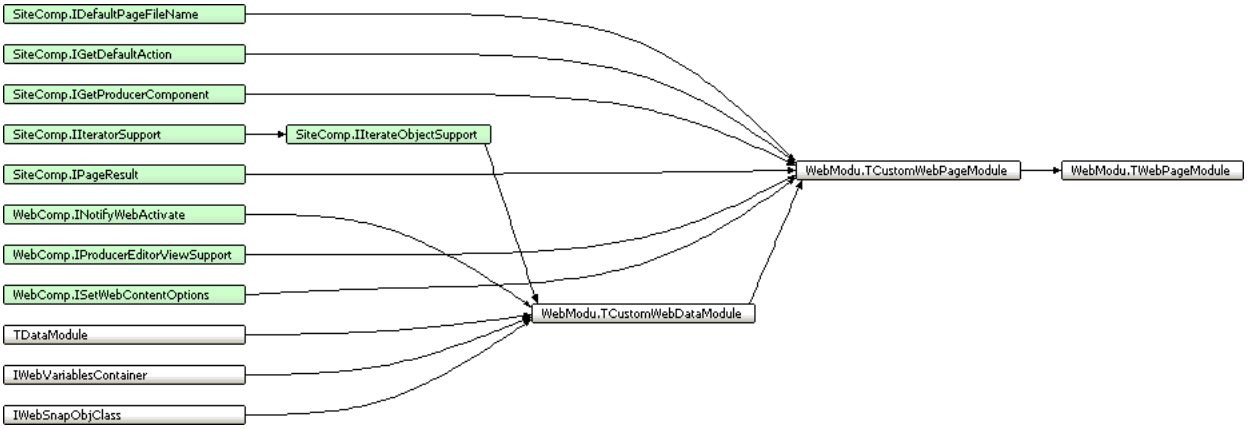
Description

This is NotifyWebDeactivate, a member of class TWebNotifyContainer.

66.1.14 TWebPageModule Class

TWebPageModule is a WebSnap module that generates a page.

Class Hierarchy



Pascal

```
TWebPageModule = class(TCustomWebPageModule);
```

C++

```
class TWebPageModule : public TCustomWebPageModule;
```

File

WebModu

Description

Use TWebPageModule in a WebSnap application to hold all the components needed for generating a specific Web page. When you use the WebSnap page module wizard to create a TWebPageModule descendant, the wizard adds a page producer to the module. The page producer generates the content of the Web page and adds code to the unit it creates (in Delphi, the code is added to the initialization section; in C++, it is added to a #pragma startup). The added code registers the TWebPageModule descendant with a factory object that the WebSnap application can use to create the Web page module.

The page producer that the wizard adds to the Web page module becomes the value of the PageProducer (see page 6572) property. If the PageProducer (see page 6572) property is nil (Delphi) or NULL (C++), the Web page module can't generate the content of a Web page. Add additional components to the Web page module that assist the page producer in creating its content. Other modules in the WebSnap application can access any components you add to the Web page module, but typically Web page module components are intended only for internal use.

TWebPageModuleFactory (see page 6273)

Web Modules

66.1.14.1 TWebPageModule Members

The following tables list the members exposed by TWebPageModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6519)	Returns the value of the SiteModuleHelper (see page 6521) property.
	GetSiteModuleHelper (see page 6526)	Returns the value of the SiteModuleHelper (see page 6521) property.
	GetSitePageModuleHelper (see page 6527)	Returns the value of the SitePageModuleHelper (see page 6528) property.
	GetWebSnapObjClass (see page 6519)	Returns the class type for this adapter field.
	Notification (see page 6519)	Responds to notifications that components are about to be inserted or removed.
	Notification (see page 6527)	Responds to notifications that components are about to be inserted or removed.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6521)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6522) and OnDeactivate (see page 6522) events.
	SitePageModuleHelper (see page 6528)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnAfterRedirectToPage (see page 6529)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeRedirectToPage (see page 6530)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Public Methods

	Name	Description
	Create (see page 6517)	Creates and initializes an instance of TCustomWebDataModule (see page 6516).
	Create (see page 6525)	Creates and initializes an instance of TCustomWebPageModule (see page 6522).
	CreateNew (see page 6518)	Creates and initializes an instance of TCustomWebDataModule (see page 6516) without using an associated form file.
	CreateNew (see page 6525)	Creates and initializes an instance of TCustomWebPageModule (see page 6522) without using an associated form file.
	Destroy (see page 6518)	Frees an instance of TCustomWebDataModule (see page 6516).
	Destroy (see page 6526)	Frees an instance of TCustomWebPageModule (see page 6522).
	DispatchPage (see page 1006)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 997)	This is EndIterator, a member of class IIteratorSupport.
	GetCurrentObject (see page 993)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultAction (see page 970)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetProducerComponent (see page 976)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 6063)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 6063)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 6063)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 6063)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 6063)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 6064)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 6064)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 1007)	This is IncludePage, a member of class IPageResult.
	NextIteration (see page 997)	Advances to the objects next item.
	NotifyActivate (see page 6061)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6061)	This is NotifyDeactivate, a member of class INotifyWebActivate.

	RedirectToPage (see page 1007)	This is RedirectToPage, a member of class IPageResult.
	SetDefaultPageFileName (see page 957)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetWebContentOptions (see page 6065)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	StartIterator (see page 998)	This is StartIterator, a member of class IIteratorSupport.

Public Properties

	Name	Description
R	Request (see page 6520)	Provides access to the current request object.
R	Response (see page 6520)	Provides access to the current response object.
R	Session (see page 6521)	Provides access to the current Web session.

Published Events

	Name	Description
	OnActivate (see page 6572)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6573)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 6573)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 6574)	Occurs when the Web module is deactivated.

Published Properties

	Name	Description
	DefaultAction (see page 6571)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6572)	Indicates the interface of the page producer that generates the content of the Web page.

66.1.14.2 TWebPageModule Properties

The properties of the TWebPageModule class are listed here.

Published Properties

	Name	Description
	DefaultAction (see page 6571)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6572)	Indicates the interface of the page producer that generates the content of the Web page.

66.1.14.2.1 TWebPageModule.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TComponent;
```

C++

```
__property TAdapterActionName DefaultAction;__property TComponent * DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 6528)

66.1.14.2.2 TWebPageModule.PageProducer Property

Indicates the interface of the page producer that generates the content of the Web page.

Pascal

```
property PageProducer: IProduceContent;
```

C++

```
__property IProduceContent PageProducer;
```

Description

PageProducer is the interface that supplies the content of the Web page this module creates. It is the interface of a page producer component that is included in the Web page module. If PageProducer is nil (Delphi) or NULL (C++), the Web page module can't produce a Web page.

TAdapterPageProducer (see page 1076)

TDataSetPagePRoducer

TXSLPagePRoducer

TPageProducer

TDataSetTableProducer

TQueryTableProducer

TInetXPageProducer

66.1.14.3 TWebPageModule Events

The events of the TWebPageModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 6572)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6573)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 6573)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 6574)	Occurs when the Web module is deactivated.

66.1.14.3.1 TWebPageModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the

CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 6522)

CreateMode

66.1.14.3.2 TWebPageModule.OnAfterDispatchPage Event

Occurs after the page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take any final action after the page producer in the Web page module has generated its Web page. For example, the OnAfterDispatchPage event handler can make adjustments to the headers of the response message.

When OnAfterDispatchPage occurs, the Web page module has already added the content to the response message, but has not yet sent the response. This event does not occur if the BeforeDispatchPage event handler handles the request, bypassing the automatic use of the module's page producer.

Note: If the Web page module does not include a page producer, the OnAfterDispatchPage event still occurs, but the response message has no content.

See Also

OnBeforeDispatchPage (see page 6530)

PageProducer (see page 6528)

Response (see page 6520)

66.1.14.3.3 TWebPageModule.OnBeforeDispatchPage Event

Occurs before the Web module calls on the page producer to generate the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the Web page module performs the default processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the Web page module from fetching the template file for the page and calling on the page producer to generate the page content.

If the event handler does not handle the request (for example, if it is merely initializing values that the page producer uses), it can leave the Handled parameter as false and the Web page module will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, use the Request and Response properties.

See Also

OnAfterDispatchPage (see page 6529)

Request (see page 6520)

Response (see page 6520)

PageProducer (see page 6528)

66.1.14.3.4 TWebPageModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 6522)

66.1.15 TWebPageModuleHelper Class

Class Hierarchy

Pascal

```
TWebPageModuleHelper = class(TSitePageModuleHelper);
```

C++

```
class TWebPageModuleHelper : public TSitePageModuleHelper;
```

File

WebModu

Description

This is class WebModu.TWebPageModuleHelper.

66.1.15.1 TWebPageModuleHelper Members

The following tables list the members exposed by TWebPageModuleHelper.

Protected Methods

	Name	Description
	DispatchPage (see page 6543)	This is DispatchPage, a member of class TSitePageModuleHelper.
	EndIterator (see page 6534)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 6534)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6535)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6535)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6535)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetDefaultAction (see page 6543)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 6577)	This is GetPageProducer, a member of class TWebPageModuleHelper.
	GetProducerComponent (see page 6544)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 6544)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 6544)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 6545)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetVariable (see page 6535)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6535)	This is GetVariableCount, a member of class TSiteModuleHelper.
	GetXMLData (see page 6545)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 6545)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 6545)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 6545)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 6546)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 6546)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 6546)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 6546)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 6547)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 6547)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 6547)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 6547)	This is IncludePage, a member of class TSitePageModuleHelper.
	NextIteration (see page 6536)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6536)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6536)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	RedirectToPage (see page 6547)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 6548)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 6548)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.
	StartIterator (see page 6537)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
R	Module (see page 6537)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 6539)	This is OnActivate, a member of class TSiteModuleHelper.
	OnAfterDispatchPage (see page 6549)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 6549)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6550)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 6550)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 6539)	This is OnDeactivate, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.

	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 6533)	Creates and initializes an instance of TSiteModuleHelper (see page 6531).
	Create (see page 6542)	Creates and initializes an instance of TSitePageModuleHelper (see page 6539).
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 6533)	Frees an instance of TSiteModuleHelper (see page 6531).
	Destroy (see page 6542)	Frees an instance of TSitePageModuleHelper (see page 6539).
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 6536)	Responds to notifications that components are about to be inserted or removed.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	DefaultAction (see page 6548)	Represents the adapter action associated with the Web page module.
R	Request (see page 6537)	Provides access to the current request object.
R	Response (see page 6538)	Provides access to the current response object.
R	Session (see page 6538)	Provides access to the current Web session.
R	WebModuleContext (see page 6538)	Keeps track of name/value pairs that store information for the Web module.

66.1.15.2 TWebPageModuleHelper Methods

The methods of the TWebPageModuleHelper class are listed here.

Protected Methods

	Name	Description
	GetPageProducer (see page 6577)	This is GetPageProducer, a member of class TWebPageModuleHelper.

66.1.15.2.1 TWebPageModuleHelper.GetPageProducer Method

Pascal

```
function GetPageProducer: IProduceContent; override;
```

C++

```
virtual __fastcall IProduceContent GetPageProducer();
```

Description

This is GetPageProducer, a member of class TWebPageModuleHelper.

66.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FindNamedModuleVariable (see page 6578)	This is function WebModu.FindNamedModuleVariable.
	GetModuleVariable (see page 6578)	This is function WebModu.GetModuleVariable.
	GetModuleVariableCount (see page 6578)	This is function WebModu.GetModuleVariableCount.

66.2.1 WebModu.FindNamedModuleVariable Function

Pascal

```
function FindNamedModuleVariable(AModule: TComponent; const AName: string): TComponent;
```

C++

```
TComponent * FindNamedModuleVariable(TComponent * AModule, const UnicodeString AName);
```

File

WebModu

Description

This is function WebModu.FindNamedModuleVariable.

66.2.2 WebModu.GetModuleVariable Function

Pascal

```
function GetModuleVariable(AModule: TComponent; Index: Integer): TComponent;
```

C++

```
TComponent * GetModuleVariable(TComponent * AModule, int Index);
```

File

WebModu

Description

This is function WebModu.GetModuleVariable.

66.2.3 WebModu.GetModuleVariableCount Function

Pascal

```
function GetModuleVariableCount(AModule: TComponent): Integer;
```

C++

```
int GetModuleVariableCount(TComponent * AModule);
```

File

WebModu

Description

This is function WebModu.GetModuleVariableCount.

66.3 Types

The following table lists types in this documentation.

Types

Name	Description
TGetParamsEvent (see page 6580)	This is type WebModu.TGetParamsEvent.

66.3.1 WebModu.TGetParamsEvent Type

Pascal

```
TGetParamsEvent = procedure (Sender: TObject; Params: TStrings);
```

C++

```
(Sender: TObject; Params: TStrings) ( TGetParamsEvent)();
```

File

WebModu

Description

This is type WebModu.TGetParamsEvent.

67 WebNode Namespace

This is namespace WebNode.

Topics

Name	Description
Interfaces (see page 6582)	The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebNode (see page 6582)	IWebNode is the interface for executing invokable interface calls from the client of a Web Service.

67.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebNode (see page 6582)	IWebNode is the interface for executing invokable interface calls from the client of a Web Service.

67.1.1 IWebNode Interface

IWebNode is the interface for executing invokable interface calls from the client of a Web Service.

Class Hierarchy

Pascal

```
IWebNode = interface;
```

C++

```
__interface IWebNode;
```

File

WebNode

Description

TRIO objects use IWebNode to execute method calls on an invokable interface. IWebNode takes an encoded method call, executes it, and returns the encoded results. Typically, objects that implement IWebNode use a specific transport protocol to forward the encoded method call to a remote server. For example, the THTTPReqResp class implements this interface for making interface calls to a remote Web Service application using HTTP.

When implementing the IWebNode interface, you can use another IWebNode implementation to delegate part of the method execution. For example, you can write a class that compresses or encrypts the encoded method call, passes it to another IWebNode implementation that expects the compressed or encrypted string, and then decompresses or decrypts the results returned by the other IWebNode implementation.

Note: C++ method declarations that use IWebNode use the _di_IWebNode type instead. This type is a DelphiInterface (see page 3263) wrapper around the IWebNode interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< >  _di_IWebNode;
```

See Also

THTTPReqResp (see page 1214)

TRio

67.1.1.1 IWebNode Members

The following tables list the members exposed by IWebNode.

Public Methods

	Name	Description
	BeforeExecute (see page 6583)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 6584)	This is the overview for the Execute method overload.
	GetMimeBoundary (see page 6585)	Returns the value of the MimeBoundary (see page 6585) property.
	SetMimeBoundary (see page 6585)	Sets the value of the MimeBoundary (see page 6585) property.

Public Properties

	Name	Description
	MimeBoundary (see page 6585)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

67.1.1.2 IWebNode Methods

The methods of the IWebNode class are listed here.

Public Methods

	Name	Description
	BeforeExecute (see page 6583)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 6584)	This is the overview for the Execute method overload.
	GetMimeBoundary (see page 6585)	Returns the value of the MimeBoundary (see page 6585) property.
	SetMimeBoundary (see page 6585)	Sets the value of the MimeBoundary (see page 6585) property.

67.1.1.2.1 IWebNode.BeforeExecute Method

Performs any transport-specific setup before executing an encoded method call.

Pascal

```
procedure BeforeExecute(const IntfMD: TIntfMetaData; const MethMD: TIntfMethEntry;
MethodIndex: Integer; AttachHandler: IMimeAttachmentHandler);
```

C++

```
__fastcall BeforeExecute(const TIntfMetaData IntfMD, const TIntfMethEntry MethMD, int
MethodIndex, IMimeAttachmentHandler AttachHandler);
```

Description

BeforeExecute handles transport-specific tasks such as dynamically querying a WSDL document or setting up serialization options before a call is made to the Execute (see page 6584) method. Remote interfaced objects (TRio) call this method after their OnBeforeExecute event, but before delegating the execution of the method to the Execute (see page 6584) method.

IntfMD is the runtime type information (RTTI) of the invokable interface that includes the method to execute.

MethMD is describes the method that is about to be executed.

MethodIndex indicates which overload to use when methMD describes an overloaded method. 0 indicates the first overload, 1 indicates the second overload, and so on.

AttachHandler is an interface to use for handling any attachments that are used as parameters of the method.

See Also

Execute (see page 6584)

OnBeforeExecute

67.1.1.2.2 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	IWebNode.Execute (String, TStream) (see page 6584)	Executes an encoded method call and returns the encoded results in a stream.
	IWebNode.Execute (TStream) (see page 6584)	Executes an encoded method call and returns the encoded results in a stream.
	IWebNode.Execute (TStream, TStream) (see page 6584)	Executes an encoded method call and returns the encoded results in a stream.

67.1.1.2.2.1 IWebNode.Execute Method (String, TStream)

Executes an encoded method call and returns the encoded results in a stream.

Pascal

```
procedure Execute(const DataMsg: String; Response: TStream); overload; deprecated;
procedure Execute(const Request: TStream; Response: TStream); overload;
function Execute(const Request: TStream): TStream; overload;
```

C++

```
__fastcall Execute(const UnicodeString DataMsg, TStream Response);
__fastcall Execute(const TStream Request, TStream Response);
__fastcall TStream Execute(const TStream Request);
```

Description

Execute interprets an encoded method call, executes it, and returns the encoded results using a stream. Typically, this method works in conjunction with an object that implements the IOPConvert interface, which marshals a method call into the DataMsg or Request string and unmarshals the return value.

DataMsg is an encoded method call. It represents the results of marshaling a method call on an invokable interface into a transportable string. The use of this syntax is not recommended.

Request is a stream from which to read the same string that is the value of the DataMsg parameter. This syntax is preferred because the stream need not store this value in memory (for example, it can be a file stream).

Response is a stream object that receives the encoded results that arise from executing the method call.

When using the third syntax, Execute returns a stream from which to read the encoded results from executing the method call. In this case, the caller is responsible for freeing the stream.

See Also

IOPConvert

BeforeExecute (see page 6583)

67.1.1.2.3 IWebNode.GetMimeBoundary Method

Returns the value of the MimeBoundary (see page 6585) property.

Pascal

```
function GetMimeBoundary: string;
```

C++

```
__fastcall UnicodeString GetMimeBoundary();
```

Description

GetMimeBoundary is the read access method for the MimeBoundary (see page 6585) property.

See Also

MimeBoundary (see page 6585)

67.1.1.2.4 IWebNode.SetMimeBoundary Method

Sets the value of the MimeBoundary (see page 6585) property.

Pascal

```
procedure SetMimeBoundary(Value: string);
```

C++

```
__fastcall SetMimeBoundary(UnicodeString Value);
```

Description

SetMimeBoundary is the write implementation for the MimeBoundary (see page 6585) property.

Value is the new value for MimeBoundary (see page 6585).

See Also

MimeBoundary (see page 6585)

67.1.1.3 IWebNode Properties

The properties of the IWebNode class are listed here.

Public Properties

	Name	Description
	MimeBoundary (see page 6585)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

67.1.1.3.1 IWebNode.MimeBoundary Property

Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

Pascal

```
property MimeBoundary: string;
```

C++

```
__property UnicodeString MimeBoundary;
```

Description

When the method call is included in a multipart form, MimeBoundary is the value of the MIME boundary header that uniquely identifies the part of the form that contains the method call. If the method call is not included in a multipart form, MimeBoundary is an empty string.

TWebModuleFactory

68.1.1.1 TWebModuleFactoryList Members

The following tables list the members exposed by TWebModuleFactoryList.

Protected Methods

	Name	Description
	GetItem (see page 6591)	This is GetItem, a member of class TWebModuleFactoryList.

Public Methods

	Name	Description
	AddFactory (see page 6590)	Adds a factory to the web module factory list.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.

	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6589)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 6590)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AppModuleFactory (see page 6591)	
R	ItemCount (see page 6591)	Lists the number of items in the web module factory list.
R	Items (see page 6592)	

68.1.1.2 TWebModuleFactoryList.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebModuleFactoryList();
```

Description

Do not create instances of Create. Instead, construct descendants of Create using the new keyword, passing any arguments for the descendant object's constructor.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

new

68.1.1.3 TWebModuleFactoryList.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebModuleFactoryList();
```

Description

Do not call ~Destroy directly. Instead, use the delete keyword when destroying VCL objects.

~Destroy deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

Warning: Never destroy a component from one of its own event handlers or from the event handler of a component it owns or contains. For example, don't destroy a button, or the form that owns the button, in the button's OnClick event handler.

To destroy a form, call its Release (see page 3732) method, which destroys the form and releases the memory allocated for it after all its event handlers and those of the components it contains have executed.

delete

68.1.1.4 TWebModuleFactoryList Methods

The methods of the TWebModuleFactoryList class are listed here.

Protected Methods

	Name	Description
	GetItem (see page 6591)	This is GetItem, a member of class TWebModuleFactoryList.

Public Methods

	Name	Description
	AddFactory (see page 6590)	Adds a factory to the web module factory list.

68.1.1.4.1 TWebModuleFactoryList.AddFactory Method

Adds a factory to the web module factory list.

Pascal

```
procedure AddFactory(AFactory: TAbstractWebModuleFactory);
```

C++

```
__fastcall AddFactory(TAbstractWebModuleFactory AFactory);
```

Description

Use the AddFactory method to add a factory to the web module factory list (more here, obviously).

See Also

AppModuleFactory (see page 6591)

68.1.1.4.2 TWebModuleFactoryList.GetItem Method

Pascal

```
function GetItem(I: Integer): TAbstractWebModuleFactory;
```

C++

```
__fastcall TAbstractWebModuleFactory GetItem(int I);
```

Description

This is GetItem, a member of class TWebModuleFactoryList.

68.1.1.5 TWebModuleFactoryList Properties

The properties of the TWebModuleFactoryList class are listed here.

Public Properties

	Name	Description
	AppModuleFactory (see page 6591)	
	ItemCount (see page 6591)	Lists the number of items in the web module factory list.
	Items (see page 6592)	

68.1.1.5.1 TWebModuleFactoryList.AppModuleFactory Property

Pascal

```
property AppModuleFactory: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory AppModuleFactory;
```

See Also

AddFactory (see page 6590)

68.1.1.5.2 TWebModuleFactoryList.ItemCount Property

Lists the number of items in the web module factory list.

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

Use the ItemCount property to list the number of items in the web module factory list.

See Also

Items (see page 6592)

68.1.1.5.3 TWebModuleFactoryList.Items Property

Pascal

```
property Items [I: Integer]: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory Items[int I];
```

See Also

AddFactory (see page 6590)

ItemCount (see page 6591)

68.1.2 TWebModuleList Class

TWebModuleList lists the WebModules in a WebSnap application and provides access to their factory objects.

Class Hierarchy

Pascal

```
TWebModuleList = class(TAbstractWebModuleList);
```

C++

```
class TWebModuleList : public TAbstractWebModuleList;
```

File

WebReq

Description

TWebModuleList contains every Web module that has been instantiated in order to serve the current request. In addition, it lists the factory objects for all Web modules in the application, including any that are not instantiated.

When a WebSnap application handles multiple requests concurrently, it includes multiple Web modules lists, each on a separate thread and each associated with a different request.

The Web context, which can be accessed using the global WebContext (see page 5977) function, provides access to the TWebModuleList object that is associated with the current request. Use the Web context's WebModules property to obtain a reference to the Web module list.

See Also

TWebModuleFactoryList (see page 6588)

TAbstractWebModuleFactory

WebContext

TAbstractWebContext (see page 5935)

68.1.2.1 TWebModuleList Members

The following tables list the members exposed by TWebModuleList.

Protected Methods

	Name	Description
	GetFactory (see page 6598)	This is GetFactory, a member of class TWebModuleList.
	GetFactoryCount (see page 6598)	
	GetItem (see page 6598)	This is GetItem, a member of class TWebModuleList.
	GetItemCount (see page 6599)	
	GetOnModuleAdded (see page 6599)	
	SetOnModuleAdded (see page 6599)	

Protected Properties

	Name	Description
	Factories (see page 6599)	This is Factories, a member of class TWebModuleList.

Public Methods

	Name	Description
	AddModule (see page 6594)	Adds a module to the Items property array.
	AddModuleClass (see page 6595)	Creates a new Web module, given its class, and adds it to the Items property array.
	AddModuleName (see page 6595)	Creates a new Web module, given its name, and adds it to the Items property array.
	AutoCreateModules (see page 6596)	Instantiates the Web modules that are flagged to handle all incoming requests.
	AutoDestroyModules (see page 6596)	Frees all Web modules that are flagged as inappropriate for caching between requests.
	Create (see page 6593)	Creates and initializes a TWebModuleList (see page 6592) object.
	Destroy (see page 6594)	Frees a TWebModuleList (see page 6592) instance.
	FindModuleClass (see page 6597)	Locates a Web module given its class reference.
	FindModuleName (see page 6597)	Locates a Web module given its name.

68.1.2.2 TWebModuleList.Create Constructor

Creates and initializes a TWebModuleList (see page 6592) object.

Pascal

```
constructor Create(const AFactories: TWebModuleFactoryList);
```

C++

```
__fastcall TWebModuleList(const TWebModuleFactoryList AFactories);
```

Description

There is no need to call the TWebModuleList (see page 6592) constructor. Web module lists are created automatically for each incoming HTTP request.

AFactories is the list of Web module factories in the WebSnap application. TWebModuleList (see page 6592) uses this list to implement the Factory property.

See Also

Factory

68.1.2.3 TWebModuleList.Destroy Destructor

Frees a TWebModuleList (see page 6592) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebModuleList();
```

Description

Do not free TWebModuleList (see page 6592) objects. Web module lists are freed automatically when the WebSnap application finishes processing the HTTP request.

68.1.2.4 TWebModuleList Methods

The methods of the TWebModuleList class are listed here.

Protected Methods

	Name	Description
	GetFactory (see page 6598)	This is GetFactory, a member of class TWebModuleList.
	GetFactoryCount (see page 6598)	
	GetItem (see page 6598)	This is GetItem, a member of class TWebModuleList.
	GetItemCount (see page 6599)	
	GetOnModuleAdded (see page 6599)	
	SetOnModuleAdded (see page 6599)	

Public Methods

	Name	Description
	AddModule (see page 6594)	Adds a module to the Items property array.
	AddModuleClass (see page 6595)	Creates a new Web module, given its class, and adds it to the Items property array.
	AddModuleName (see page 6595)	Creates a new Web module, given its name, and adds it to the Items property array.
	AutoCreateModules (see page 6596)	Instantiates the Web modules that are flagged to handle all incoming requests.
	AutoDestroyModules (see page 6596)	Frees all Web modules that are flagged as inappropriate for caching between requests.
	FindModuleClass (see page 6597)	Locates a Web module given its class reference.
	FindModuleName (see page 6597)	Locates a Web module given its name.

68.1.2.4.1 TWebModuleList.AddModule Method

Adds a module to the Items property array.

Pascal

```
procedure AddModule(AComponent: TComponent);
```

C++

```
__fastcall AddModule(TComponent * AComponent);
```

Description

Call AddModule to add a newly instantiated Web module to the Items property array.

AComponent is a Web module instance that is not already listed in the Items property array. It must be one of the objects created by a Web module factory from the Factory property array.

See Also

AddModuleName (see page 6595)

AddModuleClass (see page 6595)

Items

Factory

68.1.2.4.2 TWebModuleList.AddModuleClass Method

Creates a new Web module, given its class, and adds it to the Items property array.

Pascal

```
function AddModuleClass(AClass: TComponentClass): TComponent; override;
```

C++

```
virtual __fastcall TComponent * AddModuleClass(TComponentClass AClass);
```

Description

AddModuleClass searches for a Web module factory that can create a Web module of the specified class. If it finds a match, it instantiates the Web module and adds it to the Items property array.

AClass is a class reference to the Web module you want to instantiate. It should not match the class type of any Web module already listed in the Items property array.

AddModuleClass returns the new Web module instance. If the Factory property array does not include a Web module factory that can create a Web module of the specified class, AddModuleClass returns nil (Delphi) or NULL (C++).

See Also

AddModuleName (see page 6595)

AddModule (see page 6594)

Items

Factory

FindModuleClass (see page 6597)

68.1.2.4.3 TWebModuleList.AddModuleName Method

Creates a new Web module, given its name, and adds it to the Items property array.

Pascal

```
function AddModuleName(const AName: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * AddModuleName(const UnicodeString AName);
```

Description

AddModuleName searches for a Web module factory that can create a Web module of the specified name. If it finds a match, it instantiates the Web module and adds it to the Items property array.

AName is the name of the Web module you want to instantiate. It should not match the name of any Web module already listed in the Items property array.

AddModuleClass (see page 6595) returns the new Web module instance. If the Factory property array does not include a Web module factory that can create a Web module of the specified name, AddModuleClass (see page 6595) returns nil (Delphi) or NULL (C++).

See Also

AddModuleClass (see page 6595)

AddModule (see page 6594)

Items

Factory

FindModuleName (see page 6597)

68.1.2.4.4 TWebModuleList.AutoCreateModules Method

Instantiates the Web modules that are flagged to handle all incoming requests.

Pascal

```
procedure AutoCreateModules;
```

C++

```
__fastcall AutoCreateModules();
```

Description

TWebRequestHandler (see page 6600) calls AutoCreateModules to instantiate all of the Web modules that should be used to handle every incoming request object.

AutoCreateModules searches the module factory list for factory objects that have a CreateMode property with the crAlways flag. For each such factory object, AutoCreateModules creates the corresponding Web module if it does not already exist and adds it to the Items property array.

See Also

CreateMode

AutoDestroyModules (see page 6596)

Items

Factory

TWebRequestHandler (see page 6600)

68.1.2.4.5 TWebModuleList.AutoDestroyModules Method

Frees all Web modules that are flagged as inappropriate for caching between requests.

Pascal

```
procedure AutoDestroyModules;
```

C++

```
__fastcall AutoDestroyModules();
```

Description

TWebRequestHandler (see page 6600) calls AutoDestroyModules when it finishes processing an HTTP request message. This allows the Web module list to free those Web modules that should not be cached for reuse with another request message.

AutoDestroyModules searches the module factory list for factory objects that have a CacheMode property with the caDestroy flag. For each such factory object, AutoDestroyModules frees the Web module if it exists and removes it from Items property array.

See Also

CacheMode

AutoCreateModules (see page 6596)

TWebRequestHandler (see page 6600)

Factory

68.1.2.4.6 TWebModuleList.FindModuleClass Method

Locates a Web module given its class reference.

Pascal

```
function FindModuleClass(AClass: TComponentClass): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleClass(TComponentClass AClass);
```

Description

Call FindModuleClass to locate the Web module instance of a given class type. FindModuleClass searches the Items property array for a Web module instance of the specified class.

AClass is a class reference to the class type of the desired Web module.

FindModuleClass returns the requested Web module instance if it exists. If there is no Web module of the specified class, FindModuleClass returns nil (Delphi) or NULL (C++).

See Also

FindModuleName (see page 6597)

Items

68.1.2.4.7 TWebModuleList.FindModuleName Method

Locates a Web module given its name.

Pascal

```
function FindModuleName(const AName: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleName(const UnicodeString AName);
```

Description

Call FindModuleName to locate the Web module instance of a given name. FindModuleClass (see page 6597) searches the Items property array for a Web module instance of the specified name.

AName is the name of the desired Web module.

FindModuleName returns the requested Web module instance if it exists. If there is no Web module with the specified name, FindModuleClass (see page 6597) returns nil (Delphi) or NULL (C++).

See Also

FindModuleClass (see page 6597)

Items

68.1.2.4.8 TWebModuleList.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractWebModuleFactory; override;
```

C++

```
virtual __fastcall TAbstractWebModuleFactory GetFactory(int I);
```

Description

This is GetFactory, a member of class TWebModuleList.

68.1.2.4.9 TWebModuleList.GetFactoryCount Method

Pascal

```
function GetFactoryCount: Integer; override;
```

C++

```
virtual __fastcall int GetFactoryCount();
```

See Also

GetFactory

FactoryCount

68.1.2.4.10 TWebModuleList.GetItem Method

Pascal

```
function GetItem(I: Integer): TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetItem(int I);
```

Description

This is GetItem, a member of class TWebModuleList.

68.1.2.4.11 TWebModuleList.GetItemCount Method

Pascal

```
function GetItemCount: Integer; override;
```

C++

```
virtual __fastcall int GetItemCount();
```

See Also

GetItem

ItemCount

68.1.2.4.12 TWebModuleList.GetOnModuleAdded Method

Pascal

```
function GetOnModuleAdded: TModuleAddedProc; override;
```

C++

```
virtual __fastcall TModuleAddedProc GetOnModuleAdded();
```

See Also

OnModuleAdded

SetOnModuleAdded

68.1.2.4.13 TWebModuleList.SetOnModuleAdded Method

Pascal

```
procedure SetOnModuleAdded(AProc: TModuleAddedProc); override;
```

C++

```
virtual __fastcall SetOnModuleAdded(TModuleAddedProc AProc);
```

See Also

GetOnModuleAdded

OnModuleAdded

68.1.2.5 TWebModuleList Properties

The properties of the TWebModuleList class are listed here.

Protected Properties

	Name	Description
R	Factories (see page 6599)	This is Factories, a member of class TWebModuleList.

68.1.2.5.1 TWebModuleList.Factories Property

Pascal

```
property Factories: TWebModuleFactoryList;
```

C++

```
__property TWebModuleFactoryList Factories;
```

Description

This is Factories, a member of class TWebModuleList.

68.1.3 TWebRequestHandler Class

TWebRequestHandler maintains the Web modules in an application and creates request and response objects when the application receives HTTP request messages.

Class Hierarchy

Pascal

```
TWebRequestHandler = class(TComponent);
```

C++

```
class TWebRequestHandler : public TComponent;
```

File

WebReq

Description

TWebRequestHandler keeps a pool of active Web modules. In response to a request from the application, TWebRequestHandler creates a request object and assigns it to one of the active Web modules.

Do not create instances of TWebRequestHandler. Use TWebRequestHandler as a base class when declaring nonvisual components that can appear on the component palette and be used in the form designer. Properties and methods of TWebRequestHandler provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TWebApplication (see page 5912)

TWebModule

68.1.3.1 TWebRequestHandler Members

The following tables list the members exposed by TWebRequestHandler.

Protected Methods

	Name	Description
	ActivateWebModules (see page 6602)	Activates a Web module for the application and returns it.
	DeactivateWebModules (see page 6603)	Deactivates the Web module of the application.
	HandleRequest (see page 6603)	Responds to an HTTP request message received by the server.

Public Methods

	Name	Description
	AddWebModuleFactory (see page 6602)	Adds a Web module factory to the request handler.

	Create (see page 6601)	Creates an instance of TWebRequestHandler (see page 6600).
	Destroy (see page 6601)	Destroys the TWebRequestHandler (see page 6600) instance and frees its memory.
	HandleException (see page 6603)	Responds to exceptions related to TWebRequestHandler (see page 6600) objects.

Public Properties

	Name	Description
	ActiveCount (see page 6604)	Indicates the number of active connections currently being serviced by the application.
	CacheConnections (see page 6605)	Determines whether the Web modules used by the application are cached for re-use.
	InactiveCount (see page 6605)	Indicates the number of Web modules cached for later reuse.
	MaxConnections (see page 6606)	Sets or returns the MaxConnections used by the socket.
	WebModuleClass (see page 6606)	Contains a reference to a Web module.
	WebModuleFactory (see page 6607)	A list of Web module factory objects.
	WebModuleFactoryCount (see page 6607)	The number of Web module factories in use by the request handler.

68.1.3.2 TWebRequestHandler.Create Constructor

Creates an instance of TWebRequestHandler (see page 6600).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebRequestHandler(TComponent * AOwner);
```

Description

Call Create to instantiate a TWebRequestHandler (see page 6600) object.

See Also

Destroy (see page 6601)

68.1.3.3 TWebRequestHandler.Destroy Destructor

Destroys the TWebRequestHandler (see page 6600) instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebRequestHandler();
```

Description

Destroy cleans up references in the global fix-up list for form linking. It then calls the inherited destructor.

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3382)

System::TObject::Destroy (see page 3366)

68.1.3.4 TWebRequestHandler Methods

The methods of the TWebRequestHandler class are listed here.

Protected Methods

	Name	Description
	ActivateWebModules (see page 6602)	Activates a Web module for the application and returns it.
	DeactivateWebModules (see page 6603)	Deactivates the Web module of the application.
	HandleRequest (see page 6603)	Responds to an HTTP request message received by the server.

Public Methods

	Name	Description
	AddWebModuleFactory (see page 6602)	Adds a Web module factory to the request handler.
	HandleException (see page 6603)	Responds to exceptions related to TWebRequestHandler (see page 6600) objects.

68.1.3.4.1 TWebRequestHandler.ActivateWebModules Method

Activates a Web module for the application and returns it.

Pascal

```
function ActivateWebModules: TWebModuleList;
```

C++

```
__fastcall TWebModuleList ActivateWebModules();
```

Description

ActivateWebModules is called internally when the application receives an HTTP request message. If the InactiveCount (see page 6605) property is greater than zero, a cached Web module is reactivated. Otherwise, a new instance of the Web module is created.

Before ActivateWebModules is called, the CreateForm method must be called to register the data module.

Note: In cross-platform applications, a Web application object contains only a single Web module. Usually, that Web module is a TWebModule object, but it may also be an ordinary data module that contains a TWebDispatcher object. If no Web module is associated with the Web application, ActivateWebModule raises an exception. If the ActiveCount (see page 6604) property is already at MaxConnections (see page 6606) when ActivateWebModules is called, ActivateWebModules raises an exception.

See Also

CreateForm (see page 5914)

ActiveCount (see page 6604)

InactiveCount (see page 6605)

MaxConnections (see page 6606)

68.1.3.4.2 TWebRequestHandler.AddWebModuleFactory Method

Adds a Web module factory to the request handler.

Pascal

```
procedure AddWebModuleFactory(AFactory: TAbstractWebModuleFactory);
```

C++

```
__fastcall AddWebModuleFactory(TAbstractWebModuleFactory AFactory);
```

Description

AddWebModuleFactory is used to add a Web module factory to the Web request handler. Web module factories are for internal use, and should not require any attention from developers.

68.1.3.4.3 TWebRequestHandler.DeactivateWebModules Method

Deactivates the Web module of the application.

Pascal

```
procedure DeactivateWebModules(WebModules: TWebModuleList);
```

C++

```
__fastcall DeactivateWebModules(TWebModuleList WebModules);
```

Description

Do not call DeactivateWebModules directly. The Web application calls DeactivateWebModules internally after handling an HTTP request message. When CacheConnections (see page 6605) is true, the Web module remains inactive until the next request message is received. When CacheConnections (see page 6605) is false, the runtime instance of the Web module is destroyed.

See Also

ActivateWebModules (see page 6602)

CacheConnections (see page 6605)

HandleRequest (see page 6603)

InactiveCount (see page 6605)

68.1.3.4.4 TWebRequestHandler.HandleException Method

Responds to exceptions related to TWebRequestHandler (see page 6600) objects.

Pascal

```
procedure HandleException(Sender: TObject);
```

C++

```
__fastcall HandleException(TObject * Sender);
```

Description

When exceptions occur in TWebRequestHandler (see page 6600) and descendant objects, HandleException will attempt to deal with it. If it cannot do so, it displays an error message to the user.

68.1.3.4.5 TWebRequestHandler.HandleRequest Method

Responds to an HTTP request message received by the server.

Pascal

```
function HandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

When a descendant of TWebApplication receives an HTTP request message, it creates a TWebRequest object to represent the message, and a TWebResponse message to match the request. It then calls HandleRequest, passing those objects as the Request and Response parameters.

HandleRequest activates the Web module associated with the Web application. It then passes the request and response objects to the dispatcher, so that it can dispatch the request to the appropriate action items. When the dispatcher returns, HandleRequest checks whether the response was handled but not sent, and if not, sends it. Finally, HandleRequest deactivates the data module.

HandleRequest returns a Boolean value indicating whether the request message was handled and sent.

See Also

ActivateWebModules (see page 6602)

DeactivateWebModules (see page 6603)

68.1.3.5 TWebRequestHandler Properties

The properties of the TWebRequestHandler class are listed here.

Public Properties

	Name	Description
	ActiveCount (see page 6604)	Indicates the number of active connections currently being serviced by the application.
	CacheConnections (see page 6605)	Determines whether the Web modules used by the application are cached for re-use.
	InactiveCount (see page 6605)	Indicates the number of Web modules cached for later reuse.
	MaxConnections (see page 6606)	Sets or returns the MaxConnections used by the socket.
	WebModuleClass (see page 6606)	Contains a reference to a Web module.
	WebModuleFactory (see page 6607)	A list of Web module factory objects.
	WebModuleFactoryCount (see page 6607)	The number of Web module factories in use by the request handler.

68.1.3.5.1 TWebRequestHandler.ActiveCount Property

Indicates the number of active connections currently being serviced by the application.

Pascal

```
property ActiveCount: Integer;
```

C++

```
__property int ActiveCount;
```

Description

Use ActiveCount to monitor the number of HTTP request messages the application is servicing at any one time. Over time, this value provides an indication of the optimal value for the MaxConnections (see page 6606) property.

Each time an Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) application receives an HTTP request message, it generates a new instance of the Web module. After the response is returned to the Web client, the Web module is either destroyed or deactivated and cached for later reuse. Each active Web module resides in a separate execution thread.

ActiveCount is the number of Web modules currently in use. InactiveCount (see page 6605) is the number of deactivated Web modules cached for later reuse. MaxConnections (see page 6606) is the maximum number of Web modules that can be active at any time. ActiveCount can never exceed MaxConnections (see page 6606).

Note: ActiveCount is only meaningful for Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) applications. Each CGI application handles only a single request message.

See Also

InactiveCount (see page 6605)

68.1.3.5.2 TWebRequestHandler.CacheConnections Property

Determines whether the Web modules used by the application are cached for re-use.

Pascal

```
property CacheConnections: Boolean;
```

C++

```
__property Boolean CacheConnections;
```

Description

Each time an Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) application receives an HTTP request message, it spawns a thread to handle the request and creates a new Web module that contains instances of all the objects used in the Web application. To improve performance, these Web modules can be saved in a cache when the thread associated with the HTTP request message finishes executing.

Set CacheConnections to true to have the Web application save inactive Web modules in a cache. Caching the Web modules speeds performance as new instances of the Web module and its contents do not need to be created every time a request message is received. Set CacheConnections to false to have the Web application create a new Web module for every request thread. Recreating the Web module ensures that changes made to the module or its contents when servicing the last request do not cause unexpected behavior the next time the module is activated.

CacheConnections is only relevant to Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) Web applications.

See Also

MaxConnections (see page 6606)

68.1.3.5.3 TWebRequestHandler.InactiveCount Property

Indicates the number of Web modules cached for later reuse.

Pascal

```
property InactiveCount: Integer;
```

C++

```
__property int InactiveCount;
```

Description

Use InactiveCount to monitor the number of unused Web modules. Over time, this value provides an indication of the optimal value for the MaxConnections (see page 6606) property.

When CacheConnections (see page 6605) is true, each time an Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) application receives an HTTP request message, it reactivates one of the inactive Web modules. The application generates a new instance of the Web module if InactiveCount is 0. After the response is returned to the Web client, the Web module is deactivated again, and counted by the InactiveCount property.

When CacheConnections (see page 6605) is false, a new Web module is created for each HTTP request message and

destroyed when the response is returned. InactiveCount is always 0 when CacheConnections (see page 6605) is false.

Note: InactiveCount is only meaningful for Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only)

applications. Each CGI application handles only a single request message, so there is no need to cache unused data modules.

See Also

ActiveCount (see page 6604)

68.1.3.5.4 TWebRequestHandler.MaxConnections Property

Sets or returns the MaxConnections used by the socket.

Pascal

```
property MaxConnections: Integer;
```

C++

```
__property int MaxConnections;
```

Description

Set MaxConnections to adjust the number of HTTP request messages the application can handle simultaneously. Use the ActiveCount (see page 6604) and InactiveCount (see page 6605) properties to get a sense of the frequency and duration of request messages. Then set MaxConnections so that it is high enough to avoid exceptions when the application runs out of Web modules, but low enough not to degrade performance too severely by running too many simultaneous threads.

If a request message is received when ActiveCount (see page 6604) is already at MaxConnections, the application raises an exception.

Note: InactiveCount (see page 6605) is only meaningful for Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only)

applications. Each CGI application handles only a single request message, so there is no need to cache unused data modules.

See Also

CacheConnections (see page 6605)

68.1.3.5.5 TWebRequestHandler.WebModuleClass Property

Contains a reference to a Web module.

Pascal

```
property WebModuleClass: TComponentClass;
```

C++

```
__property TComponentClass WebModuleClass;
```

Description

WebModuleClass is a reference to a Web module, and is for internal use only. When ActivateWebModules (see page 6602) is called, it is used in that method to help generate infrastructure for a Web module.

See Also

ActivateWebModules (see page 6602)

68.1.3.5.6 TWebRequestHandler.WebModuleFactory Property

A list of Web module factory objects.

Pascal

```
property WebModuleFactory [I: Integer]: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory WebModuleFactory[int I];
```

Description

This is a list of Web module factory objects, which are intended for internal use.

See Also

WebModuleFactoryCount (see page 6607)

68.1.3.5.7 TWebRequestHandler.WebModuleFactoryCount Property

The number of Web module factories in use by the request handler.

Pascal

```
property WebModuleFactoryCount: Integer;
```

C++

```
__property int WebModuleFactoryCount;
```

Description

WebModuleFactoryCount is the number of Web module factories in use by the request handler. This property is intended for internal use.

See Also

WebModuleFactory (see page 6607)

68.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	WebRequestHandler (see page 6608)	Returns a TWebRequestHandler (see page 6600) object.

68.2.1 WebReq.WebRequestHandler Function

Returns a TWebRequestHandler (see page 6600) object.

Pascal

```
function WebRequestHandler: TWebRequestHandler;
```

C++

```
TWebRequestHandler WebRequestHandler();
```

File

WebReq

Description

Use the WebRequestHandler function to obtain a reference to the global TWebRequestHandler (see page 6600) object. This object manages all the Web modules in the application, and creates Web request and response objects when the application receives HTTP request messages.

See Also

TWebApplication

TWebModule

68.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TRequestNotification (see page 6609)	This is record WebReq.TRequestNotification.

68.3.1 WebReq.TRequestNotification Enumeration

Pascal

```
TRequestNotification = (
  rnActivateModule,
  rnDeactivateModule,
  rnCreateModule,
  rnFreeModule,
  rnStartRequest,
  rnFinishRequest
);
```

C++

```
enum TRequestNotification {
  rnActivateModule,
  rnDeactivateModule,
  rnCreateModule,
  rnFreeModule,
  rnStartRequest,
  rnFinishRequest
};
```

File

WebReq

Description

This is record WebReq.TRequestNotification.

68.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
WebRequestHandlerProc (see page 6610)	This is variable WebReq.WebRequestHandlerProc.

68.4.1 WebReq.WebRequestHandlerProc Variable

Pascal

```
WebRequestHandlerProc: function: TWebRequestHandler = nil;
```

C++

```
function: TWebRequestHandler WebRequestHandlerProc = nil;
```

File

WebReq

Description

This is variable WebReq.WebRequestHandlerProc.

69 WebScript Namespace

This is namespace WebScript.

Topics

Name	Description
Classes (see page 6613)	The following table lists classes in this documentation.

	TScriptItems (see page 6666)	This is class WebScript.TScriptItems.
	TScriptObjectFactories (see page 6668)	This is class WebScript.TScriptObjectFactories.
	TScriptProducer (see page 6673)	This is class WebScript.TScriptProducer.
	TVariableLookup (see page 6682)	This is class WebScript.TVariableLookup.

Constants

Name	Description
GlobalScriptVariableNames (see page 6689)	This is constant WebScript.GlobalScriptVariableNames.

Structs, Records, Enums

	Name	Description
	TGlobalScriptVariables (see page 6686)	This is record WebScript.TGlobalScriptVariables.
	TIncludeType (see page 6687)	This is record WebScript.TIncludeType.
	TLineNumbers (see page 6687)	This is record WebScript.TLineNumbers.

Types

Name	Description
CreateComponentStubFactory (see page 6688)	This is type WebScript.CreateComponentStubFactory.
PLineNumbers (see page 6688)	This is type WebScript.PLineNumbers.

69.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERecursiveIncludeFile (see page 6613)	This is class WebScript.ERecursiveIncludeFile.
	EScriptEvalError (see page 6614)	This is class WebScript.EScriptEvalError.
	TAbstractScriptEngine (see page 6614)	This is class WebScript.TAbstractScriptEngine.
	TAbstractScriptObjectFactories (see page 6618)	This is class WebScript.TAbstractScriptObjectFactories.
	TAbstractScriptObjectFactory (see page 6621)	This is class WebScript.TAbstractScriptObjectFactory.
	TCurrentWebPageInfo (see page 6623)	This is class WebScript.TCurrentWebPageInfo.
	THTMLItem (see page 6628)	This is class WebScript.THTMLItem.
	THTMLItems (see page 6631)	This is class WebScript.THTMLItems.
	TLineNumberMap (see page 6634)	This is class WebScript.TLineNumberMap.
	TScriptCodeItem (see page 6637)	This is class WebScript.TScriptCodeItem.
	TScriptEnginesList (see page 6639)	This is class WebScript.TScriptEnginesList.
	TScriptError (see page 6643)	This is class WebScript.TScriptError.
	TScriptErrors (see page 6647)	This is class WebScript.TScriptErrors.
	TScriptFile (see page 6649)	This is class WebScript.TScriptFile.
	TScriptGlobalObjects (see page 6653)	This is class WebScript.TScriptGlobalObjects.
	TScriptIncludeFile (see page 6658)	This is class WebScript.TScriptIncludeFile.
	TScriptIncludeFiles (see page 6659)	This is class WebScript.TScriptIncludeFiles.
	TScriptIncludeItem (see page 6662)	This is class WebScript.TScriptIncludeItem.
	TScriptItem (see page 6664)	This is class WebScript.TScriptItem.
	TScriptItems (see page 6666)	This is class WebScript.TScriptItems.
	TScriptObjectFactories (see page 6668)	This is class WebScript.TScriptObjectFactories.
	TScriptProducer (see page 6673)	This is class WebScript.TScriptProducer.
	TVariableLookup (see page 6682)	This is class WebScript.TVariableLookup.

69.1.1 ERecursiveIncludeFile Class

Class Hierarchy

Pascal

```
ERecursiveIncludeFile = class(EScriptError);
```

C++

```
class ERecursiveIncludeFile : public EScriptError;
```

File

WebScript

Description

This is class WebScript.ERecursiveIncludeFile.

69.1.2 EScriptEvalError Class

Class Hierarchy

Pascal

```
EScriptEvalError = class(EWebBrokerException);
```

C++

```
class EScriptEvalError : public EWebBrokerException;
```

File

WebScript

Description

This is class WebScript.EScriptEvalError.

69.1.3 TAbstractScriptEngine Class

Class Hierarchy

Pascal

```
TAbstractScriptEngine = class(TObject);
```

C++

```
class TAbstractScriptEngine : public TObject;
```

File

WebScript

Description

This is class WebScript.TAbstractScriptEngine.

69.1.3.1 TAbstractScriptEngine Members

The following tables list the members exposed by TAbstractScriptEngine.

Public Methods

	Name	Description
	AddObjectFactory (see page 6616)	This is AddObjectFactory, a member of class TAbstractScriptEngine.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.

	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6615)	This is Create, a member of class TAbstractScriptEngine.
	CreateComponentStub (see page 6617)	This is CreateComponentStub, a member of class TAbstractScriptEngine.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 6615)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
A	ListLanguageNames (see page 6617)	This is ListLanguageNames, a member of class TAbstractScriptEngine.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
A	SupportsLanguage (see page 6617)	This is SupportsLanguage, a member of class TAbstractScriptEngine.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Name (see page 6617)	This is Name, a member of class TAbstractScriptEngine.
R	ScriptObjectFactories (see page 6618)	This is ScriptObjectFactories, a member of class TAbstractScriptEngine.
	ScriptProducerClass (see page 6618)	This is ScriptProducerClass, a member of class TAbstractScriptEngine.

69.1.3.2 TAbstractScriptEngine.Create Constructor

Pascal

```
constructor Create(const AName: string);
```

C++

```
__fastcall TAbstractScriptEngine(const UnicodeString AName);
```

Description

This is Create, a member of class TAbstractScriptEngine.

69.1.3.3 TAbstractScriptEngine.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAbstractScriptEngine();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

69.1.3.4 TAbstractScriptEngine Methods

The methods of the TAbstractScriptEngine class are listed here.

Public Methods

	Name	Description
	AddObjectFactory (see page 6616)	This is AddObjectFactory, a member of class TAbstractScriptEngine.
	CreateComponentStub (see page 6617)	This is CreateComponentStub, a member of class TAbstractScriptEngine.
	ListLanguageNames (see page 6617)	This is ListLanguageNames, a member of class TAbstractScriptEngine.
	SupportsLanguage (see page 6617)	This is SupportsLanguage, a member of class TAbstractScriptEngine.

69.1.3.4.1 TAbstractScriptEngine.AddObjectFactory Method

Pascal

```
procedure AddObjectFactory(AFactory: TAbstractScriptObjectFactory);
```

C++

```
__fastcall AddObjectFactory(TAbstractScriptObjectFactory AFactory);
```

Description

This is AddObjectFactory, a member of class TAbstractScriptEngine.

69.1.3.4.2 TAbstractScriptEngine.CreateComponentStub Method

Pascal

```
function CreateComponentStub(AObject: TObject): IInterface;
```

C++

```
__fastcall IInterface CreateComponentStub(TObject * AObject);
```

Description

This is CreateComponentStub, a member of class TAbstractScriptEngine.

69.1.3.4.3 TAbstractScriptEngine.ListLanguageNames Method

Pascal

```
procedure ListLanguageNames(AList: TStrings); virtual; abstract;
```

C++

```
virtual __fastcall ListLanguageNames(TStrings AList) = 0;
```

Description

This is ListLanguageNames, a member of class TAbstractScriptEngine.

69.1.3.4.4 TAbstractScriptEngine.SupportsLanguage Method

Pascal

```
function SupportsLanguage(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean SupportsLanguage(const UnicodeString AName) = 0;
```

Description

This is SupportsLanguage, a member of class TAbstractScriptEngine.

69.1.3.5 TAbstractScriptEngine Properties

The properties of the TAbstractScriptEngine class are listed here.

Public Properties

	Name	Description
	Name (see page 6617)	This is Name, a member of class TAbstractScriptEngine.
	ScriptObjectFactories (see page 6618)	This is ScriptObjectFactories, a member of class TAbstractScriptEngine.
	ScriptProducerClass (see page 6618)	This is ScriptProducerClass, a member of class TAbstractScriptEngine.

69.1.3.5.1 TAbstractScriptEngine.Name Property

Pascal

```
property Name: string;
```

C++

```
__property UnicodeString Name;
```

Description

This is Name, a member of class TAbstractScriptEngine.

69.1.3.5.2 TAbstractScriptEngine.ScriptObjectFactories Property

Pascal

```
property ScriptObjectFactories: TAbstractScriptObjectFactories;
```

C++

```
__property TAbstractScriptObjectFactories ScriptObjectFactories;
```

Description

This is ScriptObjectFactories, a member of class TAbstractScriptEngine.

69.1.3.5.3 TAbstractScriptEngine.ScriptProducerClass Property

Pascal

```
property ScriptProducerClass: TScriptProducerClass;
```

C++

```
__property TScriptProducerClass ScriptProducerClass;
```

Description

This is ScriptProducerClass, a member of class TAbstractScriptEngine.

69.1.4 TAbstractScriptObjectFactories Class

Class Hierarchy

Pascal

```
TAbstractScriptObjectFactories = class(TObject);
```

C++

```
class TAbstractScriptObjectFactories : public TObject;
```

File

WebScript

Description

This is class WebScript.TAbstractScriptObjectFactories.

69.1.4.1 TAbstractScriptObjectFactories Members

The following tables list the members exposed by TAbstractScriptObjectFactories.

Protected Methods

	Name	Description
	GetCount (see page 6620)	This is GetCount, a member of class TAbstractScriptObjectFactories.
	GetFactory (see page 6620)	This is GetFactory, a member of class TAbstractScriptObjectFactories.
	GetObjectList (see page 6620)	This is GetObjectList, a member of class TAbstractScriptObjectFactories.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Count (see page 6621)	This is Count, a member of class TAbstractScriptObjectFactories.
	Factories (see page 6621)	This is Factories, a member of class TAbstractScriptObjectFactories.
	ObjectList (see page 6621)	This is ObjectList, a member of class TAbstractScriptObjectFactories.

69.1.4.2 TAbstractScriptObjectFactories Methods

The methods of the TAbstractScriptObjectFactories class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 6620)	This is GetCount, a member of class TAbstractScriptObjectFactories.
	GetFactory (see page 6620)	This is GetFactory, a member of class TAbstractScriptObjectFactories.
	GetObjectList (see page 6620)	This is GetObjectList, a member of class TAbstractScriptObjectFactories.

69.1.4.2.1 TAbstractScriptObjectFactories.GetCount Method

Pascal

```
function GetCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCount() = 0;
```

Description

This is GetCount, a member of class TAbstractScriptObjectFactories.

69.1.4.2.2 TAbstractScriptObjectFactories.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractScriptObjectFactory; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractScriptObjectFactory GetFactory(int I) = 0;
```

Description

This is GetFactory, a member of class TAbstractScriptObjectFactories.

69.1.4.2.3 TAbstractScriptObjectFactories.GetObjectList Method

Pascal

```
function GetObjectList: TObjectList; virtual; abstract;
```

C++

```
virtual __fastcall TObjectList GetObjectList() = 0;
```

Description

This is GetObjectList, a member of class TAbstractScriptObjectFactories.

69.1.4.3 TAbstractScriptObjectFactories Properties

The properties of the TAbstractScriptObjectFactories class are listed here.

Public Properties

	Name	Description
	Count (see page 6621)	This is Count, a member of class TAbstractScriptObjectFactories.
	Factories (see page 6621)	This is Factories, a member of class TAbstractScriptObjectFactories.
	ObjectList (see page 6621)	This is ObjectList, a member of class TAbstractScriptObjectFactories.

69.1.4.3.1 TAbstractScriptObjectFactories.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TAbstractScriptObjectFactories.

69.1.4.3.2 TAbstractScriptObjectFactories.Factories Property

Pascal

```
property Factories [I: Integer]: TAbstractScriptObjectFactory;
```

C++

```
__property TAbstractScriptObjectFactory Factories[int I];
```

Description

This is Factories, a member of class TAbstractScriptObjectFactories.

69.1.4.3.3 TAbstractScriptObjectFactories.ObjectList Property

Pascal

```
property ObjectList: TObjectList;
```

C++

```
__property TObjectList ObjectList;
```

Description

This is ObjectList, a member of class TAbstractScriptObjectFactories.

69.1.5 TAbstractScriptObjectFactory Class

Class Hierarchy

Pascal

```
TAbstractScriptObjectFactory = class;
```

C++

```
class TAbstractScriptObjectFactory;
```

File

WebScript

Description

This is class WebScript.TAbstractScriptObjectFactory.

69.1.5.1 TAbstractScriptObjectFactory Members

The following tables list the members exposed by TAbstractScriptObjectFactory.

Protected Methods

	Name	Description
	AddGlobalObjects (see page 6622)	This is AddGlobalObjects, a member of class TAbstractScriptObjectFactory.
	CreateComponentObject (see page 6622)	This is CreateComponentObject, a member of class TAbstractScriptObjectFactory.
	CreateProducerObject (see page 6623)	This is CreateProducerObject, a member of class TAbstractScriptObjectFactory.
	GetScriptEngine (see page 6623)	This is GetScriptEngine, a member of class TAbstractScriptObjectFactory.

Public Methods

	Name	Description
	CreateGlobalObject (see page 6623)	This is CreateGlobalObject, a member of class TAbstractScriptObjectFactory.

69.1.5.2 TAbstractScriptObjectFactory Methods

The methods of the TAbstractScriptObjectFactory class are listed here.

Protected Methods

	Name	Description
	AddGlobalObjects (see page 6622)	This is AddGlobalObjects, a member of class TAbstractScriptObjectFactory.
	CreateComponentObject (see page 6622)	This is CreateComponentObject, a member of class TAbstractScriptObjectFactory.
	CreateProducerObject (see page 6623)	This is CreateProducerObject, a member of class TAbstractScriptObjectFactory.
	GetScriptEngine (see page 6623)	This is GetScriptEngine, a member of class TAbstractScriptObjectFactory.

Public Methods

	Name	Description
	CreateGlobalObject (see page 6623)	This is CreateGlobalObject, a member of class TAbstractScriptObjectFactory.

69.1.5.2.1 TAbstractScriptObjectFactory.AddGlobalObjects Method

Pascal

```
procedure AddGlobalObjects(AScriptGlobalObjects: TScriptGlobalObjects); virtual;
```

C++

```
virtual __fastcall AddGlobalObjects(TScriptGlobalObjects AScriptGlobalObjects);
```

Description

This is AddGlobalObjects, a member of class TAbstractScriptObjectFactory.

69.1.5.2.2 TAbstractScriptObjectFactory.CreateComponentObject Method

Pascal

```
function CreateComponentObject(AComponent: TObject; AClassKey: TClass): IInterface; virtual;
abstract;
```

C++

```
virtual __fastcall IInterface CreateComponentObject(TObject * AComponent, TClass AClassKey) =
0;
```

Description

This is CreateComponentObject, a member of class TAbstractScriptObjectFactory.

69.1.5.2.3 TAbstractScriptObjectFactory.CreateGlobalObject Method

Pascal

```
function CreateGlobalObject(AVariable: TGlobalScriptVariables; AContext: IScriptContext):
IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateGlobalObject(TGlobalScriptVariables AVariable,
IScriptContext AContext) = 0;
```

Description

This is CreateGlobalObject, a member of class TAbstractScriptObjectFactory.

69.1.5.2.4 TAbstractScriptObjectFactory.CreateProducerObject Method

Pascal

```
function CreateProducerObject(AVariable: TGlobalScriptVariables; AProducer: IScriptProducer):
IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateProducerObject(TGlobalScriptVariables AVariable,
IScriptProducer AProducer) = 0;
```

Description

This is CreateProducerObject, a member of class TAbstractScriptObjectFactory.

69.1.5.2.5 TAbstractScriptObjectFactory.GetScriptEngine Method

Pascal

```
function GetScriptEngine: TAbstractScriptEngine; virtual; abstract;
```

C++

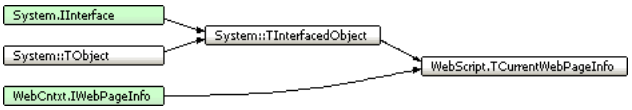
```
virtual __fastcall TAbstractScriptEngine GetScriptEngine() = 0;
```

Description

This is GetScriptEngine, a member of class TAbstractScriptObjectFactory.

69.1.6 TCurrentWebPageInfo Class

Class Hierarchy



Pascal

```
TCurrentWebPageInfo = class(TInterfacedObject, IWebPageInfo);
```

C++

```
class TCurrentWebPageInfo : public TInterfacedObject, public IWebPageInfo;
```

File

WebScript

Description

This is class WebScript.TCurrentWebPageInfo.

69.1.6.1 TCurrentWebPageInfo Members

The following tables list the members exposed by TCurrentWebPageInfo.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	GetHasViewAccess (see page 6626)	Returns the value of the HasViewAccess property.
	GetLoginRequired (see page 6626)	Returns the value of the LoginRequired property.
	GetPageDescription (see page 6626)	Returns the value of the PageDescription property.
	GetPageHREF (see page 6627)	Returns the value of the PageHREF property.
	GetPageIsPublished (see page 6627)	Returns the value of the PageIsPublished property.
	GetPageName (see page 6627)	Returns the value of the PageName property.
	GetPageTitle (see page 6628)	Returns the value of the PageTitle property.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	WebPageInfo (see page 6628)	This is WebPageInfo, a member of class TCurrentWebPageInfo.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AfterConstruction (see page 3358)	Responds after the last constructor executes.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6625)	This is Create, a member of class TCurrentWebPageInfo.

	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	HasViewAccess (see page 5974)	Indicates whether the current user has access rights to view the Web page.
	LoginRequired (see page 5974)	Indicates whether callers must log in before accessing this Web page.
	PageDescription (see page 5974)	Describes the Web page.
	PageHREF (see page 5975)	Identifies the HREF to use for references to the associated Web page.
	PageIsPublished (see page 5975)	Indicates whether the WebSnap application automatically displays the Web page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 5976).
	PageName (see page 5976)	Denotes the logical name for the Web page.
	PageTitle (see page 5976)	Indicates the title that appears on the Web page.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

69.1.6.2 TCurrentWebPageInfo.Create Constructor

Pascal

```
constructor Create(AContext: IScriptContext);
```

C++

```
__fastcall TCurrentWebPageInfo(IScriptContext AContext);
```

Description

This is Create, a member of class TCurrentWebPageInfo.

69.1.6.3 TCurrentWebPageInfo Methods

The methods of the TCurrentWebPageInfo class are listed here.

Protected Methods

	Name	Description
	GetHasViewAccess (see page 6626)	Returns the value of the HasViewAccess property.
	GetLoginRequired (see page 6626)	Returns the value of the LoginRequired property.
	GetPageDescription (see page 6626)	Returns the value of the PageDescription property.
	GetPageHREF (see page 6627)	Returns the value of the PageHREF property.
	GetPageIsPublished (see page 6627)	Returns the value of the PageIsPublished property.
	GetPageName (see page 6627)	Returns the value of the PageName property.
	GetPageTitle (see page 6628)	Returns the value of the PageTitle property.
	WebPageInfo (see page 6628)	This is WebPageInfo, a member of class TCurrentWebPageInfo.

69.1.6.3.1 TCurrentWebPageInfo.GetHasViewAccess Method

Returns the value of the HasViewAccess property.

Pascal

```
function GetHasViewAccess: Boolean;
```

C++

```
__fastcall Boolean GetHasViewAccess();
```

Description

GetHasViewAccess is the read implementation of the HasViewAccess property.

See Also

HasViewAccess (see page 5974)

69.1.6.3.2 TCurrentWebPageInfo.GetLoginRequired Method

Returns the value of the LoginRequired property.

Pascal

```
function GetLoginRequired: Boolean;
```

C++

```
__fastcall Boolean GetLoginRequired();
```

Description

GetLoginRequired is the read implementation of the LoginRequired property.

See Also

LoginRequired (see page 5974)

69.1.6.3.3 TCurrentWebPageInfo.GetPageDescription Method

Returns the value of the PageDescription property.

Pascal

```
function GetPageDescription: string;
```

C++

```
__fastcall UnicodeString GetPageDescription();
```

Description

GetPageDescription is the read implementation of the PageDescription property.

See Also

PageDescription (see page 5974)

69.1.6.3.4 TCurrentWebPageInfo.GetPageHREF Method

Returns the value of the PageHREF property.

Pascal

```
function GetPageHREF: string;
```

C++

```
__fastcall UnicodeString GetPageHREF();
```

Description

GetPageHREF is the read implementation of the PageHREF property.

See Also

PageHREF (see page 5975)

69.1.6.3.5 TCurrentWebPageInfo.GetPageIsPublished Method

Returns the value of the PageIsPublished property.

Pascal

```
function GetPageIsPublished: Boolean;
```

C++

```
__fastcall Boolean GetPageIsPublished();
```

Description

GetPageIsPublished is the read implementation of the PageIsPublished property.

See Also

PageIsPublished (see page 5975)

69.1.6.3.6 TCurrentWebPageInfo.GetPageName Method

Returns the value of the PageName property.

Pascal

```
function GetPageName: string;
```

C++

```
__fastcall UnicodeString GetPageName();
```

Description

GetPageName is the read implementation of the PageName property.

See Also

PageName (see page 5976)

69.1.6.3.7 TCurrentWebPageInfo.GetPageTitle Method

Returns the value of the PageTitle property.

Pascal

```
function GetPageTitle: string;
```

C++

```
__fastcall UnicodeString GetPageTitle();
```

Description

GetPageTitle is the read implementation of the PageTitle property.

See Also

PageTitle (see page 5976)

69.1.6.3.8 TCurrentWebPageInfo.WebPageInfo Method

Pascal

```
function WebPageInfo: IWebPageInfo;
```

C++

```
__fastcall IWebPageInfo WebPageInfo();
```

Description

This is WebPageInfo, a member of class TCurrentWebPageInfo.

69.1.7 THTMLItem Class

Class Hierarchy

Pascal

```
THTMLItem = class(TObject);
```

C++

```
class THTMLItem : public TObject;
```

File

WebScript

Description

This is class WebScript.THTMLItem.

69.1.7.1 THTMLItem Members

The following tables list the members exposed by THTMLItem.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	AssignString (see page 6630)	This is AssignString, a member of class THTMLItem.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6630)	This is Create, a member of class THTMLItem.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	HTML (see page 6630)	This is HTML, a member of class THTMLItem.
	Ident (see page 6631)	This is Ident, a member of class THTMLItem.
	ItemLength (see page 6631)	This is ItemLength, a member of class THTMLItem.
	TagToken (see page 6631)	This is TagToken, a member of class THTMLItem.

69.1.7.2 THTMLItem.Create Constructor

Pascal

```
constructor Create(AItems: THTMLItems);
```

C++

```
__fastcall THTMLItem(THTMLItems AItems);
```

Description

This is Create, a member of class THTMLItem.

69.1.7.3 THTMLItem Methods

The methods of the THTMLItem class are listed here.

Public Methods

	Name	Description
	AssignString (see page 6630)	This is AssignString, a member of class THTMLItem.

69.1.7.3.1 THTMLItem.AssignString Method

Pascal

```
procedure AssignString(AOffset: Integer; AHTML: PAnsiChar; ALength: Integer; AEncoding:
TEncoding);
```

C++

```
__fastcall AssignString(int AOffset, PAnsiChar AHTML, int ALength, TEncoding AEncoding);
```

Description

This is AssignString, a member of class THTMLItem.

69.1.7.4 THTMLItem Properties

The properties of the THTMLItem class are listed here.

Public Properties

	Name	Description
R	HTML (see page 6630)	This is HTML, a member of class THTMLItem.
R	Ident (see page 6631)	This is Ident, a member of class THTMLItem.
R	ItemLength (see page 6631)	This is ItemLength, a member of class THTMLItem.
	TagToken (see page 6631)	This is TagToken, a member of class THTMLItem.

69.1.7.4.1 THTMLItem.HTML Property

Pascal

```
property HTML: string;
```

C++

```
__property UnicodeString HTML;
```

Description

This is HTML, a member of class THTMLItem.

69.1.7.4.2 THTMLItem.Ident Property

Pascal

```
property Ident: string;
```

C++

```
__property UnicodeString Ident;
```

Description

This is Ident, a member of class THTMLItem.

69.1.7.4.3 THTMLItem.ItemLength Property

Pascal

```
property ItemLength: Integer;
```

C++

```
__property int ItemLength;
```

Description

This is ItemLength, a member of class THTMLItem.

69.1.7.4.4 THTMLItem.TagToken Property

Pascal

```
property TagToken: Boolean;
```

C++

```
__property Boolean TagToken;
```

Description

This is TagToken, a member of class THTMLItem.

69.1.8 THTMLItems Class

Class Hierarchy

Pascal

```
THTMLItems = class(TObjectList);
```

C++

```
class THTMLItems : public TObjectList;
```

File

WebScript

Description

This is class WebScript.THTMLItems.

69.1.8.1 THTMLItems Members

The following tables list the members exposed by THTMLItems.

Public Methods

	Name	Description
	Create (see page 6632)	This is Create, a member of class THTMLItems.
V	Destroy (see page 6632)	Destroys an instance of TList.
	GetHTMLItem (see page 6633)	This is GetHTMLItem, a member of class THTMLItems.
	MakeIdentifier (see page 6633)	This is MakeIdentifier, a member of class THTMLItems.

Public Properties

	Name	Description
R	Items (see page 6633)	Lists the object references.

69.1.8.2 THTMLItems.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall THTMLItems(TScriptProducer AProducer);
```

Description

This is Create, a member of class THTMLItems.

69.1.8.3 THTMLItems.Destroy Destructor

Destroys an instance of TList.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THTMLItems();
```

Description

Do not call Destroy directly. Instead, call Free. Free verifies that the TList reference is not nil, and only then calls Destroy.

Destroy frees the memory used to store the list of items.

Note: Destroy does not free the memory pointed to by the elements of the list.

See Also

System::TObject::Free (see page 3382)

69.1.8.4 THTMLItems Methods

The methods of the THTMLItems class are listed here.

Public Methods

	Name	Description
	GetHTMLItem (see page 6633)	This is GetHTMLItem, a member of class THTMLItems.
	MakeIdentifier (see page 6633)	This is MakeIdentifier, a member of class THTMLItems.

69.1.8.4.1 THTMLItems.GetHTMLItem Method

Pascal

```
function GetHTMLItem(I: Integer): THTMLItem;
```

C++

```
__fastcall THTMLItem GetHTMLItem(int I);
```

Description

This is GetHTMLItem, a member of class THTMLItems.

69.1.8.4.2 THTMLItems.MakeIdentifier Method

Pascal

```
function MakeIdentifier(AItem: THTMLItem): string;
```

C++

```
__fastcall UnicodeString MakeIdentifier(THTMLItem AItem);
```

Description

This is MakeIdentifier, a member of class THTMLItems.

69.1.8.5 THTMLItems Properties

The properties of the THTMLItems class are listed here.

Public Properties

	Name	Description
	Items (see page 6633)	Lists the object references.

69.1.8.5.1 THTMLItems.Items Property

Lists the object references.

Pascal

```
property Items [Index: Integer]: THTMLItem;
```

C++

```
__property THTMLItem Items[int Index];
```

Description

Use Items to access objects in the list. Items is a zero-based array: The first object is indexed as 0, the second object is indexed as 1, and so forth. You can read or change the value at a specific index, or use Items with the Count property to iterate through the list.

If OwnsObjects is true, reassigning an Items index frees the object that previously occupied that position in the list.

Items can contain nil (Delphi) or NULL (C++) references. To remove nil (Delphi) or NULL (C++) references and reduce the size of the array, call the Pack method.

Note: In Delphi, Items is the default property of TObjectList. This means you can omit the property name. Thus, the following two lines of code are both acceptable and do the same thing:

Note: ObjectList1.Items[i] := Form1.FindChildControl(ListBox1.Items[i]);

Note: ObjectList1[i] := Form1.FindChildControl(ListBox1.Items[i]);

69.1.9 TLineNumberMap Class

Class Hierarchy

Pascal

```
TLineNumberMap = class(TObject);
```

C++

```
class TLineNumberMap : public TObject;
```

File

WebScript

Description

This is class WebScript.TLineNumberMap.

69.1.9.1 TLineNumberMap Members

The following tables list the members exposed by TLineNumberMap.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	DestLineToSourceLine (see page 6636)	This is DestLineToSourceLine, a member of class TLineNumberMap.
	Destroy (see page 3366)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	New (see page 6636)	This is New, a member of class TLineNumberMap.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Count (see page 6636)	This is Count, a member of class TLineNumberMap.
	Items (see page 6637)	This is Items, a member of class TLineNumberMap.

69.1.9.2 TLineNumberMap Methods

The methods of the TLineNumberMap class are listed here.

Public Methods

	Name	Description
	DestLineToSourceLine (see page 6636)	This is DestLineToSourceLine, a member of class TLineNumberMap.
	New (see page 6636)	This is New, a member of class TLineNumberMap.

69.1.9.2.1 TLineNumberMap.DestLineToSourceLine Method

Pascal

```
function DestLineToSourceLine(ALine: Integer; var AFileName: string): Integer;
```

C++

```
__fastcall int DestLineToSourceLine(int ALine, UnicodeString AFileName);
```

Description

This is DestLineToSourceLine, a member of class TLineNumberMap.

69.1.9.2.2 TLineNumberMap.New Method

Pascal

```
function New: PLineNumbers;
```

C++

```
__fastcall PLineNumbers New();
```

Description

This is New, a member of class TLineNumberMap.

69.1.9.3 TLineNumberMap Properties

The properties of the TLineNumberMap class are listed here.

Public Properties

	Name	Description
R	Count (see page 6636)	This is Count, a member of class TLineNumberMap.
R	Items (see page 6637)	This is Items, a member of class TLineNumberMap.

69.1.9.3.1 TLineNumberMap.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TLineNumberMap.

69.1.9.3.2 TLineNumberMap.Items Property

Pascal

```
property Items [I: Integer]: PLineNumbers;
```

C++

```
__property PLineNumbers Items[int I];
```

Description

This is Items, a member of class TLineNumberMap.

69.1.10 TScriptCodeItem Class

Class Hierarchy

Pascal

```
TScriptCodeItem = class(TScriptItem);
```

C++

```
class TScriptCodeItem : public TScriptItem;
```

File

WebScript

Description

This is class WebScript.TScriptCodeItem.

69.1.10.1 TScriptCodeItem Members

The following tables list the members exposed by TScriptCodeItem.

Protected Methods

	Name	Description
	GetScript (see page 6639)	This is GetScript, a member of class TScriptCodeItem.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	AssignString (see page 6638)	This is AssignString, a member of class TScriptCodeItem.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.

	Create (see page 6665)	This is Create, a member of class TScriptItem.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Script (see page 6666)	This is Script, a member of class TScriptItem.

69.1.10.2 TScriptCodeItem Methods

The methods of the TScriptCodeItem class are listed here.

Protected Methods

	Name	Description
V	GetScript (see page 6639)	This is GetScript, a member of class TScriptCodeItem.

Public Methods

	Name	Description
	AssignString (see page 6638)	This is AssignString, a member of class TScriptCodeItem.

69.1.10.2.1 TScriptCodeItem.AssignString Method

Pascal

```
procedure AssignString(const AValue: string);
```

C++

```
__fastcall AssignString(const UnicodeString AValue);
```

Description

This is AssignString, a member of class TScriptCodeItem.

69.1.10.2.2 TScriptCodeItem.GetScript Method

Pascal

```
function GetScript: string; override;
```

C++

```
virtual __fastcall UnicodeString GetScript();
```

Description

This is GetScript, a member of class TScriptCodeItem.

69.1.11 TScriptEnginesList Class

Class Hierarchy

Pascal

```
TScriptEnginesList = class(TAbstractScriptEnginesList);
```

C++

```
class TScriptEnginesList : public TAbstractScriptEnginesList;
```

File

WebScript

Description

This is class WebScript.TScriptEnginesList.

69.1.11.1 TScriptEnginesList Members

The following tables list the members exposed by TScriptEnginesList.

Public Methods

	Name	Description
	AddEngine (see page 6641)	This is AddEngine, a member of class TScriptEnginesList.
	AddObjectFactory (see page 6641)	This is AddObjectFactory, a member of class TScriptEnginesList.
	Create (see page 6640)	Constructs an object and initializes its data before the object is first used.
V	Destroy (see page 6640)	Disposes of an object instance.
	Find (see page 6641)	This is Find, a member of class TScriptEnginesList.
V	FindScriptProducerClass (see page 6642)	This is FindScriptProducerClass, a member of class TScriptEnginesList.
	ListLanguageNames (see page 6642)	This is ListLanguageNames, a member of class TScriptEnginesList.
	RemoveEngine (see page 6642)	This is RemoveEngine, a member of class TScriptEnginesList.

Public Properties

	Name	Description
R	Count (see page 6642)	This is Count, a member of class TScriptEnginesList.
R	Items (see page 6643)	This is Items, a member of class TScriptEnginesList.

69.1.11.2 TScriptEnginesList.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScriptEnginesList();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

System::TObject::Free (see page 3382)

69.1.11.3 TScriptEnginesList.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptEnginesList();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

69.1.11.4 TScriptEnginesList Methods

The methods of the TScriptEnginesList class are listed here.

Public Methods

	Name	Description
	AddEngine (see page 6641)	This is AddEngine, a member of class TScriptEnginesList.
	AddObjectFactory (see page 6641)	This is AddObjectFactory, a member of class TScriptEnginesList.
	Find (see page 6641)	This is Find, a member of class TScriptEnginesList.
	FindScriptProducerClass (see page 6642)	This is FindScriptProducerClass, a member of class TScriptEnginesList.
	ListLanguageNames (see page 6642)	This is ListLanguageNames, a member of class TScriptEnginesList.
	RemoveEngine (see page 6642)	This is RemoveEngine, a member of class TScriptEnginesList.

69.1.11.4.1 TScriptEnginesList.AddEngine Method

Pascal

```
procedure AddEngine(AEngine: TAbstractScriptEngine);
```

C++

```
__fastcall AddEngine(TAbstractScriptEngine AEngine);
```

Description

This is AddEngine, a member of class TScriptEnginesList.

69.1.11.4.2 TScriptEnginesList.AddObjectFactory Method

Pascal

```
procedure AddObjectFactory(AFactory: TAbstractScriptObjectFactory; const AEngineName: string);
```

C++

```
__fastcall AddObjectFactory(TAbstractScriptObjectFactory AFactory, const UnicodeString
AEngineName);
```

Description

This is AddObjectFactory, a member of class TScriptEnginesList.

69.1.11.4.3 TScriptEnginesList.Find Method

Pascal

```
function Find(const AName: string): TAbstractScriptEngine;
```

C++

```
__fastcall TAbstractScriptEngine Find(const UnicodeString AName);
```

Description

This is Find, a member of class TScriptEnginesList.

69.1.11.4.4 TScriptEnginesList.FindScriptProducerClass Method

Pascal

```
function FindScriptProducerClass(const ALanguageName: string): TScriptProducerClass; override;
```

C++

```
virtual __fastcall TScriptProducerClass FindScriptProducerClass(const UnicodeString
ALanguageName);
```

Description

This is FindScriptProducerClass, a member of class TScriptEnginesList.

69.1.11.4.5 TScriptEnginesList.ListLanguageNames Method

Pascal

```
procedure ListLanguageNames(AList: TStrings);
```

C++

```
__fastcall ListLanguageNames(TStrings AList);
```

Description

This is ListLanguageNames, a member of class TScriptEnginesList.

69.1.11.4.6 TScriptEnginesList.RemoveEngine Method

Pascal

```
procedure RemoveEngine(AEngine: TAbstractScriptEngine);
```

C++

```
__fastcall RemoveEngine(TAbstractScriptEngine AEngine);
```

Description

This is RemoveEngine, a member of class TScriptEnginesList.

69.1.11.5 TScriptEnginesList Properties

The properties of the TScriptEnginesList class are listed here.

Public Properties

	Name	Description
	Count (see page 6642)	This is Count, a member of class TScriptEnginesList.
	Items (see page 6643)	This is Items, a member of class TScriptEnginesList.

69.1.11.5.1 TScriptEnginesList.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TScriptEnginesList.

69.1.11.5.2 TScriptEnginesList.Items Property

Pascal

```
property Items [I: Integer]: TAbstractScriptEngine;
```

C++

```
__property TAbstractScriptEngine Items[int I];
```

Description

This is Items, a member of class TScriptEnginesList.

69.1.12 TScriptError Class

Class Hierarchy

Pascal

```
TScriptError = class(TAbstractScriptError);
```

C++

```
class TScriptError : public TAbstractScriptError;
```

File

WebScript

Description

This is class WebScript.TScriptError.

69.1.12.1 TScriptError Members

The following tables list the members exposed by TScriptError.

Protected Fields

	Name	Description
	FCharPos (see page 6644)	This is FCharPos, a member of class TScriptError.
	FDescription (see page 6644)	This is FDescription, a member of class TScriptError.
	FFileName (see page 6645)	This is FFileName, a member of class TScriptError.
	FLine (see page 6645)	This is FLine, a member of class TScriptError.
	FSourceLine (see page 6645)	This is FSourceLine, a member of class TScriptError.

Protected Methods

	Name	Description
	GetCharPos (see page 6645)	This is GetCharPos, a member of class TScriptError.
	GetDescription (see page 6646)	This is GetDescription, a member of class TScriptError.
	GetFileName (see page 6646)	This is GetFileName, a member of class TScriptError.
	GetLine (see page 6646)	This is GetLine, a member of class TScriptError.

	GetSourceLine (see page 6646)	This is GetSourceLine, a member of class TScriptError.
	SetDescription (see page 6647)	This is SetDescription, a member of class TScriptError.

Public Methods

	Name	Description
	Create (see page 6644)	This is Create, a member of class TScriptError.

69.1.12.2 TScriptError.Create Constructor

Pascal

```
constructor Create(E: Exception); overload;
```

C++

```
__fastcall TScriptError(Exception E);
```

Description

This is Create, a member of class TScriptError.

69.1.12.3 TScriptError Fields

The fields of the TScriptError class are listed here.

Protected Fields

	Name	Description
	FCharPos (see page 6644)	This is FCharPos, a member of class TScriptError.
	FDescription (see page 6644)	This is FDescription, a member of class TScriptError.
	FFileName (see page 6645)	This is FFileName, a member of class TScriptError.
	FLine (see page 6645)	This is FLine, a member of class TScriptError.
	FSourceLine (see page 6645)	This is FSourceLine, a member of class TScriptError.

69.1.12.3.1 TScriptError.FCharPos Field

Pascal

```
FCharPos: Integer;
```

C++

```
int FCharPos;
```

Description

This is FCharPos, a member of class TScriptError.

69.1.12.3.2 TScriptError.FDescription Field

Pascal

```
FDescription: string;
```

C++

```
UnicodeString FDescription;
```

Description

This is FDescription, a member of class TScriptError.

69.1.12.3.3 TScriptError.FFileName Field

Pascal

```
FFileName: string;
```

C++

```
UnicodeString FFileName;
```

Description

This is FFileName, a member of class TScriptError.

69.1.12.3.4 TScriptError.FLine Field

Pascal

```
FLine: Integer;
```

C++

```
int FLine;
```

Description

This is FLine, a member of class TScriptError.

69.1.12.3.5 TScriptError.FSourceLine Field

Pascal

```
FSourceLine: string;
```

C++

```
UnicodeString FSourceLine;
```

Description

This is FSourceLine, a member of class TScriptError.

69.1.12.4 TScriptError Methods

The methods of the TScriptError class are listed here.

Protected Methods

	Name	Description
	GetCharPos (see page 6645)	This is GetCharPos, a member of class TScriptError.
	GetDescription (see page 6646)	This is GetDescription, a member of class TScriptError.
	GetFileName (see page 6646)	This is GetFileName, a member of class TScriptError.
	GetLine (see page 6646)	This is GetLine, a member of class TScriptError.
	GetSourceLine (see page 6646)	This is GetSourceLine, a member of class TScriptError.
	SetDescription (see page 6647)	This is SetDescription, a member of class TScriptError.

69.1.12.4.1 TScriptError.GetCharPos Method

Pascal

```
function GetCharPos: Integer; override;
```

C++

```
virtual __fastcall int GetCharPos();
```

Description

This is GetCharPos, a member of class TScriptError.

69.1.12.4.2 TScriptError.GetDescription Method

Pascal

```
function GetDescription: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDescription();
```

Description

This is GetDescription, a member of class TScriptError.

69.1.12.4.3 TScriptError.GetFileName Method

Pascal

```
function GetFileName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetFileName();
```

Description

This is GetFileName, a member of class TScriptError.

69.1.12.4.4 TScriptError.GetLine Method

Pascal

```
function GetLine: Integer; override;
```

C++

```
virtual __fastcall int GetLine();
```

Description

This is GetLine, a member of class TScriptError.

69.1.12.4.5 TScriptError.GetSourceLine Method

Pascal

```
function GetSourceLine: string; override;
```

C++

```
virtual __fastcall UnicodeString GetSourceLine();
```

Description

This is GetSourceLine, a member of class TScriptError.

69.1.12.4.6 TScriptError.SetDescription Method

Pascal

```
procedure SetDescription(const AValue: string); override;
```

C++

```
virtual __fastcall SetDescription(const UnicodeString AValue);
```

Description

This is SetDescription, a member of class TScriptError.

69.1.13 TScriptErrors Class

Class Hierarchy

Pascal

```
TScriptErrors = class(TAbstractScriptErrors);
```

C++

```
class TScriptErrors : public TAbstractScriptErrors;
```

File

WebScript

Description

This is class WebScript.TScriptErrors.

69.1.13.1 TScriptErrors Members

The following tables list the members exposed by TScriptErrors.

Protected Methods

	Name	Description
	GetError (see page 6649)	This is GetError, a member of class TScriptErrors.
	GetErrorCount (see page 6649)	This is GetErrorCount, a member of class TScriptErrors.

Public Methods

	Name	Description
	Add (see page 6649)	This is Add, a member of class TScriptErrors.
	Create (see page 6647)	Constructs an object and initializes its data before the object is first used.
	Destroy (see page 6648)	Disposes of an object instance.

69.1.13.2 TScriptErrors.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScriptErrors();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

System::TObject::Free (see page 3382)

69.1.13.3 TScriptErrors.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptErrors();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

69.1.13.4 TScriptErrors Methods

The methods of the TScriptErrors class are listed here.

Protected Methods

	Name	Description
	GetError (see page 6649)	This is GetError, a member of class TScriptErrors.
	GetErrorCount (see page 6649)	This is GetErrorCount, a member of class TScriptErrors.

Public Methods

	Name	Description
	Add (see page 6649)	This is Add, a member of class TScriptErrors.

69.1.13.4.1 TScriptErrors.Add Method

Pascal

```
procedure Add(const AError: TAbstractScriptError); override;
```

C++

```
virtual __fastcall Add(const TAbstractScriptError AError);
```

Description

This is Add, a member of class TScriptErrors.

69.1.13.4.2 TScriptErrors.GetError Method

Pascal

```
function GetError(I: Integer): TAbstractScriptError; override;
```

C++

```
virtual __fastcall TAbstractScriptError GetError(int I);
```

Description

This is GetError, a member of class TScriptErrors.

69.1.13.4.3 TScriptErrors.GetErrorCount Method

Pascal

```
function GetErrorCount: Integer; override;
```

C++

```
virtual __fastcall int GetErrorCount();
```

Description

This is GetErrorCount, a member of class TScriptErrors.

69.1.14 TScriptFile Class

Class Hierarchy

Pascal

```
TScriptFile = class;
```

C++

```
class TScriptFile;
```

File

WebScript

Description

This is class WebScript.TScriptFile.

69.1.14.1 TScriptFile Members

The following tables list the members exposed by TScriptFile.

Public Fields

	Name	Description
	FLineNumberMap (see page 6651)	This is FLineNumberMap, a member of class TScriptFile.

Public Methods

	Name	Description
	Create (see page 6650)	This is Create, a member of class TScriptFile.
V	Destroy (see page 6650)	This is Destroy, a member of class TScriptFile.
	ParseStream (see page 6651)	This is ParseStream, a member of class TScriptFile.
	ParseString (see page 6651)	This is ParseString, a member of class TScriptFile.

Public Properties

	Name	Description
R	ApplicationName (see page 6652)	This is ApplicationName, a member of class TScriptFile.
R	LongName (see page 6652)	This is LongName, a member of class TScriptFile.
R	Script (see page 6652)	This is Script, a member of class TScriptFile.
R	ShortName (see page 6653)	This is ShortName, a member of class TScriptFile.
R	Source (see page 6653)	This is Source, a member of class TScriptFile.

69.1.14.2 TScriptFile.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall TScriptFile(TScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptFile.

69.1.14.3 TScriptFile.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptFile();
```

Description

This is Destroy, a member of class TScriptFile.

69.1.14.4 TScriptFile Fields

The fields of the TScriptFile class are listed here.

Public Fields

	Name	Description
	FLineNumberMap (see page 6651)	This is FLineNumberMap, a member of class TScriptFile.

69.1.14.4.1 TScriptFile.FLineNumberMap Field

Pascal

```
FLineNumberMap: TLineNumberMap;
```

C++

```
TLineNumberMap FLineNumberMap;
```

Description

This is FLineNumberMap, a member of class TScriptFile.

69.1.14.5 TScriptFile Methods

The methods of the TScriptFile class are listed here.

Public Methods

	Name	Description
	ParseStream (see page 6651)	This is ParseStream, a member of class TScriptFile.
	ParseString (see page 6651)	This is ParseString, a member of class TScriptFile.

69.1.14.5.1 TScriptFile.ParseStream Method

Pascal

```
procedure ParseStream(ASource: TStream; AOwned: Boolean);
```

C++

```
__fastcall ParseStream(TStream ASource, Boolean AOwned);
```

Description

This is ParseStream, a member of class TScriptFile.

69.1.14.5.2 TScriptFile.ParseString Method

Pascal

```
procedure ParseString(const ASource: string);
```

C++

```
__fastcall ParseString(const UnicodeString ASource);
```

Description

This is ParseString, a member of class TScriptFile.

69.1.14.6 TScriptFile Properties

The properties of the TScriptFile class are listed here.

Public Properties

	Name	Description
	ApplicationName (see page 6652)	This is ApplicationName, a member of class TScriptFile.
	LongName (see page 6652)	This is LongName, a member of class TScriptFile.
	Script (see page 6652)	This is Script, a member of class TScriptFile.
	ShortName (see page 6653)	This is ShortName, a member of class TScriptFile.
	Source (see page 6653)	This is Source, a member of class TScriptFile.

69.1.14.6.1 TScriptFile.ApplicationName Property

Pascal

```
property ApplicationName: string;
```

C++

```
__property UnicodeString ApplicationName;
```

Description

This is ApplicationName, a member of class TScriptFile.

69.1.14.6.2 TScriptFile.LongName Property

Pascal

```
property LongName: string;
```

C++

```
__property UnicodeString LongName;
```

Description

This is LongName, a member of class TScriptFile.

69.1.14.6.3 TScriptFile.Script Property

Pascal

```
property Script: string;
```

C++

```
__property UnicodeString Script;
```

Description

This is Script, a member of class TScriptFile.

69.1.14.6.4 TScriptFile.ShortName Property

Pascal

```
property ShortName: string;
```

C++

```
__property UnicodeString ShortName;
```

Description

This is ShortName, a member of class TScriptFile.

69.1.14.6.5 TScriptFile.Source Property

Pascal

```
property Source: string;
```

C++

```
__property UnicodeString Source;
```

Description

This is Source, a member of class TScriptFile.

69.1.15 TScriptGlobalObjects Class

Class Hierarchy

Pascal

```
TScriptGlobalObjects = class(TObject);
```

C++

```
class TScriptGlobalObjects : public TObject;
```

File

WebScript

Description

This is class WebScript.TScriptGlobalObjects.

69.1.15.1 TScriptGlobalObjects Members

The following tables list the members exposed by TScriptGlobalObjects.

Protected Methods

	Name	Description
	GetScriptEngine (see page 6656)	This is GetScriptEngine, a member of class TScriptGlobalObjects.

Public Methods

	Name	Description
	AddNamedIntf (see page 6656)	This is AddNamedIntf, a member of class TScriptGlobalObjects.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6654)	This is Create, a member of class TScriptGlobalObjects.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 6655)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindNamedItemIntf (see page 6656)	This is FindNamedItemIntf, a member of class TScriptGlobalObjects.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamedItemCount (see page 6656)	This is GetNamedItemCount, a member of class TScriptGlobalObjects.
	GetNamedItemName (see page 6656)	This is GetNamedItemName, a member of class TScriptGlobalObjects.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	NamedItemCount (see page 6657)	This is NamedItemCount, a member of class TScriptGlobalObjects.
R	NamedItemName (see page 6657)	This is NamedItemName, a member of class TScriptGlobalObjects.
R	Producer (see page 6657)	This is Producer, a member of class TScriptGlobalObjects.
R	ScriptEngine (see page 6658)	This is ScriptEngine, a member of class TScriptGlobalObjects.

69.1.15.2 TScriptGlobalObjects.Create Constructor

Pascal

```
constructor Create(AProducer: IScriptProducer);
```

C++

```
__fastcall TScriptGlobalObjects(IScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptGlobalObjects.

69.1.15.3 TScriptGlobalObjects.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptGlobalObjects();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

69.1.15.4 TScriptGlobalObjects Methods

The methods of the TScriptGlobalObjects class are listed here.

Protected Methods

	Name	Description
	GetScriptEngine (see page 6656)	This is GetScriptEngine, a member of class TScriptGlobalObjects.

Public Methods

	Name	Description
	AddNamedIntf (see page 6656)	This is AddNamedIntf, a member of class TScriptGlobalObjects.
	FindNamedItemIntf (see page 6656)	This is FindNamedItemIntf, a member of class TScriptGlobalObjects.
	GetNamedItemCount (see page 6656)	This is GetNamedItemCount, a member of class TScriptGlobalObjects.
	GetNamedItemName (see page 6656)	This is GetNamedItemName, a member of class TScriptGlobalObjects.

69.1.15.4.1 TScriptGlobalObjects.AddNamedIntf Method

Pascal

```
procedure AddNamedIntf(const AName: string; AIntf: IUnknown);
```

C++

```
__fastcall AddNamedIntf(const UnicodeString AName, IUnknown AIntf);
```

Description

This is AddNamedIntf, a member of class TScriptGlobalObjects.

69.1.15.4.2 TScriptGlobalObjects.FindNamedItemIntf Method

Pascal

```
function FindNamedItemIntf(const AName: string): IUnknown;
```

C++

```
__fastcall IUnknown FindNamedItemIntf(const UnicodeString AName);
```

Description

This is FindNamedItemIntf, a member of class TScriptGlobalObjects.

69.1.15.4.3 TScriptGlobalObjects.GetNamedItemCount Method

Pascal

```
function GetNamedItemCount: Integer;
```

C++

```
__fastcall int GetNamedItemCount();
```

Description

This is GetNamedItemCount, a member of class TScriptGlobalObjects.

69.1.15.4.4 TScriptGlobalObjects.GetNamedItemName Method

Pascal

```
function GetNamedItemName(I: Integer): string;
```

C++

```
__fastcall UnicodeString GetNamedItemName(int I);
```

Description

This is GetNamedItemName, a member of class TScriptGlobalObjects.

69.1.15.4.5 TScriptGlobalObjects.GetScriptEngine Method

Pascal

```
function GetScriptEngine: TAbstractScriptEngine; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractScriptEngine GetScriptEngine() = 0;
```

Description

This is GetScriptEngine, a member of class TScriptGlobalObjects.

69.1.15.5 TScriptGlobalObjects Properties

The properties of the TScriptGlobalObjects class are listed here.

Public Properties

	Name	Description
	NamedItemCount (see page 6657)	This is NamedItemCount, a member of class TScriptGlobalObjects.
	NamedItemName (see page 6657)	This is NamedItemName, a member of class TScriptGlobalObjects.
	Producer (see page 6657)	This is Producer, a member of class TScriptGlobalObjects.
	ScriptEngine (see page 6658)	This is ScriptEngine, a member of class TScriptGlobalObjects.

69.1.15.5.1 TScriptGlobalObjects.NamedItemCount Property

Pascal

```
property NamedItemCount: Integer;
```

C++

```
__property int NamedItemCount;
```

Description

This is NamedItemCount, a member of class TScriptGlobalObjects.

69.1.15.5.2 TScriptGlobalObjects.NamedItemName Property

Pascal

```
property NamedItemName [I: Integer]: string;
```

C++

```
__property UnicodeString NamedItemName[int I];
```

Description

This is NamedItemName, a member of class TScriptGlobalObjects.

69.1.15.5.3 TScriptGlobalObjects.Producer Property

Pascal

```
property Producer: IScriptProducer;
```

C++

```
__property IScriptProducer Producer;
```

Description

This is Producer, a member of class TScriptGlobalObjects.

69.1.15.5.4 TScriptGlobalObjects.ScriptEngine Property

Pascal

```
property ScriptEngine: TAbstractScriptEngine;
```

C++

```
__property TAbstractScriptEngine ScriptEngine;
```

Description

This is ScriptEngine, a member of class TScriptGlobalObjects.

69.1.16 TScriptIncludeFile Class

Class Hierarchy

Pascal

```
TScriptIncludeFile = class(TScriptFile);
```

C++

```
class TScriptIncludeFile : public TScriptFile;
```

File

WebScript

Description

This is class WebScript.TScriptIncludeFile.

69.1.16.1 TScriptIncludeFile Members

The following tables list the members exposed by TScriptIncludeFile.

Public Fields

	Name	Description
	FLineNumberMap (see page 6651)	This is FLineNumberMap, a member of class TScriptFile.

Public Methods

	Name	Description
	Create (see page 6659)	This is Create, a member of class TScriptIncludeFile.
V	Destroy (see page 6650)	This is Destroy, a member of class TScriptFile.
	LoadFile (see page 6659)	This is LoadFile, a member of class TScriptIncludeFile.
	ParseStream (see page 6651)	This is ParseStream, a member of class TScriptFile.
	ParseString (see page 6651)	This is ParseString, a member of class TScriptFile.

Public Properties

	Name	Description
R	ApplicationName (see page 6652)	This is ApplicationName, a member of class TScriptFile.
R	LongName (see page 6652)	This is LongName, a member of class TScriptFile.
R	Script (see page 6652)	This is Script, a member of class TScriptFile.

	ShortName (see page 6653)	This is ShortName, a member of class TScriptFile.
	Source (see page 6653)	This is Source, a member of class TScriptFile.

69.1.16.2 TScriptIncludeFile.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer; AIncludeType: TIncludeType; const AFileName:
string);
```

C++

```
__fastcall TScriptIncludeFile(TScriptProducer AProducer, TIncludeType AIncludeType, const
UnicodeString AFileName);
```

Description

This is Create, a member of class TScriptIncludeFile.

69.1.16.3 TScriptIncludeFile Methods

The methods of the TScriptIncludeFile class are listed here.

Public Methods

	Name	Description
	LoadFile (see page 6659)	This is LoadFile, a member of class TScriptIncludeFile.

69.1.16.3.1 TScriptIncludeFile.LoadFile Method

Pascal

```
procedure LoadFile;
```

C++

```
__fastcall LoadFile();
```

Description

This is LoadFile, a member of class TScriptIncludeFile.

69.1.17 TScriptIncludeFiles Class

Class Hierarchy

Pascal

```
TScriptIncludeFiles = class(TObjectList);
```

C++

```
class TScriptIncludeFiles : public TObjectList;
```

File

WebScript

Description

This is class WebScript.TScriptIncludeFiles.

69.1.17.1 TScriptIncludeFiles Members

The following tables list the members exposed by TScriptIncludeFiles.

Public Methods

	Name	Description
	Create (see page 6660)	This is Create, a member of class TScriptIncludeFiles.
	GetScriptIncludeFile (see page 6660)	This is GetScriptIncludeFile, a member of class TScriptIncludeFiles.

Public Properties

	Name	Description
	Items (see page 6661)	Lists the object references.

69.1.17.2 TScriptIncludeFiles.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall TScriptIncludeFiles(TScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptIncludeFiles.

69.1.17.3 TScriptIncludeFiles Methods

The methods of the TScriptIncludeFiles class are listed here.

Public Methods

	Name	Description
	GetScriptIncludeFile (see page 6660)	This is GetScriptIncludeFile, a member of class TScriptIncludeFiles.

69.1.17.3.1 TScriptIncludeFiles.GetScriptIncludeFile Method

Pascal

```
function GetScriptIncludeFile(I: Integer): TScriptIncludeFile;
```

C++

```
__fastcall TScriptIncludeFile GetScriptIncludeFile(int I);
```

Description

This is GetScriptIncludeFile, a member of class TScriptIncludeFiles.

69.1.17.4 TScriptIncludeFiles Properties

The properties of the TScriptIncludeFiles class are listed here.

Public Properties

	Name	Description
	Items (see page 6661)	Lists the object references.

69.1.17.4.1 TScriptIncludeFiles.Items Property

Lists the object references.

Pascal

```
property Items [Index: Integer]: TScriptIncludeFile;
```

C++

```
__property TScriptIncludeFile Items[int Index];
```

Description

Use Items to access objects in the list. Items is a zero-based array: The first object is indexed as 0, the second object is indexed as 1, and so forth. You can read or change the value at a specific index, or use Items with the Count property to iterate through the list.

If OwnsObjects is true, reassigning an Items index frees the object that previously occupied that position in the list.

Items can contain nil (Delphi) or NULL (C++) references. To remove nil (Delphi) or NULL (C++) references and reduce the size of the array, call the Pack method.

Note: In Delphi, Items is the default property of TObjectList. This means you can omit the property name. Thus, the following two lines of code are both acceptable and do the same thing:

Note: ObjectList1.Items[i] := Form1.FindChildControl(ListBox1.Items[i]);

Note: ObjectList1[i] := Form1.FindChildControl(ListBox1.Items[i]);

69.1.18 TScriptIncludeItem Class

Class Hierarchy

Pascal

```
TScriptIncludeItem = class(TScriptItem);
```

C++

```
class TScriptIncludeItem : public TScriptItem;
```

File

WebScript

Description

This is class WebScript.TScriptIncludeItem.

69.1.18.1 TScriptIncludeItem Members

The following tables list the members exposed by TScriptIncludeItem.

Protected Methods

	Name	Description
	GetScript (see page 6663)	This is GetScript, a member of class TScriptIncludeItem.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6663)	This is Create, a member of class TScriptIncludeItem.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.

	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Script (see page 6666)	This is Script, a member of class TScriptItem.

69.1.18.2 TScriptIncludeItem.Create Constructor

Pascal

```
constructor Create(AItems: TScriptItems; AIncludeFile: TScriptIncludeFile);
```

C++

```
__fastcall TScriptIncludeItem(TScriptItems AItems, TScriptIncludeFile AIncludeFile);
```

Description

This is Create, a member of class TScriptIncludeItem.

69.1.18.3 TScriptIncludeItem Methods

The methods of the TScriptIncludeItem class are listed here.

Protected Methods

	Name	Description
V	GetScript (see page 6663)	This is GetScript, a member of class TScriptIncludeItem.

69.1.18.3.1 TScriptIncludeItem.GetScript Method

Pascal

```
function GetScript: string; override;
```

C++

```
virtual __fastcall UnicodeString GetScript();
```

Description

This is GetScript, a member of class TScriptIncludeItem.

69.1.19 TScriptItem Class

Class Hierarchy

Pascal

```
TScriptItem = class(TObject);

WebScript

Description

This is class WebScript.TScriptItem.

69.1.19.1 TScriptItem Members

The following tables list the members exposed by TScriptItem.

Protected Methods

	Name	Description
	GetScript (see page 6665)	This is GetScript, a member of class TScriptItem.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6665)	This is Create, a member of class TScriptItem.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Script (see page 6666)	This is Script, a member of class TScriptItem.

69.1.19.2 TScriptItem.Create Constructor

Pascal

```
constructor Create(AItems: TScriptItems);
```

C++

```
__fastcall TScriptItem(TScriptItems AItems);
```

Description

This is Create, a member of class TScriptItem.

69.1.19.3 TScriptItem Methods

The methods of the TScriptItem class are listed here.

Protected Methods

	Name	Description
V	GetScript (see page 6665)	This is GetScript, a member of class TScriptItem.

69.1.19.3.1 TScriptItem.GetScript Method

Pascal

```
function GetScript: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetScript();
```

Description

This is GetScript, a member of class TScriptItem.

69.1.19.4 TScriptItem Properties

The properties of the TScriptItem class are listed here.

Public Properties

	Name	Description
	Script (see page 6666)	This is Script, a member of class TScriptItem.

69.1.19.4.1 TScriptItem.Script Property

Pascal

```
property Script: string;
```

C++

```
__property UnicodeString Script;
```

Description

This is Script, a member of class TScriptItem.

69.1.20 TScriptItems Class

Class Hierarchy

Pascal

```
TScriptItems = class(TObjectList);
```

C++

```
class TScriptItems : public TObjectList;
```

File

WebScript

Description

This is class WebScript.TScriptItems.

69.1.20.1 TScriptItems Members

The following tables list the members exposed by TScriptItems.

Public Methods

	Name	Description
	Create (see page 6667)	This is Create, a member of class TScriptItems.
	GetScriptItem (see page 6667)	This is GetScriptItem, a member of class TScriptItems.

Public Properties

	Name	Description
	Items (see page 6667)	Lists the object references.

69.1.20.2 TScriptItems.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall TScriptItems(TScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptItems.

69.1.20.3 TScriptItems Methods

The methods of the TScriptItems class are listed here.

Public Methods

	Name	Description
	GetScriptItem (see page 6667)	This is GetScriptItem, a member of class TScriptItems.

69.1.20.3.1 TScriptItems.GetScriptItem Method

Pascal

```
function GetScriptItem(I: Integer): TScriptItem;
```

C++

```
__fastcall TScriptItem GetScriptItem(int I);
```

Description

This is GetScriptItem, a member of class TScriptItems.

69.1.20.4 TScriptItems Properties

The properties of the TScriptItems class are listed here.

Public Properties

	Name	Description
R	Items (see page 6667)	Lists the object references.

69.1.20.4.1 TScriptItems.Items Property

Lists the object references.

Pascal

```
property Items [Index: Integer]: TScriptItem;
```

C++

```
__property TScriptItem Items[int Index];
```

Description

Use Items to access objects in the list. Items is a zero-based array: The first object is indexed as 0, the second object is indexed

as 1, and so forth. You can read or change the value at a specific index, or use Items with the Count property to iterate through the list.

If OwnsObjects is true, reassigning an Items index frees the object that previously occupied that position in the list.

Items can contain nil (Delphi) or NULL (C++) references. To remove nil (Delphi) or NULL (C++) references and reduce the size of the array, call the Pack method.

Note: In Delphi, Items is the default property of TObjectList. This means you can omit the property name. Thus, the following two lines of code are both acceptable and do the same thing:

Note: ObjectList1.Items[i] := Form1.FindChildControl(ListBox1.Items[i]);

Note: ObjectList1[i] := Form1.FindChildControl(ListBox1.Items[i]);

69.1.21 TScriptObjectFactories Class

Class Hierarchy

Pascal

```
TScriptObjectFactories = class(TAbstractScriptObjectFactories);
```

C++

```
class TScriptObjectFactories : public TAbstractScriptObjectFactories;
```

File

WebScript

Description

This is class WebScript.TScriptObjectFactories.

69.1.21.1 TScriptObjectFactories Members

The following tables list the members exposed by TScriptObjectFactories.

Protected Methods

	Name	Description
	GetCount (see page 6671)	This is GetCount, a member of class TScriptObjectFactories.
	GetFactory (see page 6671)	This is GetFactory, a member of class TScriptObjectFactories.
	GetObjectList (see page 6672)	This is GetObjectList, a member of class TScriptObjectFactories.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6670)	Constructs an object and initializes its data before the object is first used.
	CreateGlobalObject (see page 6671)	This is CreateGlobalObject, a member of class TScriptObjectFactories.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 6670)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Count (see page 6672)	This is Count, a member of class TScriptObjectFactories.
	Factories (see page 6672)	This is Factories, a member of class TScriptObjectFactories.
	ObjectList (see page 6621)	This is ObjectList, a member of class TAbstractScriptObjectFactories.

69.1.21.2 TScriptObjectFactories.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScriptObjectFactories();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

System::TObject::Free (see page 3382)

69.1.21.3 TScriptObjectFactories.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptObjectFactories();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

69.1.21.4 TScriptObjectFactories Methods

The methods of the TScriptObjectFactories class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 6671)	This is GetCount, a member of class TScriptObjectFactories.
	GetFactory (see page 6671)	This is GetFactory, a member of class TScriptObjectFactories.
	GetObjectList (see page 6672)	This is GetObjectList, a member of class TScriptObjectFactories.

Public Methods

	Name	Description
	CreateGlobalObject (see page 6671)	This is CreateGlobalObject, a member of class TScriptObjectFactories.

69.1.21.4.1 TScriptObjectFactories.CreateGlobalObject Method

Pascal

```
function CreateGlobalObject(AVariable: TGlobalScriptVariables; AContext: IScriptContext):
IInterface;
```

C++

```
__fastcall IInterface CreateGlobalObject(TGlobalScriptVariables AVariable, IScriptContext
AContext);
```

Description

This is CreateGlobalObject, a member of class TScriptObjectFactories.

69.1.21.4.2 TScriptObjectFactories.GetCount Method

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

This is GetCount, a member of class TScriptObjectFactories.

69.1.21.4.3 TScriptObjectFactories.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractScriptObjectFactory; override;
```

C++

```
virtual __fastcall TAbstractScriptObjectFactory GetFactory(int I);
```

Description

This is GetFactory, a member of class TScriptObjectFactories.

69.1.21.4.4 TScriptObjectFactories.GetObjectList Method

Pascal

```
function GetObjectList: TObjectList; override;
```

C++

```
virtual __fastcall TObjectList GetObjectList();
```

Description

This is GetObjectList, a member of class TScriptObjectFactories.

69.1.21.5 TScriptObjectFactories Properties

The properties of the TScriptObjectFactories class are listed here.

Public Properties

	Name	Description
	Count (see page 6672)	This is Count, a member of class TScriptObjectFactories.
	Factories (see page 6672)	This is Factories, a member of class TScriptObjectFactories.

69.1.21.5.1 TScriptObjectFactories.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TScriptObjectFactories.

69.1.21.5.2 TScriptObjectFactories.Factories Property

Pascal

```
property Factories [I: Integer]: TAbstractScriptObjectFactory;
```

C++

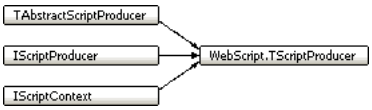
```
__property TAbstractScriptObjectFactory Factories[int I];
```

Description

This is Factories, a member of class TScriptObjectFactories.

69.1.22 TScriptProducer Class

Class Hierarchy



Pascal

```
TScriptProducer = class(TAbstractScriptProducer, IScriptProducer, IScriptContext);
```

C++

```
class TScriptProducer : public TAbstractScriptProducer, public IScriptProducer, public
IScriptContext;
```

File

WebScript

Description

This is class WebScript.TScriptProducer.

69.1.22.1 TScriptProducer Members

The following tables list the members exposed by TScriptProducer.

Protected Fields

	Name	Description
	FErrors (see page 6675)	This is FErrors, a member of class TScriptProducer.
	FScriptEngine (see page 6675)	This is FScriptEngine, a member of class TScriptProducer.
	FScriptFile (see page 6676)	This is FScriptFile, a member of class TScriptProducer.

Protected Methods

	Name	Description
	Evaluate (see page 6676)	This is Evaluate, a member of class TScriptProducer.
A	EvaluateExpression (see page 6676)	This is EvaluateExpression, a member of class TScriptProducer.
	GetContent (see page 6677)	This is GetContent, a member of class TScriptProducer.
	GetErrors (see page 6677)	This is GetErrors, a member of class TScriptProducer.
	GetHTMLBlock (see page 6677)	This is GetHTMLBlock, a member of class TScriptProducer.
	GetHTMLBlockCount (see page 6677)	This is GetHTMLBlockCount, a member of class TScriptProducer.
	GetWebModuleContext (see page 6678)	This is GetWebModuleContext, a member of class TScriptProducer.
	HandleParserError (see page 6678)	This is HandleParserError, a member of class TScriptProducer.
	HandleScriptError (see page 6678)	This is HandleScriptError, a member of class TScriptProducer.
A	ImplHandleScriptError (see page 6678)	This is ImplHandleScriptError, a member of class TScriptProducer.
	ParseStream (see page 6678)	This is ParseStream, a member of class TScriptProducer.
	ParseString (see page 6679)	This is ParseString, a member of class TScriptProducer.
	ReplaceTags (see page 6679)	This is ReplaceTags, a member of class TScriptProducer.
	SetContent (see page 6679)	This is SetContent, a member of class TScriptProducer.
	Write (see page 6679)	This is the overview for the Write method overload.
	WriteItem (see page 6680)	This is WriteItem, a member of class TScriptProducer.

Protected Properties

	Name	Description
	Component (see page 6681)	This is Component, a member of class TScriptProducer.
	Content (see page 6681)	This is Content, a member of class TScriptProducer.
	Designing (see page 6681)	This is Designing, a member of class TScriptProducer.
	Errors (see page 6681)	This is Errors, a member of class TScriptProducer.
	Script (see page 6682)	This is Script, a member of class TScriptProducer.

Public Methods

	Name	Description
	Create (see page 6674)	Constructs an object and initializes its data before the object is first used.
	Destroy (see page 6674)	Disposes of an object instance.

69.1.22.2 TScriptProducer.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create(AWebModuleContext: TWebModuleContext; AStripParamQuotes: Boolean;
AHandleTag: THandleTagProc; const AScriptEngine: string; ALocateFileService:
ILocateFileService); override;
```

C++

```
virtual __fastcall TScriptProducer(TWebModuleContext AWebModuleContext, Boolean
AStripParamQuotes, THandleTagProc AHandleTag, const UnicodeString AScriptEngine,
ILocateFileService ALocateFileService);
```

Description

Do not create instances of Create. Instead, construct descendants of Create using the new keyword, passing any arguments for the descendant object's constructor.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

new

69.1.22.3 TScriptProducer.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptProducer();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil

before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

69.1.22.4 TScriptProducer Fields

The fields of the TScriptProducer class are listed here.

Protected Fields

	Name	Description
	FErrors (see page 6675)	This is FErrors, a member of class TScriptProducer.
	FScriptEngine (see page 6675)	This is FScriptEngine, a member of class TScriptProducer.
	FScriptFile (see page 6676)	This is FScriptFile, a member of class TScriptProducer.

69.1.22.4.1 TScriptProducer.FErrors Field

Pascal

```
FErrors: TAbstractScriptErrors;
```

C++

```
TAbstractScriptErrors FErrors;
```

Description

This is FErrors, a member of class TScriptProducer.

69.1.22.4.2 TScriptProducer.FScriptEngine Field

Pascal

```
FScriptEngine: string;
```

C++

```
UnicodeString FScriptEngine;
```

Description

This is FScriptEngine, a member of class TScriptProducer.

69.1.22.4.3 TScriptProducer.FScriptFile Field

Pascal

```
FScriptFile: TScriptFile;
```

C++

```
TScriptFile FScriptFile;
```

Description

This is FScriptFile, a member of class TScriptProducer.

69.1.22.5 TScriptProducer Methods

The methods of the TScriptProducer class are listed here.

Protected Methods

	Name	Description
	Evaluate (see page 6676)	This is Evaluate, a member of class TScriptProducer.
A	EvaluateExpression (see page 6676)	This is EvaluateExpression, a member of class TScriptProducer.
	GetContent (see page 6677)	This is GetContent, a member of class TScriptProducer.
	GetErrors (see page 6677)	This is GetErrors, a member of class TScriptProducer.
	GetHTMLBlock (see page 6677)	This is GetHTMLBlock, a member of class TScriptProducer.
	GetHTMLBlockCount (see page 6677)	This is GetHTMLBlockCount, a member of class TScriptProducer.
	GetWebModuleContext (see page 6678)	This is GetWebModuleContext, a member of class TScriptProducer.
	HandleParserError (see page 6678)	This is HandleParserError, a member of class TScriptProducer.
	HandleScriptError (see page 6678)	This is HandleScriptError, a member of class TScriptProducer.
A	ImplHandleScriptError (see page 6678)	This is ImplHandleScriptError, a member of class TScriptProducer.
	ParseStream (see page 6678)	This is ParseStream, a member of class TScriptProducer.
	ParseString (see page 6679)	This is ParseString, a member of class TScriptProducer.
	ReplaceTags (see page 6679)	This is ReplaceTags, a member of class TScriptProducer.
	SetContent (see page 6679)	This is SetContent, a member of class TScriptProducer.
	Write (see page 6679)	This is the overview for the Write method overload.
	WriteItem (see page 6680)	This is WriteItem, a member of class TScriptProducer.

69.1.22.5.1 TScriptProducer.Evaluate Method

Pascal

```
function Evaluate: string;
```

C++

```
__fastcall UnicodeString Evaluate();
```

Description

This is Evaluate, a member of class TScriptProducer.

69.1.22.5.2 TScriptProducer.EvaluateExpression Method

Pascal

```
function EvaluateExpression(AScriptFile: TScriptFile): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString EvaluateExpression(TScriptFile AScriptFile) = 0;
```

Description

This is EvaluateExpression, a member of class TScriptProducer.

69.1.22.5.3 TScriptProducer.GetContent Method

Pascal

```
function GetContent: string;
```

C++

```
__fastcall UnicodeString GetContent();
```

Description

This is GetContent, a member of class TScriptProducer.

69.1.22.5.4 TScriptProducer.GetErrors Method

Pascal

```
function GetErrors: TAbstractScriptErrors;
```

C++

```
__fastcall TAbstractScriptErrors GetErrors();
```

Description

This is GetErrors, a member of class TScriptProducer.

69.1.22.5.5 TScriptProducer.GetHTMLBlock Method

Pascal

```
function GetHTMLBlock(I: Integer): string;
```

C++

```
__fastcall UnicodeString GetHTMLBlock(int I);
```

Description

This is GetHTMLBlock, a member of class TScriptProducer.

69.1.22.5.6 TScriptProducer.GetHTMLBlockCount Method

Pascal

```
function GetHTMLBlockCount: Integer;
```

C++

```
__fastcall int GetHTMLBlockCount();
```

Description

This is GetHTMLBlockCount, a member of class TScriptProducer.

69.1.22.5.7 TScriptProducer.GetWebModuleContext Method

Pascal

```
function GetWebModuleContext: TWebModuleContext;
```

C++

```
__fastcall TWebModuleContext GetWebModuleContext();
```

Description

This is GetWebModuleContext, a member of class TScriptProducer.

69.1.22.5.8 TScriptProducer.HandleParserError Method

Pascal

```
procedure HandleParserError(E: Exception);
```

C++

```
__fastcall HandleParserError(Exception E);
```

Description

This is HandleParserError, a member of class TScriptProducer.

69.1.22.5.9 TScriptProducer.HandleScriptError Method

Pascal

```
function HandleScriptError(const ScriptError: IUnknown): HRESULT;
```

C++

```
__fastcall HRESULT HandleScriptError(const IUnknown ScriptError);
```

Description

This is HandleScriptError, a member of class TScriptProducer.

69.1.22.5.10 TScriptProducer.ImplHandleScriptError Method

Pascal

```
function ImplHandleScriptError(const ScriptError: IUnknown): HRESULT; virtual; abstract;
```

C++

```
virtual __fastcall HRESULT ImplHandleScriptError(const IUnknown ScriptError) = 0;
```

Description

This is ImplHandleScriptError, a member of class TScriptProducer.

69.1.22.5.11 TScriptProducer.ParseStream Method

Pascal

```
procedure ParseStream(Stream: TStream; Owned: Boolean);
```

C++

```
__fastcall ParseStream(TStream Stream, Boolean Owned);
```

Description

This is ParseStream, a member of class TScriptProducer.

69.1.22.5.12 TScriptProducer.ParseString Method

Pascal

```
procedure ParseString(const S: string);
```

C++

```
__fastcall ParseString(const UnicodeString S);
```

Description

This is ParseString, a member of class TScriptProducer.

69.1.22.5.13 TScriptProducer.ReplaceTags Method

Pascal

```
function ReplaceTags(const AValue: string): string;
```

C++

```
__fastcall UnicodeString ReplaceTags(const UnicodeString AValue);
```

Description

This is ReplaceTags, a member of class TScriptProducer.

69.1.22.5.14 TScriptProducer.SetContent Method

Pascal

```
procedure SetContent(const Value: string);
```

C++

```
__fastcall SetContent(const UnicodeString Value);
```

Description

This is SetContent, a member of class TScriptProducer.

69.1.22.5.15 Write Method

This is the overview for the Write method overload.

Overload List

	Name	Description
	TScriptProducer.Write (PAnsiChar) (see page 6680)	This is Write, a member of class TScriptProducer.
	TScriptProducer.Write (PWideChar, Integer) (see page 6680)	This is Write, a member of class TScriptProducer.
	TScriptProducer.Write (string) (see page 6680)	This is Write, a member of class TScriptProducer.

69.1.22.5.15.1 TScriptProducer.Write Method (PAnsiChar)

Pascal

```
procedure Write(Value: PAnsiChar); overload;
```

C++

```
__fastcall Write(PAnsiChar Value);
```

Description

This is Write, a member of class TScriptProducer.

69.1.22.5.15.2 TScriptProducer.Write Method (PWideChar, Integer)

Pascal

```
procedure Write(const AValue: PWideChar; ALength: Integer); overload;
```

C++

```
__fastcall Write(const PWideChar AValue, int ALength);
```

Description

This is Write, a member of class TScriptProducer.

69.1.22.5.15.3 TScriptProducer.Write Method (string)

Pascal

```
procedure Write(const Value: string); overload;
```

C++

```
__fastcall Write(const UnicodeString Value);
```

Description

This is Write, a member of class TScriptProducer.

69.1.22.5.16 TScriptProducer.WriteItem Method

Pascal

```
procedure WriteItem(Index: Integer);
```

C++

```
__fastcall WriteItem(int Index);
```

Description

This is WriteItem, a member of class TScriptProducer.

69.1.22.6 TScriptProducer Properties

The properties of the TScriptProducer class are listed here.

Protected Properties

	Name	Description
	Component (see page 6681)	This is Component, a member of class TScriptProducer.
	Content (see page 6681)	This is Content, a member of class TScriptProducer.

	Designing (see page 6681)	This is Designing, a member of class TScriptProducer.
	Errors (see page 6681)	This is Errors, a member of class TScriptProducer.
	Script (see page 6682)	This is Script, a member of class TScriptProducer.

69.1.22.6.1 TScriptProducer.Component Property

Pascal

```
property Component: TComponent;
```

C++

```
__property TComponent * Component;
```

Description

This is Component, a member of class TScriptProducer.

69.1.22.6.2 TScriptProducer.Content Property

Pascal

```
property Content: string;
```

C++

```
__property UnicodeString Content;
```

Description

This is Content, a member of class TScriptProducer.

69.1.22.6.3 TScriptProducer.Designing Property

Pascal

```
property Designing: Boolean;
```

C++

```
__property Boolean Designing;
```

Description

This is Designing, a member of class TScriptProducer.

69.1.22.6.4 TScriptProducer.Errors Property

Pascal

```
property Errors: TAbstractScriptErrors;
```

C++

```
__property TAbstractScriptErrors Errors;
```

Description

This is Errors, a member of class TScriptProducer.

69.1.22.6.5 TScriptProducer.Script Property

Pascal

```
property Script: string;
```

C++

```
__property UnicodeString Script;
```

Description

This is Script, a member of class TScriptProducer.

69.1.23 TVariableLookup Class

Class Hierarchy

Pascal

```
TVariableLookup = class(TObject);
```

C++

```
class TVariableLookup : public TObject;
```

File

WebScript

Description

This is class WebScript.TVariableLookup.

69.1.23.1 TVariableLookup Members

The following tables list the members exposed by TVariableLookup.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6683)	This is Create, a member of class TVariableLookup.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.

	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindGlobalVariable (see page 6684)	This is FindGlobalVariable, a member of class TVariableLookup.
	FindGlobalVariableContainer (see page 6684)	This is FindGlobalVariableContainer, a member of class TVariableLookup.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	LookupObject (see page 6684)	This is LookupObject, a member of class TVariableLookup.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Ident (see page 6684)	This is Ident, a member of class TVariableLookup.
R	Obj (see page 6685)	This is Obj, a member of class TVariableLookup.

69.1.23.2 TVariableLookup.Create Constructor

Pascal

```
constructor Create(const AIdent: string; AWebModuleContext: TWebModuleContext);
```

C++

```
__fastcall TVariableLookup(const UnicodeString AIdent, TWebModuleContext AWebModuleContext);
```

Description

This is Create, a member of class TVariableLookup.

69.1.23.3 TVariableLookup Methods

The methods of the TVariableLookup class are listed here.

Public Methods

	Name	Description
	FindGlobalVariable (see page 6684)	This is FindGlobalVariable, a member of class TVariableLookup.
	FindGlobalVariableContainer (see page 6684)	This is FindGlobalVariableContainer, a member of class TVariableLookup.
	LookupObject (see page 6684)	This is LookupObject, a member of class TVariableLookup.

69.1.23.3.1 TVariableLookup.FindGlobalVariable Method

Pascal

```
function FindGlobalVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindGlobalVariable(const UnicodeString AName);
```

Description

This is FindGlobalVariable, a member of class TVariableLookup.

69.1.23.3.2 TVariableLookup.FindGlobalVariableContainer Method

Pascal

```
function FindGlobalVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindGlobalVariableContainer(const UnicodeString AName);
```

Description

This is FindGlobalVariableContainer, a member of class TVariableLookup.

69.1.23.3.3 TVariableLookup.LookupObject Method

Pascal

```
function LookupObject: Boolean;
```

C++

```
__fastcall Boolean LookupObject();
```

Description

This is LookupObject, a member of class TVariableLookup.

69.1.23.4 TVariableLookup Properties

The properties of the TVariableLookup class are listed here.

Public Properties

	Name	Description
	Ident (see page 6684)	This is Ident, a member of class TVariableLookup.
R	Obj (see page 6685)	This is Obj, a member of class TVariableLookup.

69.1.23.4.1 TVariableLookup.Ident Property

Pascal

```
property Ident: string;
```

C++

```
__property UnicodeString Ident;
```

Description

This is Ident, a member of class TVariableLookup.

69.1.23.4.2 TVariableLookup.Obj Property

Pascal

```
property Obj: TObject;
```

C++

```
__property TObject * Obj;
```

Description

This is Obj, a member of class TVariableLookup.

69.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TGlobalScriptVariables (see page 6686)	This is record WebScript.TGlobalScriptVariables.
	TIncludeType (see page 6687)	This is record WebScript.TIncludeType.

Records

	Name	Description
	TLineNumbers (see page 6687)	This is record WebScript.TLineNumbers.

69.2.1 WebScript.TGlobalScriptVariables Enumeration

Pascal

```
TGlobalScriptVariables = (
  svPage,
  svPages,
  svModules,
  svApplication,
  svSession,
  svEndUser,
  svResponse,
  svRequest,
  svHTMLItems,
  svProducer
);
```

C++

```
enum TGlobalScriptVariables {
  svPage,
  svPages,
  svModules,
  svApplication,
  svSession,
  svEndUser,
  svResponse,
  svRequest,
  svHTMLItems,
  svProducer
};
```

File

WebScript

Description

This is record WebScript.TGlobalScriptVariables.

69.2.2 WebScript.TIncludeType Enumeration

Pascal

```
TIncludeType = (
  incFile,
  incPage
);
```

C++

```
enum TIncludeType {
  incFile,
  incPage
};
```

File

WebScript

Description

This is record WebScript.TIncludeType.

69.2.3 WebScript.TLineNumbers Record

Pascal

```
TLineNumbers = record
  SourceStartLine: Integer;
  SourceLineCount: Integer;
  DestStartLine: Integer;
  DestLineCount: Integer;
  ScriptIncludeFile: TScriptIncludeFile;
end;
```

C++

```
struct TLineNumbers {
  int SourceStartLine;
  int SourceLineCount;
  int DestStartLine;
  int DestLineCount;
  TScriptIncludeFile ScriptIncludeFile;
};
```

File

WebScript

Description

This is record WebScript.TLineNumbers.

69.3 Types

The following table lists types in this documentation.

Types

Name	Description
CreateComponentStubFactory (see page 6688)	This is type WebScript.CreateComponentStubFactory.
PLineNumbers (see page 6688)	This is type WebScript.PLineNumbers.

69.3.1 WebScript.CreateComponentStubFactory Type

Pascal

```
CreateComponentStubFactory = function (AComponent: TObject; AComponentClass: TClass):
IInterface;
```

C++

```
(AComponent: TObject; AComponentClass: TClass): IInterface ( CreateComponentStubFactory)();
```

File

WebScript

Description

This is type WebScript.CreateComponentStubFactory.

69.3.2 WebScript.PLineNumbers Type

Pascal

```
PLineNumbers = ^TLineNumbers;
```

C++

```
^TLineNumbers PLineNumbers;
```

File

WebScript

Description

This is type WebScript.PLineNumbers.

69.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
GlobalScriptVariableNames (see page 6689)	This is constant WebScript.GlobalScriptVariableNames.

69.4.1 WebScript.GlobalScriptVariableNames Constant

Pascal

```
GlobalScriptVariableNames: array[TGlobalScriptVariables] of PChar = ('Page', 'Pages',
'Modules', 'Application', 'Session', 'EndUser', 'Response', 'Request', 'HTML_', 'Producer');
```

C++

```
array[TGlobalScriptVariables] of PChar GlobalScriptVariableNames = ('Page', 'Pages',
'Modules', 'Application', 'Session', 'EndUser', 'Response', 'Request', 'HTML_', 'Producer');
```

File

WebScript

Description

This is constant WebScript.GlobalScriptVariableNames.

70 WebServExp Namespace

This is namespace WebServExp.

Topics

Name	Description
Classes (see page 6693)	The following table lists classes in this documentation.
Interfaces (see page 6701)	The following table lists interfaces in this documentation.
Functions (see page 6704)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 6706)	The following table lists structs, records, enums in this documentation.
Types (see page 6708)	The following table lists types in this documentation.

Classes

	Name	Description
	TWebServExp (see page 6693)	This is class WebServExp.TWebServExp.

Functions

	Name	Description
	GetAliasBaseTypeInfo (see page 6704)	This is function WebServExp.GetAliasBaseTypeInfo.
	GetBindingType (see page 6704)	This is function WebServExp.GetBindingType.
	IsBaseClassTypeInfo (see page 6705)	This is function WebServExp.IsBaseClassTypeInfo.

Interfaces

	Name	Description
	IWebServExp (see page 6701)	IWebServExp is the interface for classes that generate schema definitions for a WSDL publisher.
	IWebServExpAccess (see page 6703)	This is class WebServExp.IWebServExpAccess.

Structs, Records, Enums

	Name	Description
	ArgumentType (see page 6706)	This is record WebServExp.ArgumentType.
	MessageType (see page 6706)	This is record WebServExp.MessageType.
	TSchemaType (see page 6707)	This is record WebServExp.TSchemaType.

Types

Name	Description
TAfterPublishingWSDLEvent (see page 6708)	This is type WebServExp.TAfterPublishingWSDLEvent.

TBeforePublishingTypesEvent (see page 6708)	This is type WebServExp.TBeforePublishingTypesEvent.
TPublishingTypeEvent (see page 6709)	This is type WebServExp.TPublishingTypeEvent.
TSchemaTypeArray (see page 6709)	This is type WebServExp.TSchemaTypeArray.

70.1 Classes

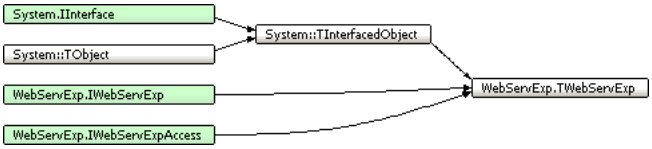
The following table lists classes in this documentation.

Classes

	Name	Description
	TWebServExp (see page 6693)	This is class WebServExp.TWebServExp.

70.1.1 TWebServExp Class

Class Hierarchy



Pascal

```
TWebServExp = class(TInterfacedObject, IWebServExp, IWebServExpAccess);
```

C++

```
class TWebServExp : public TInterfacedObject, public IWebServExp, public IWebServExpAccess;
```

File

WebServExp

Description

This is class WebServExp.TWebServExp.

70.1.1.1 TWebServExp Members

The following tables list the members exposed by TWebServExp.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6695)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 6695)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindOrAddSchema (see page 6702)	Ensures that a schema is eventually generated for a specified type.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GenerateXMLSchema (see page 6696)	Adds schema information to represent a specified type.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetWebServExp (see page 6697)	This is GetWebServExp, a member of class TWebServExp.
	GetWSDLForInterface (see page 6697)	This is GetWSDLForInterface, a member of class TWebServExp.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	ImportLocations (see page 6698)	This is ImportLocations, a member of class TWebServExp.
	ImportNames (see page 6698)	This is ImportNames, a member of class TWebServExp.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	TargetNameSpace (see page 6698)	This is TargetNameSpace, a member of class TWebServExp.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 6699)	This is OnAfterPublishingWSDL, a member of class TWebServExp.
	OnBeforePublishingTypes (see page 6699)	This is OnBeforePublishingTypes, a member of class TWebServExp.
	OnPublishingType (see page 6699)	This is OnPublishingType, a member of class TWebServExp.

Published Properties

	Name	Description
	ArrayAsComplexContent (see page 6697)	This is ArrayAsComplexContent, a member of class TWebServExp.
	BindingType (see page 6698)	This is BindingType, a member of class TWebServExp.
	ServiceAddress (see page 6698)	This is ServiceAddress, a member of class TWebServExp.
	WSDLElements (see page 6699)	This is WSDLElements, a member of class TWebServExp.

70.1.1.2 TWebServExp.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebServExp();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

System::TObject::Free (see page 3382)

70.1.1.3 TWebServExp.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebServExp();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and

call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

70.1.1.4 TWebServExp Methods

The methods of the TWebServExp class are listed here.

Public Methods

	Name	Description
	GenerateXMLSchema (see page 6696)	Adds schema information to represent a specified type.
	GetWebServExp (see page 6697)	This is GetWebServExp, a member of class TWebServExp.
	GetWSDLForInterface (see page 6697)	This is GetWSDLForInterface, a member of class TWebServExp.

70.1.1.4.1 TWebServExp.GenerateXMLSchema Method

Adds schema information to represent a specified type.

Pascal

```
procedure GenerateXMLSchema(SchemaDef: IXMLSchemaDef; const ATypeInfo: PTypeinfo; const
ParentInfo: PTypeinfo; Namespace: InvString);
```

C++

```
__fastcall GenerateXMLSchema(IXMLSchemaDef SchemaDef, const PTypeinfo ATypeInfo, const
PTypeinfo ParentInfo, InvString Namespace);
```

Description

GenerateXMLSchema adds information to an emerging schema to represent information about a specified type.

SchemaDef is the interface for the emerging schema. GenerateXMLSchema uses the properties and methods of this interface to add schema information for the specified type.

ATypeInfo is the runtime type information (RTT) for the type to add.

ParentInfo is the RTTI for the type from which the type specified by ATypeInfo is derived. If ATypeInfo does not describe a descendant type, ParentInfo is nil (Delphi) or NULL (C++).

Namespace is the namespace URI in which the schema definition is defined.

See Also

FindOrAddSchema (see page 6702)

70.1.1.4.2 TWebServExp.GetWebServExp Method

Pascal

```
function GetWebServExp: TWebServExp;
```

C++

```
__fastcall TWebServExp GetWebServExp();
```

Description

This is GetWebServExp, a member of class TWebServExp.

70.1.1.4.3 TWebServExp.GetWSDLForInterface Method

Pascal

```
procedure GetWSDLForInterface(const IntfTypeInfo: Pointer; WSDLDoc: IWSDLDocument; PortNames:
array of InvString; Locations: array of InvString);
```

C++

```
__fastcall GetWSDLForInterface(const void * IntfTypeInfo, IWSDLDocument WSDLDoc, array of
InvString PortNames, array of InvString Locations);
```

Description

This is GetWSDLForInterface, a member of class TWebServExp.

70.1.1.5 TWebServExp Properties

The properties of the TWebServExp class are listed here.

Public Properties

	Name	Description
	ImportLocations (see page 6698)	This is ImportLocations, a member of class TWebServExp.
	ImportNames (see page 6698)	This is ImportNames, a member of class TWebServExp.
	TargetNameSpace (see page 6698)	This is TargetNameSpace, a member of class TWebServExp.

Published Properties

	Name	Description
	ArrayAsComplexContent (see page 6697)	This is ArrayAsComplexContent, a member of class TWebServExp.
	BindingType (see page 6698)	This is BindingType, a member of class TWebServExp.
	ServiceAddress (see page 6698)	This is ServiceAddress, a member of class TWebServExp.
	WSDLElements (see page 6699)	This is WSDLElements, a member of class TWebServExp.

70.1.1.5.1 TWebServExp.ArrayAsComplexContent Property

Pascal

```
property ArrayAsComplexContent: Boolean;
```

C++

```
__property Boolean ArrayAsComplexContent;
```

Description

This is ArrayAsComplexContent, a member of class TWebServExp.

70.1.1.5.2 TWebServExp.BindingType Property

Pascal

```
property BindingType: TWebServiceBindingType;
```

C++

```
__property TWebServiceBindingType BindingType;
```

Description

This is BindingType, a member of class TWebServExp.

70.1.1.5.3 TWebServExp.ImportLocations Property

Pascal

```
property ImportLocations [const Index: Integer]: InvString;
```

C++

```
__property InvString ImportLocations[int const Index];
```

Description

This is ImportLocations, a member of class TWebServExp.

70.1.1.5.4 TWebServExp.ImportNames Property

Pascal

```
property ImportNames [const Index: Integer]: InvString;
```

C++

```
__property InvString ImportNames[int const Index];
```

Description

This is ImportNames, a member of class TWebServExp.

70.1.1.5.5 TWebServExp.ServiceAddress Property

Pascal

```
property ServiceAddress: InvString;
```

C++

```
__property InvString ServiceAddress;
```

Description

This is ServiceAddress, a member of class TWebServExp.

70.1.1.5.6 TWebServExp.TargetNameSpace Property

Pascal

```
property TargetNameSpace: InvString;
```

C++

```
__property InvString TargetNameSpace;
```

Description

This is TargetNameSpace, a member of class TWebServExp.

70.1.1.5.7 TWebServExp.WSDLElements Property

Pascal

```
property WSDLElements: TWSDLElements;
```

C++

```
__property TWSDLElements WSDLElements;
```

Description

This is WSDLElements, a member of class TWebServExp.

70.1.1.6 TWebServExp Events

The events of the TWebServExp class are listed here.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 6699)	This is OnAfterPublishingWSDL, a member of class TWebServExp.
	OnBeforePublishingTypes (see page 6699)	This is OnBeforePublishingTypes, a member of class TWebServExp.
	OnPublishingType (see page 6699)	This is OnPublishingType, a member of class TWebServExp.

70.1.1.6.1 TWebServExp.OnAfterPublishingWSDL Event

Pascal

```
property OnAfterPublishingWSDL: TAfterPublishingWSDLEvent;
```

C++

```
__property TAfterPublishingWSDLEvent OnAfterPublishingWSDL;
```

Description

This is OnAfterPublishingWSDL, a member of class TWebServExp.

70.1.1.6.2 TWebServExp.OnBeforePublishingTypes Event

Pascal

```
property OnBeforePublishingTypes: TBeforePublishingTypesEvent;
```

C++

```
__property TBeforePublishingTypesEvent OnBeforePublishingTypes;
```

Description

This is OnBeforePublishingTypes, a member of class TWebServExp.

70.1.1.6.3 TWebServExp.OnPublishingType Event

Pascal

```
property OnPublishingType: TPublishingTypeEvent;
```

C++

```
__property TPublishingTypeEvent OnPublishingType;
```

Description

This is OnPublishingType, a member of class TWebServExp.

70.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebServExp (see page 6701)	IWebServExp is the interface for classes that generate schema definitions for a WSDL publisher.
	IWebServExpAccess (see page 6703)	This is class WebServExp.IWebServExpAccess.

70.2.1 IWebServExp Interface

IWebServExp is the interface for classes that generate schema definitions for a WSDL publisher.

Class Hierarchy

Pascal

```
IWebServExp = interface;
```

C++

```
__interface IWebServExp;
```

File

WebServExp

Description

IWebServExp is an interface for generating the schema definitions that represent types in a WSDL document.

Note: C++ method declarations that use IWebServExp use the _di_IWebServExp type instead. This type is a DelphiInterface (see page 3263) wrapper around the IWebServExp interface:

Note: typedef System::DelphiInterface (see page 3263)< IWebServExp > _di_IWebServExp;

See Also

TWSDLHTMLPublish (see page 7232)

70.2.1.1 IWebServExp Members

The following tables list the members exposed by IWebServExp.

Public Methods

	Name	Description
	FindOrAddSchema (see page 6702)	Ensures that a schema is eventually generated for a specified type.
	GenerateXMLSchema (see page 6702)	Adds schema information to represent a specified type.

70.2.1.2 IWebServExp Methods

The methods of the IWebServExp class are listed here.

Public Methods

	Name	Description
	FindOrAddSchema (see page 6702)	Ensures that a schema is eventually generated for a specified type.
	GenerateXMLSchema (see page 6702)	Adds schema information to represent a specified type.

70.2.1.2.1 IWebServExp.FindOrAddSchema Method

Ensures that a schema is eventually generated for a specified type.

Pascal

```
function FindOrAddSchema(const ATypeInfo: PTypeinfo; const TnsURI: string): Boolean;
```

C++

```
__fastcall Boolean FindOrAddSchema(const PTypeinfo ATypeInfo, const UnicodeString TnsURI);
```

Description

Call FindOrAddSchema to indicate that a schema should be generated for a given type.

ATypeInfo is the runtime type information (RTTI) for the type.

TnsURI is the namespace URI in which the schema for the type should be defined.

FindOrAddSchema returns true if there is already a schema for the specified type. It returns false if the type has not previously been added.

See Also

GenerateXMLSchema (see page 6702)

70.2.1.2.2 IWebServExp.GenerateXMLSchema Method

Adds schema information to represent a specified type.

Pascal

```
procedure GenerateXMLSchema(SchemaDef: IXMLSchemaDef; const ATypeInfo: PTypeinfo; const
ParentInfo: PTypeinfo; Namespace: InvString);
```

C++

```
__fastcall GenerateXMLSchema(IXMLSchemaDef SchemaDef, const PTypeinfo ATypeInfo, const
PTypeinfo ParentInfo, InvString Namespace);
```

Description

GenerateXMLSchema adds information to an emerging schema to represent information about a specified type.

SchemaDef is the interface for the emerging schema. GenerateXMLSchema uses the properties and methods of this interface to add schema information for the specified type.

ATypeInfo is the runtime type information (RTT) for the type to add.

ParentInfo is the RTTI for the type from which the type specified by ATypeInfo is derived. If ATypeInfo does not describe a descendant type, ParentInfo is nil (Delphi) or NULL (C++).

Namespace is the namespace URI in which the schema definition is defined.

See Also

FindOrAddSchema (see page 6702)

70.2.2 IWebServExpAccess Interface

Class Hierarchy

Pascal

```
IWebServExpAccess = interface;
```

C++

```
__interface IWebServExpAccess;
```

File

WebServExp

Description

This is class WebServExp.IWebServExpAccess.

70.2.2.1 IWebServExpAccess Members

The following tables list the members exposed by IWebServExpAccess.

Public Methods

	Name	Description
	GetWebServExp (see page 6703)	This is GetWebServExp, a member of class IWebServExpAccess.

70.2.2.2 IWebServExpAccess Methods

The methods of the IWebServExpAccess class are listed here.

Public Methods

	Name	Description
	GetWebServExp (see page 6703)	This is GetWebServExp, a member of class IWebServExpAccess.

70.2.2.2.1 IWebServExpAccess.GetWebServExp Method

Pascal

```
function GetWebServExp: TWebServExp;
```

C++

```
__fastcall TWebServExp GetWebServExp();
```

Description

This is GetWebServExp, a member of class IWebServExpAccess.

70.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetAliasBaseTypeInfo (see page 6704)	This is function WebServExp.GetAliasBaseTypeInfo.
	GetBindingType (see page 6704)	This is function WebServExp.GetBindingType.
	IsBaseClassTypeInfo (see page 6705)	This is function WebServExp.IsBaseClassTypeInfo.

70.3.1 WebServExp.GetAliasBaseTypeInfo Function

Pascal

```
function GetAliasBaseTypeInfo(const ParamType: TTypeKind): PTypeInfo;
```

C++

```
PTypeInfo GetAliasBaseTypeInfo(const TTypeKind ParamType);
```

File

WebServExp

Description

This is function WebServExp.GetAliasBaseTypeInfo.

70.3.2 WebServExp.GetBindingType Function

Pascal

```
function GetBindingType(const MethEntry: TIntfMethEntry; Input: Boolean):
TWebServiceBindingType; overload;
```

C++

```
TWebServiceBindingType GetBindingType(const TIntfMethEntry MethEntry, Boolean Input);
```

File

WebServExp

Description

This is function WebServExp.GetBindingType.

70.3.3 WebServExp.IsBaseClassTypeInfo Function

Pascal

```
function IsBaseClassTypeInfo(const ATypeInfo: PTypeInfo): Boolean;
```

C++

```
Boolean IsBaseClassTypeInfo(const PTypeInfo ATypeInfo);
```

File

WebServExp

Description

This is function WebServExp.IsBaseClassTypeInfo.

70.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	ArgumentType (see page 6706)	This is record WebServExp.ArgumentType.
	MessageType (see page 6706)	This is record WebServExp.MessageType.

Records

	Name	Description
	TSchemaType (see page 6707)	This is record WebServExp.TSchemaType.

70.4.1 WebServExp.ArgumentType Enumeration

Pascal

```
ArgumentType = (
  argIn,
  argOut,
  argInOut,
  argReturn
);
```

C++

```
enum ArgumentType {
  argIn,
  argOut,
  argInOut,
  argReturn
};
```

File

WebServExp

Description

This is record WebServExp.ArgumentType.

70.4.2 WebServExp.MessageType Enumeration

Pascal

```
MessageType = (
  mtInput,
  mtOutput,
  mtHeaderInput,
  mtHeaderOutput,
  mtFault
);
```

C++

```
enum MessageType {
  mtInput,
  mtOutput,
  mtHeaderInput,
  mtHeaderOutput,
  mtFault
};
```

File

WebServExp

Description

This is record WebServExp.MessageType.

70.4.3 WebServExp.TSchemaType Record

Pascal

```
TSchemaType = record
  TypeName: InvString;
  NameSpace: InvString;
  TypeInfo: PTypeinfo;
  NSPrefix: InvString;
  XSGenerated: Boolean;
end;
```

C++

```
struct TSchemaType {
  InvString TypeName;
  InvString NameSpace;
  PTypeinfo TypeInfo;
  InvString NSPrefix;
  Boolean XSGenerated;
};
```

File

WebServExp

Description

This is record WebServExp.TSchemaType.

70.5 Types

The following table lists types in this documentation.

Types

Name	Description
TAfterPublishingWSDLEvent (see page 6708)	This is type WebServExp.TAfterPublishingWSDLEvent.
TBeforePublishingTypesEvent (see page 6708)	This is type WebServExp.TBeforePublishingTypesEvent.
TPublishingTypeEvent (see page 6709)	This is type WebServExp.TPublishingTypeEvent.
TSchemaTypeArray (see page 6709)	This is type WebServExp.TSchemaTypeArray.

70.5.1 WebServExp.TAfterPublishingWSDLEvent Type

Pascal

```
TAfterPublishingWSDLEvent = procedure (const WSDLDoc: IWSDLDocument) of object;
```

C++

```
(const WSDLDoc: IWSDLDocument) ( TAfterPublishingWSDLEvent)();
```

File

WebServExp

Description

This is type WebServExp.TAfterPublishingWSDLEvent.

70.5.2 WebServExp.TBeforePublishingTypesEvent Type

Pascal

```
TBeforePublishingTypesEvent = procedure (const WebServ: IWebServExp) of object;
```

C++

```
(const WebServ: IWebServExp) ( TBeforePublishingTypesEvent)();
```

File

WebServExp

Description

This is type WebServExp.TBeforePublishingTypesEvent.

70.5.3 WebServExp.TPublishingTypeEvent Type

Pascal

```
TPublishingTypeEvent = procedure (const WebServ: IWebServExp; const SchemaDef: IXMLSchemaDef;
const ATypeInfo: PTypeinfo; Namespace: InvString) of object;
```

C++

```
(const WebServ: IWebServExp; const SchemaDef: IXMLSchemaDef; const ATypeInfo: PTypeinfo;
Namespace: InvString) ( TPublishingTypeEvent)();
```

File

WebServExp

Description

This is type WebServExp.TPublishingTypeEvent.

70.5.4 WebServExp.TSchemaTypeArray Type

Pascal

```
TSchemaTypeArray = array of TSchemaType;
```

C++

```
array of TSchemaType TSchemaTypeArray;
```

File

WebServExp

Description

This is type WebServExp.TSchemaTypeArray.

71 WebSess Namespace

This is namespace WebSess.

Topics

Name	Description
Classes (see page 6712)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 6739)	The following table lists structs, records, enums in this documentation.
Types (see page 6740)	The following table lists types in this documentation.

Classes

	Name	Description
	TCustomSessionsService (see page 6712)	TCustomSessionsService stores end user data that is needed for a short period of time.
	TSessionsService (see page 6722)	TSessionsService stores end user data that is needed for a short period of time.
	TWebSessionIDsImpl (see page 6726)	This is class WebSess.TWebSessionIDsImpl.
	TWebSessionImpl (see page 6729)	This is class WebSess.TWebSessionImpl.

Structs, Records, Enums

	Name	Description
	TEndSessionReason (see page 6739)	This is record WebSess.TEndSessionReason.

Types

Name	Description
TEndSessionEvent (see page 6740)	This is type WebSess.TEndSessionEvent.
TStartSessionEvent (see page 6740)	This is type WebSess.TStartSessionEvent.

71.1 Classes

The following table lists classes in this documentation.

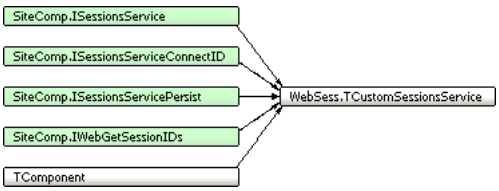
Classes

	Name	Description
	TCustomSessionsService (see page 6712)	TCustomSessionsService stores end user data that is needed for a short period of time.
	TSessionsService (see page 6722)	TSessionsService stores end user data that is needed for a short period of time.
	TWebSessionIDsImpl (see page 6726)	This is class WebSess.TWebSessionIDsImpl.
	TWebSessionImpl (see page 6729)	This is class WebSess.TWebSessionImpl.

71.1.1 TCustomSessionsService Class

TCustomSessionsService stores end user data that is needed for a short period of time.

Class Hierarchy



Pascal

```
TCustomSessionsService = class(TComponent, ISessionsService, ISessionsServiceConnectID,
IWebGetSessionIDs, ISessionsServicePersist);
```

C++

```
class TCustomSessionsService : public TComponent, public ISessionsService, public
ISessionsServiceConnectID, public IWebGetSessionIDs, public ISessionsServicePersist;
```

File

WebSess

Description

TCustomSessionsService is the base class for classes that manage the sessions in a WebSnap application. When a WebSnap application contains a TCustomSessionsService descendant, then each HTTP request is associated with a session. TCustomSessionsService can manage multiple sessions on behalf of different users, each on a separate thread of execution. Only one session is available when handling a request. This is called the current session. The current session is available as the Session property of the global Web context, which is accessed using the global WebContext function.

TCustomSessionsService stores session IDs and name/value pairs for all sessions in memory. This information must remain in memory between requests. Thus, Web application types that do not remain in memory between requests, such as CGI, do not support TCustomSessionsService.

TCustomSessionsService implements the ISessionsService (see page 1007) interface.

See Also

TSessionsService (see page 6722)

TEndUserSessionAdapter (see page 5779)

TAbstractWebContext (see page 5935)

TWebSession (see page 6225)

WebContext

ISessionsService (see page 1007)

71.1.1.1 TCustomSessionsService Members

The following tables list the members exposed by TCustomSessionsService.

Protected Methods

	Name	Description
	CheckStatusChange (see page 6714)	Checks whether any sessions have started or terminated.
	Clear (see page 6715)	Deletes all sessions from memory.
	Connect (see page 6715)	Obtains the interface for a Web session, given its Session ID.
	ConnectActive (see page 6716)	Obtains the interface for an active Web session, given its Session ID.
	DoEndSession (see page 6716)	Triggers the OnEndSession (see page 6721) event when appropriate.
	DoStartSession (see page 6716)	Triggers the OnStartSession (see page 6721) event when appropriate.
	GetSessionIDs (see page 6717)	Returns a list of the session IDs for all sessions currently in memory.
	LoadFromFile (see page 6717)	Loads the list of sessions from a file.
	LoadFromStream (see page 6718)	Loads the list of sessions from a stream.
	NewSession (see page 6718)	Starts a new session.
	NotifyStatusChange (see page 6719)	Generates an OnEndSession (see page 6721) or OnStartSession (see page 6721) event, as approrpriate.
	SaveToFile (see page 6719)	Saves the list of sessions to a file.
	SaveToStream (see page 6719)	Saves the list of sessions to a stream.

Public Events

	Name	Description
	OnEndSession (see page 6721)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 6721)	Occurs when the sessions service detects that a new session has started.

Public Methods

	Name	Description
	Create (see page 6713)	Creates and initializes an instance of TCustomSessionsService (see page 6712).

Public Properties

	Name	Description
	DefaultTimeout (see page 6720)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 6720)	Indicates the maximum number of sessions the TCustomSessionsService (see page 6712) can keep in memory.

71.1.1.2 TCustomSessionsService.Create Constructor

Creates and initializes an instance of TCustomSessionsService (see page 6712).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomSessionsService(TComponent * AOwner);
```

Description

Call Create to instantiate a sessions service at runtime. Typically, this is unnecessary, because a WebSnap application needs at most a single sessions service component, and in most cases that is added at design time.

AOwner is the component that becomes the value of the TCustomSessionsService (see page 6712) object's Owner property. This should be the Web application module.

See Also

Owner

71.1.1.3 TCustomSessionsService Methods

The methods of the TCustomSessionsService class are listed here.

Protected Methods

	Name	Description
	CheckStatusChange (see page 6714)	Checks whether any sessions have started or terminated.
	Clear (see page 6715)	Deletes all sessions from memory.
	Connect (see page 6715)	Obtains the interface for a Web session, given its Session ID.
	ConnectActive (see page 6716)	Obtains the interface for an active Web session, given its Session ID.
V	DoEndSession (see page 6716)	Triggers the OnEndSession (see page 6721) event when appropriate.
V	DoStartSession (see page 6716)	Triggers the OnStartSession (see page 6721) event when appropriate.
	GetSessionIDs (see page 6717)	Returns a list of the session IDs for all sessions currently in memory.
	LoadFromFile (see page 6717)	Loads the list of sessions from a file.
	LoadFromStream (see page 6718)	Loads the list of sessions from a stream.
	NewSession (see page 6718)	Starts a new session.
	NotifyStatusChange (see page 6719)	Generates an OnEndSession (see page 6721) or OnStartSession (see page 6721) event, as approrpriate.
	SaveToFile (see page 6719)	Saves the list of sessions to a file.
	SaveToStream (see page 6719)	Saves the list of sessions to a stream.

71.1.1.3.1 TCustomSessionsService.CheckStatusChange Method

Checks whether any sessions have started or terminated.

Pascal

```
function CheckStatusChange: Boolean;
```

C++

```
__fastcall Boolean CheckStatusChange();
```

Description

CheckStatusChange is called automatically when the application creates a new Web context or initializes a new Web module. That is, this method is called at least once every time the application receives a new HTTP request message.

If CheckStatusChange detects that a session has started or terminated since the last call, it returns true. Otherwise, it returns false.

See Also

NotifyStatusChange (see page 6719)

TWebContext (see page 5950)

71.1.1.3.2 TCustomSessionsService.Clear Method

Deletes all sessions from memory.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the sessions service of all the sessions it has stored in memory.

Clear does not generate an OnEndSession (see page 6721) event for the sessions it deletes when it frees their memory, it simply removes them from memory. To shut down all sessions in a more orderly fashion, iterate through all the active sessions by calling ConnectActive (see page 6716) for every session ID that the GetSessionIDs (see page 6717) method returns, and terminate each one. Then call NotifyStatusChange (see page 6719) to generate the OnEndSession (see page 6721) events for every terminated session. At that point, calling Clear does not prevent the application from receiving an OnEndSession (see page 6721) event for any session that the sessions service manages.

See Also

NewSession (see page 6718)

GetSessionIDs (see page 6717)

ConnectActive (see page 6716)

NotifyStatusChange (see page 6719)

71.1.1.3.3 TCustomSessionsService.Connect Method

Obtains the interface for a Web session, given its Session ID.

Pascal

```
function Connect(AID: TSessionID): IWebSession;
```

C++

```
__fastcall IWebSession Connect(TSessionID AID);
```

Description

Call Connect to access the session that has a specified Session ID. Unlike the ConnectActive (see page 6716) method, Connect may return a session that has expired or been terminated but that has not yet been freed from memory.

AID is the session ID of the session to locate.

Connect returns the IWebSession (see page 1043) interface for the located session. This interface has a single method, Terminate, which lets you terminate the session. If the sessions service does not have a session with the specified session ID, Connect returns nil (Delphi) or NULL (C++).

Note: Calling Connect does not count as accessing a session. That is, if you call Connect for any session, it does not affect the time when that session times out.

See Also

ConnectActive (see page 6716)

GetSessionIDs (see page 6717)

71.1.1.3.4 TCustomSessionsService.ConnectActive Method

Obtains the interface for an active Web session, given its Session ID.

Pascal

```
function ConnectActive(AID: TSessionID): IWebSession;
```

C++

```
__fastcall IWebSession ConnectActive(TSessionID AID);
```

Description

Call ConnectActive to access the session that has a specified Session ID. Unlike the Connect (see page 6715) method, ConnectActive never returns a session that has expired or been terminated.

AID is the session ID of the session to locate.

ConnectActive returns the IWebSession (see page 1043) interface for the located session. This interface has a single method, Terminate, which lets you terminate the session. If the sessions service does not have an active session with the specified session ID, ConnectActive returns nil (Delphi) or NULL (C++).

Note: Calling ConnectActive counts as accessing a session. That is, if you call ConnectActive for any session, the session will not time out until the entire time-out period elapses after the call to ConnectActive.

See Also

Connect (see page 6715)

GetSessionIDs (see page 6717)

71.1.1.3.5 TCustomSessionsService.DoEndSession Method

Triggers the OnEndSession (see page 6721) event when appropriate.

Pascal

```
procedure DoEndSession(ASession: TAbstractWebSession; AReason: TEndSessionReason); virtual;
```

C++

```
virtual __fastcall DoEndSession(TAbstractWebSession ASession, TEndSessionReason AReason);
```

Description

Use DoEndSession to trigger an OnEndSession (see page 6721) event, if it is appropriate to do so.

See Also

OnEndSession (see page 6721)

71.1.1.3.6 TCustomSessionsService.DoStartSession Method

Triggers the OnStartSession (see page 6721) event when appropriate.

Pascal

```
procedure DoStartSession(ASession: TAbstractWebSession); virtual;
```

C++

```
virtual __fastcall DoStartSession(TAbstractWebSession ASession);
```

Description

Use DoStartSession to trigger an OnStartSession (see page 6721) event, if it is appropriate to do so.

See Also

OnStartSession (see page 6721)

71.1.1.3.7 TCustomSessionsService.GetSessionIDs Method

Returns a list of the session IDs for all sessions currently in memory.

Pascal

```
function GetSessionIDs: IWebSessionIDs;
```

C++

```
__fastcall IWebSessionIDs GetSessionIDs();
```

Description

Call GetSessionIDs to obtain a list of the session IDs for all the sessions that the sessions service is storing. GetSessionIDs returns an IWebSessionIDs (see page 1051) interface, which lists the session IDs.

See Also

Connect (see page 6715)

GetSessionIDs

71.1.1.3.8 TCustomSessionsService.LoadFromFile Method

Loads the list of sessions from a file.

Pascal

```
procedure LoadFromFile(const Filename: string);
```

C++

```
__fastcall LoadFromFile(const UnicodeString Filename);
```

Description

Call LoadFromFile to replace the current list of sessions with a set of sessions stored in a file. The file must be previously created by a call to the SaveToFile (see page 6719) method.

Filename is the name of the file that contains the saved list of sessions.

See Also

SaveToFile (see page 6719)

LoadFromStream (see page 6718)

71.1.1.3.9 TCustomSessionsService.LoadFromStream Method

Loads the list of sessions from a stream.

Pascal

```
procedure LoadFromStream(S: TStream);
```

C++

```
__fastcall LoadFromStream(TStream S);
```

Description

Call LoadFromStream to replace the current list of sessions with a set of sessions read from a stream. The sessions must be previously saved by a call to the SaveToStream (see page 6719) method.

S is the stream from which to read the list of sessions.

See Also

SaveToStream (see page 6719)

LoadFromFile (see page 6717)

71.1.1.3.10 TCustomSessionsService.NewSession Method

Starts a new session.

Pascal

```
function NewSession: IWebSession;
```

C++

```
__fastcall IWebSession NewSession();
```

Description

Call NewSession to generate a new session. NewSession starts a new session and returns an interface that can be used to terminate that session.

If the sessions service already has MaxSessions (see page 6720) sessions, NewSession raises an ESessionsException (see page 328) exception.

Note: The OnStartSession (see page 6721) event does not occur immediately when you call NewSession to start a new session. It occurs on the next call to NotifyStatusChange (see page 6719).

Tip: To reconnect to an existing session, call the ConnectActive (see page 6716) method instead.

See Also

MaxSessions (see page 6720)

OnStartSession (see page 6721)

ConnectActive (see page 6716)

NotifyStatusChange (see page 6719)

71.1.1.3.11 TCustomSessionsService.NotifyStatusChange Method

Generates an OnEndSession (see page 6721) or OnStartSession (see page 6721) event, as approrpriate.

Pascal

```
procedure NotifyStatusChange;
```

C++

```
__fastcall NotifyStatusChange();
```

Description

Call NotifyStatusChange to generate the OnStartSession (see page 6721) event for any new sessions that have been created since the last call and to generate the OnEndSession (see page 6721) event for any sessions that terminated since the last call. For any terminated sessions, NotifyStatusChange frees the memory allocated to the session after the OnEndSession (see page 6721) event handler exits.

NotifyStatusChange is called automatically every time the WebSnap application initializes a new Web module.

See Also

OnEndSession (see page 6721)

OnStartSession (see page 6721)

CheckStatusChange (see page 6714)

71.1.1.3.12 TCustomSessionsService.SaveToFile Method

Saves the list of sessions to a file.

Pascal

```
procedure SaveToFile(const Filename: string);
```

C++

```
__fastcall SaveToFile(const UnicodeString Filename);
```

Description

Call SaveToFile to save the current list of sessions to a file. SaveToFile saves all of the sessions, including their session IDs, name/value lists, time-out period, and status information about when they were last accessed.

The file can be read back into a sessions service by calling the LoadFromFile (see page 6717) method.

Filename is the name of the file to which the list of sessions is saved.

See Also

SaveToStream (see page 6719)

LoadFromFile (see page 6717)

71.1.1.3.13 TCustomSessionsService.SaveToStream Method

Saves the list of sessions to a stream.

Pascal

```
procedure SaveToStream(S: TStream);
```

C++

```
__fastcall SaveToStream(TStream S);
```

Description

Call SaveToStream to write the current list of sessions to a stream. SaveToStream saves all of the sessions, including their session IDs, name/value lists, time-out period, and status information about when they were last accessed.

The sessions can be read back into a sessions service by calling the LoadFromStream (see page 6718) method.

S is the stream to which the list of sessions is written.

See Also

LoadFromStream (see page 6718)

SaveToFile (see page 6719)

71.1.1.4 TCustomSessionsService Properties

The properties of the TCustomSessionsService class are listed here.

Public Properties

	Name	Description
	DefaultTimeout (see page 6720)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 6720)	Indicates the maximum number of sessions the TCustomSessionsService (see page 6712) can keep in memory.

71.1.1.4.1 TCustomSessionsService.DefaultTimeout Property

Specifies the number of minutes a session can persist without being accessed.

Pascal

```
property DefaultTimeout: Integer;
```

C++

```
__property int DefaultTimeout;
```

Description

Each session that the sessions service manages has a time-out period. When a session is not accessed within that time-out period, the sessions service automatically terminates the session, discarding its session ID and name/value pairs.

Set DefaultTimeout to specify the time-out period, in minutes, for the sessions in the WebSnap application. Individual sessions can override this value by setting their TimeoutMinutes property.

See Also

TimeoutMinutes

71.1.1.4.2 TCustomSessionsService.MaxSessions Property

Indicates the maximum number of sessions the TCustomSessionsService (see page 6712) can keep in memory.

Pascal

```
property MaxSessions: Integer;
```

C++

```
__property int MaxSessions;
```

Description

Set MaxSessions to limit the number of sessions that the sessions service stores in memory. If MaxSessions is –1, then there is no limit to the number of sessions, and the application can continue creating sessions until it runs out of memory. When MaxSessions is greater than or equal to zero, any attempt to create a new session when the sessions service has MaxSessions already stored in memory causes an ESessionsException (see page 328) exception. The Exception (see page 4015) occurs before the OnStartSession (see page 6721) event.

Note: When the application terminates sessions, it frees up memory for new sessions. Thus, after reaching the limit imposed by MaxSessions, the application can add subsequent sessions after explicitly terminating a session or waiting for one to time out.

See Also

ESessionsException (see page 328)

OnStartSession (see page 6721)

Terminate (see page 6229)

71.1.1.5 TCustomSessionsService Events

The events of the TCustomSessionsService class are listed here.

Public Events

	Name	Description
	OnEndSession (see page 6721)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 6721)	Occurs when the sessions service detects that a new session has started.

71.1.1.5.1 TCustomSessionsService.OnEndSession Event

Occurs when the sessions service detects that a session has terminated.

Pascal

```
property OnEndSession: TEndSessionEvent;
```

C++

```
__property TEndSessionEvent OnEndSession;
```

Description

Write (see page 3789) an OnEndSession event handler to take specific action when a session terminates. For example, an OnEndSession event handler could store information from sessions that time out in a more persistent form such as a database.

See Also

OnStartSession (see page 6721)

Terminate (see page 6229)

TimeoutMinutes

71.1.1.5.2 TCustomSessionsService.OnStartSession Event

Occurs when the sessions service detects that a new session has started.

Pascal

```
property OnStartSession: TStartSessionEvent;
```

C++

```
__property TStartSessionEvent OnStartSession;
```

Description

Write (see page 3789) an OnStartSession event handler to take specific action when a session starts. For example, you can use this event to customize the time-out period for new sessions or initialize them by adding name/value pairs.

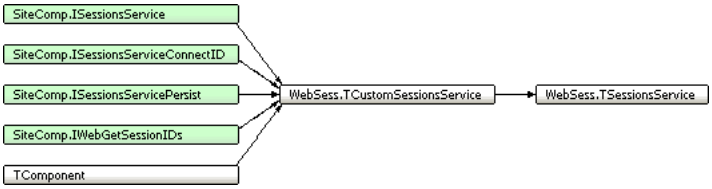
See Also

OnStartSession

71.1.2 TSessionsService Class

TSessionsService stores end user data that is needed for a short period of time.

Class Hierarchy



Pascal

```
TSessionsService = class(TCustomSessionsService);
```

C++

```
class TSessionsService : public TCustomSessionsService;
```

File

WebSess

Description

Add TSessionsService to a WebSnap application when you want to store temporary end user data in a WebSnap session. For example, TSessionsService can keep track of all users that are currently logged in and automatically log a user out after a period of inactivity.

When a WebSnap application contains a TSessionsService component, each HTTP request is associated with a session. The WebSnap application can manage multiple sessions on behalf of different users, each on a separate thread of execution. When handling a request, only one session is available, which is called the current session. The current session is available as the Session property of the global Web context, which is accessed using the global WebContext function.

TSessionsService stores session IDs and name/value pairs for all sessions in memory. This information must remain in memory between requests. Web application types that do not remain in memory between requests, such as CGI, do not support TSessionsService. When testing Web App Debugger executables, be sure to start the executables before browsing so that the executable remains running between requests.

Use TEndUserSessionsAdapter and TSessionsAdapter together to keep track of end user name and login state.

Using the Sessions Service

71.1.2.1 TSessionsService Members

The following tables list the members exposed by TSessionsService.

Protected Methods

	Name	Description
	CheckStatusChange (see page 6714)	Checks whether any sessions have started or terminated.
	Clear (see page 6715)	Deletes all sessions from memory.
	Connect (see page 6715)	Obtains the interface for a Web session, given its Session ID.
	ConnectActive (see page 6716)	Obtains the interface for an active Web session, given its Session ID.
	DoEndSession (see page 6716)	Triggers the OnEndSession (see page 6721) event when appropriate.
	DoStartSession (see page 6716)	Triggers the OnStartSession (see page 6721) event when appropriate.
	GetSessionIDs (see page 6717)	Returns a list of the session IDs for all sessions currently in memory.
	LoadFromFile (see page 6717)	Loads the list of sessions from a file.
	LoadFromStream (see page 6718)	Loads the list of sessions from a stream.
	NewSession (see page 6718)	Starts a new session.
	NotifyStatusChange (see page 6719)	Generates an OnEndSession (see page 6721) or OnStartSession (see page 6721) event, as approrpriate.
	SaveToFile (see page 6719)	Saves the list of sessions to a file.
	SaveToStream (see page 6719)	Saves the list of sessions to a stream.

Public Methods

	Name	Description
	CheckStatusChange (see page 1008)	Checks whether any sessions have started or terminated.
	Clear (see page 1008)	Deletes all sessions from memory.
	Connect (see page 1010)	This is Connect, a member of class ISessionsServiceConnectID.
	ConnectActive (see page 1011)	This is ConnectActive, a member of class ISessionsServiceConnectID.
	Create (see page 6713)	Creates and initializes an instance of TCustomSessionsService (see page 6712).
	GetSessionIDs (see page 1038)	This is GetSessionIDs, a member of class IWebGetSessionIDs.
	LoadFromFile (see page 1012)	This is LoadFromFile, a member of class ISessionsServicePersist.
	LoadFromStream (see page 1012)	This is LoadFromStream, a member of class ISessionsServicePersist.
	NewSession (see page 1009)	Starts a new session.
	NotifyStatusChange (see page 1009)	Generates an OnEndSession or OnStartSession event, as approrpriate.
	SaveToFile (see page 1012)	This is SaveToFile, a member of class ISessionsServicePersist.
	SaveToStream (see page 1012)	This is SaveToStream, a member of class ISessionsServicePersist.

Published Events

	Name	Description
	OnEndSession (see page 6725)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 6725)	Occurs when the sessions service detects that a new session has started.

Published Properties

	Name	Description
	DefaultTimeout (see page 6724)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 6724)	Indicates the maximum number of sessions the TCustomSessionsService can keep in memory.

71.1.2.2 TSessionsService Properties

The properties of the TSessionsService class are listed here.

Published Properties

	Name	Description
	DefaultTimeout (see page 6724)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 6724)	Indicates the maximum number of sessions the TCustomSessionsService can keep in memory.

71.1.2.2.1 TSessionsService.DefaultTimeout Property

Specifies the number of minutes a session can persist without being accessed.

Pascal

```
property DefaultTimeout: Integer;
```

C++

```
__property int DefaultTimeout;
```

Description

Each session that the sessions service manages has a time-out period. When a session is not accessed within that time-out period, the sessions service automatically terminates the session, discarding its session ID and name/value pairs.

Set DefaultTimeout to specify the time-out period, in minutes, for the sessions in the WebSnap application. Individual sessions can override this value by setting their TimeoutMinutes property.

See Also

TimeoutMinutes

71.1.2.2.2 TSessionsService.MaxSessions Property

Indicates the maximum number of sessions the TCustomSessionsService can keep in memory.

Pascal

```
property MaxSessions: Integer;
```

C++

```
__property int MaxSessions;
```

Description

Set MaxSessions to limit the number of sessions that the sessions service stores in memory. If MaxSessions is –1, then there is no limit to the number of sessions, and the application can continue creating sessions until it runs out of memory. When MaxSessions is greater than or equal to zero, any attempt to create a new session when the sessions service has MaxSessions already stored in memory causes an ESessionsException exception. The Exception occurs before the OnStartSession event.

Note: When the application terminates sessions, it frees up memory for new sessions. Thus, after reaching the limit imposed by

MaxSessions, the application can add subsequent sessions after explicitly terminating a session or waiting for one to time out.

See Also

ESessionsException (see page 328)

OnStartSession (see page 6721)

Terminate (see page 6229)

71.1.2.3 TSessionsService Events

The events of the TSessionsService class are listed here.

Published Events

	Name	Description
	OnEndSession (see page 6725)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 6725)	Occurs when the sessions service detects that a new session has started.

71.1.2.3.1 TSessionsService.OnEndSession Event

Occurs when the sessions service detects that a session has terminated.

Pascal

```
property OnEndSession: TEndSessionEvent;
```

C++

```
__property TEndSessionEvent OnEndSession;
```

Description

Write an OnEndSession event handler to take specific action when a session terminates. For example, an OnEndSession event handler could store information from sessions that time out in a more persistent form such as a database.

See Also

OnStartSession (see page 6721)

Terminate (see page 6229)

TimeoutMinutes

71.1.2.3.2 TSessionsService.OnStartSession Event

Occurs when the sessions service detects that a new session has started.

Pascal

```
property OnStartSession: TStartSessionEvent;
```

C++

```
__property TStartSessionEvent OnStartSession;
```

Description

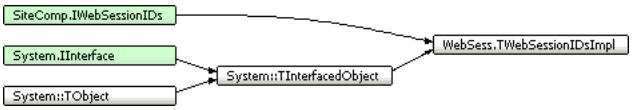
Write an OnStartSession event handler to take specific action when a session starts. For example, you can use this event to customize the time-out period for new sessions or initialize them by adding name/value pairs.

See Also

OnStartSession (see page 6721)

71.1.3 TWebSessionIDsImpl Class

Class Hierarchy



Pascal

```
TWebSessionIDsImpl = class(TInterfacedObject, IWebSessionIDs);
```

C++

```
class TWebSessionIDsImpl : public TInterfacedObject, public IWebSessionIDs;
```

File

WebSess

Description

This is class WebSess.TWebSessionIDsImpl.

71.1.3.1 TWebSessionIDsImpl Members

The following tables list the members exposed by TWebSessionIDsImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	GetID (see page 6728)	Returns the value of the IDs property.
	GetIDCount (see page 6729)	Returns the value of the IDCount property.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AfterConstruction (see page 3358)	Responds after the last constructor executes.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.

	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6727)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 6728)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	IDCount (see page 1053)	Indicates the number of session IDs (see page 1053) available.
R	IDs (see page 1053)	Lists the session IDs for all the sessions stored by the sessions service.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

71.1.3.2 TWebSessionIDsImpl.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebSessionIDsImpl();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

System::TObject::Free (see page 3382)

71.1.3.3 TWebSessionIDsImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebSessionIDsImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

71.1.3.4 TWebSessionIDsImpl Methods

The methods of the TWebSessionIDsImpl class are listed here.

Protected Methods

	Name	Description
	GetID (see page 6728)	Returns the value of the IDs property.
	GetIDCount (see page 6729)	Returns the value of the IDCount property.

71.1.3.4.1 TWebSessionIDsImpl.GetID Method

Returns the value of the IDs property.

Pascal

```
function GetID(I: Integer): TSessionID;
```

C++

```
__fastcall TSessionID GetID(int I);
```

Description

GetID is the read implementation of the IDs property.

I is the index of the session ID to return.

See Also

IDs (see page 1053)

71.1.3.4.2 TWebSessionIDsImpl.GetIDCount Method

Returns the value of the IDCount property.

Pascal

```
function GetIDCount: Integer;
```

C++

```
__fastcall int GetIDCount();
```

Description

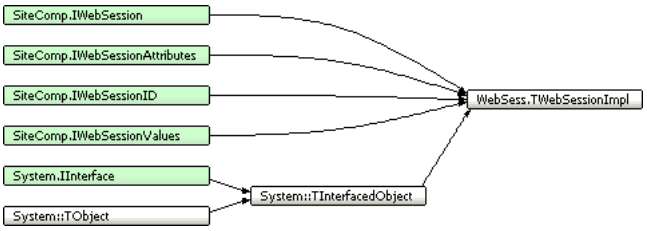
GetIDCount is the read implementation of the IDCount property.

See Also

IDCount (see page 1053)

71.1.4 TWebSessionImpl Class

Class Hierarchy



Pascal

```
TWebSessionImpl = class(TInterfacedObject, IWebSession, IWebSessionID, IWebSessionValues,
IWebSessionAttributes);
```

C++

```
class TWebSessionImpl : public TInterfacedObject, public IWebSession, public IWebSessionID,
public IWebSessionValues, public IWebSessionAttributes;
```

File

WebSess

Description

This is class WebSess.TWebSessionImpl.

71.1.4.1 TWebSessionImpl Members

The following tables list the members exposed by TWebSessionImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	GetExpirationTime (see page 6732)	This is GetExpirationTime, a member of class TWebSessionImpl.
	GetExpired (see page 6733)	This is GetExpired, a member of class TWebSessionImpl.
	GetID (see page 6733)	This is GetID, a member of class TWebSessionImpl.
	GetIsActive (see page 6733)	This is GetIsActive, a member of class TWebSessionImpl.
	GetItemCount (see page 6733)	This is GetItemCount, a member of class TWebSessionImpl.
	GetItems (see page 6734)	This is GetItems, a member of class TWebSessionImpl.
	GetStartTime (see page 6734)	This is GetStartTime, a member of class TWebSessionImpl.
	GetTerminated (see page 6734)	This is GetTerminated, a member of class TWebSessionImpl.
	GetTimeoutMinutes (see page 6734)	This is GetTimeoutMinutes, a member of class TWebSessionImpl.
	GetTouchTime (see page 6734)	This is GetTouchTime, a member of class TWebSessionImpl.
	GetValue (see page 6735)	This is GetValue, a member of class TWebSessionImpl.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	SetTimeoutMinutes (see page 6735)	This is SetTimeoutMinutes, a member of class TWebSessionImpl.
	SetValue (see page 6735)	This is SetValue, a member of class TWebSessionImpl.
	Terminate (see page 6735)	Terminates the session.

Protected Properties

	Name	Description
R	ExpirationTime (see page 6736)	This is ExpirationTime, a member of class TWebSessionImpl.
R	Expired (see page 6736)	This is Expired, a member of class TWebSessionImpl.
R	ID (see page 6736)	This is ID, a member of class TWebSessionImpl.
R	StartTime (see page 6737)	This is StartTime, a member of class TWebSessionImpl.
R	Terminated (see page 6737)	This is Terminated, a member of class TWebSessionImpl.
R	TimeoutMinutes (see page 6737)	This is TimeoutMinutes, a member of class TWebSessionImpl.
R	TouchTime (see page 6737)	This is TouchTime, a member of class TWebSessionImpl.
	Values (see page 6738)	This is Values, a member of class TWebSessionImpl.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).

	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6731)	This is Create, a member of class TWebSessionImpl.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 6731)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	IsActive (see page 1048)	This is IsActive, a member of class IWebSessionAttributes.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

71.1.4.2 TWebSessionImpl.Create Constructor

Pascal

```
constructor Create(AID: TSessionID);
```

C++

```
__fastcall TWebSessionImpl(TSessionID AID);
```

Description

This is Create, a member of class TWebSessionImpl.

71.1.4.3 TWebSessionImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebSessionImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

71.1.4.4 TWebSessionImpl Methods

The methods of the TWebSessionImpl class are listed here.

Protected Methods

	Name	Description
	GetExpirationTime (see page 6732)	This is GetExpirationTime, a member of class TWebSessionImpl.
	GetExpired (see page 6733)	This is GetExpired, a member of class TWebSessionImpl.
	GetID (see page 6733)	This is GetID, a member of class TWebSessionImpl.
	GetIsActive (see page 6733)	This is GetIsActive, a member of class TWebSessionImpl.
	GetItemCount (see page 6733)	This is GetItemCount, a member of class TWebSessionImpl.
	GetItems (see page 6734)	This is GetItems, a member of class TWebSessionImpl.
	GetStartTime (see page 6734)	This is GetStartTime, a member of class TWebSessionImpl.
	GetTerminated (see page 6734)	This is GetTerminated, a member of class TWebSessionImpl.
	GetTimeoutMinutes (see page 6734)	This is GetTimeoutMinutes, a member of class TWebSessionImpl.
	GetTouchTime (see page 6734)	This is GetTouchTime, a member of class TWebSessionImpl.
	GetValue (see page 6735)	This is GetValue, a member of class TWebSessionImpl.
	SetTimeoutMinutes (see page 6735)	This is SetTimeoutMinutes, a member of class TWebSessionImpl.
	SetValue (see page 6735)	This is SetValue, a member of class TWebSessionImpl.
	Terminate (see page 6735)	Terminates the session.

71.1.4.4.1 TWebSessionImpl.GetExpirationTime Method

Pascal

```
function GetExpirationTime: TDateTime;
```

C++

```
__fastcall TDateTime GetExpirationTime();
```

Description

This is GetExpirationTime, a member of class TWebSessionImpl.

71.1.4.4.2 TWebSessionImpl.GetExpired Method

Pascal

```
function GetExpired: Boolean;
```

C++

```
__fastcall Boolean GetExpired();
```

Description

This is GetExpired, a member of class TWebSessionImpl.

71.1.4.4.3 TWebSessionImpl.GetID Method

Pascal

```
function GetID: TSessionID;
```

C++

```
__fastcall TSessionID GetID();
```

Description

This is GetID, a member of class TWebSessionImpl.

71.1.4.4.4 TWebSessionImpl.GetIsActive Method

Pascal

```
function GetIsActive: Boolean;
```

C++

```
__fastcall Boolean GetIsActive();
```

Description

This is GetIsActive, a member of class TWebSessionImpl.

71.1.4.4.5 TWebSessionImpl.GetItemCount Method

Pascal

```
function GetItemCount: Integer;
```

C++

```
__fastcall int GetItemCount();
```

Description

This is GetItemCount, a member of class TWebSessionImpl.

71.1.4.4.6 TWebSessionImpl.GetItems Method

Pascal

```
procedure GetItems(var AItems: TAbstractNamedVariants);
```

C++

```
__fastcall GetItems(TAbstractNamedVariants AItems);
```

Description

This is GetItems, a member of class TWebSessionImpl.

71.1.4.4.7 TWebSessionImpl.GetStartTime Method

Pascal

```
function GetStartTime: TDateTime;
```

C++

```
__fastcall TDateTime GetStartTime();
```

Description

This is GetStartTime, a member of class TWebSessionImpl.

71.1.4.4.8 TWebSessionImpl.GetTerminated Method

Pascal

```
function GetTerminated: Boolean;
```

C++

```
__fastcall Boolean GetTerminated();
```

Description

This is GetTerminated, a member of class TWebSessionImpl.

71.1.4.4.9 TWebSessionImpl.GetTimeoutMinutes Method

Pascal

```
function GetTimeoutMinutes: Integer;
```

C++

```
__fastcall int GetTimeoutMinutes();
```

Description

This is GetTimeoutMinutes, a member of class TWebSessionImpl.

71.1.4.4.10 TWebSessionImpl.GetTouchTime Method

Pascal

```
function GetTouchTime: TDateTime;
```

C++

```
__fastcall TDateTime GetTouchTime();
```

Description

This is GetTouchTime, a member of class TWebSessionImpl.

71.1.4.4.11 TWebSessionImpl.GetValue Method

Pascal

```
function GetValue(const AName: string): Variant;
```

C++

```
__fastcall Variant GetValue(const UnicodeString AName);
```

Description

This is GetValue, a member of class TWebSessionImpl.

71.1.4.4.12 TWebSessionImpl.SetTimeoutMinutes Method

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer);
```

C++

```
__fastcall SetTimeoutMinutes(int AValue);
```

Description

This is SetTimeoutMinutes, a member of class TWebSessionImpl.

71.1.4.4.13 TWebSessionImpl.SetValue Method

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant);
```

C++

```
__fastcall SetValue(const UnicodeString AName, const Variant AValue);
```

Description

This is SetValue, a member of class TWebSessionImpl.

71.1.4.4.14 TWebSessionImpl.Terminate Method

Terminates the session.

Pascal

```
procedure Terminate;
```

C++

```
__fastcall Terminate();
```

Description

Call Terminate to terminate a session. Once a session terminates, the application can no longer access its Values.

Sessions are terminated automatically when the application does not receive any requests for the session for TimeOutMinutes minutes.

See Also

TimeoutMinutes

Values

71.1.4.5 TWebSessionImpl Properties

The properties of the TWebSessionImpl class are listed here.

Protected Properties

	Name	Description
R	ExpirationTime (see page 6736)	This is ExpirationTime, a member of class TWebSessionImpl.
R	Expired (see page 6736)	This is Expired, a member of class TWebSessionImpl.
R	ID (see page 6736)	This is ID, a member of class TWebSessionImpl.
R	StartTime (see page 6737)	This is StartTime, a member of class TWebSessionImpl.
R	Terminated (see page 6737)	This is Terminated, a member of class TWebSessionImpl.
R	TimeoutMinutes (see page 6737)	This is TimeoutMinutes, a member of class TWebSessionImpl.
R	TouchTime (see page 6737)	This is TouchTime, a member of class TWebSessionImpl.
	Values (see page 6738)	This is Values, a member of class TWebSessionImpl.

71.1.4.5.1 TWebSessionImpl.ExpirationTime Property

Pascal

```
property ExpirationTime: TDateTime;
```

C++

```
__property TDateTime ExpirationTime;
```

Description

This is ExpirationTime, a member of class TWebSessionImpl.

71.1.4.5.2 TWebSessionImpl.Expired Property

Pascal

```
property Expired: Boolean;
```

C++

```
__property Boolean Expired;
```

Description

This is Expired, a member of class TWebSessionImpl.

71.1.4.5.3 TWebSessionImpl.ID Property

Pascal

```
property ID: TSessionID;
```

C++

```
__property TSessionID ID;
```

Description

This is ID, a member of class TWebSessionImpl.

71.1.4.5.4 TWebSessionImpl.StartTime Property

Pascal

```
property StartTime: TDateTime;
```

C++

```
__property TDateTime StartTime;
```

Description

This is StartTime, a member of class TWebSessionImpl.

71.1.4.5.5 TWebSessionImpl.Terminated Property

Pascal

```
property Terminated: Boolean;
```

C++

```
__property Boolean Terminated;
```

Description

This is Terminated, a member of class TWebSessionImpl.

71.1.4.5.6 TWebSessionImpl.TimeoutMinutes Property

Pascal

```
property TimeoutMinutes: Integer;
```

C++

```
__property int TimeoutMinutes;
```

Description

This is TimeoutMinutes, a member of class TWebSessionImpl.

71.1.4.5.7 TWebSessionImpl.TouchTime Property

Pascal

```
property TouchTime: TDateTime;
```

C++

```
__property TDateTime TouchTime;
```

Description

This is TouchTime, a member of class TWebSessionImpl.

71.1.4.5.8 TWebSessionImpl.Values Property

Pascal

```
property Values [const AName: string]: Variant;
```

C++

```
__property Variant Values[UnicodeString const AName];
```

Description

This is Values, a member of class TWebSessionImpl.

71.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TEndSessionReason (see page 6739)	This is record WebSess.TEndSessionReason.

71.2.1 WebSess.TEndSessionReason Enumeration

Pascal

```
TEndSessionReason = (
  esTimeout,
  esTerminate
);
```

C++

```
enum TEndSessionReason {
  esTimeout,
  esTerminate
};
```

File

WebSess

Description

This is record WebSess.TEndSessionReason.

71.3 Types

The following table lists types in this documentation.

Types

Name	Description
TEndSessionEvent (see page 6740)	This is type WebSess.TEndSessionEvent.
TStartSessionEvent (see page 6740)	This is type WebSess.TStartSessionEvent.

71.3.1 WebSess.TEndSessionEvent Type

Pascal

```
TEndSessionEvent = procedure (ASender: TObject; ASession: TAbstractWebSession; AReason:
TEndSessionReason) of object;
```

C++

```
(ASender: TObject; ASession: TAbstractWebSession; AReason: TEndSessionReason) (
TEndSessionEvent)();
```

File

WebSess

Description

This is type WebSess.TEndSessionEvent.

71.3.2 WebSess.TStartSessionEvent Type

Pascal

```
TStartSessionEvent = procedure (ASender: TObject; ASession: TAbstractWebSession) of object;
```

C++

```
(ASender: TObject; ASession: TAbstractWebSession) ( TStartSessionEvent)();
```

File

WebSess

Description

This is type WebSess.TStartSessionEvent.

72 WebUsers Namespace

This is namespace WebUsers.

Topics

Name	Description
Classes (see page 6742)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 6764)	The following table lists structs, records, enums in this documentation.
Types (see page 6765)	The following table lists types in this documentation.

Classes

	Name	Description
	EUserIDNotFoundException (see page 6742)	EUserIDNotFoundException is raised when a Web user list attempts to locate information about a user that is not in the list.
	EValidateUserException (see page 6742)	EValidateUserException is raised when a Web user list fails to validate a user.
	EWebUsersListException (see page 6743)	EWebUsersListException is the base class for exceptions that TWebUserList (see page 6759) raises.
	TCustomWebUserList (see page 6744)	The TCustomWebUserList component uses a TWebUserItems (see page 6755) object to store the account information about a collection of users.
	TWebUserItem (see page 6750)	TWebUserItem stores the user identification, password, and access rights for a single user.
	TWebUserItems (see page 6755)	TWebUserItems stores multiple sets of user information.
	TWebUserList (see page 6759)	TWebUserList validates login and checks access rights for a particular user.

Structs, Records, Enums

	Name	Description
	TValidateUserError (see page 6764)	This is record WebUsers.TValidateUserError.

Types

Name	Description
TCheckAccessRightsEvent (see page 6765)	This is type WebUsers.TCheckAccessRightsEvent.
TCheckAccessRightsHandledEvent (see page 6765)	This is type WebUsers.TCheckAccessRightsHandledEvent.
TValidateUserErrorEvent (see page 6766)	This is type WebUsers.TValidateUserErrorEvent.
TValidateUserEvent (see page 6766)	This is type WebUsers.TValidateUserEvent.
TValidateUserHandledEvent (see page 6766)	This is type WebUsers.TValidateUserHandledEvent.

72.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EUserIDNotFoundException (see page 6742)	EUserIDNotFoundException is raised when a Web user list attempts to locate information about a user that is not in the list.
	EValidateUserException (see page 6742)	EValidateUserException is raised when a Web user list fails to validate a user.
	EWebUsersListException (see page 6743)	EWebUsersListException is the base class for exceptions that TWebUserList (see page 6759) raises.
	TCustomWebUserList (see page 6744)	The TCustomWebUserList component uses a TWebUserItems (see page 6755) object to store the account information about a collection of users.
	TWebUserItem (see page 6750)	TWebUserItem stores the user identification, password, and access rights for a single user.
	TWebUserItems (see page 6755)	TWebUserItems stores multiple sets of user information.
	TWebUserList (see page 6759)	TWebUserList validates login and checks access rights for a particular user.

72.1.1 EUserIDNotFoundException Class

EUserIDNotFoundException is raised when a Web user list attempts to locate information about a user that is not in the list.

Class Hierarchy

Pascal

```
EUserIDNotFoundException = class(EWebUsersListException);
```

C++

```
class EUserIDNotFoundException : public EWebUsersListException;
```

File

WebUsers

Description

When a Web user list (TWebUserList (see page 6759)) attempts to look up information about a user and fails to find an entry for that user, it generates an OnUserIDNotFound event. If that event handler does not handle the situation, then the Web user list raises an EUserIDNotFoundException exception.

See Also

TWebUserList (see page 6759)

TCustomWebUserList (see page 6744)

72.1.2 EValidateUserException Class

EValidateUserException is raised when a Web user list fails to validate a user.

Class Hierarchy

Pascal

```
EValidateUserException = class(EWebUsersListException);
```

C++

```
class EValidateUserException : public EWebUsersListException;
```

File

WebUsers

Description

When a WebSnap application that contains a Web user list (TWebUserList (see page 6759)) tries to log a user in, the Web user list raises an EValidateUserException if it can't validate the supplied user ID and password and its OnValidateUserError event handler does not handle the situation.

The Web user list may fail to validate a user ID and password for any of the following reasons:

The WebSnap application failed to supply a password or user ID when trying to validate the user.

The supplied user ID does not refer to a user in the list.

The supplied password is not correct for the specified user.

See Also

TWebUserList (see page 6759)

TCustomWebUserList (see page 6744)

TCustomWebUserList (see page 6744)

72.1.3 EWebUsersListException Class

EWebUsersListException is the base class for exceptions that TWebUserList (see page 6759) raises.

Class Hierarchy

Pascal

```
EWebUsersListException = class(EWebBrokerException);
```

C++

```
class EWebUsersListException : public EWebBrokerException;
```

File

WebUsers

Description

EWebUsersListException is the common base class for all exceptions that represent errors which TWebUserList (see page 6759) encounters. Its descendants include

EUserIDNotFoundException (see page 6742), which is raised when a WebSnap application tries to use the Web user list to look up information about a user that is not listed.

EValidateUserException (see page 6742), which is raised when the WebSnap application tries to log in a user and the Web user list fails to validate the supplied user id and password.

See Also

TWebUserList (see page 6759)

EUserIDNotFoundException (see page 6742)

EValidateUserException (see page 6742)

72.1.4 TCustomWebUserList Class

The TCustomWebUserList component uses a TWebUserItems (see page 6755) object to store the account information about a collection of users.

Class Hierarchy

Pascal

```
TCustomWebUserList = class(TComponent, IWebUserList);
```

C++

```
class TCustomWebUserList : public TComponent, public IWebUserList;
```

File

WebUsers

Description

The TCustomWebUserList component uses a TWebUserItems (see page 6755) object to store the account information about a collection of users. It also provides a way to save and load the user list from a file. Several events are triggered at stages that occur when a user is logging in that allow checks to be performed during the user validation process, including the verification of user rights.

See Also

TWebUserItems (see page 6755)

TWebUserList (see page 6759)

72.1.4.1 TCustomWebUserList Members

The following tables list the members exposed by TCustomWebUserList.

Protected Methods

	Name	Description
	CheckAccessRights (see page 6746)	Checks whether a specified user has a given access rights string.
	ValidateUser (see page 6747)	Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6744) object.

Public Events

	Name	Description
	OnAfterCheckAccessRights (see page 6748)	Triggered at the start of the CheckAccessRights (see page 6746) protected function.
	OnAfterValidateUser (see page 6749)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 6749)	Triggered at the end of the CheckAccessRights (see page 6746) protected function.
	OnBeforeValidateUser (see page 6749)	Triggered at the beginning of the ValidateUser (see page 6747) function.
	OnUserIDNotFound (see page 6750)	Triggered if the UserID is not found in the TCustomWebUserList (see page 6744) object.
	OnValidateUserError (see page 6750)	Triggered if an error occurs during the validation process.

Public Methods

	Name	Description
V	Create (see page 6745)	Creates a newTCustomWebUserList object.
V	Destroy (see page 6745)	Frees the TCustomWebUserList (see page 6744) object.
	LoadFromFile (see page 6746)	Loads the data from the file with the given filename.
	SaveToFile (see page 6747)	This procedure saves the collection of the user's account information to a file with the given filename.

Public Properties

	Name	Description
	UserItems (see page 6747)	Stores the account information about a collection of users.
R	Users (see page 6748)	Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6750).

72.1.4.2 TCustomWebUserList.Create Constructor

Creates a newTCustomWebUserList object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebUserList(TComponent * AOwner);
```

Description

Creates a newTCustomWebUserList object and initializes the TWebUserItems (see page 6755) object that will store the user's account information.

72.1.4.3 TCustomWebUserList.Destroy Destructor

Frees the TCustomWebUserList (see page 6744) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebUserList();
```

Description

Frees the TCustomWebUserList (see page 6744) object initialized by the constructor.

72.1.4.4 TCustomWebUserList Methods

The methods of the TCustomWebUserList class are listed here.

Protected Methods

	Name	Description
	CheckAccessRights (see page 6746)	Checks whether a specified user has a given access rights string.
	ValidateUser (see page 6747)	Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6744) object.

Public Methods

	Name	Description
	LoadFromFile (see page 6746)	Loads the data from the file with the given filename.
	SaveToFile (see page 6747)	This procedure saves the collection of the user's account information to a file with the given filename.

72.1.4.4.1 TCustomWebUserList.CheckAccessRights Method

Checks whether a specified user has a given access rights string.

Pascal

```
function CheckAccessRights(AUserID: Variant; ARights: string): Boolean;
```

C++

```
__fastcall Boolean CheckAccessRights(Variant AUserID, UnicodeString ARights);
```

Description

Call CheckAccessRights to determine whether the current end user is authorized to view Web pages or adapters whose access rights string is Rights. The end user must be logged in before CheckAccessRights can determine the user's access rights.

UserID is the user ID of the user to check.

Rights is the access rights string that CheckAccessRights must look for. Typically, this is the value of the ViewRights property on a Web page information object that describes the page the user wants to access or on an adapter that the user wants to call.

See Also

HasViewRights (see page 5497)

HasModifyRights (see page 5497)

HasExecuteRights (see page 5496)

ViewAccess

ViewAccess (see page 5560)

72.1.4.4.2 TCustomWebUserList.LoadFromFile Method

Loads the data from the file with the given filename.

Pascal

```
procedure LoadFromFile(FileName: string);
```

C++

```
__fastcall LoadFromFile(UnicodeString FileName);
```

Description

Loads the data from the file with the given filename into the TCustomWebUserList (see page 6744) object.

72.1.4.4.3 TCustomWebUserList.SaveToFile Method

This procedure saves the collection of the user's account information to a file with the given filename.

Pascal

```
procedure SaveToFile(FileName: string);
```

C++

```
__fastcall SaveToFile(UnicodeString FileName);
```

Description

Saves the collection of the user's account information to a file with the given filename. This file can later be reloaded by calling LoadFromFile (see page 6746).

72.1.4.4.4 TCustomWebUserList.ValidateUser Method

Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6744) object.

Pascal

```
function ValidateUser(Strings: TStrings): Variant;
```

C++

```
__fastcall Variant ValidateUser(TStrings Strings);
```

Description

This function verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6744) object. Before the validation begins, it triggers the OnBeforeValidateUser (see page 6749) event. If an error occurs during the validation check, the OnValidateUserError (see page 6750) event will be triggered and a description of the error is sent, which could be either a missing or invalid password, or a missing or unknown user name. After the validation is complete, this function triggers the OnAfterValidateUser (see page 6749) event.

72.1.4.5 TCustomWebUserList Properties

The properties of the TCustomWebUserList class are listed here.

Public Properties

	Name	Description
	UserItems (see page 6747)	Stores the account information about a collection of users.
R	Users (see page 6748)	Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6750).

72.1.4.5.1 TCustomWebUserList.UserItems Property

Stores the account information about a collection of users.

Pascal

```
property UserItems: TWebUserItems;
```

C++

```
__property TWebUserItems UserItems;
```

Description

Use this object to store the account information about a collection of users. This property provides read and write access to the stored collection.

See Also

Users (see page 6748)

72.1.4.5.2 TCustomWebUserList.Users Property

Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6750).

Pascal

```
property Users [I: Integer]: TWebUserItem;
```

C++

```
__property TWebUserItem Users[int I];
```

Description

Use this property to provide read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6750). An individual TWebUserItem (see page 6750) object can be indexed from the array using the standard bracketed array notation.

See Also

UserItems (see page 6747)

72.1.4.6 TCustomWebUserList Events

The events of the TCustomWebUserList class are listed here.

Public Events

	Name	Description
	OnAfterCheckAccessRights (see page 6748)	Triggered at the start of the CheckAccessRights (see page 6746) protected function.
	OnAfterValidateUser (see page 6749)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 6749)	Triggered at the end of the CheckAccessRights (see page 6746) protected function.
	OnBeforeValidateUser (see page 6749)	Triggered at the beginning of the ValidateUser (see page 6747) function.
	OnUserIDNotFound (see page 6750)	Triggered if the UserID is not found in the TCustomWebUserList (see page 6744) object.
	OnValidateUserError (see page 6750)	Triggered if an error occurs during the validation process.

72.1.4.6.1 TCustomWebUserList.OnAfterCheckAccessRights Event

Triggered at the start of the CheckAccessRights (see page 6746) protected function.

Pascal

```
property OnAfterCheckAccessRights: TCheckAccessRightsEvent;
```

C++

```
__property TCheckAccessRightsEvent OnAfterCheckAccessRights;
```

Description

This event is triggered at the start of the CheckAccessRights (see page 6746) protected function. This event can be used if any additional checking or initializing is desired before the access rights are checked.

See Also

OnBeforeCheckAccessRights (see page 6749)

72.1.4.6.2 TCustomWebUserList.OnAfterValidateUser Event

Occurs after a user has been validated.

Pascal

```
property OnAfterValidateUser: TValidateUserEvent;
```

C++

```
__property TValidateUserEvent OnAfterValidateUser;
```

Description

This event is triggered at the end of the ValidateUser (see page 6747) function. It can be used if any additional processing needs to be done after a user's name and password are verified.

See Also

OnBeforeValidateUser (see page 6749)

ValidateUser (see page 6747)

72.1.4.6.3 TCustomWebUserList.OnBeforeCheckAccessRights Event

Triggered at the end of the CheckAccessRights (see page 6746) protected function.

Pascal

```
property OnBeforeCheckAccessRights: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnBeforeCheckAccessRights;
```

Description

This event is triggered at the end of the CheckAccessRights (see page 6746) protected function. It can be used to perform your own custom checking instead of the default checking by the Web user list.

See Also

OnAfterCheckAccessRights (see page 6748)

72.1.4.6.4 TCustomWebUserList.OnBeforeValidateUser Event

Triggered at the beginning of the ValidateUser (see page 6747) function.

Pascal

```
property OnBeforeValidateUser: TValidateUserHandledEvent;
```

C++

```
__property TValidateUserHandledEvent OnBeforeValidateUser;
```

Description

This event is triggered at the beginning of the ValidateUser (see page 6747) function. It can be used to identify a user given a name and password and supply a user ID for the user, once identified.

See Also

OnAfterValidateUser (see page 6749)

72.1.4.6.5 TCustomWebUserList.OnUserIDNotFound Event

Triggered if the UserID is not found in the TCustomWebUserList (see page 6744) object.

Pascal

```
property OnUserIDNotFound: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnUserIDNotFound;
```

Description

This event is triggered if the UserID is not found in the TCustomWebUserList (see page 6744) object. The CheckAccessRights (see page 6746) protected function triggers this function if the UserID is not found while checking the access rights.

72.1.4.6.6 TCustomWebUserList.OnValidateUserError Event

Triggered if an error occurs during the validation process.

Pascal

```
property OnValidateUserError: TValidateUserErrorEvent;
```

C++

```
__property TValidateUserErrorEvent OnValidateUserError;
```

Description

This event is triggered if an error occurs during the validation process. The ValidateUser (see page 6747) function calls this event with a description of the error. Examples of error descriptions include a missing or unknown user name or a missing or invalid password. Any additional processing that needs to be completed in the case of one of these error conditions can be added to this event handler.

See Also

ValidateUser (see page 6747)

72.1.5 TWebUserItem Class

TWebUserItem stores the user identification, password, and access rights for a single user.

Class Hierarchy

Pascal

```
TWebUserItem = class(TCollectionItem);
```

C++

```
class TWebUserItem : public TCollectionItem;
```

File

WebUsers

Description

TWebUserItem stores the user ID and password along with the associated access rights for a single user. Methods are provided to set the access rights as well as methods to retrieve the access rights in the form of a single delimited string, or as a collection in the form of a TString.

See Also

TWebUserList (see page 6759)

TWebUserItems (see page 6755)

72.1.5.1 TWebUserItem Members

The following tables list the members exposed by TWebUserItem.

Public Methods

	Name	Description
	Assign (see page 6752)	Copies the UserName (see page 6754), Password (see page 6754), and AccessRights (see page 6753) from the given TWebUserItem (see page 6750).
	CheckRights (see page 6753)	Checks the user's stored access rights against the access rights passed in.
	Create (see page 6751)	Creates an instance of Create.
	Destroy (see page 6752)	Destroys an instance of TWebUserItem (see page 6750).

Public Properties

	Name	Description
	AccessRightsStrings (see page 6754)	Stores the access rights for the user as a collection of individual strings in the form of a TStrings object.
	UserID (see page 6754)	Provides read-only access to the user ID.

Published Properties

	Name	Description
	AccessRights (see page 6753)	Stores the user rights as a comma, semicolon, or space delimited string.
	Password (see page 6754)	Stores the user's password as a string.
	UserName (see page 6754)	Stores the user's name.

72.1.5.2 TWebUserItem.Create Constructor

Creates an instance of Create.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TWebUserItem(TCollection Collection);
```

Description

Do not call Create. It is called automatically when the Create object is created.

See Also

Create_c

72.1.5.3 TWebUserItem.Destroy Destructor

Destroys an instance of TWebUserItem (see page 6750).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebUserItem();
```

Description

The Destroy destructor frees all objects owned by the TWebUserItem (see page 6750) object. Never call the destructor explicitly; it is called automatically when the TWebUserItem (see page 6750) object is destroyed (for example, when the object falls out of the scope of the program).

See Also

delete

72.1.5.4 TWebUserItem Methods

The methods of the TWebUserItem class are listed here.

Public Methods

	Name	Description
	Assign (see page 6752)	Copies the UserName (see page 6754), Password (see page 6754), and AccessRights (see page 6753) from the given TWebUserItem (see page 6750).
	CheckRights (see page 6753)	Checks the user's stored access rights against the access rights passed in.

72.1.5.4.1 TWebUserItem.Assign Method

Copies the UserName (see page 6754), Password (see page 6754), and AccessRights (see page 6753) from the given TWebUserItem (see page 6750).

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

The Assign procedure copies the UserName (see page 6754), Password (see page 6754), and AccessRights (see page 6753) from the given TWebUserItem (see page 6750).

See Also

UserName (see page 6754)

Password (see page 6754)

AccessRights (see page 6753)

72.1.5.4.2 TWebUserItem.CheckRights Method

Checks the user's stored access rights against the access rights passed in.

Pascal

```
function CheckRights(const ARights: string): Boolean;
```

C++

```
__fastcall Boolean CheckRights(const UnicodeString ARights);
```

Description

This function checks the user's stored access rights against the access rights passed in. If the user has a matching right, then the function returns true or it will return false if the rights do not match.

See Also

AccessRights (see page 6753)

72.1.5.5 TWebUserItem Properties

The properties of the TWebUserItem class are listed here.

Public Properties

	Name	Description
R	AccessRightsStrings (see page 6754)	Stores the access rights for the user as a collection of individual strings in the form of a TStrings object.
R	UserID (see page 6754)	Provides read-only access to the user ID.

Published Properties

	Name	Description
	AccessRights (see page 6753)	Stores the user rights as a comma, semicolon, or space delimited string.
	Password (see page 6754)	Stores the user's password as a string.
	UserName (see page 6754)	Stores the user's name.

72.1.5.5.1 TWebUserItem.AccessRights Property

Stores the user rights as a comma, semicolon, or space delimited string.

Pascal

```
property AccessRights: string;
```

C++

```
__property UnicodeString AccessRights;
```

Description

The AccessRights property stores the user rights as a comma, semicolon, or space delimited string. This variable can be read or written directly or set as a single string using SetAccessRights. The individual rights can be obtained as a collection in the form of a TString by calling the GetAccessRightsStrings function.

See Also

CheckRights (see page 6753)

72.1.5.5.2 TWebUserItem.AccessRightsStrings Property

Stores the access rights for the user as a collection of individual strings in the form of a TStrings object.

Pascal

```
property AccessRightsStrings: TStrings;
```

C++

```
__property TStrings AccessRightsStrings;
```

Description

The AccessRightsStrings property stores the access rights for the user as a collection of individual strings in the form of a TStrings object.

See Also

AccessRights (see page 6753)

TStrings

72.1.5.5.3 TWebUserItem.Password Property

Stores the user's password as a string.

Pascal

```
property Password: string;
```

C++

```
__property UnicodeString Password;
```

Description

The Password property stores the user's password as a string.

72.1.5.5.4 TWebUserItem.UserID Property

Provides read-only access to the user ID.

Pascal

```
property UserID: Variant;
```

C++

```
__property Variant UserID;
```

Description

The UserID property provides read-only access to the user ID.

See Also

Variant (see page 3430)

72.1.5.5.5 TWebUserItem.UserName Property

Stores the user's name.

Pascal

```
property UserName: string;
```

C++

```
__property UnicodeString UserName;
```

Description

The UserName property stores the user's name. This property can be read or written directly.

72.1.6 TWebUserItems Class

TWebUserItems stores multiple sets of user information.

Class Hierarchy

Pascal

```
TWebUserItems = class(TCollection);
```

C++

```
class TWebUserItems : public TCollection;
```

File

WebUsers

Description

The TWebUserItems stores multiple TWebUserItem (see page 6750) modules as an array. It also provides methods to access a particular user's information by giving the user name or user ID.

72.1.6.1 TWebUserItems Members

The following tables list the members exposed by TWebUserItems.

Protected Methods

	Name	Description
	GetAttr (see page 6757)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
	GetAttrCount (see page 6757)	Returns the number of custom attributes associated with items in the collection.
	GetItemAttr (see page 6758)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 6758)	Returns the owner of an object.

Public Methods

	Name	Description
	Create (see page 6756)	Constructor used for the TWebUserItems (see page 6755) object.
	FindUserID (see page 6756)	Returns the user ID, password, and access rights information for the user.
	FindUserName (see page 6756)	Returns the user ID, password, and access rights information for the user.

Public Properties

	Name	Description
	Items (see page 6759)	Allows public read and write access to individual TWebUserItem (see page 6750) records as if they were stored in an array.

72.1.6.2 TWebUserItems.Create Constructor

Constructor used for the TWebUserItems (see page 6755) object.

Pascal

```
constructor Create(AOwner: TComponent; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TWebUserItems(TComponent * AOwner, TCollectionItemClass ItemClass);
```

Description

The constructor used for the TWebUserItems (see page 6755) object. This method creates a new TWebUserItem (see page 6750) and sets the owner.

72.1.6.3 TWebUserItems Methods

The methods of the TWebUserItems class are listed here.

Protected Methods

	Name	Description
	GetAttr (see page 6757)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
	GetAttrCount (see page 6757)	Returns the number of custom attributes associated with items in the collection.
	GetItemAttr (see page 6758)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 6758)	Returns the owner of an object.

Public Methods

	Name	Description
	FindUserID (see page 6756)	Returns the user ID, password, and access rights information for the user.
	FindUserName (see page 6756)	Returns the user ID, password, and access rights information for the user.

72.1.6.3.1 TWebUserItems.FindUserID Method

Returns the user ID, password, and access rights information for the user.

Pascal

```
function FindUserID(AUserID: Variant): TWebUserItem;
```

C++

```
__fastcall TWebUserItem FindUserID(Variant AUserID);
```

Description

This method returns the user ID, password, and access rights information for the user with the given user name in the form of a TWebUserItem (see page 6750) object.

72.1.6.3.2 TWebUserItems.FindUserName Method

Returns the user ID, password, and access rights information for the user.

Pascal

```
function FindUserName(AUserName: string): TWebUserItem;
```

C++

```
__fastcall TWebUserItem FindUserName(UnicodeString AUserName);
```

Description

This method returns the user ID, password, and access rights information for the user with the given user ID in the form of a TWebUserItem (see page 6750) object.

72.1.6.3.3 TWebUserItems.GetAttr Method

Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.

Pascal

```
function GetAttr(Index: Integer): string; override;
```

C++

```
virtual __fastcall UnicodeString GetAttr(int Index);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. The GetAttr method returns the name of an attribute.

Index identifies the attribute whose name is requested. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

As implemented by TCollection, GetAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttrCount

GetItemAttr

72.1.6.3.4 TWebUserItems.GetAttrCount Method

Returns the number of custom attributes associated with items in the collection.

Pascal

```
function GetAttrCount: Integer; override;
```

C++

```
virtual __fastcall int GetAttrCount();
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetAttrCount returns the number of distinct attributes assigned to each item in the collection.

As implemented in TCollection, GetAttrCount always returns 0, because TCollection defines no custom attributes.

See Also

GetAttr

GetItemAttr

72.1.6.3.5 TWebUserItems.GetItemAttr Method

Returns the value of a custom attribute assigned to one of the collection's items.

Pascal

```
function GetItemAttr(Index: Integer; ItemIndex: Integer): string; override;
```

C++

```
virtual __fastcall UnicodeString GetItemAttr(int Index, int ItemIndex);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetItemAttr returns the value of one of these attributes for a specified item in the collection.

Index identifies which attribute's value is desired. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

ItemIndex identifies the item whose attribute value is desired. This is an index into the Items property array.

As implemented in TCollection, GetItemAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttr

GetAttrCount

72.1.6.3.6 TWebUserItems.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath

TCollection

TComponent

Owner

72.1.6.4 TWebUserItems Properties

The properties of the TWebUserItems class are listed here.

Public Properties

	Name	Description
	Items (see page 6759)	Allows public read and write access to individual TWebUserItem (see page 6750) records as if they were stored in an array.

72.1.6.4.1 TWebUserItems.Items Property

Allows public read and write access to individual TWebUserItem (see page 6750) records as if they were stored in an array.

Pascal

```
property Items [Index: Integer]: TWebUserItem;
```

C++

```
__property TWebUserItem Items[int Index];
```

Description

The Items property allows public read and write access to individual TWebUserItem (see page 6750) records as if they were stored in an array. It also provides methods to access a particular user's information by giving the user name or user ID.

See Also

operator_sb

72.1.7 TWebUserList Class

TWebUserList validates login and checks access rights for a particular user.

Class Hierarchy

Pascal

```
TWebUserList = class(TCustomWebUserList);
```

C++

```
class TWebUserList : public TCustomWebUserList;
```

File

WebUsers

Description

Use TWebUserList, which contains a list of user names, passwords, and access rights, to validate login and to check a user's access rights.

The TWebUserList component provides events that are triggered during the initial stages when a user is logging in, before and after the user is validated, before and after the user's access rights are checked, in the case of an error, and when detecting an invalid user.

See Also

TWebUserItems (see page 6755)

TWebUserItem (see page 6750)

Adding Login Support

72.1.7.1 TWebUserList Members

The following tables list the members exposed by TWebUserList.

Protected Methods

	Name	Description
	CheckAccessRights (see page 6746)	Checks whether a specified user has a given access rights string.
	ValidateUser (see page 6747)	Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6744) object.

Public Methods

	Name	Description
	CheckAccessRights (see page 1058)	Checks whether a specified user has a given access rights string.
V	Create (see page 6745)	Creates a newTCustomWebUserList object.
V	Destroy (see page 6745)	Frees the TCustomWebUserList (see page 6744) object.
	LoadFromFile (see page 6746)	Loads the data from the file with the given filename.
	SaveToFile (see page 6747)	This procedure saves the collection of the user's account information to a file with the given filename.
	ValidateUser (see page 1059)	Validates a user login.

Public Properties

	Name	Description
R	Users (see page 6748)	Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6750).

Published Events

	Name	Description
	OnAfterCheckAccessRights (see page 6761)	Triggered at the start of the CheckAccessRights protected function.
	OnAfterValidateUser (see page 6761)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 6762)	Triggered at the end of the CheckAccessRights protected function.
	OnBeforeValidateUser (see page 6762)	Triggered at the beginning of the ValidateUser function.
	OnUserIDNotFound (see page 6762)	Triggered if the UserID is not found in the TCustomWebUserList object.
	OnValidateUserError (see page 6763)	Triggered if an error occurs during the validation process.

Published Properties

	Name	Description
	UserItems (see page 6761)	Stores the account information about a collection of users.

72.1.7.2 TWebUserList Properties

The properties of the TWebUserList class are listed here.

Published Properties

	Name	Description
	UserItems (see page 6761)	Stores the account information about a collection of users.

72.1.7.2.1 TWebUserList.UserItems Property

Stores the account information about a collection of users.

Pascal

```
property UserItems: TWebUserItems;
```

C++

```
__property TWebUserItems UserItems;
```

Description

Use this object to store the account information about a collection of users. This property provides read and write access to the stored collection.

See Also

Users (see page 6748)

72.1.7.3 TWebUserList Events

The events of the TWebUserList class are listed here.

Published Events

	Name	Description
	OnAfterCheckAccessRights (see page 6761)	Triggered at the start of the CheckAccessRights protected function.
	OnAfterValidateUser (see page 6761)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 6762)	Triggered at the end of the CheckAccessRights protected function.
	OnBeforeValidateUser (see page 6762)	Triggered at the beginning of the ValidateUser function.
	OnUserIDNotFound (see page 6762)	Triggered if the UserID is not found in the TCustomWebUserList object.
	OnValidateUserError (see page 6763)	Triggered if an error occurs during the validation process.

72.1.7.3.1 TWebUserList.OnAfterCheckAccessRights Event

Triggered at the start of the CheckAccessRights protected function.

Pascal

```
property OnAfterCheckAccessRights: TCheckAccessRightsEvent;
```

C++

```
__property TCheckAccessRightsEvent OnAfterCheckAccessRights;
```

Description

This event is triggered at the start of the CheckAccessRights protected function. This event can be used if any additional checking or initializing is desired before the access rights are checked.

See Also

OnBeforeCheckAccessRights (see page 6749)

72.1.7.3.2 TWebUserList.OnAfterValidateUser Event

Occurs after a user has been validated.

Pascal

```
property OnAfterValidateUser: TValidateUserEvent;
```

C++

```
__property TValidateUserEvent OnAfterValidateUser;
```

Description

This event is triggered at the end of the ValidateUser function. It can be used if any additional processing needs to be done after a user's name and password are verified.

See Also

OnBeforeValidateUser (see page 6749)

ValidateUser (see page 6747)

72.1.7.3.3 TWebUserList.OnBeforeCheckAccessRights Event

Triggered at the end of the CheckAccessRights protected function.

Pascal

```
property OnBeforeCheckAccessRights: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnBeforeCheckAccessRights;
```

Description

This event is triggered at the end of the CheckAccessRights protected function. It can be used to perform your own custom checking instead of the default checking by the Web user list.

See Also

OnAfterCheckAccessRights (see page 6748)

72.1.7.3.4 TWebUserList.OnBeforeValidateUser Event

Triggered at the beginning of the ValidateUser function.

Pascal

```
property OnBeforeValidateUser: TValidateUserHandledEvent;
```

C++

```
__property TValidateUserHandledEvent OnBeforeValidateUser;
```

Description

This event is triggered at the beginning of the ValidateUser function. It can be used to identify a user given a name and password and supply a user ID for the user, once identified.

See Also

OnAfterValidateUser (see page 6749)

72.1.7.3.5 TWebUserList.OnUserIDNotFound Event

Triggered if the UserID is not found in the TCustomWebUserList object.

Pascal

```
property OnUserIDNotFound: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnUserIDNotFound;
```

Description

This event is triggered if the UserID is not found in the TCustomWebUserList object. The CheckAccessRights protected function triggers this function if the UserID is not found while checking the access rights.

72.1.7.3.6 TWebUserList.OnValidateUserError Event

Triggered if an error occurs during the validation process.

Pascal

```
property OnValidateUserError: TValidateUserErrorEvent;
```

C++

```
__property TValidateUserErrorEvent OnValidateUserError;
```

Description

This event is triggered if an error occurs during the validation process. The ValidateUser function calls this event with a description of the error. Examples of error descriptions include a missing or unknown user name or a missing or invalid password. Any additional processing that needs to be completed in the case of one of these error conditions can be added to this event handler.

See Also

ValidateUser (see page 6747)

72.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TValidateUserError (see page 6764)	This is record WebUsers.TValidateUserError.

72.2.1 WebUsers.TValidateUserError Enumeration

Pascal

```
TValidateUserError = (
  vuBlankPassword,
  vuBlankUserName,
  vuUnknownUserName,
  vuUnknownPassword
);
```

C++

```
enum TValidateUserError {
  vuBlankPassword,
  vuBlankUserName,
  vuUnknownUserName,
  vuUnknownPassword
};
```

File

WebUsers

Description

This is record WebUsers.TValidateUserError.

72.3 Types

The following table lists types in this documentation.

Types

Name	Description
TCheckAccessRightsEvent (see page 6765)	This is type WebUsers.TCheckAccessRightsEvent.
TCheckAccessRightsHandledEvent (see page 6765)	This is type WebUsers.TCheckAccessRightsHandledEvent.
TValidateUserErrorEvent (see page 6766)	This is type WebUsers.TValidateUserErrorEvent.
TValidateUserEvent (see page 6766)	This is type WebUsers.TValidateUserEvent.
TValidateUserHandledEvent (see page 6766)	This is type WebUsers.TValidateUserHandledEvent.

72.3.1 WebUsers.TCheckAccessRightsEvent Type

Pascal

```
TCheckAccessRightsEvent = procedure (UserID: Variant; Rights: string; var HasRight: Boolean)
of object;
```

C++

```
(UserID: Variant; Rights: string; var HasRight: Boolean) ( TCheckAccessRightsEvent)();
```

File

WebUsers

Description

This is type WebUsers.TCheckAccessRightsEvent.

72.3.2 WebUsers.TCheckAccessRightsHandledEvent Type

Pascal

```
TCheckAccessRightsHandledEvent = procedure (UserID: Variant; Rights: string; var HasRight:
Boolean; var Handled: Boolean) of object;
```

C++

```
(UserID: Variant; Rights: string; var HasRight: Boolean; var Handled: Boolean) (
TCheckAccessRightsHandledEvent)();
```

File

WebUsers

Description

This is type WebUsers.TCheckAccessRightsHandledEvent.

72.3.3 WebUsers.TValidateUserErrorEvent Type

Pascal

```
TValidateUserErrorEvent = procedure (Error: TValidateUserError; Strings: TStrings; var UserID:
Variant; var Handled: Boolean) of object;
```

C++

```
(Error: TValidateUserError; Strings: TStrings; var UserID: Variant; var Handled: Boolean) (
TValidateUserErrorEvent)();
```

File

WebUsers

Description

This is type WebUsers.TValidateUserErrorEvent.

72.3.4 WebUsers.TValidateUserEvent Type

Pascal

```
TValidateUserEvent = procedure (Strings: TStrings; var UserID: Variant) of object;
```

C++

```
(Strings: TStrings; var UserID: Variant) ( TValidateUserEvent)();
```

File

WebUsers

Description

This is type WebUsers.TValidateUserEvent.

72.3.5 WebUsers.TValidateUserHandledEvent Type

Pascal

```
TValidateUserHandledEvent = procedure (Strings: TStrings; var UserID: Variant; var Handled:
Boolean) of object;
```

C++

```
(Strings: TStrings; var UserID: Variant; var Handled: Boolean) ( TValidateUserHandledEvent)();
```

File

WebUsers

Description

This is type WebUsers.TValidateUserHandledEvent.

73 WideStrings Namespace

This is namespace WideStrings.

Topics

Name	Description
Classes (see page 6768)	The following table lists classes in this documentation.
Interfaces (see page 6819)	The following table lists interfaces in this documentation.
Structs, Records, Enums (see page 6821)	The following table lists structs, records, enums in this documentation.
Types (see page 6822)	The following table lists types in this documentation.

Classes

	Name	Description
	TWideStringList (see page 6768)	TWideStringList maintains a list of strings.
	TWideStrings (see page 6785)	TWideStrings is the base class for objects that represent a list of Unicode strings.
	TWideStringsEnumerator (see page 6816)	Enumerates through the strings of a TWideStrings (see page 6785) object.

Interfaces

	Name	Description
	IWideStringsAdapter (see page 6819)	This is class WideStrings.IWideStringsAdapter.

Structs, Records, Enums

	Name	Description
	TWideStringItem (see page 6821)	TWideStringItem defines a TWideStringList (see page 6768) entry.

Types

Name	Description
PWideStringItem (see page 6822)	PWideStringItem is a TWideStringItem (see page 6821) pointer.
PWideStringItemList (see page 6822)	PWideStringItemList is a TWideStringItemList (see page 6823) pointer.
TWideStringItemList (see page 6823)	TWideStringItemList defines an array of TWideStringItems.
TWideStringListSortCompare (see page 6823)	TWideStringListSortCompare is a type of callback function called used internally by the TWideStringList (see page 6768) class.

73.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWideStringList (see page 6768)	TWideStringList maintains a list of strings.
	TWideStrings (see page 6785)	TWideStrings is the base class for objects that represent a list of Unicode strings.
	TWideStringsEnumerator (see page 6816)	Enumerates through the strings of a TWideStrings (see page 6785) object.

73.1.1 TWideStringList Class

TWideStringList maintains a list of strings.

Class Hierarchy

Pascal

```
TWideStringList = class(TWideStrings);
```

C++

```
class TWideStringList : public TWideStrings;
```

File

WideStrings

Description

Use a string list object to store and manipulate a list of strings. TWideStringList implements the abstract properties and methods introduced by TWideStrings (see page 6785), and introduces new properties, events, and methods to

Sort (see page 6781) the strings in the list.

Prohibit duplicate strings in sorted lists.

Respond to changes in the contents of the list.

Control whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.

Working with Lists

73.1.1.1 TWideStringList Members

The following tables list the members exposed by TWideStringList.

Protected Methods

	Name	Description
	AssignTo (see page 6792)	Copies the properties of an object to a destination object.
	Changed (see page 6773)	This is Changed, a member of class TWideStringList.
	Changing (see page 6774)	This is Changing, a member of class TWideStringList.
	CompareStrings (see page 6774)	Compares two strings.
	DefineProperties (see page 6794)	Reads and writes the Strings (see page 6813) property as if it were published.
	Error (see page 6795)	This is the overview for the Error method overload.
	ExtractName (see page 6797)	Returns the name portion of a string that is a name value pair.
	Get (see page 6777)	Returns a string given its index.
	GetCapacity (see page 6777)	Returns the currently allocated size of the list of strings.
	GetCount (see page 6777)	Returns the number of strings in the list
	GetObject (see page 6778)	Returns the object associated with the string at a specified index.
	GetTextStr (see page 6799)	Returns the value of the Text (see page 6814) property.
	InsertItem (see page 6779)	This is InsertItem, a member of class TWideStringList.
	Put (see page 6780)	Changes the value of the string with a specified index.
	PutObject (see page 6780)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 6780)	Changes the amount of memory allocated to hold strings in the list.
	SetTextStr (see page 6806)	Sets the Text (see page 6814) property.
	SetUpdateState (see page 6781)	Performs internal adjustments before or after a series of updates.

Protected Properties

	Name	Description
	UpdateCount (see page 6815)	Indicates the number of calls to BeginUpdate (see page 6792) that have not been matched by a call to EndUpdate (see page 6795).

Public Events

	Name	Description
	OnChange (see page 6784)	Occurs immediately after the list of strings changes.
	OnChanging (see page 6785)	Occurs immediately before the list of strings changes.

Public Methods

	Name	Description
	Add (see page 6772)	Adds a new string to the list.
	AddObject (see page 6773)	Adds a string to the list, and associates an object with the string.
	AddStrings (see page 6790)	This is the overview for the AddStrings method overload.
	Append (see page 6791)	Adds a string to the list.
	Assign (see page 6791)	Sets the strings in the list, and possibly associated objects, from a source object.
	BeginUpdate (see page 6792)	Enables the TWideStrings (see page 6785) object to track when the list of strings is changing.
	Clear (see page 6774)	Deletes all the strings from the list.
	Create (see page 6770)	This is the overview for the Create constructor overload.
	CustomSort (see page 6775)	Sorts the strings in the list in a customized order.
	Delete (see page 6775)	Removes the string specified by the Index parameter.
	Destroy (see page 6771)	Destroys an instance of TWideStringList (see page 6768).
	EndUpdate (see page 6795)	Enables the TWideStrings (see page 6785) object to keep track of when the list of strings has finished changing.
	Equals (see page 6795)	Compares the list of strings to the list from another TWideStrings (see page 6785) object and returns true if the two lists match.
	Exchange (see page 6776)	Swaps the position of two strings in the list.

	Find (see page 6776)	Locates the index for a string in a sorted list and indicates whether a string with that value already exists in the list.
	GetEnumerator (see page 6798)	Returns a TWideStrings (see page 6785) enumerator.
	GetText (see page 6799)	Allocates a text buffer and fills it with the value of the Text (see page 6814) property.
	IndexOf (see page 6778)	Returns the position of a string in the list.
	IndexOfName (see page 6800)	Returns the position of the first name-value pair with the specified name.
	IndexOfObject (see page 6800)	Returns the index of the first string in the list associated with a given object.
	Insert (see page 6779)	Inserts a string to the list at the position specified by Index.
	InsertObject (see page 6779)	Inserts a string into the list at the specified position, and associates it with an object.
	LoadFromFile (see page 6802)	Fills the list with the lines of text in a specified file.
	LoadFromStream (see page 6802)	Fills the list with lines of text read from a stream.
	Move (see page 6803)	Changes the position of a string in the list.
	SaveToFile (see page 6804)	Saves the strings in the list to the specified file.
	SaveToStream (see page 6804)	Writes the value of the Text (see page 6814) property to a stream object.
	SetText (see page 6805)	Sets the Text (see page 6814) property.
	Sort (see page 6781)	Sorts the strings in the list in ascending order.

Public Properties

	Name	Description
	Capacity (see page 6807)	Indicates the number of strings the TWideStrings (see page 6785) object can hold.
	CaseSensitive (see page 6782)	Controls whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.
	CommaText (see page 6807)	Lists the strings in the TWideStrings (see page 6785) object in system data format (SDF).
R	Count (see page 6809)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 6809)	Represents all the strings in the TWideStrings (see page 6785) object as a single delimited string.
	Delimiter (see page 6810)	Specifies the delimiter used by the DelimitedText (see page 6809) property.
	Duplicates (see page 6782)	Specifies whether duplicate strings can be added to sorted lists.
	LineBreak (see page 6810)	Defines the line break character(s).
R	Names (see page 6810)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 6811)	Indicates the character used to separate names from values.
	Objects (see page 6811)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 6813) property.
	OwnsObjects (see page 6783)	This is OwnsObjects, a member of class TWideStringList.
	QuoteChar (see page 6812)	Specifies the quote character used by the DelimitedText (see page 6809) property.
	Sorted (see page 6783)	Specifies whether the strings in the list should be automatically sorted.
	StrictDelimiter (see page 6812)	Determines how the Delimiter (see page 6810) property is used.
	Strings (see page 6813)	References the strings in the list by their positions.
	StringsAdapter (see page 6814)	Implements an IWideStringsAdapter (see page 6819) interface for the TWideStrings (see page 6785) object.
	Text (see page 6814)	Lists the strings in the TWideStrings (see page 6785) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 6815)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 6816)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

73.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TWideStringList.Create () (see page 6771)	Constructs an object and initializes its data before the object is first used.
	TWideStringList.Create (Boolean) (see page 6771)	This is Create, a member of class TWideStringList.

73.1.1.2.1 TWideStringList.Create Constructor ()

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create; overload;
```

C++

```
__fastcall TWideStringList();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3366)

System::TObject::Free (see page 3382)

73.1.1.2.2 TWideStringList.Create Constructor (Boolean)

Pascal

```
constructor Create(OwnsObjects: Boolean); overload;
```

C++

```
__fastcall TWideStringList(Boolean OwnsObjects);
```

Description

This is Create, a member of class TWideStringList.

73.1.1.3 TWideStringList.Destroy Destructor

Destroys an instance of TWideStringList (see page 6768).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWideStringList();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWideStringList (see page 6768) reference is not nil and only then calls Destroy.

Destroy frees the memory allocated to hold the list of strings and object references before calling the inherited destructor.

See Also

System::TObject::Free (see page 3382)

73.1.1.4 TWideStringList Methods

The methods of the TWideStringList class are listed here.

Protected Methods

	Name	Description
	Changed (see page 6773)	This is Changed, a member of class TWideStringList.
	Changing (see page 6774)	This is Changing, a member of class TWideStringList.
	CompareStrings (see page 6774)	Compares two strings.
	Get (see page 6777)	Returns a string given its index.
	GetCapacity (see page 6777)	Returns the currently allocated size of the list of strings.
	GetCount (see page 6777)	Returns the number of strings in the list
	GetObject (see page 6778)	Returns the object associated with the string at a specified index.
	InsertItem (see page 6779)	This is InsertItem, a member of class TWideStringList.
	Put (see page 6780)	Changes the value of the string with a specified index.
	PutObject (see page 6780)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 6780)	Changes the amount of memory allocated to hold strings in the list.
	SetUpdateState (see page 6781)	Performs internal adjustments before or after a series of updates.

Public Methods

	Name	Description
	Add (see page 6772)	Adds a new string to the list.
	AddObject (see page 6773)	Adds a string to the list, and associates an object with the string.
	Clear (see page 6774)	Deletes all the strings from the list.
	CustomSort (see page 6775)	Sorts the strings in the list in a customized order.
	Delete (see page 6775)	Removes the string specified by the Index parameter.
	Exchange (see page 6776)	Swaps the position of two strings in the list.
	Find (see page 6776)	Locates the index for a string in a sorted list and indicates whether a string with that value already exists in the list.
	IndexOf (see page 6778)	Returns the position of a string in the list.
	Insert (see page 6779)	Inserts a string to the list at the position specified by Index.
	InsertObject (see page 6779)	Inserts a string into the list at the specified position, and associates it with an object.
	Sort (see page 6781)	Sorts the strings in the list in ascending order.

73.1.1.4.1 TWideStringList.Add Method

Adds a new string to the list.

Pascal

```
function Add(const S: WideString): Integer; override;
```

C++

```
virtual __fastcall int Add(const BSTR S);
```

Description

Call Add to add the string S to the list. If the list is sorted, S is added to the appropriate position in the sort order. If the list is not sorted, S is added to the end of the list. Add returns the position of the item in the list, where the first item in the list has a value of 0.

Note: For sorted lists, Add will raise an EListError exception if the string S already appears in the list and Duplicates (see page 6782) is set to dupError. If Duplicates (see page 6782) is set to dupIgnore, trying to add a duplicate string causes Add to return the index of the existing entry.

See Also

AddStrings (see page 6790)

Append (see page 6791)

Delete (see page 6775)

Duplicates (see page 6782)

Insert (see page 6779)

Sorted (see page 6783)

73.1.1.4.2 TWideStringList.AddObject Method

Adds a string to the list, and associates an object with the string.

Pascal

```
function AddObject(const S: WideString; AObject: TObject): Integer; override;
```

C++

```
virtual __fastcall int AddObject(const BSTR S, TObject * AObject);
```

Description

Call AddObject to add a string and its associated object to the list. AddObject returns the index of the new string and object.

Note: The TWideStringList (see page 6768) object does not own the objects you add this way. Objects (see page 6811) added to the TWideStringList (see page 6768) object still exist even if the TWideStringList (see page 6768) instance is destroyed. They must be explicitly destroyed by the application.

Note: For sorted lists, AddObject raises an EListError exception if the string S already appears in the list and Duplicates (see page 6782) is set to dupError. If Duplicates (see page 6782) is set to dupIgnore, trying to add a duplicate string causes AddObject to return the index of the existing entry.

See Also

Add (see page 6772)

AddStrings (see page 6790)

73.1.1.4.3 TWideStringList.Changed Method

Pascal

```
procedure Changed; virtual;
```

C++

```
virtual __fastcall Changed();
```

Description

This is Changed, a member of class TWideStringList.

73.1.1.4.4 TWideStringList.Changing Method

Pascal

```
procedure Changing; virtual;
```

C++

```
virtual __fastcall Changing();
```

Description

This is Changing, a member of class TWideStringList.

73.1.1.4.5 TWideStringList.Clear Method

Deletes all the strings from the list.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Call clear to empty the list of strings. All references to associated objects are also removed. However, the objects themselves are not freed.

See Also

Delete (see page 6775)

Objects

Strings

73.1.1.4.6 TWideStringList.CompareStrings Method

Compares two strings.

Pascal

```
function CompareStrings(const S1: WideString; const S2: WideString): Integer; override;
```

C++

```
virtual __fastcall int CompareStrings(const BSTR S1, const BSTR S2);
```

Description

TWideStrings uses CompareStrings internally to compare the values of strings that appear in the list. For example, the IndexOf and IndexOfName methods use CompareStrings to compare a specified string with the strings in the list.

S1 and S2 are the strings to compare.

CompareStrings returns a value less than 0 if S1 < S2, 0 if S1 == S2, and a value greater than 0 if S1 > S2.

As implemented in TWideStrings, CompareStrings uses the global WideCompareText function, which compares strings case insensitively. Some descendant classes override this method to change the way strings are compared (for example, to introduce case sensitivity).

See Also

WideCompareText (see page 4355)

IndexOf (see page 6800)

IndexOfName (see page 6800)

73.1.1.4.7 TWideStringList.CustomSort Method

Sorts the strings in the list in a customized order.

Pascal

```
procedure CustomSort(Compare: TWideStringListSortCompare); virtual;
```

C++

```
virtual __fastcall CustomSort(TWideStringListSortCompare Compare);
```

Description

Use CustomSort to sort the strings in the list, where the sort order is defined by the Compare parameter.

Supply a value for the Compare function that compares two strings in the string list. The List parameter provides access to the string list, while the Index1 and Index2 parameters identify the strings to be compared.

Do not pass nil (Delphi) or NULL (C++) as the value of the Compare parameter.

Note: You must explicitly call the CustomSort method. Setting the Sorted (see page 6783) property only sorts strings using ANSI (Windows) or UTF-8 (Linux) order, as implemented in the Sort (see page 6781) method.

See Also

Sort (see page 6781)

Strings (see page 6813)

Sorted (see page 6783)

73.1.1.4.8 TWideStringList.Delete Method

Removes the string specified by the Index parameter.

Pascal

```
procedure Delete(Index: Integer); override;
```

C++

```
virtual __fastcall Delete(int Index);
```

Description

Call Delete to remove a single string from the list. If an object is associated with the string, the reference to the object is removed as well. Index gives the position of the string, where 0 is the first string, 1 is the second string, and so on.

See Also

Add (see page 6772)

AddObject (see page 6773)

Clear (see page 6774)

IndexOf (see page 6778)

InsertObject

Objects (see page 6811)

Strings (see page 6813)

73.1.1.4.9 TWideStringList.Exchange Method

Swaps the position of two strings in the list.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); override;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

Call Exchange to rearrange the strings in the list. The strings are specified by their index values in the Index1 and Index2 parameters. Indexes are zero-based, so the first string in the list has an index value of 0, the second has an index value of 1, and so on.

If either string has an associated object, Exchange changes the index of the object as well.

Warning: Do not call Exchange on a sorted list except to swap two identical strings with different associated objects. Exchange does not check whether the list is sorted, and can destroy the sort order of a sorted list.

See Also

Move (see page 6803)

Objects (see page 6811)

Sorted (see page 6783)

Strings (see page 6813)

73.1.1.4.10 TWideStringList.Find Method

Locates the index for a string in a sorted list and indicates whether a string with that value already exists in the list.

Pascal

```
function Find(const S: WideString; var Index: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean Find(const BSTR S, int Index);
```

Description

Use Find to obtain the index in a sorted list where the string S should be added. If the string S, or a string that differs from S only in case when CaseSensitive (see page 6782) is false, already exists in the list, Find returns true. If the list does not contain a string that matches S, Find returns false. The index where S should go is returned in the Index parameter. The value of Index is zero-based, where the first string has the index 0, the second string has the index 1, and so on.

Note: Only use Find with sorted lists. For unsorted lists, use the IndexOf (see page 6778) method instead.

See Also

Duplicates (see page 6782)

IndexOf (see page 6778)

Sorted (see page 6783)

Strings (see page 6813)

73.1.1.4.11 TWideStringList.Get Method

Returns a string given its index.

Pascal

```
function Get(Index: Integer): WideString; override;
```

C++

```
virtual __fastcall BSTR Get(int Index);
```

Description

Get is the protected read implementation of the Strings property.

In TWideStrings Get is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the string with the specified index.

See Also

Strings (see page 6813)

73.1.1.4.12 TWideStringList.GetCapacity Method

Returns the currently allocated size of the list of strings.

Pascal

```
function GetCapacity: Integer; override;
```

C++

```
virtual __fastcall int GetCapacity();
```

Description

GetCapacity is the protected read implementation of the Capacity property. In TWideStrings, GetCapacity returns the value of the Count property. Descendants of TWideStrings can override this property to let a string list allocate memory for entries that have not been added to the list.

See Also

Capacity (see page 6807)

Count (see page 6809)

73.1.1.4.13 TWideStringList.GetCount Method

Returns the number of strings in the list

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count property.

In TWideStrings GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the number of strings that have been added to the list.

See Also

Count (see page 6809)

73.1.1.4.14 TWideStringList.GetObject Method

Returns the object associated with the string at a specified index.

Pascal

```
function GetObject(Index: Integer): TObject; override;
```

C++

```
virtual __fastcall TObject * GetObject(int Index);
```

Description

GetObject is the protected read implementation of the Objects property.

Index is the index of the string with which the object is associated.

In TWideStrings, GetObject always returns nil (Delphi) or NULL (C++). This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override GetObject to return the specified object.

See Also

Objects (see page 6811)

73.1.1.4.15 TWideStringList.IndexOf Method

Returns the position of a string in the list.

Pascal

```
function IndexOf(const S: WideString): Integer; override;
```

C++

```
virtual __fastcall int IndexOf(const BSTR S);
```

Description

Call IndexOf to obtain the position of the first occurrence of a string that matches S. A string matches S if it is identical to S or, if CaseSensitive (see page 6782) is false, if it differs only in case.

IndexOf returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOf returns 0, if S is the second string, IndexOf returns 1, and so on. If the string does not have a match in the string list, IndexOf returns -1.

See Also

Find (see page 6776)

IndexOfName (see page 6800)

IndexOfObject (see page 6800)

Strings (see page 6813)

73.1.1.4.16 TWideStringList.Insert Method

Inserts a string to the list at the position specified by Index.

Pascal

```
procedure Insert(Index: Integer; const S: WideString); override;
```

C++

```
virtual __fastcall Insert(int Index, const BSTR S);
```

Description

Call Insert to add the string S to the list at the position specified by Index. If Index is 0, the string is inserted at the beginning of the list. If Index is 1, the string is put in the second position of the list, and so on.

If the string has an associated object, use the InsertObject (see page 6779) method instead.

Note: If the list is sorted, calling Insert or InsertObject (see page 6779) will raise an EListError exception. Use Add (see page 6772) or AddObject (see page 6773) with sorted lists.

See Also

Add (see page 6772)

AddObject (see page 6773)

EListError

InsertObject (see page 6779)

Sorted (see page 6783)

Strings (see page 6813)

73.1.1.4.17 TWideStringList.InsertItem Method

Pascal

```
procedure InsertItem(Index: Integer; const S: WideString; AObject: TObject); virtual;
```

C++

```
virtual __fastcall InsertItem(int Index, const BSTR S, TObject * AObject);
```

Description

This is InsertItem, a member of class TWideStringList.

73.1.1.4.18 TWideStringList.InsertObject Method

Inserts a string into the list at the specified position, and associates it with an object.

Pascal

```
procedure InsertObject(Index: Integer; const S: WideString; AObject: TObject); override;
```

C++

```
virtual __fastcall InsertObject(int Index, const BSTR S, TObject * AObject);
```

Description

Call InsertObject to insert the string S into the list at the position identified by Index, and associate it with the object AObject. If Index is 0, the string is inserted at the beginning of the list. If Index is 1, the string is put in the second position of the list, and so on.

See Also

Insert (see page 6779)

Objects (see page 6811)

73.1.1.4.19 TWideStringList.Put Method

Changes the value of the string with a specified index.

Pascal

```
procedure Put(Index: Integer; const S: WideString); override;
```

C++

```
virtual __fastcall Put(int Index, const BSTR S);
```

Description

Put is the protected write implementation of the Strings property.

Put changes the value of the string with the index specified by Index to S. Put does not change the object at the specified position. That is, any object associated with the previous string becomes associated with the new string.

See Also

Strings (see page 6813)

Objects (see page 6811)

73.1.1.4.20 TWideStringList.PutObject Method

Changes the object associated with the string at a specified index.

Pascal

```
procedure PutObject(Index: Integer; AObject: TObject); override;
```

C++

```
virtual __fastcall PutObject(int Index, TObject * AObject);
```

Description

PutObject is the protected write implementation of the Objects property.

As implemented in TWideStrings, PutObject does nothing. This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override PutObject to change the specified object.

See Also

Objects (see page 6811)

73.1.1.4.21 TWideStringList.SetCapacity Method

Changes the amount of memory allocated to hold strings in the list.

Pascal

```
procedure SetCapacity(NewCapacity: Integer); override;
```

C++

```
virtual __fastcall SetCapacity(int NewCapacity);
```

Description

SetCapacity is the protected read implementation of the Capacity property.

Integer is the number of strings the list can hold after the capacity has changed.

In TWideStrings, SetCapacity does nothing. Descendant classes override this method to change the number of strings that the list can hold. For descendant classes that implement SetCapacity, assigning a value smaller than Count removes strings from the end of the list. Assigning a value greater than Count allocates space for more strings to be added.

See Also

Capacity (see page 6807)

Count (see page 6809)

73.1.1.4.22 TWideStringList.SetUpdateState Method

Performs internal adjustments before or after a series of updates.

Pascal

```
procedure SetUpdateState(Updating: Boolean); override;
```

C++

```
virtual __fastcall SetUpdateState(Boolean Updating);
```

Description

SetUpdateState is called at the beginning or end of a series of updates. When the BeginUpdate method is first called and the TWideStrings object is not already in the middle of an update, TWideStrings calls SetUpdateState internally, with Updating set to true. When the EndUpdate method is called and it cancels out the last unmatched call to BeginUpdate, TWideStrings calls SetUpdateState internally, with Updating set to false.

As implemented in TWideStrings, SetUpdateState does nothing. Descendant classes can override this method to optimize the response to updates.

See Also

BeginUpdate (see page 6792)

EndUpdate (see page 6795)

73.1.1.4.23 TWideStringList.Sort Method

Sorts the strings in the list in ascending order.

Pascal

```
procedure Sort; virtual;
```

C++

```
virtual __fastcall Sort();
```

Description

Call Sort to sort the strings in a list that has the Sorted (see page 6783) property set to false. String lists with the Sorted (see page 6783) property set to true are automatically sorted.

Note: Sort uses WideCompareStr (see page 4354) to sort the strings when CaseSensitive (see page 6782) is true and WideCompareText (see page 4355) when CaseSensitive (see page 6782) is false. To provide your own comparison operator instead, use the CustomSort (see page 6775) method.

See Also

CustomSort (see page 6775)

Sorted (see page 6783)

Strings (see page 6813)

WideCompareStr (see page 4354)

WideCompareText (see page 4355)

73.1.1.5 TWideStringList Properties

The properties of the TWideStringList class are listed here.

Public Properties

	Name	Description
	CaseSensitive (see page 6782)	Controls whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.
	Duplicates (see page 6782)	Specifies whether duplicate strings can be added to sorted lists.
	OwnsObjects (see page 6783)	This is OwnsObjects, a member of class TWideStringList.
	Sorted (see page 6783)	Specifies whether the strings in the list should be automatically sorted.

73.1.1.5.1 TWideStringList.CaseSensitive Property

Controls whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.

Pascal

```
property CaseSensitive: Boolean;
```

C++

```
__property Boolean CaseSensitive;
```

Description

Use CaseSensitive to indicate whether strings in the list should be compared in a case-sensitive or case-insensitive manner. Set CaseSensitive to true to make the string list locate, check for duplicates, and sort its strings in a case-sensitive manner. Set CaseSensitive to false to make the string list perform these operations case-insensitively.

See Also

CustomSort (see page 6775)

Sort (see page 6781)

73.1.1.5.2 TWideStringList.Duplicates Property

Specifies whether duplicate strings can be added to sorted lists.

Pascal

```
property Duplicates: TDuplicates;
```

C++

```
__property TDuplicates Duplicates;
```

Description

Set Duplicates to specify what should happen when an attempt is made to add a duplicate string to a sorted list. The CaseSensitive (see page 6782) property controls whether two strings are considered duplicates if they are identical except for differences in case.

The value of Duplicates should be one of the following.

Value	Meaning
dupIgnore	Ignore attempts to add duplicate strings to the list.
dupError	raise an EStringListError exception when an attempt is made to add duplicate strings to the sorted list.
dupAccept	Permit duplicate strings in the sorted list.

Set Duplicates before adding any strings to the list. Setting Duplicates to dupIgnore or dupError does nothing about duplicate strings that are already in the list.

Note: Duplicates does nothing if the list is not sorted.

See Also

Add (see page 6772)

EStringListError

Sorted (see page 6783)

CaseSensitive (see page 6782)

73.1.1.5.3 TWideStringList.OwnsObjects Property

Pascal

```
property OwnsObjects: Boolean;
```

C++

```
__property Boolean OwnsObjects;
```

Description

This is OwnsObjects, a member of class TWideStringList.

73.1.1.5.4 TWideStringList.Sorted Property

Specifies whether the strings in the list should be automatically sorted.

Pascal

```
property Sorted: Boolean;
```

C++

```
__property Boolean Sorted;
```

Description

Set Sorted to true to cause the strings in the list to be automatically sorted in ascending order. Set Sorted to false to allow strings to remain where they are inserted. When Sorted is false, the strings in the list can be put in ascending order at any time by calling the Sort (see page 6781) method.

When Sorted is true, do not use Insert (see page 6779) to add strings to the list. Instead, use Add (see page 6772), which will insert the new strings in the appropriate position. When Sorted is false, use Insert (see page 6779) to add strings to an arbitrary position in the list, or Add (see page 6772) to add strings to the end of the list.

Note: The CaseSensitive (see page 6782) property controls whether the strings in the list are sorted based on a case-sensitive or case-insensitive comparison. The sort order takes into account the locale of the system on which the application is running.

See Also

Add (see page 6772)

Duplicates (see page 6782)

Insert (see page 6779)

Sort (see page 6781)

WideCompareStr (see page 4354)

CaseSensitive (see page 6782)

73.1.1.6 TWideStringList Events

The events of the TWideStringList class are listed here.

Public Events

	Name	Description
	OnChange (see page 6784)	Occurs immediately after the list of strings changes.
	OnChanging (see page 6785)	Occurs immediately before the list of strings changes.

73.1.1.6.1 TWideStringList.OnChange Event

Occurs immediately after the list of strings changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write (see page 3789) an OnChange event handler to respond to changes in the list of strings. For example, if the string list is associated with a control, the OnChange event handler could tell the control to repaint itself whenever the content of the list changes.

Whenever strings in the list are added, deleted, moved, or modified, the following events take place:

1. An OnChanging (see page 6785) event occurs before the change.
2. The strings are added, deleted, moved, or modified.

3. An OnChange event occurs.

   Note: OnChange occurs for every change made to the list, regardless of whether the application calls BeginUpdate (see page 6792) and EndUpdate (see page 6795) around a series of changes.

See Also

BeginUpdate (see page 6792)

EndUpdate (see page 6795)

OnChanging (see page 6785)

73.1.1.6.2 TWideStringList.OnChanging Event

Occurs immediately before the list of strings changes.

Pascal

```
property OnChanging: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChanging;
```

Description

Write (see page 3789) an OnChanging event handler to prepare for changes in the list of strings. For example, if the string list is associated with a control, the OnChanging event handler could tell the control to disable repaints until the OnChange (see page 6784) event when the list has finished changing.

Whenever strings in the list are added, deleted, moved, or modified, the following events take place:

1. An OnChanging event occurs.
2. The strings are added, deleted, moved, or modified.
3. An OnChange (see page 6784) event occurs after the changes are complete.

   Note: OnChanging occurs for every change made to the list, regardless of whether the application calls BeginUpdate (see page 6792) and EndUpdate (see page 6795) around a series of changes.

See Also

BeginUpdate (see page 6792)

EndUpdate (see page 6795)

OnChange (see page 6784)

73.1.2 TWideStrings Class

TWideStrings is the base class for objects that represent a list of Unicode strings.

Class Hierarchy

Pascal

```
TWideStrings = class(TPersistent);
```

C++

```
class TWideStrings : public TPersistent;
```

File

WideStrings

Description

Derive a class from TWideStrings to store and manipulate a list of strings. TWideStrings contains abstract or, in C++ terminology, pure virtual methods and should not be directly instantiated.

Descendants of TWideStrings can represent several individual strings, such as the individual lines that appear in a list box. Some objects use descendants of TWideStrings to represent one long body of text so that it can be manipulated in smaller chunks.

TWideStrings introduces many properties and methods to

Add (see page 6789) or delete strings at specified positions in the list.

Rearrange the strings in the list.

Access the string at a particular location.

Read (see page 3727) the strings from or write the strings to a file or stream.

Associate an object with each string in the list.

Store and retrieve strings as name-value pairs.

For an explanation of name-value pairs, refer to the NameValueSeparator (see page 6811) property.

See Also

TWideStringList (see page 6768)

TList

THashedStringList

73.1.2.1 TWideStrings Members

The following tables list the members exposed by TWideStrings.

Protected Methods

	Name	Description
	AssignTo (see page 6792)	Copies the properties of an object to a destination object.
	CompareStrings (see page 6793)	Compares two strings.
	DefineProperties (see page 6794)	Reads and writes the Strings (see page 6813) property as if it were published.
	Error (see page 6795)	This is the overview for the Error method overload.
	ExtractName (see page 6797)	Returns the name portion of a string that is a name value pair.
	Get (see page 6797)	Returns a string given its index.
	GetCapacity (see page 6797)	Returns the currently allocated size of the list of strings.
	GetCount (see page 6798)	Returns the number of strings in the list

	GetObject (see page 6798)	Returns the object associated with the string at a specified index.
	GetTextStr (see page 6799)	Returns the value of the Text (see page 6814) property.
	Put (see page 6803)	Changes the value of the string with a specified index.
	PutObject (see page 6804)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 6805)	Changes the amount of memory allocated to hold strings in the list.
	SetTextStr (see page 6806)	Sets the Text (see page 6814) property.
	SetUpdateState (see page 6806)	Performs internal adjustments before or after a series of updates.

Protected Properties

	Name	Description
	UpdateCount (see page 6815)	Indicates the number of calls to BeginUpdate (see page 6792) that have not been matched by a call to EndUpdate (see page 6795).

Public Methods

	Name	Description
	Add (see page 6789)	Adds a string at the end of the list.
	AddObject (see page 6790)	Adds a string to the list, and associates an object with the string.
	AddStrings (see page 6790)	This is the overview for the AddStrings method overload.
	Append (see page 6791)	Adds a string to the list.
	Assign (see page 6791)	Sets the strings in the list, and possibly associated objects, from a source object.
	BeginUpdate (see page 6792)	Enables the TWideStrings (see page 6785) object to track when the list of strings is changing.
	Clear (see page 6793)	Introduces an abstract (Delphi) or pure virtual (C++) method to empty the list and any associated objects.
	Delete (see page 6794)	Introduces an abstract (Delphi) or pure virtual (C++) method to delete a specified Unicode string from the list.
	Destroy (see page 6788)	Destroys the TPersistent instance and frees its memory.
	EndUpdate (see page 6795)	Enables the TWideStrings (see page 6785) object to keep track of when the list of strings has finished changing.
	Equals (see page 6795)	Compares the list of strings to the list from another TWideStrings (see page 6785) object and returns true if the two lists match.
	Exchange (see page 6796)	Swaps the position of two strings in the list.
	GetEnumerator (see page 6798)	Returns a TWideStrings (see page 6785) enumerator.
	GetText (see page 6799)	Allocates a text buffer and fills it with the value of the Text (see page 6814) property.
	IndexOf (see page 6800)	Returns the position of a string in the list.
	IndexOfName (see page 6800)	Returns the position of the first name-value pair with the specified name.
	IndexOfObject (see page 6800)	Returns the index of the first string in the list associated with a given object.
	Insert (see page 6801)	Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.
	InsertObject (see page 6801)	Inserts a string into the list at the specified position, and associates it with an object.
	LoadFromFile (see page 6802)	Fills the list with the lines of text in a specified file.
	LoadFromStream (see page 6802)	Fills the list with lines of text read from a stream.
	Move (see page 6803)	Changes the position of a string in the list.
	SaveToFile (see page 6804)	Saves the strings in the list to the specified file.
	SaveToStream (see page 6804)	Writes the value of the Text (see page 6814) property to a stream object.
	SetText (see page 6805)	Sets the Text (see page 6814) property.

Public Properties

	Name	Description
	Capacity (see page 6807)	Indicates the number of strings the TWideStrings (see page 6785) object can hold.
	CommaText (see page 6807)	Lists the strings in the TWideStrings (see page 6785) object in system data format (SDF).
	Count (see page 6809)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 6809)	Represents all the strings in the TWideStrings (see page 6785) object as a single delimited string.

	Delimiter (see page 6810)	Specifies the delimiter used by the DelimitedText (see page 6809) property.
	LineBreak (see page 6810)	Defines the line break character(s).
R	Names (see page 6810)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 6811)	Indicates the character used to separate names from values.
	Objects (see page 6811)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 6813) property.
	QuoteChar (see page 6812)	Specifies the quote character used by the DelimitedText (see page 6809) property.
	StrictDelimiter (see page 6812)	Determines how the Delimiter (see page 6810) property is used.
	Strings (see page 6813)	References the strings in the list by their positions.
	StringsAdapter (see page 6814)	Implements an IWideStringsAdapter (see page 6819) interface for the TWideStrings (see page 6785) object.
	Text (see page 6814)	Lists the strings in the TWideStrings (see page 6785) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 6815)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 6816)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

73.1.2.2 TWideStrings.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWideStrings();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3382)

System::TObject::Destroy (see page 3366)

73.1.2.3 TWideStrings Methods

The methods of the TWideStrings class are listed here.

Protected Methods

	Name	Description
V	AssignTo (see page 6792)	Copies the properties of an object to a destination object.
V	CompareStrings (see page 6793)	Compares two strings.
V	DefineProperties (see page 6794)	Reads and writes the Strings (see page 6813) property as if it were published.
	Error (see page 6795)	This is the overview for the Error method overload.
	ExtractName (see page 6797)	Returns the name portion of a string that is a name value pair.
A	Get (see page 6797)	Returns a string given its index.
V	GetCapacity (see page 6797)	Returns the currently allocated size of the list of strings.
A	GetCount (see page 6798)	Returns the number of strings in the list
V	GetObject (see page 6798)	Returns the object associated with the string at a specified index.
V	GetTextStr (see page 6799)	Returns the value of the Text (see page 6814) property.
V	Put (see page 6803)	Changes the value of the string with a specified index.

	PutObject (see page 6804)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 6805)	Changes the amount of memory allocated to hold strings in the list.
	SetTextStr (see page 6806)	Sets the Text (see page 6814) property.
	SetUpdateState (see page 6806)	Performs internal adjustments before or after a series of updates.

Public Methods

	Name	Description
	Add (see page 6789)	Adds a string at the end of the list.
	AddObject (see page 6790)	Adds a string to the list, and associates an object with the string.
	AddStrings (see page 6790)	This is the overview for the AddStrings method overload.
	Append (see page 6791)	Adds a string to the list.
	Assign (see page 6791)	Sets the strings in the list, and possibly associated objects, from a source object.
	BeginUpdate (see page 6792)	Enables the TWideStrings (see page 6785) object to track when the list of strings is changing.
	Clear (see page 6793)	Introduces an abstract (Delphi) or pure virtual (C++) method to empty the list and any associated objects.
	Delete (see page 6794)	Introduces an abstract (Delphi) or pure virtual (C++) method to delete a specified Unicode string from the list.
	EndUpdate (see page 6795)	Enables the TWideStrings (see page 6785) object to keep track of when the list of strings has finished changing.
	Equals (see page 6795)	Compares the list of strings to the list from another TWideStrings (see page 6785) object and returns true if the two lists match.
	Exchange (see page 6796)	Swaps the position of two strings in the list.
	GetEnumerator (see page 6798)	Returns a TWideStrings (see page 6785) enumerator.
	GetText (see page 6799)	Allocates a text buffer and fills it with the value of the Text (see page 6814) property.
	IndexOf (see page 6800)	Returns the position of a string in the list.
	IndexOfName (see page 6800)	Returns the position of the first name-value pair with the specified name.
	IndexOfObject (see page 6800)	Returns the index of the first string in the list associated with a given object.
	Insert (see page 6801)	Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.
	InsertObject (see page 6801)	Inserts a string into the list at the specified position, and associates it with an object.
	LoadFromFile (see page 6802)	Fills the list with the lines of text in a specified file.
	LoadFromStream (see page 6802)	Fills the list with lines of text read from a stream.
	Move (see page 6803)	Changes the position of a string in the list.
	SaveToFile (see page 6804)	Saves the strings in the list to the specified file.
	SaveToStream (see page 6804)	Writes the value of the Text (see page 6814) property to a stream object.
	SetText (see page 6805)	Sets the Text (see page 6814) property.

73.1.2.3.1 TWideStrings.Add Method

Adds a string at the end of the list.

Pascal

```
function Add(const S: WideString): Integer; virtual;
```

C++

```
virtual __fastcall int Add(const BSTR S);
```

Description

Call Add to add a string to the end of the list. Add returns the index of the new string.

See Also

AddStrings (see page 6790)

Append (see page 6791)

Count (see page 6809)

IndexOf (see page 6800)

Insert (see page 6801)

73.1.2.3.2 TWideStrings.AddObject Method

Adds a string to the list, and associates an object with the string.

Pascal

```
function AddObject(const S: WideString; AObject: TObject): Integer; virtual;
```

C++

```
virtual __fastcall int AddObject(const BSTR S, TObject * AObject);
```

Description

Call AddObject to add a string and its associated object to the list. AddObject returns the index of the new string and object.

Note: The TWideStrings (see page 6785) object does not own the objects you add this way. Objects (see page 6811) added to the TWideStrings (see page 6785) object still exist even if the TWideStrings (see page 6785) instance is destroyed. They must be explicitly destroyed by the application.

See Also

Add (see page 6789)

AddStrings (see page 6790)

Count (see page 6809)

IndexOfObject (see page 6800)

Objects (see page 6811)

73.1.2.3.3 AddStrings Method

This is the overview for the AddStrings method overload.

Overload List

	Name	Description
	TWideStrings.AddStrings (TStrings) (see page 6790)	Adds a group of strings to the list.
	TWideStrings.AddStrings (TWideStrings) (see page 6790)	Adds a group of strings to the list.

73.1.2.3.3.1 TWideStrings.AddStrings Method (TStrings)

Adds a group of strings to the list.

Pascal

```
procedure AddStrings(Strings: TStrings); virtual; overload;
procedure AddStrings(Strings: TWideStrings); virtual; overload;
```

C++

```
virtual __fastcall AddStrings(TStrings Strings);
virtual __fastcall AddStrings(TWideStrings Strings);
```

Description

Call AddStrings to add the strings from another TWideStrings (see page 6785) object to the list. If both the source and destination TWideStrings (see page 6785) objects support objects associated with their strings, references to the associated objects will be added as well.

See Also

Add (see page 6789)

AddObject (see page 6790)

Assign (see page 6791)

Count (see page 6809)

Objects (see page 6811)

73.1.2.3.4 TWideStrings.Append Method

Adds a string to the list.

Pascal

```
procedure Append(const S: WideString);
```

C++

```
__fastcall Append(const BSTR S);
```

Description

Append is the same as the Add (see page 6789) method, except that it does not return a value. Use Append when there is no need to know the index of the string after it has been added, or with descendants of TWideStrings (see page 6785) for which the index returned is not meaningful.

For example, the TWideStrings (see page 6785) descendant used by memo objects uses an index to determine where to insert a string, but the inserted string does not necessarily end up as a single string in the list. Part of the inserted text may become part of the previous string, and part may be broken off into a subsequent string. The index returned by Add (see page 6789) is not meaningful in this case.

See Also

Add (see page 6789)

73.1.2.3.5 TWideStrings.Assign Method

Sets the strings in the list, and possibly associated objects, from a source object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use Assign to set the value of the TWideStrings (see page 6785) object from another object. If Source is of type TWideStrings (see page 6785), the list is set to the list of the source TWideStrings (see page 6785) object, and if associated objects are supported, any associated objects are copied from the Source as well.

If Source is not of type TWideStrings (see page 6785), the inherited Assign will set the value of the list from any object that

supports TWideStrings (see page 6785) in its AssignTo (see page 6792) method.

See Also

AddStrings (see page 6790)

Objects (see page 6811)

Strings (see page 6813)

AssignTo

73.1.2.3.6 TWideStrings.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError (see page 3985)

73.1.2.3.7 TWideStrings.BeginUpdate Method

Enables the TWideStrings (see page 6785) object to track when the list of strings is changing.

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

BeginUpdate is called automatically by any property or method that changes the list of strings. Once the changes are complete, the property or method calls EndUpdate (see page 6795). Call BeginUpdate before directly modifying the strings in the list, and EndUpdate (see page 6795) after. When implementing properties or methods that change the list in descendants of TWideStrings (see page 6785), call BeginUpdate before the changes are made, and EndUpdate (see page 6795) when the changes are complete.

TWideStrings (see page 6785) simply keeps track of when the list of strings is being changed. Some descendants of TWideStrings (see page 6785) use this information to perform certain actions, such as telling a control to repaint, when updates are complete.

See Also

EndUpdate (see page 6795)

UpdateCount (see page 6815)

73.1.2.3.8 TWideStrings.Clear Method

Introduces an abstract (Delphi) or pure virtual (C++) method to empty the list and any associated objects.

Pascal

```
procedure Clear; virtual; abstract;
```

C++

```
virtual __fastcall Clear() = 0;
```

Description

Descendants of TWideStrings (see page 6785) implement a Clear method to delete all the strings in the list, and to remove any references to associated objects.

See Also

Delete (see page 6794)

Objects (see page 6811)

Strings (see page 6813)

73.1.2.3.9 TWideStrings.CompareStrings Method

Compares two strings.

Pascal

```
function CompareStrings(const S1: WideString; const S2: WideString): Integer; virtual;
```

C++

```
virtual __fastcall int CompareStrings(const BSTR S1, const BSTR S2);
```

Description

TWideStrings (see page 6785) uses CompareStrings internally to compare the values of strings that appear in the list. For example, the IndexOf (see page 6800) and IndexOfName (see page 6800) methods use CompareStrings to compare a specified string with the strings in the list.

S1 and S2 are the strings to compare.

CompareStrings returns a value less than 0 if S1 < S2, 0 if S1 == S2, and a value greater than 0 if S1 > S2.

As implemented in TWideStrings (see page 6785), CompareStrings uses the global WideCompareText (see page 4355) function, which compares strings case insensitively. Some descendant classes override this method to change the way strings are compared (for example, to introduce case sensitivity).

See Also

WideCompareText (see page 4355)

IndexOf (see page 6800)

IndexOfName (see page 6800)

73.1.2.3.10 TWideStrings.DefineProperties Method

Reads and writes the Strings (see page 6813) property as if it were published.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TWideStrings (see page 6785) overrides DefineProperties so that the strings in the list can be loaded and saved with a form file as if the Strings (see page 6813) property were published.

See Also

DefineProperties

Strings (see page 6813)

73.1.2.3.11 TWideStrings.Delete Method

Introduces an abstract (Delphi) or pure virtual (C++) method to delete a specified Unicode string from the list.

Pascal

```
procedure Delete(Index: Integer); virtual; abstract;
```

C++

```
virtual __fastcall Delete(int Index) = 0;
```

Description

Descendants of TWideStrings (see page 6785) implement a Delete method to remove a specified string from the list. If an object is associated with the string, the reference to the object is removed as well. Index gives the position of the string, where 0 is the first string, 1 is the second string, and so on.

See Also

AddObject (see page 6790)

Clear (see page 6793)

IndexOf (see page 6800)

InsertObject (see page 6801)

Objects (see page 6811)

Strings (see page 6813)

73.1.2.3.12 TWideStrings.EndUpdate Method

Enables the TWideStrings (see page 6785) object to keep track of when the list of strings has finished changing.

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

EndUpdate is called automatically by any property or method that changes the list of strings. Call BeginUpdate (see page 6792) before directly modifying the strings in the list, and EndUpdate after. When implementing properties or methods that change the list in descendants of TWideStrings (see page 6785), call BeginUpdate (see page 6792) before the changes are made, and EndUpdate when the changes are complete.

TWideStrings (see page 6785) simply keeps track of when the list of strings is being changed. Some descendants of TWideStrings (see page 6785) use this information to perform certain actions, such as telling a control to repaint, when updates are complete.

See Also

BeginUpdate (see page 6792)

UpdateCount (see page 6815)

73.1.2.3.13 TWideStrings.Equals Method

Compares the list of strings to the list from another TWideStrings (see page 6785) object and returns true if the two lists match.

Pascal

```
function Equals(Strings: TWideStrings): Boolean; reintroduce;
```

C++

```
__fastcall Boolean Equals(TWideStrings Strings);
```

Description

Call Equals to compare the lists in two TWideStrings (see page 6785) objects. Equals compares only the strings, not any references to associated objects. Equals returns true if the lists for both TWideStrings (see page 6785) objects have the same number of strings and the strings in each list match. Equals returns false if the lists are different in length, if they contain different strings, or if the order of the strings in the two lists differ.

Note: The Equals method uses an overridden Get (see page 6797) method to perform the compare, thus it does not provide a context-insensitive option.

See Also

Count (see page 6809)

Strings (see page 6813)

CompareStrings (see page 6793)

73.1.2.3.14 Error Method

This is the overview for the Error method overload.

Overload List

	Name	Description
	TWideStrings.Error (PResStringRec, Integer) (see page 6796)	raises an EStringListError exception.
	TWideStrings.Error (WideString, Integer) (see page 6796)	raises an EStringListError exception.

73.1.2.3.14.1 TWideStrings.Error Method (PResStringRec, Integer)

raises an EStringListError exception.

Pascal

```
procedure Error(const Msg: WideString; Data: Integer); overload;
procedure Error(Msg: PResStringRec; Data: Integer); overload;
```

C++

```
__fastcall Error(const BSTR Msg, int Data);
__fastcall Error(PResStringRec Msg, int Data);
```

Description

TWideStrings (see page 6785) calls Error internally to raise an EStringListError exception when it encounters a problem.

Msg specifies the string with a single format specifier for an integer, that appears in the exception message box. It can be either a string, or a pointer to a record structure that indicates the module and resource identifier for a string.

Data is an integer value that is inserted into Msg.

See Also

EStringListError

73.1.2.3.15 TWideStrings.Exchange Method

Swaps the position of two strings in the list.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); virtual;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

Call Exchange to rearrange the strings in the list. The strings are specified by their index values in the Index1 and Index2 parameters. Indexes are zero-based, so the first string in the list has an index value of 0, the second has an index value of 1, and so on.

If either string has an associated object, Exchange changes the position of the object as well.

See Also

Move (see page 6803)

Objects (see page 6811)

Strings (see page 6813)

73.1.2.3.16 TWideStrings.ExtractName Method

Returns the name portion of a string that is a name value pair.

Pascal

```
function ExtractName(const S: WideString): WideString;
```

C++

```
__fastcall BSTR ExtractName(const BSTR S);
```

Description

TWideStrings (see page 6785) calls ExtractName internally to parse strings that are name-value pairs and return the name portion.

S is the string to parse.

If S is a name-value pair, ExtractName returns the name portion. Otherwise, ExtractName returns an empty string.

See Also

Names (see page 6810)

73.1.2.3.17 TWideStrings.Get Method

Returns a string given its index.

Pascal

```
function Get(Index: Integer): WideString; virtual; abstract;
```

C++

```
virtual __fastcall BSTR Get(int Index) = 0;
```

Description

Get is the protected read implementation of the Strings (see page 6813) property.

In TWideStrings (see page 6785) Get is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the string with the specified index.

See Also

Strings (see page 6813)

73.1.2.3.18 TWideStrings.GetCapacity Method

Returns the currently allocated size of the list of strings.

Pascal

```
function GetCapacity: Integer; virtual;
```

C++

```
virtual __fastcall int GetCapacity();
```

Description

GetCapacity is the protected read implementation of the Capacity (see page 6807) property. In TWideStrings (see page 6785), GetCapacity returns the value of the Count (see page 6809) property. Descendants of TWideStrings (see page 6785) can override this property to let a string list allocate memory for entries that have not been added to the list.

See Also

Capacity (see page 6807)

Count (see page 6809)

73.1.2.3.19 TWideStrings.GetCount Method

Returns the number of strings in the list

Pascal

```
function GetCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCount() = 0;
```

Description

GetCount is the protected read implementation of the Count (see page 6809) property.

In TWideStrings (see page 6785) GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the number of strings that have been added to the list.

See Also

Count (see page 6809)

73.1.2.3.20 TWideStrings.GetEnumerator Method

Returns a TWideStrings (see page 6785) enumerator.

Pascal

```
function GetEnumerator: TWideStringsEnumerator;
```

C++

```
__fastcall TWideStringsEnumerator GetEnumerator();
```

Description

GetEnumerator returns a TWideStringsEnumerator (see page 6816) reference, which enumerates the strings in a TWideStrings (see page 6785) object.

To process all these strings, call the TWideStringsEnumerator (see page 6816) GetCurrent (see page 3679) method within a While MoveNext do loop.

See Also

TWideStringsEnumerator (see page 6816)

73.1.2.3.21 TWideStrings.GetObject Method

Returns the object associated with the string at a specified index.

Pascal

```
function GetObject(Index: Integer): TObject; virtual;
```

C++

```
virtual __fastcall TObject * GetObject(int Index);
```

Description

GetObject is the protected read implementation of the Objects (see page 6811) property.

Index is the index of the string with which the object is associated.

In TWideStrings (see page 6785), GetObject always returns nil (Delphi) or NULL (C++). This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override GetObject to return the specified object.

See Also

Objects (see page 6811)

73.1.2.3.22 TWideStrings.GetText Method

Allocates a text buffer and fills it with the value of the Text (see page 6814) property.

Pascal

```
function GetText: PwideChar; virtual;
```

C++

```
virtual __fastcall PwideChar GetText();
```

Description

Call GetText to obtain a dynamically allocated character buffer containing all of the strings in the list. Individual strings are separated by a carriage return and (on Windows) line feed. The caller is responsible for freeing the returned value using the StrDispose (see page 4291) procedure.

See Also

SetText (see page 6805)

Strings (see page 6813)

Text (see page 6814)

StrDispose (see page 4291)

73.1.2.3.23 TWideStrings.GetTextStr Method

Returns the value of the Text (see page 6814) property.

Pascal

```
function GetTextStr: WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetTextStr();
```

Description

GetTextStr is the protected read implementation of the Text (see page 6814) property. It returns a string that lists all the strings in the list, with individual strings separated by a carriage return and (on Windows) line feed.

See Also

GetText (see page 6799)

Text (see page 6814)

73.1.2.3.24 TWideStrings.IndexOf Method

Returns the position of a string in the list.

Pascal

```
function IndexOf(const S: WideString): Integer; virtual;
```

C++

```
virtual __fastcall int IndexOf(const BSTR S);
```

Description

Call IndexOf to obtain the position of the first occurrence of the string S, or of a string that differs from S only by case. IndexOf returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOf returns 0, if S is the second string, IndexOf returns 1, and so on. If the string is not in the string list, IndexOf returns -1.

Note: If the string appears in the list more than once, IndexOf returns the position of the first occurrence.

See Also

IndexOfName (see page 6800)

IndexOfObject (see page 6800)

Strings (see page 6813)

73.1.2.3.25 TWideStrings.IndexOfName Method

Returns the position of the first name-value pair with the specified name.

Pascal

```
function IndexOfName(const Name: WideString): Integer; virtual;
```

C++

```
virtual __fastcall int IndexOfName(const BSTR Name);
```

Description

Call IndexOfName to locate the first occurrence of a name-value pair where the name part is equal to the Name parameter or differs only in case. IndexOfName returns the 0-based index of the string. If no string in the list has the indicated name, IndexOfName returns -1.

Note: If there is more than one name-value pair with a name portion matching the Name parameter, IndexOfName returns the position of the first such string.

See Also

IndexOf (see page 6800)

Names (see page 6810)

Values (see page 6816)

73.1.2.3.26 TWideStrings.IndexOfObject Method

Returns the index of the first string in the list associated with a given object.

Pascal

```
function IndexOfObject(AObject: TObject): Integer; virtual;
```

C++

```
virtual __fastcall int IndexOfObject(TObject * AObject);
```

Description

Call IndexOfObject to locate the first string in the list associated with the object AObject. Specify the object you want to locate as the value of the AObject parameter. IndexOfObject returns the 0-based index of the string and object. If the object is not associated with any of the strings, IndexOfObject returns -1.

See Also

IndexOf (see page 6800)

Objects (see page 6811)

73.1.2.3.27 TWideStrings.Insert Method

Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.

Pascal

```
procedure Insert(Index: Integer; const S: WideString); virtual; abstract;
```

C++

```
virtual __fastcall Insert(int Index, const BSTR S) = 0;
```

Description

Descendants of TWideStrings (see page 6785) implement an Insert method to add the string S to the list at the position specified by Index. If Index is 0, the string is inserted at the beginning of the list. If Index is 1, the string is put in the second position of the list, and so on.

All methods that add strings to the list use the Insert method to add the string.

If the string has an associated object, use the InsertObject (see page 6801) method instead.

See Also

Add (see page 6789)

AddObject (see page 6790)

AddStrings (see page 6790)

Append (see page 6791)

BeginUpdate (see page 6792)

EndUpdate (see page 6795)

InsertObject (see page 6801)

Strings (see page 6813)

73.1.2.3.28 TWideStrings.InsertObject Method

Inserts a string into the list at the specified position, and associates it with an object.

Pascal

```
procedure InsertObject(Index: Integer; const S: WideString; AObject: TObject); virtual;
```

C++

```
virtual __fastcall InsertObject(int Index, const BSTR S, TObject * AObject);
```

Description

Call InsertObject to insert the string S into the list at the position identified by Index, and associate it with the object AObject. If Index is 0, the string is inserted at the beginning of the list. If Index is 1, the string is put in the second position of the list, and so on.

See Also

Insert

Objects

73.1.2.3.29 TWideStrings.LoadFromFile Method

Fills the list with the lines of text in a specified file.

Pascal

```
procedure LoadFromFile(const FileName: WideString); virtual;
```

C++

```
virtual __fastcall LoadFromFile(const BSTR FileName);
```

Description

Call LoadFromFile to fill the list of the TWideStrings (see page 6785) object from the file specified by FileName. LoadFromFile first clears any strings already in the list. Then, each line in the file, as indicated by carriage return or linefeed characters, is appended as a string in the list.

Note: LoadFromFile uses the Add (see page 6789) method to add the strings that are read from the file.

See Also

Add (see page 6789)

LoadFromStream (see page 6802)

SaveToFile (see page 6804)

Strings (see page 6813)

Text (see page 6814)

73.1.2.3.30 TWideStrings.LoadFromStream Method

Fills the list with lines of text read from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream); virtual;
```

C++

```
virtual __fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to fill the list of the TWideStrings (see page 6785) object from the stream specified by Stream. The text read from the stream is parsed into strings separated by carriage return or linefeed characters. Thus, LoadFromStream reads the value of the Text (see page 6814) property.

If the stream is a file stream, LoadFromStream does the same thing as LoadFromFile (see page 6802), except the application must create and destroy the file stream.

See Also

Add (see page 6789)

LoadFromFile (see page 6802)

SaveToStream (see page 6804)

Text (see page 6814)

73.1.2.3.31 TWideStrings.Move Method

Changes the position of a string in the list.

Pascal

```
procedure Move(CurIndex: Integer; NewIndex: Integer); virtual;
```

C++

```
virtual __fastcall Move(int CurIndex, int NewIndex);
```

Description

Use Move to move the string at position CurIndex so that it occupies the position NewIndex. The positions are specified as 0-based indexes. For example, the following lines of code move the string in the first position to the last position.

```
MyStringsObject.Move(0, MyStringsObject.Count)
MyStringsObject->Move(0, MyStringsObject->Count - 1);
```

If the string has an associated object, the object remains associated with the string in its new position.

See Also

Count (see page 6809)

Objects (see page 6811)

Strings (see page 6813)

73.1.2.3.32 TWideStrings.Put Method

Changes the value of the string with a specified index.

Pascal

```
procedure Put(Index: Integer; const S: WideString); virtual;
```

C++

```
virtual __fastcall Put(int Index, const BSTR S);
```

Description

Put is the protected write implementation of the Strings (see page 6813) property.

Put changes the value of the string with the index specified by Index to S. Put does not change the object at the specified position. That is, any object associated with the previous string becomes associated with the new string.

See Also

Strings (see page 6813)

Objects (see page 6811)

73.1.2.3.33 TWideStrings.PutObject Method

Changes the object associated with the string at a specified index.

Pascal

```
procedure PutObject(Index: Integer; AObject: TObject); virtual;
```

C++

```
virtual __fastcall PutObject(int Index, TObject * AObject);
```

Description

PutObject is the protected write implementation of the Objects (see page 6811) property.

As implemented in TWideStrings (see page 6785), PutObject does nothing. This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override PutObject to change the specified object.

See Also

Objects (see page 6811)

73.1.2.3.34 TWideStrings.SaveToFile Method

Saves the strings in the list to the specified file.

Pascal

```
procedure SaveToFile(const FileName: WideString); virtual;
```

C++

```
virtual __fastcall SaveToFile(const BSTR FileName);
```

Description

Call SaveToFile to save the strings in the list to the file specified by FileName. Each string in the list is written to a separate line in the file.

Note: In Linux, SaveToFile saves the strings as they appear in the list. If the last string does not have an end-of-line marker, the resulting file may be considered incomplete by some editors.

See Also

LoadFromFile (see page 6802)

SaveToStream (see page 6804)

Strings (see page 6813)

Text (see page 6814)

73.1.2.3.35 TWideStrings.SaveToStream Method

Writes the value of the Text (see page 6814) property to a stream object.

Pascal

```
procedure SaveToStream(Stream: TStream); virtual;
```

C++

```
virtual __fastcall SaveToStream(TStream Stream);
```

Description

Call SaveToStream to save the strings in the list to the stream specified by the Stream parameter. SaveToStream writes the strings delimited by carriage return, line feed pairs. If the stream is a file stream, SaveToStream does the same thing as SaveToFile (see page 6804), except the application must create and destroy the file stream.

See Also

LoadFromStream (see page 6802)

SaveToFile (see page 6804)

Strings (see page 6813)

Text (see page 6814)

73.1.2.3.36 TWideStrings.SetCapacity Method

Changes the amount of memory allocated to hold strings in the list.

Pascal

```
procedure SetCapacity(NewCapacity: Integer); virtual;
```

C++

```
virtual __fastcall SetCapacity(int NewCapacity);
```

Description

SetCapacity is the protected read implementation of the Capacity (see page 6807) property.

Integer is the number of strings the list can hold after the capacity has changed.

In TWideStrings (see page 6785), SetCapacity does nothing. Descendant classes override this method to change the number of strings that the list can hold. For descendant classes that implement SetCapacity, assigning a value smaller than Count (see page 6809) removes strings from the end of the list. Assigning a value greater than Count (see page 6809) allocates space for more strings to be added.

See Also

Capacity (see page 6807)

Count (see page 6809)

73.1.2.3.37 TWideStrings.SetText Method

Sets the Text (see page 6814) property.

Pascal

```
procedure SetText(Text: PwideChar); virtual;
```

C++

```
virtual __fastcall SetText(PwideChar Text);
```

Description

Call SetText to replace the list with the strings specified by the Text (see page 6814) parameter. SetText adds strings one at a time to the list, using the carriage returns or linefeed characters in Text (see page 6814) as delimiters indicating when to add a new string.

See Also

SetTextStr (see page 6806)

Text (see page 6814)

73.1.2.3.38 TWideStrings.SetTextStr Method

Sets the Text (see page 6814) property.

Pascal

```
procedure SetTextStr(const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetTextStr(const BSTR Value);
```

Description

GetTextStr (see page 6799) is the protected write implementation of the Text (see page 6814) property. It replaces the list with the strings specified by the Value parameter. SetTextStr adds strings one at a time to the list, using the carriage returns or linefeed characters in Value as delimiters indicating when to add a new string.

See Also

SetText (see page 6805)

Text (see page 6814)

73.1.2.3.39 TWideStrings.SetUpdateState Method

Performs internal adjustments before or after a series of updates.

Pascal

```
procedure SetUpdateState(Updating: Boolean); virtual;
```

C++

```
virtual __fastcall SetUpdateState(Boolean Updating);
```

Description

SetUpdateState is called at the beginning or end of a series of updates. When the BeginUpdate (see page 6792) method is first called and the TWideStrings (see page 6785) object is not already in the middle of an update, TWideStrings (see page 6785) calls SetUpdateState internally, with Updating set to true. When the EndUpdate (see page 6795) method is called and it cancels out the last unmatched call to BeginUpdate (see page 6792), TWideStrings (see page 6785) calls SetUpdateState internally, with Updating set to false.

As implemented in TWideStrings (see page 6785), SetUpdateState does nothing. Descendant classes can override this method to optimize the response to updates.

See Also

BeginUpdate (see page 6792)

EndUpdate (see page 6795)

73.1.2.4 TWideStrings Properties

The properties of the TWideStrings class are listed here.

Protected Properties

	Name	Description
R	UpdateCount (see page 6815)	Indicates the number of calls to BeginUpdate (see page 6792) that have not been matched by a call to EndUpdate (see page 6795).

Public Properties

	Name	Description
	Capacity (see page 6807)	Indicates the number of strings the TWideStrings (see page 6785) object can hold.
	CommaText (see page 6807)	Lists the strings in the TWideStrings (see page 6785) object in system data format (SDF).
R	Count (see page 6809)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 6809)	Represents all the strings in the TWideStrings (see page 6785) object as a single delimited string.
	Delimiter (see page 6810)	Specifies the delimiter used by the DelimitedText (see page 6809) property.
	LineBreak (see page 6810)	Defines the line break character(s).
R	Names (see page 6810)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 6811)	Indicates the character used to separate names from values.
	Objects (see page 6811)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 6813) property.
	QuoteChar (see page 6812)	Specifies the quote character used by the DelimitedText (see page 6809) property.
	StrictDelimiter (see page 6812)	Determines how the Delimiter (see page 6810) property is used.
	Strings (see page 6813)	References the strings in the list by their positions.
	StringsAdapter (see page 6814)	Implements an IWideStringsAdapter (see page 6819) interface for the TWideStrings (see page 6785) object.
	Text (see page 6814)	Lists the strings in the TWideStrings (see page 6785) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 6815)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 6816)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

73.1.2.4.1 TWideStrings.Capacity Property

Indicates the number of strings the TWideStrings (see page 6785) object can hold.

Pascal

```
property Capacity: Integer;
```

C++

```
__property int Capacity;
```

Description

Read (see page 3727) Capacity to determine the currently allocated size of the string list. For the TWideStrings (see page 6785) object, reading Capacity returns the Count (see page 6809) property, and setting Capacity does nothing. Descendants of TWideStrings (see page 6785) can override this property to allow a string list to allocate memory for entries that have not been added to the list.

See Also

Count (see page 6809)

73.1.2.4.2 TWideStrings.CommaText Property

Lists the strings in the TWideStrings (see page 6785) object in system data format (SDF).

Pascal

```
property CommaText: WideString;
```

C++

```
__property BSTR CommaText;
```

Description

Use CommaText to get or set all the strings in the TWideStrings (see page 6785) object in a single comma-delimited string.

When retrieving CommaText, any string in the list that include spaces, commas or quotes will be contained in double quotes, and any double quotes in a string will be repeated. For example, if the list contains the following strings:

```
Stri,ng 1
Stri"ng 2
String 3
String4
```

CommaText will return:

```
"Stri,ng 1","Stri""ng 2","String 3",String4
```

When assigning CommaText, the value is parsed as SDF formatted text. For SDF format, strings are separated by commas or spaces, and optionally enclosed in double quotes. Double quote marks that are part of the string are repeated to distinguish them from the quotes that surround the string. Spaces and commas that are not contained within double quote marks are delimiters. Two commas next to each other will indicate an empty string, but spaces that appear next to another delimiter are ignored. For example, suppose CommaText is set to:

```
"Stri,ng 1", "Stri""ng 2" , String 3,String4
```

The list will then contain:

```
Stri,ng 1
Stri"ng 2
String
3
String4
```

Note: CommaText is the same as the DelimitedText (see page 6809) property with a delimiter of ',' and a quote character of "".

Including a trailing comma in the source string causes a blank item to be included in the string list. For example, if CommaText is set to

```
"String1, String 2, String 3,"
```

the string list will contain

```
String1
String2
String3
<Blank>
```

See Also

Add (see page 6789)

Strings (see page 6813)

Text (see page 6814)

DelimitedText (see page 6809)

73.1.2.4.3 TWideStrings.Count Property

Introduces an abstract property to represent the number of strings in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Descendants of TWideStrings (see page 6785) implement a Count property to indicate the number of strings in the list.

Use the Count property when iterating over all the strings in the list, or when trying to locate the position of a string relative to the last string in the list.

See Also

IndexOf (see page 6800)

Strings (see page 6813)

73.1.2.4.4 TWideStrings.DelimitedText Property

Represents all the strings in the TWideStrings (see page 6785) object as a single delimited string.

Pascal

```
property DelimitedText: WideString;
```

C++

```
__property BSTR DelimitedText;
```

Description

Use DelimitedText to get or set all the strings in the TWideStrings (see page 6785) object in a single string.

When retrieving DelimitedText, the resulting value delimits individual strings in two ways: each string is surrounded (before and after) by the quote character specified by the QuoteChar (see page 6812) property. In addition, individual strings are separated by the character specified by the Delimiter (see page 6810) property.

When assigning DelimitedText, individual strings must be separated using QuoteChar (see page 6812) at both ends, using Delimiter (see page 6810) as a separator, or using both these methods.

A space is always interpreted as a delimiter, regardless of the value of Delimiter (see page 6810), unless the space occurs between quote characters.

Note: CommaText (see page 6807) is the same as the DelimitedText property when Delimiter (see page 6810) is ',' and QuoteChar (see page 6812) is "".

See Also

CommaText (see page 6807)

Delimiter (see page 6810)

Text (see page 6814)

QuoteChar (see page 6812)

73.1.2.4.5 TWideStrings.Delimiter Property

Specifies the delimiter used by the DelimitedText (see page 6809) property.

Pascal

```
property Delimiter: WideChar;
```

C++

```
__property WideChar Delimiter;
```

Description

Use Delimiter to get or set the delimiter used by the DelimitedText (see page 6809) property. DelimitedText (see page 6809) represents all of the strings in the TWideStrings (see page 6785) object as a single string, with individual strings separated by the character that is the value of Delimiter.

See Also

DelimitedText (see page 6809)

QuoteChar (see page 6812)

73.1.2.4.6 TWideStrings.LineBreak Property

Defines the line break character(s).

Pascal

```
property LineBreak: WideString;
```

C++

```
__property BSTR LineBreak;
```

Description

LineBreak can be read and set. It is used internally in TWideStrings (see page 6785) to terminate strings in multi-string output operations.

For example, the GetText (see page 6799) method returns a long string containing all TWideStrings (see page 6785) strings, each of which is terminated by the LineBreak value.

Note: In Windows, the default LineBreak value is a carriage return and line feed combination (#13#10), whereas on Linux, it is just a carriage return (#13).

See Also

GetText (see page 6799)

73.1.2.4.7 TWideStrings.Names Property

Indicates the name part of strings that are name-value pairs.

Pascal

```
property Names [Index: Integer]: WideString;
```

C++

```
__property BSTR Names[int Index];
```

Description

When the list of strings for the TWideStrings (see page 6785) object includes strings that are name-value pairs, read Names to access the name part of a string. Names is the name part of the string at Index, where 0 is the first string, 1 is the second string, and so on. If the string is not a name-value pair, Names contains an empty string.

See Also

NameValueSeparator (see page 6811)

IndexOfName (see page 6800)

Strings (see page 6813)

Values (see page 6816)

73.1.2.4.8 TWideStrings.NameValueSeparator Property

Indicates the character used to separate names from values.

Pascal

```
property NameValueSeparator: WideChar;
```

C++

```
__property WideChar NameValueSeparator;
```

Description

Strings (see page 6813) that contain the NameValueSeparator character are considered name-value pairs. NameValueSeparator defaults to the equal sign (=). TWideStrings (see page 6785) defines various methods for accessing names and values and for searching for specific names.

Strings (see page 6813) that are name-value pairs consist of a name part, the separator character, and a value part. Any spaces around the separator character are part of the name or value. This convention corresponds to the format used in many initialization files. For example:

```
DisplayGrid=1
SnapToGrid=1
GridSizeX=8
GridSizeY=8
```

See Also

ValueFromIndex (see page 6815)

Names (see page 6810)

IndexOfName (see page 6800)

Strings (see page 6813)

Values (see page 6816)

73.1.2.4.9 TWideStrings.Objects Property

Represents a set of objects that are associated one with each of the strings in the Strings (see page 6813) property.

Pascal

```
property Objects [Index: Integer]: TObject;
```

C++

```
__property TObject * Objects[int Index];
```

Description

Setting the Objects property for TWideStrings (see page 6785) does nothing. Reading the Objects property for TWideStrings (see page 6785) returns nil (Delphi) or NULL (C++). Descendant classes can associate objects with the strings in the set by implementing the Objects property.

Use the Objects property of a descendant of TWideStrings (see page 6785) to get or set the object associated with the string at the position indicated by Index. Index gives the position of the string associated with the object, where 0 is the first string, 1 is the second string, and so on. If a descendant of TWideStrings (see page 6785) does not support the Objects property, reading this property returns nil (Delphi) or NULL (C++)

Note: The TWideStrings (see page 6785) object does not own the objects in the Objects array. Objects added to the Objects array still exist even if the TWideStrings (see page 6785) object is destroyed. They must be explicitly destroyed by the application.

See Also

AddObject (see page 6790)

IndexOfObject (see page 6800)

InsertObject (see page 6801)

Strings (see page 6813)

73.1.2.4.10 TWideStrings.QuoteChar Property

Specifies the quote character used by the DelimitedText (see page 6809) property.

Pascal

```
property QuoteChar: WideChar;
```

C++

```
__property WideChar QuoteChar;
```

Description

Use QuoteChar to get or set the quote character that is used to enclose individual strings in the DelimitedText (see page 6809) property.

See Also

Delimiter (see page 6810)

DelimitedText (see page 6809)

CommaText (see page 6807)

73.1.2.4.11 TWideStrings.StrictDelimiter Property

Determines how the Delimiter (see page 6810) property is used.

Pascal

```
property StrictDelimiter: Boolean;
```

C++

```
__property Boolean StrictDelimiter;
```

Description

Use this property to specify whether the Delimiter (see page 6810) is the only value used within the DelimitedText (see page 6809) property. If set to True, individual strings in DelimitedText (see page 6809) are separated only by the character that is the value of Delimiter (see page 6810) If set to False, individual strings in DelimitedText (see page 6809) can be separated by a space, a non-printable character, or the character that is the value of Delimiter (see page 6810).

73.1.2.4.12 TWideStrings.Strings Property

References the strings in the list by their positions.

Pascal

```
property Strings [Index: Integer]: WideString;
```

C++

```
__property BSTR Strings[int Index];
```

Description

Descendants of TWideStrings (see page 6785) must implement an accessor function for the Strings property to return the string at the position indicated by Index. Index gives the position of the string, where 0 is the first string, 1 is the second string, and so on.

Use the Strings property to get or set the string at a particular position.

To store a string as a name-value pair, assign Strings a value that includes the NameValueSeparator (see page 6811) character. The name and value will then be accessible separately using the Names (see page 6810) and Values (see page 6816) properties.

Note: In Delphi, Strings is the default property of TWideStrings (see page 6785) objects. The Strings identifier can be omitted when accessing the Strings property of a descendant of TWideStrings (see page 6785). For example, the following two lines of code are both acceptable and do the same thing:

```
MyStrings.Strings[0] := 'This is the first string';
        MyStrings[0] := 'This is the first string';
```

See Also

ValueFromIndex (see page 6815)

NameValueSeparator (see page 6811)

Names (see page 6810)

Values (see page 6816)

CommaText (see page 6807)

IndexOf (see page 6800)

Names (see page 6810)

Objects (see page 6811)

Text (see page 6814)

Values (see page 6816)

73.1.2.4.13 TWideStrings.StringsAdapter Property

Implements an IWideStringsAdapter (see page 6819) interface for the TWideStrings (see page 6785) object.

Pascal

```
property StringsAdapter: IWideStringsAdapter;
```

C++

```
__property IWideStringsAdapter StringsAdapter;
```

Description

Do not use the StringsAdapter property. StringsAdapter is used internally.

See Also

TStringsAdapter

73.1.2.4.14 TWideStrings.Text Property

Lists the strings in the TWideStrings (see page 6785) object as a single string with the individual strings delimited by carriage returns and line feeds.

Pascal

```
property Text: WideString;
```

C++

```
__property BSTR Text;
```

Description

Use Text to get or set all the strings in the TWideStrings (see page 6785) object in a single string delimited by carriage return, line feed pairs.

When reading Text, the strings in the list will be separated by carriage return and (on Windows) line feed. If any of the strings in the list contain a carriage return (and line feed), the resulting value of Text will appear to contain more strings than is indicated by the Count (see page 6809) property.

When setting Text, the value will be parsed by separating into substrings whenever a carriage return or linefeed is encountered. (The two do not need to form pairs).

If the strings in the list contain carriage return or linefeed characters, a less ambiguous format for the strings is available through the CommaText (see page 6807) or DelimitedText (see page 6809) property.

See Also

Add (see page 6789)

CommaText (see page 6807)

Count (see page 6809)

Strings (see page 6813)

GetText (see page 6799)

SetText (see page 6805)

DelimitedText (see page 6809)

73.1.2.4.15 TWideStrings.UpdateCount Property

Indicates the number of calls to BeginUpdate (see page 6792) that have not been matched by a call to EndUpdate (see page 6795).

Pascal

```
property UpdateCount: Integer;
```

C++

```
__property int UpdateCount;
```

Description

TWideStrings (see page 6785) uses UpdateCount to keep track of calls to the BeginUpdate (see page 6792) and EndUpdate (see page 6795) methods. Every time a call is made to BeginUpdate (see page 6792), TWideStrings (see page 6785) increments the value of UpdateCount. Every call to EndUpdate (see page 6795) causes TWideStrings (see page 6785) to decrement UpdateCount.

When UpdateCount changes from 0 to 1, TWideStrings (see page 6785) calls the SetUpdateState (see page 6806) method with a parameter of true. When UpdateCount changes from 1 to 0, TStrings calls the SetUpdateState (see page 6806) method with a parameter of false. This allows descendant classes to perform optimizations when handling multiple updates.

See Also

BeginUpdate (see page 6792)

EndUpdate (see page 6795)

SetUpdateState (see page 6806)

73.1.2.4.16 TWideStrings.ValueFromIndex Property

Represents the value part of a string with a given index, on strings that are name-value pairs.

Pascal

```
property ValueFromIndex [Index: Integer]: WideString;
```

C++

```
__property BSTR ValueFromIndex[int Index];
```

Description

When the list of strings for the TWideStrings (see page 6785) object includes strings that are name-value pairs, use ValueFromIndex to get or set the value part of a string associated with an index.

For more information on name-value pairs, refer to the NameValueSeparator (see page 6811) property.

See Also

NameValueSeparator (see page 6811)

IndexOfName (see page 6800)

Strings (see page 6813)

Values (see page 6816)

73.1.2.4.17 TWideStrings.Values Property

Represents the value part of a string associated with a given name, on strings that are name-value pairs.

Pascal

```
property Values [const Name: WideString]: WideString;
```

C++

```
__property BSTR Values[BSTR const Name];
```

Description

When the list of strings for the TWideStrings (see page 6785) object includes strings that are name-value pairs, use Values to get or set the value part of a string associated with a specific name part.

For more information on name-value pairs, refer to the NameValueSeparator (see page 6811) property.

Note: The Name index is case-insensitive. That is, Values is the value part for the first occurrence of Name or an equivalent string that differs only in case.

See Also

ValueFromIndex (see page 6815)

NameValueSeparator (see page 6811)

IndexOfName (see page 6800)

Names (see page 6810)

Strings (see page 6813)

73.1.3 TWideStringsEnumerator Class

Enumerates through the strings of a TWideStrings (see page 6785) object.

Class Hierarchy

Pascal

```
TWideStringsEnumerator = class;
```

C++

```
class TWideStringsEnumerator;
```

File

WideStrings

Description

TWideStringsEnumerator provides an enumerator for TWideStrings (see page 6785) objects.

73.1.3.1 TWideStringsEnumerator Members

The following tables list the members exposed by TWideStringsEnumerator.

Public Methods

	Name	Description
	Create (see page 6817)	Creates a TWideStrings (see page 6785) enumerator.
	GetCurrent (see page 6817)	Gets the current string.
	MoveNext (see page 6817)	Moves the enumerator to the next string in the TWideStrings (see page 6785) collection.

Public Properties

	Name	Description
	Current (see page 6818)	The current string.

73.1.3.2 TWideStringsEnumerator.Create Constructor

Creates a TWideStrings (see page 6785) enumerator.

Pascal

```
constructor Create(AStrings: TWideStrings);
```

C++

```
__fastcall TWideStringsEnumerator(TWideStrings AStrings);
```

Description

Creates an instance of TWideStringsEnumerator (see page 6816).

73.1.3.3 TWideStringsEnumerator Methods

The methods of the TWideStringsEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 6817)	Gets the current string.
	MoveNext (see page 6817)	Moves the enumerator to the next string in the TWideStrings (see page 6785) collection.

73.1.3.3.1 TWideStringsEnumerator.GetCurrent Method

Gets the current string.

Pascal

```
function GetCurrent: WideString;
```

C++

```
__fastcall BSTR GetCurrent();
```

Description

Use GetCurrent to get the current string in the TWideStrings (see page 6785) object being enumerated.

73.1.3.3.2 TWideStringsEnumerator.MoveNext Method

Moves the enumerator to the next string in the TWideStrings (see page 6785) collection.

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

Use MoveNext to move the TWideStringsEnumerator (see page 6816) to the next string in the TWideStrings (see page 6785) object being enumerated.

73.1.3.4 TWideStringsEnumerator Properties

The properties of the TWideStringsEnumerator class are listed here.

Public Properties

	Name	Description
	Current (see page 6818)	The current string.

73.1.3.4.1 TWideStringsEnumerator.Current Property

The current string.

Pascal

```
property Current: WideString;
```

C++

```
__property BSTR Current;
```

Description

Current contains the current string in the TWideStrings (see page 6785) object being enumerated.

73.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWideStringsAdapter (see page 6819)	This is class WideStrings.IWideStringsAdapter.

73.2.1 IWideStringsAdapter Interface

Class Hierarchy

WideStrings.IWideStringsAdapter

Pascal

```
IWideStringsAdapter = interface;
```

C++

```
__interface IWideStringsAdapter;
```

File

WideStrings

Description

This is class WideStrings.IWideStringsAdapter.

73.2.1.1 IWideStringsAdapter Members

The following tables list the members exposed by IWideStringsAdapter.

Public Methods

	Name	Description
	ReferenceStrings (see page 6820)	This is ReferenceStrings, a member of class IWideStringsAdapter.
	ReleaseStrings (see page 6820)	This is ReleaseStrings, a member of class IWideStringsAdapter.

73.2.1.2 IWideStringsAdapter Methods

The methods of the IWideStringsAdapter class are listed here.

Public Methods

	Name	Description
	ReferenceStrings (see page 6820)	This is ReferenceStrings, a member of class IWideStringsAdapter.
	ReleaseStrings (see page 6820)	This is ReleaseStrings, a member of class IWideStringsAdapter.

73.2.1.2.1 IWideStringsAdapter.ReferenceStrings Method

Pascal

```
procedure ReferenceStrings(S: TWideStrings);
```

C++

```
__fastcall ReferenceStrings(TWideStrings S);
```

Description

This is ReferenceStrings, a member of class IWideStringsAdapter.

73.2.1.2.2 IWideStringsAdapter.ReleaseStrings Method

Pascal

```
procedure ReleaseStrings;
```

C++

```
__fastcall ReleaseStrings();
```

Description

This is ReleaseStrings, a member of class IWideStringsAdapter.

73.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TWideStringItem (see page 6821)	TWideStringItem defines a TWideStringList (see page 6768) entry.

73.3.1 WideStrings.TWideStringItem Record

TWideStringItem defines a TWideStringList (see page 6768) entry.

Pascal

```
TWideStringItem = record
  FString: WideString;
  FObject: TObject;
end;
```

C++

```
struct TWideStringItem {
  BSTR FString;
  TObject * FObject;
};
```

File

WideStrings

Description

The TWideStringItem type defines a data structure used internally in Delphi.

It is used by TWideStringList (see page 6768) to hold a list entry.

FString defines an Unicode string for a list entry.

FObject points to an optional TObject (see page 3364) associated with the string.

See Also

TWideStringList (see page 6768)

73.4 Types

The following table lists types in this documentation.

Types

Name	Description
PWideStringItem (see page 6822)	PWideStringItem is a TWideStringItem (see page 6821) pointer.
PWideStringItemList (see page 6822)	PWideStringItemList is a TWideStringItemList (see page 6823) pointer.
TWideStringItemList (see page 6823)	TWideStringItemList defines an array of TWideStringItems.
TWideStringListSortCompare (see page 6823)	TWideStringListSortCompare is a type of callback function called used internally by the TWideStringList (see page 6768) class.

73.4.1 WideStrings.PWideStringItem Type

PWideStringItem is a TWideStringItem (see page 6821) pointer.

Pascal

```
PWideStringItem = ^TWideStringItem;
```

C++

```
^TWideStringItem PWideStringItem;
```

File

WideStrings

Description

PWideStringItem is used internally by TWideStringList (see page 6768) to point to a TWideStringItem (see page 6821) value.

TWideStringItem (see page 6821) comprises :

FString defines an Unicode string for a list entry.

FObject points to an optional TObject (see page 3364) associated with the string.

See Also

TWideStringItem (see page 6821)

TWideStringList (see page 6768)

73.4.2 WideStrings.PWideStringItemList Type

PWideStringItemList is a TWideStringItemList (see page 6823) pointer.

Pascal

```
PWideStringItemList = ^TWideStringItemList;
```

C++

```
^TWideStringItemList PWideStringItemList;
```

File

WideStrings

Description

PWideStringItemList is used internally by TWideStringList (see page 6768) to refer to its internal array of TWideStringItem (see page 6821) values. This array holds the list of strings.

TWideStringItem (see page 6821) comprises :

FString defines an Unicode string for a list entry.

FObject points to an optional TObject (see page 3364) associated with the string.

See Also

TWideStringItem (see page 6821)

TWideStringList (see page 6768)

73.4.3 WideStrings.TWideStringItemList Type

TWideStringItemList defines an array of TWideStringItems.

Pascal

```
TWideStringItemList = array[0..MaxListSize] of TWideStringItem;
```

C++

```
array[0..MaxListSize] of TWideStringItem TWideStringItemList;
```

File

WideStrings

Description

TWideStringItemList is used internally by TWideStringList (see page 6768) to refer to its internal array of TWideStringItem (see page 6821) values. This array holds the list of strings.

TWideStringItem (see page 6821) comprises :

FString defines an Unicode string for a list entry.

FObject points to an optional TObject (see page 3364) associated with the string.

See Also

TWideStringItem (see page 6821)

TWideStringList (see page 6768)

73.4.4 WideStrings.TWideStringListSortCompare Type

TWideStringListSortCompare is a type of callback function called used internally by the TWideStringList (see page 6768) class.

Pascal

```
TWideStringListSortCompare = function (List: TWideStringList; Index1, Index2: Integer):
```

```
Integer;
```

C++

```
(List: TWideStringList; Index1, Index2: Integer): Integer ( TWideStringListSortCompare)();
```

File

WideStrings

Description

You define a TWideStringListSortCompare function when you need to use the TWideStringList (see page 6768) CustomSort method. The procedure defined by TWideStringListSortCompare is invoked by CustomSort to sort the TWideStringList (see page 6768) elements into sequence.

CustomSort is used instead of Sort when the sort sequence required differs from the default alphanumeric sequence.

List is the list of Unicode strings.

Index1 and **Index2** are indexes into the list. When these are passed to the TWideListSortCompare function, the CustomSort method is asking which order they should be in.

You return 0 if the entry referred to by **Index1** equals the entry referred to by **Index2**

You return less than 0 if the entry referred to by **Index1** is less than the entry referred to by **Index2**

You return a number above 0 if the entry referred to by **Index1** is greater than the entry referred to by **Index2**

Note: One of the principle advantages of the CustomSort method is that a TWideStringList (see page 6768) may be sorted according to the objects optionally attachable to each string.

See Also

CustomSort (see page 6775)

TWideStringList (see page 6768)

74 WideStrUtils Namespace

This is namespace WideStrUtils.

Topics

Name	Description
Functions (see page 6827)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 6842)	The following table lists structs, records, enums in this documentation.
Types (see page 6843)	The following table lists types in this documentation.
Constants (see page 6844)	The following table lists constants in this documentation.

Constants

Name	Description
sUTF8BOMString (see page 6844)	This is constant WideStrUtils.sUTF8BOMString.

Functions

	Name	Description
	AnsiToUtf8Ex (see page 6828)	This is function WideStrUtils.AnsiToUtf8Ex.
	ConvertStreamFromAnsiToUTF8 (see page 6828)	This is function WideStrUtils.ConvertStreamFromAnsiToUTF8.
	ConvertStreamFromUTF8ToAnsi (see page 6828)	This is function WideStrUtils.ConvertStreamFromUTF8ToAnsi.
	DetectUTF8Encoding (see page 6829)	This is function WideStrUtils.DetectUTF8Encoding.
	HasExtendCharacter (see page 6829)	This is function WideStrUtils.HasExtendCharacter.
	HasUTF8BOM (see page 6829)	This is function WideStrUtils.HasUTF8BOM.
	HasUTF8BOM (see page 6830)	This is function WideStrUtils.HasUTF8BOM.
	inOpArray (see page 6830)	This is function WideStrUtils.inOpArray.
	inOpSet (see page 6830)	This is function WideStrUtils.inOpSet.
	IsUTF8LeadByte (see page 6831)	This is function WideStrUtils.IsUTF8LeadByte.
	IsUTF8String (see page 6831)	This is function WideStrUtils.IsUTF8String.
	IsUTF8TrailByte (see page 6831)	This is function WideStrUtils.IsUTF8TrailByte.
	LoadResWideString (see page 6832)	This is function WideStrUtils.LoadResWideString.
	LoadWideStr (see page 6832)	This is function WideStrUtils.LoadWideStr.
	UTF8CharLength (see page 6832)	This is function WideStrUtils.UTF8CharLength.
	UTF8CharSize (see page 6833)	This is function WideStrUtils.UTF8CharSize.
	UTF8LowerCase (see page 6833)	This is function WideStrUtils.UTF8LowerCase.
	Utf8ToAnsiEx (see page 6833)	This is function WideStrUtils.Utf8ToAnsiEx.
	UTF8UpperCase (see page 6834)	This is function WideStrUtils.UTF8UpperCase.
	WideAdjustLineBreaks (see page 6834)	This is function WideStrUtils.WideAdjustLineBreaks.

	WideDequotedStr (see page 6834)	This is function WideStrUtils.WideDequotedStr.
	WideExtractQuotedStr (see page 6835)	This is function WideStrUtils.WideExtractQuotedStr.
	WideLastChar (see page 6835)	This is function WideStrUtils.WideLastChar.
	WideQuotedStr (see page 6835)	This is function WideStrUtils.WideQuotedStr.
	WideReplaceStr (see page 6836)	This is function WideStrUtils.WideReplaceStr.
	WideReplaceText (see page 6836)	This is function WideStrUtils.WideReplaceText.
	WideStringReplace (see page 6836)	This is function WideStrUtils.WideStringReplace.
	WStrAlloc (see page 6837)	This is function WideStrUtils.WStrAlloc.
	WStrBufSize (see page 6837)	This is function WideStrUtils.WStrBufSize.
	WStrCat (see page 6837)	This is function WideStrUtils.WStrCat.
	WStrComp (see page 6838)	This is function WideStrUtils.WStrComp.
	WStrCopy (see page 6838)	This is function WideStrUtils.WStrCopy.
	WStrDispose (see page 6838)	This is function WideStrUtils.WStrDispose.
	WStrEnd (see page 6839)	This is function WideStrUtils.WStrEnd.
	WStrLCopy (see page 6839)	This is function WideStrUtils.WStrLCopy.
	WStrLen (see page 6839)	This is function WideStrUtils.WStrLen.
	WStrMove (see page 6840)	This is function WideStrUtils.WStrMove.
	WStrNew (see page 6840)	This is function WideStrUtils.WStrNew.
	WStrPCopy (see page 6840)	This is function WideStrUtils.WStrPCopy.
	WStrPLCopy (see page 6841)	This is function WideStrUtils.WStrPLCopy.
	WStrPos (see page 6841)	This is function WideStrUtils.WStrPos.
	WStrScan (see page 6841)	This is function WideStrUtils.WStrScan.

Structs, Records, Enums

	Name	Description
	TEncodeType (see page 6842)	This is record WideStrUtils.TEncodeType.

Types

Name	Description
CharSet (see page 6843)	This is type WideStrUtils.CharSet.

74.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AnsiToUtf8Ex (see page 6828)	This is function WideStrUtils.AnsiToUtf8Ex.
	ConvertStreamFromAnsiToUTF8 (see page 6828)	This is function WideStrUtils.ConvertStreamFromAnsiToUTF8.
	ConvertStreamFromUTF8ToAnsi (see page 6828)	This is function WideStrUtils.ConvertStreamFromUTF8ToAnsi.
	DetectUTF8Encoding (see page 6829)	This is function WideStrUtils.DetectUTF8Encoding.
	HasExtendCharacter (see page 6829)	This is function WideStrUtils.HasExtendCharacter.
	HasUTF8BOM (see page 6829)	This is function WideStrUtils.HasUTF8BOM.
	HasUTF8BOM (see page 6830)	This is function WideStrUtils.HasUTF8BOM.
	inOpArray (see page 6830)	This is function WideStrUtils.inOpArray.
	inOpSet (see page 6830)	This is function WideStrUtils.inOpSet.
	IsUTF8LeadByte (see page 6831)	This is function WideStrUtils.IsUTF8LeadByte.
	IsUTF8String (see page 6831)	This is function WideStrUtils.IsUTF8String.
	IsUTF8TrailByte (see page 6831)	This is function WideStrUtils.IsUTF8TrailByte.
	LoadResWideString (see page 6832)	This is function WideStrUtils.LoadResWideString.
	LoadWideStr (see page 6832)	This is function WideStrUtils.LoadWideStr.
	UTF8CharLength (see page 6832)	This is function WideStrUtils.UTF8CharLength.
	UTF8CharSize (see page 6833)	This is function WideStrUtils.UTF8CharSize.
	UTF8LowerCase (see page 6833)	This is function WideStrUtils.UTF8LowerCase.
	Utf8ToAnsiEx (see page 6833)	This is function WideStrUtils.Utf8ToAnsiEx.
	UTF8UpperCase (see page 6834)	This is function WideStrUtils.UTF8UpperCase.
	WideAdjustLineBreaks (see page 6834)	This is function WideStrUtils.WideAdjustLineBreaks.
	WideDequotedStr (see page 6834)	This is function WideStrUtils.WideDequotedStr.
	WideExtractQuotedStr (see page 6835)	This is function WideStrUtils.WideExtractQuotedStr.
	WideLastChar (see page 6835)	This is function WideStrUtils.WideLastChar.
	WideQuotedStr (see page 6835)	This is function WideStrUtils.WideQuotedStr.
	WideReplaceStr (see page 6836)	This is function WideStrUtils.WideReplaceStr.
	WideReplaceText (see page 6836)	This is function WideStrUtils.WideReplaceText.
	WideStringReplace (see page 6836)	This is function WideStrUtils.WideStringReplace.
	WStrAlloc (see page 6837)	This is function WideStrUtils.WStrAlloc.
	WStrBufSize (see page 6837)	This is function WideStrUtils.WStrBufSize.
	WStrCat (see page 6837)	This is function WideStrUtils.WStrCat.
	WStrComp (see page 6838)	This is function WideStrUtils.WStrComp.
	WStrCopy (see page 6838)	This is function WideStrUtils.WStrCopy.
	WStrDispose (see page 6838)	This is function WideStrUtils.WStrDispose.
	WStrEnd (see page 6839)	This is function WideStrUtils.WStrEnd.
	WStrLCopy (see page 6839)	This is function WideStrUtils.WStrLCopy.
	WStrLen (see page 6839)	This is function WideStrUtils.WStrLen.
	WStrMove (see page 6840)	This is function WideStrUtils.WStrMove.
	WStrNew (see page 6840)	This is function WideStrUtils.WStrNew.
	WStrPCopy (see page 6840)	This is function WideStrUtils.WStrPCopy.
	WStrPLCopy (see page 6841)	This is function WideStrUtils.WStrPLCopy.
	WStrPos (see page 6841)	This is function WideStrUtils.WStrPos.
	WStrScan (see page 6841)	This is function WideStrUtils.WStrScan.

74.1.1 WideStrUtils.AnsiToUtf8Ex Function

Pascal

```
function AnsiToUtf8Ex(const S: AnsiString; const cp: integer): UTF8String;
```

C++

```
UTF8String AnsiToUtf8Ex(const AnsiString S, const int cp);
```

File

WideStrUtils

Description

This is function WideStrUtils.AnsiToUtf8Ex.

74.1.2 WideStrUtils.ConvertStreamFromAnsiToUTF8 Function

Pascal

```
procedure ConvertStreamFromAnsiToUTF8(Src: TStream; Dst: TStream; cp: integer = CP_ACP);
```

C++

```
ConvertStreamFromAnsiToUTF8(TStream Src, TStream Dst, int cp = CP_ACP);
```

File

WideStrUtils

Description

This is function WideStrUtils.ConvertStreamFromAnsiToUTF8.

74.1.3 WideStrUtils.ConvertStreamFromUTF8ToAnsi Function

Pascal

```
procedure ConvertStreamFromUTF8ToAnsi(Src: TStream; Dst: TStream; cp: integer = CP_ACP);
```

C++

```
ConvertStreamFromUTF8ToAnsi(TStream Src, TStream Dst, int cp = CP_ACP);
```

File

WideStrUtils

Description

This is function WideStrUtils.ConvertStreamFromUTF8ToAnsi.

74.1.4 WideStrUtils.DetectUTF8Encoding Function

Pascal

```
function DetectUTF8Encoding(const s: RawByteString): TEncodeType;
```

C++

```
TEncodeType DetectUTF8Encoding(const RawByteString s);
```

File

WideStrUtils

Description

This is function WideStrUtils.DetectUTF8Encoding.

74.1.5 WideStrUtils.HasExtendCharacter Function

Pascal

```
function HasExtendCharacter(const s: RawByteString): Boolean;
```

C++

```
Boolean HasExtendCharacter(const RawByteString s);
```

File

WideStrUtils

Description

This is function WideStrUtils.HasExtendCharacter.

74.1.6 WideStrUtils.HasUTF8BOM Function

Pascal

```
function HasUTF8BOM(const S: RawByteString): boolean; overload;
```

C++

```
boolean HasUTF8BOM(const RawByteString S);
```

File

WideStrUtils

Description

This is function WideStrUtils.HasUTF8BOM.

74.1.7 WideStrUtils.HasUTF8BOM Function

Pascal

```
function HasUTF8BOM(S: TStream): boolean; overload;
```

C++

```
boolean HasUTF8BOM(TStream S);
```

File

WideStrUtils

Description

This is function WideStrUtils.HasUTF8BOM.

74.1.8 WideStrUtils.inOpArray Function

Pascal

```
function inOpArray(W: WideChar; sets: array of WideChar): boolean;
```

C++

```
boolean inOpArray(WideChar W, array of WideChar sets);
```

File

WideStrUtils

Description

This is function WideStrUtils.inOpArray.

74.1.9 WideStrUtils.inOpSet Function

Pascal

```
function inOpSet(W: WideChar; sets: CharSet): boolean;
```

C++

```
boolean inOpSet(WideChar W, CharSet sets);
```

File

WideStrUtils

Description

This is function WideStrUtils.inOpSet.

74.1.10 WideStrUtils.IsUTF8LeadByte Function

Pascal

```
function IsUTF8LeadByte(Lead: AnsiChar): Boolean;
```

C++

```
Boolean IsUTF8LeadByte(AnsiChar Lead);
```

File

WideStrUtils

Description

This is function WideStrUtils.IsUTF8LeadByte.

74.1.11 WideStrUtils.IsUTF8String Function

Pascal

```
function IsUTF8String(const s: RawByteString): Boolean;
```

C++

```
Boolean IsUTF8String(const RawByteString s);
```

File

WideStrUtils

Description

This is function WideStrUtils.IsUTF8String.

74.1.12 WideStrUtils.IsUTF8TrailByte Function

Pascal

```
function IsUTF8TrailByte(Lead: AnsiChar): Boolean;
```

C++

```
Boolean IsUTF8TrailByte(AnsiChar Lead);
```

File

WideStrUtils

Description

This is function WideStrUtils.IsUTF8TrailByte.

74.1.13 WideStrUtils.LoadResWideString Function

Pascal

```
function LoadResWideString(ResStringRec: PResStringRec): WideString;
```

C++

```
BSTR LoadResWideString(PResStringRec ResStringRec);
```

File

WideStrUtils

Description

This is function WideStrUtils.LoadResWideString.

74.1.14 WideStrUtils.LoadWideStr Function

Pascal

```
function LoadWideStr(Ident: Integer): WideString;
```

C++

```
BSTR LoadWideStr(int Ident);
```

File

WideStrUtils

Description

This is function WideStrUtils.LoadWideStr.

74.1.15 WideStrUtils.UTF8CharLength Function

Pascal

```
function UTF8CharLength(Lead: AnsiChar): Integer;
```

C++

```
int UTF8CharLength(AnsiChar Lead);
```

File

WideStrUtils

Description

This is function WideStrUtils.UTF8CharLength.

74.1.16 WideStrUtils.UTF8CharSize Function

Pascal

```
function UTF8CharSize(Lead: AnsiChar): Integer;
```

C++

```
int UTF8CharSize(AnsiChar Lead);
```

File

WideStrUtils

Description

This is function WideStrUtils.UTF8CharSize.

74.1.17 WideStrUtils.UTF8LowerCase Function

Pascal

```
function UTF8LowerCase(const S: UTF8string): UTF8string;
```

C++

```
UTF8string UTF8LowerCase(const UTF8string S);
```

File

WideStrUtils

Description

This is function WideStrUtils.UTF8LowerCase.

74.1.18 WideStrUtils.Utf8ToAnsiEx Function

Pascal

```
function Utf8ToAnsiEx(const S: UTF8String; const cp: integer): AnsiString;
```

C++

```
AnsiString Utf8ToAnsiEx(const UTF8String S, const int cp);
```

File

WideStrUtils

Description

This is function WideStrUtils.Utf8ToAnsiEx.

74.1.19 WideStrUtils.UTF8UpperCase Function

Pascal

```
function UTF8UpperCase(const S: UTF8string): UTF8string;
```

C++

```
UTF8string UTF8UpperCase(const UTF8string S);
```

File

WideStrUtils

Description

This is function WideStrUtils.UTF8UpperCase.

74.1.20 WideStrUtils.WideAdjustLineBreaks Function

Pascal

```
function WideAdjustLineBreaks(const S: WideString; Style: TTextLineBreakStyle = tlbsCRLF):
WideString;
```

C++

```
BSTR WideAdjustLineBreaks(const BSTR S, TTextLineBreakStyle Style = tlbsCRLF);
```

File

WideStrUtils

Description

This is function WideStrUtils.WideAdjustLineBreaks.

74.1.21 WideStrUtils.WideDequotedStr Function

Pascal

```
function WideDequotedStr(const S: WideString; AQuote: WideChar): WideString;
```

C++

```
BSTR WideDequotedStr(const BSTR S, WideChar AQuote);
```

File

WideStrUtils

Description

This is function WideStrUtils.WideDequotedStr.

74.1.22 WideStrUtils.WideExtractQuotedStr Function

Pascal

```
function WideExtractQuotedStr(var Src: PWideChar; Quote: WideChar): WideString;
```

C++

```
BSTR WideExtractQuotedStr(PWideChar Src, WideChar Quote);
```

File

WideStrUtils

Description

This is function WideStrUtils.WideExtractQuotedStr.

74.1.23 WideStrUtils.WideLastChar Function

Pascal

```
function WideLastChar(const S: WideString): PWideChar;
```

C++

```
PWideChar WideLastChar(const BSTR S);
```

File

WideStrUtils

Description

This is function WideStrUtils.WideLastChar.

74.1.24 WideStrUtils.WideQuotedStr Function

Pascal

```
function WideQuotedStr(const S: WideString; Quote: WideChar): WideString;
```

C++

```
BSTR WideQuotedStr(const BSTR S, WideChar Quote);
```

File

WideStrUtils

Description

This is function WideStrUtils.WideQuotedStr.

74.1.25 WideStrUtils.WideReplaceStr Function

Pascal

```
function WideReplaceStr(const AText: WideString; const AFromText: WideString; const AToText:
WideString): WideString;
```

C++

```
BSTR WideReplaceStr(const BSTR AText, const BSTR AFromText, const BSTR AToText);
```

File

WideStrUtils

Description

This is function WideStrUtils.WideReplaceStr.

74.1.26 WideStrUtils.WideReplaceText Function

Pascal

```
function WideReplaceText(const AText: WideString; const AFromText: WideString; const AToText:
WideString): WideString;
```

C++

```
BSTR WideReplaceText(const BSTR AText, const BSTR AFromText, const BSTR AToText);
```

File

WideStrUtils

Description

This is function WideStrUtils.WideReplaceText.

74.1.27 WideStrUtils.WideStringReplace Function

Pascal

```
function WideStringReplace(const S: Widestring; const OldPattern: Widestring; const
NewPattern: Widestring; Flags: TReplaceFlags): Widestring;
```

C++

```
BSTR WideStringReplace(const BSTR S, const BSTR OldPattern, const BSTR NewPattern,
TReplaceFlags Flags);
```

File

WideStrUtils

Description

This is function WideStrUtils.WideStringReplace.

74.1.28 WideStrUtils.WStrAlloc Function

Pascal

```
function WStrAlloc(Size: Cardinal): PWideChar;
```

C++

```
PWideChar WStrAlloc(unsigned Size);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrAlloc.

74.1.29 WideStrUtils.WStrBufSize Function

Pascal

```
function WStrBufSize(const Str: PWideChar): Cardinal;
```

C++

```
unsigned WStrBufSize(const PWideChar Str);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrBufSize.

74.1.30 WideStrUtils.WStrCat Function

Pascal

```
function WStrCat(Dest: PWideChar; const Source: PWideChar): PWideChar;
```

C++

```
PWideChar WStrCat(PWideChar Dest, const PWideChar Source);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrCat.

74.1.31 WideStrUtils.WStrComp Function

Pascal

```
function WStrComp(const Str1: PWideChar; const Str2: PWideChar): Integer;
```

C++

```
int WStrComp(const PWideChar Str1, const PWideChar Str2);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrComp.

74.1.32 WideStrUtils.WStrCopy Function

Pascal

```
function WStrCopy(Dest: PWideChar; const Source: PWideChar): PWideChar;
```

C++

```
PWideChar WStrCopy(PWideChar Dest, const PWideChar Source);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrCopy.

74.1.33 WideStrUtils.WStrDispose Function

Pascal

```
procedure WStrDispose(Str: PWideChar);
```

C++

```
WStrDispose(PWideChar Str);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrDispose.

74.1.34 WideStrUtils.WStrEnd Function

Pascal

```
function WStrEnd(const Str: PWideChar): PWideChar;
```

C++

```
PWideChar WStrEnd(const PWideChar Str);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrEnd.

74.1.35 WideStrUtils.WStrLCopy Function

Pascal

```
function WStrLCopy(Dest: PWideChar; const Source: PWideChar; MaxLen: Cardinal): PWideChar;
```

C++

```
PWideChar WStrLCopy(PWideChar Dest, const PWideChar Source, unsigned MaxLen);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrLCopy.

74.1.36 WideStrUtils.WStrLen Function

Pascal

```
function WStrLen(const Str: PWideChar): Cardinal;
```

C++

```
unsigned WStrLen(const PWideChar Str);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrLen.

74.1.37 WideStrUtils.WStrMove Function

Pascal

```
function WStrMove(Dest: PWideChar; const Source: PWideChar; Count: Cardinal): PWideChar;
```

C++

```
PWideChar WStrMove(PWideChar Dest, const PWideChar Source, unsigned Count);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrMove.

74.1.38 WideStrUtils.WStrNew Function

Pascal

```
function WStrNew(const Str: PWideChar): PWideChar;
```

C++

```
PWideChar WStrNew(const PWideChar Str);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrNew.

74.1.39 WideStrUtils.WStrPCopy Function

Pascal

```
function WStrPCopy(Dest: PWideChar; const Source: WideString): PWideChar;
```

C++

```
PWideChar WStrPCopy(PWideChar Dest, const BSTR Source);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrPCopy.

74.1.40 WideStrUtils.WStrPLCopy Function

Pascal

```
function WStrPLCopy(Dest: PWideChar; const Source: WideString; MaxLen: Cardinal): PWideChar;
```

C++

```
PWideChar WStrPLCopy(PWideChar Dest, const BSTR Source, unsigned MaxLen);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrPLCopy.

74.1.41 WideStrUtils.WStrPos Function

Pascal

```
function WStrPos(const Str1: PWideChar; const Str2: PWideChar): PWideChar;
```

C++

```
PWideChar WStrPos(const PWideChar Str1, const PWideChar Str2);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrPos.

74.1.42 WideStrUtils.WStrScan Function

Pascal

```
function WStrScan(Str: PWideChar; Chr: WideChar): PWideChar;
```

C++

```
PWideChar WStrScan(PWideChar Str, WideChar Chr);
```

File

WideStrUtils

Description

This is function WideStrUtils.WStrScan.

74.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TEncodeType (see page 6842)	This is record WideStrUtils.TEncodeType.

74.2.1 WideStrUtils.TEncodeType Enumeration

Pascal

```
TEncodeType = (
  etUSASCII,
  etUTF8,
  etANSI
);
```

C++

```
enum TEncodeType {
  etUSASCII,
  etUTF8,
  etANSI
};
```

File

WideStrUtils

Description

This is record WideStrUtils.TEncodeType.

74.3 Types

The following table lists types in this documentation.

Types

Name	Description
CharSet (see page 6843)	This is type WideStrUtils.CharSet.

74.3.1 WideStrUtils.CharSet Type

Pascal

```
CharSet = set of ansichar;
```

C++

```
ansichar CharSet;
```

File

WideStrUtils

Description

This is type WideStrUtils.CharSet.

74.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sUTF8BOMString (see page 6844)	This is constant WideStrUtils.sUTF8BOMString.

74.4.1 WideStrUtils.sUTF8BOMString Constant

Pascal

```
sUTF8BOMString: array[1..3] of AnsiChar = (AnsiChar(#$EF), AnsiChar(#$BB), AnsiChar(#$BF));
```

C++

```
array[1..3] of AnsiChar sUTF8BOMString = (AnsiChar(#$EF), AnsiChar(#$BB), AnsiChar(#$BF));
```

File

WideStrUtils

Description

This is constant WideStrUtils.sUTF8BOMString.

75 WinHelpViewer Namespace

This is namespace WinHelpViewer.

Topics

Name	Description
Interfaces (see page 6846)	The following table lists interfaces in this documentation.
Variables (see page 6849)	The following table lists variables in this documentation.

Interfaces

	Name	Description
	IWinHelpTester (see page 6846)	This is class WinHelpViewer.IWinHelpTester.

Variables

Name	Description
ViewerName (see page 6849)	This is variable WinHelpViewer.ViewerName.
WinHelpTester (see page 6849)	This is variable WinHelpViewer.WinHelpTester.

75.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWinHelpTester (see page 6846)	This is class WinHelpViewer.IWinHelpTester.

75.1.1 IWinHelpTester Interface

Class Hierarchy

Pascal

```
IWinHelpTester = interface(IInterface);
```

C++

```
__interface IWinHelpTester : public IInterface;
```

File

WinHelpViewer

Description

This is class WinHelpViewer.IWinHelpTester.

75.1.1.1 IWinHelpTester Members

The following tables list the members exposed by IWinHelpTester.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	CanShowALink (see page 6847)	This is CanShowALink, a member of class IWinHelpTester.
	CanShowContext (see page 6847)	This is CanShowContext, a member of class IWinHelpTester.
	CanShowTopic (see page 6847)	This is CanShowTopic, a member of class IWinHelpTester.
	GetDefaultHelpFile (see page 6847)	This is GetDefaultHelpFile, a member of class IWinHelpTester.
	GetHelpPath (see page 6848)	This is GetHelpPath, a member of class IWinHelpTester.
	GetHelpStrings (see page 6848)	This is GetHelpStrings, a member of class IWinHelpTester.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.

75.1.1.2 IWinHelpTester Methods

The methods of the IWinHelpTester class are listed here.

Public Methods

	Name	Description
	CanShowALink (see page 6847)	This is CanShowALink, a member of class IWinHelpTester.
	CanShowContext (see page 6847)	This is CanShowContext, a member of class IWinHelpTester.
	CanShowTopic (see page 6847)	This is CanShowTopic, a member of class IWinHelpTester.
	GetDefaultHelpFile (see page 6847)	This is GetDefaultHelpFile, a member of class IWinHelpTester.
	GetHelpPath (see page 6848)	This is GetHelpPath, a member of class IWinHelpTester.
	GetHelpStrings (see page 6848)	This is GetHelpStrings, a member of class IWinHelpTester.

75.1.1.2.1 IWinHelpTester.CanShowALink Method

Pascal

```
function CanShowALink(const ALink: String; const FileName: String): Boolean;
```

C++

```
__fastcall Boolean CanShowALink(const UnicodeString ALink, const UnicodeString FileName);
```

Description

This is CanShowALink, a member of class IWinHelpTester.

75.1.1.2.2 IWinHelpTester.CanShowContext Method

Pascal

```
function CanShowContext(const Context: Integer; const FileName: String): Boolean;
```

C++

```
__fastcall Boolean CanShowContext(const int Context, const UnicodeString FileName);
```

Description

This is CanShowContext, a member of class IWinHelpTester.

75.1.1.2.3 IWinHelpTester.CanShowTopic Method

Pascal

```
function CanShowTopic(const Topic: String; const FileName: String): Boolean;
```

C++

```
__fastcall Boolean CanShowTopic(const UnicodeString Topic, const UnicodeString FileName);
```

Description

This is CanShowTopic, a member of class IWinHelpTester.

75.1.1.2.4 IWinHelpTester.GetDefaultHelpFile Method

Pascal

```
[FileIOPermission(SecurityAction.Demand, Unrestricted=True)]
function GetDefaultHelpFile: String;
```

C++

```
[FileIOPermission(SecurityAction.Demand, Unrestricted=True)]
__fastcall UnicodeString GetDefaultHelpFile();
```

Description

This is GetDefaultHelpFile, a member of class IWinHelpTester.

75.1.1.2.5 IWinHelpTester.GetHelpPath Method

Pascal

```
[FileIOPermission(SecurityAction.Demand, Unrestricted=True)]
function GetHelpPath: String;
```

C++

```
[FileIOPermission(SecurityAction.Demand, Unrestricted=True)]
__fastcall UnicodeString GetHelpPath();
```

Description

This is GetHelpPath, a member of class IWinHelpTester.

75.1.1.2.6 IWinHelpTester.GetHelpStrings Method

Pascal

```
function GetHelpStrings(const ALink: String): TStringList;
```

C++

```
__fastcall TStringList GetHelpStrings(const UnicodeString ALink);
```

Description

This is GetHelpStrings, a member of class IWinHelpTester.

75.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
ViewerName (see page 6849)	This is variable WinHelpViewer.ViewerName.
WinHelpTester (see page 6849)	This is variable WinHelpViewer.WinHelpTester.

75.2.1 WinHelpViewer.ViewerName Variable

Pascal

```
ViewerName: String;
```

C++

```
UnicodeString ViewerName;
```

File

WinHelpViewer

Description

This is variable WinHelpViewer.ViewerName.

75.2.2 WinHelpViewer.WinHelpTester Variable

Pascal

```
WinHelpTester: IWinHelpTester;
```

C++

```
IWinHelpTester WinHelpTester;
```

File

WinHelpViewer

Description

This is variable WinHelpViewer.WinHelpTester.

76 WSDLBind Namespace

This is namespace WSDLBind.

Topics

Name	Description
Classes (see page 6854)	The following table lists classes in this documentation.
Interfaces (see page 7029)	The following table lists interfaces in this documentation.
Functions (see page 7122)	The following table lists functions in this documentation.
Constants (see page 7124)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBinding (see page 6854)	This is class WSDLBind.TBinding.
	TBindingOperation (see page 6861)	This is class WSDLBind.TBindingOperation.
	TBindingOperations (see page 6869)	This is class WSDLBind.TBindingOperations.
	TBindings (see page 6875)	This is class WSDLBind.TBindings.
	TDefinition (see page 6882)	This is class WSDLBind.TDefinition.
	TDocumentation (see page 6890)	This is class WSDLBind.TDocumentation.
	TDocumentationCollection (see page 6891)	This is class WSDLBind.TDocumentationCollection.
	TDocumented (see page 6897)	This is class WSDLBind.TDocumented.
	TFault (see page 6903)	This is class WSDLBind.TFault.
	TFaults (see page 6904)	This is class WSDLBind.TFaults.
	TImport (see page 6910)	This is class WSDLBind.TImport.
	TImports (see page 6916)	This is class WSDLBind.TImports.
	TMessage (see page 6923)	This is class WSDLBind.TMessage.
	TMessages (see page 6930)	This is class WSDLBind.TMessages.
	TOperation (see page 6936)	This is class WSDLBind.TOperation.
	TOperations (see page 6943)	This is class WSDLBind.TOperations.
	TParam (see page 6950)	This is class WSDLBind.TParam.
	TPart (see page 6957)	This is class WSDLBind.TPart.
	TParts (see page 6964)	This is class WSDLBind.TParts.
	TPort (see page 6970)	This is class WSDLBind.TPort.
	TPorts (see page 6977)	This is class WSDLBind.TPorts.
	TPortType (see page 6983)	This is class WSDLBind.TPortType.
	TPortTypes (see page 6990)	This is class WSDLBind.TPortTypes.
	TService (see page 6996)	This is class WSDLBind.TService.

	TServices (see page 7003)	This is class WSDLBind.TServices.
	TTypes (see page 7009)	This is class WSDLBind.TTypes.
	TWSDLDocument (see page 7015)	TWSDLDocument represents a WSDL document.
	TXMLSchemaDefs (see page 7022)	This is class WSDLBind.TXMLSchemaDefs.

Constants

Name	Description
SBinding (see page 7124)	This is constant WSDLBind.SBinding.
SDefinitions (see page 7124)	This is constant WSDLBind.SDefinitions.
SFault (see page 7125)	This is constant WSDLBind.SFault.
SImport (see page 7125)	This is constant WSDLBind.SImport.
SInput (see page 7125)	This is constant WSDLBind.SInput.
SLocation (see page 7126)	This is constant WSDLBind.SLocation.
SMessage (see page 7126)	This is constant WSDLBind.SMessage.
SNamespace (see page 7126)	This is constant WSDLBind.SNamespace.
SOperation (see page 7127)	This is constant WSDLBind.SOperation.
SOutput (see page 7127)	This is constant WSDLBind.SOutput.
SPart (see page 7127)	This is constant WSDLBind.SPart.
SPort (see page 7128)	This is constant WSDLBind.SPort.
SPortType (see page 7128)	This is constant WSDLBind.SPortType.
SService (see page 7128)	This is constant WSDLBind.SService.
SType (see page 7129)	This is constant WSDLBind.SType.
STypes (see page 7129)	This is constant WSDLBind.STypes.

Functions

	Name	Description
	GetDefinition (see page 7122)	This is function WSDLBind.GetDefinition.
	LoadWSDLDoc (see page 7122)	This is function WSDLBind.LoadWSDLDoc.
	NewWSDLDoc (see page 7122)	This is function WSDLBind.NewWSDLDoc.

Interfaces

	Name	Description
	IBinding (see page 7029)	This is class WSDLBind.IBinding.
	IBindingInput (see page 7033)	This is class WSDLBind.IBindingInput.
	IBindingOperation (see page 7034)	This is class WSDLBind.IBindingOperation.
	IBindingOperations (see page 7038)	This is class WSDLBind.IBindingOperations.
	IBindingOutput (see page 7041)	This is class WSDLBind.IBindingOutput.
	IBindings (see page 7042)	This is class WSDLBind.IBindings.
	IDefinition (see page 7045)	This is class WSDLBind.IDefinition.
	IDocumentation (see page 7051)	This is class WSDLBind.IDocumentation.
	IDocumentationCollection (see page 7052)	This is class WSDLBind.IDocumentationCollection.
	IDocumented (see page 7055)	This is class WSDLBind.IDocumented.
	IFault (see page 7057)	This is class WSDLBind.IFault.
	IFaults (see page 7058)	This is class WSDLBind.IFaults.
	IImport (see page 7061)	This is class WSDLBind.IImport.
	IImports (see page 7064)	This is class WSDLBind.IImports.
	IMessage (see page 7067)	This is class WSDLBind.IMessage.
	IMessages (see page 7071)	This is class WSDLBind.IMessages.
	IOperation (see page 7074)	This is class WSDLBind.IOperation.
	IOperations (see page 7078)	This is class WSDLBind.IOperations.
	IParam (see page 7082)	This is class WSDLBind.IParam.
	IPart (see page 7085)	This is class WSDLBind.IPart.
	IParts (see page 7090)	This is class WSDLBind.IParts.
	IPort (see page 7093)	This is class WSDLBind.IPort.
	IPorts (see page 7096)	This is class WSDLBind.IPorts.

	IPortType (see page 7099)	This is class WSDLBind.IPortType.
	IPortTypes (see page 7103)	This is class WSDLBind.IPortTypes.
	IService (see page 7106)	This is class WSDLBind.IService.
	IServices (see page 7109)	This is class WSDLBind.IServices.
	ITypes (see page 7112)	This is class WSDLBind.ITypes.
	IWSDLDocument (see page 7115)	IWSDLDocument provides low-level access to the definitions in a WSDL document.
	IXMLSchemaDefs (see page 7119)	This is class WSDLBind.IXMLSchemaDefs.

76.1 Classes

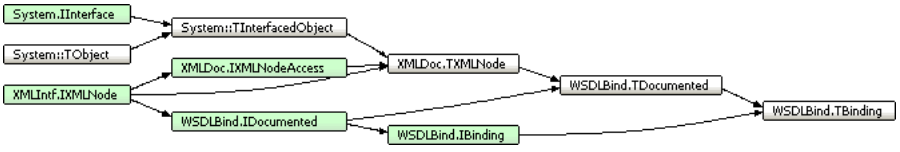
The following table lists classes in this documentation.

Classes

	Name	Description
	TBinding (see page 6854)	This is class WSDLBind.TBinding.
	TBindingOperation (see page 6861)	This is class WSDLBind.TBindingOperation.
	TBindingOperations (see page 6869)	This is class WSDLBind.TBindingOperations.
	TBindings (see page 6875)	This is class WSDLBind.TBindings.
	TDefinition (see page 6882)	This is class WSDLBind.TDefinition.
	TDocumentation (see page 6890)	This is class WSDLBind.TDocumentation.
	TDocumentationCollection (see page 6891)	This is class WSDLBind.TDocumentationCollection.
	TDocumented (see page 6897)	This is class WSDLBind.TDocumented.
	TFault (see page 6903)	This is class WSDLBind.TFault.
	TFaults (see page 6904)	This is class WSDLBind.TFaults.
	TImport (see page 6910)	This is class WSDLBind.TImport.
	TImports (see page 6916)	This is class WSDLBind.TImports.
	TMessage (see page 6923)	This is class WSDLBind.TMessage.
	TMessages (see page 6930)	This is class WSDLBind.TMessages.
	TOperation (see page 6936)	This is class WSDLBind.TOperation.
	TOperations (see page 6943)	This is class WSDLBind.TOperations.
	TParam (see page 6950)	This is class WSDLBind.TParam.
	TPart (see page 6957)	This is class WSDLBind.TPart.
	TParts (see page 6964)	This is class WSDLBind.TParts.
	TPort (see page 6970)	This is class WSDLBind.TPort.
	TPorts (see page 6977)	This is class WSDLBind.TPorts.
	TPortType (see page 6983)	This is class WSDLBind.TPortType.
	TPortTypes (see page 6990)	This is class WSDLBind.TPortTypes.
	TService (see page 6996)	This is class WSDLBind.TService.
	TServices (see page 7003)	This is class WSDLBind.TServices.
	TTypes (see page 7009)	This is class WSDLBind.TTypes.
	TWSDLDocument (see page 7015)	TWSDLDocument represents a WSDL document.
	TXMLSchemaDefs (see page 7022)	This is class WSDLBind.TXMLSchemaDefs.

76.1.1 TBinding Class

Class Hierarchy



Pascal

```
TBinding = class(TDocumented, IBinding);
```

C++

```
class TBinding : public TDocumented, public IBinding;
```

File

WSDLBind

Description

This is class WSDLBind.TBinding.

76.1.1.1 TBinding Members

The following tables list the members exposed by TBinding.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.

	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBindingOperations (see page 6860)	This is GetBindingOperations, a member of class TBinding.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetName (see page 6860)	This is GetName, a member of class TBinding.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetType_ (see page 6861)	This is GetType_, a member of class TBinding.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.

	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetName (see page 6861)	This is SetName, a member of class TBinding.
	SetNodeValue (see page 7387)	Sets the value of this node.
	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	SetType_ (see page 6861)	This is SetType_, a member of class TBinding.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 6860)	Responds after the last constructor executes.
	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.

	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.

	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	BindingOperations (see page 7033)	This is BindingOperations, a member of class IBinding.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7033)	This is Name, a member of class IBinding.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
	Type_ (see page 7033)	This is Type_, a member of class IBinding.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.1.2 TBinding Methods

The methods of the TBinding class are listed here.

Protected Methods

	Name	Description
	GetBindingOperations (see page 6860)	This is GetBindingOperations, a member of class TBinding.
	GetName (see page 6860)	This is GetName, a member of class TBinding.
	GetType_ (see page 6861)	This is GetType_, a member of class TBinding.
	SetName (see page 6861)	This is SetName, a member of class TBinding.
	SetType_ (see page 6861)	This is SetType_, a member of class TBinding.

Public Methods

	Name	Description
	AfterConstruction (see page 6860)	Responds after the last constructor executes.

76.1.1.2.1 TBinding.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3358)

System::TInterfacedObject::NewInstance (see page 3358)

System::TInterfacedObject::RefCount (see page 3360)

76.1.1.2.2 TBinding.GetBindingOperations Method

Pascal

```
function GetBindingOperations: IBindingOperations;
```

C++

```
__fastcall IBindingOperations GetBindingOperations();
```

Description

This is GetBindingOperations, a member of class TBinding.

76.1.1.2.3 TBinding.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TBinding.

76.1.1.2.4 TBinding.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class TBinding.

76.1.1.2.5 TBinding.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TBinding.

76.1.1.2.6 TBinding.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

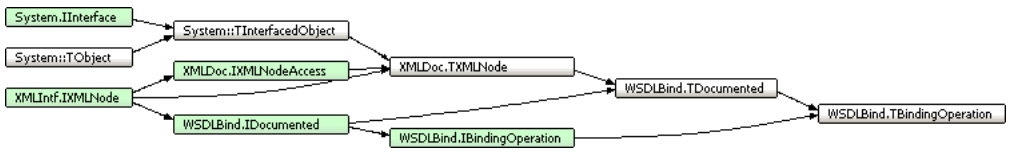
```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class TBinding.

76.1.2 TBindingOperation Class

Class Hierarchy



Pascal

```
TBindingOperation = class(TDocumented, IBindingOperation);
```

C++

```
class TBindingOperation : public TDocumented, public IBindingOperation;
```

File

WSDLBind

Description

This is class WSDLBind.TBindingOperation.

76.1.2.1 TBindingOperation Members

The following tables list the members exposed by TBindingOperation.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.

	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetFaults (see page 6867)	This is GetFaults, a member of class TBindingOperation.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetInput (see page 6868)	This is GetInput, a member of class TBindingOperation.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetName (see page 6868)	This is GetName, a member of class TBindingOperation.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOutput (see page 6868)	This is GetOutput, a member of class TBindingOperation.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.

	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetName (see page 6868)	This is SetName, a member of class TBindingOperation.
	SetNodeValue (see page 7387)	Sets the value of this node.
	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 6867)	Responds after the last constructor executes.
	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.

	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.

	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	Faults (see page 7037)	This is Faults, a member of class IBindingOperation.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	Input (see page 7037)	This is Input, a member of class IBindingOperation.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7038)	This is Name, a member of class IBindingOperation.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	Output (see page 7038)	This is Output, a member of class IBindingOperation.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.2.2 TBindingOperation Methods

The methods of the TBindingOperation class are listed here.

Protected Methods

	Name	Description
	GetFaults (see page 6867)	This is GetFaults, a member of class TBindingOperation.
	GetInput (see page 6868)	This is GetInput, a member of class TBindingOperation.
	GetName (see page 6868)	This is GetName, a member of class TBindingOperation.
	GetOutput (see page 6868)	This is GetOutput, a member of class TBindingOperation.
	SetName (see page 6868)	This is SetName, a member of class TBindingOperation.

Public Methods

	Name	Description
	AfterConstruction (see page 6867)	Responds after the last constructor executes.

76.1.2.2.1 TBindingOperation.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3358)

System::TInterfacedObject::NewInstance (see page 3358)

System::TInterfacedObject::RefCount (see page 3360)

76.1.2.2.2 TBindingOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class TBindingOperation.

76.1.2.2.3 TBindingOperation.GetInput Method

Pascal

```
function GetInput: IBindingInput;
```

C++

```
__fastcall IBindingInput GetInput();
```

Description

This is GetInput, a member of class TBindingOperation.

76.1.2.2.4 TBindingOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TBindingOperation.

76.1.2.2.5 TBindingOperation.GetOutput Method

Pascal

```
function GetOutput: IBindingOutput;
```

C++

```
__fastcall IBindingOutput GetOutput();
```

Description

This is GetOutput, a member of class TBindingOperation.

76.1.2.2.6 TBindingOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

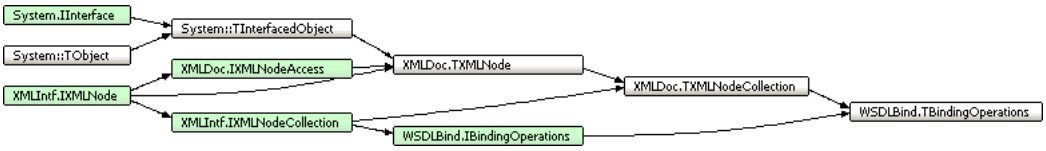
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TBindingOperation.

76.1.3 TBindingOperations Class

Class Hierarchy



Pascal

```
TBindingOperations = class(TXMLNodeCollection, IBindingOperations);
```

C++

```
class TBindingOperations : public TXMLNodeCollection, public IBindingOperations;
```

File

WSDLBind

Description

This is class WSDLBind.TBindingOperations.

76.1.3.1 TBindingOperations Members

The following tables list the members exposed by TBindingOperations.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6874)	This is Add, a member of class TBindingOperations.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.

	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBindingOperation (see page 6875)	This is GetBindingOperation, a member of class TBindingOperations.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.

	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6875)	This is Insert, a member of class TBindingOperations.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.

R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.

	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.

	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	BindingOperation (see page 7041)	This is BindingOperation, a member of class IBindingOperations.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.3.2 TBindingOperations Methods

The methods of the TBindingOperations class are listed here.

Protected Methods

	Name	Description
	Add (see page 6874)	This is Add, a member of class TBindingOperations.
	GetBindingOperation (see page 6875)	This is GetBindingOperation, a member of class TBindingOperations.
	Insert (see page 6875)	This is Insert, a member of class TBindingOperations.

76.1.3.2.1 TBindingOperations.Add Method

Pascal

```
function Add(const Name: WideString): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Add(const BSTR Name);
```

Description

This is Add, a member of class TBindingOperations.

76.1.3.2.2 TBindingOperations.GetBindingOperation Method

Pascal

```
function GetBindingOperation(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation GetBindingOperation(int Index);
```

Description

This is GetBindingOperation, a member of class TBindingOperations.

76.1.3.2.3 TBindingOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IBindingOperation;
```

C++

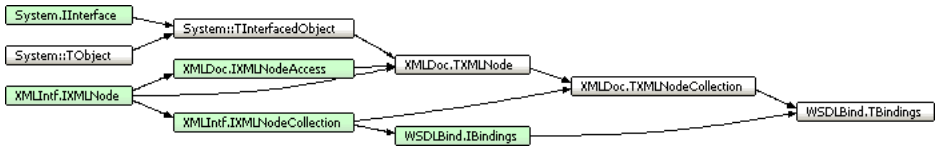
```
__fastcall IBindingOperation Insert(int Index);
```

Description

This is Insert, a member of class TBindingOperations.

76.1.4 TBindings Class

Class Hierarchy



Pascal

```
TBindings = class(TXMLNodeCollection, IBindings);
```

C++

```
class TBindings : public TXMLNodeCollection, public IBindings;
```

File

WSDLBind

Description

This is class WSDLBind.TBindings.

76.1.4.1 TBindings Members

The following tables list the members exposed by TBindings.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6881)	This is Add, a member of class TBindings.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBinding (see page 6881)	This is GetBinding, a member of class TBindings.

	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6881)	This is Insert, a member of class TBindings.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.

	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.

	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.

	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	Binding (see page 7045)	This is Binding, a member of class IBindings.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.

	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.4.2 TBindings Methods

The methods of the TBindings class are listed here.

Protected Methods

	Name	Description
	Add (see page 6881)	This is Add, a member of class TBindings.
	GetBinding (see page 6881)	This is GetBinding, a member of class TBindings.
	Insert (see page 6881)	This is Insert, a member of class TBindings.

76.1.4.2.1 TBindings.Add Method

Pascal

```
function Add(const Name: WideString; const AType: WideString): IBinding;
```

C++

```
__fastcall IBinding Add(const BSTR Name, const BSTR AType);
```

Description

This is Add, a member of class TBindings.

76.1.4.2.2 TBindings.GetBinding Method

Pascal

```
function GetBinding(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding GetBinding(int Index);
```

Description

This is GetBinding, a member of class TBindings.

76.1.4.2.3 TBindings.Insert Method

Pascal

```
function Insert(Index: Integer): IBinding;
```

C++

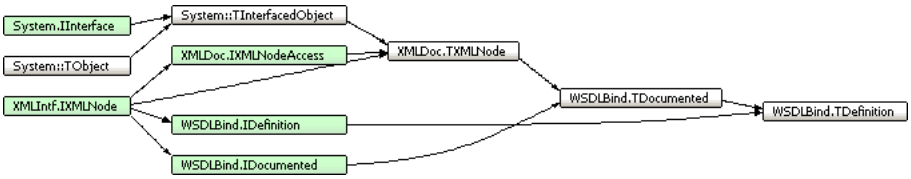
```
__fastcall IBinding Insert(int Index);
```

Description

This is Insert, a member of class TBindings.

76.1.5 TDefinition Class

Class Hierarchy



Pascal

```
TDefinition = class(TDocumented, IDefinition);
```

C++

```
class TDefinition : public TDocumented, public IDefinition;
```

File

WSDLBind

Description

This is class WSDLBind.TDefinition.

76.1.5.1 TDefinition Members

The following tables list the members exposed by TDefinition.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.

	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBindings (see page 6888)	This is GetBindings, a member of class TDefinition.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetImports (see page 6888)	This is GetImports, a member of class TDefinition.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetMessages (see page 6888)	This is GetMessages, a member of class TDefinition.
	GetName (see page 6889)	This is GetName, a member of class TDefinition.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPortTypes (see page 6889)	This is GetPortTypes, a member of class TDefinition.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetServices (see page 6889)	This is GetServices, a member of class TDefinition.
	GetTargetNamespace (see page 6889)	This is GetTargetNamespace, a member of class TDefinition.
	GetText (see page 7378)	Returns the text value of the node.
	GetTypes (see page 6889)	This is GetTypes, a member of class TDefinition.

	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetName (see page 6890)	This is SetName, a member of class TDefinition.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetTargetNamespace (see page 6890)	This is SetTargetNamespace, a member of class TDefinition.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 6887)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.

	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.

	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	Bindings (see page 7050)	This is Bindings, a member of class IDefinition.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.

	Imports (see page 7050)	This is Imports, a member of class IDefinition.
	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Messages (see page 7050)	This is Messages, a member of class IDefinition.
	Name (see page 7050)	This is Name, a member of class IDefinition.
	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7639)	Indicates the node name.
	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	PortTypes (see page 7050)	This is PortTypes, a member of class IDefinition.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Services (see page 7051)	This is Services, a member of class IDefinition.
	TargetNamespace (see page 7051)	This is TargetNamespace, a member of class IDefinition.
	Text (see page 7643)	Represents the Text of the node.
	Types (see page 7051)	This is Types, a member of class IDefinition.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.5.2 TDefinition Methods

The methods of the TDefinition class are listed here.

Protected Methods

	Name	Description
	GetBindings (see page 6888)	This is GetBindings, a member of class TDefinition.
	GetImports (see page 6888)	This is GetImports, a member of class TDefinition.
	GetMessages (see page 6888)	This is GetMessages, a member of class TDefinition.
	GetName (see page 6889)	This is GetName, a member of class TDefinition.
	GetPortTypes (see page 6889)	This is GetPortTypes, a member of class TDefinition.
	GetServices (see page 6889)	This is GetServices, a member of class TDefinition.
	GetTargetNamespace (see page 6889)	This is GetTargetNamespace, a member of class TDefinition.
	GetTypes (see page 6889)	This is GetTypes, a member of class TDefinition.
	SetName (see page 6890)	This is SetName, a member of class TDefinition.
	SetTargetNamespace (see page 6890)	This is SetTargetNamespace, a member of class TDefinition.

Public Methods

	Name	Description
	AfterConstruction (see page 6887)	Responds after the last constructor executes.

76.1.5.2.1 TDefinition.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3358)

System::TInterfacedObject::NewInstance (see page 3358)

System::TInterfacedObject::RefCount (see page 3360)

76.1.5.2.2 TDefinition.GetBindings Method

Pascal

```
function GetBindings: IBindings;
```

C++

```
__fastcall IBindings GetBindings();
```

Description

This is GetBindings, a member of class TDefinition.

76.1.5.2.3 TDefinition.GetImports Method

Pascal

```
function GetImports: IImports;
```

C++

```
__fastcall IImports GetImports();
```

Description

This is GetImports, a member of class TDefinition.

76.1.5.2.4 TDefinition.GetMessages Method

Pascal

```
function GetMessages: IMessages;
```

C++

```
__fastcall IMessages GetMessages();
```

Description

This is GetMessages, a member of class TDefinition.

76.1.5.2.5 TDefinition.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TDefinition.

76.1.5.2.6 TDefinition.GetPortTypes Method

Pascal

```
function GetPortTypes: IPortTypes;
```

C++

```
__fastcall IPortTypes GetPortTypes();
```

Description

This is GetPortTypes, a member of class TDefinition.

76.1.5.2.7 TDefinition.GetServices Method

Pascal

```
function GetServices: IServices;
```

C++

```
__fastcall IServices GetServices();
```

Description

This is GetServices, a member of class TDefinition.

76.1.5.2.8 TDefinition.GetTargetNamespace Method

Pascal

```
function GetTargetNamespace: WideString;
```

C++

```
__fastcall BSTR GetTargetNamespace();
```

Description

This is GetTargetNamespace, a member of class TDefinition.

76.1.5.2.9 TDefinition.GetTypes Method

Pascal

```
function GetTypes: ITypes;
```

C++

```
__fastcall ITypes GetTypes();
```

Description

This is GetTypes, a member of class TDefinition.

76.1.5.2.10 TDefinition.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TDefinition.

76.1.5.2.11 TDefinition.SetTargetNamespace Method

Pascal

```
procedure SetTargetNamespace(Value: WideString);
```

C++

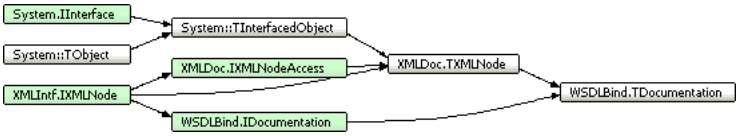
```
__fastcall SetTargetNamespace(BSTR Value);
```

Description

This is SetTargetNamespace, a member of class TDefinition.

76.1.6 TDocumentation Class

Class Hierarchy



Pascal

```
TDocumentation = class(TXMLNode, IDocumentation);
```

C++

```
class TDocumentation : public TXMLNode, public IDocumentation;
```

File

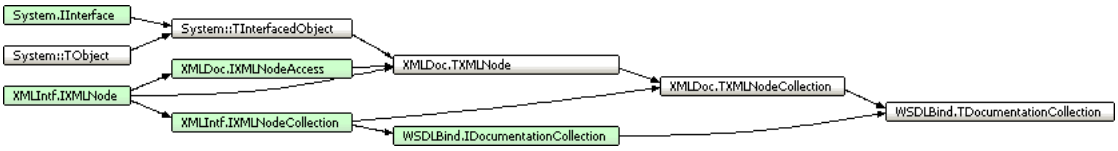
WSDLBind

Description

This is class WSDLBind.TDocumentation.

76.1.7 TDocumentationCollection Class

Class Hierarchy



Pascal

```
TDocumentationCollection = class(TXMLNodeCollection, IDocumentationCollection);
```

C++

```
class TDocumentationCollection : public TXMLNodeCollection, public IDocumentationCollection;
```

File

WSDLBind

Description

This is class WSDLBind.TDocumentationCollection.

76.1.7.1 TDocumentationCollection Members

The following tables list the members exposed by TDocumentationCollection.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6896)	This is Add, a member of class TDocumentationCollection.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.

	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDocumentation (see page 6897)	This is GetDocumentation, a member of class TDocumentationCollection.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.

	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6897)	This is Insert, a member of class TDocumentationCollection.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.

R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.

	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.

	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	Documentation (see page 7055)	This is Documentation, a member of class IDocumentationCollection.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.7.2 TDocumentationCollection Methods

The methods of the TDocumentationCollection class are listed here.

Protected Methods

	Name	Description
	Add (see page 6896)	This is Add, a member of class TDocumentationCollection.
	GetDocumentation (see page 6897)	This is GetDocumentation, a member of class TDocumentationCollection.
	Insert (see page 6897)	This is Insert, a member of class TDocumentationCollection.

76.1.7.2.1 TDocumentationCollection.Add Method

Pascal

```
function Add(const Text: WideString): IDocumentation;
```

C++

```
__fastcall IDocumentation Add(const BSTR Text);
```

Description

This is Add, a member of class TDocumentationCollection.

76.1.7.2.2 TDocumentationCollection.GetDocumentation Method

Pascal

```
function GetDocumentation(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation GetDocumentation(int Index);
```

Description

This is GetDocumentation, a member of class TDocumentationCollection.

76.1.7.2.3 TDocumentationCollection.Insert Method

Pascal

```
function Insert(Index: Integer): IDocumentation;
```

C++

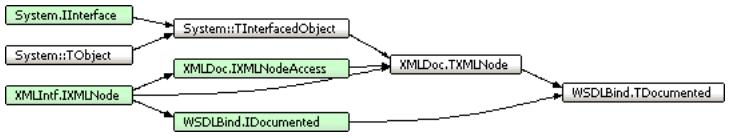
```
__fastcall IDocumentation Insert(int Index);
```

Description

This is Insert, a member of class TDocumentationCollection.

76.1.8 TDocumented Class

Class Hierarchy



Pascal

```
TDocumented = class(TXMLNode, IDocumented);
```

C++

```
class TDocumented : public TXMLNode, public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.TDocumented.

76.1.8.1 TDocumented Members

The following tables list the members exposed by TDocumented.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.

	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.

R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 6902)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.

	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
	Collection (see page 7636)	Indicates the collection in which this node appears.
	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7639)	Indicates the node name.
	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.8.2 TDocumented Methods

The methods of the TDocumented class are listed here.

Protected Methods

	Name	Description
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.

Public Methods

	Name	Description
	AfterConstruction (see page 6902)	Responds after the last constructor executes.

76.1.8.2.1 TDocumented.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is

incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3358)

System::TInterfacedObject::NewInstance (see page 3358)

System::TInterfacedObject::RefCount (see page 3360)

76.1.8.2.2 TDocumented.GetDocumentationCollection Method

Pascal

```
function GetDocumentationCollection: IDocumentationCollection;
```

C++

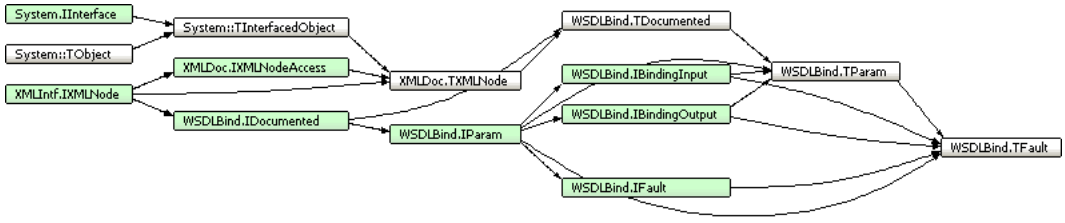
```
__fastcall IDocumentationCollection GetDocumentationCollection();
```

Description

This is GetDocumentationCollection, a member of class TDocumented.

76.1.9 TFault Class

Class Hierarchy



Pascal

```
TFault = class(TParam, IParam, IFault, IBindingInput, IBindingOutput);
```

C++

```
class TFault : public TParam, public IParam, public IFault, public IBindingInput, public
IBindingOutput;
```

File

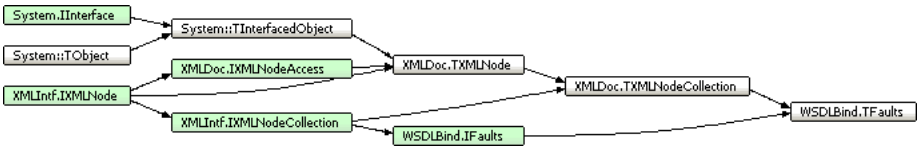
WSDLBind

Description

This is class WSDLBind.TFault.

76.1.10 TFaults Class

Class Hierarchy



Pascal

```
TFaults = class(TXMLNodeCollection, IFaults);
```

C++

```
class TFaults : public TXMLNodeCollection, public IFaults;
```

File

WSDLBind

Description

This is class WSDLBind.TFaults.

76.1.10.1 TFaults Members

The following tables list the members exposed by TFaults.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6909)	This is Add, a member of class TFaults.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.

	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetFault (see page 6910)	This is GetFault, a member of class TFaults.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.

	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6910)	This is Insert, a member of class TFaults.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.

R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.

	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.

	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	Fault (see page 7061)	This is Fault, a member of class IFaults.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.10.2 TFaults Methods

The methods of the TFaults class are listed here.

Protected Methods

	Name	Description
	Add (see page 6909)	This is Add, a member of class TFaults.
	GetFault (see page 6910)	This is GetFault, a member of class TFaults.
	Insert (see page 6910)	This is Insert, a member of class TFaults.

76.1.10.2.1 TFaults.Add Method

Pascal

```
function Add(const Name: WideString; const Message: WideString): IFault;
```

C++

```
__fastcall IFault Add(const BSTR Name, const BSTR Message);
```

Description

This is Add, a member of class TFaults.

76.1.10.2.2 TFaults.GetFault Method

Pascal

```
function GetFault(Index: Integer): IFault;
```

C++

```
__fastcall IFault GetFault(int Index);
```

Description

This is GetFault, a member of class TFaults.

76.1.10.2.3 TFaults.Insert Method

Pascal

```
function Insert(Index: Integer): IFault;
```

C++

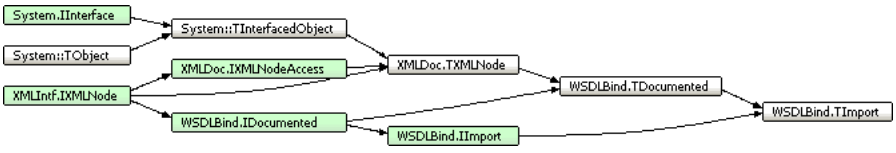
```
__fastcall IFault Insert(int Index);
```

Description

This is Insert, a member of class TFaults.

76.1.11 TImport Class

Class Hierarchy



Pascal

```
TImport = class(TDocumented, IImport);
```

C++

```
class TImport : public TDocumented, public IImport;
```

File

WSDLBind

Description

This is class WSDLBind.TImport.

76.1.11.1 TImport Members

The following tables list the members exposed by TImport.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.

	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetLocation (see page 6915)	This is GetLocation, a member of class TImport.
	GetNamespace (see page 6916)	This is GetNamespace, a member of class TImport.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetLocation (see page 6916)	This is SetLocation, a member of class TImport.
	SetNamespace (see page 6916)	This is SetNamespace, a member of class TImport.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.

R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 6902)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.

	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.

	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Location (see page 7064)	This is Location, a member of class IImport.
	Namespace (see page 7064)	This is Namespace, a member of class IImport.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.11.2 TImport Methods

The methods of the TImport class are listed here.

Protected Methods

	Name	Description
	GetLocation (see page 6915)	This is GetLocation, a member of class TImport.
	GetNamespace (see page 6916)	This is GetNamespace, a member of class TImport.
	SetLocation (see page 6916)	This is SetLocation, a member of class TImport.
	SetNamespace (see page 6916)	This is SetNamespace, a member of class TImport.

76.1.11.2.1 TImport.GetLocation Method

Pascal

```
function GetLocation: WideString;
```

C++

```
__fastcall BSTR GetLocation();
```

Description

This is GetLocation, a member of class TImport.

76.1.11.2.2 TImport.GetNamespace Method

Pascal

```
function GetNamespace: WideString;
```

C++

```
__fastcall BSTR GetNamespace();
```

Description

This is GetNamespace, a member of class TImport.

76.1.11.2.3 TImport.SetLocation Method

Pascal

```
procedure SetLocation(Value: WideString);
```

C++

```
__fastcall SetLocation(BSTR Value);
```

Description

This is SetLocation, a member of class TImport.

76.1.11.2.4 TImport.SetNamespace Method

Pascal

```
procedure SetNamespace(Value: WideString);
```

C++

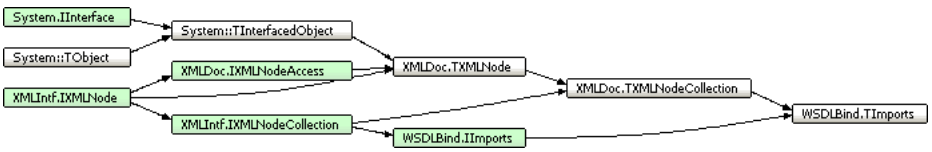
```
__fastcall SetNamespace(BSTR Value);
```

Description

This is SetNamespace, a member of class TImport.

76.1.12 TImports Class

Class Hierarchy



Pascal

```
TImports = class(TXMLNodeCollection, IImports);
```

C++

```
class TImports : public TXMLNodeCollection, public IImports;
```

File

WSDLBind

Description

This is class WSDLBind.TImports.

76.1.12.1 TImports Members

The following tables list the members exposed by TImports.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6922)	This is Add, a member of class TImports.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.

	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetImport (see page 6922)	This is GetImport, a member of class TImports.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6923)	This is Insert, a member of class TImports.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.

	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.

	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.

	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.

	Collection (see page 7636)	Indicates the collection in which this node appears.
	Count (see page 7648)	Indicates the number of repeating child nodes.
	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
	Import (see page 7067)	This is Import, a member of class IImports.
	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7639)	Indicates the node name.
	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.12.2 TImports Methods

The methods of the TImports class are listed here.

Protected Methods

	Name	Description
	Add (see page 6922)	This is Add, a member of class TImports.
	GetImport (see page 6922)	This is GetImport, a member of class TImports.
	Insert (see page 6923)	This is Insert, a member of class TImports.

76.1.12.2.1 TImports.Add Method

Pascal

```
function Add(const Namespace: WideString; const Location: WideString): IImport;
```

C++

```
__fastcall IImport Add(const BSTR Namespace, const BSTR Location);
```

Description

This is Add, a member of class TImports.

76.1.12.2.2 TImports.GetImport Method

Pascal

```
function GetImport(Index: Integer): IImport;
```

C++

```
__fastcall IImport GetImport(int Index);
```

Description

This is GetImport, a member of class TImports.

76.1.12.2.3 TImports.Insert Method

Pascal

```
function Insert(Index: Integer): IImport;
```

C++

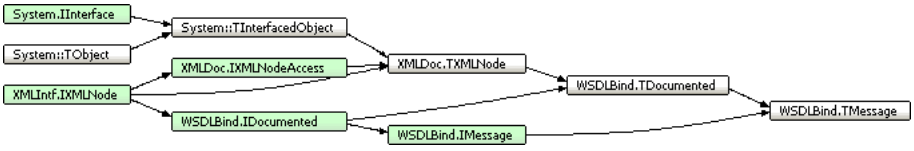
```
__fastcall IImport Insert(int Index);
```

Description

This is Insert, a member of class TImports.

76.1.13 TMessage Class

Class Hierarchy



Pascal

```
TMessage = class(TDocumented, IMessage);
```

C++

```
class TMessage : public TDocumented, public IMessage;
```

File

WSDLBind

Description

This is class WSDLBind.TMessage.

76.1.13.1 TMessage Members

The following tables list the members exposed by TMessage.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetName (see page 6929)	This is GetName, a member of class TMessage.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.

	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetParts (see page 6929)	This is GetParts, a member of class TMessage.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetName (see page 6929)	This is SetName, a member of class TMessage.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 6928)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.

	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.

	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7070)	This is Name, a member of class IMessage.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Parts (see page 7070)	This is Parts, a member of class IMessage.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.13.2 TMessage Methods

The methods of the TMessage class are listed here.

Protected Methods

	Name	Description
	GetName (see page 6929)	This is GetName, a member of class TMessage.
	GetParts (see page 6929)	This is GetParts, a member of class TMessage.
	SetName (see page 6929)	This is SetName, a member of class TMessage.

Public Methods

	Name	Description
V	AfterConstruction (see page 6928)	Responds after the last constructor executes.

76.1.13.2.1 TMessage.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is

incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3358)

System::TInterfacedObject::NewInstance (see page 3358)

System::TInterfacedObject::RefCount (see page 3360)

76.1.13.2.2 TMessage.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TMessage.

76.1.13.2.3 TMessage.GetParts Method

Pascal

```
function GetParts: IParts;
```

C++

```
__fastcall IParts GetParts();
```

Description

This is GetParts, a member of class TMessage.

76.1.13.2.4 TMessage.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

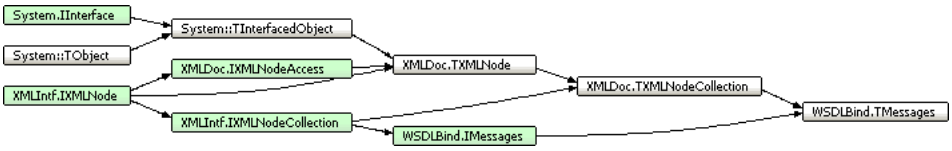
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TMessage.

76.1.14 TMessages Class

Class Hierarchy



Pascal

```
TMessages = class(TXMLNodeCollection, IMessages);
```

C++

```
class TMessages : public TXMLNodeCollection, public IMessages;
```

File

WSDLBind

Description

This is class WSDLBind.TMessages.

76.1.14.1 TMessages Members

The following tables list the members exposed by TMessages.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6935)	This is Add, a member of class TMessages.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.

	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 6936)	This is GetMessage, a member of class TMessages.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.

	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6936)	This is Insert, a member of class TMessages.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.

R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.

	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.

	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	Message (see page 7074)	This is Message, a member of class IMessages.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.14.2 TMessages Methods

The methods of the TMessages class are listed here.

Protected Methods

	Name	Description
	Add (see page 6935)	This is Add, a member of class TMessages.
	GetMessage (see page 6936)	This is GetMessage, a member of class TMessages.
	Insert (see page 6936)	This is Insert, a member of class TMessages.

76.1.14.2.1 TMessages.Add Method

Pascal

```
function Add(const Name: WideString): IMessage;
```

C++

```
__fastcall IMessage Add(const BSTR Name);
```

Description

This is Add, a member of class TMessages.

76.1.14.2.2 TMessages.GetMessage Method

Pascal

```
function GetMessage(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage GetMessage(int Index);
```

Description

This is GetMessage, a member of class TMessages.

76.1.14.2.3 TMessages.Insert Method

Pascal

```
function Insert(Index: Integer): IMessage;
```

C++

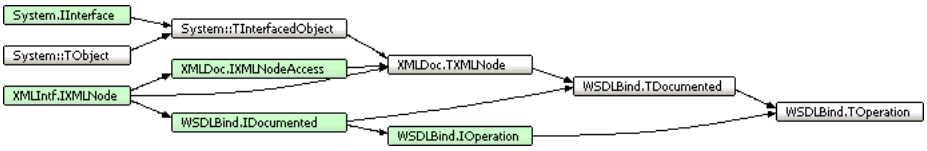
```
__fastcall IMessage Insert(int Index);
```

Description

This is Insert, a member of class TMessages.

76.1.15 TOperation Class

Class Hierarchy



Pascal

```
TOperation = class(TDocumented, IOperation);
```

C++

```
class TOperation : public TDocumented, public IOperation;
```

File

WSDLBind

Description

This is class WSDLBind.TOperation.

76.1.15.1 TOperation Members

The following tables list the members exposed by TOperation.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetFaults (see page 6942)	This is GetFaults, a member of class TOperation.

	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetInput (see page 6942)	This is GetInput, a member of class TOperation.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetName (see page 6942)	This is GetName, a member of class TOperation.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOutput (see page 6943)	This is GetOutput, a member of class TOperation.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetName (see page 6943)	This is SetName, a member of class TOperation.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.

R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 6942)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.

	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.

	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	Faults (see page 7077)	This is Faults, a member of class IOperation.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	Input (see page 7077)	This is Input, a member of class IOperation.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7078)	This is Name, a member of class IOperation.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	Output (see page 7078)	This is Output, a member of class IOperation.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.15.2 TOperation Methods

The methods of the TOperation class are listed here.

Protected Methods

	Name	Description
	GetFaults (see page 6942)	This is GetFaults, a member of class TOperation.
	GetInput (see page 6942)	This is GetInput, a member of class TOperation.
	GetName (see page 6942)	This is GetName, a member of class TOperation.
	GetOutput (see page 6943)	This is GetOutput, a member of class TOperation.
	SetName (see page 6943)	This is SetName, a member of class TOperation.

Public Methods

	Name	Description
V	AfterConstruction (see page 6942)	Responds after the last constructor executes.

76.1.15.2.1 TOperation.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3358)

System::TInterfacedObject::NewInstance (see page 3358)

System::TInterfacedObject::RefCount (see page 3360)

76.1.15.2.2 TOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class TOperation.

76.1.15.2.3 TOperation.GetInput Method

Pascal

```
function GetInput: IParam;
```

C++

```
__fastcall IParam GetInput();
```

Description

This is GetInput, a member of class TOperation.

76.1.15.2.4 TOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TOperation.

76.1.15.2.5 TOperation.GetOutput Method

Pascal

```
function GetOutput: IParam;
```

C++

```
__fastcall IParam GetOutput();
```

Description

This is GetOutput, a member of class TOperation.

76.1.15.2.6 TOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

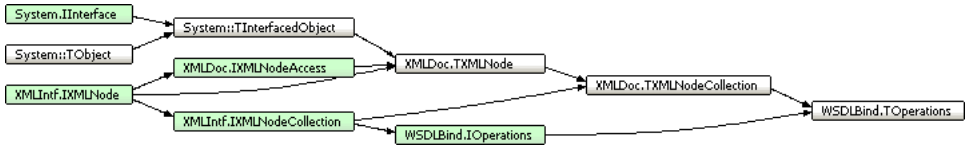
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TOperation.

76.1.16 TOperations Class

Class Hierarchy



Pascal

```
TOperations = class(TXMLNodeCollection, IOperations);
```

C++

```
class TOperations : public TXMLNodeCollection, public IOperations;
```

File

WSDLBind

Description

This is class WSDLBind.TOperations.

76.1.16.1 TOperations Members

The following tables list the members exposed by TOperations.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6949)	This is the overview for the Add method overload.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.

	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOperation (see page 6950)	This is GetOperation, a member of class TOperations.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6950)	This is Insert, a member of class TOperations.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.

	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
	Count (see page 7409)	Indicates the number of repeating child nodes.
	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
	List (see page 7411)	Lists the interfaces for the children that are repeated elements.
	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	Add (see page 7080)	This is the overview for the Add method overload.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 3358)	Responds after the last constructor executes.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.

	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.

	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.

	NodeValue (see page 7641)	Specifies the value of this node.
R	Operation (see page 7081)	This is Operation, a member of class IOperations.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.16.2 TOperations Methods

The methods of the TOperations class are listed here.

Protected Methods

	Name	Description
	Add (see page 6949)	This is the overview for the Add method overload.
	GetOperation (see page 6950)	This is GetOperation, a member of class TOperations.
	Insert (see page 6950)	This is Insert, a member of class TOperations.

76.1.16.2.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	TOperations.Add (WideString) (see page 6949)	This is Add, a member of class TOperations.
	TOperations.Add (WideString, WideString, WideString, WideString) (see page 6949)	This is Add, a member of class TOperations.

76.1.16.2.1.1 TOperations.Add Method (WideString)

Pascal

```
function Add(const Name: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name);
```

Description

This is Add, a member of class TOperations.

76.1.16.2.1.2 TOperations.Add Method (WideString, WideString, WideString, WideString)

Pascal

```
function Add(const Name: WideString; const InputMessage: WideString; const InputName:
WideString; const OutputMessage: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name, const BSTR InputMessage, const BSTR InputName,
const BSTR OutputMessage);
```

Description

This is Add, a member of class TOperations.

76.1.16.2.2 TOperations.GetOperation Method

Pascal

```
function GetOperation(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation GetOperation(int Index);
```

Description

This is GetOperation, a member of class TOperations.

76.1.16.2.3 TOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IOperation;
```

C++

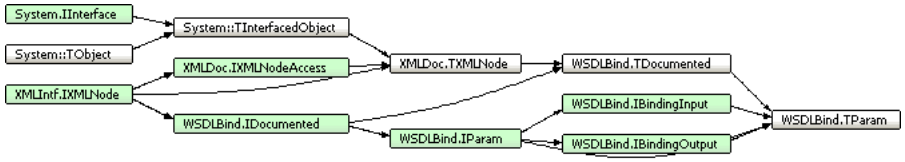
```
__fastcall IOperation Insert(int Index);
```

Description

This is Insert, a member of class TOperations.

76.1.17 TParam Class

Class Hierarchy



Pascal

```
TParam = class(TDocumented, IParam, IBindingInput, IBindingOutput);
```

C++

```
class TParam : public TDocumented, public IParam, public IBindingInput, public IBindingOutput;
```

File

WSDLBind

Description

This is class WSDLBind.TParam.

76.1.17.1 TParam Members

The following tables list the members exposed by TParam.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.

	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 6956)	This is GetMessage, a member of class TParam.
	GetName (see page 6956)	This is GetName, a member of class TParam.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetMessage (see page 6956)	This is SetMessage, a member of class TParam.
	SetName (see page 6956)	This is SetName, a member of class TParam.
	SetNodeValue (see page 7387)	Sets the value of this node.
	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 3358)	Responds after the last constructor executes.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	AfterConstruction (see page 6902)	Responds after the last constructor executes.
	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.

	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.

	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Message (see page 7085)	This is Message, a member of class IParam.
	Name (see page 7085)	This is Name, a member of class IParam.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.17.2 TParam Methods

The methods of the TParam class are listed here.

Protected Methods

	Name	Description
	GetMessage (see page 6956)	This is GetMessage, a member of class TParam.
	GetName (see page 6956)	This is GetName, a member of class TParam.
	SetMessage (see page 6956)	This is SetMessage, a member of class TParam.
	SetName (see page 6956)	This is SetName, a member of class TParam.

76.1.17.2.1 TParam.GetMessage Method

Pascal

```
function GetMessage: WideString;
```

C++

```
__fastcall BSTR GetMessage();
```

Description

This is GetMessage, a member of class TParam.

76.1.17.2.2 TParam.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TParam.

76.1.17.2.3 TParam.SetMessage Method

Pascal

```
procedure SetMessage(Value: WideString);
```

C++

```
__fastcall SetMessage(BSTR Value);
```

Description

This is SetMessage, a member of class TParam.

76.1.17.2.4 TParam.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

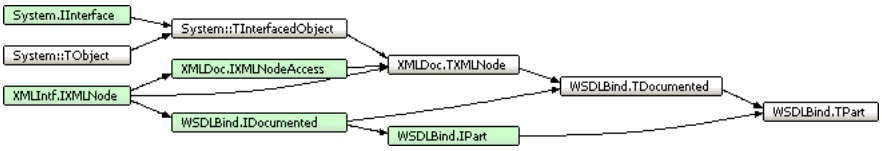
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TParam.

76.1.18 TPart Class

Class Hierarchy



Pascal

```
TPart = class(TDocumented, IPart);
```

C++

```
class TPart : public TDocumented, public IPart;
```

File

WSDLBind

Description

This is class WSDLBind.TPart.

76.1.18.1 TPart Members

The following tables list the members exposed by TPart.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.

	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetElement (see page 6962)	This is GetElement, a member of class TPart.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetName (see page 6962)	This is GetName, a member of class TPart.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetType_ (see page 6963)	This is GetType_, a member of class TPart.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.

	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetElement (see page 6963)	This is SetElement, a member of class TPart.
	SetName (see page 6963)	This is SetName, a member of class TPart.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	SetType_ (see page 6963)	This is SetType_, a member of class TPart.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 6902)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.

	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
	Element (see page 7089)	This is Element, a member of class IPart.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7089)	This is Name, a member of class IPart.

	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7639)	Indicates the node name.
	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
	Type_ (see page 7089)	This is Type_, a member of class IPart.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.18.2 TPart Methods

The methods of the TPart class are listed here.

Protected Methods

	Name	Description
	GetElement (see page 6962)	This is GetElement, a member of class TPart.
	GetName (see page 6962)	This is GetName, a member of class TPart.
	GetType_ (see page 6963)	This is GetType_, a member of class TPart.
	SetElement (see page 6963)	This is SetElement, a member of class TPart.
	SetName (see page 6963)	This is SetName, a member of class TPart.
	SetType_ (see page 6963)	This is SetType_, a member of class TPart.

76.1.18.2.1 TPart.GetElement Method

Pascal

```
function GetElement: WideString;
```

C++

```
__fastcall BSTR GetElement();
```

Description

This is GetElement, a member of class TPart.

76.1.18.2.2 TPart.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TPart.

76.1.18.2.3 TPart.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class TPart.

76.1.18.2.4 TPart.SetElement Method

Pascal

```
procedure SetElement(Value: WideString);
```

C++

```
__fastcall SetElement(BSTR Value);
```

Description

This is SetElement, a member of class TPart.

76.1.18.2.5 TPart.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TPart.

76.1.18.2.6 TPart.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

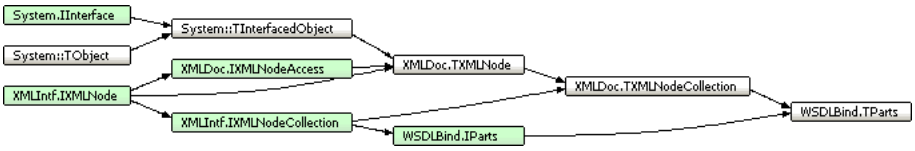
```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class TPart.

76.1.19 TParts Class

Class Hierarchy



Pascal

```
TParts = class(TXMLNodeCollection, IParts);
```

C++

```
class TParts : public TXMLNodeCollection, public IParts;
```

File

WSDLBind

Description

This is class WSDLBind.TParts.

76.1.19.1 TParts Members

The following tables list the members exposed by TParts.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6969)	This is Add, a member of class TParts.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.

	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPart (see page 6970)	This is GetPart, a member of class TParts.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.

	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6970)	This is Insert, a member of class TParts.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.

R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.

	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.

	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Part (see page 7093)	This is Part, a member of class IParts.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.19.2 TParts Methods

The methods of the TParts class are listed here.

Protected Methods

	Name	Description
	Add (see page 6969)	This is Add, a member of class TParts.
	GetPart (see page 6970)	This is GetPart, a member of class TParts.
	Insert (see page 6970)	This is Insert, a member of class TParts.

76.1.19.2.1 TParts.Add Method

Pascal

```
function Add(const Name: WideString; const Element: WideString; const AType: WideString = ''):
IPart;
```

C++

```
__fastcall IPart Add(const BSTR Name, const BSTR Element, const BSTR AType = '');
```

Description

This is Add, a member of class TParts.

76.1.19.2.2 TParts.GetPart Method

Pascal

```
function GetPart(Index: Integer): IPart;
```

C++

```
__fastcall IPart GetPart(int Index);
```

Description

This is GetPart, a member of class TParts.

76.1.19.2.3 TParts.Insert Method

Pascal

```
function Insert(Index: Integer): IPart;
```

C++

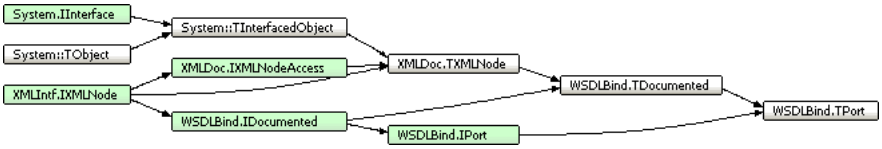
```
__fastcall IPart Insert(int Index);
```

Description

This is Insert, a member of class TParts.

76.1.20 TPort Class

Class Hierarchy



Pascal

```
TPort = class(TDocumented, IPort);
```

C++

```
class TPort : public TDocumented, public IPort;
```

File

WSDLBind

Description

This is class WSDLBind.TPort.

76.1.20.1 TPort Members

The following tables list the members exposed by TPort.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBinding (see page 6976)	This is GetBinding, a member of class TPort.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.

	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetName (see page 6976)	This is GetName, a member of class TPort.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetBinding (see page 6976)	This is SetBinding, a member of class TPort.
	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetName (see page 6976)	This is SetName, a member of class TPort.
	SetNodeValue (see page 7387)	Sets the value of this node.
	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 3358)	Responds after the last constructor executes.
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	AfterConstruction (see page 6902)	Responds after the last constructor executes.
	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.

	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.

	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
	Binding (see page 7096)	This is Binding, a member of class IPort.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7096)	This is Name, a member of class IPort.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.20.2 TPort Methods

The methods of the TPort class are listed here.

Protected Methods

	Name	Description
	GetBinding (see page 6976)	This is GetBinding, a member of class TPort.
	GetName (see page 6976)	This is GetName, a member of class TPort.
	SetBinding (see page 6976)	This is SetBinding, a member of class TPort.
	SetName (see page 6976)	This is SetName, a member of class TPort.

76.1.20.2.1 TPort.GetBinding Method

Pascal

```
function GetBinding: WideString;
```

C++

```
__fastcall BSTR GetBinding();
```

Description

This is GetBinding, a member of class TPort.

76.1.20.2.2 TPort.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TPort.

76.1.20.2.3 TPort.SetBinding Method

Pascal

```
procedure SetBinding(Value: WideString);
```

C++

```
__fastcall SetBinding(BSTR Value);
```

Description

This is SetBinding, a member of class TPort.

76.1.20.2.4 TPort.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

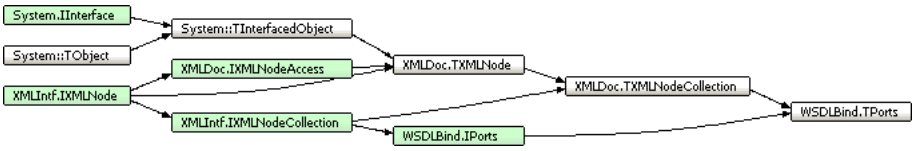
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TPort.

76.1.21 TPorts Class

Class Hierarchy



Pascal

```
TPorts = class(TXMLNodeCollection, IPorts);
```

C++

```
class TPorts : public TXMLNodeCollection, public IPorts;
```

File

WSDLBind

Description

This is class WSDLBind.TPorts.

76.1.21.1 TPorts Members

The following tables list the members exposed by TPorts.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6982)	This is Add, a member of class TPorts.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.

	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPort (see page 6983)	This is GetPort, a member of class TPorts.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.

	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6983)	This is Insert, a member of class TPorts.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.

R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.

	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.

	SetText (see page 7632)	Sets the text value of the node.
	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
	Collection (see page 7636)	Indicates the collection in which this node appears.
	Count (see page 7648)	Indicates the number of repeating child nodes.
	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7639)	Indicates the node name.
	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	Port (see page 7099)	This is Port, a member of class IPorts.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.21.2 TPorts Methods

The methods of the TPorts class are listed here.

Protected Methods

	Name	Description
	Add (see page 6982)	This is Add, a member of class TPorts.
	GetPort (see page 6983)	This is GetPort, a member of class TPorts.
	Insert (see page 6983)	This is Insert, a member of class TPorts.

76.1.21.2.1 TPorts.Add Method

Pascal

```
function Add(const Name: WideString; const Binding: WideString): IPort;
```

C++

```
__fastcall IPort Add(const BSTR Name, const BSTR Binding);
```

Description

This is Add, a member of class TPorts.

76.1.21.2.2 TPorts.GetPort Method

Pascal

```
function GetPort(Index: Integer): IPort;
```

C++

```
__fastcall IPort GetPort(int Index);
```

Description

This is GetPort, a member of class TPorts.

76.1.21.2.3 TPorts.Insert Method

Pascal

```
function Insert(Index: Integer): IPort;
```

C++

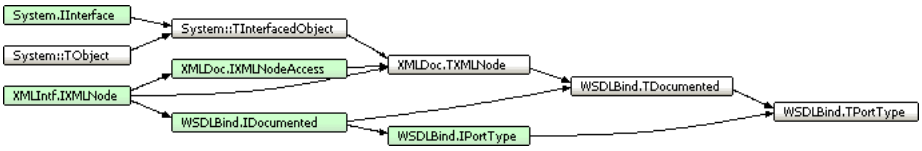
```
__fastcall IPort Insert(int Index);
```

Description

This is Insert, a member of class TPorts.

76.1.22 TPortType Class

Class Hierarchy



Pascal

```
TPortType = class(TDocumented, IPortType);
```

C++

```
class TPortType : public TDocumented, public IPortType;
```

File

WSDLBind

Description

This is class WSDLBind.TPortType.

76.1.22.1 TPortType Members

The following tables list the members exposed by TPortType.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.

	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetName (see page 6989)	This is GetName, a member of class TPortType.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOperations (see page 6989)	This is GetOperations, a member of class TPortType.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetName (see page 6989)	This is SetName, a member of class TPortType.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.

	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 6988)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.

	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.

	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
	Collection (see page 7636)	Indicates the collection in which this node appears.
	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7102)	This is Name, a member of class IPortType.
	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7639)	Indicates the node name.
	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
	Operations (see page 7102)	This is Operations, a member of class IPortType.
	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.22.2 TPortType Methods

The methods of the TPortType class are listed here.

Protected Methods

	Name	Description
	GetName (see page 6989)	This is GetName, a member of class TPortType.
	GetOperations (see page 6989)	This is GetOperations, a member of class TPortType.
	SetName (see page 6989)	This is SetName, a member of class TPortType.

Public Methods

	Name	Description
	AfterConstruction (see page 6988)	Responds after the last constructor executes.

76.1.22.2.1 TPortType.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3358)

System::TInterfacedObject::NewInstance (see page 3358)

System::TInterfacedObject::RefCount (see page 3360)

76.1.22.2.2 TPortType.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TPortType.

76.1.22.2.3 TPortType.GetOperations Method

Pascal

```
function GetOperations: IOperations;
```

C++

```
__fastcall IOperations GetOperations();
```

Description

This is GetOperations, a member of class TPortType.

76.1.22.2.4 TPortType.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

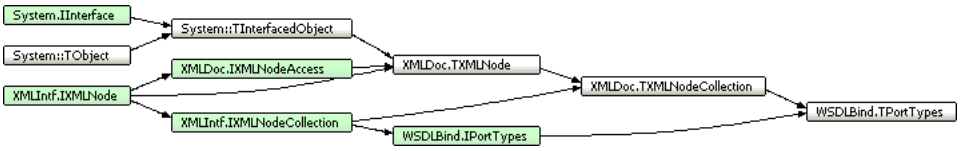
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TPortType.

76.1.23 TPortTypes Class

Class Hierarchy



Pascal

```
TPortTypes = class(TXMLNodeCollection, IPortTypes);
```

C++

```
class TPortTypes : public TXMLNodeCollection, public IPortTypes;
```

File

WSDLBind

Description

This is class WSDLBind.TPortTypes.

76.1.23.1 TPortTypes Members

The following tables list the members exposed by TPortTypes.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 6995)	This is Add, a member of class TPortTypes.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.

	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPortType (see page 6996)	This is GetPortType, a member of class TPortTypes.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.

	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 6996)	This is Insert, a member of class TPortTypes.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.

R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.

	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.

	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	PortType (see page 7106)	This is PortType, a member of class IPortTypes.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.23.2 TPortTypes Methods

The methods of the TPortTypes class are listed here.

Protected Methods

	Name	Description
	Add (see page 6995)	This is Add, a member of class TPortTypes.
	GetPortType (see page 6996)	This is GetPortType, a member of class TPortTypes.
	Insert (see page 6996)	This is Insert, a member of class TPortTypes.

76.1.23.2.1 TPortTypes.Add Method

Pascal

```
function Add(const Name: WideString): IPortType; overload;
```

C++

```
__fastcall IPortType Add(const BSTR Name);
```

Description

This is Add, a member of class TPortTypes.

76.1.23.2.2 TPortTypes.GetPortType Method

Pascal

```
function GetPortType(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType GetPortType(int Index);
```

Description

This is GetPortType, a member of class TPortTypes.

76.1.23.2.3 TPortTypes.Insert Method

Pascal

```
function Insert(Index: Integer): IPortType;
```

C++

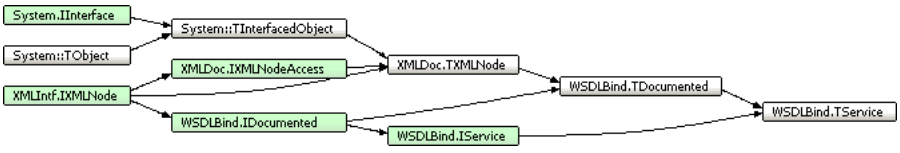
```
__fastcall IPortType Insert(int Index);
```

Description

This is Insert, a member of class TPortTypes.

76.1.24 TService Class

Class Hierarchy



Pascal

```
TService = class(TDocumented, IService);
```

C++

```
class TService : public TDocumented, public IService;
```

File

WSDLBind

Description

This is class WSDLBind.TService.

76.1.24.1 TService Members

The following tables list the members exposed by TService.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.

	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetName (see page 7002)	This is GetName, a member of class TService.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPorts (see page 7002)	This is GetPorts, a member of class TService.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetName (see page 7002)	This is SetName, a member of class TService.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.

	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7001)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.

	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.

	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
	Collection (see page 7636)	Indicates the collection in which this node appears.
	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7109)	This is Name, a member of class IService.
	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7639)	Indicates the node name.
	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	Ports (see page 7109)	This is Ports, a member of class IService.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.24.2 TService Methods

The methods of the TService class are listed here.

Protected Methods

	Name	Description
	GetName (see page 7002)	This is GetName, a member of class TService.
	GetPorts (see page 7002)	This is GetPorts, a member of class TService.
	SetName (see page 7002)	This is SetName, a member of class TService.

Public Methods

	Name	Description
	AfterConstruction (see page 7001)	Responds after the last constructor executes.

76.1.24.2.1 TService.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3358)

System::TInterfacedObject::NewInstance (see page 3358)

System::TInterfacedObject::RefCount (see page 3360)

76.1.24.2.2 TService.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TService.

76.1.24.2.3 TService.GetPorts Method

Pascal

```
function GetPorts: IPorts;
```

C++

```
__fastcall IPorts GetPorts();
```

Description

This is GetPorts, a member of class TService.

76.1.24.2.4 TService.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

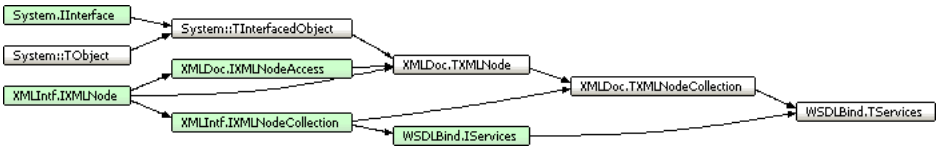
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TService.

76.1.25 TServices Class

Class Hierarchy



Pascal

```
TServices = class(TXMLNodeCollection, IServices);
```

C++

```
class TServices : public TXMLNodeCollection, public IServices;
```

File

WSDLBind

Description

This is class WSDLBind.TServices.

76.1.25.1 TServices Members

The following tables list the members exposed by TServices.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 7008)	This is Add, a member of class TServices.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.

	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetService (see page 7009)	This is GetService, a member of class TServices.

	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	Insert (see page 7009)	This is Insert, a member of class TServices.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.

R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.

	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.

	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
R	Service (see page 7112)	This is Service, a member of class IServices.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.25.2 TServices Methods

The methods of the TServices class are listed here.

Protected Methods

	Name	Description
	Add (see page 7008)	This is Add, a member of class TServices.
	GetService (see page 7009)	This is GetService, a member of class TServices.
	Insert (see page 7009)	This is Insert, a member of class TServices.

76.1.25.2.1 TServices.Add Method

Pascal

```
function Add(const Name: WideString): IService;
```

C++

```
__fastcall IService Add(const BSTR Name);
```

Description

This is Add, a member of class TServices.

76.1.25.2.2 TServices.GetService Method

Pascal

```
function GetService(Index: Integer): IService;
```

C++

```
__fastcall IService GetService(int Index);
```

Description

This is GetService, a member of class TServices.

76.1.25.2.3 TServices.Insert Method

Pascal

```
function Insert(Index: Integer): IService;
```

C++

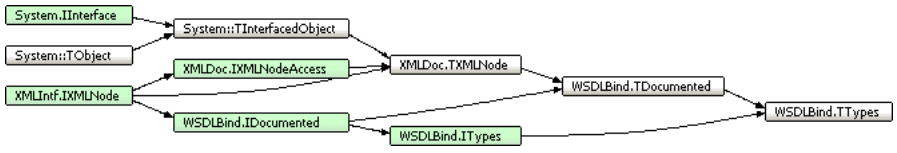
```
__fastcall IService Insert(int Index);
```

Description

This is Insert, a member of class TServices.

76.1.26 TTypes Class

Class Hierarchy



Pascal

```
TTypes = class(TDocumented, ITypes);
```

C++

```
class TTypes : public TDocumented, public ITypes;
```

File

WSDLBind

Description

This is class WSDLBind.TTypes.

76.1.26.1 TTypes Members

The following tables list the members exposed by TTypes.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDocumentationCollection (see page 6903)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.

	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetSchemaDefs (see page 7015)	This is GetSchemaDefs, a member of class TTypes.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.

R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7014)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.

	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
R	SchemaDefs (see page 7114)	This is SchemaDefs, a member of class ITypes.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.26.2 TTypes Methods

The methods of the TTypes class are listed here.

Protected Methods

	Name	Description
	GetSchemaDefs (see page 7015)	This is GetSchemaDefs, a member of class TTypes.

Public Methods

	Name	Description
V	AfterConstruction (see page 7014)	Responds after the last constructor executes.

76.1.26.2.1 TTypes.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call

it explicitly in your applications.

When an instance of System::TInterfacedObject::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3358)

System::TInterfacedObject::NewInstance (see page 3358)

System::TInterfacedObject::RefCount (see page 3360)

76.1.26.2.2 TTypes.GetSchemaDefs Method

Pascal

```
function GetSchemaDefs: IXMLSchemaDefs;
```

C++

```
__fastcall IXMLSchemaDefs GetSchemaDefs();
```

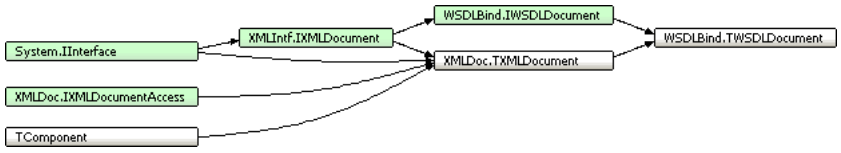
Description

This is GetSchemaDefs, a member of class TTypes.

76.1.27 TWSDLDocument Class

TWSDLDocument represents a WSDL document.

Class Hierarchy



Pascal

```
TWSDLDocument = class(TXMLDocument, IWSDLDocument);
```

C++

```
class TWSDLDocument : public TXMLDocument, public IWSDLDocument;
```

File

WSDLBind

Description

Use TWSDLDocument to represent a WSDL (Web Services Definition (see page 7022) Language) document. A WSDL document is a special form of XML document that describes the contents of a Web Service application and how you call the services it implements.

TWSDLDocument can read an existing WSDL document from a file, it can be associated with an in-memory string that is the contents of a WSDL document, or it can create a new, empty WSDL document. TWSDLDocument uses an external DOM

(Document Object Model) parser to analyze the WSDL document. This parser is usually assigned by specifying the DOMVendor property. When you set the Active property to true, TWSDLDocument uses the DOM parser to parse the WSDL document so that you can examine or modify it.

When TWSDLDocument is created without an Owner, it behaves like an interfaced object. That is, when all references to its interface are released, the TWSDLDocument instance is automatically freed. When TWSDLDocument is created with an Owner, however, it behaves like any other component, and is freed by its Owner.

Tip: Although you can work directly with TWSDLDocument to access a WSDL document, it is often easier to use TWSDLItems, a TWSDLDocument descendant. TWSDLItems implements a number of methods for getting at the definitions in a WSDL document.

See Also

TWSDLItems (see page 7163)

TWSDLView (see page 7223)

76.1.27.1 TWSDLDocument Members

The following tables list the members exposed by TWSDLDocument.

Protected Methods

	Name	Description
	_AddRef (see page 7306)	Called when an application uses a component interface.
	_Release (see page 7306)	Called when an application releases a component interface.
	AssignParseOptions (see page 7308)	This is AssignParseOptions, a member of class TXMLDocument.
	CheckActive (see page 7308)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 7308)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 7309)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 7311)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 7311)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 7311)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 7312)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 7312)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 7312)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 7313)	Returns the value of the Active property.
	GetAsyncLoadState (see page 7313)	Returns the value of the AsyncLoadState property.
V	GetChildNodeClass (see page 7313)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 7313)	Returns the value of the ChildNodes property.
	GetDefinition (see page 7021)	Returns the value of the Definition property.
	GetDocumentElement (see page 7314)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 7315)	Returns the value of the Node property.
	GetDocumentObject (see page 7315)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 7315)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 7315)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 7316)	Returns the value of the Encoding property.
	GetFileName (see page 7316)	Returns the value of the FileName property.
	GetModified (see page 7316)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 7317)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 7317)	Returns the value of the Options property.
	GetParseOptions (see page 7317)	Returns the value of the ParseOptions property.
	GetPrologNode (see page 7317)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 7318)	This is GetPrologValue, a member of class TXMLDocument.

	GetSchemaRef (see page 7318)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 7318)	Returns the value of the StandAlone property.
	GetVersion (see page 7318)	Returns the value of the Version property.
	GetXML (see page 7319)	Returns the value of the XML property.
	InternalSetPrologValue (see page 7319)	This is InternalSetPrologValue, a member of class TXMLDocument.
V	LoadData (see page 7021)	This is LoadData, a member of class TWSDLDocument.
V	Loaded (see page 7320)	Initializes the component after the form file has been read into memory.
	ReadDOMVendor (see page 7323)	This is ReadDOMVendor, a member of class TXMLDocument.
	ReleaseDoc (see page 7324)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 7326)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 7327)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 7327)	Sets the value of the Active property.
	SetDefinition (see page 7021)	Sets the value of the Definition property.
	SetDocumentElement (see page 7327)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 7328)	Sets the value of the DOMDocument property.
	SetEncoding (see page 7328)	Sets the value of the Encoding property.
	SetFileName (see page 7328)	Sets the value of the FileName property.
	SetModified (see page 7329)	This is SetModified, a member of class TXMLDocument.
	SetNodeIndentStr (see page 7329)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 7329)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 7330)	Sets the value of the Options property.
	SetParseOptions (see page 7330)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 7330)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 7330)	Sets the value of the StandAlone property.
	SetVersion (see page 7331)	Sets the value of the Version property.
	SetXML (see page 7331)	Sets the value of the XML property.
	SetXMLStrings (see page 7331)	This is SetXMLStrings, a member of class TXMLDocument.
	WriteDOMVendor (see page 7332)	This is WriteDOMVendor, a member of class TXMLDocument.
	XMLStringsChanging (see page 7332)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 7335)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 7335)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 7337)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 7337)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 7342)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7307)	This is the overview for the AddChild method overload.
	AddChild (see page 7589)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7020)	Initializes the TWSDLDocument (see page 7015) object after the last constructor has executed.
	Create (see page 7303)	This is the overview for the Create constructor overload.
	CreateElement (see page 7309)	Creates a new element node that is associated with this document.
	CreateElement (see page 7590)	Creates a new element node that is associated with this document.
	CreateNode (see page 7309)	Creates a new node that is associated with this document.
	CreateNode (see page 7591)	Creates a new node that is associated with this document.
V	Destroy (see page 7304)	Disposes of a TXMLDocument (see page 7299) object.
	GeneratePrefix (see page 7312)	Generates a unique namespace prefix that can be used for a node in the document.

	GeneratePrefix (see page 7592)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 7592)	Returns the value of the Active (see page 7607) property.
	GetAsyncLoadState (see page 7593)	Returns the value of the AsyncLoadState (see page 7608) property.
	GetChildNodes (see page 7593)	Returns the value of the ChildNodes (see page 7609) property.
	GetDocBinding (see page 7314)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 7593)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 7594)	Returns the value of the DocumentElement (see page 7609) property.
	GetDocumentNode (see page 7594)	Returns the value of the Node (see page 7611) property.
	GetDocumentObject (see page 7430)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 7594)	Returns the value of the DOMDocument (see page 7609) property.
	GetDOMPersist (see page 7430)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 7595)	Returns the value of the Encoding (see page 7610) property.
	GetFileName (see page 7595)	Returns the value of the FileName (see page 7610) property.
	GetModified (see page 7595)	Returns the value of the Modified (see page 7611) property.
	GetNodeIndentStr (see page 7596)	Returns the value of the NodeIndentStr (see page 7612) property.
	GetOptions (see page 7596)	Returns the value of the Options (see page 7612) property.
	GetParseOptions (see page 7596)	Returns the value of the ParseOptions (see page 7613) property.
	GetSchemaRef (see page 7596)	Returns the value of the SchemaRef (see page 7613) property.
	GetStandAlone (see page 7597)	Returns the value of the StandAlone (see page 7614) property.
	GetVersion (see page 7597)	Returns the value of the Version (see page 7614) property.
	GetXML (see page 7597)	Returns the value of the XML (see page 7614) property.
	IsEmptyDoc (see page 7319)	Indicates whether the TXMLDocument (see page 7299) instance represents an empty document.
	IsEmptyDoc (see page 7598)	Indicates whether the IXMLDocument (see page 7586) instance represents an empty document.
	LoadFromFile (see page 7321)	Loads an XML (see page 7344) document and activates it.
	LoadFromFile (see page 7598)	Loads an XML (see page 7614) document from disk.
	LoadFromStream (see page 7321)	Loads an XML (see page 7344) document from a stream and activates it.
	LoadFromStream (see page 7599)	Loads an XML (see page 7614) document from a stream and activates it.
	LoadFromXML (see page 7322)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 7599)	This is the overview for the LoadFromXML method overload.
	NewInstance (see page 7322)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7323)	Updates the parsed XML (see page 7344) document to reflect external changes.
	Refresh (see page 7600)	Updates the parsed XML (see page 7614) document to reflect external changes.
	RegisterDocBinding (see page 7324)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 7600)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7325)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 7601)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7325)	Saves the XML (see page 7344) document to disk.
	SaveToFile (see page 7601)	Saves the XML (see page 7614) document to disk.
	SaveToStream (see page 7325)	Saves the XML (see page 7344) document to a stream.
	SaveToStream (see page 7602)	Saves the XML (see page 7614) document to a stream.
	SaveToXML (see page 7326)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 7602)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7603)	Sets the value of the Active (see page 7607) property.
	SetDocumentElement (see page 7603)	Sets the value of the DocumentElement (see page 7609) property.
	SetDOMDocument (see page 7604)	Sets the value of the DOMDocument (see page 7609) property.
	SetEncoding (see page 7604)	Sets the value of the Encoding (see page 7610) property.

	SetFileName (see page 7604)	Sets the value of the FileName (see page 7610) property.
	SetNodeIndentStr (see page 7605)	Sets the value of the NodeIndentStr (see page 7612) property.
	SetOnAsyncLoad (see page 7605)	Supplies an event handler that responds when the AsyncLoadState (see page 7608) property changes.
	SetOptions (see page 7605)	Sets the value of the Options (see page 7612) property.
	SetParseOptions (see page 7606)	Sets the value of the ParseOptions (see page 7613) property.
	SetStandAlone (see page 7606)	Sets the value of the StandAlone (see page 7614) property.
	SetVersion (see page 7606)	Sets the value of the Version (see page 7614) property.
	SetXML (see page 7607)	Sets the value of the XML (see page 7614) property.

Public Properties

	Name	Description
	Active (see page 7607)	Specifies whether the XML (see page 7614) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 7334)	Indicates the state of the DOM parser when it parses the XML (see page 7344) document asynchronously.
R	AsyncLoadState (see page 7608)	Indicates the state of the DOM parser when it parses the XML (see page 7614) document asynchronously.
R	ChildNodes (see page 7335)	Lists all of the child nodes of the document.
R	ChildNodes (see page 7609)	Lists all of the child nodes of the document.
	Definition (see page 7022)	Provides access to the definitions contained in the WSDL document.
	DocumentElement (see page 7335)	Provides access to the root node of the XML (see page 7344) document.
	DocumentElement (see page 7609)	Provides access to the root node of the XML (see page 7614) document.
R	DocumentObject (see page 7430)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 7336)	Provides access to the DOM interface for the parsed XML (see page 7344) document.
	DOMDocument (see page 7609)	Provides access to the DOM interface for the parsed XML (see page 7614) document.
	DOMImplementation (see page 7337)	This is DOMImplementation, a member of class TXMLDocument.
R	DOMPersist (see page 7431)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 7338)	Indicates the character set that the XML (see page 7344) document uses to encode characters.
	Encoding (see page 7610)	Indicates the character set that the XML (see page 7614) document uses to encode characters.
	FileName (see page 7610)	Indicates the XML (see page 7614) document file, if any, that this interface represents.
R	Modified (see page 7339)	Indicates whether the XML (see page 7344) document has been modified.
R	Modified (see page 7611)	Indicates whether the XML (see page 7614) document has been modified.
R	Node (see page 7340)	Provides access to the document node for the XML (see page 7344) document.
R	Node (see page 7611)	Provides access to the document node for the XML (see page 7614) document.
	NodeIndentStr (see page 7612)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7614) text.
	NSPrefixBase (see page 7341)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 7612)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7613)	Specifies implementation-specific options that are followed when parsing the XML (see page 7614) document.
R	SchemaRef (see page 7343)	Returns the name of the schema associated with this XML (see page 7344) document.
R	SchemaRef (see page 7613)	Returns the name of the schema associated with this XML (see page 7614) document.
	StandAlone (see page 7343)	Indicates whether the XML (see page 7344) document includes any external markup declarations.
	StandAlone (see page 7614)	Indicates whether the XML (see page 7614) document includes any external markup declarations.
	Version (see page 7343)	Indicates the XML (see page 7344) version that the document uses.
	Version (see page 7614)	Indicates the XML (see page 7614) version that the document uses.
	XML (see page 7614)	Specifies the content of the XML document associated with this IXMLDocument (see page 7586) interface.

Published Events

	Name	Description
	AfterClose (see page 7344)	Occurs after the XML (see page 7344) document is closed.
	AfterNodeChange (see page 7345)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 7345)	Occurs immediately after the XML (see page 7344) document is opened.
	BeforeClose (see page 7346)	Occurs immediately before the XML (see page 7344) document is closed.
	BeforeNodeChange (see page 7346)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 7347)	Occurs immediately before the XML (see page 7344) document is opened.
	OnAsyncLoad (see page 7347)	Occurs at various stages during the asynchronous parsing of an XML (see page 7344) document.

Published Properties

	Name	Description
	Active (see page 7333)	Specifies whether the XML (see page 7344) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 7337)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 7344) document.
	FileName (see page 7339)	Specifies the file name for the XML (see page 7344) document associated with this TXMLDocument (see page 7299) object.
	NodeIndentStr (see page 7340)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7344) text.
	Options (see page 7341)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7342)	Specifies implementation-specific options that are followed when parsing the XML (see page 7344) document.
	XML (see page 7344)	Specifies the content of the XML document associated with this TXMLDocument (see page 7299) object.

76.1.27.2 TWSDLDocument Methods

The methods of the TWSDLDocument class are listed here.

Protected Methods

	Name	Description
	GetDefinition (see page 7021)	Returns the value of the Definition property.
	LoadData (see page 7021)	This is LoadData, a member of class TWSDLDocument.
	SetDefinition (see page 7021)	Sets the value of the Definition property.

Public Methods

	Name	Description
	AfterConstruction (see page 7020)	Initializes the TWSDLDocument (see page 7015) object after the last constructor has executed.

76.1.27.2.1 TWSDLDocument.AfterConstruction Method

Initializes the TWSDLDocument (see page 7015) object after the last constructor has executed.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

The AfterConstruction method is called automatically after the last constructor has finished executing. TWSDLDocument (see page 7015) overrides this method to register an implementation class for the document element. That class implements the

IDefinition (see page 7045) interface that is the value of the Definition (see page 7022) property.

See Also

RegisterDocBinding (see page 7324)

Definition (see page 7022)

76.1.27.2.2 TWSDLDocument.GetDefinition Method

Returns the value of the Definition property.

Pascal

```
function GetDefinition: IDefinition;
```

C++

```
__fastcall IDefinition GetDefinition();
```

Description

GetDefinition is the read access method for the Definition property.

See Also

Definition (see page 7118)

76.1.27.2.3 TWSDLDocument.LoadData Method

Pascal

```
procedure LoadData; override;
```

C++

```
virtual __fastcall LoadData();
```

Description

This is LoadData, a member of class TWSDLDocument.

76.1.27.2.4 TWSDLDocument.SetDefinition Method

Sets the value of the Definition property.

Pascal

```
procedure SetDefinition(const Value: IDefinition);
```

C++

```
__fastcall SetDefinition(const IDefinition Value);
```

Description

SetDefinition is the write method for the Definition property.

See Also

Definition (see page 7118)

76.1.27.3 TWSDLDocument Properties

The properties of the TWSDLDocument class are listed here.

Public Properties

	Name	Description
	Definition (see page 7022)	Provides access to the definitions contained in the WSDL document.

76.1.27.3.1 TWSDLDocument.Definition Property

Provides access to the definitions contained in the WSDL document.

Pascal

```
property Definition: IDefinition;
```

C++

```
__property IDefinition Definition;
```

Description

Definition is the IDefinition (see page 7045) interface of the root node in the WSDL document. This interface is implemented by the node specified by DocumentElement.

You can use the IDefinition (see page 7045) interface to access the Bindings, Messages, PortTypes, Services, and Types (see page 4683) defined in the WSDL document by reading properties of the same names. Alternately, you can use the methods of TWSDLItems (a TWSDLDocument (see page 7015) descendant) to access those definitions.

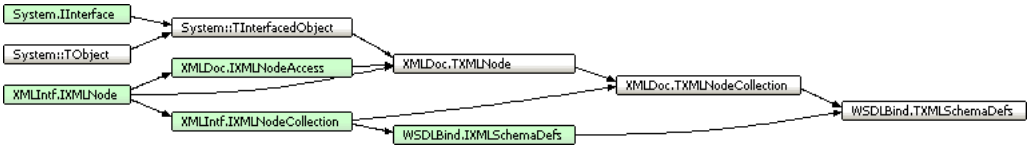
DocumentElement (see page 7335)

TWSDLItems (see page 7163)

76.1.28 TXMLSchemaDefs Class

Class Hierarchy



Pascal

```
TXMLSchemaDefs = class(TXMLNodeCollection, IXMLSchemaDefs);
```

C++

```
class TXMLSchemaDefs : public TXMLNodeCollection, public IXMLSchemaDefs;
```

File

WSDLBind

Description

This is class WSDLBind.TXMLSchemaDefs.

76.1.28.1 TXMLSchemaDefs Members

The following tables list the members exposed by TXMLSchemaDefs.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	Add (see page 7028)	This is Add, a member of class TXMLSchemaDefs.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.

	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	GetXMLSchemaDef (see page 7028)	This is GetXMLSchemaDef, a member of class TXMLSchemaDefs.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.

	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.

	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.

	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.

	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	SchemaDef (see page 7121)	This is SchemaDef, a member of class IXMLSchemaDefs.
	Text (see page 7643)	Represents the Text of the node.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.1.28.2 TXMLSchemaDefs Methods

The methods of the TXMLSchemaDefs class are listed here.

Protected Methods

	Name	Description
	Add (see page 7028)	This is Add, a member of class TXMLSchemaDefs.
	GetXMLSchemaDef (see page 7028)	This is GetXMLSchemaDef, a member of class TXMLSchemaDefs.

76.1.28.2.1 TXMLSchemaDefs.Add Method

Pascal

```
function Add(const NamespaceURI: WideString = ''; const TargetNamespace: WideString = ''):
IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef Add(const BSTR NamespaceURI = '', const BSTR TargetNamespace = '');
```

Description

This is Add, a member of class TXMLSchemaDefs.

76.1.28.2.2 TXMLSchemaDefs.GetXMLSchemaDef Method

Pascal

```
function GetXMLSchemaDef(Index: Integer): IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef GetXMLSchemaDef(int Index);
```

Description

This is GetXMLSchemaDef, a member of class TXMLSchemaDefs.

76.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IBinding (see page 7029)	This is class WSDLBind.IBinding.
	IBindingInput (see page 7033)	This is class WSDLBind.IBindingInput.
	IBindingOperation (see page 7034)	This is class WSDLBind.IBindingOperation.
	IBindingOperations (see page 7038)	This is class WSDLBind.IBindingOperations.
	IBindingOutput (see page 7041)	This is class WSDLBind.IBindingOutput.
	IBindings (see page 7042)	This is class WSDLBind.IBindings.
	IDefinition (see page 7045)	This is class WSDLBind.IDefinition.
	IDocumentation (see page 7051)	This is class WSDLBind.IDocumentation.
	IDocumentationCollection (see page 7052)	This is class WSDLBind.IDocumentationCollection.
	IDocumented (see page 7055)	This is class WSDLBind.IDocumented.
	IFault (see page 7057)	This is class WSDLBind.IFault.
	IFaults (see page 7058)	This is class WSDLBind.IFaults.
	IImport (see page 7061)	This is class WSDLBind.IImport.
	IImports (see page 7064)	This is class WSDLBind.IImports.
	IMessage (see page 7067)	This is class WSDLBind.IMessage.
	IMessages (see page 7071)	This is class WSDLBind.IMessages.
	IOperation (see page 7074)	This is class WSDLBind.IOperation.
	IOperations (see page 7078)	This is class WSDLBind.IOperations.
	IParam (see page 7082)	This is class WSDLBind.IParam.
	IPart (see page 7085)	This is class WSDLBind.IPart.
	IParts (see page 7090)	This is class WSDLBind.IParts.
	IPort (see page 7093)	This is class WSDLBind.IPort.
	IPorts (see page 7096)	This is class WSDLBind.IPorts.
	IPortType (see page 7099)	This is class WSDLBind.IPortType.
	IPortTypes (see page 7103)	This is class WSDLBind.IPortTypes.
	IService (see page 7106)	This is class WSDLBind.IService.
	IServices (see page 7109)	This is class WSDLBind.IServices.
	ITypes (see page 7112)	This is class WSDLBind.ITypes.
	IWSDLDocument (see page 7115)	IWSDLDocument provides low-level access to the definitions in a WSDL document.
	IXMLSchemaDefs (see page 7119)	This is class WSDLBind.IXMLSchemaDefs.

76.2.1 IBinding Interface

Class Hierarchy

Pascal

```
IBinding = interface(IDocumented);
```

C++

```
__interface IBinding : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IBinding.

76.2.1.1 IBinding Members

The following tables list the members exposed by IBinding.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetBindingOperations (see page 7031)	This is GetBindingOperations, a member of class IBinding.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetName (see page 7032)	This is GetName, a member of class IBinding.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetType_ (see page 7032)	This is GetType_, a member of class IBinding.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetName (see page 7032)	This is SetName, a member of class IBinding.

	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	SetType_ (see page 7032)	This is SetType_, a member of class IBinding.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	BindingOperations (see page 7033)	This is BindingOperations, a member of class IBinding.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7033)	This is Name, a member of class IBinding.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
	Type_ (see page 7033)	This is Type_, a member of class IBinding.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.1.2 IBinding Methods

The methods of the IBinding class are listed here.

Public Methods

	Name	Description
	GetBindingOperations (see page 7031)	This is GetBindingOperations, a member of class IBinding.
	GetName (see page 7032)	This is GetName, a member of class IBinding.
	GetType_ (see page 7032)	This is GetType_, a member of class IBinding.
	SetName (see page 7032)	This is SetName, a member of class IBinding.
	SetType_ (see page 7032)	This is SetType_, a member of class IBinding.

76.2.1.2.1 IBinding.GetBindingOperations Method

Pascal

```
function GetBindingOperations: IBindingOperations;
```

C++

```
__fastcall IBindingOperations GetBindingOperations();
```

Description

This is GetBindingOperations, a member of class IBinding.

76.2.1.2.2 IBinding.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IBinding.

76.2.1.2.3 IBinding.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class IBinding.

76.2.1.2.4 IBinding.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IBinding.

76.2.1.2.5 IBinding.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class IBinding.

76.2.1.3 IBinding Properties

The properties of the IBinding class are listed here.

Public Properties

	Name	Description
	BindingOperations (see page 7033)	This is BindingOperations, a member of class IBinding.
	Name (see page 7033)	This is Name, a member of class IBinding.
	Type_ (see page 7033)	This is Type_, a member of class IBinding.

76.2.1.3.1 IBinding.BindingOperations Property

Pascal

```
property BindingOperations: IBindingOperations;
```

C++

```
__property IBindingOperations BindingOperations;
```

Description

This is BindingOperations, a member of class IBinding.

76.2.1.3.2 IBinding.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IBinding.

76.2.1.3.3 IBinding.Type_ Property

Pascal

```
property Type_: WideString;
```

C++

```
__property BSTR Type_;
```

Description

This is Type_, a member of class IBinding.

76.2.2 IBindingInput Interface

Class Hierarchy

Pascal

```
IBindingInput = interface(IParam);
```

C++

```
__interface IBindingInput : public IParam;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingInput.

76.2.3 IBindingOperation Interface

Class Hierarchy

Pascal

```
IBindingOperation = interface(IDocumented);
```

C++

```
__interface IBindingOperation : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingOperation.

76.2.3.1 IBindingOperation Members

The following tables list the members exposed by IBindingOperation.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetFaults (see page 7036)	This is GetFaults, a member of class IBindingOperation.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetInput (see page 7036)	This is GetInput, a member of class IBindingOperation.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetName (see page 7036)	This is GetName, a member of class IBindingOperation.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.

	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOutput (see page 7036)	This is GetOutput, a member of class IBindingOperation.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetName (see page 7037)	This is SetName, a member of class IBindingOperation.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	Faults (see page 7037)	This is Faults, a member of class IBindingOperation.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	Input (see page 7037)	This is Input, a member of class IBindingOperation.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7038)	This is Name, a member of class IBindingOperation.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	Output (see page 7038)	This is Output, a member of class IBindingOperation.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.3.2 IBindingOperation Methods

The methods of the IBindingOperation class are listed here.

Public Methods

	Name	Description
	GetFaults (see page 7036)	This is GetFaults, a member of class IBindingOperation.
	GetInput (see page 7036)	This is GetInput, a member of class IBindingOperation.
	GetName (see page 7036)	This is GetName, a member of class IBindingOperation.
	GetOutput (see page 7036)	This is GetOutput, a member of class IBindingOperation.
	SetName (see page 7037)	This is SetName, a member of class IBindingOperation.

76.2.3.2.1 IBindingOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class IBindingOperation.

76.2.3.2.2 IBindingOperation.GetInput Method

Pascal

```
function GetInput: IBindingInput;
```

C++

```
__fastcall IBindingInput GetInput();
```

Description

This is GetInput, a member of class IBindingOperation.

76.2.3.2.3 IBindingOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IBindingOperation.

76.2.3.2.4 IBindingOperation.GetOutput Method

Pascal

```
function GetOutput: IBindingOutput;
```

C++

```
__fastcall IBindingOutput GetOutput();
```

Description

This is GetOutput, a member of class IBindingOperation.

76.2.3.2.5 IBindingOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IBindingOperation.

76.2.3.3 IBindingOperation Properties

The properties of the IBindingOperation class are listed here.

Public Properties

	Name	Description
	Faults (see page 7037)	This is Faults, a member of class IBindingOperation.
	Input (see page 7037)	This is Input, a member of class IBindingOperation.
	Name (see page 7038)	This is Name, a member of class IBindingOperation.
	Output (see page 7038)	This is Output, a member of class IBindingOperation.

76.2.3.3.1 IBindingOperation.Faults Property

Pascal

```
property Faults: IFaults;
```

C++

```
__property IFaults Faults;
```

Description

This is Faults, a member of class IBindingOperation.

76.2.3.3.2 IBindingOperation.Input Property

Pascal

```
property Input: IBindingInput;
```

C++

```
__property IBindingInput Input;
```

Description

This is Input, a member of class IBindingOperation.

76.2.3.3.3 IBindingOperation.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IBindingOperation.

76.2.3.3.4 IBindingOperation.Output Property

Pascal

```
property Output: IBindingOutput;
```

C++

```
__property IBindingOutput Output;
```

Description

This is Output, a member of class IBindingOperation.

76.2.4 IBindingOperations Interface

Class Hierarchy

Pascal

```
IBindingOperations = interface(IXMLNodeCollection);
```

C++

```
__interface IBindingOperations : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingOperations.

76.2.4.1 IBindingOperations Members

The following tables list the members exposed by IBindingOperations.

Public Methods

	Name	Description
	Add (see page 7040)	This is Add, a member of class IBindingOperations.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.

	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetBindingOperation (see page 7040)	This is GetBindingOperation, a member of class IBindingOperations.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7041)	This is Insert, a member of class IBindingOperations.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	BindingOperation (see page 7041)	This is BindingOperation, a member of class IBindingOperations.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.

R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.4.2 IBindingOperations Methods

The methods of the IBindingOperations class are listed here.

Public Methods

	Name	Description
	Add (see page 7040)	This is Add, a member of class IBindingOperations.
	GetBindingOperation (see page 7040)	This is GetBindingOperation, a member of class IBindingOperations.
	Insert (see page 7041)	This is Insert, a member of class IBindingOperations.

76.2.4.2.1 IBindingOperations.Add Method

Pascal

```
function Add(const Name: WideString): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Add(const BSTR Name);
```

Description

This is Add, a member of class IBindingOperations.

76.2.4.2.2 IBindingOperations.GetBindingOperation Method

Pascal

```
function GetBindingOperation(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation GetBindingOperation(int Index);
```

Description

This is GetBindingOperation, a member of class IBindingOperations.

76.2.4.2.3 IBindingOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Insert(int Index);
```

Description

This is Insert, a member of class IBindingOperations.

76.2.4.3 IBindingOperations Properties

The properties of the IBindingOperations class are listed here.

Public Properties

	Name	Description
	BindingOperation (see page 7041)	This is BindingOperation, a member of class IBindingOperations.

76.2.4.3.1 IBindingOperations.BindingOperation Property

Pascal

```
property BindingOperation [Index: Integer]: IBindingOperation;
```

C++

```
__property IBindingOperation BindingOperation[int Index];
```

Description

This is BindingOperation, a member of class IBindingOperations.

76.2.5 IBindingOutput Interface

Class Hierarchy

Pascal

```
IBindingOutput = interface(IParam);
```

C++

```
__interface IBindingOutput : public IParam;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingOutput.

76.2.6 IBindings Interface

Class Hierarchy

Pascal

```
IBindings = interface(IXMLNodeCollection);
```

C++

```
__interface IBindings : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IBindings.

76.2.6.1 IBindings Members

The following tables list the members exposed by IBindings.

Public Methods

	Name	Description
	Add (see page 7044)	This is Add, a member of class IBindings.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetBinding (see page 7044)	This is GetBinding, a member of class IBindings.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.

	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7044)	This is Insert, a member of class IBindings.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	Binding (see page 7045)	This is Binding, a member of class IBindings.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.6.2 IBindings Methods

The methods of the IBindings class are listed here.

Public Methods

	Name	Description
	Add (see page 7044)	This is Add, a member of class IBindings.
	GetBinding (see page 7044)	This is GetBinding, a member of class IBindings.
	Insert (see page 7044)	This is Insert, a member of class IBindings.

76.2.6.2.1 IBindings.Add Method

Pascal

```
function Add(const Name: WideString; const AType: WideString): IBinding;
```

C++

```
__fastcall IBinding Add(const BSTR Name, const BSTR AType);
```

Description

This is Add, a member of class IBindings.

76.2.6.2.2 IBindings.GetBinding Method

Pascal

```
function GetBinding(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding GetBinding(int Index);
```

Description

This is GetBinding, a member of class IBindings.

76.2.6.2.3 IBindings.Insert Method

Pascal

```
function Insert(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding Insert(int Index);
```

Description

This is Insert, a member of class IBindings.

76.2.6.3 IBindings Properties

The properties of the IBindings class are listed here.

Public Properties

	Name	Description
R	Binding (see page 7045)	This is Binding, a member of class IBindings.

76.2.6.3.1 IBindings.Binding Property

Pascal

```
property Binding [Index: Integer]: IBinding;
```

C++

```
__property IBinding Binding[int Index];
```

Description

This is Binding, a member of class IBindings.

76.2.7 IDefinition Interface

Class Hierarchy

Pascal

```
IDefinition = interface(IXMLNode);
```

C++

```
__interface IDefinition : public IXMLNode;
```

File

WSDLBind

Description

This is class WSDLBind.IDefinition.

76.2.7.1 IDefinition Members

The following tables list the members exposed by IDefinition.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetBindings (see page 7047)	This is GetBindings, a member of class IDefinition.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetImports (see page 7047)	This is GetImports, a member of class IDefinition.

	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetMessages (see page 7048)	This is GetMessages, a member of class IDefinition.
	GetName (see page 7048)	This is GetName, a member of class IDefinition.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPortTypes (see page 7048)	This is GetPortTypes, a member of class IDefinition.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetServices (see page 7048)	This is GetServices, a member of class IDefinition.
	GetTargetNamespace (see page 7048)	This is GetTargetNamespace, a member of class IDefinition.
	GetText (see page 7627)	Returns the text value of the node.
	GetTypes (see page 7049)	This is GetTypes, a member of class IDefinition.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetName (see page 7049)	This is SetName, a member of class IDefinition.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetTargetNamespace (see page 7049)	This is SetTargetNamespace, a member of class IDefinition.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	Bindings (see page 7050)	This is Bindings, a member of class IDefinition.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	Imports (see page 7050)	This is Imports, a member of class IDefinition.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	Messages (see page 7050)	This is Messages, a member of class IDefinition.
	Name (see page 7050)	This is Name, a member of class IDefinition.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.

	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	PortTypes (see page 7050)	This is PortTypes, a member of class IDefinition.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Services (see page 7051)	This is Services, a member of class IDefinition.
	TargetNamespace (see page 7051)	This is TargetNamespace, a member of class IDefinition.
	Text (see page 7643)	Represents the Text of the node.
	Types (see page 7051)	This is Types, a member of class IDefinition.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.7.2 IDefinition Methods

The methods of the IDefinition class are listed here.

Public Methods

	Name	Description
	GetBindings (see page 7047)	This is GetBindings, a member of class IDefinition.
	GetImports (see page 7047)	This is GetImports, a member of class IDefinition.
	GetMessages (see page 7048)	This is GetMessages, a member of class IDefinition.
	GetName (see page 7048)	This is GetName, a member of class IDefinition.
	GetPortTypes (see page 7048)	This is GetPortTypes, a member of class IDefinition.
	GetServices (see page 7048)	This is GetServices, a member of class IDefinition.
	GetTargetNamespace (see page 7048)	This is GetTargetNamespace, a member of class IDefinition.
	GetTypes (see page 7049)	This is GetTypes, a member of class IDefinition.
	SetName (see page 7049)	This is SetName, a member of class IDefinition.
	SetTargetNamespace (see page 7049)	This is SetTargetNamespace, a member of class IDefinition.

76.2.7.2.1 IDefinition.GetBindings Method

Pascal

```
function GetBindings: IBindings;
```

C++

```
__fastcall IBindings GetBindings();
```

Description

This is GetBindings, a member of class IDefinition.

76.2.7.2.2 IDefinition.GetImports Method

Pascal

```
function GetImports: IImports;
```

C++

```
__fastcall IImports GetImports();
```

Description

This is GetImports, a member of class IDefinition.

76.2.7.2.3 IDefinition.GetMessages Method

Pascal

```
function GetMessages: IMessages;
```

C++

```
__fastcall IMessages GetMessages();
```

Description

This is GetMessages, a member of class IDefinition.

76.2.7.2.4 IDefinition.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IDefinition.

76.2.7.2.5 IDefinition.GetPortTypes Method

Pascal

```
function GetPortTypes: IPortTypes;
```

C++

```
__fastcall IPortTypes GetPortTypes();
```

Description

This is GetPortTypes, a member of class IDefinition.

76.2.7.2.6 IDefinition.GetServices Method

Pascal

```
function GetServices: IServices;
```

C++

```
__fastcall IServices GetServices();
```

Description

This is GetServices, a member of class IDefinition.

76.2.7.2.7 IDefinition.GetTargetNamespace Method

Pascal

```
function GetTargetNamespace: WideString;
```

C++

```
__fastcall BSTR GetTargetNamespace();
```

Description

This is GetTargetNamespace, a member of class IDefinition.

76.2.7.2.8 IDefinition.GetTypes Method

Pascal

```
function GetTypes: ITypes;
```

C++

```
__fastcall ITypes GetTypes();
```

Description

This is GetTypes, a member of class IDefinition.

76.2.7.2.9 IDefinition.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IDefinition.

76.2.7.2.10 IDefinition.SetTargetNamespace Method

Pascal

```
procedure SetTargetNamespace(Value: WideString);
```

C++

```
__fastcall SetTargetNamespace(BSTR Value);
```

Description

This is SetTargetNamespace, a member of class IDefinition.

76.2.7.3 IDefinition Properties

The properties of the IDefinition class are listed here.

Public Properties

	Name	Description
R	Bindings (see page 7050)	This is Bindings, a member of class IDefinition.
R	Imports (see page 7050)	This is Imports, a member of class IDefinition.
R	Messages (see page 7050)	This is Messages, a member of class IDefinition.
	Name (see page 7050)	This is Name, a member of class IDefinition.
R	PortTypes (see page 7050)	This is PortTypes, a member of class IDefinition.
R	Services (see page 7051)	This is Services, a member of class IDefinition.
	TargetNamespace (see page 7051)	This is TargetNamespace, a member of class IDefinition.
R	Types (see page 7051)	This is Types, a member of class IDefinition.

76.2.7.3.1 IDefinition.Bindings Property

Pascal

```
property Bindings: IBindings;
```

C++

```
__property IBindings Bindings;
```

Description

This is Bindings, a member of class IDefinition.

76.2.7.3.2 IDefinition.Imports Property

Pascal

```
property Imports: IImports;
```

C++

```
__property IImports Imports;
```

Description

This is Imports, a member of class IDefinition.

76.2.7.3.3 IDefinition.Messages Property

Pascal

```
property Messages: IMessages;
```

C++

```
__property IMessages Messages;
```

Description

This is Messages, a member of class IDefinition.

76.2.7.3.4 IDefinition.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IDefinition.

76.2.7.3.5 IDefinition.PortTypes Property

Pascal

```
property PortTypes: IPortTypes;
```

C++

```
__property IPortTypes PortTypes;
```

Description

This is PortTypes, a member of class IDefinition.

76.2.7.3.6 IDefinition.Services Property

Pascal

```
property Services: IServices;
```

C++

```
__property IServices Services;
```

Description

This is Services, a member of class IDefinition.

76.2.7.3.7 IDefinition.TargetNamespace Property

Pascal

```
property TargetNamespace: WideString;
```

C++

```
__property BSTR TargetNamespace;
```

Description

This is TargetNamespace, a member of class IDefinition.

76.2.7.3.8 IDefinition.Types Property

Pascal

```
property Types: ITypes;
```

C++

```
__property ITypes Types;
```

Description

This is Types, a member of class IDefinition.

76.2.8 IDocumentation Interface

Class Hierarchy

Pascal

```
IDocumentation = interface(IXMLNode);
```

C++

```
__interface IDocumentation : public IXMLNode;
```

File

WSDLBind

Description

This is class WSDLBind.IDocumentation.

76.2.9 IDocumentationCollection Interface

Class Hierarchy

Pascal

```
IDocumentationCollection = interface(IXMLNodeCollection);
```

C++

```
__interface IDocumentationCollection : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IDocumentationCollection.

76.2.9.1 IDocumentationCollection Members

The following tables list the members exposed by IDocumentationCollection.

Public Methods

	Name	Description
	Add (see page 7054)	This is Add, a member of class IDocumentationCollection.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDocumentation (see page 7054)	This is GetDocumentation, a member of class IDocumentationCollection.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.

	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7054)	This is Insert, a member of class IDocumentationCollection.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	Documentation (see page 7055)	This is Documentation, a member of class IDocumentationCollection.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.9.2 IDocumentationCollection Methods

The methods of the IDocumentationCollection class are listed here.

Public Methods

	Name	Description
	Add (see page 7054)	This is Add, a member of class IDocumentationCollection.
	GetDocumentation (see page 7054)	This is GetDocumentation, a member of class IDocumentationCollection.
	Insert (see page 7054)	This is Insert, a member of class IDocumentationCollection.

76.2.9.2.1 IDocumentationCollection.Add Method

Pascal

```
function Add(const Text: WideString): IDocumentation;
```

C++

```
__fastcall IDocumentation Add(const BSTR Text);
```

Description

This is Add, a member of class IDocumentationCollection.

76.2.9.2.2 IDocumentationCollection.GetDocumentation Method

Pascal

```
function GetDocumentation(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation GetDocumentation(int Index);
```

Description

This is GetDocumentation, a member of class IDocumentationCollection.

76.2.9.2.3 IDocumentationCollection.Insert Method

Pascal

```
function Insert(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation Insert(int Index);
```

Description

This is Insert, a member of class IDocumentationCollection.

76.2.9.3 IDocumentationCollection Properties

The properties of the IDocumentationCollection class are listed here.

Public Properties

	Name	Description
R	Documentation (see page 7055)	This is Documentation, a member of class IDocumentationCollection.

76.2.9.3.1 IDocumentationCollection.Documentation Property

Pascal

```
property Documentation [Index: Integer]: IDocumentation;
```

C++

```
__property IDocumentation Documentation[int Index];
```

Description

This is Documentation, a member of class IDocumentationCollection.

76.2.10 IDocumented Interface

Class Hierarchy

Pascal

```
IDocumented = interface(IXMLNode);
```

C++

```
__interface IDocumented : public IXMLNode;
```

File

WSDLBind

Description

This is class WSDLBind.IDocumented.

76.2.10.1 IDocumented Members

The following tables list the members exposed by IDocumented.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.

	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.10.2 IDocumented Methods

The methods of the IDocumented class are listed here.

Public Methods

	Name	Description
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.

76.2.10.2.1 IDocumented.GetDocumentationCollection Method

Pascal

```
function GetDocumentationCollection: IDocumentationCollection;
```

C++

```
__fastcall IDocumentationCollection GetDocumentationCollection();
```

Description

This is GetDocumentationCollection, a member of class IDocumented.

76.2.10.3 IDocumented Properties

The properties of the IDocumented class are listed here.

Public Properties

	Name	Description
	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.

76.2.10.3.1 IDocumented.Documentation Property

Pascal

```
property Documentation: IDocumentationCollection;
```

C++

```
__property IDocumentationCollection Documentation;
```

Description

This is Documentation, a member of class IDocumented.

76.2.11 IFault Interface

Class Hierarchy

Pascal

```
IFault = interface(IParam);
```

C++

```
__interface IFault : public IParam;
```

File

WSDLBind

Description

This is class WSDLBind.IFault.

76.2.12 IFaults Interface

Class Hierarchy

Pascal

```
IFaults = interface(IXMLNodeCollection);
```

C++

```
__interface IFaults : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IFaults.

76.2.12.1 IFaults Members

The following tables list the members exposed by IFaults.

Public Methods

	Name	Description
	Add (see page 7060)	This is Add, a member of class IFaults.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetFault (see page 7060)	This is GetFault, a member of class IFaults.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.

	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7060)	This is Insert, a member of class IFaults.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	Fault (see page 7061)	This is Fault, a member of class IFaults.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.12.2 IFaults Methods

The methods of the IFaults class are listed here.

Public Methods

	Name	Description
	Add (see page 7060)	This is Add, a member of class IFaults.
	GetFault (see page 7060)	This is GetFault, a member of class IFaults.
	Insert (see page 7060)	This is Insert, a member of class IFaults.

76.2.12.2.1 IFaults.Add Method

Pascal

```
function Add(const Name: WideString; const Message: WideString): IFault;
```

C++

```
__fastcall IFault Add(const BSTR Name, const BSTR Message);
```

Description

This is Add, a member of class IFaults.

76.2.12.2.2 IFaults.GetFault Method

Pascal

```
function GetFault(Index: Integer): IFault;
```

C++

```
__fastcall IFault GetFault(int Index);
```

Description

This is GetFault, a member of class IFaults.

76.2.12.2.3 IFaults.Insert Method

Pascal

```
function Insert(Index: Integer): IFault;
```

C++

```
__fastcall IFault Insert(int Index);
```

Description

This is Insert, a member of class IFaults.

76.2.12.3 IFaults Properties

The properties of the IFaults class are listed here.

Public Properties

	Name	Description
	Fault (see page 7061)	This is Fault, a member of class IFaults.

76.2.12.3.1 IFaults.Fault Property

Pascal

```
property Fault [Index: Integer]: IFault;
```

C++

```
__property IFault Fault[int Index];
```

Description

This is Fault, a member of class IFaults.

76.2.13 IImport Interface

Class Hierarchy

Pascal

```
IImport = interface(IDocumented);
```

C++

```
__interface IImport : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IImport.

76.2.13.1 IImport Members

The following tables list the members exposed by IImport.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.

	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetLocation (see page 7063)	This is GetLocation, a member of class IImport.
	GetNamespace (see page 7063)	This is GetNamespace, a member of class IImport.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetLocation (see page 7063)	This is SetLocation, a member of class IImport.
	SetNamespace (see page 7063)	This is SetNamespace, a member of class IImport.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Location (see page 7064)	This is Location, a member of class IImport.
	Namespace (see page 7064)	This is Namespace, a member of class IImport.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.13.2 IImport Methods

The methods of the IImport class are listed here.

Public Methods

	Name	Description
	GetLocation (see page 7063)	This is GetLocation, a member of class IImport.
	GetNamespace (see page 7063)	This is GetNamespace, a member of class IImport.
	SetLocation (see page 7063)	This is SetLocation, a member of class IImport.
	SetNamespace (see page 7063)	This is SetNamespace, a member of class IImport.

76.2.13.2.1 IImport.GetLocation Method

Pascal

```
function GetLocation: WideString;
```

C++

```
__fastcall BSTR GetLocation();
```

Description

This is GetLocation, a member of class IImport.

76.2.13.2.2 IImport.GetNamespace Method

Pascal

```
function GetNamespace: WideString;
```

C++

```
__fastcall BSTR GetNamespace();
```

Description

This is GetNamespace, a member of class IImport.

76.2.13.2.3 IImport.SetLocation Method

Pascal

```
procedure SetLocation(Value: WideString);
```

C++

```
__fastcall SetLocation(BSTR Value);
```

Description

This is SetLocation, a member of class IImport.

76.2.13.2.4 IImport.SetNamespace Method

Pascal

```
procedure SetNamespace(Value: WideString);
```

C++

```
__fastcall SetNamespace(BSTR Value);
```

Description

This is SetNamespace, a member of class IImport.

76.2.13.3 IImport Properties

The properties of the IImport class are listed here.

Public Properties

	Name	Description
	Location (see page 7064)	This is Location, a member of class IImport.
	Namespace (see page 7064)	This is Namespace, a member of class IImport.

76.2.13.3.1 IImport.Location Property

Pascal

```
property Location: WideString;
```

C++

```
__property BSTR Location;
```

Description

This is Location, a member of class IImport.

76.2.13.3.2 IImport.Namespace Property

Pascal

```
property Namespace: WideString;
```

C++

```
__property BSTR Namespace;
```

Description

This is Namespace, a member of class IImport.

76.2.14 IImports Interface

Class Hierarchy

Pascal

```
IImports = interface(IXMLNodeCollection);
```

C++

```
__interface IImports : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IImports.

76.2.14.1 IImports Members

The following tables list the members exposed by IImports.

Public Methods

	Name	Description
	Add (see page 7066)	This is Add, a member of class IImports.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetImport (see page 7067)	This is GetImport, a member of class IImports.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7067)	This is Insert, a member of class IImports.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	Import (see page 7067)	This is Import, a member of class IImports.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.14.2 IImports Methods

The methods of the IImports class are listed here.

Public Methods

	Name	Description
	Add (see page 7066)	This is Add, a member of class IImports.
	GetImport (see page 7067)	This is GetImport, a member of class IImports.
	Insert (see page 7067)	This is Insert, a member of class IImports.

76.2.14.2.1 IImports.Add Method

Pascal

```
function Add(const Namespace: WideString; const Location: WideString): IImport;
```

C++

```
__fastcall IImport Add(const BSTR Namespace, const BSTR Location);
```

Description

This is Add, a member of class IImports.

76.2.14.2.2 IImports.GetImport Method

Pascal

```
function GetImport(Index: Integer): IImport;
```

C++

```
__fastcall IImport GetImport(int Index);
```

Description

This is GetImport, a member of class IImports.

76.2.14.2.3 IImports.Insert Method

Pascal

```
function Insert(Index: Integer): IImport;
```

C++

```
__fastcall IImport Insert(int Index);
```

Description

This is Insert, a member of class IImports.

76.2.14.3 IImports Properties

The properties of the IImports class are listed here.

Public Properties

	Name	Description
	Import (see page 7067)	This is Import, a member of class IImports.

76.2.14.3.1 IImports.Import Property

Pascal

```
property Import [Index: Integer]: IImport;
```

C++

```
__property IImport Import[int Index];
```

Description

This is Import, a member of class IImports.

76.2.15 IMessage Interface

Class Hierarchy

Pascal

```
IMessage = interface(IDocumented);
```

C++

```
__interface IMessage : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IMessage.

76.2.15.1 IMessage Members

The following tables list the members exposed by IMessage.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetName (see page 7069)	This is GetName, a member of class IMessage.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetParts (see page 7070)	This is GetParts, a member of class IMessage.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetName (see page 7070)	This is SetName, a member of class IMessage.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7070)	This is Name, a member of class IMessage.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Parts (see page 7070)	This is Parts, a member of class IMessage.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.15.2 IMessage Methods

The methods of the IMessage class are listed here.

Public Methods

	Name	Description
	GetName (see page 7069)	This is GetName, a member of class IMessage.
	GetParts (see page 7070)	This is GetParts, a member of class IMessage.
	SetName (see page 7070)	This is SetName, a member of class IMessage.

76.2.15.2.1 IMessage.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IMessage.

76.2.15.2.2 IMessage.GetParts Method

Pascal

```
function GetParts: IParts;
```

C++

```
__fastcall IParts GetParts();
```

Description

This is GetParts, a member of class IMessage.

76.2.15.2.3 IMessage.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IMessage.

76.2.15.3 IMessage Properties

The properties of the IMessage class are listed here.

Public Properties

	Name	Description
	Name (see page 7070)	This is Name, a member of class IMessage.
R	Parts (see page 7070)	This is Parts, a member of class IMessage.

76.2.15.3.1 IMessage.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IMessage.

76.2.15.3.2 IMessage.Parts Property

Pascal

```
property Parts: IParts;
```

C++

```
__property IParts Parts;
```

Description

This is Parts, a member of class IMessage.

76.2.16 IMessages Interface

Class Hierarchy

Pascal

```
IMessages = interface(IXMLNodeCollection);
```

C++

```
__interface IMessages : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IMessages.

76.2.16.1 IMessages Members

The following tables list the members exposed by IMessages.

Public Methods

	Name	Description
	Add (see page 7073)	This is Add, a member of class IMessages.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 7073)	This is GetMessage, a member of class IMessages.

	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7073)	This is Insert, a member of class IMessages.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	Message (see page 7074)	This is Message, a member of class IMessages.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.16.2 IMessages Methods

The methods of the IMessages class are listed here.

Public Methods

	Name	Description
	Add (see page 7073)	This is Add, a member of class IMessages.
	GetMessage (see page 7073)	This is GetMessage, a member of class IMessages.
	Insert (see page 7073)	This is Insert, a member of class IMessages.

76.2.16.2.1 IMessages.Add Method

Pascal

```
function Add(const Name: WideString): IMessage;
```

C++

```
__fastcall IMessage Add(const BSTR Name);
```

Description

This is Add, a member of class IMessages.

76.2.16.2.2 IMessages.GetMessage Method

Pascal

```
function GetMessage(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage GetMessage(int Index);
```

Description

This is GetMessage, a member of class IMessages.

76.2.16.2.3 IMessages.Insert Method

Pascal

```
function Insert(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage Insert(int Index);
```

Description

This is Insert, a member of class IMessages.

76.2.16.3 IMessages Properties

The properties of the IMessages class are listed here.

Public Properties

	Name	Description
R	Message (see page 7074)	This is Message, a member of class IMessages.

76.2.16.3.1 IMessages.Message Property

Pascal

```
property Message [Index: Integer]: IMessage;
```

C++

```
__property IMessage Message[int Index];
```

Description

This is Message, a member of class IMessages.

76.2.17 IOperation Interface

Class Hierarchy

Pascal

```
IOperation = interface(IDocumented);
```

C++

```
__interface IOperation : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IOperation.

76.2.17.1 IOperation Members

The following tables list the members exposed by IOperation.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetFaults (see page 7076)	This is GetFaults, a member of class IOperation.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.

	GetInput (see page 7076)	This is GetInput, a member of class IOperation.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetName (see page 7076)	This is GetName, a member of class IOperation.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOutput (see page 7077)	This is GetOutput, a member of class IOperation.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetName (see page 7077)	This is SetName, a member of class IOperation.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	Faults (see page 7077)	This is Faults, a member of class IOperation.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	Input (see page 7077)	This is Input, a member of class IOperation.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7078)	This is Name, a member of class IOperation.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	Output (see page 7078)	This is Output, a member of class IOperation.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.

	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.17.2 IOperation Methods

The methods of the IOperation class are listed here.

Public Methods

	Name	Description
	GetFaults (see page 7076)	This is GetFaults, a member of class IOperation.
	GetInput (see page 7076)	This is GetInput, a member of class IOperation.
	GetName (see page 7076)	This is GetName, a member of class IOperation.
	GetOutput (see page 7077)	This is GetOutput, a member of class IOperation.
	SetName (see page 7077)	This is SetName, a member of class IOperation.

76.2.17.2.1 IOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class IOperation.

76.2.17.2.2 IOperation.GetInput Method

Pascal

```
function GetInput: IParam;
```

C++

```
__fastcall IParam GetInput();
```

Description

This is GetInput, a member of class IOperation.

76.2.17.2.3 IOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IOperation.

76.2.17.2.4 IOperation.GetOutput Method

Pascal

```
function GetOutput: IParam;
```

C++

```
__fastcall IParam GetOutput();
```

Description

This is GetOutput, a member of class IOperation.

76.2.17.2.5 IOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IOperation.

76.2.17.3 IOperation Properties

The properties of the IOperation class are listed here.

Public Properties

	Name	Description
R	Faults (see page 7077)	This is Faults, a member of class IOperation.
R	Input (see page 7077)	This is Input, a member of class IOperation.
	Name (see page 7078)	This is Name, a member of class IOperation.
R	Output (see page 7078)	This is Output, a member of class IOperation.

76.2.17.3.1 IOperation.Faults Property

Pascal

```
property Faults: IFaults;
```

C++

```
__property IFaults Faults;
```

Description

This is Faults, a member of class IOperation.

76.2.17.3.2 IOperation.Input Property

Pascal

```
property Input: IParam;
```

C++

```
__property IParam Input;
```

Description

This is Input, a member of class IOperation.

76.2.17.3.3 IOperation.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IOperation.

76.2.17.3.4 IOperation.Output Property

Pascal

```
property Output: IParam;
```

C++

```
__property IParam Output;
```

Description

This is Output, a member of class IOperation.

76.2.18 IOperations Interface

Class Hierarchy

Pascal

```
IOperations = interface(IXMLNodeCollection);
```

C++

```
__interface IOperations : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IOperations.

76.2.18.1 IOperations Members

The following tables list the members exposed by IOperations.

Public Methods

	Name	Description
	Add (see page 7080)	This is the overview for the Add method overload.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOperation (see page 7081)	This is GetOperation, a member of class IOperations.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7081)	This is Insert, a member of class IOperations.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.

	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	Operation (see page 7081)	This is Operation, a member of class IOperations.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.18.2 IOperations Methods

The methods of the IOperations class are listed here.

Public Methods

	Name	Description
	Add (see page 7080)	This is the overview for the Add method overload.
	GetOperation (see page 7081)	This is GetOperation, a member of class IOperations.
	Insert (see page 7081)	This is Insert, a member of class IOperations.

76.2.18.2.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	IOperations.Add (WideString) (see page 7080)	This is Add, a member of class IOperations.
	IOperations.Add (WideString, WideString, WideString, WideString) (see page 7081)	This is Add, a member of class IOperations.

76.2.18.2.1.1 IOperations.Add Method (WideString)

Pascal

```
function Add(const Name: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name);
```

Description

This is Add, a member of class IOperations.

76.2.18.2.1.2 IOperations.Add Method (WideString, WideString, WideString, WideString)

Pascal

```
function Add(const Name: WideString; const InputMessage: WideString; const InputName:
WideString; const OutputMessage: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name, const BSTR InputMessage, const BSTR InputName,
const BSTR OutputMessage);
```

Description

This is Add, a member of class IOperations.

76.2.18.2.2 IOperations.GetOperation Method

Pascal

```
function GetOperation(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation GetOperation(int Index);
```

Description

This is GetOperation, a member of class IOperations.

76.2.18.2.3 IOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation Insert(int Index);
```

Description

This is Insert, a member of class IOperations.

76.2.18.3 IOperations Properties

The properties of the IOperations class are listed here.

Public Properties

	Name	Description
R	Operation (see page 7081)	This is Operation, a member of class IOperations.

76.2.18.3.1 IOperations.Operation Property

Pascal

```
property Operation [Index: Integer]: IOperation;
```

C++

```
__property IOperation Operation[int Index];
```

Description

This is Operation, a member of class IOperations.

76.2.19 IParam Interface

Class Hierarchy

Pascal

```
IParam = interface(IDocumented);
```

C++

```
__interface IParam : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IParam.

76.2.19.1 IParam Members

The following tables list the members exposed by IParam.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 7084)	This is GetMessage, a member of class IParam.
	GetName (see page 7084)	This is GetName, a member of class IParam.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.

	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetMessage (see page 7084)	This is SetMessage, a member of class IParam.
	SetName (see page 7084)	This is SetName, a member of class IParam.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Message (see page 7085)	This is Message, a member of class IParam.
	Name (see page 7085)	This is Name, a member of class IParam.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.19.2 IParam Methods

The methods of the IParam class are listed here.

Public Methods

	Name	Description
	GetMessage (see page 7084)	This is GetMessage, a member of class IParam.
	GetName (see page 7084)	This is GetName, a member of class IParam.
	SetMessage (see page 7084)	This is SetMessage, a member of class IParam.
	SetName (see page 7084)	This is SetName, a member of class IParam.

76.2.19.2.1 IParam.GetMessage Method

Pascal

```
function GetMessage: WideString;
```

C++

```
__fastcall BSTR GetMessage();
```

Description

This is GetMessage, a member of class IParam.

76.2.19.2.2 IParam.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IParam.

76.2.19.2.3 IParam.SetMessage Method

Pascal

```
procedure SetMessage(Value: WideString);
```

C++

```
__fastcall SetMessage(BSTR Value);
```

Description

This is SetMessage, a member of class IParam.

76.2.19.2.4 IParam.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IParam.

76.2.19.3 IParam Properties

The properties of the IParam class are listed here.

Public Properties

	Name	Description
	Message (see page 7085)	This is Message, a member of class IParam.
	Name (see page 7085)	This is Name, a member of class IParam.

76.2.19.3.1 IParam.Message Property

Pascal

```
property Message: WideString;
```

C++

```
__property BSTR Message;
```

Description

This is Message, a member of class IParam.

76.2.19.3.2 IParam.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IParam.

76.2.20 IPart Interface

Class Hierarchy

Pascal

```
IPart = interface(IDocumented);
```

C++

```
__interface IPart : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IPart.

76.2.20.1 IPart Members

The following tables list the members exposed by IPart.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetElement (see page 7087)	This is GetElement, a member of class IPart.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetName (see page 7088)	This is GetName, a member of class IPart.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetType_ (see page 7088)	This is GetType_, a member of class IPart.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetElement (see page 7088)	This is SetElement, a member of class IPart.
	SetName (see page 7088)	This is SetName, a member of class IPart.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	SetType_ (see page 7088)	This is SetType_, a member of class IPart.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
	Element (see page 7089)	This is Element, a member of class IPart.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7089)	This is Name, a member of class IPart.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
	Type_ (see page 7089)	This is Type_, a member of class IPart.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.20.2 IPart Methods

The methods of the IPart class are listed here.

Public Methods

	Name	Description
	GetElement (see page 7087)	This is GetElement, a member of class IPart.
	GetName (see page 7088)	This is GetName, a member of class IPart.
	GetType_ (see page 7088)	This is GetType_, a member of class IPart.
	SetElement (see page 7088)	This is SetElement, a member of class IPart.
	SetName (see page 7088)	This is SetName, a member of class IPart.
	SetType_ (see page 7088)	This is SetType_, a member of class IPart.

76.2.20.2.1 IPart.GetElement Method

Pascal

```
function GetElement: WideString;
```

C++

```
__fastcall BSTR GetElement();
```

Description

This is GetElement, a member of class IPart.

76.2.20.2.2 IPart.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IPart.

76.2.20.2.3 IPart.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class IPart.

76.2.20.2.4 IPart.SetElement Method

Pascal

```
procedure SetElement(Value: WideString);
```

C++

```
__fastcall SetElement(BSTR Value);
```

Description

This is SetElement, a member of class IPart.

76.2.20.2.5 IPart.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IPart.

76.2.20.2.6 IPart.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class IPart.

76.2.20.3 IPart Properties

The properties of the IPart class are listed here.

Public Properties

	Name	Description
	Element (see page 7089)	This is Element, a member of class IPart.
	Name (see page 7089)	This is Name, a member of class IPart.
	Type_ (see page 7089)	This is Type_, a member of class IPart.

76.2.20.3.1 IPart.Element Property

Pascal

```
property Element: WideString;
```

C++

```
__property BSTR Element;
```

Description

This is Element, a member of class IPart.

76.2.20.3.2 IPart.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IPart.

76.2.20.3.3 IPart.Type_ Property

Pascal

```
property Type_: WideString;
```

C++

```
__property BSTR Type_;
```

Description

This is Type_, a member of class IPart.

76.2.21 IParts Interface

Class Hierarchy

Pascal

```
IParts = interface(IXMLNodeCollection);
```

C++

```
__interface IParts : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IParts.

76.2.21.1 IParts Members

The following tables list the members exposed by IParts.

Public Methods

	Name	Description
	Add (see page 7092)	This is Add, a member of class IParts.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.

	GetPart (see page 7092)	This is GetPart, a member of class IParts.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7092)	This is Insert, a member of class IParts.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Part (see page 7093)	This is Part, a member of class IParts.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.21.2 IParts Methods

The methods of the IParts class are listed here.

Public Methods

	Name	Description
	Add (see page 7092)	This is Add, a member of class IParts.
	GetPart (see page 7092)	This is GetPart, a member of class IParts.
	Insert (see page 7092)	This is Insert, a member of class IParts.

76.2.21.2.1 IParts.Add Method

Pascal

```
function Add(const Name: WideString; const Element: WideString; const AType: WideString = ''):
IPart;
```

C++

```
__fastcall IPart Add(const BSTR Name, const BSTR Element, const BSTR AType = '');
```

Description

This is Add, a member of class IParts.

76.2.21.2.2 IParts.GetPart Method

Pascal

```
function GetPart(Index: Integer): IPart;
```

C++

```
__fastcall IPart GetPart(int Index);
```

Description

This is GetPart, a member of class IParts.

76.2.21.2.3 IParts.Insert Method

Pascal

```
function Insert(Index: Integer): IPart;
```

C++

```
__fastcall IPart Insert(int Index);
```

Description

This is Insert, a member of class IParts.

76.2.21.3 IParts Properties

The properties of the IParts class are listed here.

Public Properties

	Name	Description
R	Part (see page 7093)	This is Part, a member of class IParts.

76.2.21.3.1 IParts.Part Property

Pascal

```
property Part [Index: Integer]: IPart;
```

C++

```
__property IPart Part[int Index];
```

Description

This is Part, a member of class IParts.

76.2.22 IPort Interface

Class Hierarchy

Pascal

```
IPort = interface(IDocumented);
```

C++

```
__interface IPort : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IPort.

76.2.22.1 IPort Members

The following tables list the members exposed by IPort.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetBinding (see page 7095)	This is GetBinding, a member of class IPort.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.

	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetName (see page 7095)	This is GetName, a member of class IPort.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetBinding (see page 7095)	This is SetBinding, a member of class IPort.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetName (see page 7095)	This is SetName, a member of class IPort.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
	Binding (see page 7096)	This is Binding, a member of class IPort.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7096)	This is Name, a member of class IPort.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.22.2 IPort Methods

The methods of the IPort class are listed here.

Public Methods

	Name	Description
	GetBinding (see page 7095)	This is GetBinding, a member of class IPort.
	GetName (see page 7095)	This is GetName, a member of class IPort.
	SetBinding (see page 7095)	This is SetBinding, a member of class IPort.
	SetName (see page 7095)	This is SetName, a member of class IPort.

76.2.22.2.1 IPort.GetBinding Method

Pascal

```
function GetBinding: WideString;
```

C++

```
__fastcall BSTR GetBinding();
```

Description

This is GetBinding, a member of class IPort.

76.2.22.2.2 IPort.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IPort.

76.2.22.2.3 IPort.SetBinding Method

Pascal

```
procedure SetBinding(Value: WideString);
```

C++

```
__fastcall SetBinding(BSTR Value);
```

Description

This is SetBinding, a member of class IPort.

76.2.22.2.4 IPort.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IPort.

76.2.22.3 IPort Properties

The properties of the IPort class are listed here.

Public Properties

	Name	Description
	Binding (see page 7096)	This is Binding, a member of class IPort.
	Name (see page 7096)	This is Name, a member of class IPort.

76.2.22.3.1 IPort.Binding Property

Pascal

```
property Binding: WideString;
```

C++

```
__property BSTR Binding;
```

Description

This is Binding, a member of class IPort.

76.2.22.3.2 IPort.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IPort.

76.2.23 IPorts Interface

Class Hierarchy

Pascal

```
IPorts = interface(IXMLNodeCollection);
```

C++

```
__interface IPorts : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IPorts.

76.2.23.1 IPorts Members

The following tables list the members exposed by IPorts.

Public Methods

	Name	Description
	Add (see page 7098)	This is Add, a member of class IPorts.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPort (see page 7099)	This is GetPort, a member of class IPorts.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7099)	This is Insert, a member of class IPorts.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Port (see page 7099)	This is Port, a member of class IPorts.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.23.2 IPorts Methods

The methods of the IPorts class are listed here.

Public Methods

	Name	Description
	Add (see page 7098)	This is Add, a member of class IPorts.
	GetPort (see page 7099)	This is GetPort, a member of class IPorts.
	Insert (see page 7099)	This is Insert, a member of class IPorts.

76.2.23.2.1 IPorts.Add Method

Pascal

```
function Add(const Name: WideString; const ABinding: WideString): IPort;
```

C++

```
__fastcall IPort Add(const BSTR Name, const BSTR ABinding);
```

Description

This is Add, a member of class IPorts.

76.2.23.2.2 IPorts.GetPort Method

Pascal

```
function GetPort(Index: Integer): IPort;
```

C++

```
__fastcall IPort GetPort(int Index);
```

Description

This is GetPort, a member of class IPorts.

76.2.23.2.3 IPorts.Insert Method

Pascal

```
function Insert(Index: Integer): IPort;
```

C++

```
__fastcall IPort Insert(int Index);
```

Description

This is Insert, a member of class IPorts.

76.2.23.3 IPorts Properties

The properties of the IPorts class are listed here.

Public Properties

	Name	Description
	Port (see page 7099)	This is Port, a member of class IPorts.

76.2.23.3.1 IPorts.Port Property

Pascal

```
property Port [Index: Integer]: IPort;
```

C++

```
__property IPort Port[int Index];
```

Description

This is Port, a member of class IPorts.

76.2.24 IPortType Interface

Class Hierarchy

Pascal

```
IPortType = interface(IDocumented);
```

C++

```
__interface IPortType : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IPortType.

76.2.24.1 IPortType Members

The following tables list the members exposed by IPortType.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetName (see page 7101)	This is GetName, a member of class IPortType.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOperations (see page 7102)	This is GetOperations, a member of class IPortType.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetName (see page 7102)	This is SetName, a member of class IPortType.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7102)	This is Name, a member of class IPortType.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	Operations (see page 7102)	This is Operations, a member of class IPortType.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.24.2 IPortType Methods

The methods of the IPortType class are listed here.

Public Methods

	Name	Description
	GetName (see page 7101)	This is GetName, a member of class IPortType.
	GetOperations (see page 7102)	This is GetOperations, a member of class IPortType.
	SetName (see page 7102)	This is SetName, a member of class IPortType.

76.2.24.2.1 IPortType.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IPortType.

76.2.24.2.2 IPortType.GetOperations Method

Pascal

```
function GetOperations: IOperations;
```

C++

```
__fastcall IOperations GetOperations();
```

Description

This is GetOperations, a member of class IPortType.

76.2.24.2.3 IPortType.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IPortType.

76.2.24.3 IPortType Properties

The properties of the IPortType class are listed here.

Public Properties

	Name	Description
	Name (see page 7102)	This is Name, a member of class IPortType.
R	Operations (see page 7102)	This is Operations, a member of class IPortType.

76.2.24.3.1 IPortType.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IPortType.

76.2.24.3.2 IPortType.Operations Property

Pascal

```
property Operations: IOperations;
```

C++

```
__property IOperations Operations;
```

Description

This is Operations, a member of class IPortType.

76.2.25 IPortTypes Interface

Class Hierarchy

Pascal

```
IPortTypes = interface(IXMLNodeCollection);
```

C++

```
__interface IPortTypes : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IPortTypes.

76.2.25.1 IPortTypes Members

The following tables list the members exposed by IPortTypes.

Public Methods

	Name	Description
	Add (see page 7105)	This is Add, a member of class IPortTypes.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.

	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPortType (see page 7105)	This is GetPortType, a member of class IPortTypes.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7105)	This is Insert, a member of class IPortTypes.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	PortType (see page 7106)	This is PortType, a member of class IPortTypes.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.25.2 IPortTypes Methods

The methods of the IPortTypes class are listed here.

Public Methods

	Name	Description
	Add (see page 7105)	This is Add, a member of class IPortTypes.
	GetPortType (see page 7105)	This is GetPortType, a member of class IPortTypes.
	Insert (see page 7105)	This is Insert, a member of class IPortTypes.

76.2.25.2.1 IPortTypes.Add Method

Pascal

```
function Add(const Name: WideString): IPortType;
```

C++

```
__fastcall IPortType Add(const BSTR Name);
```

Description

This is Add, a member of class IPortTypes.

76.2.25.2.2 IPortTypes.GetPortType Method

Pascal

```
function GetPortType(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType GetPortType(int Index);
```

Description

This is GetPortType, a member of class IPortTypes.

76.2.25.2.3 IPortTypes.Insert Method

Pascal

```
function Insert(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType Insert(int Index);
```

Description

This is Insert, a member of class IPortTypes.

76.2.25.3 IPortTypes Properties

The properties of the IPortTypes class are listed here.

Public Properties

	Name	Description
R	PortType (see page 7106)	This is PortType, a member of class IPortTypes.

76.2.25.3.1 IPortTypes.PortType Property

Pascal

```
property PortType [Index: Integer]: IPortType;
```

C++

```
__property IPortType PortType[int Index];
```

Description

This is PortType, a member of class IPortTypes.

76.2.26 IService Interface

Class Hierarchy

Pascal

```
IService = interface(IDocumented);
```

C++

```
__interface IService : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IService.

76.2.26.1 IService Members

The following tables list the members exposed by IService.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.

	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetName (see page 7108)	This is GetName, a member of class IService.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPorts (see page 7108)	This is GetPorts, a member of class IService.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetName (see page 7108)	This is SetName, a member of class IService.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	Name (see page 7109)	This is Name, a member of class IService.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Ports (see page 7109)	This is Ports, a member of class IService.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.26.2 IService Methods

The methods of the IService class are listed here.

Public Methods

	Name	Description
	GetName (see page 7108)	This is GetName, a member of class IService.
	GetPorts (see page 7108)	This is GetPorts, a member of class IService.
	SetName (see page 7108)	This is SetName, a member of class IService.

76.2.26.2.1 IService.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IService.

76.2.26.2.2 IService.GetPorts Method

Pascal

```
function GetPorts: IPorts;
```

C++

```
__fastcall IPorts GetPorts();
```

Description

This is GetPorts, a member of class IService.

76.2.26.2.3 IService.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IService.

76.2.26.3 IService Properties

The properties of the IService class are listed here.

Public Properties

	Name	Description
	Name (see page 7109)	This is Name, a member of class IService.

	Ports (see page 7109)	This is Ports, a member of class IService.

76.2.26.3.1 IService.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IService.

76.2.26.3.2 IService.Ports Property

Pascal

```
property Ports: IPorts;
```

C++

```
__property IPorts Ports;
```

Description

This is Ports, a member of class IService.

76.2.27 IServices Interface

Class Hierarchy

Pascal

```
IServices = interface(IXMLNodeCollection);
```

C++

```
__interface IServices : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IServices.

76.2.27.1 IServices Members

The following tables list the members exposed by IServices.

Public Methods

	Name	Description
	Add (see page 7111)	This is Add, a member of class IServices.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.

	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetService (see page 7111)	This is GetService, a member of class IServices.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	Insert (see page 7112)	This is Insert, a member of class IServices.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.

	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7639)	Indicates the node name.
	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Service (see page 7112)	This is Service, a member of class IServices.
	Text (see page 7643)	Represents the Text of the node.
	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.27.2 IServices Methods

The methods of the IServices class are listed here.

Public Methods

	Name	Description
	Add (see page 7111)	This is Add, a member of class IServices.
	GetService (see page 7111)	This is GetService, a member of class IServices.
	Insert (see page 7112)	This is Insert, a member of class IServices.

76.2.27.2.1 IServices.Add Method

Pascal

```
function Add(const Name: WideString): IService;
```

C++

```
__fastcall IService Add(const BSTR Name);
```

Description

This is Add, a member of class IServices.

76.2.27.2.2 IServices.GetService Method

Pascal

```
function GetService(Index: Integer): IService;
```

C++

```
__fastcall IService GetService(int Index);
```

Description

This is GetService, a member of class IServices.

76.2.27.2.3 IServices.Insert Method

Pascal

```
function Insert(Index: Integer): IService;
```

C++

```
__fastcall IService Insert(int Index);
```

Description

This is Insert, a member of class IServices.

76.2.27.3 IServices Properties

The properties of the IServices class are listed here.

Public Properties

	Name	Description
	Service (see page 7112)	This is Service, a member of class IServices.

76.2.27.3.1 IServices.Service Property

Pascal

```
property Service [Index: Integer]: IService;
```

C++

```
__property IService Service[int Index];
```

Description

This is Service, a member of class IServices.

76.2.28 ITypes Interface

Class Hierarchy

Pascal

```
ITypes = interface(IDocumented);
```

C++

```
__interface ITypes : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.ITypes.

76.2.28.1 ITypes Members

The following tables list the members exposed by ITypes.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDocumentationCollection (see page 7057)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetSchemaDefs (see page 7114)	This is GetSchemaDefs, a member of class ITypes.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.

	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Documentation (see page 7057)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	SchemaDefs (see page 7114)	This is SchemaDefs, a member of class ITypes.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.28.2 ITypes Methods

The methods of the ITypes class are listed here.

Public Methods

	Name	Description
	GetSchemaDefs (see page 7114)	This is GetSchemaDefs, a member of class ITypes.

76.2.28.2.1 ITypes.GetSchemaDefs Method

Pascal

```
function GetSchemaDefs: IXMLSchemaDefs;
```

C++

```
__fastcall IXMLSchemaDefs GetSchemaDefs();
```

Description

This is GetSchemaDefs, a member of class ITypes.

76.2.28.3 ITypes Properties

The properties of the ITypes class are listed here.

Public Properties

	Name	Description
R	SchemaDefs (see page 7114)	This is SchemaDefs, a member of class ITypes.

76.2.28.3.1 ITypes.SchemaDefs Property

Pascal

```
property SchemaDefs: IXMLSchemaDefs;
```

C++

```
__property IXMLSchemaDefs SchemaDefs;
```

Description

This is SchemaDefs, a member of class ITypes.

76.2.29 IWSDLDocument Interface

IWSDLDocument provides low-level access to the definitions in a WSDL document.

Class Hierarchy

Pascal

```
IWSDLDocument = interface(IXMLDocument);
```

C++

```
__interface IWSDLDocument : public IXMLDocument;
```

File

WSDLBind

Description

IWSDLDocument is an interface to the TWSDLDocument (see page 7015) class. It is primarily for internal use, because it only provides access to the Definitions property, which is used for low-level access to the definitions in a WSDL document. It is generally easier to work with a TWSDLItems object. You can often obtain this from an IWSDLDocument interface by using the global Supports function (Delphi) or the Supports method (C++) to obtain an IWSDLItems interface from this one, and then obtaining a TWSDLItems object from that interface.

Note: C++ method declarations that use IWSDLDocument use the _di_IWSDLDocument type instead. This type is a DelphiInterface (see page 3263) wrapper around the IWSDLDocument interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IWSDLDocument >  _di_IWSDLDocument;
```

See Also

TWSDLDocument (see page 7015)

IWSDLItems (see page 7208)

TWSDLItems (see page 7163)

76.2.29.1 IWSDLDocument Members

The following tables list the members exposed by IWSDLDocument.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7589)	This is the overview for the AddChild method overload.

	CreateElement (see page 7590)	Creates a new element node that is associated with this document.
	CreateNode (see page 7591)	Creates a new node that is associated with this document.
	GeneratePrefix (see page 7592)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 7592)	Returns the value of the Active (see page 7607) property.
	GetAsyncLoadState (see page 7593)	Returns the value of the AsyncLoadState (see page 7608) property.
	GetChildNodes (see page 7593)	Returns the value of the ChildNodes (see page 7609) property.
	GetDefinition (see page 7117)	Returns the value of the Definition (see page 7118) property.
	GetDocBinding (see page 7593)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 7594)	Returns the value of the DocumentElement (see page 7609) property.
	GetDocumentNode (see page 7594)	Returns the value of the Node (see page 7611) property.
	GetDOMDocument (see page 7594)	Returns the value of the DOMDocument (see page 7609) property.
	GetEncoding (see page 7595)	Returns the value of the Encoding (see page 7610) property.
	GetFileName (see page 7595)	Returns the value of the FileName (see page 7610) property.
	GetModified (see page 7595)	Returns the value of the Modified (see page 7611) property.
	GetNodeIndentStr (see page 7596)	Returns the value of the NodeIndentStr (see page 7612) property.
	GetOptions (see page 7596)	Returns the value of the Options (see page 7612) property.
	GetParseOptions (see page 7596)	Returns the value of the ParseOptions (see page 7613) property.
	GetSchemaRef (see page 7596)	Returns the value of the SchemaRef (see page 7613) property.
	GetStandAlone (see page 7597)	Returns the value of the StandAlone (see page 7614) property.
	GetVersion (see page 7597)	Returns the value of the Version (see page 7614) property.
	GetXML (see page 7597)	Returns the value of the XML (see page 7614) property.
	IsEmptyDoc (see page 7598)	Indicates whether the IXMLDocument (see page 7586) instance represents an empty document.
	LoadFromFile (see page 7598)	Loads an XML (see page 7614) document from disk.
	LoadFromStream (see page 7599)	Loads an XML (see page 7614) document from a stream and activates it.
	LoadFromXML (see page 7599)	This is the overview for the LoadFromXML method overload.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7600)	Updates the parsed XML (see page 7614) document to reflect external changes.
	RegisterDocBinding (see page 7600)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7601)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7601)	Saves the XML (see page 7614) document to disk.
	SaveToStream (see page 7602)	Saves the XML (see page 7614) document to a stream.
	SaveToXML (see page 7602)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7603)	Sets the value of the Active (see page 7607) property.
	SetDefinition (see page 7117)	Sets the value of the Definition (see page 7118) property.
	SetDocumentElement (see page 7603)	Sets the value of the DocumentElement (see page 7609) property.
	SetDOMDocument (see page 7604)	Sets the value of the DOMDocument (see page 7609) property.
	SetEncoding (see page 7604)	Sets the value of the Encoding (see page 7610) property.
	SetFileName (see page 7604)	Sets the value of the FileName (see page 7610) property.
	SetNodeIndentStr (see page 7605)	Sets the value of the NodeIndentStr (see page 7612) property.
	SetOnAsyncLoad (see page 7605)	Supplies an event handler that responds when the AsyncLoadState (see page 7608) property changes.
	SetOptions (see page 7605)	Sets the value of the Options (see page 7612) property.
	SetParseOptions (see page 7606)	Sets the value of the ParseOptions (see page 7613) property.
	SetStandAlone (see page 7606)	Sets the value of the StandAlone (see page 7614) property.
	SetVersion (see page 7606)	Sets the value of the Version (see page 7614) property.
	SetXML (see page 7607)	Sets the value of the XML (see page 7614) property.

Public Properties

	Name	Description
	Active (see page 7607)	Specifies whether the XML (see page 7614) document has been parsed so that the DOM interfaces are available to examine or change its contents.

R	AsyncLoadState (see page 7608)	Indicates the state of the DOM parser when it parses the XML (see page 7614) document asynchronously.
R	ChildNodes (see page 7609)	Lists all of the child nodes of the document.
	Definition (see page 7118)	Provides access to the definitions contained in the WSDL document.
	DocumentElement (see page 7609)	Provides access to the root node of the XML (see page 7614) document.
	DOMDocument (see page 7609)	Provides access to the DOM interface for the parsed XML (see page 7614) document.
	Encoding (see page 7610)	Indicates the character set that the XML (see page 7614) document uses to encode characters.
	FileName (see page 7610)	Indicates the XML (see page 7614) document file, if any, that this interface represents.
R	Modified (see page 7611)	Indicates whether the XML (see page 7614) document has been modified.
R	Node (see page 7611)	Provides access to the document node for the XML (see page 7614) document.
	NodeIndentStr (see page 7612)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7614) text.
	Options (see page 7612)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7613)	Specifies implementation-specific options that are followed when parsing the XML (see page 7614) document.
R	SchemaRef (see page 7613)	Returns the name of the schema associated with this XML (see page 7614) document.
	StandAlone (see page 7614)	Indicates whether the XML (see page 7614) document includes any external markup declarations.
	Version (see page 7614)	Indicates the XML (see page 7614) version that the document uses.
	XML (see page 7614)	Specifies the content of the XML document associated with this IXMLDocument (see page 7586) interface.

76.2.29.2 IWSDLDocument Methods

The methods of the IWSDLDocument class are listed here.

Public Methods

	Name	Description
	GetDefinition (see page 7117)	Returns the value of the Definition (see page 7118) property.
	SetDefinition (see page 7117)	Sets the value of the Definition (see page 7118) property.

76.2.29.2.1 IWSDLDocument.GetDefinition Method

Returns the value of the Definition (see page 7118) property.

Pascal

```
function GetDefinition: IDefinition;
```

C++

```
__fastcall IDefinition GetDefinition();
```

Description

GetDefinition is the read access method for the Definition (see page 7118) property.

See Also

Definition (see page 7118)

76.2.29.2.2 IWSDLDocument.SetDefinition Method

Sets the value of the Definition (see page 7118) property.

Pascal

```
procedure SetDefinition(const Value: IDefinition);
```

C++

```
__fastcall SetDefinition(const IDefinition Value);
```

Description

SetDefinition is the write method for the Definition (see page 7118) property.

See Also

Definition (see page 7118)

76.2.29.3 IWSDLDocument Properties

The properties of the IWSDLDocument class are listed here.

Public Properties

	Name	Description
	Definition (see page 7118)	Provides access to the definitions contained in the WSDL document.

76.2.29.3.1 IWSDLDocument.Definition Property

Provides access to the definitions contained in the WSDL document.

Pascal

```
property Definition: IDefinition;
```

C++

```
__property IDefinition Definition;
```

Description

Definition is the IDefinition (see page 7045) interface of the root node in the WSDL document. This interface is implemented by the node specified by DocumentElement.

You can use the IDefinition (see page 7045) interface to access the Bindings, Messages, PortTypes, Services, and Types (see page 4683) defined in the WSDL document by reading properties of the same names. Alternately, you can use the methods of TWSDLItems. To obtain a TWSDLItems instance for this document,

1.Cast this interface to IWSDLItems using the global Supports function (C++) or the inherited Supports method (C++).

2.Use the GetWSDLItems method of that interface.

See Also

DocumentElement (see page 7609)

TWSDLItems (see page 7163)

Supports

Supports (see page 4335)

76.2.30 IXMLSchemaDefs Interface

Class Hierarchy

Pascal

```
IXMLSchemaDefs = interface(IXMLNodeCollection);
```

C++

```
__interface IXMLSchemaDefs : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IXMLSchemaDefs.

76.2.30.1 IXMLSchemaDefs Members

The following tables list the members exposed by IXMLSchemaDefs.

Public Methods

	Name	Description
	Add (see page 7121)	This is Add, a member of class IXMLSchemaDefs.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	Clear (see page 7646)	Removes all child nodes in the Nodes (see page 7649) property from the ChildList and Nodes (see page 7649) properties.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7646)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetCount (see page 7647)	Returns the value of the Count (see page 7648) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7647)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.

	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	GetXMLSchemaDef (see page 7121)	This is GetXMLSchemaDef, a member of class IXMLSchemaDefs.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	Remove (see page 7648)	Removes one of the repeating child nodes from this node.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	Count (see page 7648)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	SchemaDef (see page 7121)	This is SchemaDef, a member of class IXMLSchemaDefs.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

76.2.30.2 IXMLSchemaDefs Methods

The methods of the IXMLSchemaDefs class are listed here.

Public Methods

	Name	Description
	Add (see page 7121)	This is Add, a member of class IXMLSchemaDefs.

	GetXMLSchemaDef (see page 7121)	This is GetXMLSchemaDef, a member of class IXMLSchemaDefs.

76.2.30.2.1 IXMLSchemaDefs.Add Method

Pascal

```
function Add(const NamespaceURI: WideString = ''; const TargetNamespace: WideString = ''):
IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef Add(const BSTR NamespaceURI = '', const BSTR TargetNamespace = '');
```

Description

This is Add, a member of class IXMLSchemaDefs.

76.2.30.2.2 IXMLSchemaDefs.GetXMLSchemaDef Method

Pascal

```
function GetXMLSchemaDef(Index: Integer): IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef GetXMLSchemaDef(int Index);
```

Description

This is GetXMLSchemaDef, a member of class IXMLSchemaDefs.

76.2.30.3 IXMLSchemaDefs Properties

The properties of the IXMLSchemaDefs class are listed here.

Public Properties

	Name	Description
	SchemaDef (see page 7121)	This is SchemaDef, a member of class IXMLSchemaDefs.

76.2.30.3.1 IXMLSchemaDefs.SchemaDef Property

Pascal

```
property SchemaDef [Index: Integer]: IXMLSchemaDef;
```

C++

```
__property IXMLSchemaDef SchemaDef[int Index];
```

Description

This is SchemaDef, a member of class IXMLSchemaDefs.

76.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetDefinition (see page 7122)	This is function WSDLBind.GetDefinition.
	LoadWSDLDoc (see page 7122)	This is function WSDLBind.LoadWSDLDoc.
	NewWSDLDoc (see page 7122)	This is function WSDLBind.NewWSDLDoc.

76.3.1 WSDLBind.GetDefinition Function

Pascal

```
function GetDefinition(Doc: TXMLDocument): IDefinition;
```

C++

```
IDefinition GetDefinition(TXMLDocument Doc);
```

File

WSDLBind

Description

This is function WSDLBind.GetDefinition.

76.3.2 WSDLBind.LoadWSDLDoc Function

Pascal

```
function LoadWSDLDoc(const FileName: WideString): IWSDLDocument;
```

C++

```
IWSDLDocument LoadWSDLDoc(const BSTR FileName);
```

File

WSDLBind

Description

This is function WSDLBind.LoadWSDLDoc.

76.3.3 WSDLBind.NewWSDLDoc Function

Pascal

```
function NewWSDLDoc: IWSDLDocument;
```

C++

```
IWSDLDocument NewWSDLDoc();
```

File

WSDLBind

Description

This is function WSDLBind.NewWSDLDoc.

76.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
SBinding (see page 7124)	This is constant WSDLBind.SBinding.
SDefinitions (see page 7124)	This is constant WSDLBind.SDefinitions.
SFault (see page 7125)	This is constant WSDLBind.SFault.
SImport (see page 7125)	This is constant WSDLBind.SImport.
SInput (see page 7125)	This is constant WSDLBind.SInput.
SLocation (see page 7126)	This is constant WSDLBind.SLocation.
SMessage (see page 7126)	This is constant WSDLBind.SMessage.
SNamespace (see page 7126)	This is constant WSDLBind.SNamespace.
SOperation (see page 7127)	This is constant WSDLBind.SOperation.
SOutput (see page 7127)	This is constant WSDLBind.SOutput.
SPart (see page 7127)	This is constant WSDLBind.SPart.
SPort (see page 7128)	This is constant WSDLBind.SPort.
SPortType (see page 7128)	This is constant WSDLBind.SPortType.
SService (see page 7128)	This is constant WSDLBind.SService.
SType (see page 7129)	This is constant WSDLBind.SType.
STypes (see page 7129)	This is constant WSDLBind.STypes.

76.4.1 WSDLBind.SBinding Constant

Pascal

```
SBinding = 'binding';
```

C++

```
SBinding = 'binding';
```

File

WSDLBind

Description

This is constant WSDLBind.SBinding.

76.4.2 WSDLBind.SDefinitions Constant

Pascal

```
SDefinitions = 'definitions';
```

C++

```
SDefinitions = 'definitions';
```

File

WSDLBind

Description

This is constant WSDLBind.SDefinitions.

76.4.3 WSDLBind.SFault Constant

Pascal

```
SFault = 'fault';
```

C++

```
SFault = 'fault';
```

File

WSDLBind

Description

This is constant WSDLBind.SFault.

76.4.4 WSDLBind.SImport Constant

Pascal

```
SImport = 'import';
```

C++

```
SImport = 'import';
```

File

WSDLBind

Description

This is constant WSDLBind.SImport.

76.4.5 WSDLBind.SInput Constant

Pascal

```
SInput = 'input';
```

C++

```
SInput = 'input';
```

File

WSDLBind

Description

This is constant WSDLBind.SInput.

76.4.6 WSDLBind.SLocation Constant

Pascal

```
SLocation = 'location';
```

C++

```
SLocation = 'location';
```

File

WSDLBind

Description

This is constant WSDLBind.SLocation.

76.4.7 WSDLBind.SMessage Constant

Pascal

```
SMessage = 'message';
```

C++

```
SMessage = 'message';
```

File

WSDLBind

Description

This is constant WSDLBind.SMessage.

76.4.8 WSDLBind.SNamespace Constant

Pascal

```
SNamespace = 'namespace';
```

C++

```
SNamespace = 'namespace';
```

File

WSDLBind

Description

This is constant WSDLBind.SNamespace.

76.4.9 WSDLBind.SOperation Constant

Pascal

```
SOperation = 'operation';
```

C++

```
SOperation = 'operation';
```

File

WSDLBind

Description

This is constant WSDLBind.SOperation.

76.4.10 WSDLBind.SOutput Constant

Pascal

```
SOutput = 'output';
```

C++

```
SOutput = 'output';
```

File

WSDLBind

Description

This is constant WSDLBind.SOutput.

76.4.11 WSDLBind.SPart Constant

Pascal

```
SPart = 'part';
```

C++

```
SPart = 'part';
```

File

WSDLBind

Description

This is constant WSDLBind.SPart.

76.4.12 WSDLBind.SPort Constant

Pascal

```
SPort = 'port';
```

C++

```
SPort = 'port';
```

File

WSDLBind

Description

This is constant WSDLBind.SPort.

76.4.13 WSDLBind.SPortType Constant

Pascal

```
SPortType = 'portType';
```

C++

```
SPortType = 'portType';
```

File

WSDLBind

Description

This is constant WSDLBind.SPortType.

76.4.14 WSDLBind.SService Constant

Pascal

```
SService = 'service';
```

C++

```
SService = 'service';
```

File

WSDLBind

Description

This is constant WSDLBind.SService.

76.4.15 WSDLBind.SType Constant

Pascal

```
SType = 'type';
```

C++

```
SType = 'type';
```

File

WSDLBind

Description

This is constant WSDLBind.SType.

76.4.16 WSDLBind.STypes Constant

Pascal

```
STypes = 'types';
```

C++

```
STypes = 'types';
```

File

WSDLBind

Description

This is constant WSDLBind.STypes.

77 WSDLIntf Namespace

This is namespace WSDLIntf.

Topics

Name	Description
Classes (see page 7133)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 7137)	The following table lists structs, records, enums in this documentation.
Types (see page 7139)	The following table lists types in this documentation.
Constants (see page 7140)	The following table lists constants in this documentation.

Classes

	Name	Description
	TDOMStrings (see page 7133)	This is class WSDLIntf.TDOMStrings.

Constants

Name	Description
Directives (see page 7141)	This is constant WSDLIntf.Directives.
DynArrayTypes (see page 7141)	This is constant WSDLIntf.DynArrayTypes.
Httpns (see page 7142)	This is constant WSDLIntf.Httpns.
Operators (see page 7142)	This is constant WSDLIntf.Operators.
OtherReservedWords (see page 7142)	This is constant WSDLIntf.OtherReservedWords.
ReservedWords (see page 7143)	This is constant WSDLIntf.ReservedWords.
SAddress (see page 7143)	This is constant WSDLIntf.SAddress.
SAnySimpleType (see page 7144)	This is constant WSDLIntf.SAnySimpleType.
SAnyType (see page 7144)	This is constant WSDLIntf.SAnyType.
SArray (see page 7144)	This is constant WSDLIntf.SArray.
SArrayOf (see page 7145)	This is constant WSDLIntf.SArrayOf.
SArrayType (see page 7145)	This is constant WSDLIntf.SArrayType.
SBinding (see page 7145)	This is constant WSDLIntf.SBinding.
SBody (see page 7146)	This is constant WSDLIntf.SBody.
ScalarArrayTypes (see page 7146)	This is constant WSDLIntf.ScalarArrayTypes.
SComplexType (see page 7146)	This is constant WSDLIntf.SComplexType.
SDefinitions (see page 7147)	This is constant WSDLIntf.SDefinitions.
SDynArray (see page 7147)	This is constant WSDLIntf.SDynArray.
SElement (see page 7147)	This is constant WSDLIntf.SElement.
SEncodingStyle (see page 7148)	This is constant WSDLIntf.SEncodingStyle.

SFault (see page 7148)	This is constant WSDLIntf.SFault.
SHeader (see page 7148)	This is constant WSDLIntf.SHeader.
SImport (see page 7149)	This is constant WSDLIntf.SImport.
SInOut (see page 7149)	This is constant WSDLIntf.SInOut.
SInput (see page 7149)	This is constant WSDLIntf.SInput.
SLocation (see page 7150)	This is constant WSDLIntf.SLocation.
SMessage (see page 7150)	This is constant WSDLIntf.SMessage.
SName (see page 7150)	This is constant WSDLIntf.SName.
SNameSpace (see page 7151)	This is constant WSDLIntf.SNameSpace.
SNsPrefix (see page 7151)	This is constant WSDLIntf.SNsPrefix.
Soapns (see page 7151)	This is constant WSDLIntf.Soapns.
SOperation (see page 7152)	This is constant WSDLIntf.SOperation.
SOutput (see page 7152)	This is constant WSDLIntf.SOutput.
SPart (see page 7152)	This is constant WSDLIntf.SPart.
SParts (see page 7153)	This is constant WSDLIntf.SParts.
SPort (see page 7153)	This is constant WSDLIntf.SPort.
SPortType (see page 7153)	This is constant WSDLIntf.SPortType.
SRequest (see page 7154)	This is constant WSDLIntf.SRequest.
SResponse (see page 7154)	This is constant WSDLIntf.SResponse.
SReturn (see page 7154)	This is constant WSDLIntf.SReturn.
SSchema (see page 7155)	This is constant WSDLIntf.SSchema.
SService (see page 7155)	This is constant WSDLIntf.SService.
SSoapAction (see page 7155)	This is constant WSDLIntf.SSoapAction.
SStyle (see page 7156)	This is constant WSDLIntf.SStyle.
STns (see page 7156)	This is constant WSDLIntf.STns.
STransport (see page 7156)	This is constant WSDLIntf.STransport.
SType (see page 7157)	This is constant WSDLIntf.SType.
STypes (see page 7157)	This is constant WSDLIntf.STypes.
SUnknown (see page 7157)	This is constant WSDLIntf.SUnknown.
SUse (see page 7158)	This is constant WSDLIntf.SUse.
SVerb (see page 7158)	This is constant WSDLIntf.SVerb.
tns (see page 7158)	This is constant WSDLIntf.tns.
Wsdlns (see page 7159)	This is constant WSDLIntf.Wsdlns.
xsdns (see page 7159)	This is constant WSDLIntf.xsdns.

Structs, Records, Enums

	Name	Description
	TWebServiceBindingType (see page 7137)	This is record WSDLIntf.TWebServiceBindingType.
	TWSDLElement (see page 7137)	This is record WSDLIntf.TWSDLElement.
	TWString (see page 7138)	This is record WSDLIntf.TWString.

Types

Name	Description
TWSDLElements (see page 7139)	This is type WSDLIntf.TWSDLElements.

77.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TDOMStrings (see page 7133)	This is class WSDLIntf.TDOMStrings.

77.1.1 TDOMStrings Class

Class Hierarchy

Pascal

```
TDOMStrings = class;
```

C++

```
class TDOMStrings;
```

File

WSDLIntf

Description

This is class WSDLIntf.TDOMStrings.

77.1.1.1 TDOMStrings Members

The following tables list the members exposed by TDOMStrings.

Public Methods

	Name	Description
	Add (see page 7134)	This is Add, a member of class TDOMStrings.
	Clear (see page 7135)	This is Clear, a member of class TDOMStrings.
	Count (see page 7135)	This is Count, a member of class TDOMStrings.
	Create (see page 7134)	This is Create, a member of class TDOMStrings.
	Destroy (see page 7134)	This is Destroy, a member of class TDOMStrings.
	IndexOf (see page 7135)	This is IndexOf, a member of class TDOMStrings.
	IndexOfIgnoreCase (see page 7135)	This is IndexOfIgnoreCase, a member of class TDOMStrings.
	Insert (see page 7135)	This is Insert, a member of class TDOMStrings.

Public Properties

	Name	Description
	Strings (see page 7136)	This is Strings, a member of class TDOMStrings.

77.1.1.2 TDOMStrings.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TDOMStrings();
```

Description

This is Create, a member of class TDOMStrings.

77.1.1.3 TDOMStrings.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDOMStrings();
```

Description

This is Destroy, a member of class TDOMStrings.

77.1.1.4 TDOMStrings Methods

The methods of the TDOMStrings class are listed here.

Public Methods

	Name	Description
	Add (see page 7134)	This is Add, a member of class TDOMStrings.
	Clear (see page 7135)	This is Clear, a member of class TDOMStrings.
	Count (see page 7135)	This is Count, a member of class TDOMStrings.
	IndexOf (see page 7135)	This is IndexOf, a member of class TDOMStrings.
	IndexOfIgnoreCase (see page 7135)	This is IndexOfIgnoreCase, a member of class TDOMStrings.
	Insert (see page 7135)	This is Insert, a member of class TDOMStrings.

77.1.1.4.1 TDOMStrings.Add Method

Pascal

```
function Add(const S: DOMString): Integer;
```

C++

```
__fastcall int Add(const DOMString S);
```

Description

This is Add, a member of class TDOMStrings.

77.1.1.4.2 TDOMStrings.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TDOMStrings.

77.1.1.4.3 TDOMStrings.Count Method

Pascal

```
function Count: Integer;
```

C++

```
__fastcall int Count();
```

Description

This is Count, a member of class TDOMStrings.

77.1.1.4.4 TDOMStrings.IndexOf Method

Pascal

```
function IndexOf(const S: DOMString): Integer;
```

C++

```
__fastcall int IndexOf(const DOMString S);
```

Description

This is IndexOf, a member of class TDOMStrings.

77.1.1.4.5 TDOMStrings.IndexOfIgnoreCase Method

Pascal

```
function IndexOfIgnoreCase(const S: DOMString): Integer;
```

C++

```
__fastcall int IndexOfIgnoreCase(const DOMString S);
```

Description

This is IndexOfIgnoreCase, a member of class TDOMStrings.

77.1.1.4.6 TDOMStrings.Insert Method

Pascal

```
procedure Insert(Index: Integer; const S: DOMString);
```

C++

```
__fastcall Insert(int Index, const DOMString S);
```

Description

This is Insert, a member of class TDOMStrings.

77.1.1.5 TDOMStrings Properties

The properties of the TDOMStrings class are listed here.

Public Properties

	Name	Description
	Strings (see page 7136)	This is Strings, a member of class TDOMStrings.

77.1.1.5.1 TDOMStrings.Strings Property

Pascal

```
property Strings [Index: Integer]: DOMString;
```

C++

```
__property DOMString Strings[int Index];
```

Description

This is Strings, a member of class TDOMStrings.

77.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TWebServiceBindingType (see page 7137)	This is record WSDLIntf.TWebServiceBindingType.
	TWSDLElement (see page 7137)	This is record WSDLIntf.TWSDLElement.

Records

	Name	Description
	TWString (see page 7138)	This is record WSDLIntf.TWString.

77.2.1 WSDLIntf.TWebServiceBindingType Enumeration

Pascal

```
TWebServiceBindingType = (
  btUnknown,
  btSoap,
  btHttp,
  btMime,
  btDIME
);
```

C++

```
enum TWebServiceBindingType {
  btUnknown,
  btSoap,
  btHttp,
  btMime,
  btDIME
};
```

File

WSDLIntf

Description

This is record WSDLIntf.TWebServiceBindingType.

77.2.2 WSDLIntf.TWSDLElement Enumeration

Pascal

```
TWSDLElement = (
  weServiceIntf,
  weServiceImpl,
  weMessage,
  wePortType,
  weBinding,
```

```
    weService,
    weTypes,
    WeImport,
    weOperation,
    wePart
  );
```

C++

```
  enum TWSDLElement {
    weServiceIntf,
    weServiceImpl,
    weMessage,
    wePortType,
    weBinding,
    weService,
    weTypes,
    WeImport,
    weOperation,
    wePart
  };
```

File

WSDLIntf

Description

This is record WSDLIntf.TWSDLElement.

77.2.3 WSDLIntf.TWString Record

Pascal

```
  TWString = record
    WString: DOMString;
  end;
```

C++

```
  struct TWString {
    DOMString WString;
  };
```

File

WSDLIntf

Description

This is record WSDLIntf.TWString.

77.3 Types

The following table lists types in this documentation.

Types

Name	Description
TWSDLElements (see page 7139)	This is type WSDLIntf.TWSDLElements.

77.3.1 WSDLIntf.TWSDLElements Type

Pascal

```
TWSDLElements = set of TWSDLElement;
```

C++

```
TWSDLElement TWSDLElements;
```

File

WSDLIntf

Description

This is type WSDLIntf.TWSDLElements.

77.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
Directives (see page 7141)	This is constant WSDLIntf.Directives.
DynArrayTypes (see page 7141)	This is constant WSDLIntf.DynArrayTypes.
Httpns (see page 7142)	This is constant WSDLIntf.Httpns.
Operators (see page 7142)	This is constant WSDLIntf.Operators.
OtherReservedWords (see page 7142)	This is constant WSDLIntf.OtherReservedWords.
ReservedWords (see page 7143)	This is constant WSDLIntf.ReservedWords.
SAddress (see page 7143)	This is constant WSDLIntf.SAddress.
SAnySimpleType (see page 7144)	This is constant WSDLIntf.SAnySimpleType.
SAnyType (see page 7144)	This is constant WSDLIntf.SAnyType.
SArray (see page 7144)	This is constant WSDLIntf.SArray.
SArrayOf (see page 7145)	This is constant WSDLIntf.SArrayOf.
SArrayType (see page 7145)	This is constant WSDLIntf.SArrayType.
SBinding (see page 7145)	This is constant WSDLIntf.SBinding.
SBody (see page 7146)	This is constant WSDLIntf.SBody.
ScalarArrayTypes (see page 7146)	This is constant WSDLIntf.ScalarArrayTypes.
SComplexType (see page 7146)	This is constant WSDLIntf.SComplexType.
SDefinitions (see page 7147)	This is constant WSDLIntf.SDefinitions.
SDynArray (see page 7147)	This is constant WSDLIntf.SDynArray.
SElement (see page 7147)	This is constant WSDLIntf.SElement.
SEncodingStyle (see page 7148)	This is constant WSDLIntf.SEncodingStyle.
SFault (see page 7148)	This is constant WSDLIntf.SFault.
SHeader (see page 7148)	This is constant WSDLIntf.SHeader.
SImport (see page 7149)	This is constant WSDLIntf.SImport.
SInOut (see page 7149)	This is constant WSDLIntf.SInOut.
SInput (see page 7149)	This is constant WSDLIntf.SInput.
SLocation (see page 7150)	This is constant WSDLIntf.SLocation.
SMessage (see page 7150)	This is constant WSDLIntf.SMessage.
SName (see page 7150)	This is constant WSDLIntf.SName.
SNameSpace (see page 7151)	This is constant WSDLIntf.SNameSpace.
SNsPrefix (see page 7151)	This is constant WSDLIntf.SNsPrefix.
Soapns (see page 7151)	This is constant WSDLIntf.Soapns.
SOperation (see page 7152)	This is constant WSDLIntf.SOperation.
SOutput (see page 7152)	This is constant WSDLIntf.SOutput.
SPart (see page 7152)	This is constant WSDLIntf.SPart.
SParts (see page 7153)	This is constant WSDLIntf.SParts.
SPort (see page 7153)	This is constant WSDLIntf.SPort.
SPortType (see page 7153)	This is constant WSDLIntf.SPortType.
SRequest (see page 7154)	This is constant WSDLIntf.SRequest.
SResponse (see page 7154)	This is constant WSDLIntf.SResponse.
SReturn (see page 7154)	This is constant WSDLIntf.SReturn.
SSchema (see page 7155)	This is constant WSDLIntf.SSchema.
SService (see page 7155)	This is constant WSDLIntf.SService.
SSoapAction (see page 7155)	This is constant WSDLIntf.SSoapAction.
SStyle (see page 7156)	This is constant WSDLIntf.SStyle.

STns (see page 7156)	This is constant WSDLIntf.STns.
STransport (see page 7156)	This is constant WSDLIntf.STransport.
SType (see page 7157)	This is constant WSDLIntf.SType.
STypes (see page 7157)	This is constant WSDLIntf.STypes.
SUnknown (see page 7157)	This is constant WSDLIntf.SUnknown.
SUse (see page 7158)	This is constant WSDLIntf.SUse.
SVerb (see page 7158)	This is constant WSDLIntf.SVerb.
tns (see page 7158)	This is constant WSDLIntf.tns.
Wsdlns (see page 7159)	This is constant WSDLIntf.Wsdlns.
xsdns (see page 7159)	This is constant WSDLIntf.xsdns.

77.4.1 WSDLIntf.Directives Constant

Pascal

```
Directives: array[0..43] of string =
('absolute','abstract','assembler','automated','cdecl','contains', 'default','dispid',
'dynamic', 'export','external','far','forward','implements','index','message',
'name','near','nodefault','overload','override','package','pascal','private','protected','publi
c',
'published','read','readonly','register','reintroduce','requires','resident','safecall','stdcal
l',
'stored','virtual','write','writeonly','on','platform','deprecated','local','varargs');
```

C++

```
array[0..43] of string Directives =
('absolute','abstract','assembler','automated','cdecl','contains', 'default','dispid',
'dynamic', 'export','external','far','forward','implements','index','message',
'name','near','nodefault','overload','override','package','pascal','private','protected','publi
c',
'published','read','readonly','register','reintroduce','requires','resident','safecall','stdcal
l',
'stored','virtual','write','writeonly','on','platform','deprecated','local','varargs');
```

File

WSDLIntf

Description

This is constant WSDLIntf.Directives.

77.4.2 WSDLIntf.DynArrayTypes Constant

Pascal

```
DynArrayTypes: array[0..12] of string =
('TIntegerDynArray','TCardinalDynArray','TWordDynArray',
'TSmallIntDynArray','TByteDynArray','TShortIntDynArray','TInt64DynArray','TLongWordDynArray','T
SingleDynArray',
'TDoubleDynArray','TBooleanDynArray','TStringDynArray','TWideStringDynArray');
```

C++

```
array[0..12] of string DynArrayTypes =
('TIntegerDynArray','TCardinalDynArray','TWordDynArray',
'TSmallIntDynArray','TByteDynArray','TShortIntDynArray','TInt64DynArray','TLongWordDynArray','T
SingleDynArray',
```

```
'TDoubleDynArray','TBooleanDynArray','TStringDynArray','TWideStringDynArray');
```

File

WSDLIntf

Description

This is constant WSDLIntf.DynArrayTypes.

77.4.3 WSDLIntf.Httpns Constant

Pascal

```
Httpns = Wsdlns +'http/';
```

C++

```
Httpns = Wsdlns +'http/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.Httpns.

77.4.4 WSDLIntf.Operators Constant

Pascal

```
Operators: array[0..12] of string = ('+','-','*','/','@','^','=','>','<','<>','<=','>=',':=');
```

C++

```
array[0..12] of string Operators = ('+','-','*','/','@','^','=','>','<','<>','<=','>=',':=');
```

File

WSDLIntf

Description

This is constant WSDLIntf.Operators.

77.4.5 WSDLIntf.OtherReservedWords Constant

Pascal

```
OtherReservedWords: array[0..0] of string = ('Application');
```

C++

```
array[0..0] of string OtherReservedWords = ('Application');
```

File

WSDLIntf

Description

This is constant WSDLIntf.OtherReservedWords.

77.4.6 WSDLIntf.ReservedWords Constant

Pascal

```
ReservedWords: array[0..66] of string = ('and', 'array', 'as', 'asm', 'begin','case',
'class','const','constructor','destructor', 'dispinterface', 'div', 'do','downto', 'else',
'end', 'except', 'exports', 'file', 'finalization', 'finally', 'for','function', 'goto',
'high', 'if', 'implementation', 'in','inherited','initialization', 'inline','interface',
'is','label','library', 'low',
'mod','nil','not','object','of','or','out','packed','procedure',
'program','property','raise','record','repeat', 'resourcestring', 'set','shl','shr', 'string',
'then', 'threadvar', 'to','try','type','unit','until','uses','var','while','with','xor');
```

C++

```
array[0..66] of string ReservedWords = ('and', 'array', 'as', 'asm', 'begin','case',
'class','const','constructor','destructor', 'dispinterface', 'div', 'do','downto', 'else',
'end', 'except', 'exports', 'file', 'finalization', 'finally', 'for','function', 'goto',
'high', 'if', 'implementation', 'in','inherited','initialization', 'inline','interface',
'is','label','library', 'low',
'mod','nil','not','object','of','or','out','packed','procedure',
'program','property','raise','record','repeat', 'resourcestring', 'set','shl','shr', 'string',
'then', 'threadvar', 'to','try','type','unit','until','uses','var','while','with','xor');
```

File

WSDLIntf

Description

This is constant WSDLIntf.ReservedWords.

77.4.7 WSDLIntf.SAddress Constant

Pascal

```
SAddress = 'address';
```

C++

```
SAddress = 'address';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SAddress.

77.4.8 WSDLIntf.SAnySimpleType Constant

Pascal

```
SAnySimpleType = 'anySimpleType';
```

C++

```
SAnySimpleType = 'anySimpleType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SAnySimpleType.

77.4.9 WSDLIntf.SAnyType Constant

Pascal

```
SAnyType = 'anyType';
```

C++

```
SAnyType = 'anyType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SAnyType.

77.4.10 WSDLIntf.SArray Constant

Pascal

```
SArray = 'Array';
```

C++

```
SArray = 'Array';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SArray.

77.4.11 WSDLIntf.SArrayOf Constant

Pascal

```
SArrayOf = 'ArrayOf';
```

C++

```
SArrayOf = 'ArrayOf';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SArrayOf.

77.4.12 WSDLIntf.SArrayType Constant

Pascal

```
SArrayType = 'arrayType';
```

C++

```
SArrayType = 'arrayType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SArrayType.

77.4.13 WSDLIntf.SBinding Constant

Pascal

```
SBinding = 'binding';
```

C++

```
SBinding = 'binding';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SBinding.

77.4.14 WSDLIntf.SBody Constant

Pascal

```
SBody = 'body';
```

C++

```
SBody = 'body';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SBody.

77.4.15 WSDLIntf.ScalarArrayTypes Constant

Pascal

```
ScalarArrayTypes: array[0..12] of string =
('Integer','Cardinal','Word','SmallInt','Byte','ShortInt','Int64',
'LongWord','Single','Double','Boolean','String','WideString');
```

C++

```
array[0..12] of string ScalarArrayTypes =
('Integer','Cardinal','Word','SmallInt','Byte','ShortInt','Int64',
'LongWord','Single','Double','Boolean','String','WideString');
```

File

WSDLIntf

Description

This is constant WSDLIntf.ScalarArrayTypes.

77.4.16 WSDLIntf.SComplexType Constant

Pascal

```
SComplexType = 'complexType';
```

C++

```
SComplexType = 'complexType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SComplexType.

77.4.17 WSDLIntf.SDefinitions Constant

Pascal

```
SDefinitions = 'definitions';
```

C++

```
SDefinitions = 'definitions';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SDefinitions.

77.4.18 WSDLIntf.SDynArray Constant

Pascal

```
SDynArray = 'array of ';
```

C++

```
SDynArray = 'array of ';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SDynArray.

77.4.19 WSDLIntf.SElement Constant

Pascal

```
SElement = 'element';
```

C++

```
SElement = 'element';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SElement.

77.4.20 WSDLIntf.SEncodingStyle Constant

Pascal

```
SEncodingStyle = 'encodingStyle';
```

C++

```
SEncodingStyle = 'encodingStyle';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SEncodingStyle.

77.4.21 WSDLIntf.SFault Constant

Pascal

```
SFault = 'fault';
```

C++

```
SFault = 'fault';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SFault.

77.4.22 WSDLIntf.SHeader Constant

Pascal

```
SHeader = 'header';
```

C++

```
SHeader = 'header';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SHeader.

77.4.23 WSDLIntf.SImport Constant

Pascal

```
SImport = 'import';
```

C++

```
SImport = 'import';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SImport.

77.4.24 WSDLIntf.SInOut Constant

Pascal

```
SInOut = 'inout';
```

C++

```
SInOut = 'inout';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SInOut.

77.4.25 WSDLIntf.SInput Constant

Pascal

```
SInput = 'input';
```

C++

```
SInput = 'input';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SInput.

77.4.26 WSDLIntf.SLocation Constant

Pascal

```
SLocation = 'location';
```

C++

```
SLocation = 'location';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SLocation.

77.4.27 WSDLIntf.SMessage Constant

Pascal

```
SMessage = 'message';
```

C++

```
SMessage = 'message';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SMessage.

77.4.28 WSDLIntf.SName Constant

Pascal

```
SName = 'name';
```

C++

```
SName = 'name';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SName.

77.4.29 WSDLIntf.SNameSpace Constant

Pascal

```
SNameSpace = 'namespace';
```

C++

```
SNameSpace = 'namespace';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SNameSpace.

77.4.30 WSDLIntf.SNsPrefix Constant

Pascal

```
SNsPrefix = 'ns';
```

C++

```
SNsPrefix = 'ns';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SNsPrefix.

77.4.31 WSDLIntf.Soapns Constant

Pascal

```
Soapns = Wsdlns +'soap/';
```

C++

```
Soapns = Wsdlns +'soap/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.Soapns.

77.4.32 WSDLIntf.SOperation Constant

Pascal

```
SOperation = 'operation';
```

C++

```
SOperation = 'operation';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SOperation.

77.4.33 WSDLIntf.SOutput Constant

Pascal

```
SOutput = 'output';
```

C++

```
SOutput = 'output';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SOutput.

77.4.34 WSDLIntf.SPart Constant

Pascal

```
SPart = 'part';
```

C++

```
SPart = 'part';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SPart.

77.4.35 WSDLIntf.SParts Constant

Pascal

```
SParts = 'parts';
```

C++

```
SParts = 'parts';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SParts.

77.4.36 WSDLIntf.SPort Constant

Pascal

```
SPort = 'port';
```

C++

```
SPort = 'port';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SPort.

77.4.37 WSDLIntf.SPortType Constant

Pascal

```
SPortType = 'portType';
```

C++

```
SPortType = 'portType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SPortType.

77.4.38 WSDLIntf.SRequest Constant

Pascal

```
SRequest = 'Request';
```

C++

```
SRequest = 'Request';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SRequest.

77.4.39 WSDLIntf.SResponse Constant

Pascal

```
SResponse = 'Response';
```

C++

```
SResponse = 'Response';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SResponse.

77.4.40 WSDLIntf.SReturn Constant

Pascal

```
SReturn = 'return';
```

C++

```
SReturn = 'return';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SReturn.

77.4.41 WSDLIntf.SSchema Constant

Pascal

```
SSchema = 'schema';
```

C++

```
SSchema = 'schema';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SSchema.

77.4.42 WSDLIntf.SService Constant

Pascal

```
SService = 'service';
```

C++

```
SService = 'service';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SService.

77.4.43 WSDLIntf.SSoapAction Constant

Pascal

```
SSoapAction = 'soapAction';
```

C++

```
SSoapAction = 'soapAction';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SSoapAction.

77.4.44 WSDLIntf.SStyle Constant

Pascal

```
SStyle = 'style';
```

C++

```
SStyle = 'style';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SStyle.

77.4.45 WSDLIntf.STns Constant

Pascal

```
STns = 'targetNamespace';
```

C++

```
STns = 'targetNamespace';
```

File

WSDLIntf

Description

This is constant WSDLIntf.STns.

77.4.46 WSDLIntf.STransport Constant

Pascal

```
STransport = 'transport';
```

C++

```
STransport = 'transport';
```

File

WSDLIntf

Description

This is constant WSDLIntf.STransport.

77.4.47 WSDLIntf.SType Constant

Pascal

```
SType = 'type';
```

C++

```
SType = 'type';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SType.

77.4.48 WSDLIntf.STypes Constant

Pascal

```
STypes = 'types';
```

C++

```
STypes = 'types';
```

File

WSDLIntf

Description

This is constant WSDLIntf.STypes.

77.4.49 WSDLIntf.SUnknown Constant

Pascal

```
SUnknown = 'Unknown';
```

C++

```
SUnknown = 'Unknown';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SUnknown.

77.4.50 WSDLIntf.SUse Constant

Pascal

```
SUse = 'use';
```

C++

```
SUse = 'use';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SUse.

77.4.51 WSDLIntf.SVerb Constant

Pascal

```
SVerb = 'verb';
```

C++

```
SVerb = 'verb';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SVerb.

77.4.52 WSDLIntf.tns Constant

Pascal

```
tns = 'http:/'+'/tempuri.org/';
```

C++

```
tns = 'http:/'+'/tempuri.org/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.tns.

77.4.53 WSDLIntf.Wsdlns Constant

Pascal

```
Wsdlns = 'http:/'+'/schemas.xmlsoap.org/wsdl/';
```

C++

```
Wsdlns = 'http:/'+'/schemas.xmlsoap.org/wsdl/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.Wsdlns.

77.4.54 WSDLIntf.xsdns Constant

Pascal

```
xsdns = 'http:/'+'/www.w3.org/1999/XMLSchema';
```

C++

```
xsdns = 'http:/'+'/www.w3.org/1999/XMLSchema';
```

File

WSDLIntf

Description

This is constant WSDLIntf.xsdns.

78 WSDLItems Namespace

This is namespace WSDLItems.

Topics

Name	Description
Classes (see page 7163)	The following table lists classes in this documentation.
Interfaces (see page 7199)	The following table lists interfaces in this documentation.
Functions (see page 7211)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 7213)	The following table lists structs, records, enums in this documentation.
Types (see page 7214)	The following table lists types in this documentation.

Classes

	Name	Description
	TWSDLItems (see page 7163)	TWSDLItems represents the definitions in a WSDL document.

Functions

	Name	Description
	HasDefinition (see page 7211)	This is function WSDLItems.HasDefinition.
	HasDefinition (see page 7211)	This is function WSDLItems.HasDefinition.
	NewQualifiedName (see page 7211)	This is function WSDLItems.NewQualifiedName.

Interfaces

	Name	Description
	IHeaderInfo (see page 7199)	This is class WSDLItems.IHeaderInfo.
	IQualifiedName (see page 7204)	IQualifiedName is the interface for obtaining an information about a name in an XML document.
	IWSDLItems (see page 7208)	IWSDLItems provides access to a WSDL document.

Structs, Records, Enums

	Name	Description
	IterateImportOptions (see page 7213)	This is record WSDLItems.IterateImportOptions.

Types

Name	Description
IHeaderInfoArray (see page 7214)	This is type WSDLItems.IHeaderInfoArray.
IQualifiedNameArray (see page 7214)	This is type WSDLItems.IQualifiedNameArray.

TWSDLIterateProc (see page 7214)	This is type WSDLItems.TWSDLIterateProc.

78.1 Classes

The following table lists classes in this documentation.

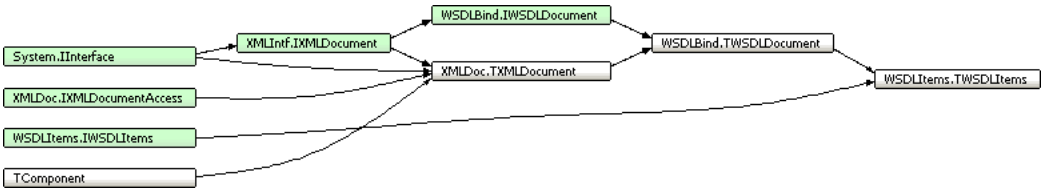
Classes

	Name	Description
	TWSDLItems (see page 7163)	TWSDLItems represents the definitions in a WSDL document.

78.1.1 TWSDLItems Class

TWSDLItems represents the definitions in a WSDL document.

Class Hierarchy



Pascal

```
TWSDLItems = class(TWSDLDocument, IWSDLItems);
```

C++

```
class TWSDLItems : public TWSDLDocument, public IWSDLItems;
```

File

WSDLItems

Description

Use TWSDLItems to represent a WSDL (Web Services Definition Language) document. A WSDL document is a special form of XML document that describes the contents of a Web Service application and how you call the services it implements. TWSDLItems augments its immediate ancestor (TWSDLDocument (see page 7015)) by introducing methods that provide easier access to the definitions in the WSDL document.

TWSDLItems can read an existing WSDL document from a file or server, it can be associated with an in-memory string that is the contents of a WSDL document, or it can create a new, empty WSDL document. TWSDLItems uses an external DOM (Document Object Model) parser to analyze the WSDL document. This parser is usually assigned by specifying the DOMVendor property. When you set the Active property to true, TWSDLItems uses the DOM parser to parse the WSDL document so that you can examine or modify it.

When TWSDLItems is created without an Owner, it behaves like an interfaced object. That is, when all references to its interface are released, the TWSDLItems instance is automatically freed. When TWSDLItems is created with an Owner, however, it behaves like any other component, and is freed by its Owner.

See Also

TWSDLView (see page 7223)

78.1.1.1 TWSDLItems Members

The following tables list the members exposed by TWSDLItems.

Protected Methods

	Name	Description
	_AddRef (see page 7306)	Called when an application uses a component interface.
	_Release (see page 7306)	Called when an application releases a component interface.
	AssignParseOptions (see page 7308)	This is AssignParseOptions, a member of class TXMLDocument.
	CheckActive (see page 7308)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 7308)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 7309)	This is CheckDOM, a member of class TXMLDocument.
	DefineProperties (see page 7311)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 7311)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 7311)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 7312)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 7312)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 7312)	This is DoNodeChange, a member of class TXMLDocument.
	GetActive (see page 7313)	Returns the value of the Active property.
	GetAsyncLoadState (see page 7313)	Returns the value of the AsyncLoadState property.
	GetChildNodeClass (see page 7313)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 7313)	Returns the value of the ChildNodes property.
	GetDefinition (see page 7021)	Returns the value of the Definition property.
	GetDocumentElement (see page 7314)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 7315)	Returns the value of the Node property.
	GetDocumentObject (see page 7315)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 7315)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 7315)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 7316)	Returns the value of the Encoding property.
	GetFileName (see page 7316)	Returns the value of the FileName property.
	GetModified (see page 7316)	Returns the value of the Modified property.
	GetName (see page 7177)	Returns the name of the definitions node in the WSDL document.
	GetNodeIndentStr (see page 7317)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 7317)	Returns the value of the Options property.
	GetParseOptions (see page 7317)	Returns the value of the ParseOptions property.
	GetPrologNode (see page 7317)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 7318)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 7318)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 7318)	Returns the value of the StandAlone property.
	GetTargetNamespace (see page 7194)	Returns the value of the TargetNamespace (see page 7198) property.
	GetTargetNamespacePrefix (see page 7195)	Returns the prefix string that represents the target namespace of the WSDL document.
	GetVersion (see page 7318)	Returns the value of the Version property.
	GetXML (see page 7319)	Returns the value of the XML property.
	InternalSetPrologValue (see page 7319)	This is InternalSetPrologValue, a member of class TXMLDocument.
	LoadData (see page 7021)	This is LoadData, a member of class TWSDLDocument.
	LoadData (see page 7320)	This is LoadData, a member of class TXMLDocument.
	Loaded (see page 7320)	Initializes the component after the form file has been read into memory.
	ReadDOMVendor (see page 7323)	This is ReadDOMVendor, a member of class TXMLDocument.
	ReleaseDoc (see page 7324)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 7326)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 7327)	This is SaveToXMLStrings, a member of class TXMLDocument.

	SetActive (see page 7327)	Sets the value of the Active property.
	SetDefinition (see page 7021)	Sets the value of the Definition property.
	SetDocumentElement (see page 7327)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 7328)	Sets the value of the DOMDocument property.
	SetEncoding (see page 7328)	Sets the value of the Encoding property.
	SetFileName (see page 7328)	Sets the value of the FileName property.
	SetModified (see page 7329)	This is SetModified, a member of class TXMLDocument.
	SetNodeIndentStr (see page 7329)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 7329)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 7330)	Sets the value of the Options property.
	SetParseOptions (see page 7330)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 7330)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 7330)	Sets the value of the StandAlone property.
	SetVersion (see page 7331)	Sets the value of the Version property.
	SetXML (see page 7331)	Sets the value of the XML property.
	SetXMLStrings (see page 7331)	This is SetXMLStrings, a member of class TXMLDocument.
	WriteDOMVendor (see page 7332)	This is WriteDOMVendor, a member of class TXMLDocument.
	XMLStringsChanging (see page 7332)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
	DocBindingInfo (see page 7335)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 7335)	This is DocSource, a member of class TXMLDocument.
	DOMParseOptions (see page 7337)	This is DOMParseOptions, a member of class TXMLDocument.
	DOMPersist (see page 7337)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 7342)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7307)	This is the overview for the AddChild method overload.
	AddChild (see page 7589)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 7020)	Initializes the TWSDLDocument (see page 7015) object after the last constructor has executed.
	AfterConstruction (see page 7307)	Responds after the last constructor has executed.
	CompareName (see page 7171)	Indicates whether two node names refer to the same element.
	Create (see page 7169)	This is the overview for the Create constructor overload.
	Create (see page 7303)	This is the overview for the Create constructor overload.
	CreateElement (see page 7309)	Creates a new element node that is associated with this document.
	CreateElement (see page 7590)	Creates a new element node that is associated with this document.
	CreateNode (see page 7309)	Creates a new node that is associated with this document.
	CreateNode (see page 7591)	Creates a new node that is associated with this document.
	Destroy (see page 7304)	Disposes of a TXMLDocument (see page 7299) object.
	GeneratePrefix (see page 7312)	Generates a unique namespace prefix that can be used for a node in the document.
	GeneratePrefix (see page 7592)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 7592)	Returns the value of the Active (see page 7607) property.
	GetAsyncLoadState (see page 7593)	Returns the value of the AsyncLoadState (see page 7608) property.
	GetBindingForServicePort (see page 7172)	Returns the name of the binding associated with a specified service and port.
	GetBindingOfType (see page 7173)	Returns the names of all bindings associated with a specified port type.
	GetBindingOperationNode (see page 7173)	Returns the interface for a specified operation on a specified binding.
	GetBindings (see page 7174)	Fills a WideString (see page 3476) list with the names of all bindings defined in the WSDL document.

	GetBindingType (see page 7174)	Returns the port type to which a specified binding applies.
	GetChildNodes (see page 7593)	Returns the value of the ChildNodes (see page 7609) property.
	GetDefinition (see page 7117)	Returns the value of the Definition (see page 7118) property.
	GetDocBinding (see page 7314)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 7593)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 7594)	Returns the value of the DocumentElement (see page 7609) property.
	GetDocumentNode (see page 7594)	Returns the value of the Node (see page 7611) property.
	GetDocumentObject (see page 7430)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 7594)	Returns the value of the DOMDocument (see page 7609) property.
	GetDOMPersist (see page 7430)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 7595)	Returns the value of the Encoding (see page 7610) property.
	GetFileName (see page 7595)	Returns the value of the FileName (see page 7610) property.
	GetHttpBindingAttribute (see page 7175)	This is the overview for the GetHttpBindingAttribute method overload.
	GetImports (see page 7175)	Fills a WideString (see page 3476) list with the namespaces of all documents imported by this one.
	GetLocationForImport (see page 7176)	Fills a string list with the names of all messages that must be passed in or out when calling a specified operation.
	GetMessageNode (see page 7176)	Returns the interface for the node that describes a message.
	GetMessages (see page 7177)	Fills a WideString (see page 3476) list with the names of all messages defined in the WSDL document.
	GetModified (see page 7595)	Returns the value of the Modified (see page 7611) property.
	GetNodeIndentStr (see page 7596)	Returns the value of the NodeIndentStr (see page 7612) property.
	GetOperationNode (see page 7177)	Returns the interface for the node that describes an operation.
	GetOperations (see page 7178)	Fills a WideString (see page 3476) list with the names of all operations defined for a specified port type.
	GetOperationsForBinding (see page 7178)	This is GetOperationsForBinding, a member of class TWSDLItems.
	GetOptions (see page 7596)	Returns the value of the Options (see page 7612) property.
	GetParseOptions (see page 7596)	Returns the value of the ParseOptions (see page 7613) property.
	GetPartNode (see page 7179)	Returns the interface for the node that describes a part of a message.
	GetParts (see page 7179)	Fills a list with the names of all parts defined for a specified message.
	GetPartsForOperation (see page 7180)	Fills a list with the names of all parts defined for input messages of a specified operation.
	GetPortsForService (see page 7180)	Fills a list with the names of all ports defined within a specified service.
	GetPortTypeNode (see page 7181)	Returns the interface for the node that describes a port type defined in the WSDL document.
	GetPortTypes (see page 7181)	Fills a list with the names of all port types defined in the WSDL document.
	GetSchemaNode (see page 7182)	Returns the interface for the schema node that defines a type.
	GetSchemaRef (see page 7596)	Returns the value of the SchemaRef (see page 7613) property.
	GetSchemas (see page 7182)	Fills a list with the namespaces for all schema definitions of types in the WSDL document.
	GetServiceAndPortOfBinding (see page 7183)	Retrieves the names of the service and port associated with a specified binding.
	GetServiceNode (see page 7183)	Returns the interface for the node that describes a service defined in the WSDL document.
	GetServices (see page 7184)	Fills a list with the names of all services defined in the WSDL document.
	GetSoapAction (see page 7184)	Returns the value of the soapAction attribute of a specified operation on a specified binding.
	GetSoapActionList (see page 7185)	Fills a list with the soapAction attributes for all operations on a specified SOAP binding.
	GetSoapAddressForServicePort (see page 7185)	Returns the address of a specified port from a specified service.
	GetSoapBindingAttribute (see page 7186)	Returns the value of a specified attribute of a specified SOAP binding.
	GetSoapBindingInputNode (see page 7186)	Returns the interface for the input node on a specified binding and operation.
	GetSoapBindingIONode (see page 7187)	Returns the interface for a node on a specified binding and operation.
	GetSoapBindingOutputNode (see page 7188)	Returns the interface for the output node on a specified binding and operation.
	GetSoapBodyAttribute (see page 7188)	Returns the value of an attribute of a body tag of a message type in an operation on the port type of a SOAP binding.
	GetSoapBodyInputAttribute (see page 7189)	Returns the value of an attribute of a body tag of an input message in an operation on the port type of a SOAP binding.

	GetSoapBodyNamespace (see page 7190)	Returns the value of the first namespace attribute found on a SOAP body node inside a binding with a specified port type.
	GetSoapBodyOutputAttribute (see page 7190)	Returns the value of an attribute of a body tag of an output message in an operation on the port type of a SOAP binding.
	GetSoapHeaders (see page 7191)	Returns an interface for accessing a specified set of header nodes.
	GetSoapInputHeaders (see page 7192)	Returns an interface for accessing the header nodes that belong to the input node of a specified binding and operation.
	GetSoapOperationAttribute (see page 7192)	Returns the value of an attribute on the <soap:operation> node of an operation on a SOAP binding.
	GetSoapOperationStyle (see page 7193)	Returns the value of the style attribute of a specified operation on a specified binding.
	GetSoapOutputHeaders (see page 7193)	Returns an interface for accessing the header nodes that belong to the output node of a specified binding and operation.
	GetStandAlone (see page 7597)	Returns the value of the StandAlone (see page 7614) property.
	GetVersion (see page 7597)	Returns the value of the Version (see page 7614) property.
	GetWSDLDoc (see page 7195)	Returns the interface for this TWSDLItems (see page 7163) instance.
	GetWSDLItems (see page 7195)	Returns a reference to this TWSDLItems (see page 7163) instance.
	GetXML (see page 7597)	Returns the value of the XML (see page 7614) property.
	HasTypesNode (see page 7196)	Indicates whether the WSDL document includes any type definitions.
	IsEmptyDoc (see page 7319)	Indicates whether the TXMLDocument (see page 7299) instance represents an empty document.
	IsEmptyDoc (see page 7598)	Indicates whether the IXMLDocument (see page 7586) instance represents an empty document.
	IsPortTypeHTTPBound (see page 7196)	Indicates whether a specified port type has an HTTP binding.
	IterateImports (see page 7196)	Executes a callback for every WSDL document that this one imports.
	Load (see page 7197)	Loads a WSDL document and activates it.
	LoadFromFile (see page 7321)	Loads an XML (see page 7344) document and activates it.
	LoadFromFile (see page 7598)	Loads an XML (see page 7614) document from disk.
	LoadFromStream (see page 7321)	Loads an XML (see page 7344) document from a stream and activates it.
	LoadFromStream (see page 7599)	Loads an XML (see page 7614) document from a stream and activates it.
	LoadFromXML (see page 7322)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 7599)	This is the overview for the LoadFromXML method overload.
	NewInstance (see page 7322)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7323)	Updates the parsed XML (see page 7344) document to reflect external changes.
	Refresh (see page 7600)	Updates the parsed XML (see page 7614) document to reflect external changes.
	RegisterDocBinding (see page 7324)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 7600)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7325)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 7601)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7325)	Saves the XML (see page 7344) document to disk.
	SaveToFile (see page 7601)	Saves the XML (see page 7614) document to disk.
	SaveToStream (see page 7325)	Saves the XML (see page 7344) document to a stream.
	SaveToStream (see page 7602)	Saves the XML (see page 7614) document to a stream.
	SaveToXML (see page 7326)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 7602)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7603)	Sets the value of the Active (see page 7607) property.
	SetDefinition (see page 7117)	Sets the value of the Definition (see page 7118) property.
	SetDocumentElement (see page 7603)	Sets the value of the DocumentElement (see page 7609) property.
	SetDOMDocument (see page 7604)	Sets the value of the DOMDocument (see page 7609) property.
	SetEncoding (see page 7604)	Sets the value of the Encoding (see page 7610) property.
	SetFileName (see page 7604)	Sets the value of the FileName (see page 7610) property.
	SetNodeIndentStr (see page 7605)	Sets the value of the NodeIndentStr (see page 7612) property.

	SetOnAsyncLoad (see page 7605)	Supplies an event handler that responds when the AsyncLoadState (see page 7608) property changes.
	SetOptions (see page 7605)	Sets the value of the Options (see page 7612) property.
	SetParseOptions (see page 7606)	Sets the value of the ParseOptions (see page 7613) property.
	SetStandAlone (see page 7606)	Sets the value of the StandAlone (see page 7614) property.
	SetVersion (see page 7606)	Sets the value of the Version (see page 7614) property.
	SetXML (see page 7607)	Sets the value of the XML (see page 7614) property.

Public Properties

	Name	Description
	Active (see page 7607)	Specifies whether the XML (see page 7614) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 7334)	Indicates the state of the DOM parser when it parses the XML (see page 7344) document asynchronously.
R	AsyncLoadState (see page 7608)	Indicates the state of the DOM parser when it parses the XML (see page 7614) document asynchronously.
R	ChildNodes (see page 7335)	Lists all of the child nodes of the document.
R	ChildNodes (see page 7609)	Lists all of the child nodes of the document.
	Definition (see page 7118)	Provides access to the definitions contained in the WSDL document.
	Definition (see page 7022)	Provides access to the definitions contained in the WSDL document.
	DocumentElement (see page 7335)	Provides access to the root node of the XML (see page 7344) document.
	DocumentElement (see page 7609)	Provides access to the root node of the XML (see page 7614) document.
R	DocumentObject (see page 7430)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 7336)	Provides access to the DOM interface for the parsed XML (see page 7344) document.
	DOMDocument (see page 7609)	Provides access to the DOM interface for the parsed XML (see page 7614) document.
	DOMImplementation (see page 7337)	This is DOMImplementation, a member of class TXMLDocument.
R	DOMPersist (see page 7431)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 7338)	Indicates the character set that the XML (see page 7344) document uses to encode characters.
	Encoding (see page 7610)	Indicates the character set that the XML (see page 7614) document uses to encode characters.
	FileName (see page 7610)	Indicates the XML (see page 7614) document file, if any, that this interface represents.
R	Modified (see page 7339)	Indicates whether the XML (see page 7344) document has been modified.
R	Modified (see page 7611)	Indicates whether the XML (see page 7614) document has been modified.
R	Node (see page 7340)	Provides access to the document node for the XML (see page 7344) document.
R	Node (see page 7611)	Provides access to the document node for the XML (see page 7614) document.
	NodeIndentStr (see page 7612)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7614) text.
	NSPrefixBase (see page 7341)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 7612)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7613)	Specifies implementation-specific options that are followed when parsing the XML (see page 7614) document.
R	SchemaRef (see page 7343)	Returns the name of the schema associated with this XML (see page 7344) document.
R	SchemaRef (see page 7613)	Returns the name of the schema associated with this XML (see page 7614) document.
	StandAlone (see page 7343)	Indicates whether the XML (see page 7344) document includes any external markup declarations.
	StandAlone (see page 7614)	Indicates whether the XML (see page 7614) document includes any external markup declarations.
R	StreamLoader (see page 7197)	Provides access to an interface for loading the WSDL document.
R	TargetNamespace (see page 7198)	Provides access to an interface for loading the WSDL document.
	Version (see page 7343)	Indicates the XML (see page 7344) version that the document uses.
	Version (see page 7614)	Indicates the XML (see page 7614) version that the document uses.

	XML (see page 7614)	Specifies the content of the XML document associated with this IXMLDocument (see page 7586) interface.

Published Events

	Name	Description
	AfterClose (see page 7344)	Occurs after the XML (see page 7344) document is closed.
	AfterNodeChange (see page 7345)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 7345)	Occurs immediately after the XML (see page 7344) document is opened.
	BeforeClose (see page 7346)	Occurs immediately before the XML (see page 7344) document is closed.
	BeforeNodeChange (see page 7346)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 7347)	Occurs immediately before the XML (see page 7344) document is opened.
	OnAsyncLoad (see page 7347)	Occurs at various stages during the asynchronous parsing of an XML (see page 7344) document.

Published Properties

	Name	Description
	Active (see page 7333)	Specifies whether the XML (see page 7344) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 7337)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 7344) document.
	FileName (see page 7339)	Specifies the file name for the XML (see page 7344) document associated with this TXMLDocument (see page 7299) object.
	NodeIndentStr (see page 7340)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7344) text.
	Options (see page 7341)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7342)	Specifies implementation-specific options that are followed when parsing the XML (see page 7344) document.
	XML (see page 7344)	Specifies the content of the XML document associated with this TXMLDocument (see page 7299) object.

78.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TWSDLItems.Create (TComponent) (see page 7169)	Creates and initializes a TWSDLItems (see page 7163) object.
	TWSDLItems.Create (TWSDLItems, IStreamLoader) (see page 7169)	Creates and initializes a TWSDLItems (see page 7163) object.

78.1.1.2.1 TWSDLItems.Create Constructor (TComponent)

Creates and initializes a TWSDLItems (see page 7163) object.

Pascal

```
constructor Create(AOwner: TComponent); override; overload;
constructor Create(const WSDLItems: TWSDLItems; const StreamLoader: IStreamLoader); virtual;
overload;
```

C++

```
virtual __fastcall TWSDLItems(TComponent * AOwner);
virtual __fastcall TWSDLItems(const TWSDLItems WSDLItems, const IStreamLoader StreamLoader);
```

Description

Call Create to instantiate a TWSDLItems (see page 7163) component at runtime. Typically, TWSDLItems (see page 7163) instances are created by other components, such as THTTPRIO, that use them.

AOwner is another component, typically a form or data module, that is responsible for freeing the TWSDLItems (see page 7163) instance. It becomes the value of the Owner property.

WSDLItems (see page 7161) is another TWSDLItems (see page 7163) object that the new instance can use to extract a stream loader if none is specified using the StreamLoader (see page 7197) property,

StreamLoader (see page 7197) is an interface to use for loading the WSDL document from a server. It includes properties for specifying the user name, password, and proxy server needed to connect to the server that hosts the WSDL document.

If you do not specify a stream loader, the TWSDLItems (see page 7163) constructor creates one as follows: Using the first syntax, it creates a default stream loader object. Using the second syntax, it uses the stream loader from the TWSDLItems (see page 7163) instance that is the first parameter. Thus, when using the second syntax, you must supply either the WSDLItems (see page 7161) or StreamLoader (see page 7197) argument.

THTTPRio

Owner

78.1.1.3 TWSDLItems Methods

The methods of the TWSDLItems class are listed here.

Protected Methods

	Name	Description
	GetName (see page 7177)	Returns the name of the definitions node in the WSDL document.
	GetTargetNamespace (see page 7194)	Returns the value of the TargetNamespace (see page 7198) property.
	GetTargetNamespacePrefix (see page 7195)	Returns the prefix string that represents the target namespace of the WSDL document.

Public Methods

	Name	Description
	CompareName (see page 7171)	Indicates whether two node names refer to the same element.
	GetBindingForServicePort (see page 7172)	Returns the name of the binding associated with a specified service and port.
	GetBindingOfType (see page 7173)	Returns the names of all bindings associated with a specified port type.
	GetBindingOperationNode (see page 7173)	Returns the interface for a specified operation on a specified binding.
	GetBindings (see page 7174)	Fills a WideString (see page 3476) list with the names of all bindings defined in the WSDL document.
	GetBindingType (see page 7174)	Returns the port type to which a specified binding applies.
	GetHttpBindingAttribute (see page 7175)	This is the overview for the GetHttpBindingAttribute method overload.
	GetImports (see page 7175)	Fills a WideString (see page 3476) list with the namespaces of all documents imported by this one.
	GetLocationForImport (see page 7176)	Fills a string list with the names of all messages that must be passed in or out when calling a specified operation.
	GetMessageNode (see page 7176)	Returns the interface for the node that describes a message.
	GetMessages (see page 7177)	Fills a WideString (see page 3476) list with the names of all messages defined in the WSDL document.
	GetOperationNode (see page 7177)	Returns the interface for the node that describes an operation.
	GetOperations (see page 7178)	Fills a WideString (see page 3476) list with the names of all operations defined for a specified port type.
	GetOperationsForBinding (see page 7178)	This is GetOperationsForBinding, a member of class TWSDLItems.
	GetPartNode (see page 7179)	Returns the interface for the node that describes a part of a message.

	GetParts (see page 7179)	Fills a list with the names of all parts defined for a specified message.
	GetPartsForOperation (see page 7180)	Fills a list with the names of all parts defined for input messages of a specified operation.
	GetPortsForService (see page 7180)	Fills a list with the names of all ports defined within a specified service.
	GetPortTypeNode (see page 7181)	Returns the interface for the node that describes a port type defined in the WSDL document.
	GetPortTypes (see page 7181)	Fills a list with the names of all port types defined in the WSDL document.
	GetSchemaNode (see page 7182)	Returns the interface for the schema node that defines a type.
	GetSchemas (see page 7182)	Fills a list with the namespaces for all schema definitions of types in the WSDL document.
	GetServiceAndPortOfBinding (see page 7183)	Retrieves the names of the service and port associated with a specified binding.
	GetServiceNode (see page 7183)	Returns the interface for the node that describes a service defined in the WSDL document.
	GetServices (see page 7184)	Fills a list with the names of all services defined in the WSDL document.
	GetSoapAction (see page 7184)	Returns the value of the soapAction attribute of a specified operation on a specified binding.
	GetSoapActionList (see page 7185)	Fills a list with the soapAction attributes for all operations on a specified SOAP binding.
	GetSoapAddressForServicePort (see page 7185)	Returns the address of a specified port from a specified service.
	GetSoapBindingAttribute (see page 7186)	Returns the value of a specified attribute of a specified SOAP binding.
	GetSoapBindingInputNode (see page 7186)	Returns the interface for the input node on a specified binding and operation.
	GetSoapBindingIONode (see page 7187)	Returns the interface for a node on a specified binding and operation.
	GetSoapBindingOutputNode (see page 7188)	Returns the interface for the output node on a specified binding and operation.
	GetSoapBodyAttribute (see page 7188)	Returns the value of an attribute of a body tag of a message type in an operation on the port type of a SOAP binding.
	GetSoapBodyInputAttribute (see page 7189)	Returns the value of an attribute of a body tag of an input message in an operation on the port type of a SOAP binding.
	GetSoapBodyNamespace (see page 7190)	Returns the value of the first namespace attribute found on a SOAP body node inside a binding with a specified port type.
	GetSoapBodyOutputAttribute (see page 7190)	Returns the value of an attribute of a body tag of an output message in an operation on the port type of a SOAP binding.
	GetSoapHeaders (see page 7191)	Returns an interface for accessing a specified set of header nodes.
	GetSoapInputHeaders (see page 7192)	Returns an interface for accessing the header nodes that belong to the input node of a specified binding and operation.
	GetSoapOperationAttribute (see page 7192)	Returns the value of an attribute on the <soap:operation> node of an operation on a SOAP binding.
	GetSoapOperationStyle (see page 7193)	Returns the value of the style attribute of a specified operation on a specified binding.
	GetSoapOutputHeaders (see page 7193)	Returns an interface for accessing the header nodes that belong to the output node of a specified binding and operation.
	GetWSDLDoc (see page 7195)	Returns the interface for this TWSDLItems (see page 7163) instance.
	GetWSDLItems (see page 7195)	Returns a reference to this TWSDLItems (see page 7163) instance.
	HasTypesNode (see page 7196)	Indicates whether the WSDL document includes any type definitions.
	IsPortTypeHTTPBound (see page 7196)	Indicates whether a specified port type has an HTTP binding.
	IterateImports (see page 7196)	Executes a callback for every WSDL document that this one imports.
	Load (see page 7197)	Loads a WSDL document and activates it.

78.1.1.3.1 TWSDLItems.CompareName Method

Indicates whether two node names refer to the same element.

Pascal

```
function CompareName(const NodeName: DOMString; const OtherName: DOMString; const TNS:
DOMString = ''): boolean;
```

C++

```
__fastcall boolean CompareName(const DOMString NodeName, const DOMString OtherName, const
DOMString TNS = '');
```

Description

Call CompareName to compare the names of two nodes to determine whether they match. CompareName compares the node names, taking into account any namespace prefix added to the node names. CompareName uses the namespace prefix to look up the corresponding namespace URI. If either node name does not have a namespace prefix, CompareName uses the TargetNamespace (see page 7198) property for the first node name, and the supplied namespace for the second. CompareName can find a match between two node names that have different namespace prefixes, as long as both prefixes map to the same namespace URI.

NodeName and OtherName are the two node names to compare.

TNS is the target namespace for OtherName. If this is a nonempty string, it is used to replace the namespace of OtherName. If it is an empty string, OtherName uses the namespace associated with its namespace prefix, or the TargetNamespace (see page 7198) property if it has no namespace prefix.

CompareName returns true if the two names match, false if they differ (either in the local name, or in the namespace to which the names belong).

See Also

NodeName (see page 7639)

TargetNamespace (see page 7198)

78.1.1.3.2 TWSDLItems.GetBindingForServicePort Method

Returns the name of the binding associated with a specified service and port.

Pascal

```
function GetBindingForServicePort(const ServiceName: DOMString; const PortName: DOMString):
IQualifiedName;
```

C++

```
__fastcall IQualifiedName GetBindingForServicePort(const DOMString ServiceName, const
DOMString PortName);
```

Description

Call GetBindingForServicePort to retrieve the name of a binding that is associated with the specified service and port. The binding is defined in the WSDL document or another document that it imports. A binding identifies an encoding format (e.g. soap:rpc) and communications protocol (eg. HTML) that is available for a specific port type (interface).

ServiceName is the name of the service to which the desired binding belongs.

PortName is the name of a port within the specified service that uses the binding.

See Also

GetBindings (see page 7174)

GetBindingType (see page 7174)

GetPortsForService (see page 7180)

GetServices (see page 7184)

GetBindingOfType (see page 7173)

GetServiceAndPortOfBinding (see page 7183)

78.1.1.3.3 TWSDLItems.GetBindingOfType Method

Returns the names of all bindings associated with a specified port type.

Pascal

```
function GetBindingOfType(const BindingTypeName: DOMString; const TNS: DOMString = ''):
IQualifiedNameArray; overload;
```

C++

```
__fastcall IQualifiedNameArray GetBindingOfType(const DOMString BindingTypeName, const
DOMString TNS = '');
```

Description

Call GetBindingOfType to retrieve the names of the bindings that are associated with the specified port type. Each bindings is defined in the WSDL document or another document that it imports. A binding identifies an encoding format (e.g. soap:rpc) and communications protocol (eg. HTML) that is available for a specific port type (interface).

BindingTypeName is the type of the binding. This is the name of a port type for which the binding describes an encoding format and communications protocol.

TNS is the namespace in which BindingTypeName is defined. If this parameter is omitted, GetBindingOfType assumes the value of the TargetNamespace (see page 7198) property.

GetBindingOfType returns an array of qualified names for each binding defined for the specified type.

See Also

GetBindings (see page 7174)

GetPortTypes (see page 7181)

GetBindingType (see page 7174)

TargetNamespace (see page 7198)

78.1.1.3.4 TWSDLItems.GetBindingOperationNode Method

Returns the interface for a specified operation on a specified binding.

Pascal

```
function GetBindingOperationNode(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation GetBindingOperationNode(const DOMString BindingName, const
DOMString Operation, int OverloadIndex);
```

Description

Call GetBindingOperationNode to retrieve the operation interface for a SOAP binding. GetBindingOperationNode locates a binding with the specified name, and searches its child nodes for an operation node with the specified name. If there is more than one operation with the specified name (that is, if the method is overloaded), GetBindingOperationNode locates the desired overload based on its position.

BindingName is the name of the binding. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that binding node. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node to choose if there are overloaded methods. 0 indicates the first operation node with the specified name, 1 indicates the second operation node with that name, and so on.

GetBindingOperationNode returns an IBindingOperation (see page 7034) interface, which can be used to access the name, inputs, outputs, and faults associated with the operation. If GetBindingOperationNode is unable to locate an operation node for the specified binding and operation names, it returns nil (Delphi) or NULL (C++).

See Also

GetOperationNode (see page 7177)

78.1.1.3.5 TWSDLItems.GetBindings Method

Fills a WideString (see page 3476) list with the names of all bindings defined in the WSDL document.

Pascal

```
procedure GetBindings(BindingNames: TDOMStrings; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetBindings(TDOMStrings BindingNames, Boolean QualifiedNames = False);
```

Description

Call GetBindings to retrieve the names of all bindings defined in the WSDL document. A binding identifies an encoding format (e.g. soap:rpc) and communications protocol (eg. HTML) that is available for a specific port type (interface).

BindingNames is an existing TWideStrings object to which the names of any defined bindings are added.

QualifiedNames indicates whether the binding names should be qualified using the target namespace prefix.

Note: GetBindings does not clear the WideString (see page 3476) list before adding the names of all defined bindings.

See Also

GetBindingForServicePort (see page 7172)

GetBindingType (see page 7174)

GetPortTypes (see page 7181)

78.1.1.3.6 TWSDLItems.GetBindingType Method

Returns the port type to which a specified binding applies.

Pascal

```
function GetBindingType(const BindingName: DOMString): DOMString;
```

C++

```
__fastcall DOMString GetBindingType(const DOMString BindingName);
```

Description

Call GetBindingType to retrieve the names of the port type to which a specified binding applies.

BindingName is the name of a binding defined in the WSDL document.

See Also

GetBindingForServicePort (see page 7172)

GetBindings (see page 7174)

GetPortTypes (see page 7181)

GetBindingOfType (see page 7173)

78.1.1.3.7 GetHttpBindingAttribute Method

This is the overview for the GetHttpBindingAttribute method overload.

Overload List

	Name	Description
	TWSDLItems.GetHttpBindingAttribute (DOMString, DOMString) (see page 7175)	Returns the value of a specified attribute of a binding's <http:binding> node.
	TWSDLItems.GetHttpBindingAttribute (IQualifiedName, DOMString) (see page 7175)	Returns the value of a specified attribute of a binding's <http:binding> node.

78.1.1.3.7.1 TWSDLItems.GetHttpBindingAttribute Method (DOMString, DOMString)

Returns the value of a specified attribute of a binding's <http:binding> node.

Pascal

```
function GetHttpBindingAttribute(const BindingName: DOMString; Attribute: DOMString):
DOMString; overload;
function GetHttpBindingAttribute(const QualifiedName: IQualifiedName; Attribute: DOMString):
DOMString; overload;
```

C++

```
__fastcall DOMString GetHttpBindingAttribute(const DOMString BindingName, DOMString Attribute);
__fastcall DOMString GetHttpBindingAttribute(const IQualifiedName QualifiedName, DOMString
Attribute);
```

Description

Call GetHttpBindingAttribute to retrieve value of an attribute on the http binding tag of a specified binding. The http binding tag can come from the WSDL document or another document that it imports.

BindingName or QualifiedName is the name of the binding that includes the <http:binding> tag.

Attribute is the name of the desired attribute on the <http:binding> tag.

See Also

GetSoapBindingAttribute (see page 7186)

GetSoapFaultAttribute

GetSoapHeaderAttribute

GetSoapOperationAttribute (see page 7192)

GetSoapBodyAttribute (see page 7188)

78.1.1.3.8 TWSDLItems.GetImports Method

Fills a WideString (see page 3476) list with the namespaces of all documents imported by this one.

Pascal

```
procedure GetImports(ImportNames: TDOMStrings);
```

C++

```
__fastcall GetImports(TDOMStrings ImportNames);
```

Description

Call GetImports to retrieve the namespaces for of all documents that are imported into this one using an <import> tag. The location of these imported documents can be retrieved from the namespace using the GetLocationForImport (see page 7176) method.

ImportNames is an existing TWideStrings object to which the namespaces for any imports are added.

Note: GetImports does not clear the WideString (see page 3476) list before adding the namespaces for all imported documents.

See Also

GetLocationForImport (see page 7176)

78.1.1.3.9 TWSDLItems.GetLocationForImport Method

Fills a string list with the names of all messages that must be passed in or out when calling a specified operation.

Pascal

```
function GetLocationForImport(const ImportNameSpace: DOMString): DOMString;
```

C++

```
__fastcall DOMString GetLocationForImport(const DOMString ImportNameSpace);
```

Description

Call GetLocationForImport to retrieve the URI that indicates the location of an imported document, given its namespace.

ImportNameSpace is the namespace that identifies another document that is imported into this WSDL document. It is one of the strings retrieved by the GetImports (see page 7175) method.

See Also

GetImports (see page 7175)

78.1.1.3.10 TWSDLItems.GetMessageNode Method

Returns the interface for the node that describes a message.

Pascal

```
function GetMessageNode(const MessageName: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetMessageNode(const DOMString MessageName);
```

Description

Call GetMessageNode to obtain information about a message defined in the WSDL document. A message describes a single item of data that is passed in or out when executing an operation (method). The parameters and return value of a method each map onto a message.

MessageName is the name of the message whose node is returned.

See Also

GetMessages (see page 7177)

GetParts (see page 7179)

78.1.1.3.11 TWSDLItems.GetMessages Method

Fills a WideString (see page 3476) list with the names of all messages defined in the WSDL document.

Pascal

```
procedure GetMessages(MessageNames: TDOMStrings; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetMessages(TDOMStrings MessageNames, Boolean QualifiedNames = False);
```

Description

Call GetMessages to retrieve the names of all messages defined in the WSDL document. Each message describes a single item of data that is passed in or out when executing an operation (method). The parameters and return value of a method each map onto a message.

MessageNames is an existing TWideStrings object to which the names of all messages are added.

QualifiedNames indicates whether the message names added to the list should be qualified using the target namespace prefix.

Note: GetMessages does not clear the WideString (see page 3476) list before adding the message names defined in the WSDL document.

See Also

GetMessageNode (see page 7176)

GetParts (see page 7179)

78.1.1.3.12 TWSDLItems.GetName Method

Returns the name of the definitions node in the WSDL document.

Pascal

```
function GetName: DOMString;
```

C++

```
__fastcall DOMString GetName();
```

Description

The root node of a WSDL document is always a definitions node. This node gives a name to the set of definitions in the WSDL document. Call GetName to retrieve that name.

See Also

Definition (see page 7022)

GetTargetNamespace (see page 7194)

78.1.1.3.13 TWSDLItems.GetOperationNode Method

Returns the interface for the node that describes an operation.

Pascal

```
function GetOperationNode(const PortTypeName: DOMString; const OperationName: DOMString):
IXMLNode;
```

C++

```
__fastcall IXMLNode GetOperationNode(const DOMString PortTypeName, const DOMString
OperationName);
```

Description

Call GetOperationNode to obtain information about an operation defined in the WSDL document. An operation corresponds to a method on the interface that corresponds to a specified port type.

PortTypeName is the name of the port type that contains the specified operation.

OperationName is the name of the operation whose node is returned.

See Also

GetOperations (see page 7178)

getoperationsforbinding (see page 7178)

GetPortTypes (see page 7181)

78.1.1.3.14 TWSDLItems.GetOperations Method

Fills a WideString (see page 3476) list with the names of all operations defined for a specified port type.

Pascal

```
procedure GetOperations(const PortTypeName: DOMString; OperationNames: TDOMStrings;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetOperations(const DOMString PortTypeName, TDOMStrings OperationNames, Boolean
QualifiedNames = False);
```

Description

Call GetOperations to retrieve the names of all operations defined in for the port type specified by PortTypeName. An operation corresponds to a method on the interface that corresponds to the specified port type.

PortTypeName is the name of the port type whose operations are retrieved.

OperationNames is an existing TWideStrings object to which the names of all operations on PortTypeName are added.

QualifiedNames indicates whether the operation names added to the list should be qualified using the target namespace prefix.

Note: GetOperations does not clear the WideString (see page 3476) list before adding the names of the operations on the specified port type.

See Also

GetOperationNode (see page 7177)

getoperationsforbinding (see page 7178)

GetPortTypes (see page 7181)

78.1.1.3.15 TWSDLItems.GetOperationsForBinding Method

Pascal

```
procedure GetOperationsForBinding(const BindingName: DOMString; OperationNames: TDOMStrings;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetOperationsForBinding(const DOMString BindingName, TDOMStrings OperationNames,
Boolean QualifiedNames = False);
```

Description

This is GetOperationsForBinding, a member of class TWSDLItems.

78.1.1.3.16 TWSDLItems.GetPartNode Method

Returns the interface for the node that describes a part of a message.

Pascal

```
function GetPartNode(const MessageName: DOMString; const PartName: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetPartNode(const DOMString MessageName, const DOMString PartName);
```

Description

Call GetPartNode to obtain information about a part that is defined for a message. Every message consists of one or more parts, each of which is associated with a definition from some type system.

MessageName is the name of the message that is defined using the part.

PartName is the name of the part whose node is returned.

See Also

GetParts (see page 7179)

GetMessages (see page 7177)

GetPartsForOperation (see page 7180)

78.1.1.3.17 TWSDLItems.GetParts Method

Fills a list with the names of all parts defined for a specified message.

Pascal

```
procedure GetParts(const MessageName: DOMString; PartNames: TDOMStrings; QualifiedNames:
Boolean = False);
```

C++

```
__fastcall GetParts(const DOMString MessageName, TDOMStrings PartNames, Boolean QualifiedNames
= False);
```

Description

Call GetParts to retrieve the names of all parts that make up a specified message. A part corresponds to definition from some type system.

MessageName is the name of the message whose parts are retrieved.

PartNames is an existing TWideStrings object to which the names of all parts on MessageName are added.

QualifiedNames indicates whether the part names added to the list should be qualified using the target namespace prefix.

Note: GetParts does not clear the WideString (see page 3476) list before adding the names of the parts of the specified message.

See Also

GetPartNode (see page 7179)

GetMessages (see page 7177)

GetPartsForOperation (see page 7180)

78.1.1.3.18 TWSDLItems.GetPartsForOperation Method

Fills a list with the names of all parts defined for input messages of a specified operation.

Pascal

```
function GetPartsForOperation(const PortTypeName: DOMString; const OperationName: DOMString;
OperationIndex: Integer; PartNames: TDOMStrings): Boolean;
```

C++

```
__fastcall Boolean GetPartsForOperation(const DOMString PortTypeName, const DOMString
OperationName, int OperationIndex, TDOMStrings PartNames);
```

Description

Call GetPartsForOperation to retrieve the names of all parts that make up input messages on a specified operation. The part definition must be in the WSDL document or a document that it imports. A part corresponds to definition from some type system.

PortTypeName is the name of the port type that contains the operation. A port type corresponds to an invokable interface in a Web Service application.

OperationName is the name of the operation from whose input messages the parts are retrieved. An operation corresponds to a method on the interface that corresponds to PortTypeName.

PartNames is an existing TWideStrings object to which the names of all parts on input messages (input parameters) of the operation specified by OperationName.

GetPartsForOperation returns true if it adds any part names to PartNames, false if there are no parts to add.

Note: GetPartsForOperation does not clear the WideString (see page 3476) list before adding the names of the parts of the specified message.

See Also

GetPartNode (see page 7179)

GetParts (see page 7179)

GetOperations (see page 7178)

78.1.1.3.19 TWSDLItems.GetPortsForService Method

Fills a list with the names of all ports defined within a specified service.

Pascal

```
procedure GetPortsForService(const ServiceName: DOMString; PortNames: TDOMStrings;
SkipHttpBindings: Boolean = True; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetPortsForService(const DOMString ServiceName, TDOMStrings PortNames, Boolean
SkipHttpBindings = True, Boolean QualifiedNames = False);
```

Description

Call GetPortsForService to retrieve the names of all ports defined for the specified service. A port represents a binding, plus the address where that binding can be found.

ServiceName is the name of the service whose ports are listed.

PortNames is an existing TWideStrings object to which the names of all ports in the specified service are added.

SkipHttpBindings indicates whether GetPortsForService should include port types whose definitions include an <http:binding> tag. When false, GetPortsForService retrieves all port type definitions. When true, GetPortsForService ignores port type definitions with simple HTTP bindings.

QualifiedNames indicates whether the port names added to the list should be qualified using the target namespace prefix.

Note: GetPortsForService does not clear the WideString (see page 3476) list before adding the names of the ports.

See Also

GetBindingForServicePort (see page 7172)

GetServices (see page 7184)

78.1.1.3.20 TWSDLItems.GetPortTypeNode Method

Returns the interface for the node that describes a port type defined in the WSDL document.

Pascal

```
function GetPortTypeNode(const PortTypeName: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetPortTypeNode(const DOMString PortTypeName);
```

Description

Call GetPortTypeNode to obtain information about a port type that is defined in the WSDL document or a document that it imports. Each port type corresponds to an interface that the Web Service application can execute.

PortTypeName is the name of the port type whose node is returned.

See Also

GetPortTypes (see page 7181)

78.1.1.3.21 TWSDLItems.GetPortTypes Method

Fills a list with the names of all port types defined in the WSDL document.

Pascal

```
procedure GetPortTypes(PortTypeNames: TDOMStrings; SkipHttpBindings: Boolean = True;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetPortTypes(TDOMStrings PortTypeNames, Boolean SkipHttpBindings = True, Boolean
QualifiedNames = False);
```

Description

Call GetPortTypes to retrieve the names of all port types defined in the WSDL document or any document that it imports. Each port type corresponds to an interface that the Web Service application can execute.

PortTypeNames is an existing TWideStrings object to which the names of all port types are added.

SkipHttpBindings indicates whether GetPortTypes should include port types whose definitions include an <http:binding> tag. When false, GetPortTypes retrieves all port type definitions. When true, GetPortTypes ignores port type definitions with simple HTTP bindings.

QualifiedNames indicates whether the port type names added to the list should be qualified using the target namespace prefix.

Note: GetPortTypes does not clear the WideString (see page 3476) list before adding the names of the port types.

See Also

GetPortTypeNode (see page 7181)

GetOperations (see page 7178)

78.1.1.3.22 TWSDLItems.GetSchemaNode Method

Returns the interface for the schema node that defines a type.

Pascal

```
function GetSchemaNode(const SchemaTns: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSchemaNode(const DOMString SchemaTns);
```

Description

Call GetSchemaNode to obtain information about a schema definition for a type that is defined in the WSDL document.

SchemaTns is the target namespace of the schema definition for a type.

GetSchemaNode returns the corresponding node.

See Also

GetSchemas (see page 7182)

HasTypesNode (see page 7196)

78.1.1.3.23 TWSDLItems.GetSchemas Method

Fills a list with the namespaces for all schema definitions of types in the WSDL document.

Pascal

```
procedure GetSchemas(SchemaNames: TDOMStrings);
```

C++

```
__fastcall GetSchemas(TDOMStrings SchemaNames);
```

Description

Call GetSchemaTypes to retrieve the namespaces that correspond to schema definitions of types.

SchemaNames is an existing TWideStrings object to which the namespaces for the schema definitions are added.

Note: GetSchemas does not clear the WideString (see page 3476) list before adding the namespaces of the schema definitions.

See Also

GetSchemaNode (see page 7182)

HasTypesNode (see page 7196)

78.1.1.3.24 TWSDLItems.GetServiceAndPortOfBinding Method

Retrieves the names of the service and port associated with a specified binding.

Pascal

```
function GetServiceAndPortOfBinding(const BindingName: IQualifiedName; var ServiceName:
DOMString; var PortName: DOMString): Boolean;
```

C++

```
__fastcall Boolean GetServiceAndPortOfBinding(const IQualifiedName BindingName, DOMString
ServiceName, DOMString PortName);
```

Description

Call GetServiceAndPortOfBinding to retrieve the name of the service and port associated with a specified binding. GetServiceAndPortOfBinding performs the converse lookup from the GetBindingForServicePort (see page 7172) method.

BindingName specifies the qualified name of the binding for which you want to look up the service and port.

ServiceName returns the name of the service to which the binding belongs.

PortName returns the name of a port within the service that uses the binding.

GetServiceAndPortOfBinding returns true if it locates the specified binding and returns a service and port. It returns false if the specified binding is not defined in the WSDL document.

See Also

GetServices (see page 7184)

GetServiceNode (see page 7183)

GetBindingForServicePort (see page 7172)

GetPortsForService (see page 7180)

GetBindingOfType (see page 7173)

GetBindings (see page 7174)

78.1.1.3.25 TWSDLItems.GetServiceNode Method

Returns the interface for the node that describes a service defined in the WSDL document.

Pascal

```
function GetServiceNode(const ServiceName: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetServiceNode(const DOMString ServiceName);
```

Description

Call GetServiceNode to obtain information about a service that is defined in the WSDL document. A service is a collection of related ports.

ServiceName is the name of the service whose node is returned.

See Also

GetServices (see page 7184)

GetPortsForService (see page 7180)

GetServiceAndPortOfBinding (see page 7183)

78.1.1.3.26 TWSDLItems.GetServices Method

Fills a list with the names of all services defined in the WSDL document.

Pascal

```
procedure GetServices(ServiceNames: TDOMStrings; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetServices(TDOMStrings ServiceNames, Boolean QualifiedNames = False);
```

Description

Call GetServices to retrieve the names of all services defined in the WSDL document or any document that it imports. Each service is a collection of related ports.

ServiceNames is an existing TWideStrings object to which the names of all services are added.

QualifiedNames indicates whether the service names added to the list should be qualified using the target namespace prefix.

Note: GetServices does not clear the WideString (see page 3476) list before adding the names of the services.

See Also

GetServiceNode (see page 7183)

GetPortsForService (see page 7180)

GetServiceAndPortOfBinding (see page 7183)

78.1.1.3.27 TWSDLItems.GetSoapAction Method

Returns the value of the soapAction attribute of a specified operation on a specified binding.

Pascal

```
function GetSoapAction(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapAction(const DOMString BindingName, const DOMString Operation, int
OverloadIndex);
```

Description

Call GetSoapAction to retrieve the value of the soapAction attribute on the <soap:operation> tag associated with an operation on a specified SOAP binding. The soap operation tag can be in the WSDL document or in another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the <soap:operation> tag.

OverloadIndex indicates which operation is desired when the operation is overloaded.

See Also

GetSoapActionList (see page 7185)

GetBindings (see page 7174)

getoperationsforbinding (see page 7178)

GetSoapOperationAttribute (see page 7192)

78.1.1.3.28 TWSDLItems.GetSoapActionList Method

Fills a list with the soapAction attributes for all operations on a specified SOAP binding.

Pascal

```
procedure GetSoapActionList(const BindingName: DOMString; ActionList: TDOMStrings;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetSoapActionList(const DOMString BindingName, TDOMStrings ActionList, Boolean
QualifiedNames = False);
```

Description

Call GetSoapActionList to retrieve the value of the soapAction attribute of each operation of a specified SOAP binding. Each soapAction is added as a string with the format

```
OperationName = soapActionName
```

where OperationName is the name of the operation with which the soapAction attribute is associated.

BindingName is the name of the binding associated with the port type whose operations are retrieved along with their SOAP actions.

OperationNames is an existing TWideStrings object to which the names of all operations on the binding's port type are added.

QualifiedNames specifies whether the operation names should be qualified using the target namespace prefix.

Note: GetSoapActionList does not clear the WideString (see page 3476) list before adding the names of the operations and their corresponding SOAP actions.

See Also

GetSoapAction (see page 7184)

GetBindings (see page 7174)

getoperationsforbinding (see page 7178)

GetSoapOperationAttribute (see page 7192)

78.1.1.3.29 TWSDLItems.GetSoapAddressForServicePort Method

Returns the address of a specified port from a specified service.

Pascal

```
function GetSoapAddressForServicePort(const ServiceName: DOMString; const PortName:
DOMString): DOMString;
```

C++

```
__fastcall DOMString GetSoapAddressForServicePort(const DOMString ServiceName, const DOMString
PortName);
```

Description

Call GetSoapAddressForServicePort to retrieve the address to which a SOAP request should be sent if it wants to access a specified port from a specified service.

ServiceName is the name of the service that contains the desired port. It is defined in the WSDL document or another document that it imports.

PortName is the name of the port whose address is returned.

See Also

GetBindingForServicePort (see page 7172)

GetPortsForService (see page 7180)

78.1.1.3.30 TWSDLItems.GetSoapBindingAttribute Method

Returns the value of a specified attribute of a specified SOAP binding.

Pascal

```
function GetSoapBindingAttribute(const BindingName: DOMString; Attribute: DOMString):
DOMString;
```

C++

```
__fastcall DOMString GetSoapBindingAttribute(const DOMString BindingName, DOMString Attribute);
```

Description

Call GetSoapBindingAttribute to retrieve value of an attribute on a SOAP binding. GetSoapBindingAttribute locates a binding with the specified name that includes a <soap:binding> tag, and returns the specified attribute from that <soap:binding> tag.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Attribute is the name of the desired attribute on the <soap:binding> tag.

If BindingName does not identify a binding that includes a <soap:binding> tag that has the specified attribute, GetSoapBindingAttribute returns an empty string.

See Also

GetSoapBodyAttribute (see page 7188)

GetSoapFaultAttribute

GetSoapHeaderAttribute

GetSoapOperationAttribute (see page 7192)

GetBindingForServicePort (see page 7172)

78.1.1.3.31 TWSDLItems.GetSoapBindingInputNode Method

Returns the interface for the input node on a specified binding and operation.

Pascal

```
function GetSoapBindingInputNode(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSoapBindingInputNode(const DOMString BindingName, const DOMString
Operation, int OverloadIndex);
```

Description

Call GetSoapBindingInputNode to retrieve the node for input messages (parameters) on an operation of a SOAP binding. GetSoapBindingInputNode locates a binding with the specified name that includes a <soap:binding> tag, locates the specified operation node that is a child of that binding, and returns the input node for that operation.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport

protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

If GetSoapBindingInputNode is unable to locate an input node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapBindingOutputNode (see page 7188)

GetSoapBodyAttribute (see page 7188)

GetSoapBindingIONode (see page 7187)

GetBindingForServicePort (see page 7172)

78.1.1.3.32 TWSDLItems.GetSoapBindingIONode Method

Returns the interface for a node on a specified binding and operation.

Pascal

```
function GetSoapBindingIONode(const BindingName: DOMString; const Operation: DOMString; Input:
Boolean; OverloadIndex: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSoapBindingIONode(const DOMString BindingName, const DOMString
Operation, Boolean Input, int OverloadIndex);
```

Description

Call GetSoapBindingIONode to retrieve a specified node on an operation of a SOAP binding. GetSoapBindingIONode locates a binding with the specified name that includes a <soap:binding> tag, locates the specified operation node that is a child of that binding, and returns the child of that node with a specified name. This method provides the underlying implementation for the GetSoapBindingInputNode (see page 7186) and GetSoapBindingOutputNode (see page 7188) methods.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

Input (see page 3895) indicates whether the child node is an input node (true) or an output node (false).

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

If GetSoapBindingIONode is unable to locate a node for the specified name, binding, and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapBindingOutputNode (see page 7188)

GetSoapBodyAttribute (see page 7188)

GetSoapBindingInputNode (see page 7186)

GetBindingForServicePort (see page 7172)

78.1.1.3.33 TWSDLItems.GetSoapBindingOutputNode Method

Returns the interface for the output node on a specified binding and operation.

Pascal

```
function GetSoapBindingOutputNode(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSoapBindingOutputNode(const DOMString BindingName, const DOMString
Operation, int OverloadIndex);
```

Description

Call GetSoapBindingOutputNode to retrieve the node for output messages (output parameters or return value) on an operation of a SOAP binding. GetSoapBindingOutputNode locates a binding with the specified name that includes a <soap:binding> tag, locates the specified operation node that is a child of that binding, and returns the output node for that operation.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

If GetSoapBindingOutputNode is unable to locate an output node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapBindingInputNode (see page 7186)

GetSoapBodyAttribute (see page 7188)

GetSoapBindingIONode (see page 7187)

GetBindingForServicePort (see page 7172)

78.1.1.3.34 TWSDLItems.GetSoapBodyAttribute Method

Returns the value of an attribute of a body tag of a message type in an operation on the port type of a SOAP binding.

Pascal

```
function GetSoapBodyAttribute(const BindingName: DOMString; const Operation: DOMString; const
IOType: DOMString; const Attribute: DOMString; OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapBodyAttribute(const DOMString BindingName, const DOMString
Operation, const DOMString IOType, const DOMString Attribute, int OverloadIndex);
```

Description

Call GetSoapBodyAttribute to retrieve value of an attribute on the body tag for a message type that is part of an operation of the port type associated with a specified binding. The body tag can come from the WSDL document or another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the message.

IOType indicates the type of the message (input or output).

Attribute is the name of the desired attribute on the <soap:body> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

See Also

GetSoapBindingAttribute (see page 7186)

GetSoapBodyOutputAttribute (see page 7190)

78.1.1.3.35 TWSDLItems.GetSoapBodyInputAttribute Method

Returns the value of an attribute of a body tag of an input message in an operation on the port type of a SOAP binding.

Pascal

```
function GetSoapBodyInputAttribute(const BindingName: DOMString; const Operation: DOMString;
const Attribute: DOMString; OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapBodyInputAttribute(const DOMString BindingName, const DOMString
Operation, const DOMString Attribute, int OverloadIndex);
```

Description

Call GetSoapBodyInputAttribute to retrieve value of an attribute on the body tag for an input message that is part of an operation of the port type associated with a specified binding. The body tag can come from the WSDL document or another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the input message.

Attribute is the name of the desired attribute on the <soap:body> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

Note: GetSoapBodyInputAttribute returns the same value as GetSoapBodyAttribute (see page 7188) with an IOType of 'input'.

See Also

GetSoapBodyAttribute (see page 7188)

GetSoapBodyOutputAttribute (see page 7190)

GetSoapHeaderAttribute

GetSoapOperationAttribute (see page 7192)

GetBindingForServicePort (see page 7172)

getoperationsforbinding (see page 7178)

GetInOutMessagesForOperation

78.1.1.3.36 TWSDLItems.GetSoapBodyNamespace Method

Returns the value of the first namespace attribute found on a SOAP body node inside a binding with a specified port type.

Pascal

```
function GetSoapBodyNamespace(const BindingPortType: DOMString): DOMString;
```

C++

```
__fastcall DOMString GetSoapBodyNamespace(const DOMString BindingPortType);
```

Description

GetSoapBodyNamespace searches the bindings in the WSDL document and any documents it imports for one that has a port type that matches BindingPortType. It then searches the operations of that binding to find one whose messages include a SOAP body node. It returns the namespace attribute of that SOAP body node.

PortTypeName is the name of the port type (interface) that must appear in the binding.

See Also

GetSoapBodyAttribute (see page 7188)

GetPortTypes (see page 7181)

78.1.1.3.37 TWSDLItems.GetSoapBodyOutputAttribute Method

Returns the value of an attribute of a body tag of an output message in an operation on the port type of a SOAP binding.

Pascal

```
function GetSoapBodyOutputAttribute(const BindingName: DOMString; const Operation: DOMString;
const Attribute: DOMString; OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapBodyOutputAttribute(const DOMString BindingName, const DOMString
Operation, const DOMString Attribute, int OverloadIndex);
```

Description

Call GetSoapBodyOutputAttribute to retrieve value of an attribute on the body tag for an output message that is part of an operation of the port type associated with a specified binding. The body tag can come from the WSDL document or another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the output message.

Attribute is the name of the desired attribute on the <soap:body> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

Note: GetSoapBodyOutputAttribute returns the same value as GetSoapBodyAttribute (see page 7188) with an IOType of 'output'.

See Also

GetSoapBodyAttribute (see page 7188)

GetSoapBodyInputAttribute (see page 7189)

GetBindingForServicePort (see page 7172)

getoperationsforbinding (see page 7178)

GetInOutMessagesForOperation

78.1.1.3.38 TWSDLItems.GetSoapHeaders Method

Returns an interface for accessing a specified set of header nodes.

Pascal

```
function GetSoapHeaders(BindingName: IQualifiedName; const Operation: DOMString; Input:
Boolean; OverloadIndex: Integer; const MessageName: DOMString = ''): IHeaderInfoArray;
```

C++

```
__fastcall IHeaderInfoArray GetSoapHeaders(IQualifiedName BindingName, const DOMString
Operation, Boolean Input, int OverloadIndex, const DOMString MessageName = '');
```

Description

Call GetSoapHeaders to retrieve a dynamic array of interfaces for accessing information about the header nodes of a specified operation on a specified binding. This method provides the underlying implementation for the GetSoapInputHeaders (see page 7192) and GetSoapOutputHeaders (see page 7193) methods.

BindingName is an interface for reading the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

Input (see page 3895) indicates whether the header node should belong to the operation's input node (true) or output node (false).

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

MessageName is the name of a Message with which the header should be associated. If MessageName is an empty string, GetSoapHeaders does not check the message with which the header is associated.

If GetSoapHeaders is unable to locate a header node for the specified name, binding, and IOType, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapOutputHeaders (see page 7193)

GetSoapBindingIONode (see page 7187)

GetSoapInputHeaders (see page 7192)

GetBindingForServicePort (see page 7172)

GetPartNode (see page 7179)

78.1.1.3.39 TWSDLItems.GetSoapInputHeaders Method

Returns an interface for accessing the header nodes that belong to the input node of a specified binding and operation.

Pascal

```
function GetSoapInputHeaders(BindingName: IQualifiedName; const Operation: DOMString;
OverloadIndex: Integer; const MessageName: DOMString = ''): IHeaderInfoArray;
```

C++

```
__fastcall IHeaderInfoArray GetSoapInputHeaders(IQualifiedName BindingName, const DOMString
Operation, int OverloadIndex, const DOMString MessageName = '');
```

Description

Call GetSoapInputHeaders to retrieve a dynamic array of interfaces for accessing the header nodes of the input node on a specified binding. GetSoapInputHeaders locates the specified input node using the GetSoapBindingIONode (see page 7187) method, and extracts all of its child header nodes. It then checks the message and part attributes of that input node, and returns a dynamic array of interfaces for the headers.

BindingName is an interface for reading the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

MessageName is the name of a Message with which the header should be associated. If MessageName is an empty string, GetSoapInputHeaders does not check the message with which the header is associated.

If GetSoapInputHeaders is unable to locate an input header node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

GetSoapOutputHeaders (see page 7193)

GetSoapBindingIONode (see page 7187)

GetSoapHeaders (see page 7191)

GetBindingForServicePort (see page 7172)

GetPartNode (see page 7179)

78.1.1.3.40 TWSDLItems.GetSoapOperationAttribute Method

Returns the value of an attribute on the <soap:operation> node of an operation on a SOAP binding.

Pascal

```
function GetSoapOperationAttribute(const BindingName: DOMString; const Operation: DOMString;
const Attribute: DOMString; OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapOperationAttribute(const DOMString BindingName, const DOMString
Operation, const DOMString Attribute, int OverloadIndex);
```

Description

Call GetSoapOperationAttribute to retrieve value of an attribute on the <soap:operation> tag associated with an operation on a specified SOAP binding. The soap operation tag can be in the WSDL document or in another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the <soap:operation> tag.

Attribute is the name of the desired attribute on the <soap:operation> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

See Also

GetSoapBindingAttribute (see page 7186)

GetSoapBodyAttribute (see page 7188)

GetSoapHeaderAttribute

GetSoapOperationAttribute

GetSoapFaultsForOperation

78.1.1.3.41 TWSDLItems.GetSoapOperationStyle Method

Returns the value of the style attribute of a specified operation on a specified binding.

Pascal

```
function GetSoapOperationStyle(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapOperationStyle(const DOMString BindingName, const DOMString
Operation, int OverloadIndex);
```

Description

Call GetSoapOperationStyle to retrieve the value of the style attribute on the <soap:operation> tag associated with an operation on a specified SOAP binding. The soap operation tag can be in the WSDL document or in another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the <soap:operation> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

See Also

GetBindings (see page 7174)

getoperationsforbinding (see page 7178)

GetSoapOperationAttribute (see page 7192)

78.1.1.3.42 TWSDLItems.GetSoapOutputHeaders Method

Returns an interface for accessing the header nodes that belong to the output node of a specified binding and operation.

Pascal

```
function GetSoapOutputHeaders(BindingName: IQualifiedName; const Operation: DOMString;
OverloadIndex: Integer; const MessageName: DOMString = ''): IHeaderInfoArray;
```

C++

```
__fastcall IHeaderInfoArray GetSoapOutputHeaders(IQualifiedName BindingName, const DOMString
Operation, int OverloadIndex, const DOMString MessageName = '');
```

Description

Call GetSoapOutputHeaders to retrieve a dynamic array of interfaces for accessing the header nodes of the output node on a specified binding. GetSoapOutputHeaders locates the specified output node using the GetSoapBindingIONode (see page 7187) method, and extracts all of its child header nodes. It then checks the message and part attributes of that output node, and returns a dynamic array of interfaces for the headers.

BindingName is an interface for reading the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

MessageName is the name of a Message with which the header should be associated. If MessageName is an empty string, GetSoapOutputHeaders does not check the message with which the header is associated.

If GetSoapOutputHeaders is unable to locate an output header node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapInputHeaders (see page 7192)

GetSoapBindingIONode (see page 7187)

GetSoapHeaders (see page 7191)

GetBindingForServicePort (see page 7172)

GetPartNode (see page 7179)

78.1.1.3.43 TWSDLItems.GetTargetNamespace Method

Returns the value of the TargetNamespace (see page 7198) property.

Pascal

```
function GetTargetNamespace: DOMString;
```

C++

```
__fastcall DOMString GetTargetNamespace();
```

Description

GetTargetNamespace is the read access method for the TargetNamespace (see page 7198) property.

See Also

Definition (see page 7022)

GetTargetNamespacePrefix (see page 7195)

TargetNamespace (see page 7198)

78.1.1.3.44 TWSDLItems.GetTargetNamespacePrefix Method

Returns the prefix string that represents the target namespace of the WSDL document.

Pascal

```
function GetTargetNamespacePrefix: DOMString;
```

C++

```
__fastcall DOMString GetTargetNamespacePrefix();
```

Description

Call GetTargetNamespacePrefix to retrieve the prefix string that should be added to node names so that they explicitly use the target namespace of the WSDL document. Node names that include this prefix are defined in the namespace identified by the URL that is the value of the TargetNamespace (see page 7198) property.

See Also

TargetNamespace (see page 7198)

78.1.1.3.45 TWSDLItems.GetWSDLDoc Method

Returns the interface for this TWSDLItems (see page 7163) instance.

Pascal

```
function GetWSDLDoc: IWSDLDocument;
```

C++

```
__fastcall IWSDLDocument GetWSDLDoc();
```

Description

GetWSDLDoc returns the IWSDLDocument (see page 7115) for this TWSDLItems (see page 7163) instance. This interface can be used to access the Definition property, which supplies uninterpreted access to the definitions in the WSDL document.

See Also

Definition (see page 7022)

78.1.1.3.46 TWSDLItems.GetWSDLItems Method

Returns a reference to this TWSDLItems (see page 7163) instance.

Pascal

```
function GetWSDLItems: TWSDLItems;
```

C++

```
__fastcall TWSDLItems GetWSDLItems();
```

Description

GetWSDLItems returns a reference to the TWSDLItems (see page 7163) instance. This method is mostly used by code that holds an IWSDLItems (see page 7208) interface and needs to use the methods of the object itself.

See Also

IWSDLItems (see page 7208)

78.1.1.3.47 TWSDLItems.HasTypesNode Method

Indicates whether the WSDL document includes any type definitions.

Pascal

```
function HasTypesNode: Boolean;
```

C++

```
__fastcall Boolean HasTypesNode();
```

Description

HasTypesNode returns true if the WSDL document includes any type definitions, false otherwise.

78.1.1.3.48 TWSDLItems.IsPortTypeHTTPBound Method

Indicates whether a specified port type has an HTTP binding.

Pascal

```
function IsPortTypeHTTPBound(const PortType: DOMString): Boolean;
```

C++

```
__fastcall Boolean IsPortTypeHTTPBound(const DOMString PortType);
```

Description

Call IsPortTypeHTTPBound to determine whether there is an HTTP binding for a specified port type. A port type corresponds to an invokable interface.

PortType is the port type you want to check.

IsPortTypeHTTPBound returns true if the specified port type has an HTTP binding, false otherwise.

See Also

GetPortTypes (see page 7181)

GetPortTypeNode (see page 7181)

GetBindingOfType (see page 7173)

78.1.1.3.49 TWSDLItems.IterateImports Method

Executes a callback for every WSDL document that this one imports.

Pascal

```
procedure IterateImports(IterateProc: TWSDLIterateProc);
```

C++

```
__fastcall IterateImports(TWSDLIterateProc IterateProc);
```

Description

IterateImports is used to execute a callback before and after loading each WSDL document that this one imports, including those documents that are imported by documents that this one imports.

78.1.1.3.50 TWSDLItems.Load Method

Loads a WSDL document and activates it.

Pascal

```
procedure Load(const WSDLFileName: DOMString);
```

C++

```
__fastcall Load(const DOMString WSDLFileName);
```

Description

Load uses the stream loader specified by the StreamLoader (see page 7197) property to load a WSDL document into memory. It then sets itself to represent that WSDL document and activates it.

WSDLFileName is the name of a WSDL document file, an XML schema file, or the URL where such a document can be found.

See Also

StreamLoader (see page 7197)

LoadFromFile (see page 7321)

LoadFromStream (see page 7321)

LoadFromXML (see page 7322)

78.1.1.4 TWSDLItems Properties

The properties of the TWSDLItems class are listed here.

Public Properties

	Name	Description
R	StreamLoader (see page 7197)	Provides access to an interface for loading the WSDL document.
R	TargetNamespace (see page 7198)	Provides access to an interface for loading the WSDL document.

78.1.1.4.1 TWSDLItems.StreamLoader Property

Provides access to an interface for loading the WSDL document.

Pascal

```
property StreamLoader: IStreamLoader;
```

C++

```
__property IStreamLoader StreamLoader;
```

Description

StreamLoader is set by the TWSDLItems (see page 7163) constructor. It is an interface that specifies basic authentication information that can be used to load a WSDL document that is on another server. The IStreamLoader interface specifies the password, user name, and proxy server that can be used to connect to the server that hosts the WSDL document. TWSDLItems (see page 7163) uses this to load the WSDL document.

See Also

Create (see page 7169)

78.1.1.4.2 TWSDLItems.TargetNamespace Property

Provides access to an interface for loading the WSDL document.

Pascal

```
property TargetNamespace: DOMString;
```

C++

```
__property DOMString TargetNamespace;
```

Description

The root node of a WSDL document is always a definitions node. This node includes a TargetNamespace attribute that uniquely identifies the set of definitions in the WSDL document. Read (see page 3727) TargetNamespace to retrieve that namespace.

See Also

Definition (see page 7022)

GetTargetNamespacePrefix (see page 7195)

78.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IHeaderInfo (see page 7199)	This is class WSDLItems.IHeaderInfo.
	IQualifiedName (see page 7204)	IQualifiedName is the interface for obtaining an information about a name in an XML document.
	IWSDLItems (see page 7208)	IWSDLItems provides access to a WSDL document.

78.2.1 IHeaderInfo Interface

Class Hierarchy

WSDLItems.IHeaderInfo

Pascal

```
IHeaderInfo = interface;
```

C++

```
__interface IHeaderInfo;
```

File

WSDLItems

Description

This is class WSDLItems.IHeaderInfo.

78.2.1.1 IHeaderInfo Members

The following tables list the members exposed by IHeaderInfo.

Public Methods

	Name	Description
	GetEncodingStyle (see page 7200)	This is GetEncodingStyle, a member of class IHeaderInfo.
	GetName (see page 7200)	This is GetName, a member of class IHeaderInfo.
	GetNamespace (see page 7201)	This is GetNamespace, a member of class IHeaderInfo.
	GetPart (see page 7201)	This is GetPart, a member of class IHeaderInfo.
	GetRequired (see page 7201)	This is GetRequired, a member of class IHeaderInfo.
	GetUse (see page 7201)	This is GetUse, a member of class IHeaderInfo.
	SetEncodingStyle (see page 7201)	This is SetEncodingStyle, a member of class IHeaderInfo.
	SetName (see page 7202)	This is SetName, a member of class IHeaderInfo.
	SetNamespace (see page 7202)	This is SetNamespace, a member of class IHeaderInfo.
	SetPart (see page 7202)	This is SetPart, a member of class IHeaderInfo.
	SetRequired (see page 7202)	This is SetRequired, a member of class IHeaderInfo.
	SetUse (see page 7203)	This is SetUse, a member of class IHeaderInfo.

Public Properties

	Name	Description
	EncodingStyle (see page 7203)	This is EncodingStyle, a member of class IHeaderInfo.
	Name (see page 7203)	This is Name, a member of class IHeaderInfo.
	Namespace (see page 7203)	This is Namespace, a member of class IHeaderInfo.
	Part (see page 7204)	This is Part, a member of class IHeaderInfo.
	Required (see page 7204)	This is Required, a member of class IHeaderInfo.
	Use (see page 7204)	This is Use, a member of class IHeaderInfo.

78.2.1.2 IHeaderInfo Methods

The methods of the IHeaderInfo class are listed here.

Public Methods

	Name	Description
	GetEncodingStyle (see page 7200)	This is GetEncodingStyle, a member of class IHeaderInfo.
	GetName (see page 7200)	This is GetName, a member of class IHeaderInfo.
	GetNamespace (see page 7201)	This is GetNamespace, a member of class IHeaderInfo.
	GetPart (see page 7201)	This is GetPart, a member of class IHeaderInfo.
	GetRequired (see page 7201)	This is GetRequired, a member of class IHeaderInfo.
	GetUse (see page 7201)	This is GetUse, a member of class IHeaderInfo.
	SetEncodingStyle (see page 7201)	This is SetEncodingStyle, a member of class IHeaderInfo.
	SetName (see page 7202)	This is SetName, a member of class IHeaderInfo.
	SetNamespace (see page 7202)	This is SetNamespace, a member of class IHeaderInfo.
	SetPart (see page 7202)	This is SetPart, a member of class IHeaderInfo.
	SetRequired (see page 7202)	This is SetRequired, a member of class IHeaderInfo.
	SetUse (see page 7203)	This is SetUse, a member of class IHeaderInfo.

78.2.1.2.1 IHeaderInfo.GetEncodingStyle Method

Pascal

```
function GetEncodingStyle: DOMString;
```

C++

```
__fastcall DOMString GetEncodingStyle();
```

Description

This is GetEncodingStyle, a member of class IHeaderInfo.

78.2.1.2.2 IHeaderInfo.GetName Method

Pascal

```
function GetName: DOMString;
```

C++

```
__fastcall DOMString GetName();
```

Description

This is GetName, a member of class IHeaderInfo.

78.2.1.2.3 IHeaderInfo.GetNamespace Method

Pascal

```
function GetNamespace: DOMString;
```

C++

```
__fastcall DOMString GetNamespace();
```

Description

This is GetNamespace, a member of class IHeaderInfo.

78.2.1.2.4 IHeaderInfo.GetPart Method

Pascal

```
function GetPart: IPart;
```

C++

```
__fastcall IPart GetPart();
```

Description

This is GetPart, a member of class IHeaderInfo.

78.2.1.2.5 IHeaderInfo.GetRequired Method

Pascal

```
function GetRequired: Boolean;
```

C++

```
__fastcall Boolean GetRequired();
```

Description

This is GetRequired, a member of class IHeaderInfo.

78.2.1.2.6 IHeaderInfo.GetUse Method

Pascal

```
function GetUse: DOMString;
```

C++

```
__fastcall DOMString GetUse();
```

Description

This is GetUse, a member of class IHeaderInfo.

78.2.1.2.7 IHeaderInfo.SetEncodingStyle Method

Pascal

```
procedure SetEncodingStyle(const EncStyl: DOMString);
```

C++

```
__fastcall SetEncodingStyle(const DOMString EncStyl);
```

Description

This is SetEncodingStyle, a member of class IHeaderInfo.

78.2.1.2.8 IHeaderInfo.SetName Method

Pascal

```
procedure SetName(const N: DOMString);
```

C++

```
__fastcall SetName(const DOMString N);
```

Description

This is SetName, a member of class IHeaderInfo.

78.2.1.2.9 IHeaderInfo.SetNamespace Method

Pascal

```
procedure SetNamespace(const N: DOMString);
```

C++

```
__fastcall SetNamespace(const DOMString N);
```

Description

This is SetNamespace, a member of class IHeaderInfo.

78.2.1.2.10 IHeaderInfo.SetPart Method

Pascal

```
procedure SetPart(const P: IPart);
```

C++

```
__fastcall SetPart(const IPart P);
```

Description

This is SetPart, a member of class IHeaderInfo.

78.2.1.2.11 IHeaderInfo.SetRequired Method

Pascal

```
procedure SetRequired(Req: Boolean);
```

C++

```
__fastcall SetRequired(Boolean Req);
```

Description

This is SetRequired, a member of class IHeaderInfo.

78.2.1.2.12 IHeaderInfo.SetUse Method

Pascal

```
procedure SetUse(const U: DOMString);
```

C++

```
__fastcall SetUse(const DOMString U);
```

Description

This is SetUse, a member of class IHeaderInfo.

78.2.1.3 IHeaderInfo Properties

The properties of the IHeaderInfo class are listed here.

Public Properties

	Name	Description
	EncodingStyle (see page 7203)	This is EncodingStyle, a member of class IHeaderInfo.
	Name (see page 7203)	This is Name, a member of class IHeaderInfo.
	Namespace (see page 7203)	This is Namespace, a member of class IHeaderInfo.
	Part (see page 7204)	This is Part, a member of class IHeaderInfo.
	Required (see page 7204)	This is Required, a member of class IHeaderInfo.
	Use (see page 7204)	This is Use, a member of class IHeaderInfo.

78.2.1.3.1 IHeaderInfo.EncodingStyle Property

Pascal

```
property EncodingStyle: DOMString;
```

C++

```
__property DOMString EncodingStyle;
```

Description

This is EncodingStyle, a member of class IHeaderInfo.

78.2.1.3.2 IHeaderInfo.Name Property

Pascal

```
property Name: DOMString;
```

C++

```
__property DOMString Name;
```

Description

This is Name, a member of class IHeaderInfo.

78.2.1.3.3 IHeaderInfo.Namespace Property

Pascal

```
property Namespace: DOMString;
```

C++

```
__property DOMString Namespace;
```

Description

This is Namespace, a member of class IHeaderInfo.

78.2.1.3.4 IHeaderInfo.Part Property

Pascal

```
property Part: IPart;
```

C++

```
__property IPart Part;
```

Description

This is Part, a member of class IHeaderInfo.

78.2.1.3.5 IHeaderInfo.Required Property

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

This is Required, a member of class IHeaderInfo.

78.2.1.3.6 IHeaderInfo.Use Property

Pascal

```
property Use: DOMString;
```

C++

```
__property DOMString Use;
```

Description

This is Use, a member of class IHeaderInfo.

78.2.2 IQualifiedName Interface

IQualifiedName is the interface for obtaining an information about a name in an XML document.

Class Hierarchy

Pascal

```
IQualifiedName = interface;
```

C++

```
__interface IQualifiedName;
```

File

WSDLItems

Description

IQualifiedName introduces two properties, Name (see page 7207) and Namespace (see page 7207), which represent the local name and namespace URI for a name that is used in an XML document. Using IQualifiedName makes it easier to work with names where it is important to know the namespace in which the name is defined.

Note: C++ method declarations that use IQualifiedName use the _di_IQualifiedName type instead. This type is a DelphiInterface (see page 3263) wrapper around the IQualifiedName interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IQualifiedName >  _di_IQualifiedName;
```

See Also

TWSDLItems (see page 7163)

TMemoryStream

78.2.2.1 IQualifiedName Members

The following tables list the members exposed by IQualifiedName.

Public Methods

	Name	Description
	GetName (see page 7205)	Returns the value of the Name (see page 7207) property.
	GetNamespace (see page 7206)	Returns the value of the Namespace (see page 7207) property.
	SetName (see page 7206)	Sets the value of the Name (see page 7207) property.
	SetNamespace (see page 7206)	Sets the value of the Namespace (see page 7207) property.

Public Properties

	Name	Description
	Name (see page 7207)	Specifies the local name.
	Namespace (see page 7207)	Specifies the namespace in which the name is defined.

78.2.2.2 IQualifiedName Methods

The methods of the IQualifiedName class are listed here.

Public Methods

	Name	Description
	GetName (see page 7205)	Returns the value of the Name (see page 7207) property.
	GetNamespace (see page 7206)	Returns the value of the Namespace (see page 7207) property.
	SetName (see page 7206)	Sets the value of the Name (see page 7207) property.
	SetNamespace (see page 7206)	Sets the value of the Namespace (see page 7207) property.

78.2.2.2.1 IQualifiedName.GetName Method

Returns the value of the Name (see page 7207) property.

Pascal

```
function GetName: DOMString;
```

C++

```
__fastcall DOMString GetName();
```

Description

GetName is the read implementation for the Name (see page 7207) property.

See Also

Name (see page 7207)

78.2.2.2.2 IQualifiedName.GetNamespace Method

Returns the value of the Namespace (see page 7207) property.

Pascal

```
function GetNamespace: DOMString;
```

C++

```
__fastcall DOMString GetNamespace();
```

Description

GetNamespace is the read implementation for the Namespace (see page 7207) property.

See Also

Namespace (see page 7207)

78.2.2.2.3 IQualifiedName.SetName Method

Sets the value of the Name (see page 7207) property.

Pascal

```
procedure SetName(const name: DOMString);
```

C++

```
__fastcall SetName(const DOMString name);
```

Description

SetName is the write implementation for the Name (see page 7207) property.

Name (see page 7207) is the new name.

See Also

Name (see page 7207)

78.2.2.2.4 IQualifiedName.SetNamespace Method

Sets the value of the Namespace (see page 7207) property.

Pascal

```
procedure SetNamespace(const ns: DOMString);
```

C++

```
__fastcall SetNamespace(const DOMString ns);
```

Description

SetNamespace is the write implementation for the Namespace (see page 7207) property.

Namespace (see page 7207) is the new namespace in which to interpret Name (see page 7207).

See Also

Namespace (see page 7207)

78.2.2.3 IQualifiedName Properties

The properties of the IQualifiedName class are listed here.

Public Properties

	Name	Description
	Name (see page 7207)	Specifies the local name.
	Namespace (see page 7207)	Specifies the namespace in which the name is defined.

78.2.2.3.1 IQualifiedName.Name Property

Specifies the local name.

Pascal

```
property Name: DOMString;
```

C++

```
__property DOMString Name;
```

Description

Name specifies the local name portion of the qualified name. This name is defined within the context of the namespace that the Namespace (see page 7207) property specifies.

See Also

Namespace (see page 7207)

78.2.2.3.2 IQualifiedName.Namespace Property

Specifies the namespace in which the name is defined.

Pascal

```
property Namespace: DOMString;
```

C++

```
__property DOMString Namespace;
```

Description

Namespace specifies the namespace that is used to interpret the value of the Name (see page 7207) property.

See Also

Name (see page 7207)

78.2.3 IWSDLItems Interface

IWSDLItems provides access to a WSDL document.

Class Hierarchy

Pascal

```
IWSDLItems = interface;
```

C++

```
__interface IWSDLItems;
```

File

WSDLItems

Description

IWSDLItems is an interface to the TWSDLItems (see page 7163) class. You can use this interface to load the WSDL document from a file or server, obtain access to the TWSDLItems (see page 7163) object whose methods provide information about the definitions in that document, and obtain an IWSDLDocument (see page 7115) interface for low-level access to the definitions in the document.

Note: C++ method declarations that use IWSDLItems use the _di_IWSDLItems type instead. This type is a DelphiInterface (see page 3263) wrapper around the IWSDLItems interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IWSDLDocument >  _di_IWSDLDocument;
```

See Also

TWSDLItems (see page 7163)

IWSDLItems

78.2.3.1 IWSDLItems Members

The following tables list the members exposed by IWSDLItems.

Public Methods

	Name	Description
	GetWSDLDoc (see page 7209)	Returns the IWSDLDocument (see page 7115) interface for the WSDL document.
	GetWSDLItems (see page 7209)	Returns a reference to the TWSDLItems (see page 7163) instance that implements this interface.
	Load (see page 7209)	Loads a WSDL document so that its definitions are available.

78.2.3.2 IWSDLItems Methods

The methods of the IWSDLItems class are listed here.

Public Methods

	Name	Description
	GetWSDLDoc (see page 7209)	Returns the IWSDLDocument (see page 7115) interface for the WSDL document.
	GetWSDLItems (see page 7209)	Returns a reference to the TWSDLItems (see page 7163) instance that implements this interface.
	Load (see page 7209)	Loads a WSDL document so that its definitions are available.

78.2.3.2.1 IWSDLItems.GetWSDLDoc Method

Returns the IWSDLDocument (see page 7115) interface for the WSDL document.

Pascal

```
function GetWSDLDoc: IWSDLDocument;
```

C++

```
__fastcall IWSDLDocument GetWSDLDoc();
```

Description

GetWSDLDoc returns a IWSDLDocument (see page 7115) interface, which supplies uninterpreted access to the definitions in the WSDL document. To access these definitions more easily, use the GetWSDLItems (see page 7209) method, which returns a reference to the underlying TWSDLItems (see page 7163) object.

See Also

GetWSDLItems (see page 7209)

78.2.3.2.2 IWSDLItems.GetWSDLItems Method

Returns a reference to the TWSDLItems (see page 7163) instance that implements this interface.

Pascal

```
function GetWSDLItems: TWSDLItems;
```

C++

```
__fastcall TWSDLItems GetWSDLItems();
```

Description

GetWSDLItems returns a reference to the underlying TWSDLItems (see page 7163) instance. This object has numerous methods that let you access the definitions in the WSDL document.

78.2.3.2.3 IWSDLItems.Load Method

Loads a WSDL document so that its definitions are available.

Pascal

```
procedure Load(const WSDLFileName: DOMString);
```

C++

```
__fastcall Load(const DOMString WSDLFileName);
```

Description

Load reads and interprets a specified WSDL document. This method should be called before you attempt to access the definitions in the WSDL document.

WSDLFileName is the name of a WSDL document file, an XML schema file, or the URL where such a document can be found.

78.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	HasDefinition (see page 7211)	This is function WSDLItems.HasDefinition.
	HasDefinition (see page 7211)	This is function WSDLItems.HasDefinition.
	NewQualifiedName (see page 7211)	This is function WSDLItems.NewQualifiedName.

78.3.1 WSDLItems.HasDefinition Function

Pascal

```
function HasDefinition(const WSDLDoc: IWSDLDocument): Boolean; overload;
```

C++

```
Boolean HasDefinition(const IWSDLDocument WSDLDoc);
```

File

WSDLItems

Description

This is function WSDLItems.HasDefinition.

78.3.2 WSDLItems.HasDefinition Function

Pascal

```
function HasDefinition(const WSDLItems: IWSDLItems): Boolean; overload;
```

C++

```
Boolean HasDefinition(const IWSDLItems WSDLItems);
```

File

WSDLItems

Description

This is function WSDLItems.HasDefinition.

78.3.3 WSDLItems.NewQualifiedName Function

Pascal

```
function NewQualifiedName(const Name: DOMString = ''; const Namespace: DOMString = ''):
```

```
  IQualifiedName;
```

C++

```
  IQualifiedName NewQualifiedName(const DOMString Name = '', const DOMString Namespace = '');
```

File

WSDLItems

Description

This is function WSDLItems.NewQualifiedName.

78.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	IterateImportOptions (see page 7213)	This is record WSDLItems.IterateImportOptions.

78.4.1 WSDLItems.IterateImportOptions Enumeration

Pascal

```
IterateImportOptions = (
  ioBeforeLoad,
  ioLoaded
);
```

C++

```
enum IterateImportOptions {
  ioBeforeLoad,
  ioLoaded
};
```

File

WSDLItems

Description

This is record WSDLItems.IterateImportOptions.

78.5 Types

The following table lists types in this documentation.

Types

Name	Description
IHeaderInfoArray (see page 7214)	This is type WSDLItems.IHeaderInfoArray.
IQualifiedNameArray (see page 7214)	This is type WSDLItems.IQualifiedNameArray.
TWSDLIterateProc (see page 7214)	This is type WSDLItems.TWSDLIterateProc.

78.5.1 WSDLItems.IHeaderInfoArray Type

Pascal

```
IHeaderInfoArray = array of IHeaderInfo;
```

C++

```
array of IHeaderInfo IHeaderInfoArray;
```

File

WSDLItems

Description

This is type WSDLItems.IHeaderInfoArray.

78.5.2 WSDLItems.IQualifiedNameArray Type

Pascal

```
IQualifiedNameArray = array of IQualifiedName;
```

C++

```
array of IQualifiedName IQualifiedNameArray;
```

File

WSDLItems

Description

This is type WSDLItems.IQualifiedNameArray.

78.5.3 WSDLItems.TWSDLIterateProc Type

Pascal

```
TWSDLIterateProc = procedure (const Options: IterateImportOptions; const WSDLItems:
```

```
IWSDLItems; const XMLSchemaDoc: IXMLSchemaDoc; const Name: DOMString) of object;
```

C++

```
(const Options: IterateImportOptions; const WSDLItems: IWSDLItems; const XMLSchemaDoc:
IXMLSchemaDoc; const Name: DOMString) ( TWSDLIterateProc)();
```

File

WSDLItems

Description

This is type WSDLItems.TWSDLIterateProc.

79 WSDLNode Namespace

This is namespace WSDLNode.

Topics

Name	Description
Classes (see page 7218)	The following table lists classes in this documentation.
Functions (see page 7229)	The following table lists functions in this documentation.

Classes

	Name	Description
	EWSDLLoadException (see page 7218)	This is class WSDLNode.EWSDLLoadException.
	TWSDLClientNode (see page 7218)	This is class WSDLNode.TWSDLClientNode.
	TWSDLView (see page 7223)	TWSDLView represents a specific binding and operation in a WSDL (see page 7228) document.

Functions

	Name	Description
	ActivateWSDL (see page 7229)	This is function WSDLNode.ActivateWSDL.

79.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EWSDLLoadException (see page 7218)	This is class WSDLNode.EWSDLLoadException.
	TWSDLClientNode (see page 7218)	This is class WSDLNode.TWSDLClientNode.
	TWSDLView (see page 7223)	TWSDLView represents a specific binding and operation in a WSDL (see page 7228) document.

79.1.1 EWSDLLoadException Class

Class Hierarchy

Pascal

```
EWSDLLoadException = class(Exception);
```

C++

```
class EWSDLLoadException : public Exception;
```

File

WSDLNode

Description

This is class WSDLNode.EWSDLLoadException.

79.1.2 TWSDLClientNode Class

Class Hierarchy

Pascal

```
TWSDLClientNode = class(TComponent, IWebNode);
```

C++

```
class TWSDLClientNode : public TComponent, public IWebNode;
```

File

WSDLNode

Description

This is class WSDLNode.TWSDLClientNode.

79.1.2.1 TWSDLClientNode Members

The following tables list the members exposed by TWSDLClientNode.

Protected Methods

	Name	Description
	GetMimeBoundary (see page 7221)	Returns the value of the MimeBoundary property.
	SetMimeBoundary (see page 7222)	Sets the value of the MimeBoundary property.

Public Methods

	Name	Description
	BeforeExecute (see page 7219)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 6584)	This is the overview for the Execute method overload.
	Execute (see page 7220)	This is the overview for the Execute method overload.
	Notification (see page 7221)	Forwards notification messages to all owned components.

Public Properties

	Name	Description
	MimeBoundary (see page 6585)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

Published Properties

	Name	Description
	TransportNode (see page 7222)	This is TransportNode, a member of class TWSDLClientNode.
	WSDLView (see page 7223)	This is WSDLView, a member of class TWSDLClientNode.

79.1.2.2 TWSDLClientNode Methods

The methods of the TWSDLClientNode class are listed here.

Protected Methods

	Name	Description
	GetMimeBoundary (see page 7221)	Returns the value of the MimeBoundary property.
	SetMimeBoundary (see page 7222)	Sets the value of the MimeBoundary property.

Public Methods

	Name	Description
	BeforeExecute (see page 7219)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 7220)	This is the overview for the Execute method overload.
	Notification (see page 7221)	Forwards notification messages to all owned components.

79.1.2.2.1 TWSDLClientNode.BeforeExecute Method

Performs any transport-specific setup before executing an encoded method call.

Pascal

```
procedure BeforeExecute(const IntfMetaData: TIntfMetaData; const MethodMetaData:
TIntfMethEntry; MethodIndex: Integer; AttachHandler: IMimeAttachmentHandler);
```

C++

```
__fastcall BeforeExecute(const TIntfMetaData IntfMetaData, const TIntfMethEntry
MethodMetaData, int MethodIndex, IMimeAttachmentHandler AttachHandler);
```

Description

BeforeExecute handles transport-specific tasks such as dynamically querying a WSDL document or setting up serialization options before a call is made to the Execute method. Remote interfaced objects (TRio) call this method after their OnBeforeExecute event, but before delegating the execution of the method to the Execute method.

IntfMD is the runtime type information (RTTI) of the invokable interface that includes the method to execute.

MethMD is describes the method that is about to be executed.

MethodIndex indicates which overload to use when methMD describes an overloaded method. 0 indicates the first overload, 1 indicates the second overload, and so on.

AttachHandler is an interface to use for handling any attachments that are used as parameters of the method.

See Also

Execute (see page 6584)

OnBeforeExecute

79.1.2.2.2 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	TWSDLClientNode.Execute (String, TStream) (see page 7220)	Executes an encoded method call and returns the encoded results in a stream.
	TWSDLClientNode.Execute (TStream) (see page 7221)	This is Execute, a member of class TWSDLClientNode.
	TWSDLClientNode.Execute (TStream, TStream) (see page 7221)	This is Execute, a member of class TWSDLClientNode.

79.1.2.2.2.1 TWSDLClientNode.Execute Method (String, TStream)

Executes an encoded method call and returns the encoded results in a stream.

Pascal

```
procedure Execute(const DataMsg: String; Resp: TStream); overload;
```

C++

```
__fastcall Execute(const UnicodeString DataMsg, TStream Resp);
```

Description

Execute interprets an encoded method call, executes it, and returns the encoded results using a stream. Typically, this method works in conjunction with an object that implements the IOPConvert interface, which marshals a method call into the DataMsg or Request string and unmarshals the return value.

DataMsg is an encoded method call. It represents the results of marshaling a method call on an invokable interface into a transportable string. The use of this syntax is not recommended.

Request is a stream from which to read the same string that is the value of the DataMsg parameter. This syntax is preferred because the stream need not store this value in memory (for example, it can be a file stream).

Response is a stream object that receives the encoded results that arise from executing the method call.

When using the third syntax, Execute returns a stream from which to read the encoded results from executing the method call. In this case, the caller is responsible for freeing the stream.

See Also

IOPConvert

BeforeExecute (see page 6583)

79.1.2.2.2.2 TWSDLClientNode.Execute Method (TStream)

Pascal

```
function Execute(const Request: TStream): TStream; overload;
```

C++

```
__fastcall TStream Execute(const TStream Request);
```

Description

This is Execute, a member of class TWSDLClientNode.

79.1.2.2.2.3 TWSDLClientNode.Execute Method (TStream, TStream)

Pascal

```
procedure Execute(const Request: TStream; Response: TStream); overload;
```

C++

```
__fastcall Execute(const TStream Request, TStream Response);
```

Description

This is Execute, a member of class TWSDLClientNode.

79.1.2.2.3 TWSDLClientNode.GetMimeBoundary Method

Returns the value of the MimeBoundary property.

Pascal

```
function GetMimeBoundary: string;
```

C++

```
__fastcall UnicodeString GetMimeBoundary();
```

Description

GetMimeBoundary is the read access method for the MimeBoundary property.

See Also

MimeBoundary (see page 6585)

79.1.2.2.4 TWSDLClientNode.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

79.1.2.2.5 TWSDLClientNode.SetMimeBoundary Method

Sets the value of the MimeBoundary property.

Pascal

```
procedure SetMimeBoundary(Value: string);
```

C++

```
__fastcall SetMimeBoundary(UnicodeString Value);
```

Description

SetMimeBoundary is the write implementation for the MimeBoundary property.

Value is the new value for MimeBoundary.

See Also

MimeBoundary (see page 6585)

79.1.2.3 TWSDLClientNode Properties

The properties of the TWSDLClientNode class are listed here.

Published Properties

	Name	Description
	TransportNode (see page 7222)	This is TransportNode, a member of class TWSDLClientNode.
	WSDLView (see page 7223)	This is WSDLView, a member of class TWSDLClientNode.

79.1.2.3.1 TWSDLClientNode.TransportNode Property

Pascal

```
property TransportNode: IWebNode;
```

C++

```
__property IWebNode TransportNode;
```

Description

This is TransportNode, a member of class TWSDLClientNode.

79.1.2.3.2 TWSDLClientNode.WSDLView Property

Pascal

```
property WSDLView: TWSDLView;
```

C++

```
__property TWSDLView WSDLView;
```

Description

This is WSDLView, a member of class TWSDLClientNode.

79.1.3 TWSDLView Class

TWSDLView represents a specific binding and operation in a WSDL (see page 7228) document.

Class Hierarchy

Pascal

```
TWSDLView = class(TComponent);
```

C++

```
class TWSDLView : public TComponent;
```

File

WSDLNode

Description

TWSDLView is used by components that work with WSDL (see page 7228) documents to represent a specific port and/or operation that is defined in a WSDL (see page 7228) document. The WSDL (see page 7228) property provides access to the WSDL (see page 7228) document itself. The other properties give the names of the entities of interest that are defined within that document.

See Also

THTTPReqResp (see page 1214)

TOPToSoapDomConvert

TWSDLItems (see page 7163)

79.1.3.1 TWSDLView Members

The following tables list the members exposed by TWSDLView.

Public Fields

	Name	Description
	IntfInfo (see page 7224)	This is IntfInfo, a member of class TWSDLView.

Public Methods

	Name	Description
	Activate (see page 7225)	This is Activate, a member of class TWSDLView.
	SetDesignState (see page 7225)	This is SetDesignState, a member of class TWSDLView.

Published Properties

	Name	Description
	Operation (see page 7225)	Identifies the target operation that is defined in the WSDL (see page 7228) document.
	Password (see page 7226)	This is Password, a member of class TWSDLView.
	Port (see page 7226)	Specifies the target port that is defined in the WSDL (see page 7228) document.
	PortType (see page 7226)	Specifies the target port type that is defined in the WSDL (see page 7228) document.
	Proxy (see page 7227)	This is Proxy, a member of class TWSDLView.
	Service (see page 7227)	Specifies the target service that is defined in the WSDL (see page 7228) document.
	UserName (see page 7227)	This is UserName, a member of class TWSDLView.
	WSDL (see page 7228)	Provides access to the definitions in the WSDL document.

79.1.3.2 TWSDLView Fields

The fields of the TWSDLView class are listed here.

Public Fields

	Name	Description
	IntfInfo (see page 7224)	This is IntfInfo, a member of class TWSDLView.

79.1.3.2.1 TWSDLView.IntfInfo Field

Pascal

```
IntfInfo: PTypeInfo;
```

C++

```
PTypeInfo IntfInfo;
```

Description

This is IntfInfo, a member of class TWSDLView.

79.1.3.3 TWSDLView Methods

The methods of the TWSDLView class are listed here.

Public Methods

	Name	Description
	Activate (see page 7225)	This is Activate, a member of class TWSDLView.
	SetDesignState (see page 7225)	This is SetDesignState, a member of class TWSDLView.

79.1.3.3.1 TWSDLView.Activate Method

Pascal

```
procedure Activate;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class TWSDLView.

79.1.3.3.2 TWSDLView.SetDesignState Method

Pascal

```
procedure SetDesignState(Designing: Boolean);
```

C++

```
__fastcall SetDesignState(Boolean Designing);
```

Description

This is SetDesignState, a member of class TWSDLView.

79.1.3.4 TWSDLView Properties

The properties of the TWSDLView class are listed here.

Published Properties

	Name	Description
	Operation (see page 7225)	Identifies the target operation that is defined in the WSDL (see page 7228) document.
	Password (see page 7226)	This is Password, a member of class TWSDLView.
	Port (see page 7226)	Specifies the target port that is defined in the WSDL (see page 7228) document.
	PortType (see page 7226)	Specifies the target port type that is defined in the WSDL (see page 7228) document.
	Proxy (see page 7227)	This is Proxy, a member of class TWSDLView.
	Service (see page 7227)	Specifies the target service that is defined in the WSDL (see page 7228) document.
	UserName (see page 7227)	This is UserName, a member of class TWSDLView.
	WSDL (see page 7228)	Provides access to the definitions in the WSDL document.

79.1.3.4.1 TWSDLView.Operation Property

Identifies the target operation that is defined in the WSDL (see page 7228) document.

Pascal

```
property Operation: string;
```

C++

```
__property UnicodeString Operation;
```

Description

Operation is the name of an operation that is defined in the WSDL (see page 7228) document identified by the WSDL (see

page 7228) property. Operation maps to a method on the interface that corresponds to the PortType (see page 7226) property.

See Also

PortType (see page 7226)

WSDL (see page 7228)

79.1.3.4.2 TWSDLView.Password Property

Pascal

```
property Password: string;
```

C++

```
__property UnicodeString Password;
```

Description

This is Password, a member of class TWSDLView.

79.1.3.4.3 TWSDLView.Port Property

Specifies the target port that is defined in the WSDL (see page 7228) document.

Pascal

```
property Port: string;
```

C++

```
__property UnicodeString Port;
```

Description

Port is the name of a port that is defined in the WSDL (see page 7228) document identified by the WSDL (see page 7228) property. A Port represents the address of a Web Service (see page 7227) application, a transport protocol that is used for requests to that application, the data format to use for encoding requests, and the port type that defines the operations contained in those requests.

See Also

PortType (see page 7226)

WSDL (see page 7228)

Service (see page 7227)

79.1.3.4.4 TWSDLView.PortType Property

Specifies the target port type that is defined in the WSDL (see page 7228) document.

Pascal

```
property PortType: string;
```

C++

```
__property UnicodeString PortType;
```

Description

Port (see page 7226) is the name of a port type that is defined in the WSDL (see page 7228) document identified by the WSDL (see page 7228) property. A port type corresponds to an interface that the Web Service (see page 7227) application

implements.

The target method on that interface is identified by the Operation (see page 7225) property. The address and protocols to use when calling this interface are identified by the Port (see page 7226) property.

See Also

WSDL (see page 7228)

Port (see page 7226)

Operation (see page 7225)

79.1.3.4.5 TWSDLView.Proxy Property

Pascal

```
property Proxy: string;
```

C++

```
__property UnicodeString Proxy;
```

Description

This is Proxy, a member of class TWSDLView.

79.1.3.4.6 TWSDLView.Service Property

Specifies the target service that is defined in the WSDL (see page 7228) document.

Pascal

```
property Service: string;
```

C++

```
__property UnicodeString Service;
```

Description

Service is the name of the service of interest that is defined in the WSDL (see page 7228) document identified by the WSDL (see page 7228) property. A service is a collection of related ports, including the one specified by the Port (see page 7226) property.

See Also

Port (see page 7226)

WSDL (see page 7228)

79.1.3.4.7 TWSDLView.UserName Property

Pascal

```
property UserName: string;
```

C++

```
__property UnicodeString UserName;
```

Description

This is UserName, a member of class TWSDLView.

79.1.3.4.8 TWSDLView.WSDL Property

Provides access to the definitions in the WSDL document.

Pascal

```
property WSDL: TWSDLItems;
```

C++

```
__property TWSDLItems WSDL;
```

Description

WSDLItems (see page 7161) is a helper object whose methods return the definitions included in the WSDL document. All the other TWSDLView (see page 7223) properties refer to definitions contained in this WSDL document

79.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ActivateWSDL (see page 7229)	This is function WSDLNode.ActivateWSDL.

79.2.1 WSDLNode.ActivateWSDL Function

Pascal

```
function ActivateWSDL(WSDL: TWSDLItems; const Name: string; const Password: string; const
Proxy: string): Boolean;
```

C++

```
Boolean ActivateWSDL(TWSDLItems WSDL, const UnicodeString Name, const UnicodeString Password,
const UnicodeString Proxy);
```

File

WSDLNode

Description

This is function WSDLNode.ActivateWSDL.

80 WSDLPub Namespace

This is namespace WSDLPub.

Topics

Name	Description
Classes (see page 7232)	The following table lists classes in this documentation.
Interfaces (see page 7247)	The following table lists interfaces in this documentation.
Functions (see page 7249)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 7250)	The following table lists structs, records, enums in this documentation.
Types (see page 7251)	The following table lists types in this documentation.

Classes

	Name	Description
	TWSDLHTMLPublish (see page 7232)	TWSDLHTMLPublish publishes a list of WSDL documents describing a Web Services application.
	TWSDLPublish (see page 7242)	This is class WSDLPub.TWSDLPublish.

Functions

	Name	Description
	WSDLPubFactory (see page 7249)	This is function WSDLPub.WSDLPubFactory.

Interfaces

	Name	Description
	IWSDLPublish (see page 7247)	This is class WSDLPub.IWSDLPublish.

Structs, Records, Enums

	Name	Description
	SOAPPublishOptions (see page 7250)	This is record WSDLPub.SOAPPublishOptions.

Types

Name	Description
TBeforePublishingWSDLEvent (see page 7251)	This is type WSDLPub.TBeforePublishingWSDLEvent.
TSOAPPublishOptions (see page 7251)	This is type WSDLPub.TSOAPPublishOptions.

80.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWSDLHTMLPublish (see page 7232)	TWSDLHTMLPublish publishes a list of WSDL documents describing a Web Services application.
	TWSDLPublish (see page 7242)	This is class WSDLPub.TWSDLPublish.

80.1.1 TWSDLHTMLPublish Class

TWSDLHTMLPublish publishes a list of WSDL documents describing a Web Services application.

Class Hierarchy

Pascal

```
TWSDLHTMLPublish = class(TComponent, IWebDispatch);
```

C++

```
class TWSDLHTMLPublish : public TComponent, public IWebDispatch;
```

File

WSDLPub

Description

Add TWSDLHTMLPublish to the Web module of a Web Service application to publish a list of WSDL documents that describe how to call that Web Service application. By publishing WSDL documents for your Web Service application, you allow arbitrary clients to call on your Web Services.

TWSDLHTMLPublish publishes definitions it derives from all the invokable interfaces that are registered with the invocation registry (InvRegistry), as well as from all remotable classes and types that are registered with the remotable type registry (RemTypeRegistry). By default, it uses the address where you install the application that contains the TWSDLHTMLPublish component as the address where those services are available. If you deploy the implementation of those Web Services elsewhere, you can enable the WSDL administrator (using the AdminEnabled (see page 7239) property), and then launch the WSDL administrator from a Web browser to change the addresses specified in the generated WSDL documents.

TWSDLHTMLPublish automatically registers itself with the Web module (or Web dispatcher) as an auto-dispatching object. This means that the Web module or Web dispatcher forwards all incoming HTTP messages directed to the WSDL publisher without requiring the use of Web action items. Those messages include requests for the list of WSDL documents and requests for the WSDL administrator.

80.1.1.1 TWSDLHTMLPublish Members

The following tables list the members exposed by TWSDLHTMLPublish.

Protected Methods

	Name	Description
	AddInterfaceList (see page 7235)	This is AddInterfaceList, a member of class TWSDLHTMLPublish.
	AddPortList (see page 7235)	This is AddPortList, a member of class TWSDLHTMLPublish.
	GetHostScriptBaseURL (see page 7237)	This is GetHostScriptBaseURL, a member of class TWSDLHTMLPublish.
	UpdatePortList (see page 7238)	This is UpdatePortList, a member of class TWSDLHTMLPublish.
	WSILInfo (see page 7238)	Returns the WS inspection document that describes the Web Service.

Public Methods

	Name	Description
	Create (see page 7233)	Creates an instance of TWSDLHTMLPublish (see page 7232).
	Destroy (see page 7234)	Destroys the instance of a TWSDLHTMLPublish (see page 7232) object.
	DispatchEnabled (see page 7235)	Indicates whether the WSDL publisher is enabled to respond to incoming messages.
	DispatchMask (see page 7235)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 7236)	Returns the method type of all HTTP messages to which this component responds.
	DispatchRequest (see page 7236)	Responds to an incoming message and generates the appropriate response message.
	GetTargetNamespace (see page 7237)	Returns the value of the TargetNamespace (see page 7240) property.
	HandleRequest (see page 7237)	Generates the response for an incoming request message.
	ServiceInfo (see page 7238)	Responds to requests that are otherwise not handled by the application.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 7241)	Occurs after the publisher generates a WSDL document for the Web Service application.
	OnBeforePublishingTypes (see page 7241)	Occurs before the publisher starts adding type definitions to the WSDL document.
	OnBeforePublishingWSDL (see page 7242)	Occurs before the publisher generates its WSDL document.
	OnPublishingType (see page 7242)	Occurs before the publisher generates the schema for a given type.

Published Properties

	Name	Description
	AdminEnabled (see page 7239)	Enables or disables the WSDL administrator.
	PublishOptions (see page 7240)	Controls the definitions TWSDLHTMLPublish (see page 7232) creates when it generates its WSDL documents.
	TargetNamespace (see page 7240)	Specifies the target namespace URL of the WSDL document.
	WebDispatch (see page 7240)	This is WebDispatch, a member of class TWSDLHTMLPublish.

80.1.1.2 TWSDLHTMLPublish.Create Constructor

Creates an instance of TWSDLHTMLPublish (see page 7232).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWSDLHTMLPublish(TComponent * AOwner);
```

Description

Call Create to instantiate a TWSDLHTMLPublish (see page 7232) object at runtime. TWSDLHTMLPublish (see page 7232) components added to web modules at design time are created automatically.

The AOwner parameter specifies another component (usually the web module) that is responsible for freeing the TWSDLHTMLPublish (see page 7232) instance. It becomes the value of the Owner property.

See Also

Owner

80.1.1.3 TWSDLHTMLPublish.Destroy Destructor

Destroys the instance of a TWSDLHTMLPublish (see page 7232) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWSDLHTMLPublish();
```

Description

Use the Free method to free a TWSDLHTMLPublish (see page 7232) instance. Unlike the Destroy method, Free guards against a nil reference.

See Also

System::TObject::Free (see page 3382)

80.1.1.4 TWSDLHTMLPublish Methods

The methods of the TWSDLHTMLPublish class are listed here.

Protected Methods

	Name	Description
	AddInterfaceList (see page 7235)	This is AddInterfaceList, a member of class TWSDLHTMLPublish.
	AddPortList (see page 7235)	This is AddPortList, a member of class TWSDLHTMLPublish.
	GetHostScriptBaseURL (see page 7237)	This is GetHostScriptBaseURL, a member of class TWSDLHTMLPublish.
	UpdatePortList (see page 7238)	This is UpdatePortList, a member of class TWSDLHTMLPublish.
	WSILInfo (see page 7238)	Returns the WS inspection document that describes the Web Service.

Public Methods

	Name	Description
	DispatchEnabled (see page 7235)	Indicates whether the WSDL publisher is enabled to respond to incoming messages.
	DispatchMask (see page 7235)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 7236)	Returns the method type of all HTTP messages to which this component responds.

	DispatchRequest (see page 7236)	Responds to an incoming message and generates the appropriate response message.
	GetTargetNamespace (see page 7237)	Returns the value of the TargetNamespace (see page 7240) property.
	HandleRequest (see page 7237)	Generates the response for an incoming request message.
	ServiceInfo (see page 7238)	Responds to requests that are otherwise not handled by the application.

80.1.1.4.1 TWSDLHTMLPublish.AddInterfaceList Method

Pascal

```
procedure AddInterfaceList(htmldoc: TStringList; const WSDLBaseURL: String);
```

C++

```
__fastcall AddInterfaceList(TStringList htmldoc, const UnicodeString WSDLBaseURL);
```

Description

This is AddInterfaceList, a member of class TWSDLHTMLPublish.

80.1.1.4.2 TWSDLHTMLPublish.AddPortList Method

Pascal

```
procedure AddPortList(htmldoc: TStringList; const PortType: String);
```

C++

```
__fastcall AddPortList(TStringList htmldoc, const UnicodeString PortType);
```

Description

This is AddPortList, a member of class TWSDLHTMLPublish.

80.1.1.4.3 TWSDLHTMLPublish.DispatchEnabled Method

Indicates whether the WSDL publisher is enabled to respond to incoming messages.

Pascal

```
function DispatchEnabled: Boolean;
```

C++

```
__fastcall Boolean DispatchEnabled();
```

Description

The DispatchEnabled method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to determine whether it can receive incoming messages. In TWSDLHTMLPublish (see page 7232), DispatchEnabled always returns true.

See Also

webdispatch (see page 7240)

80.1.1.4.4 TWSDLHTMLPublish.DispatchMask Method

Returns a mask that matches the path portion of any URL to which this object responds.

Pascal

```
function DispatchMask: TMask;
```

C++

```
__fastcall TMask DispatchMask();
```

Description

The DispatchMask method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to the this component. It returns a Mask derived from the Mask property of the WebDispatch (see page 7240) property.

See Also

webdispatch (see page 7240)

Mask

80.1.1.4.5 TWSDLHTMLPublish.DispatchMethodType Method

Returns the method type of all HTTP messages to which this component responds.

Pascal

```
function DispatchMethodType: TMethodType;
```

C++

```
__fastcall TMethodType DispatchMethodType();
```

Description

The DispatchMethodType method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to this component. It returns the MethodType properties of WebDispatch (see page 7240).

See Also

MethodType

webdispatch (see page 7240)

80.1.1.4.6 TWSDLHTMLPublish.DispatchRequest Method

Responds to an incoming message and generates the appropriate response message.

Pascal

```
function DispatchRequest(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean DispatchRequest(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

Description

The Web Module (or Web Dispatcher) calls DispatchRequest when it identifies an HTTP message that matches the properties of the WebDispatch (see page 7240) property. DispatchRequest responds by generating an HTML page that lists the WSDL documents describing the Web Service, and including a button for the WSDL administrator if the AdminEnabled (see page 7239) property is true.

Sender is not used in the DispatchRequest method.

Request contains information about the incoming request message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

DispatchRequest returns true if it successfully generates a response. It returns false if it could not handle the request.

See Also

webdispatch (see page 7240)

AdminEnabled (see page 7239)

80.1.1.4.7 TWSDLHTMLPublish.GetHostScriptBaseURL Method

Pascal

```
function GetHostScriptBaseURL(Request: TWebRequest): String;
```

C++

```
__fastcall UnicodeString GetHostScriptBaseURL(TWebRequest Request);
```

Description

This is GetHostScriptBaseURL, a member of class TWSDLHTMLPublish.

80.1.1.4.8 TWSDLHTMLPublish.GetTargetNamespace Method

Returns the value of the TargetNamespace (see page 7240) property.

Pascal

```
function GetTargetNamespace: InvString;
```

C++

```
__fastcall InvString GetTargetNamespace();
```

Description

GetTargetNamespace is the read implementation for the TargetNamespace (see page 7240) property.

See Also

TargetNamespace (see page 7240)

80.1.1.4.9 TWSDLHTMLPublish.HandleRequest Method

Generates the response for an incoming request message.

Pascal

```
function HandleRequest(Resp: TStringList; const Path: String; const HostScriptBaseURL: String;
var ContentType: String; Request: TWebRequest): integer;
```

C++

```
__fastcall int HandleRequest(TStringList Resp, const UnicodeString Path, const UnicodeString
HostScriptBaseURL, UnicodeString ContentType, TWebRequest Request);
```

Description

The DispatchRequest (see page 7236) method calls HandleRequest to generate the content of the HTTP response message it fills out. Typically, applications should not need to call this method.

Resp is a string list to which HandleRequest writes the content of the response.

Path is the path information taken from the incoming request message.

HostScriptBaseURL is the URL for the script name to which the incoming request is addressed.

ContentType returns the content type of the response that is written to Resp. This becomes the value of a ContentType header on the response message.

Request is the request message for which this method generates a response.

HandleRequest returns the StatusCode for the generated response. This becomes the StatusCode property of the response message.

See Also

DispatchRequest (see page 7236)

StatusCode

80.1.1.4.10 TWSDLHTMLPublish.ServiceInfo Method

Responds to requests that are otherwise not handled by the application.

Pascal

```
procedure ServiceInfo(Sender: TObject; Request: TWebRequest; Response: TWebResponse; var
Handled: Boolean);
```

C++

```
__fastcall ServiceInfo(TObject * Sender, TWebRequest Request, TWebResponse Response, Boolean
Handled);
```

Description

The Web Module (or Web Dispatcher) calls ServiceInfo when there are no other components in the application to handle an incoming request message. ServiceInfo responds by generating a default Web page that includes a link to the WSDL documents.

Sender is not used in the ServiceInfo method.

Request contains information about the incoming request message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

Handled always returns true, indicating that ServiceInfo successfully generated a response.

See Also

DispatchRequest (see page 7236)

80.1.1.4.11 TWSDLHTMLPublish.UpdatePortList Method

Pascal

```
procedure UpdatePortList(PortList: TStrings; const PortType: String; const Command: String);
```

C++

```
__fastcall UpdatePortList(TStrings PortList, const UnicodeString PortType, const UnicodeString
Command);
```

Description

This is UpdatePortList, a member of class TWSDLHTMLPublish.

80.1.1.4.12 TWSDLHTMLPublish.WSILInfo Method

Returns the WS inspection document that describes the Web Service.

Pascal

```
procedure WSILInfo(const HostScriptBaseURL: string; Request: TWebRequest; Response:
TWebResponse; var Handled: Boolean);
```

C++

```
__fastcall WSILInfo(const UnicodeString HostScriptBaseURL, TWebRequest Request, TWebResponse
Response, Boolean Handled);
```

Description

The Web Module (or Web Dispatcher) calls WSILInfo when a request is made for the WS inspection document for the Web Service (when the path portion of the request ends in the string 'inspection.wisl'.. WSILInfo responds by generating the WSIL description.

HostScriptBaseURL is the base path for accessing the WSDL documents of the Web Service.

Request contains information about the incoming request message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

Handled always returns true, indicating that WSILInfo successfully generated a response.

See Also

DispatchRequest (see page 7236)

ServiceInfo (see page 7238)

80.1.1.5 TWSDLHTMLPublish Properties

The properties of the TWSDLHTMLPublish class are listed here.

Published Properties

	Name	Description
	AdminEnabled (see page 7239)	Enables or disables the WSDL administrator.
	PublishOptions (see page 7240)	Controls the definitions TWSDLHTMLPublish (see page 7232) creates when it generates its WSDL documents.
	TargetNamespace (see page 7240)	Specifies the target namespace URL of the WSDL document.
	WebDispatch (see page 7240)	This is WebDispatch, a member of class TWSDLHTMLPublish.

80.1.1.5.1 TWSDLHTMLPublish.AdminEnabled Property

Enables or disables the WSDL administrator.

Pascal

```
property AdminEnabled: Boolean;
```

C++

```
__property Boolean AdminEnabled;
```

Description

Use AdminEnabled to indicate whether this application implements the WSDL administrator. When AdminEnabled is true, pointing a Web browser at the URL that addresses this application using the path info specified by WebDispatch (see page 7240) launches a Web page that includes a button for the WSDL administrator. The WSDL administrator can then adjust the published WSDL documents to indicate an address other than the one where this application is installed as the location or locations where the Web Services are deployed.

When AdminEnabled is false, the URL that includes WebDispatch (see page 7240) publishes a list of WSDL documents but

does not provide access to the WSDL administrator.

Tip: You can set AdminEnabled to true, update the URLs in the resulting WSDL documents, and then rebuild your application, setting AdminEnabled to false. The WSDL administrator stores your changes in a .ini file so that they appear in the list of WSDL documents even after you have changed AdminEnabled.

See Also

webdispatch (see page 7240)

TargetNamespace (see page 7240)

Generating WSDL Documents for a Web Service Application

80.1.1.5.2 TWSDLHTMLPublish.PublishOptions Property

Controls the definitions TWSDLHTMLPublish (see page 7232) creates when it generates its WSDL documents.

Pascal

```
property PublishOptions: TSOAPPublishOptions;
```

C++

```
__property TSOAPPublishOptions PublishOptions;
```

Description

PublishOptions is a set of flags that customize the generated WSDL document.

See Also

TargetNamespace (see page 7240)

80.1.1.5.3 TWSDLHTMLPublish.TargetNamespace Property

Specifies the target namespace URL of the WSDL document.

Pascal

```
property TargetNamespace: InvString;
```

C++

```
__property InvString TargetNamespace;
```

Description

Use TargetNamespace to specify a namespace for the WSDL documents this component publishes. This is the namespace URL that the WSDL document uses for the definitions it publishes.

See Also

AdminEnabled (see page 7239)

80.1.1.5.4 TWSDLHTMLPublish.WebDispatch Property

Pascal

```
property WebDispatch: TWebDispatch;
```

C++

```
__property TWebDispatch WebDispatch;
```

Description

This is WebDispatch, a member of class TWSDLHTMLPublish.

80.1.1.6 TWSDLHTMLPublish Events

The events of the TWSDLHTMLPublish class are listed here.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 7241)	Occurs after the publisher generates a WSDL document for the Web Service application.
	OnBeforePublishingTypes (see page 7241)	Occurs before the publisher starts adding type definitions to the WSDL document.
	OnBeforePublishingWSDL (see page 7242)	Occurs before the publisher generates its WSDL document.
	OnPublishingType (see page 7242)	Occurs before the publisher generates the schema for a given type.

80.1.1.6.1 TWSDLHTMLPublish.OnAfterPublishingWSDL Event

Occurs after the publisher generates a WSDL document for the Web Service application.

Pascal

```
property OnAfterPublishingWSDL: TAfterPublishingWSDLEvent;
```

C++

```
__property TAfterPublishingWSDLEvent OnAfterPublishingWSDL;
```

Description

Use OnAfterPublishingWSDL to perform special actions after the publisher has generated a WSDL document. For example, you can use this event to cache the generated WSDL document and then re-use the cached document in an OnBeforePublishingWSDL (see page 7242) event rather than requiring the publisher to generate a new document for every WSDL request it receives.

See Also

OnBeforePublishingWSDL (see page 7242)

80.1.1.6.2 TWSDLHTMLPublish.OnBeforePublishingTypes Event

Occurs before the publisher starts adding type definitions to the WSDL document.

Pascal

```
property OnBeforePublishingTypes: TBeforePublishingTypesEvent;
```

C++

```
__property TBeforePublishingTypesEvent OnBeforePublishingTypes;
```

Description

Use OnBeforePublishingTypes to add your own type definitions to the WSDL document before the publisher adds definitions for the types that the invokable interfaces use and types that are registered with the remotable type registry. If the OnBeforePublishingTypes event handler adds a schema definition for a type, the publisher uses that definition rather than generating its own version.

See Also

OnBeforePublishingWSDL (see page 7242)

OnPublishingType (see page 7242)

80.1.1.6.3 TWSDLHTMLPublish.OnBeforePublishingWSDL Event

Occurs before the publisher generates its WSDL document.

Pascal

```
property OnBeforePublishingWSDL: TBeforePublishingWSDLEvent;
```

C++

```
__property TBeforePublishingWSDLEvent OnBeforePublishingWSDL;
```

Description

Use OnBeforePublishingWSDL to provide your own WSDL document rather than letting the publisher generate one dynamically. For example, the event handler can supply a cached version of the WSDL document that you saved previously from an OnAfterPublishingWSDL (see page 7241) event handler.

See Also

OnAfterPublishingWSDL (see page 7241)

OnBeforePublishingTypes (see page 7241)

80.1.1.6.4 TWSDLHTMLPublish.OnPublishingType Event

Occurs before the publisher generates the schema for a given type.

Pascal

```
property OnPublishingType: TPublishingTypeEvent;
```

C++

```
__property TPublishingTypeEvent OnPublishingType;
```

Description

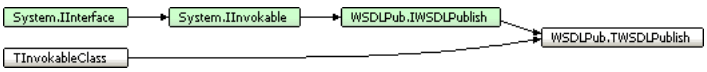
Use OnPublishingType to perform specific actions immediately before the publisher adds a type definition to the emerging WSDL document.

See Also

OnBeforePublishingTypes (see page 7241)

80.1.2 TWSDLPublish Class

Class Hierarchy



Pascal

```
TWSDLPublish = class(TInvokableClass, IWSDLPublish);
```

C++

```
class TWSDLPublish : public TInvokableClass, public IWSDLPublish;
```

File

WSDLPub

Description

This is class WSDLPub.TWSDLPublish.

80.1.2.1 TWSDLPublish Members

The following tables list the members exposed by TWSDLPublish.

Public Events

	Name	Description
	OnAfterPublishingWSDL (see page 7245)	This is OnAfterPublishingWSDL, a member of class TWSDLPublish.
	OnBeforePublishingTypes (see page 7245)	This is OnBeforePublishingTypes, a member of class TWSDLPublish.
	OnBeforePublishingWSDL (see page 7246)	This is OnBeforePublishingWSDL, a member of class TWSDLPublish.
	OnPublishingType (see page 7246)	This is OnPublishingType, a member of class TWSDLPublish.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	GetPortTypeEntries (see page 7243)	This is GetPortTypeEntries, a member of class TWSDLPublish.
	GetPortTypeList (see page 7244)	This is GetPortTypeList, a member of class TWSDLPublish.
	GetTypeSystemsList (see page 7244)	This is GetTypeSystemsList, a member of class TWSDLPublish.
	GetWSDLForPortType (see page 7244)	This is GetWSDLForPortType, a member of class TWSDLPublish.
	GetXSDForTypeSystem (see page 7244)	This is GetXSDForTypeSystem, a member of class TWSDLPublish.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.

Public Properties

	Name	Description
	TargetNamespace (see page 7245)	This is TargetNamespace, a member of class TWSDLPublish.

80.1.2.2 TWSDLPublish Methods

The methods of the TWSDLPublish class are listed here.

Public Methods

	Name	Description
	GetPortTypeEntries (see page 7243)	This is GetPortTypeEntries, a member of class TWSDLPublish.
	GetPortTypeList (see page 7244)	This is GetPortTypeList, a member of class TWSDLPublish.
	GetTypeSystemsList (see page 7244)	This is GetTypeSystemsList, a member of class TWSDLPublish.
	GetWSDLForPortType (see page 7244)	This is GetWSDLForPortType, a member of class TWSDLPublish.
	GetXSDForTypeSystem (see page 7244)	This is GetXSDForTypeSystem, a member of class TWSDLPublish.

80.1.2.2.1 TWSDLPublish.GetPortTypeEntries Method

Pascal

```
procedure GetPortTypeEntries(var Entries: TInvRegIntfEntryArray);
```

C++

```
__fastcall GetPortTypeEntries(TInvRegIntfEntryArray Entries);
```

Description

This is GetPortTypeEntries, a member of class TWSDLPublish.

80.1.2.2.2 TWSDLPublish.GetPortTypeList Method

Pascal

```
function GetPortTypeList: InvStringDynArray; stdcall;
```

C++

```
__fastcall __stdcall InvStringDynArray GetPortTypeList();
```

Description

This is GetPortTypeList, a member of class TWSDLPublish.

80.1.2.2.3 TWSDLPublish.GetTypeSystemsList Method

Pascal

```
function GetTypeSystemsList: InvStringDynArray; stdcall;
```

C++

```
__fastcall __stdcall InvStringDynArray GetTypeSystemsList();
```

Description

This is GetTypeSystemsList, a member of class TWSDLPublish.

80.1.2.2.4 TWSDLPublish.GetWSDLForPortType Method

Pascal

```
function GetWSDLForPortType(const PortType: InvString): InvString; stdcall;
```

C++

```
__fastcall __stdcall InvString GetWSDLForPortType(const InvString PortType);
```

Description

This is GetWSDLForPortType, a member of class TWSDLPublish.

80.1.2.2.5 TWSDLPublish.GetXSDForTypeSystem Method

Pascal

```
function GetXSDForTypeSystem(const TypeSystem: InvString): InvString; stdcall;
```

C++

```
__fastcall __stdcall InvString GetXSDForTypeSystem(const InvString TypeSystem);
```

Description

This is GetXSDForTypeSystem, a member of class TWSDLPublish.

80.1.2.3 TWSDLPublish Properties

The properties of the TWSDLPublish class are listed here.

Public Properties

	Name	Description
	TargetNamespace (see page 7245)	This is TargetNamespace, a member of class TWSDLPublish.

80.1.2.3.1 TWSDLPublish.TargetNamespace Property

Pascal

```
property TargetNamespace: InvString;
```

C++

```
__property InvString TargetNamespace;
```

Description

This is TargetNamespace, a member of class TWSDLPublish.

80.1.2.4 TWSDLPublish Events

The events of the TWSDLPublish class are listed here.

Public Events

	Name	Description
	OnAfterPublishingWSDL (see page 7245)	This is OnAfterPublishingWSDL, a member of class TWSDLPublish.
	OnBeforePublishingTypes (see page 7245)	This is OnBeforePublishingTypes, a member of class TWSDLPublish.
	OnBeforePublishingWSDL (see page 7246)	This is OnBeforePublishingWSDL, a member of class TWSDLPublish.
	OnPublishingType (see page 7246)	This is OnPublishingType, a member of class TWSDLPublish.

80.1.2.4.1 TWSDLPublish.OnAfterPublishingWSDL Event

Pascal

```
property OnAfterPublishingWSDL: TAfterPublishingWSDLEvent;
```

C++

```
__property TAfterPublishingWSDLEvent OnAfterPublishingWSDL;
```

Description

This is OnAfterPublishingWSDL, a member of class TWSDLPublish.

80.1.2.4.2 TWSDLPublish.OnBeforePublishingTypes Event

Pascal

```
property OnBeforePublishingTypes: TBeforePublishingTypesEvent;
```

C++

```
__property TBeforePublishingTypesEvent OnBeforePublishingTypes;
```

Description

This is OnBeforePublishingTypes, a member of class TWSDLPublish.

80.1.2.4.3 TWSDLPublish.OnBeforePublishingWSDL Event

Pascal

```
property OnBeforePublishingWSDL: TBeforePublishingWSDLEvent;
```

C++

```
__property TBeforePublishingWSDLEvent OnBeforePublishingWSDL;
```

Description

This is OnBeforePublishingWSDL, a member of class TWSDLPublish.

80.1.2.4.4 TWSDLPublish.OnPublishingType Event

Pascal

```
property OnPublishingType: TPublishingTypeEvent;
```

C++

```
__property TPublishingTypeEvent OnPublishingType;
```

Description

This is OnPublishingType, a member of class TWSDLPublish.

80.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWSDLPublish (see page 7247)	This is class WSDLPub.IWSDLPublish.

80.2.1 IWSDLPublish Interface

Class Hierarchy

Pascal

```
IWSDLPublish = interface(IInvokable);
```

C++

```
__interface IWSDLPublish : public IInvokable;
```

File

WSDLPub

Description

This is class WSDLPub.IWSDLPublish.

80.2.1.1 IWSDLPublish Members

The following tables list the members exposed by IWSDLPublish.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	GetPortTypeList (see page 7248)	This is GetPortTypeList, a member of class IWSDLPublish.
	GetTypeSystemsList (see page 7248)	This is GetTypeSystemsList, a member of class IWSDLPublish.
	GetWSDLForPortType (see page 7248)	This is GetWSDLForPortType, a member of class IWSDLPublish.
	GetXSDForTypeSystem (see page 7248)	This is GetXSDForTypeSystem, a member of class IWSDLPublish.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.

80.2.1.2 IWSDLPublish Methods

The methods of the IWSDLPublish class are listed here.

Public Methods

	Name	Description
	GetPortTypeList (see page 7248)	This is GetPortTypeList, a member of class IWSDLPublish.
	GetTypeSystemsList (see page 7248)	This is GetTypeSystemsList, a member of class IWSDLPublish.
	GetWSDLForPortType (see page 7248)	This is GetWSDLForPortType, a member of class IWSDLPublish.
	GetXSDForTypeSystem (see page 7248)	This is GetXSDForTypeSystem, a member of class IWSDLPublish.

80.2.1.2.1 IWSDLPublish.GetPortTypeList Method

Pascal

```
function GetPortTypeList: InvStringDynArray; stdcall;
```

C++

```
__fastcall __stdcall InvStringDynArray GetPortTypeList();
```

Description

This is GetPortTypeList, a member of class IWSDLPublish.

80.2.1.2.2 IWSDLPublish.GetTypeSystemsList Method

Pascal

```
function GetTypeSystemsList: InvStringDynArray; stdcall;
```

C++

```
__fastcall __stdcall InvStringDynArray GetTypeSystemsList();
```

Description

This is GetTypeSystemsList, a member of class IWSDLPublish.

80.2.1.2.3 IWSDLPublish.GetWSDLForPortType Method

Pascal

```
function GetWSDLForPortType(const PortType: InvString): InvString; stdcall;
```

C++

```
__fastcall __stdcall InvString GetWSDLForPortType(const InvString PortType);
```

Description

This is GetWSDLForPortType, a member of class IWSDLPublish.

80.2.1.2.4 IWSDLPublish.GetXSDForTypeSystem Method

Pascal

```
function GetXSDForTypeSystem(const TypeSystem: InvString): InvString; stdcall;
```

C++

```
__fastcall __stdcall InvString GetXSDForTypeSystem(const InvString TypeSystem);
```

Description

This is GetXSDForTypeSystem, a member of class IWSDLPublish.

80.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	WSDLPubFactory (see page 7249)	This is function WSDLPub.WSDLPubFactory.

80.3.1 WSDLPub.WSDLPubFactory Function

Pascal

```
procedure WSDLPubFactory(out obj: TObject);
```

C++

```
WSDLPubFactory(TObject * obj);
```

File

WSDLPub

Description

This is function WSDLPub.WSDLPubFactory.

80.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	SOAPPublishOptions (see page 7250)	This is record WSDLPub.SOAPPublishOptions.

80.4.1 WSDLPub.SOAPPublishOptions Enumeration

Pascal

```
SOAPPublishOptions = (
  poDefault,
  poPublishLocationAsSecure,
  poUTF8ContentType
);
```

C++

```
enum SOAPPublishOptions {
  poDefault,
  poPublishLocationAsSecure,
  poUTF8ContentType
};
```

File

WSDLPub

Description

This is record WSDLPub.SOAPPublishOptions.

80.5 Types

The following table lists types in this documentation.

Types

Name	Description
TBeforePublishingWSDLEvent (see page 7251)	This is type WSDLPub.TBeforePublishingWSDLEvent.
TSOAPPublishOptions (see page 7251)	This is type WSDLPub.TSOAPPublishOptions.

80.5.1 WSDLPub.TBeforePublishingWSDLEvent Type

Pascal

```
TBeforePublishingWSDLEvent = procedure (const IntfName: InvString; var WSDL: InvString; var
Handled: Boolean) of object;
```

C++

```
(const IntfName: InvString; var WSDL: InvString; var Handled: Boolean) (
TBeforePublishingWSDLEvent)();
```

File

WSDLPub

Description

This is type WSDLPub.TBeforePublishingWSDLEvent.

80.5.2 WSDLPub.TSOAPPublishOptions Type

Pascal

```
TSOAPPublishOptions = set of SOAPPublishOptions;
```

C++

```
SOAPPublishOptions TSOAPPublishOptions;
```

File

WSDLPub

Description

This is type WSDLPub.TSOAPPublishOptions.

81 XMLBrokr Namespace

This is namespace XMLBrokr.

Topics

Name	Description
Classes (see page 7255)	The following table lists classes in this documentation.
Interfaces (see page 7289)	The following table lists interfaces in this documentation.
Functions (see page 7291)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 7292)	The following table lists structs, records, enums in this documentation.
Types (see page 7293)	The following table lists types in this documentation.
Constants (see page 7295)	The following table lists constants in this documentation.

Classes

	Name	Description
	TXMLBroker (see page 7255)	TXMLBroker fetches XML data packets from an application server and applies XML updates to the application server.
	TXMLParams (see page 7285)	TXMLParams manages a list of parameters for an XML broker.

Constants

Name	Description
sPostDelta (see page 7295)	This is constant XMLBrokr.sPostDelta.
sProducer (see page 7295)	This is constant XMLBrokr.sProducer.
sRedirect (see page 7295)	This is constant XMLBrokr.sRedirect.

Functions

	Name	Description
	FormatXML (see page 7291)	This is function XMLBrokr.FormatXML.

Interfaces

	Name	Description
	INotifyConnectionChange (see page 7289)	This is class XMLBrokr.INotifyConnectionChange.

Structs, Records, Enums

	Name	Description
	TXMLOption (see page 7292)	This is record XMLBrokr.TXMLOption.

Types

Name	Description
TGetErrorResponseEvent (see page 7293)	This is type XMLBrokr.TGetErrorResponseEvent.
TGetResponseEvent (see page 7293)	This is type XMLBrokr.TGetResponseEvent.
TRequestRecordsEvent (see page 7294)	This is type XMLBrokr.TRequestRecordsEvent.
TRequestUpdateEvent (see page 7294)	This is type XMLBrokr.TRequestUpdateEvent.
TXMLOptions (see page 7294)	This is type XMLBrokr.TXMLOptions.

81.1 Classes

The following table lists classes in this documentation.

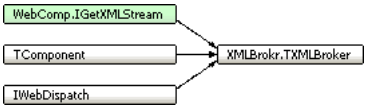
Classes

	Name	Description
	TXMLBroker (see page 7255)	TXMLBroker fetches XML data packets from an application server and applies XML updates to the application server.
	TXMLParams (see page 7285)	TXMLParams manages a list of parameters for an XML broker.

81.1.1 TXMLBroker Class

TXMLBroker fetches XML data packets from an application server and applies XML updates to the application server.

Class Hierarchy



Pascal

```
TXMLBroker = class(TComponent, IWebDispatch, IGetXMLStream);
```

C++

```
class TXMLBroker : public TComponent, public IWebDispatch, public IGetXMLStream;
```

File

XMLBrokr

Description

Use TXMLBroker in an application that is simultaneously the client of a multi-tiered database application and a Web server application. This class serves two major functions:

It fetches XML data packets from a provider using the IAppServer interface.

It receives HTTP messages from Web browsers that contain XML delta packets and applies them to the application server.

Add a TXMLBroker object to a Web module to make database information supplied by a provider on the application server available as XML. An InternetExpress page producer (TInetXPageProducer) in the same Web module uses this XML to build HTML pages that represent that database information.

The XML broker automatically registers itself with the Web module (or Web dispatcher) as an auto-dispatching object. This means that the Web module or Web dispatcher forwards all incoming HTTP messages directed to the XML broker without requiring the use of Web action items.

These incoming messages are assumed to be update messages created by the browser in response to HTML generated by a TApplyUpdatesButton component. The XML broker automatically applies the delta packet (the content of the HTTP request message) to the application server, and passes any update errors to a separate content producer, which can generate a response message.

81.1.1.1 TXMLBroker Members

The following tables list the members exposed by TXMLBroker.

Protected Methods

	Name	Description
	AS_ApplyUpdates (see page 7260)	This is AS_ApplyUpdates, a member of class TXMLBroker.
	AS_FetchParams (see page 7261)	This is AS_FetchParams, a member of class TXMLBroker.
	AS_GetRecords (see page 7261)	This is AS_GetRecords, a member of class TXMLBroker.
	CheckInactive (see page 7261)	This is CheckInactive, a member of class TXMLBroker.
	DispatchEnabled (see page 7261)	
	DispatchMask (see page 7261)	
	DispatchMethodType (see page 7262)	
	DispatchRequest (see page 7262)	
	GetAppServer (see page 7262)	This is GetAppServer, a member of class TXMLBroker.
	GetConnected (see page 7263)	This is GetConnected, a member of class TXMLBroker.
	GetErrorResponse (see page 7263)	This is GetErrorResponse, a member of class TXMLBroker.
	GetHasAppServer (see page 7264)	This is GetHasAppServer, a member of class TXMLBroker.
	GetNotify (see page 7264)	This is GetNotify, a member of class TXMLBroker.
	GetNotifyCount (see page 7265)	This is GetNotifyCount, a member of class TXMLBroker.
	GetProducerName (see page 7265)	This is GetProducerName, a member of class TXMLBroker.
	GetRedirect (see page 7265)	This is GetRedirect, a member of class TXMLBroker.
	GetResponse (see page 7265)	This is GetResponse, a member of class TXMLBroker.
	GetXMLStream (see page 7266)	This is GetXMLStream, a member of class TXMLBroker.
	Notification (see page 7267)	Forwards notification messages to all owned components.
	SendConnectEvent (see page 7271)	This is SendConnectEvent, a member of class TXMLBroker.
	SetAppServer (see page 7271)	This is SetAppServer, a member of class TXMLBroker.
	SetConnected (see page 7271)	This is SetConnected, a member of class TXMLBroker.
	SetParams (see page 7271)	This is SetParams, a member of class TXMLBroker.
	SetProviderName (see page 7272)	This is SetProviderName, a member of class TXMLBroker.
	SetReconcileProducer (see page 7272)	This is SetReconcileProducer, a member of class TXMLBroker.
	SetRemoteServer (see page 7272)	This is SetRemoteServer, a member of class TXMLBroker.
	SetWebDispatch (see page 7273)	This is SetWebDispatch, a member of class TXMLBroker.

Public Methods

	Name	Description
	AddNotify (see page 7259)	Adds an object to the Notify (see page 7276) property list.
	ApplyXMLUpdates (see page 7260)	Sends an XML delta packet of updated, inserted, and deleted records to the provider on the application server for writing to the database.
	Create (see page 7257)	Creates a new TXMLBroker (see page 7255) object.
	Destroy (see page 7258)	Frees the memory associated with the TXMLBroker (see page 7255) object.
	FetchParams (see page 7262)	Retrieves parameter values from the application server.
	GetDelta (see page 7263)	Extracts an XML delta packet from an HTTP request message.

	GetErrorCount (see page 7263)	This is GetErrorCount, a member of class TXMLBroker.
	GetErrors (see page 7264)	Returns the XML delta packet (if any) that describes the errors that occurred when applying updates.
	GetXMLRecords (see page 7265)	Retrieves an XML data packet from the application server.
	HTMLSubmitFormName (see page 7266)	Returns the name of the HTML form that submits updates to the XML broker.
	MasterRowSetVarName (see page 7267)	Returns the name of the javascript variable for the XML broker's dataset.
	RemoveNotify (see page 7268)	Removes an object to the Notify (see page 7276) property list.
V	RequestRecords (see page 7268)	Returns an XML data packet from the application server.
V	RequestUpdate (see page 7269)	Responds to an HTTP update request.
	RowSetVarName (see page 7270)	Returns the name of the javascript variable for the XML broker's dataset.
	SetProvider (see page 7272)	Associates the XML broker with a provider in the same process space.
	SubmitFormVarName (see page 7273)	Returns the name of the variable that refers to the HTML form named by HTMLSubmitFormName (see page 7266).

Public Properties

	Name	Description
	AppServer (see page 7274)	Provides access to the interface the XML broker uses to communicate with the application server.
R	HasAppServer (see page 7275)	Indicates whether the XML broker has an IAppServer interface for communicating with its provider.
R	Notify (see page 7276)	Lists the objects that are notified when any properties affecting the XML broker's connection to its provider change.
R	NotifyCount (see page 7277)	Indicates the number of objects in the Notify (see page 7276) property list.

Published Events

	Name	Description
	AfterDispatch (see page 7281)	Occurs after the XML broker generates the content of a response message.
	BeforeDispatch (see page 7282)	Occurs when the XML broker receives an HTTP request message.
	OnGetErrorResponse (see page 7282)	Occurs when there are errors applying updates to the application server.
	OnGetResponse (see page 7283)	Occurs when there are no errors applying updates to the application server.
	OnRequestRecords (see page 7284)	Occurs when the XML broker needs to fetch a data packet from its associated provider.
	OnRequestUpdate (see page 7284)	Occurs immediately before the XML broker applies updates to the application server.

Published Properties

	Name	Description
	Connected (see page 7274)	Determines whether the XML broker has an active connection to the provider that supplies its data and applies its updates.
	MaxErrors (see page 7275)	Specifies the maximum number of update errors allowed before aborting an update operations.
	MaxRecords (see page 7276)	Specifies the maximum number of records that can appear in XML data packets.
	Params (see page 7277)	Contains parameter values that are sent to or retrieved from the application server.
	ProviderName (see page 7278)	Specifies the name of a registered provider from the application server.
	ReconcileProducer (see page 7279)	Specifies the producer that generates response message content when an update generates errors.
	RemoteServer (see page 7280)	Specifies the connection component that this XML broker uses to connect to an application server.
	WebDispatch (see page 7280)	Lets the Web dispatcher identify what HTTP messages should be forwarded to the XML broker.

81.1.1.2 TXMLBroker.Create Constructor

Creates a new TXMLBroker (see page 7255) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TXMLBroker(TComponent * AOwner);
```

Description

Most applications do not need to call the XML broker constructor. Typically the XML broker is added to a Web module at design time, so that the constructor is called automatically.

The Owner parameter specifies the component (usually the Web module) that is responsible for freeing the XML broker.

See Also

Owner

81.1.1.3 TXMLBroker.Destroy Destructor

Frees the memory associated with the TXMLBroker (see page 7255) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLBroker();
```

Description

Do not call Destroy directly. Instead,call Free, which verifies that the XML broker is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3382)

81.1.1.4 TXMLBroker Methods

The methods of the TXMLBroker class are listed here.

Protected Methods

	Name	Description
	AS_ApplyUpdates (see page 7260)	This is AS_ApplyUpdates, a member of class TXMLBroker.
	AS_FetchParams (see page 7261)	This is AS_FetchParams, a member of class TXMLBroker.
	AS_GetRecords (see page 7261)	This is AS_GetRecords, a member of class TXMLBroker.
	CheckInactive (see page 7261)	This is CheckInactive, a member of class TXMLBroker.
	DispatchEnabled (see page 7261)	
	DispatchMask (see page 7261)	
	DispatchMethodType (see page 7262)	
	DispatchRequest (see page 7262)	
	GetAppServer (see page 7262)	This is GetAppServer, a member of class TXMLBroker.
	GetConnected (see page 7263)	This is GetConnected, a member of class TXMLBroker.
	GetErrorResponse (see page 7263)	This is GetErrorResponse, a member of class TXMLBroker.
	GetHasAppServer (see page 7264)	This is GetHasAppServer, a member of class TXMLBroker.
	GetNotify (see page 7264)	This is GetNotify, a member of class TXMLBroker.
	GetNotifyCount (see page 7265)	This is GetNotifyCount, a member of class TXMLBroker.
	GetProducerName (see page 7265)	This is GetProducerName, a member of class TXMLBroker.

	GetRedirect (see page 7265)	This is GetRedirect, a member of class TXMLBroker.
	GetResponse (see page 7265)	This is GetResponse, a member of class TXMLBroker.
	GetXMLStream (see page 7266)	This is GetXMLStream, a member of class TXMLBroker.
V	Notification (see page 7267)	Forwards notification messages to all owned components.
	SendConnectEvent (see page 7271)	This is SendConnectEvent, a member of class TXMLBroker.
	SetAppServer (see page 7271)	This is SetAppServer, a member of class TXMLBroker.
	SetConnected (see page 7271)	This is SetConnected, a member of class TXMLBroker.
	SetParams (see page 7271)	This is SetParams, a member of class TXMLBroker.
	SetProviderName (see page 7272)	This is SetProviderName, a member of class TXMLBroker.
	SetReconcileProducer (see page 7272)	This is SetReconcileProducer, a member of class TXMLBroker.
	SetRemoteServer (see page 7272)	This is SetRemoteServer, a member of class TXMLBroker.
	SetWebDispatch (see page 7273)	This is SetWebDispatch, a member of class TXMLBroker.

Public Methods

	Name	Description
	AddNotify (see page 7259)	Adds an object to the Notify (see page 7276) property list.
	ApplyXMLUpdates (see page 7260)	Sends an XML delta packet of updated, inserted, and deleted records to the provider on the application server for writing to the database.
V	FetchParams (see page 7262)	Retrieves parameter values from the application server.
	GetDelta (see page 7263)	Extracts an XML delta packet from an HTTP request message.
	GetErrorCount (see page 7263)	This is GetErrorCount, a member of class TXMLBroker.
	GetErrors (see page 7264)	Returns the XML delta packet (if any) that describes the errors that occurred when applying updates.
	GetXMLRecords (see page 7265)	Retrieves an XML data packet from the application server.
	HTMLSubmitFormName (see page 7266)	Returns the name of the HTML form that submits updates to the XML broker.
	MasterRowSetVarName (see page 7267)	Returns the name of the javascript variable for the XML broker's dataset.
	RemoveNotify (see page 7268)	Removes an object to the Notify (see page 7276) property list.
V	RequestRecords (see page 7268)	Returns an XML data packet from the application server.
V	RequestUpdate (see page 7269)	Responds to an HTTP update request.
	RowSetVarName (see page 7270)	Returns the name of the javascript variable for the XML broker's dataset.
	SetProvider (see page 7272)	Associates the XML broker with a provider in the same process space.
	SubmitFormVarName (see page 7273)	Returns the name of the variable that refers to the HTML form named by HTMLSubmitFormName (see page 7266).

81.1.1.4.1 TXMLBroker.AddNotify Method

Adds an object to the Notify (see page 7276) property list.

Pascal

```
procedure AddNotify(ANotify: TObject);
```

C++

```
__fastcall AddNotify(TObject * ANotify);
```

Description

Call AddNotify to add an object to the list maintained by the Notify (see page 7276) property. Each object in this list is notified every time a property that affects the metadata of the XML broker's data packets changes. These include changes to the RemoteServer (see page 7280), AppServer (see page 7274), and ProviderName (see page 7278) properties.

ANotify specifies the object that wants to be notified of property changes. This object must support the INotifyConnectionChange (see page 7289) interface, which the XML broker uses to notify it of changes.

See Also

NotifyCount (see page 7277)

Notify (see page 7276)

RemoveNotify (see page 7268)

RemoteServer (see page 7280)

AppServer (see page 7274)

ProviderName (see page 7278)

81.1.1.4.2 TXMLBroker.ApplyXMLUpdates Method

Sends an XML delta packet of updated, inserted, and deleted records to the provider on the application server for writing to the database.

Pascal

```
function ApplyXMLUpdates(const Delta: string; out ErrorCount: Integer): string;
```

C++

```
__fastcall UnicodeString ApplyXMLUpdates(const UnicodeString Delta, int ErrorCount);
```

Description

Call ApplyXMLUpdates to send the updates in the XML delta packet specified by Delta to the application server. ApplyXMLUpdates is used internally (by the RequestUpdate (see page 7269) method) to apply updates in an XML delta packet and retrieve a delta packet containing any failed updates.

Delta is the XML delta packet that contains the insertions, deletions and modifications from a Web browser. Typically, it is retrieved from an HTTP request message using the GetDelta (see page 7263) method.

ErrorCount returns the number of errors encountered on the application server before it terminated the update operation. If ErrorCount is 0, all updates were applied successfully. ErrorCount can not exceed the value of MaxErrors (see page 7275).

ApplyXMLUpdates returns an XML delta packet containing all updates that were not successfully applied. If ErrorCount is 0, this is an empty string.

See Also

RequestUpdate (see page 7269)

AS_ApplyUpdates

MaxErrors (see page 7275)

GetDelta (see page 7263)

81.1.1.4.3 TXMLBroker.AS_ApplyUpdates Method

Pascal

```
function AS_ApplyUpdates(Delta: OleVariant; MaxErrors: Integer; out ErrorCount: Integer):
OleVariant;
```

C++

```
__fastcall OleVariant AS_ApplyUpdates(OleVariant Delta, int MaxErrors, int ErrorCount);
```

Description

This is AS_ApplyUpdates, a member of class TXMLBroker.

81.1.1.4.4 TXMLBroker.AS_FetchParams Method

Pascal

```
procedure AS_FetchParams;
```

C++

```
__fastcall AS_FetchParams();
```

Description

This is AS_FetchParams, a member of class TXMLBroker.

81.1.1.4.5 TXMLBroker.AS_GetRecords Method

Pascal

```
function AS_GetRecords(Count: Integer; out RecsOut: Integer; Options: Integer; const
CommandText: WideString; Params: OleVariant; var OwnerData: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant AS_GetRecords(int Count, int RecsOut, int Options, const BSTR
CommandText, OleVariant Params, OleVariant OwnerData);
```

Description

This is AS_GetRecords, a member of class TXMLBroker.

81.1.1.4.6 TXMLBroker.CheckInactive Method

Pascal

```
procedure CheckInactive;
```

C++

```
__fastcall CheckInactive();
```

Description

This is CheckInactive, a member of class TXMLBroker.

81.1.1.4.7 TXMLBroker.DispatchEnabled Method

Pascal

```
function DispatchEnabled: Boolean;
```

C++

```
__fastcall Boolean DispatchEnabled();
```

See Also

Enabled

81.1.1.4.8 TXMLBroker.DispatchMask Method

Pascal

```
function DispatchMask: TMask;
```

C++

```
__fastcall TMask DispatchMask();
```

See Also

Mask

81.1.1.4.9 TXMLBroker.DispatchMethodType Method

Pascal

```
function DispatchMethodType: TMethodType;
```

C++

```
__fastcall TMethodType DispatchMethodType();
```

See Also

MethodType

81.1.1.4.10 TXMLBroker.DispatchRequest Method

Pascal

```
function DispatchRequest(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean DispatchRequest(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

81.1.1.4.11 TXMLBroker.FetchParams Method

Retrieves parameter values from the application server.

Pascal

```
procedure FetchParams; virtual;
```

C++

```
virtual __fastcall FetchParams();
```

Description

Call FetchParams to initialize the Params (see page 7277) property with the current parameter values on the application server. FetchParams does nothing unless the provider component on the application server can supply parameter values.

Warning: if the XML broker uses a stateless application server, other clients can change the values returned by FetchParams at any time.

RowRequest

Params (see page 7277)

81.1.1.4.12 TXMLBroker.GetAppServer Method

Pascal

```
function GetAppServer: IAppServer;
```

C++

```
__fastcall IAppServer GetAppServer();
```

Description

This is GetAppServer, a member of class TXMLBroker.

81.1.1.4.13 TXMLBroker.GetConnected Method

Pascal

```
function GetConnected: Boolean;
```

C++

```
__fastcall Boolean GetConnected();
```

Description

This is GetConnected, a member of class TXMLBroker.

81.1.1.4.14 TXMLBroker.GetDelta Method

Extracts an XML delta packet from an HTTP request message.

Pascal

```
function GetDelta(Request: TWebRequest): string;
```

C++

```
__fastcall UnicodeString GetDelta(TWebRequest Request);
```

Description

Call GetDelta to obtain the XML delta packet contained in the content of the request message specified by Request. This value can be used to apply the updates from the request message by calling ApplyXMLUpdates (see page 7260).

See Also

ApplyXMLUpdates (see page 7260)

81.1.1.4.15 TXMLBroker.GetErrorCount Method

Pascal

```
function GetErrorCount: Integer;
```

C++

```
__fastcall int GetErrorCount();
```

Description

This is GetErrorCount, a member of class TXMLBroker.

81.1.1.4.16 TXMLBroker.GetErrorResponse Method

Pascal

```
function GetErrorResponse(ErrorCount: Integer; XMLErrors: string; Request: TWebRequest;
Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean GetErrorResponse(int ErrorCount, UnicodeString XMLErrors, TWebRequest
Request, TWebResponse Response);
```

Description

This is GetErrorResponse, a member of class TXMLBroker.

81.1.1.4.17 TXMLBroker.GetErrors Method

Returns the XML delta packet (if any) that describes the errors that occurred when applying updates.

Pascal

```
function GetErrors: string;
```

C++

```
__fastcall UnicodeString GetErrors();
```

Description

Call GetErrors to obtain the XML delta packet returned by the application server when an update operation included some errors.

Note: See the template err.html (included in the WebMidas directory) for one possible use for the XML delta packet of errors. In err.html, the string returned by GetErrors should replace the <#XMLEMBED_VAR_ERR> tag.

See Also

OnGetErrorResponse (see page 7282)

ApplyXMLUpdates (see page 7260)

GetErrorcount (see page 7263)

81.1.1.4.18 TXMLBroker.GetHasAppServer Method

Pascal

```
function GetHasAppServer: Boolean;
```

C++

```
__fastcall Boolean GetHasAppServer();
```

Description

This is GetHasAppServer, a member of class TXMLBroker.

81.1.1.4.19 TXMLBroker.GetNotify Method

Pascal

```
function GetNotify(Index: Integer): TObject;
```

C++

```
__fastcall TObject * GetNotify(int Index);
```

Description

This is GetNotify, a member of class TXMLBroker.

81.1.1.4.20 TXMLBroker.GetNotifyCount Method

Pascal

```
function GetNotifyCount: Integer;
```

C++

```
__fastcall int GetNotifyCount();
```

Description

This is GetNotifyCount, a member of class TXMLBroker.

81.1.1.4.21 TXMLBroker.GetProducerName Method

Pascal

```
function GetProducerName(Request: TWebRequest): string;
```

C++

```
__fastcall UnicodeString GetProducerName(TWebRequest Request);
```

Description

This is GetProducerName, a member of class TXMLBroker.

81.1.1.4.22 TXMLBroker.GetRedirect Method

Pascal

```
function GetRedirect(Request: TWebRequest): string;
```

C++

```
__fastcall UnicodeString GetRedirect(TWebRequest Request);
```

Description

This is GetRedirect, a member of class TXMLBroker.

81.1.1.4.23 TXMLBroker.GetResponse Method

Pascal

```
function GetResponse(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean GetResponse(TWebRequest Request, TWebResponse Response);
```

Description

This is GetResponse, a member of class TXMLBroker.

81.1.1.4.24 TXMLBroker.GetXMLRecords Method

Retrieves an XML data packet from the application server.

Pascal

```
function GetXMLRecords(var RecsOut: Integer; var OwnerData: OleVariant; XMLOptions:
TXMLOptions): string;
```

C++

```
__fastcall UnicodeString GetXMLRecords(int RecsOut, OleVariant OwnerData, TXMLOptions
XMLOptions);
```

Description

Call GetXMLRecords to obtain the XML data packet from the application server. GetXMLRecords calls the interface specified by AppServer (see page 7274), requesting an XML data packet with at most MaxRecords (see page 7276) records. It returns the resulting XML data packet in a form that is ready for insertion into an HTML document.

RecsOut returns the number of records in the XML data packet.

On entry, OwnerData contains an application-defined value that is passed to the provider's BeforeGetRecords event handler. OwnerData returns an application-defined value that is set by the provider's AfterGetRecords event handler. Typically, this parameter is used to transmit persistent state information to and from a stateless application server.

XMLOptions is a set of flags that indicate how the broker should format the XML data packet after it is retrieved from the application server.

GetXMLRecords returns the formatted XML data packet.

Note: Unlike the RequestRecords (see page 7268) method, GetXMLRecords bypasses the OnRequestRecords (see page 7284) event.

See Also

RequestRecords (see page 7268)

AfterGetRecords

Using an XML Broker

81.1.1.4.25 TXMLBroker.GetXMLStream Method

Pascal

```
function GetXMLStream(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLStream(Boolean Owned);
```

Description

This is GetXMLStream, a member of class TXMLBroker.

81.1.1.4.26 TXMLBroker.HTMLSubmitFormName Method

Returns the name of the HTML form that submits updates to the XML broker.

Pascal

```
function HTMLSubmitFormName: string;
```

C++

```
__fastcall UnicodeString HTMLSubmitFormName();
```

Description

When the InternetExpress page producer assembles an HTML document that uses the XML data packets managed by the XML broker, it declares an HTML form that submits the updates to the XML broker. HTMLSubmitFormName is the name of that HTML form.

The HTML form named by this return value sends the HTTP request messages containing an XML delta packet of updates to be applied.

See Also

SubmitFormVarName (see page 7273)

Content

81.1.1.4.27 TXMLBroker.MasterRowSetVarName Method

Returns the name of the javascript variable for the XML broker's dataset.

Pascal

```
function MasterRowSetVarName(Path: TStrings): string;
```

C++

```
__fastcall UnicodeString MasterRowSetVarName(TStrings Path);
```

Description

When the InternetExpress page producer assembles an HTML document that uses the XML data packets managed by the XML broker, it declares a javascript variable of type RowSet for the javascript object that represents the XML broker's dataset. When the variable is first declared, the InternetExpress page producer calls MasterRowSetVarName.

Path is a set of variable names for all the master datasets for which the XML broker's dataset is a detail set. These names come from previous calls to the MasterRowSetVarName method of their XML brokers. The last string in Path refers to the XML broker's dataset itself.

MasterRowSetVarName returns the name of the XML broker, qualified by all strings in Path except for the last one, which is assumed to refer to the XML broker's dataset. Thus, to change the name of the generated variable for an XML broker's dataset, change the Name property of the XML broker.

Note: To retrieve the name of the XML broker preceded by all the datasets in Path, use the RowSetVarName (see page 7270) method instead.

See Also

Name

Content

RowSetVarName (see page 7270)

81.1.1.4.28 TXMLBroker.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

81.1.1.4.29 TXMLBroker.RemoveNotify Method

Removes an object to the Notify (see page 7276) property list.

Pascal

```
procedure RemoveNotify(ANotify: TObject);
```

C++

```
__fastcall RemoveNotify(TObject * ANotify);
```

Description

Call RemoveNotify to remove an object from the list maintained by the Notify (see page 7276) property. Each object in this list is notified every time a property that affects the metadata of the XML broker's data packets changes.

See Also

NotifyCount (see page 7277)

Notify (see page 7276)

AddNotify (see page 7259)

81.1.1.4.30 TXMLBroker.RequestRecords Method

Returns an XML data packet from the application server.

Pascal

```
function RequestRecords(Sender: TObject; Request: TWebRequest; out RecCount: Integer; var
OwnerData: OleVariant; XMLOptions: TXMLOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString RequestRecords(TObject * Sender, TWebRequest Request, int
RecCount, OleVariant OwnerData, TXMLOptions XMLOptions);
```

Description

Call RequestRecords to obtain a current XML data packet, while first allowing the OnRequestRecords (see page 7284) event handler to customize it. After generating the OnRequestRecords (see page 7284) event, RequestRecords fetches the XML data packet by calling GetXMLRecords (see page 7265), unless the event handler supplies the XML data packet first.

Sender is the object that is requesting the XML data packet (usually an InternetExpress page producer).

Request describes an HTTP request message that originated the need for an XML data packet. Typically, this is a request message for which the InternetExpress page producer is creating a response.

RecCount returns the number of records in the XML data packet.

On entry, OwnerData contains an application-defined value that is passed to the OnRequestRecords (see page 7284) event handler, and then forwarded (with any changes provided by the event handler) to the provider's BeforeGetRecords event handler. OwnerData returns an application-defined value that is set by the provider's AfterGetRecords event handler. Typically, this parameter is used to transmit persistent state information to and from a stateless application server.

XMLOptions is a set of flags indicating how the XML broker should format the XML data packet that the application server or OnRequestRecords (see page 7284) event handler supplies.

RequestRecords returns the XML data packet.

AfterGetRecords

Using an XML Broker

81.1.1.4.31 TXMLBroker.RequestUpdate Method

Responds to an HTTP update request.

Pascal

```
function RequestUpdate(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean; virtual;
```

C++

```
virtual __fastcall Boolean RequestUpdate(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

Description

Call RequestUpdate when using a Web action item to respond to update requests from a Web browser. When using a Web action item to respond to update requests, instead of letting the XML broker receive the update requests directly, you should set the Enabled property of the WebDispatch (see page 7280) to false.

RequestUpdate generates an OnRequestUpdate (see page 7284) event, to allow the event handler to apply the updates in the HTTP request message and generate a response. If the OnRequestUpdate (see page 7284) event handler does not handle the message, RequestUpdate applies the updates using the ApplyXMLUpdates (see page 7260) method. Finally, if there are no update errors, RequestUpdate generates an OnGetResponse (see page 7283) event. If there were update errors,

RequestResponse generates an OnGetErrorResponse (see page 7282) event and (if the event handler does not generate a response) assigns the content of ReconcileProducer (see page 7279) to the response message. If there are update errors and the response is not completed by an event handler or the ReconcileProducer (see page 7279), the XML broker raises an exception.

Sender is the object that received the request message.

Request describes an HTTP request message that contains the updates that need to be applied.

Response is the emerging response object that should be completed by RequestUpdate so that the XML broker can send it back to the Web browser.

RequestUpdate returns true if the response message is ready to send back to the Web browser, false if it still needs more processing.

Enabled

81.1.1.4.32 TXMLBroker.RowSetVarName Method

Returns the name of the javascript variable for the XML broker's dataset.

Pascal

```
function RowSetVarName(Path: TStrings): string;
```

C++

```
__fastcall UnicodeString RowSetVarName(TStrings Path);
```

Description

When the InternetExpress page producer assembles an HTML document that uses the XML data packets managed by the XML broker, it declares a javascript variable of type RowSet for the javascript object that represents the XML broker's dataset. When the InternetExpress page producer needs to determine whether a RowSet variable was already declared, it looks up the variable name by calling RowSetVarName.

Path is a set of variable names for all the master datasets for which the XML broker's dataset is a detail set.

RowSetVarName returns the name of the XML broker, qualified by all strings in Path.

Note: Variable names are assigned for an XML broker's dataset using the MasterRowSetVarName (see page 7267) method.

Name

Content

MasterRowSetVarName (see page 7267)

81.1.1.4.33 TXMLBroker.SendConnectEvent Method

Pascal

```
procedure SendConnectEvent(Connecting: Boolean);
```

C++

```
__fastcall SendConnectEvent(Boolean Connecting);
```

Description

This is SendConnectEvent, a member of class TXMLBroker.

81.1.1.4.34 TXMLBroker.SetAppServer Method

Pascal

```
procedure SetAppServer(Value: IAppServer);
```

C++

```
__fastcall SetAppServer(IAppServer Value);
```

Description

This is SetAppServer, a member of class TXMLBroker.

81.1.1.4.35 TXMLBroker.SetConnected Method

Pascal

```
procedure SetConnected(Value: Boolean);
```

C++

```
__fastcall SetConnected(Boolean Value);
```

Description

This is SetConnected, a member of class TXMLBroker.

81.1.1.4.36 TXMLBroker.SetParams Method

Pascal

```
procedure SetParams(const Value: TXMLParams);
```

C++

```
__fastcall SetParams(const TXMLParams Value);
```

Description

This is SetParams, a member of class TXMLBroker.

81.1.1.4.37 TXMLBroker.SetProvider Method

Associates the XML broker with a provider in the same process space.

Pascal

```
procedure SetProvider(Provider: TComponent);
```

C++

```
__fastcall SetProvider(TComponent * Provider);
```

Description

Use SetProvider to specify a local provider component that provides data to and applies updates from the XML broker. The XML broker communicates with this provider using the IAppServer interface specified by the AppServer (see page 7274) property.

Do not use SetProvider for remote providers on an application server. If the provider is not in the same process space as the XML broker, use the ProviderName (see page 7278) property.

The Provider parameter must be a descendant of TCustomProvider. Otherwise, SetProvider raises an exception.

See Also

AppServer (see page 7274)

ProviderName (see page 7278)

TDataSetProvider

TCustomProvider

81.1.1.4.38 TXMLBroker.SetProviderName Method

Pascal

```
procedure SetProviderName(const Value: string);
```

C++

```
__fastcall SetProviderName(const UnicodeString Value);
```

Description

This is SetProviderName, a member of class TXMLBroker.

81.1.1.4.39 TXMLBroker.SetReconcileProducer Method

Pascal

```
procedure SetReconcileProducer(const Value: TCustomContentProducer);
```

C++

```
__fastcall SetReconcileProducer(const TCustomContentProducer Value);
```

Description

This is SetReconcileProducer, a member of class TXMLBroker.

81.1.1.4.40 TXMLBroker.SetRemoteServer Method

Pascal

```
procedure SetRemoteServer(Value: TCustomRemoteServer);
```

C++

```
__fastcall SetRemoteServer(TCustomRemoteServer Value);
```

Description

This is SetRemoteServer, a member of class TXMLBroker.

81.1.1.4.41 TXMLBroker.SetWebDispatch Method

Pascal

```
procedure SetWebDispatch(const Value: TWebDispatch);
```

C++

```
__fastcall SetWebDispatch(const TWebDispatch Value);
```

Description

This is SetWebDispatch, a member of class TXMLBroker.

81.1.1.4.42 TXMLBroker.SubmitFormVarName Method

Returns the name of the variable that refers to the HTML form named by HTMLSubmitFormName (see page 7266).

Pascal

```
function SubmitFormVarName: string;
```

C++

```
__fastcall UnicodeString SubmitFormVarName();
```

Description

When the InternetExpress page producer assembles an HTML document that uses the XML data packets managed by the XML broker, it declares an HTML form that submits the updates to the XML broker. In addition, it declares a variable that refers to that form. SubmitFormVarName is the name of that variable.

See Also

HTMLSubmitFormName (see page 7266)

Content

81.1.1.5 TXMLBroker Properties

The properties of the TXMLBroker class are listed here.

Public Properties

	Name	Description
	AppServer (see page 7274)	Provides access to the interface the XML broker uses to communicate with the application server.
R	HasAppServer (see page 7275)	Indicates whether the XML broker has an IAppServer interface for communicating with its provider.
R	Notify (see page 7276)	Lists the objects that are notified when any properties affecting the XML broker's connection to its provider change.
R	NotifyCount (see page 7277)	Indicates the number of objects in the Notify (see page 7276) property list.

Published Properties

	Name	Description
	Connected (see page 7274)	Determines whether the XML broker has an active connection to the provider that supplies its data and applies its updates.
	MaxErrors (see page 7275)	Specifies the maximum number of update errors allowed before aborting an update operations.
	MaxRecords (see page 7276)	Specifies the maximum number of records that can appear in XML data packets.
	Params (see page 7277)	Contains parameter values that are sent to or retrieved from the application server.
	ProviderName (see page 7278)	Specifies the name of a registered provider from the application server.
	ReconcileProducer (see page 7279)	Specifies the producer that generates response message content when an update generates errors.
	RemoteServer (see page 7280)	Specifies the connection component that this XML broker uses to connect to an application server.
	WebDispatch (see page 7280)	Lets the Web dispatcher identify what HTTP messages should be forwarded to the XML broker.

81.1.1.5.1 TXMLBroker.AppServer Property

Provides access to the interface the XML broker uses to communicate with the application server.

Pascal

```
property AppServer: IAppServer;
```

C++

```
__property IAppServer AppServer;
```

Description

Use AppServer to communicate with the providers that supply data to and resolve updates for the XML broker. If the providers are on a remote application server, AppServer has the same value as the AppServer property of the connection component. If the XML broker uses a provider in the same process space, AppServer is the interface to an internally created object that dispatches IAppServer calls to the local provider.

Applications don't need to work directly with the IAppServer interface. The properties and methods of the XML broker are automatically translated into IAppServer calls as needed.

See Also

HasAppServer (see page 7275)

AppServer

SetProvider (see page 7272)

81.1.1.5.2 TXMLBroker.Connected Property

Determines whether the XML broker has an active connection to the provider that supplies its data and applies its updates.

Pascal

```
property Connected: Boolean;
```

C++

```
__property Boolean Connected;
```

Description

Use Connected to determine whether the XML broker can supply XML data packets and apply updates. If the XML broker uses a provider on an application server, setting Connected to true sets the Connected property of the connection component to true. If

the XML broker uses a local provider component, setting Connected to true causes the XML broker to generate an internal object that communicates with the provider using the IAppServer interface. Thus, the value of Connected indicates whether an IAppServer interface is available for communicating with a provider, and so the value of Connected is the same as the value of HasAppServer (see page 7275).

You can't set Connected to true unless the XML broker has a provider to which it can connect. Trying to set Connected to true before the ProviderName (see page 7278) property is set or a local provider is assigned using the SetProvider (see page 7272) method causes the XML broker to raise an exception.

Note: In the Web Page editor, default fields or parameter values may not appear if the associated XML broker is not connected.

See Also

HasAppServer (see page 7275)

AppServer (see page 7274)

Connected

TDataSetProvider

ProviderName (see page 7278)

SetProvider (see page 7272)

81.1.1.5.3 TXMLBroker.HasAppServer Property

Indicates whether the XML broker has an IAppServer interface for communicating with its provider.

Pascal

```
property HasAppServer: Boolean;
```

C++

```
__property Boolean HasAppServer;
```

Description

Read (see page 3727) HasAppServer to determine whether the XML broker can get its data from an IAppServer interface. When HasAppServer is true, the XML broker can interact with its provider through the IAppServer interface.

Use HasAppServer to check whether the XML broker is connected rather than reading the AppServer (see page 7274) property. Reading AppServer (see page 7274) causes the XML broker to obtain an IAppServer interface if it does not already have one.

See Also

IAppServer

AppServer (see page 7274)

Connected (see page 7274)

81.1.1.5.4 TXMLBroker.MaxErrors Property

Specifies the maximum number of update errors allowed before aborting an update operations.

Pascal

```
property MaxErrors: Integer;
```

C++

```
__property int MaxErrors;
```

Description

Set MaxErrors to indicate the maximum number of errors that the associated provider should allow before prematurely stopping an update operation. Set MaxErrors to –1 to indicate that there is no limit to the number of errors.

See Also

AS_ApplyUpdates

ReconcileProducer (see page 7279)

ApplyXMLUpdates (see page 7260)

81.1.1.5.5 TXMLBroker.MaxRecords Property

Specifies the maximum number of records that can appear in XML data packets.

Pascal

```
property MaxRecords: Integer;
```

C++

```
__property int MaxRecords;
```

Description

Set MaxRecords to limit the size of XML data packets retrieved from the associated provider.

When MaxRecords is –1, XML data packets contain all the records in the provider's dataset.

When MaxRecords is 0, XML data packets contain only metadata.

When MaxRecords is greater than 0, XML data packets contain up to MaxRecords records, depending on the number of records in the provider's dataset.

Tip: Because an InternetExpress application sends the entire data packet to client applications, it is important to limit the size of data packets. Otherwise, the time to download web pages containing data packets can be prohibitively long.

Note: When limiting the number of records that appear in data packets, you may need to fetch several data packets before all data is returned. Because InternetExpress applications are always stateless, you will need to supply information about what record should start the next data packet as the OwnerData parameter of GetXMLRecords (see page 7265) or RequestRecords (see page 7268). You can use a query form to obtain information about the last record seen by a particular Web client.

See Also

AS_GetRecords

GetXMLRecords (see page 7265)

RequestRecords (see page 7268)

TQueryForm

Using an XML Broker

81.1.1.5.6 TXMLBroker.Notify Property

Lists the objects that are notified when any properties affecting the XML broker's connection to its provider change.

Pascal

```
property Notify [Index: Integer]: TObject;
```

C++

```
__property TObject * Notify[int Index];
```

Description

Read (see page 3727) Notify to access the objects that respond when the XML broker's connection to its provider changes. These objects are sent a notification when the ProviderName (see page 7278), AppServer (see page 7274), or RemoteServer (see page 7280) property changes.

Most applications do not need to use the Notify property. It allows the Web page editor to remain synchronized with property changes made at design time.

See Also

NotifyCount (see page 7277)

AddNotify (see page 7259)

RemoveNotify (see page 7268)

RemoteServer (see page 7280)

AppServer (see page 7274)

ProviderName (see page 7278)

81.1.1.5.7 TXMLBroker.NotifyCount Property

Indicates the number of objects in the Notify (see page 7276) property list.

Pascal

```
property NotifyCount: Integer;
```

C++

```
__property int NotifyCount;
```

Description

NotifyCount specifies the number of objects listed in the Notify (see page 7276) property.

See Also

Notify (see page 7276)

AddNotify (see page 7259)

RemoveNotify (see page 7268)

81.1.1.5.8 TXMLBroker.Params Property

Contains parameter values that are sent to or retrieved from the application server.

Pascal

```
property Params: TXMLParams;
```

C++

```
__property TXMLParams Params;
```

Description

Use Params to specify parameter values that should be passed to a source dataset on the application server. These parameter values are used in one of two ways:

If the associated provider represents a query or stored procedure, they supply parameter values that the application server uses when executing the query or stored procedure.

If the associated provider represents a table, they limit the records that are sent in data packets so that they only include records where each field with the same name as a parameter has the same value as the parameter.

After the application specifies parameters (at design time or runtime), they are sent to the application server automatically when the XML broker fetches data.

To send parameter values to a query or stored procedure, add a parameter object (TParam) to Params for every parameter on the query or stored procedure for which you want to supply a value. Assign each parameter object the same Name, DataType, and ParamType as the corresponding parameter on the query or stored procedure. These values are automatically encoded and sent to the application server when the XML broker fetches data.

To send parameter values to a table, add a parameter object for each field in the table that is used to limit the values sent in data packets. Assign each parameter object the same Name and DataType as the corresponding field component on the table. These parameter values are automatically sent when the client dataset fetches data, and the records returned in data packets from the application server only contain records that match the assigned value on the corresponding fields.

Tip: You can assign parameter values from the content fields supplied to a request message by TSubmitQueryButton using the AssignStrings method of Params.

Note: To initialize Params so that it reflects the parameters of a query or stored procedure on an application server, call the FetchParams (see page 7262) method.

AssignStrings (see page 7287)

Using an XML Broker

81.1.1.5.9 TXMLBroker.ProviderName Property

Specifies the name of a registered provider from the application server.

Pascal

```
property ProviderName: string;
```

C++

```
__property UnicodeString ProviderName;
```

Description

Use ProviderName to specify the provider with which to communicate on the server (or in the same Web module). This property is passed as a parameter to IAppServer interface calls when the XML broker fetches data or applies updates. If an application server contains multiple provider objects, an XML broker can set ProviderName to any of them once the connection component

establishes a connection to the application server.

ProviderName can be set from a drop-down in the Object Inspector once the RemoteServer (see page 7280) property is set.

Note: ProviderName can also be used to link the XML broker to a provider in the same process space, as long as the provider component has the same Owner as the XML broker. If the local provider component has a different Owner, use the SetProvider (see page 7272) method instead.

SetProvider (see page 7272)

Using an XML Broker

81.1.1.5.10 TXMLBroker.ReconcileProducer Property

Specifies the producer that generates response message content when an update generates errors.

Pascal

```
property ReconcileProducer: TCustomContentProducer;
```

C++

```
__property TCustomContentProducer ReconcileProducer;
```

Description

Use ReconcileProducer to specify the component that generates the content of response messages to update requests when the update operation generated errors.

When the XML broker applies updates, the application server returns a delta packet containing all records that could not be updated because of errors. The XML broker can attempt to respond to those errors or generate its own response message using the OnGetErrorResponse (see page 7282) event. However, unless the OnGetErrorResponse (see page 7282) event handler generates an HTML document to be sent in the response message and indicates that the update is completely handled, the XML broker must still generate a response to the update operation. To do so, it calls the Content method of the ReconcileProducer to generate the content of the response message.

Tip: The Reconcile producer will probably need information about the update errors that the application server returned. You can provide it with this information either by initializing the Reconcile producer in an OnGetErrorResponse (see page 7282) event handler or by having the Reconcile producer call the GetErrors (see page 7264) method.

Note: If there is no ReconcileProducer assigned and an update generates errors, the XML broker raises an exception unless the OnGetErrorResponse (see page 7282) event handler generates a response message.

Tip: The InetXCustom demo contains a TReconcilePageProducer component that you can use as the value of the ReconcileProducer property or as the basis of your own reconcile producer.

Using an XML Broker

81.1.1.5.11 TXMLBroker.RemoteServer Property

Specifies the connection component that this XML broker uses to connect to an application server.

Pascal

```
property RemoteServer: TCustomRemoteServer;
```

C++

```
__property TCustomRemoteServer RemoteServer;
```

Description

Use RemoteServer to specify the connection component that establishes a connection to the remote application server. The connection component obtains an IAppServer interface for data exchange and maintains the interface of the remote data module on the application server.

If a Web application uses more than connection component, the application can change which connection an XML broker uses by changing the value for this property.

AppServer

IAppServer

Using an XML Broker

81.1.1.5.12 TXMLBroker.WebDispatch Property

Lets the Web dispatcher identify what HTTP messages should be forwarded to the XML broker.

Pascal

```
property WebDispatch: TWebDispatch;
```

C++

```
__property TWebDispatch WebDispatch;
```

Description

Use WebDispatch to specify the HTTP messages to which the XML broker responds. Typically, these originate from a button added to HTML forms by TApplyUpdatesButton.

The TWebDispatch object that implements WebDispatch includes properties that let you specify the path portion of URLs to which the XML broker responds, as well as the types of messages it accepts (typically post messages). You can also use this property to disable the XML broker so that the Web dispatcher does not send it any HTTP messages. When the XML broker is disabled in this way, it can still provide XML data packets to an InternetExpress page producer, but any update messages must be handled by a Web action item.

Using an XML Broker

81.1.1.6 TXMLBroker Events

The events of the TXMLBroker class are listed here.

Published Events

	Name	Description
	AfterDispatch (see page 7281)	Occurs after the XML broker generates the content of a response message.
	BeforeDispatch (see page 7282)	Occurs when the XML broker receives an HTTP request message.
	OnGetErrorResponse (see page 7282)	Occurs when there are errors applying updates to the application server.
	OnGetResponse (see page 7283)	Occurs when there are no errors applying updates to the application server.
	OnRequestRecords (see page 7284)	Occurs when the XML broker needs to fetch a data packet from its associated provider.
	OnRequestUpdate (see page 7284)	Occurs immediately before the XML broker applies updates to the application server.

81.1.1.6.1 TXMLBroker.AfterDispatch Event

Occurs after the XML broker generates the content of a response message.

Pascal

```
property AfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent AfterDispatch;
```

Description

Write (see page 3789) an AfterDispatch event handler to perform any final actions before sending a response back to the Web browser that sent the XML broker an update message. Usually by the time AfterDispatch occurs, the XML broker has already applied the updates and generated the response message (using the ReconcileProducer (see page 7279) or one of the events that occurs when the XML broker receives an update request).

See Also

WebDispatch (see page 7280)

BeforeDispatch (see page 7282)

OnRequestUpdate (see page 7284)

OnGetResponse (see page 7283)

OnGetErrorResponse (see page 7282)

ReconcileProducer (see page 7279)

Using an XML Broker

81.1.1.6.2 TXMLBroker.BeforeDispatch Event

Occurs when the XML broker receives an HTTP request message.

Pascal

```
property BeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent BeforeDispatch;
```

Description

Write (see page 3789) a BeforeDispatch event handler to initialize the response to an update request or to handle any messages sent to the XML broker that are not update requests. If the event handler completely handles the request, filling out the response object so that it is ready to send, it should set the Handled parameter to true, thereby preventing the XML broker from applying the updates.

Unless the BeforeDispatch event handler sets the Handled parameter to true, the XML broker receives an OnRequestUpdate (see page 7284) event after the BeforeDispatch event handler exits. After the OnRequestUpdate (see page 7284) event, the XML broker applies the updates to the application server and generates the contents of the response based on whether there were any update errors. Finally, the XML broker receives an AfterDispatch (see page 7281) event where it can perform any final changes to the response message before it is sent back to the Web browser.

If the BeforeDispatch event handler sets the Handled parameter to true, the XML broker receives an AfterDispatch (see page 7281) event, but does not attempt to apply updates from the request message or receive any of the events that accompany that process.

See Also

WebDispatch (see page 7280)

AfterDispatch (see page 7281)

OnRequestUpdate (see page 7284)

Using an XML Broker

81.1.1.6.3 TXMLBroker.OnGetErrorResponse Event

Occurs when there are errors applying updates to the application server.

Pascal

```
property OnGetErrorResponse: TGetErrorResponseEvent;
```

C++

```
__property TGetErrorResponseEvent OnGetErrorResponse;
```

Description

Write (see page 3789) an OnGetErrorResponse event handler to generate the response message after an update request encountered errors or to initialize a ReconcileProducer (see page 7279) before it generates the response.

The Sender parameter is the XML broker that applied updates to the application server and received back a delta packet of update errors.

ErrorCount is the number of update errors found by the application server before it halted the update operation.

XMLErrors is a string of XML returned by the application server. It is a delta packet containing all the updates that could not be applied.

Request is the original request message that contains the delta packet of updates from the Web browser.

Response is the emerging response message that will be sent to the Web browser in response to the update request. Fill in the properties of this object to generate a response (such as an error message or a reconcile form) that indicates the errors in XMLErrors.

Handled indicates whether the event handler completed filling out Response. Set Handled to true if the event handler completes the response for the Web browser. Leave Handled as false if ReconcileProducer (see page 7279) should generate the content of Response.

Note: If the OnGetErrorResponse event handler does not set Handled to true and there is no ReconcileProducer (see page 7279), the XML broker raises an exception.

See Also

MaxErrors (see page 7275)

ReconcileProducer (see page 7279)

OnGetResponse (see page 7283)

ApplyXMLUpdates (see page 7260)

Using an XML Broker

81.1.1.6.4 TXMLBroker.OnGetResponse Event

Occurs when there are no errors applying updates to the application server.

Pascal

```
property OnGetResponse: TGetResponseEvent;
```

C++

```
__property TGetResponseEvent OnGetResponse;
```

Description

Write (see page 3789) an OnGetResponse event handler to edit the response message after an update request is successfully applied.

The Sender parameter is the XML broker that applied updates to the application server with no errors.

Request is the original request message that contains the delta packet of updates from the Web browser.

Response is the emerging response message that will be sent to the Web browser in response to the update request. Fill in the properties of this object to generate a response (such as refreshing the data).

Handled indicates whether the event handler completed filling out Response. Set Handled to true if the event handler completes the response for the Web browser. Leave Handled as false if the XML broker should send a redirect response that sends the browser back to the page that generated the update request.

See Also

OnGetErrorResponse (see page 7282)

ApplyXMLUpdates (see page 7260)

Using an XML Broker

81.1.1.6.5 TXMLBroker.OnRequestRecords Event

Occurs when the XML broker needs to fetch a data packet from its associated provider.

Pascal

```
property OnRequestRecords: TRequestRecordsEvent;
```

C++

```
__property TRequestRecordsEvent OnRequestRecords;
```

Description

Write (see page 3789) an OnRequestRecords event handler to provide an alternate mechanism for providing XML data packets or to perform other actions whenever the XML broker needs to fetch an XML data packet. For example, the OnRequestRecords event handler might call GetXMLRecords (see page 7265) to fetch an XML data packet from the application server and then edit its contents.

OnRequestRecords occurs when the InternetExpress page producer requests an XML data packet (usually in response to a request message) or when the application calls the XML broker's RequestRecords (see page 7268) method.

The Sender parameter is the object that originates the request (usually an InternetExpress page producer).

Request is the request message that prompted the request for an XML data packet. This value may be nil (Delphi) or NULL (C++) if the request did not arise from a page producer or if the page producer is not processing a request message.

OwnerData contains an application-defined variant that is sent to the provider's BeforeGetRecords event handler. The InternetExpress page producer that is requesting records or the caller of RequestRecords (see page 7268) may initialize this value. OwnerData can be used to pass persistent state information to a stateless application server (for example, the first record that should appear in the data packet when MaxRecords (see page 7276) is greater than 0).

Records optionally returns an XML data packet as a string. If Records is an empty string on exit from the event handler, the XML broker automatically fetches the XML data packet from its associated provider. Otherwise, the XML broker uses the value of Records as the new XML data packet.

RequestRecords (see page 7268)

GetXMLRecords (see page 7265)

GetXMLData

BeforeGetRecords

MaxRecords (see page 7276)

Using an XML Broker

81.1.1.6.6 TXMLBroker.OnRequestUpdate Event

Occurs immediately before the XML broker applies updates to the application server.

Pascal

```
property OnRequestUpdate: TRequestUpdateEvent;
```

C++

```
__property TRequestUpdateEvent OnRequestUpdate;
```

Description

Write (see page 3789) an OnRequestUpdate event handler to provide an alternate mechanism for applying updates to the application server. For example, the OnRequestUpdate event handler might call GetDelta (see page 7263) to extract the delta packet from the request message and then preprocess the XML string before applying the updates with a call to ApplyXMLUpdates (see page 7260).

OnRequestUpdate occurs immediately after the BeforeDispatch (see page 7282) event or when the application calls the XML broker's RequestUpdate (see page 7269) method.

The Sender parameter is the object that received the update request (the XML broker or a Web action item).

Request is the request message that contains the updates to be applied. The XML delta packet can be extracted from this request object using the GetDelta (see page 7263) method.

Response is the emerging response message that will be sent back to the Web browser that generated the update request. The event handler can set properties on this response object to partially or completely specify the message will be returned to the Web browser.

Handled indicates whether the event handler applied the updates. If Handled is true on exit from the event handler, the XML broker does not apply the updates, does not receive an OnGetResponse (see page 7283) or OnGetErrorResponse (see page 7282) event, and does not call on the ReconcileProducer (see page 7279) to generate a response message. (It does still receive an AfterDispatch (see page 7281) event). If Handled is false on exit from the event handler, the XML broker proceeds to apply the updates contained in the request message and receives all the associated events.

Note: If the event handler applies the updates, it must also generate the response message.

Using an XML Broker

81.1.2 TXMLParams Class

TXMLParams manages a list of parameters for an XML broker.

Class Hierarchy

Pascal

```
TXMLParams = class(TParams);
```

C++

```
class TXMLParams : public TParams;
```

File

XMLBrokr

Description

XML brokers use TXMLParams to manage a list of parameters that it passes to a provider on the application server. These parameters supply values to a query or stored procedure on the application server, or limit the records provided from a table on the application server.

Use the properties and methods of TXMLParams to:

Access a specific parameter.

Add or delete parameters from the list.

Get or set the values of individual parameters.

Assign parameter values from a list such as the one supplied in a request message from a Web browser.

Compare parameters.

Iterate through all parameters.

Copy (see page 3648) a set of parameters to another parameter list.

See Also

TParam

TXMLBroker (see page 7255)

81.1.2.1 TXMLParams Members

The following tables list the members exposed by TXMLParams.

Protected Methods

	Name	Description
	AssignTo (see page 7287)	Copies the properties of an object to a destination object.

Public Methods

	Name	Description
	AssignStrings (see page 7287)	Assigns values to the parameters from a list of name/value pairs.

81.1.2.2 TXMLParams Methods

The methods of the TXMLParams class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 7287)	Copies the properties of an object to a destination object.

Public Methods

	Name	Description
	AssignStrings (see page 7287)	Assigns values to the parameters from a list of name/value pairs.

81.1.2.2.1 TXMLParams.AssignStrings Method

Assigns values to the parameters from a list of name/value pairs.

Pascal

```
procedure AssignStrings(Value: TStrings);
```

C++

```
__fastcall AssignStrings(TStrings Value);
```

Description

Use AssignStrings to update the values of the parameters in the Items list to match the values in the list specified by Value. For each string in Value of the form Name=Value, AssignStrings locates the parameter (if any) that has the same name as the name portion of the string. It then assigns the Value portion of the string as the parameter's value.

AssignStrings makes it very convenient to assign parameter values that are received as the content of a request message. In particular, TSubmitQueryButton generates an HTML control that sends the values in an HTML query form to the Web application. If the query form displays parameter values that should be sent to a provider on the application server, you can call AssignStrings with the ContentFields property of that Web request message.

See Also

Items

ParamValues

ContentFields

TQueryForm

TSubmitQueryButton

81.1.2.2.2 TXMLParams.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

Assign

EConvertError (see page 3985)

81.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	INotifyConnectionChange (see page 7289)	This is class XMLBrokr.INotifyConnectionChange.

81.2.1 INotifyConnectionChange Interface

Class Hierarchy

XMLBrokr.INotifyConnectionChange

Pascal

```
INotifyConnectionChange = interface;
```

C++

```
__interface INotifyConnectionChange;
```

File

XMLBrokr

Description

This is class XMLBrokr.INotifyConnectionChange.

81.2.1.1 INotifyConnectionChange Members

The following tables list the members exposed by INotifyConnectionChange.

Public Methods

	Name	Description
	ConnectionChange (see page 7290)	This is ConnectionChange, a member of class INotifyConnectionChange.

81.2.1.2 INotifyConnectionChange Methods

The methods of the INotifyConnectionChange class are listed here.

Public Methods

	Name	Description
	ConnectionChange (see page 7290)	This is ConnectionChange, a member of class INotifyConnectionChange.

81.2.1.2.1 INotifyConnectionChange.ConnectionChange Method

Pascal

```
procedure ConnectionChange(Sender: TComponent; Connected: Boolean);
```

C++

```
__fastcall ConnectionChange(TComponent * Sender, Boolean Connected);
```

Description

This is ConnectionChange, a member of class INotifyConnectionChange.

81.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FormatXML (see page 7291)	This is function XMLBrokr.FormatXML.

81.3.1 XMLBrokr.FormatXML Function

Pascal

```
function FormatXML(const Value: string; XMLOptions: TXMLOptions): string;
```

C++

```
UnicodeString FormatXML(const UnicodeString Value, TXMLOptions XMLOptions);
```

File

XMLBrokr

Description

This is function XMLBrokr.FormatXML.

81.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TXMLOption (see page 7292)	This is record XMLBrokr.TXMLOption.

81.4.1 XMLBrokr.TXMLOption Enumeration

Pascal

```
TXMLOption = (
  xoQuote
);
```

C++

```
enum TXMLOption {
  xoQuote
};
```

File

XMLBrokr

Description

This is record XMLBrokr.TXMLOption.

81.5 Types

The following table lists types in this documentation.

Types

Name	Description
TGetErrorResponseEvent (see page 7293)	This is type XMLBrokr.TGetErrorResponseEvent.
TGetResponseEvent (see page 7293)	This is type XMLBrokr.TGetResponseEvent.
TRequestRecordsEvent (see page 7294)	This is type XMLBrokr.TRequestRecordsEvent.
TRequestUpdateEvent (see page 7294)	This is type XMLBrokr.TRequestUpdateEvent.
TXMLOptions (see page 7294)	This is type XMLBrokr.TXMLOptions.

81.5.1 XMLBrokr.TGetErrorResponseEvent Type

Pascal

```
TGetErrorResponseEvent = procedure (Sender: TObject; ErrorCount: Integer; XMLErrors: string;
Request: TWebRequest; Response: TWebResponse; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; ErrorCount: Integer; XMLErrors: string; Request: TWebRequest; Response:
TWebResponse; var Handled: Boolean) ( TGetErrorResponseEvent)();
```

File

XMLBrokr

Description

This is type XMLBrokr.TGetErrorResponseEvent.

81.5.2 XMLBrokr.TGetResponseEvent Type

Pascal

```
TGetResponseEvent = procedure (Sender: TObject;Request: TWebRequest; Response: TWebResponse;
var Handled: Boolean) of object;
```

C++

```
(Sender: TObject;Request: TWebRequest; Response: TWebResponse; var Handled: Boolean) (
TGetResponseEvent)();
```

File

XMLBrokr

Description

This is type XMLBrokr.TGetResponseEvent.

81.5.3 XMLBrokr.TRequestRecordsEvent Type

Pascal

```
TRequestRecordsEvent = procedure (Sender: TObject; Request: TWebRequest; out RecCount:
Integer; var OwnerData: OleVariant; var Records: string) of object;
```

C++

```
(Sender: TObject; Request: TWebRequest; out RecCount: Integer; var OwnerData: OleVariant; var
Records: string) ( TRequestRecordsEvent)();
```

File

XMLBrokr

Description

This is type XMLBrokr.TRequestRecordsEvent.

81.5.4 XMLBrokr.TRequestUpdateEvent Type

Pascal

```
TRequestUpdateEvent = procedure (Sender: TObject; Request: TWebRequest; Response:
TWebResponse; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Request: TWebRequest; Response: TWebResponse; var Handled: Boolean) (
TRequestUpdateEvent)();
```

File

XMLBrokr

Description

This is type XMLBrokr.TRequestUpdateEvent.

81.5.5 XMLBrokr.TXMLOptions Type

Pascal

```
TXMLOptions = set of TXMLOption;
```

C++

```
TXMLOption TXMLOptions;
```

File

XMLBrokr

Description

This is type XMLBrokr.TXMLOptions.

81.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sPostDelta (see page 7295)	This is constant XMLBrokr.sPostDelta.
sProducer (see page 7295)	This is constant XMLBrokr.sProducer.
sRedirect (see page 7295)	This is constant XMLBrokr.sRedirect.

81.6.1 XMLBrokr.sPostDelta Constant

Pascal

```
sPostDelta = 'postdelta';
```

C++

```
sPostDelta = 'postdelta';
```

File

XMLBrokr

Description

This is constant XMLBrokr.sPostDelta.

81.6.2 XMLBrokr.sProducer Constant

Pascal

```
sProducer = 'PRODUCER';
```

C++

```
sProducer = 'PRODUCER';
```

File

XMLBrokr

Description

This is constant XMLBrokr.sProducer.

81.6.3 XMLBrokr.sRedirect Constant

Pascal

```
sRedirect = 'REDIRECT';
```

C++

```
sRedirect = 'REDIRECT';
```

File

XMLBrokr

Description

This is constant XMLBrokr.sRedirect.

82 XMLDoc Namespace

This is namespace XMLDoc.

Topics

Name	Description
Classes (see page 7299)	The following table lists classes in this documentation.
Interfaces (see page 7429)	The following table lists interfaces in this documentation.
Functions (see page 7439)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 7445)	The following table lists structs, records, enums in this documentation.
Types (see page 7449)	The following table lists types in this documentation.
Variables (see page 7453)	The following table lists variables in this documentation.

Classes

	Name	Description
	TXMLDocument (see page 7299)	TXMLDocument represents an XML (see page 7344) document.
	TXMLNode (see page 7348)	TXMLNode represents a node in an XML document.
	TXMLNodeCollection (see page 7396)	TXMLNodeCollection represents a node in an XML document whose children are instances of the same repeating element.
	TXMLNodeList (see page 7411)	TXMLNodeList represents a set of nodes in an XML document.

Functions

	Name	Description
	CheckEncoding (see page 7439)	This is function XMLDoc.CheckEncoding.
	CreateDOMNode (see page 7439)	Creates a new DOM node and returns its interface.
	DetectCharEncoding (see page 7440)	This is function XMLDoc.DetectCharEncoding.
	FormatXMLData (see page 7441)	Formats a string of XML so that it is more readable.
	LoadXMLData (see page 7441)	Creates and returns the interface of an XML document object, given a string of XML.
	LoadXMLData (see page 7441)	Creates and returns the interface of an XML document object, given a string of XML.
	LoadXMLDocument (see page 7442)	Returns the interface for an XML document given the name of an XML file.
	NewXMLDocument (see page 7442)	Returns the interface for a new, empty XML document.
	XMLDocError (see page 7443)	Raises an EXMLDocError (see page 7585) exception.
	XMLDocError (see page 7443)	Raises an EXMLDocError (see page 7585) exception.
	XMLStringToUnicodeString (see page 7443)	This is function XMLDoc.XMLStringToUnicodeString.
	XMLStringToWideString (see page 7443)	This is function XMLDoc.XMLStringToWideString.

Interfaces

	Name	Description
	IXMLDocumentAccess (see page 7429)	This is class XMLDoc.IXMLDocumentAccess.
	IXMLNodeAccess (see page 7431)	This is class XMLDoc.IXMLNodeAccess.

Structs, Records, Enums

	Name	Description
	TNodeChange (see page 7445)	TNodeChange indicates the type of change made to a node in an XML document.
	TNodeClassInfo (see page 7446)	TNodeClassInfo and TNodeClassArray (see page 7449) represent information about the classes that implement XML node interfaces.
	TNodeListOperation (see page 7446)	TNodeListOperation indicates what type of change is about to occur using an IXMLNodeList (see page 7649) interface.
	TXMLDocumentSource (see page 7447)	This is record XMLDoc.TXMLDocumentSource.
	TXMLPrologItem (see page 7448)	This is record XMLDoc.TXMLPrologItem.

Types

Name	Description
TNodeChangeEvent (see page 7449)	TNodeChangeEvent is the type for event handlers that respond when XML nodes are changed.
TNodeClassArray (see page 7449)	This is type XMLDoc.TNodeClassArray.
TNodeListNotification (see page 7450)	TNodeListNotification is the type of the callback the TXMLNodeList (see page 7411) calls when it adds, deletes, or creates XML nodes.
TXMLNodeArray (see page 7451)	TXMLNodeArray is a dynamic array of TXMLNode (see page 7348) objects.
TXMLNodeClass (see page 7451)	TXMLNodeClass is a class reference to a TXMLNode (see page 7348) descendant.
TXMLNodeCollectionClass (see page 7452)	TXMLNodeCollectionClass is a class reference to a TXMLNodeCollection (see page 7396) descendant.

Variables

Name	Description
UseXSDBooleanStrings (see page 7453)	This is variable XMLDoc.UseXSDBooleanStrings.

82.1 Classes

The following table lists classes in this documentation.

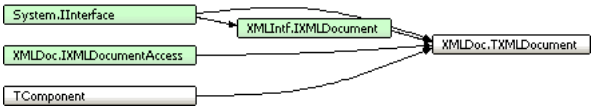
Classes

	Name	Description
	TXMLDocument (see page 7299)	TXMLDocument represents an XML (see page 7344) document.
	TXMLNode (see page 7348)	TXMLNode represents a node in an XML document.
	TXMLNodeCollection (see page 7396)	TXMLNodeCollection represents a node in an XML document whose children are instances of the same repeating element.
	TXMLNodeList (see page 7411)	TXMLNodeList represents a set of nodes in an XML document.

82.1.1 TXMLDocument Class

TXMLDocument represents an XML (see page 7344) document.

Class Hierarchy



Pascal

```
TXMLDocument = class(TComponent, IInterface, IXMLDocument, IXMLDocumentAccess);
```

C++

```
class TXMLDocument : public TComponent, public IInterface, public IXMLDocument, public
IXMLDocumentAccess;
```

File

XMLDoc

Description

Use TXMLDocument to represent an XML (see page 7344) document. TXMLDocument can read an existing XML (see page 7344) document from a file, it can be associated with an in-memory string that is the contents of an XML (see page 7344) document, or it can create a new, empty XML (see page 7344) document.

You can use TXMLDocument directly to load an XML (see page 7344) document, read and edit it, and save any changes. You can also use TXMLDocument to access the objects generated by the XML (see page 7344) Data Binding wizard.

TXMLDocument uses an external DOM (Document Object Model) parser to analyze the XML (see page 7344) document. This parser is usually assigned by specifying the DOMVendor (see page 7337) property.

When you set the Active (see page 7333) property to true, TXMLDocument uses the DOM parser to parse the XML (see page 7344) document so that you can examine or modify it. In particular, the DocumentElement (see page 7335) property provides an interface to the root node of the document. You can use that interface to access its child nodes and to add or delete child nodes.

TXMLDocument implements the IXMLDocument (see page 7586) interface. Applications obtain this interface from TXMLDocument or from the nodes in the document.

When TXMLDocument is created without an Owner, it behaves like an interfaced object. That is, when all references to its interface are released, the TXMLDocument instance is automatically freed. When TXMLDocument is created with an Owner, however, it behaves like any other component, and is freed by its Owner. When you add a TXMLDocument component from the component palette to a form or data module, it is automatically created with an Owner. When the TXMLDocument component is created using the global LoadXMLDocument (see page 7442) function (or by a function that the XML (see page 7344) Data Binding wizard generates to return the root node of the document), the function creates a TXMLDocument instance without an Owner.

Using Code That the XML Data Binding Wizard Generates

82.1.1.1 TXMLDocument Members

The following tables list the members exposed by TXMLDocument.

Protected Methods

	Name	Description
	_AddRef (see page 7306)	Called when an application uses a component interface.
	_Release (see page 7306)	Called when an application releases a component interface.
	AssignParseOptions (see page 7308)	This is AssignParseOptions, a member of class TXMLDocument.
	CheckActive (see page 7308)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 7308)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 7309)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 7311)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 7311)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 7311)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 7312)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 7312)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 7312)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 7313)	Returns the value of the Active property.
	GetAsyncLoadState (see page 7313)	Returns the value of the AsyncLoadState property.
V	GetChildNodeClass (see page 7313)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 7313)	Returns the value of the ChildNodes property.
	GetDocumentElement (see page 7314)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 7315)	Returns the value of the Node property.
	GetDocumentObject (see page 7315)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 7315)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 7315)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 7316)	Returns the value of the Encoding property.
	GetFileName (see page 7316)	Returns the value of the FileName property.
	GetModified (see page 7316)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 7317)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 7317)	Returns the value of the Options property.
	GetParseOptions (see page 7317)	Returns the value of the ParseOptions property.

	GetPrologNode (see page 7317)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 7318)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 7318)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 7318)	Returns the value of the StandAlone property.
	GetVersion (see page 7318)	Returns the value of the Version property.
	GetXML (see page 7319)	Returns the value of the XML property.
	InternalSetPrologValue (see page 7319)	This is InternalSetPrologValue, a member of class TXMLDocument.
	LoadData (see page 7320)	This is LoadData, a member of class TXMLDocument.
V	Loaded (see page 7320)	Initializes the component after the form file has been read into memory.
	ReadDOMVendor (see page 7323)	This is ReadDOMVendor, a member of class TXMLDocument.
	ReleaseDoc (see page 7324)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 7326)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 7327)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 7327)	Sets the value of the Active property.
	SetDocumentElement (see page 7327)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 7328)	Sets the value of the DOMDocument property.
	SetEncoding (see page 7328)	Sets the value of the Encoding property.
	SetFileName (see page 7328)	Sets the value of the FileName property.
	SetModified (see page 7329)	This is SetModified, a member of class TXMLDocument.
	SetNodeIndentStr (see page 7329)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 7329)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 7330)	Sets the value of the Options property.
	SetParseOptions (see page 7330)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 7330)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 7330)	Sets the value of the StandAlone property.
	SetVersion (see page 7331)	Sets the value of the Version property.
	SetXML (see page 7331)	Sets the value of the XML property.
	SetXMLStrings (see page 7331)	This is SetXMLStrings, a member of class TXMLDocument.
	WriteDOMVendor (see page 7332)	This is WriteDOMVendor, a member of class TXMLDocument.
	XMLStringsChanging (see page 7332)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 7335)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 7335)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 7337)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 7337)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 7342)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	AddChild (see page 7307)	This is the overview for the AddChild method overload.
	AddChild (see page 7589)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7307)	Responds after the last constructor has executed.
	Create (see page 7303)	This is the overview for the Create constructor overload.
	CreateElement (see page 7309)	Creates a new element node that is associated with this document.
	CreateNode (see page 7309)	Creates a new node that is associated with this document.
V	Destroy (see page 7304)	Disposes of a TXMLDocument (see page 7299) object.
	GeneratePrefix (see page 7312)	Generates a unique namespace prefix that can be used for a node in the document.
	GetDocBinding (see page 7314)	Replaces the document element with an instance of a specified implementation class.
	IsEmptyDoc (see page 7319)	Indicates whether the TXMLDocument (see page 7299) instance represents an empty document.
	LoadFromFile (see page 7321)	Loads an XML (see page 7344) document and activates it.

	LoadFromStream (see page 7321)	Loads an XML (see page 7344) document from a stream and activates it.
	LoadFromXML (see page 7322)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 7599)	This is the overview for the LoadFromXML method overload.
V	NewInstance (see page 7322)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7323)	Updates the parsed XML (see page 7344) document to reflect external changes.
	RegisterDocBinding (see page 7324)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7325)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7325)	Saves the XML (see page 7344) document to disk.
	SaveToStream (see page 7325)	Saves the XML (see page 7344) document to a stream.
	SaveToXML (see page 7326)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 7602)	This is the overview for the SaveToXML method overload.

Public Properties

	Name	Description
R	AsyncLoadState (see page 7334)	Indicates the state of the DOM parser when it parses the XML (see page 7344) document asynchronously.
R	ChildNodes (see page 7335)	Lists all of the child nodes of the document.
	DocumentElement (see page 7335)	Provides access to the root node of the XML (see page 7344) document.
R	DocumentObject (see page 7430)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 7336)	Provides access to the DOM interface for the parsed XML (see page 7344) document.
	DOMImplementation (see page 7337)	This is DOMImplementation, a member of class TXMLDocument.
	Encoding (see page 7338)	Indicates the character set that the XML (see page 7344) document uses to encode characters.
R	Modified (see page 7339)	Indicates whether the XML (see page 7344) document has been modified.
R	Node (see page 7340)	Provides access to the document node for the XML (see page 7344) document.
	NSPrefixBase (see page 7341)	Specifies the base string for automatically-generated namespace prefixes.
R	SchemaRef (see page 7343)	Returns the name of the schema associated with this XML (see page 7344) document.
	StandAlone (see page 7343)	Indicates whether the XML (see page 7344) document includes any external markup declarations.
	Version (see page 7343)	Indicates the XML (see page 7344) version that the document uses.

Published Events

	Name	Description
	AfterClose (see page 7344)	Occurs after the XML (see page 7344) document is closed.
	AfterNodeChange (see page 7345)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 7345)	Occurs immediately after the XML (see page 7344) document is opened.
	BeforeClose (see page 7346)	Occurs immediately before the XML (see page 7344) document is closed.
	BeforeNodeChange (see page 7346)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 7347)	Occurs immediately before the XML (see page 7344) document is opened.
	OnAsyncLoad (see page 7347)	Occurs at various stages during the asynchronous parsing of an XML (see page 7344) document.

Published Properties

	Name	Description
	Active (see page 7333)	Specifies whether the XML (see page 7344) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 7337)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 7344) document.
	FileName (see page 7339)	Specifies the file name for the XML (see page 7344) document associated with this TXMLDocument (see page 7299) object.
	NodeIndentStr (see page 7340)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7344) text.

	Options (see page 7341)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7342)	Specifies implementation-specific options that are followed when parsing the XML (see page 7344) document.
	XML (see page 7344)	Specifies the content of the XML document associated with this TXMLDocument (see page 7299) object.

82.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TXMLDocument.Create (DOMString) (see page 7303)	Instantiates a TXMLDocument (see page 7299) object.
	TXMLDocument.Create (TComponent) (see page 7303)	Instantiates a TXMLDocument (see page 7299) object.

82.1.1.2.1 TXMLDocument.Create Constructor (DOMString)

Instantiates a TXMLDocument (see page 7299) object.

Pascal

```
constructor Create(AOwner: TComponent); override; overload;
constructor Create(const AFileName: DOMString); overload; reintroduce;
```

C++

```
virtual __fastcall TXMLDocument(TComponent * AOwner);
__fastcall TXMLDocument(const DOMString AFileName);
```

Description

Call Create to instantiate a TXMLDocument (see page 7299) component at runtime. You do not need to explicitly create TXMLDocument (see page 7299) components that are added to forms or data modules at design time: they are created automatically.

AFileName specifies the file that the new TXMLDocument (see page 7299) instance represents.

AOwner is another component that is responsible for freeing the TXMLDocument (see page 7299) instance. It becomes the value of the Owner property.

TXMLDocument (see page 7299) components that are created at runtime without an owner are freed automatically when all references to their IXMLDocument (see page 7586) interface are released. This differs from TXMLDocument (see page 7299) components added to a form or data module at design time or those created with an owner. When added to a form or data module at design time, the object is explicitly freed by its Owner (the form or data module).

See Also

FileName (see page 7339)

IXMLDocument (see page 7586)

Owner

82.1.1.3 TXMLDocument.Destroy Destructor

Disposes of a TXMLDocument (see page 7299) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLDocument();
```

Description

It is not necessary to explicitly free a TXMLDocument (see page 7299) component. If the component is created with an Owner, that Owner handles the task of freeing the document. If the component is created without an Owner, it is freed automatically when the reference count on its IXMLDocument (see page 7586) interface drops to zero.

See Also

Create (see page 7303)

82.1.1.4 TXMLDocument Methods

The methods of the TXMLDocument class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 7306)	Called when an application uses a component interface.
	_Release (see page 7306)	Called when an application releases a component interface.
	AssignParseOptions (see page 7308)	This is AssignParseOptions, a member of class TXMLDocument.
	CheckActive (see page 7308)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 7308)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 7309)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 7311)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 7311)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 7311)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 7312)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 7312)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 7312)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 7313)	Returns the value of the Active property.
	GetAsyncLoadState (see page 7313)	Returns the value of the AsyncLoadState property.
V	GetChildNodeClass (see page 7313)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 7313)	Returns the value of the ChildNodes property.
	GetDocumentElement (see page 7314)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 7315)	Returns the value of the Node property.
	GetDocumentObject (see page 7315)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 7315)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 7315)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 7316)	Returns the value of the Encoding property.
	GetFileName (see page 7316)	Returns the value of the FileName property.
	GetModified (see page 7316)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 7317)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 7317)	Returns the value of the Options property.
	GetParseOptions (see page 7317)	Returns the value of the ParseOptions property.

	GetPrologNode (see page 7317)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 7318)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 7318)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 7318)	Returns the value of the StandAlone property.
	GetVersion (see page 7318)	Returns the value of the Version property.
	GetXML (see page 7319)	Returns the value of the XML property.
	InternalSetPrologValue (see page 7319)	This is InternalSetPrologValue, a member of class TXMLDocument.
	LoadData (see page 7320)	This is LoadData, a member of class TXMLDocument.
V	Loaded (see page 7320)	Initializes the component after the form file has been read into memory.
	ReadDOMVendor (see page 7323)	This is ReadDOMVendor, a member of class TXMLDocument.
	ReleaseDoc (see page 7324)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 7326)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 7327)	This is SaveToXMLStrings, a member of class TXMLDocument.
V	SetActive (see page 7327)	Sets the value of the Active property.
	SetDocumentElement (see page 7327)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 7328)	Sets the value of the DOMDocument property.
	SetEncoding (see page 7328)	Sets the value of the Encoding property.
	SetFileName (see page 7328)	Sets the value of the FileName property.
	SetModified (see page 7329)	This is SetModified, a member of class TXMLDocument.
	SetNodeIndentStr (see page 7329)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 7329)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 7330)	Sets the value of the Options property.
	SetParseOptions (see page 7330)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 7330)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 7330)	Sets the value of the StandAlone property.
	SetVersion (see page 7331)	Sets the value of the Version property.
	SetXML (see page 7331)	Sets the value of the XML property.
	SetXMLStrings (see page 7331)	This is SetXMLStrings, a member of class TXMLDocument.
	WriteDOMVendor (see page 7332)	This is WriteDOMVendor, a member of class TXMLDocument.
	XMLStringsChanging (see page 7332)	This is XMLStringsChanging, a member of class TXMLDocument.

Public Methods

	Name	Description
	AddChild (see page 7307)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7307)	Responds after the last constructor has executed.
	CreateElement (see page 7309)	Creates a new element node that is associated with this document.
	CreateNode (see page 7309)	Creates a new node that is associated with this document.
	GeneratePrefix (see page 7312)	Generates a unique namespace prefix that can be used for a node in the document.
	GetDocBinding (see page 7314)	Replaces the document element with an instance of a specified implementation class.
	IsEmptyDoc (see page 7319)	Indicates whether the TXMLDocument (see page 7299) instance represents an empty document.
	LoadFromFile (see page 7321)	Loads an XML (see page 7344) document and activates it.
	LoadFromStream (see page 7321)	Loads an XML (see page 7344) document from a stream and activates it.
	LoadFromXML (see page 7322)	This is the overview for the LoadFromXML method overload.
V	NewInstance (see page 7322)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Refresh (see page 7323)	Updates the parsed XML (see page 7344) document to reflect external changes.
	RegisterDocBinding (see page 7324)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7325)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7325)	Saves the XML (see page 7344) document to disk.
	SaveToStream (see page 7325)	Saves the XML (see page 7344) document to a stream.
	SaveToXML (see page 7326)	This is the overview for the SaveToXML method overload.

82.1.1.4.1 TXMLDocument._AddRef Method

Called when an application uses a component interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef is a basic implementation of the IInterface method, _AddRef.

Note: If the component is a wrapper for a COM object, __AddRef calls the _AddRef method of that COM object, and returns the resulting reference count.

In all other cases, __AddRef simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __AddRef to implement reference counting.

See Also

Invoke

QueryInterface

_Release

ComObject

_AddRef (see page 3504)

82.1.1.4.2 TXMLDocument._Release Method

Called when an application releases a component interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release is a basic implementation of the IInterface method, _Release.

__Release returns the resulting value of the reference count for the component's interface.

Note:

In all other cases, __Release simply returns –1 and takes no action. This allows the component to implement interfaces where reference counting is not required. More sophisticated components should override __Release to implement reference counting.

Invoke

QueryInterface

_AddRef

ComObject

82.1.1.4.3 AddChild Method

This is the overview for the AddChild method overload.

Overload List

	Name	Description
	TXMLDocument.AddChild (DOMString) (see page 7307)	Creates and adds a node to the child nodes of this document.
	TXMLDocument.AddChild (DOMString, DOMString) (see page 7307)	Creates and adds a node to the child nodes of this document.

82.1.1.4.3.1 TXMLDocument.AddChild Method (DOMString)

Creates and adds a node to the child nodes of this document.

Pascal

```
function AddChild(const TagName: DOMString): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI);
```

Description

Call AddChild to add a new child element node to the document itself. The new node is added to the end of the list maintained by the ChildNodes (see page 7335) property.

TagName is the tag name for the new element node.

NamespaceURI identifies the namespace, if any, that includes the new node's definition.

AddChild returns the interface for the newly created node.

Note: Do not call AddChild to add a child to the document element of this document. When adding data to the XML (see page 7344) document, use the AddChild method of the document element or of the node in the hierarchy that should be the parent of the new node.

See Also

AddChild (see page 7618)

CreateNode (see page 7309)

CreateElement (see page 7309)

ChildNodes (see page 7335)

DocumentElement (see page 7335)

82.1.1.4.4 TXMLDocument.AfterConstruction Method

Responds after the last constructor has executed.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

The System::TObject::AfterConstruction method implemented in System::TObject::TObject does nothing. Override this method when creating a class that takes some action after the object is created. For example, TCustomForm overrides System::TObject::AfterConstruction to generate an OnCreate event.

See Also

System::TObject::BeforeDestruction (see page 3368)

OnCreate

System::TObject::Create (see page 3366)

82.1.1.4.5 TXMLDocument.AssignParseOptions Method

Pascal

```
procedure AssignParseOptions;
```

C++

```
__fastcall AssignParseOptions();
```

Description

This is AssignParseOptions, a member of class TXMLDocument.

82.1.1.4.6 TXMLDocument.CheckActive Method

Pascal

```
procedure CheckActive;
```

C++

```
__fastcall CheckActive();
```

Description

This is CheckActive, a member of class TXMLDocument.

82.1.1.4.7 TXMLDocument.CheckAutoSave Method

Pascal

```
procedure CheckAutoSave; dynamic;
```

C++

```
__fastcall CheckAutoSave();
```

Description

This is CheckAutoSave, a member of class TXMLDocument.

82.1.1.4.8 TXMLDocument.CheckDOM Method

Pascal

```
procedure CheckDOM; dynamic;
```

C++

```
__fastcall CheckDOM();
```

Description

This is CheckDOM, a member of class TXMLDocument.

82.1.1.4.9 TXMLDocument.CreateElement Method

Creates a new element node that is associated with this document.

Pascal

```
function CreateElement(const TagOrData: DOMString; const NamespaceURI: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateElement(const DOMString TagOrData, const DOMString NamespaceURI);
```

Description

Call CreateElement to create a new generic element node. The resulting node does not have a parent, but can be added to the ChildNodes (see page 7335) list of any node in the document (including this document's ChildNodes (see page 7335) property). It can also be assigned to the DocumentElement (see page 7335) property to replace the entire data hierarchy of this document.

TagOrData provides the tag name of the newly created node.

NamespaceURI identifies the namespace that includes the new node's definition.

CreateElement returns the interface for the new node.

Note: To add a node as the child of another node in this document, it is simpler to call that node's AddChild (see page 7307) method.

See Also

AddChild (see page 7618)

ChildNodes (see page 7335)

DocumentElement (see page 7335)

AddChild (see page 7307)

CreateNode (see page 7309)

82.1.1.4.10 TXMLDocument.CreateNode Method

Creates a new node that is associated with this document.

Pascal

```
function CreateNode(const NameOrData: DOMString; NodeType: TNodeType = ntElement; const
AddlData: DOMString = ''): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateNode(const DOMString NameOrData, TNodeType NodeType = ntElement,
const DOMString AddlData = '');
```

Description

Call CreateNode to create a new generic XML (see page 7344) node. The resulting node does not have a parent, but can be added to the ChildNodes (see page 7335) or AttributeNodes list of any node in the document (including this document's ChildNodes (see page 7335) property). It can also be assigned to the DocumentElement (see page 7335) property to replace the entire data hierarchy of this document.

NameOrData provides the tag name or value of the newly created node. Its interpretation depends on the type of node created, as indicated in the following table:

NodeType	NameOrData
ntElement	The tag name.
ntAttribute	The attribute name.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.
ntProcessingInstr	The content of the processing instruction, except for the target.

NodeType indicates the type of node to create. It can only be one of the types listed in the previous table.

The meaning of AddlData depends on the node type, as indicated in the following table:

NodeType	AddlData
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.
ntProcessingInstr	The content of the processing instruction, except for the target.

CreateNode returns the interface for the new node.

Note: To add a node as the child of another node in this document, it is simpler to call that node's AddChild (see page 7307) method.

See Also

AddChild (see page 7618)

ChildNodes (see page 7335)

AttributeNodes (see page 7390)

DocumentElement (see page 7335)

AddChild (see page 7307)

CreateElement (see page 7309)

CreateDOMNode (see page 7439)

82.1.1.4.11 TXMLDocument.DefineProperties Method

Designates methods for storing an object's unpublished data on a stream such as a form file.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TComponent overrides the DefineProperties method defined in TPersistent to define "fake" Top and Left properties. These are defined so that components that are not controls can be manipulated at design-time. However, the Top and Left properties are hidden, that is, they are not published, because only controls appear at run-time.

DefineProperties is virtual; descendant classes can override it. When overriding DefineProperties, be aware that the Ancestor property of Filer might be set, and that this property can determine whether or not it is appropriate to write properties.

DefineProperties is called automatically as part of the component streaming system; do not call it directly.

Ancestor

DefineBinaryProperty

DefineProperties

DefineProperty

82.1.1.4.12 TXMLDocument.DoAfterClose Method

Pascal

```
procedure DoAfterClose; dynamic;
```

C++

```
__fastcall DoAfterClose();
```

Description

This is DoAfterClose, a member of class TXMLDocument.

82.1.1.4.13 TXMLDocument.DoAfterOpen Method

Pascal

```
procedure DoAfterOpen; dynamic;
```

C++

```
__fastcall DoAfterOpen();
```

Description

This is DoAfterOpen, a member of class TXMLDocument.

82.1.1.4.14 TXMLDocument.DoBeforeClose Method

Pascal

```
procedure DoBeforeClose; dynamic;
```

C++

```
__fastcall DoBeforeClose();
```

Description

This is DoBeforeClose, a member of class TXMLDocument.

82.1.1.4.15 TXMLDocument.DoBeforeOpen Method

Pascal

```
procedure DoBeforeOpen; dynamic;
```

C++

```
__fastcall DoBeforeOpen();
```

Description

This is DoBeforeOpen, a member of class TXMLDocument.

82.1.1.4.16 TXMLDocument.DoNodeChange Method

Pascal

```
procedure DoNodeChange(const Node: IXMLNode; ChangeType: TNodeChange; BeforeOperation:
Boolean);
```

C++

```
__fastcall DoNodeChange(const IXMLNode Node, TNodeChange ChangeType, Boolean BeforeOperation);
```

Description

This is DoNodeChange, a member of class TXMLDocument.

82.1.1.4.17 TXMLDocument.GeneratePrefix Method

Generates a unique namespace prefix that can be used for a node in the document.

Pascal

```
function GeneratePrefix(const Node: IXMLNode): DOMString;
```

C++

```
__fastcall DOMString GeneratePrefix(const IXMLNode Node);
```

Description

Call GeneratePrefix to generate a new namespace prefix that is not already used in the document to represent a namespace URI. GeneratePrefix uses the NSPrefixBase (see page 7341) property to generate a unique string to act as a namespace prefix. This unique string consists of NSPrefixBase (see page 7341) followed by a number that ensures uniqueness. Thus, for example, if NSPrefixBase (see page 7341) is 'NS', automatically-generated namespace prefixes have the form 'NS1', 'NS2', and so on.

Node (see page 7340) is the interface for the node which will use the newly-generated namespace prefix.

The generated namespace prefixes are only unique within a single document. If two document components have the same value for NSPrefixBase (see page 7341), they will generate the same namespace prefixes.

See Also

NSPrefixBase (see page 7341)

82.1.1.4.18 TXMLDocument.GetActive Method

Returns the value of the Active property.

Pascal

```
function GetActive: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetActive();
```

Description

GetActive is the read implementation of the Active property.

See Also

Active (see page 7607)

82.1.1.4.19 TXMLDocument.GetAsyncLoadState Method

Returns the value of the AsyncLoadState property.

Pascal

```
function GetAsyncLoadState: Integer;
```

C++

```
__fastcall int GetAsyncLoadState();
```

Description

GetAsyncLoadState is the read implementation of the AsyncLoadState property.

See Also

AsyncLoadState (see page 7608)

82.1.1.4.20 TXMLDocument.GetChildNodeClass Method

Pascal

```
function GetChildNodeClass(const Node: IDOMNode): TXMLNodeClass; virtual;
```

C++

```
virtual __fastcall TXMLNodeClass GetChildNodeClass(const IDOMNode Node);
```

Description

This is GetChildNodeClass, a member of class TXMLDocument.

82.1.1.4.21 TXMLDocument.GetChildNodes Method

Returns the value of the ChildNodes property.

Pascal

```
function GetChildNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetChildNodes();
```

Description

GetChildNodes is the read implementation of the ChildNodes property.

See Also

ChildNodes (see page 7609)

82.1.1.4.22 TXMLDocument.GetDocBinding Method

Replaces the document element with an instance of a specified implementation class.

Pascal

```
function GetDocBinding(const TagName: DOMString; DocNodeClass: TClass; NamespaceURI: DOMString
= ''): IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocBinding(const DOMString TagName, TClass DocNodeClass, DOMString
NamespaceURI = '');
```

Description

Call GetDocBinding to specify the implementation class and tag name for the document element. After replacing the specified node with an instance of the specified class, GetDocBinding returns the interface of the document element.

TagName is the tag name of the child node to be replaced. Typically, this identifies the document element.

DocNodeClass is the implementation class to use for all child nodes with the specified tag name.

NamespaceURI is the URI of the namespace in which TagName is defined.

See Also

DocumentElement (see page 7335)

RegisterDocBinding (see page 7324)

ChildNodes (see page 7335)

82.1.1.4.23 TXMLDocument.GetDocumentElement Method

Returns the value of the DocumentElement property.

Pascal

```
function GetDocumentElement: IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocumentElement();
```

Description

GetDocumentElement is the read implementation of the DocumentElement property.

See Also

DocumentElement (see page 7609)

82.1.1.4.24 TXMLDocument.GetDocumentNode Method

Returns the value of the Node property.

Pascal

```
function GetDocumentNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetDocumentNode();
```

Description

GetDocumentNode is the read implementation of the Node property.

See Also

Node (see page 7611)

82.1.1.4.25 TXMLDocument.GetDocumentObject Method

Pascal

```
function GetDocumentObject: TXMLDocument;
```

C++

```
__fastcall TXMLDocument GetDocumentObject();
```

Description

This is GetDocumentObject, a member of class TXMLDocument.

82.1.1.4.26 TXMLDocument.GetDOMDocument Method

Returns the value of the DOMDocument property.

Pascal

```
function GetDOMDocument: IDOMDocument;
```

C++

```
__fastcall IDOMDocument GetDOMDocument();
```

Description

GetDOMDocument is the read implementation of the DOMDocument property.

See Also

DOMDocument (see page 7609)

82.1.1.4.27 TXMLDocument.GetDOMPersist Method

Pascal

```
function GetDOMPersist: IDOMPersist;
```

C++

```
__fastcall IDOMPersist GetDOMPersist();
```

Description

This is GetDOMPersist, a member of class TXMLDocument.

82.1.1.4.28 TXMLDocument.GetEncoding Method

Returns the value of the Encoding property.

Pascal

```
function GetEncoding: DOMString;
```

C++

```
__fastcall DOMString GetEncoding();
```

Description

GetEncoding is the read implementation of the Encoding property.

See Also

Encoding (see page 7610)

82.1.1.4.29 TXMLDocument.GetFileName Method

Returns the value of the FileName property.

Pascal

```
function GetFileName: DOMString;
```

C++

```
__fastcall DOMString GetFileName();
```

Description

GetFileName is the read implementation of the FileName property.

See Also

FileName (see page 7610)

82.1.1.4.30 TXMLDocument.GetModified Method

Returns the value of the Modified property.

Pascal

```
function GetModified: Boolean;
```

C++

```
__fastcall Boolean GetModified();
```

Description

GetModified is the read implementation of the Modified property.

See Also

Modified (see page 7611)

82.1.1.4.31 TXMLDocument.GetNodeIndentStr Method

Returns the value of the NodeIndentStr property.

Pascal

```
function GetNodeIndentStr: DOMString;
```

C++

```
__fastcall DOMString GetNodeIndentStr();
```

Description

GetNodeIndentStr is the read implementation of the NodeIndentStr property.

See Also

NodeIndentStr (see page 7612)

82.1.1.4.32 TXMLDocument.GetOptions Method

Returns the value of the Options property.

Pascal

```
function GetOptions: TXMLDocOptions;
```

C++

```
__fastcall TXMLDocOptions GetOptions();
```

Description

GetOptions is the read implementation of the Options property.

See Also

Options (see page 7612)

82.1.1.4.33 TXMLDocument.GetParseOptions Method

Returns the value of the ParseOptions property.

Pascal

```
function GetParseOptions: TParseOptions;
```

C++

```
__fastcall TParseOptions GetParseOptions();
```

Description

GetParseOptions is the read implementation of the ParseOptions property.

See Also

ParseOptions (see page 7613)

82.1.1.4.34 TXMLDocument.GetPrologNode Method

Pascal

```
function GetPrologNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetPrologNode();
```

Description

This is GetPrologNode, a member of class TXMLDocument.

82.1.1.4.35 TXMLDocument.GetPrologValue Method

Pascal

```
function GetPrologValue(PrologItem: TXMLPrologItem; const Default: DOMString = ''): DOMString;
```

C++

```
__fastcall DOMString GetPrologValue(TXMLPrologItem PrologItem, const DOMString Default = '');
```

Description

This is GetPrologValue, a member of class TXMLDocument.

82.1.1.4.36 TXMLDocument.GetSchemaRef Method

Returns the value of the SchemaRef property.

Pascal

```
function GetSchemaRef: DOMString;
```

C++

```
__fastcall DOMString GetSchemaRef();
```

Description

GetSchemaRef is the read implementation of the SchemaRef property.

See Also

SchemaRef (see page 7613)

82.1.1.4.37 TXMLDocument.GetStandAlone Method

Returns the value of the StandAlone property.

Pascal

```
function GetStandAlone: DOMString;
```

C++

```
__fastcall DOMString GetStandAlone();
```

Description

GetStandAlone is the read implementation of the StandAlone property.

See Also

StandAlone (see page 7614)

82.1.1.4.38 TXMLDocument.GetVersion Method

Returns the value of the Version property.

Pascal

```
function GetVersion: DOMString;
```

C++

```
__fastcall DOMString GetVersion();
```

Description

GetVersion is the read implementation of the Version property.

See Also

Version (see page 7614)

82.1.1.4.39 TXMLDocument.GetXML Method

Returns the value of the XML property.

Pascal

```
function GetXML: TStrings;
```

C++

```
__fastcall TStrings GetXML();
```

Description

GetXML is the read implementation of the XML property.

See Also

XML (see page 7614)

82.1.1.4.40 TXMLDocument.InternalSetPrologValue Method

Pascal

```
function InternalSetPrologValue(const PrologNode: IXMLNode; const Value: Variant; PrologItem:
TXMLPrologItem): string;
```

C++

```
__fastcall UnicodeString InternalSetPrologValue(const IXMLNode PrologNode, const Variant
Value, TXMLPrologItem PrologItem);
```

Description

This is InternalSetPrologValue, a member of class TXMLDocument.

82.1.1.4.41 TXMLDocument.IsEmptyDoc Method

Indicates whether the TXMLDocument (see page 7299) instance represents an empty document.

Pascal

```
function IsEmptyDoc: Boolean;
```

C++

```
__fastcall Boolean IsEmptyDoc();
```

Description

Call IsEmptyDoc to determine whether the TXMLDocument (see page 7299) instance represents an empty document.

IsEmptyDoc returns true if the DOMDocument (see page 7336) property is not set (for example, if there is no DOM implementation) or if this object represents a document with no child nodes.

See Also

XML (see page 7344)

ChildNodes (see page 7335)

DOMDocument (see page 7336)

82.1.1.4.42 TXMLDocument.LoadData Method

Pascal

```
procedure LoadData; dynamic;
```

C++

```
__fastcall LoadData();
```

Description

This is LoadData, a member of class TXMLDocument.

82.1.1.4.43 TXMLDocument.Loaded Method

Initializes the component after the form file has been read into memory.

Pascal

```
procedure Loaded; override;
```

C++

```
virtual __fastcall Loaded();
```

Description

Do not call the protected Loaded method. The streaming system calls this method after it loads the component's form from a stream.

When the streaming system loads a form or data module from its form file, it first constructs the form component by calling its constructor, then reads its property values from the form file. After reading all the property values for all the components, the streaming system calls the Loaded methods of each component in the order the components were created. This gives the components a chance to initialize any data that depends on the values of other components or other parts of itself.

Note: All references to sibling components are resolved by the time Loaded is called. Loaded is the first place that sibling pointers can be used after being streamed in.

As implemented in TComponent, Loaded clears the csLoading flag in the ComponentState property, indicating that the component is no longer loading.

Warning: Loaded may be called multiple times on inherited forms. It is called every time a level of inheritance is streamed in. Do not allocate memory in an overridden Loaded method without first checking that the memory has not been allocated in a previous call.

See Also

ComponentState

Create

TReader

82.1.1.4.44 TXMLDocument.LoadFromFile Method

Loads an XML (see page 7344) document and activates it.

Pascal

```
procedure LoadFromFile(const AFileName: DOMString = '');
```

C++

```
__fastcall LoadFromFile(const DOMString AFileName = '');
```

Description

Call LoadFromFile to load the XML (see page 7344) document specified by AFileName and set the Active (see page 7333) property to true so that you can examine or modify the document.

AFileName is the name of the XML (see page 7344) document to load from disk. If AFileName is an empty string, TXMLDocument (see page 7299) uses the value of the FileName (see page 7339) property. If AFileName is not an empty string, TXMLDocument (see page 7299) changes the FileName (see page 7339) property to AFileName.

Once you have loaded an XML (see page 7344) document, any changes you make to the document are not saved back to disk until you call the SaveToFile (see page 7325) method.

See Also

SaveToFile (see page 7325)

FileName (see page 7339)

Active (see page 7333)

Refresh (see page 7323)

LoadFromXML (see page 7322)

LoadFromStream (see page 7321)

82.1.1.4.45 TXMLDocument.LoadFromStream Method

Loads an XML (see page 7344) document from a stream and activates it.

Pascal

```
procedure LoadFromStream(const Stream: TStream; EncodingType: TXMLEncodingType = xetUnknown);
```

C++

```
__fastcall LoadFromStream(const TStream Stream, TXMLEncodingType EncodingType = xetUnknown);
```

Description

Call LoadFromStream to load the XML (see page 7344) document from a stream.

Stream is a stream object that can be used to read the string of XML (see page 7344) that makes up the document.

EncodingType indicates the character set that is used for Stream. If EncodingType is xetUnknown (the default), LoadFromStream attempts to infer the encoding type from the XML (see page 7344) encoding declaration at the beginning of the document.

After loading the document from Stream, LoadFromStream sets the Active (see page 7333) property to true.

See Also

SaveToStream (see page 7325)

LoadFromFile (see page 7321)

Active (see page 7333)

LoadFromXML (see page 7322)

82.1.1.4.46 LoadFromXML Method

This is the overview for the LoadFromXML method overload.

Overload List

	Name	Description
	TXMLDocument.LoadFromXML (AnsiString) (see page 7322)	Loads a string representation of an XML (see page 7344) document and activates it.
	TXMLDocument.LoadFromXML (DOMString) (see page 7322)	Loads a string representation of an XML (see page 7344) document and activates it.

82.1.1.4.46.1 TXMLDocument.LoadFromXML Method (AnsiString)

Loads a string representation of an XML (see page 7344) document and activates it.

Pascal

```
procedure LoadFromXML(const XML: AnsiString); overload;
procedure LoadFromXML(const XML: DOMString); overload;
```

C++

```
__fastcall LoadFromXML(const AnsiString XML);
__fastcall LoadFromXML(const DOMString XML);
```

Description

Call LoadFromXML to assign a string as the value of the XML (see page 7344) document. Unlike the XML (see page 7344) property, which lets you assign XML (see page 7344) on a line-by-line basis, LoadFromXML treats the text of the XML (see page 7344) document as a whole.

The XML (see page 7344) parameter is a string containing the text of an XML (see page 7344) document. It should represent the XML (see page 7344) text encoded using UTF-8, Unicode, or UTF-16.

After assigning the XML (see page 7344) property as the contents of the document, LoadFromXML sets the Active (see page 7333) property to true.

See Also

SaveToXML (see page 7326)

LoadFromFile (see page 7321)

Active (see page 7333)

LoadFromStream (see page 7321)

XML (see page 7344)

82.1.1.4.47 TXMLDocument.NewInstance Method

Allocates memory for an instance of an object type and returns a pointer to that new instance.

Pascal

```
class function NewInstance: TObject; override;
```

C++

```
virtual __fastcall TObject * NewInstance();
```

Description

All constructors call System::TObject::NewInstance automatically. System::TObject::NewInstance calls System::TObject::InstanceSize to determine how much memory to allocate from the heap to contain a particular instance. Do not call System::TObject::NewInstance directly.

Override System::TObject::NewInstance only for special memory allocation requirements. For example, when allocating a large number of identical objects that all need to be in memory at the same time, you could allocate a single block of memory for the entire group, then override System::TObject::NewInstance to use part of that larger block for each instance.

If you override System::TObject::NewInstance to allocate memory, you may need to override System::TObject::FreeInstance to deallocate the memory.

Note: By default System::TObject::NewInstance calls System::TObject::InitInstance.

See Also

System::TObject::FreeInstance (see page 3386)

System::TObject::InstanceSize (see page 3389)

System::TObject::InitInstance (see page 3389)

82.1.1.4.48 TXMLDocument.ReadDOMVendor Method

Pascal

```
procedure ReadDOMVendor(Reader: TReader);
```

C++

```
__fastcall ReadDOMVendor(TReader Reader);
```

Description

This is ReadDOMVendor, a member of class TXMLDocument.

82.1.1.4.49 TXMLDocument.Refresh Method

Updates the parsed XML (see page 7344) document to reflect external changes.

Pascal

```
procedure Refresh;
```

C++

```
__fastcall Refresh();
```

Description

Call Refresh when the XML (see page 7344) document specified by FileName (see page 7339) has changed due to an external cause. Refresh updates the parsed version of the XML (see page 7344) document (which can be traversed starting with DocumentElement (see page 7335)) to reflect the current contents of the file specified by FileName (see page 7339).

The Active (see page 7333) property must be true when you call Refresh. If the XML (see page 7344) document is not active when you call Refresh, TXMLDocument (see page 7299) raises an EXMLDocError (see page 7585) exception.

Note: Do not call Refresh after making changes directly to the XML (see page 7344) property, because assigning a value to XML (see page 7344) automatically closes the XML (see page 7344) document. To refresh the XML (see page 7344) document after assigning a new value to XML (see page 7344), set the Active (see page 7333) property to true.

See Also

FileName (see page 7339)

Active (see page 7333)

DOMDocument (see page 7336)

DocumentElement (see page 7335)

Resync (see page 7325)

82.1.1.4.50 TXMLDocument.RegisterDocBinding Method

Registers an implementation class for child nodes with a specified tag name.

Pascal

```
procedure RegisterDocBinding(const TagName: DOMString; DocNodeClass: TClass; NamespaceURI:
DOMString = '');
```

C++

```
__fastcall RegisterDocBinding(const DOMString TagName, TClass DocNodeClass, DOMString
NamespaceURI = '');
```

Description

Call RegisterDocBinding to specify the implementation class for one of the child nodes of the document node. RegisterDocBinding replaces the specified node with an instance of the specified class.

TagName is the tag name of the child node to be replaced. Typically, this identifies the document element.

DocNodeClass is the implementation class to use for all child nodes with the specified tag name.

NamespaceURI is the URI of the namespace in which TagName is defined.

See Also

DocumentElement (see page 7335)

GetDocBinding (see page 7314)

ChildNodes (see page 7335)

82.1.1.4.51 TXMLDocument.ReleaseDoc Method

Pascal

```
procedure ReleaseDoc(const CheckSave: Boolean = True); dynamic;
```

C++

```
__fastcall ReleaseDoc(const Boolean CheckSave = True);
```

Description

This is ReleaseDoc, a member of class TXMLDocument.

82.1.1.4.52 TXMLDocument.Resync Method

Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

Pascal

```
procedure Resync;
```

C++

```
__fastcall Resync();
```

Description

Resync forces the document to reread the values of its child nodes and attribute nodes, discarding any changes that have not been propagated to the underlying DOM implementation.

See Also

ChildNodes (see page 7335)

Refresh (see page 7323)

82.1.1.4.53 TXMLDocument.SaveToFile Method

Saves the XML (see page 7344) document to disk.

Pascal

```
procedure SaveToFile(const AFileName: DOMString = ''); dynamic;
```

C++

```
__fastcall SaveToFile(const DOMString AFileName = '');
```

Description

Call SaveToFile to save any modifications you have made to the parsed XML (see page 7344) document.

AFileName is the name of the file to save. If AFileName is an empty string, TXMLDocument (see page 7299) uses the value of the FileName (see page 7339) property.

See Also

LoadFromFile (see page 7321)

FileName (see page 7339)

SaveToXML (see page 7326)

SaveToStream (see page 7325)

Using Code That the XML Data Binding Wizard Generates

82.1.1.4.54 TXMLDocument.SaveToStream Method

Saves the XML (see page 7344) document to a stream.

Pascal

```
procedure SaveToStream(const Stream: TStream);
```

C++

```
__fastcall SaveToStream(const TStream Stream);
```

Description

Call SaveToStream to save the contents of the XML (see page 7344) document to the stream specified by Stream. Regardless of the encoding system of the original XML (see page 7344) document, SaveToStream always saves the stream in UTF-16.

See Also

LoadFromStream (see page 7321)

SaveToXML (see page 7326)

SaveToFile (see page 7325)

82.1.1.4.55 TXMLDocument.SaveToUTF8String Method

Pascal

```
procedure SaveToUTF8String(var XML: UTF8String);
```

C++

```
__fastcall SaveToUTF8String(UTF8String XML);
```

Description

This is SaveToUTF8String, a member of class TXMLDocument.

82.1.1.4.56 SaveToXML Method

This is the overview for the SaveToXML method overload.

Overload List

	Name	Description
	TXMLDocument.SaveToXML (DOMString) (see page 7326)	Saves the XML (see page 7344) document to a string-type variable.
	TXMLDocument.SaveToXML (UTF8String) (see page 7326)	Saves the XML (see page 7344) document to a string-type variable.
	TXMLDocument.SaveToXML (WideString) (see page 7326)	Saves the XML (see page 7344) document to a string-type variable.

82.1.1.4.56.1 TXMLDocument.SaveToXML Method (DOMString)

Saves the XML (see page 7344) document to a string-type variable.

Pascal

```
procedure SaveToXML(var XML: DOMString); overload;
procedure SaveToXML(var XML: WideString); overload;
procedure SaveToXML(var XML: UTF8String); overload;
```

C++

```
__fastcall SaveToXML(DOMString XML);
__fastcall SaveToXML(BSTR XML);
__fastcall SaveToXML(UTF8String XML);
```

Description

Call SaveToXML to save the contents of the XML (see page 7344) document to the string-type variable specified by XML (

see page 7344). SaveToXML writes the contents of XML (see page 7344) document using UTF-8 or UTF-16 as an encoding system, depending on the type of the XML (see page 7344) parameter.

Unlike the XML (see page 7344) property, which lets you write individual lines from the XML (see page 7344) document, SaveToXML writes the entire text of the XML (see page 7344) document.

See Also

LoadFromXML (see page 7322)

SaveToStream (see page 7325)

SaveToFile (see page 7325)

XML (see page 7344)

82.1.1.4.57 TXMLDocument.SaveToXMLStrings Method

Pascal

```
procedure SaveToXMLStrings;
```

C++

```
__fastcall SaveToXMLStrings();
```

Description

This is SaveToXMLStrings, a member of class TXMLDocument.

82.1.1.4.58 TXMLDocument.SetActive Method

Sets the value of the Active property.

Pascal

```
procedure SetActive(const Value: Boolean); virtual;
```

C++

```
virtual __fastcall SetActive(const Boolean Value);
```

Description

SetActive is the write implementation of the Active property.

Value is the new value to set.

See Also

Active (see page 7607)

82.1.1.4.59 TXMLDocument.SetDocumentElement Method

Sets the value of the DocumentElement property.

Pascal

```
procedure SetDocumentElement(const Value: IXMLNode);
```

C++

```
__fastcall SetDocumentElement(const IXMLNode Value);
```

Description

SetDocumentElement is the write implementation of the DocumentElement property.

Value is the interface for the node tree that replaces the current document element.

See Also

DocumentElement (see page 7609)

82.1.1.4.60 TXMLDocument.SetDOMDocument Method

Sets the value of the DOMDocument property.

Pascal

```
procedure SetDOMDocument(const Value: IDOMDocument);
```

C++

```
__fastcall SetDOMDocument(const IDOMDocument Value);
```

Description

SetDOMDocument is the write implementation of the DOMDocument property.

Value is the DOM interface for the document to assign.

See Also

DOMDocument (see page 7609)

82.1.1.4.61 TXMLDocument.SetEncoding Method

Sets the value of the Encoding property.

Pascal

```
procedure SetEncoding(const Value: DOMString);
```

C++

```
__fastcall SetEncoding(const DOMString Value);
```

Description

SetEncoding is the write implementation of the Encoding property.

Value is the value of the encoding attribute of the document type node.

See Also

Encoding (see page 7610)

82.1.1.4.62 TXMLDocument.SetFileName Method

Sets the value of the FileName property.

Pascal

```
procedure SetFileName(const Value: DOMString);
```

C++

```
__fastcall SetFileName(const DOMString Value);
```

Description

SetFileName is the write implementation of the FileName property.

Value is the name of an XML document or, if the vendor supports it, an URL for the XML document.

See Also

FileName (see page 7610)

82.1.1.4.63 TXMLDocument.SetModified Method

Pascal

```
procedure SetModified(const Value: Boolean);
```

C++

```
__fastcall SetModified(const Boolean Value);
```

Description

This is SetModified, a member of class TXMLDocument.

82.1.1.4.64 TXMLDocument.SetNodeIndentStr Method

Sets the value of the NodeIndentStr property.

Pascal

```
procedure SetNodeIndentStr(const Value: DOMString);
```

C++

```
__fastcall SetNodeIndentStr(const DOMString Value);
```

Description

SetNodeIndentStr is the write implementation of the NodeIndentStr property.

Value is the string that is inserted before nested nodes to indicate a level of nesting.

See Also

NodeIndentStr (see page 7612)

82.1.1.4.65 TXMLDocument.SetOnAsyncLoad Method

Supplies an event handler that responds when the AsyncLoadState property changes.

Pascal

```
procedure SetOnAsyncLoad(const Value: TAsyncEventHandler);
```

C++

```
__fastcall SetOnAsyncLoad(const TAsyncEventHandler Value);
```

Description

Use SetOnAsyncLoad to supply a callback that responds when the asynchronous parsing of an XML document progresses to a certain point.

Value is a method that is called when the AsyncLoadState property changes to reflect a new stage in the parsing process.

See Also

AsyncLoadState (see page 7608)

82.1.1.4.66 TXMLDocument.SetOptions Method

Sets the value of the Options property.

Pascal

```
procedure SetOptions(const Value: TXMLDocOptions);
```

C++

```
__fastcall SetOptions(const TXMLDocOptions Value);
```

Description

GetOptions is the write implementation of the Options property.

Value is the set of options to assign.

See Also

Options (see page 7612)

82.1.1.4.67 TXMLDocument.SetParseOptions Method

Sets the value of the ParseOptions property.

Pascal

```
procedure SetParseOptions(const Value: TParseOptions);
```

C++

```
__fastcall SetParseOptions(const TParseOptions Value);
```

Description

GetParseOptions is the write implementation of the ParseOptions property.

Value is the set of parser options to assign.

See Also

ParseOptions (see page 7613)

82.1.1.4.68 TXMLDocument.SetPrologValue Method

Pascal

```
procedure SetPrologValue(const Value: Variant; PrologItem: TXMLPrologItem);
```

C++

```
__fastcall SetPrologValue(const Variant Value, TXMLPrologItem PrologItem);
```

Description

This is SetPrologValue, a member of class TXMLDocument.

82.1.1.4.69 TXMLDocument.SetStandAlone Method

Sets the value of the StandAlone property.

Pascal

```
procedure SetStandAlone(const Value: DOMString);
```

C++

```
__fastcall SetStandAlone(const DOMString Value);
```

Description

SetStandAlone is the write implementation of the StandAlone property.

Value is the value of the stand-alone attribute of the document type node.

See Also

StandAlone (see page 7614)

82.1.1.4.70 TXMLDocument.SetVersion Method

Sets the value of the Version property.

Pascal

```
procedure SetVersion(const Value: DOMString);
```

C++

```
__fastcall SetVersion(const DOMString Value);
```

Description

SetVersion is the write implementation of the Version property.

Value is the value of the version attribute of the document type node.

See Also

Version (see page 7614)

82.1.1.4.71 TXMLDocument.SetXML Method

Sets the value of the XML property.

Pascal

```
procedure SetXML(const Value: TStrings);
```

C++

```
__fastcall SetXML(const TStrings Value);
```

Description

SetXML is the write implementation of the XML property.

Value contains the raw (unparsed) XML to assign.

See Also

XML (see page 7614)

82.1.1.4.72 TXMLDocument.SetXMLStrings Method

Pascal

```
procedure SetXMLStrings(const Value: string);
```

C++

```
__fastcall SetXMLStrings(const UnicodeString Value);
```

Description

This is SetXMLStrings, a member of class TXMLDocument.

82.1.1.4.73 TXMLDocument.WriteDOMVendor Method

Pascal

```
procedure WriteDOMVendor(Writer: TWriter);
```

C++

```
__fastcall WriteDOMVendor(TWriter Writer);
```

Description

This is WriteDOMVendor, a member of class TXMLDocument.

82.1.1.4.74 TXMLDocument.XMLStringsChanging Method

Pascal

```
procedure XMLStringsChanging(Sender: TObject);
```

C++

```
__fastcall XMLStringsChanging(TObject * Sender);
```

Description

This is XMLStringsChanging, a member of class TXMLDocument.

82.1.1.5 TXMLDocument Properties

The properties of the TXMLDocument class are listed here.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 7335)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 7335)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 7337)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 7337)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 7342)	This is PrefixID, a member of class TXMLDocument.

Public Properties

	Name	Description
R	AsyncLoadState (see page 7334)	Indicates the state of the DOM parser when it parses the XML (see page 7344) document asynchronously.
R	ChildNodes (see page 7335)	Lists all of the child nodes of the document.
	DocumentElement (see page 7335)	Provides access to the root node of the XML (see page 7344) document.
	DOMDocument (see page 7336)	Provides access to the DOM interface for the parsed XML (see page 7344) document.
	DOMImplementation (see page 7337)	This is DOMImplementation, a member of class TXMLDocument.
	Encoding (see page 7338)	Indicates the character set that the XML (see page 7344) document uses to encode characters.
R	Modified (see page 7339)	Indicates whether the XML (see page 7344) document has been modified.

R	Node (see page 7340)	Provides access to the document node for the XML (see page 7344) document.
	NSPrefixBase (see page 7341)	Specifies the base string for automatically-generated namespace prefixes.
R	SchemaRef (see page 7343)	Returns the name of the schema associated with this XML (see page 7344) document.
	StandAlone (see page 7343)	Indicates whether the XML (see page 7344) document includes any external markup declarations.
	Version (see page 7343)	Indicates the XML (see page 7344) version that the document uses.

Published Properties

	Name	Description
	Active (see page 7333)	Specifies whether the XML (see page 7344) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 7337)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 7344) document.
	FileName (see page 7339)	Specifies the file name for the XML (see page 7344) document associated with this TXMLDocument (see page 7299) object.
	NodeIndentStr (see page 7340)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7344) text.
	Options (see page 7341)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7342)	Specifies implementation-specific options that are followed when parsing the XML (see page 7344) document.
	XML (see page 7344)	Specifies the content of the XML document associated with this TXMLDocument (see page 7299) object.

82.1.1.5.1 TXMLDocument.Active Property

Specifies whether the XML (see page 7344) document has been parsed so that the DOM interfaces are available to examine or change its contents.

Pascal

```
property Active: Boolean;
```

C++

```
__property Boolean Active;
```

Description

Before you can use TXMLDocument (see page 7299) to examine or change the contents of an XML (see page 7344) document, it must be active. Setting Active to true causes TXMLDocument (see page 7299) to do the following:

1.Generate a BeforeOpen (see page 7347) event.

2.If necessary, load the DOM parser and assign the DOMImplementation (see page 7337) property.

3.Parse the XML (see page 7344) document specified by FileName (see page 7339) or, if FileName (see page 7339) is an empty string, by the XML (see page 7344) property using the options specified by ParseOptions (see page 7342). If both FileName (see page 7339) and XML (see page 7344) are empty strings, TXMLDocument (see page 7299) creates an empty document. The interface for the parsed document is assigned to the DOMDocument (see page 7336) property.

4. Generate an AfterOpen (see page 7345) event.

Note: Once the DOMDocument (see page 7336) property is assigned, you can also use the DocumentElement (see page 7335) property.

Setting Active to false causes TXMLDocument (see page 7299) to do the following:

1.Generate a BeforeClose (see page 7346) event.

2.Release (see page 3732) all of the DOM interfaces, such as DOMDocument (see page 7336) and DocumentElement (

see page 7335), that represent the parsed XML (see page 7344) document.

3. Generate an AfterClose (see page 7344) event.

See Also

DOMDocument (see page 7336)

DocumentElement (see page 7335)

FileName (see page 7339)

XML (see page 7344)

ParseOptions (see page 7342)

AfterOpen (see page 7345)

domimplementation (see page 7337)

BeforeClose (see page 7346)

AfterClose (see page 7344)

Using TXMLDocument

82.1.1.5.2 TXMLDocument.AsyncLoadState Property

Indicates the state of the DOM parser when it parses the XML (see page 7344) document asynchronously.

Pascal

```
property AsyncLoadState: Integer;
```

C++

```
__property int AsyncLoadState;
```

Description

Use AsyncLoadState to determine that status of the DOM parser when it is parsing an XML (see page 7344) document asynchronously. AsyncLoadState is only meaningful when the value of ParseOptions (see page 7342) is poAsyncLoad.

The value of AsyncLoadState is vendor-specific. That is, each DOM parser that loads and parses an XML (see page 7344) document asynchronously supplies its own flags to indicate state information.

When the DOM vendor is MSXML, AsyncLoadState can have any of the following values:

Value	Meaning
0	Uninitialized: The AsyncLoadState is not assigned. (Usually indicates that the parser has not tried to parse a document or it is not parsing the document asynchronously.)
1	Loading: The parser is currently parsing the structure of the XML (see page 7344) document.
2	Loaded (see page 7320): The parser has finished reading and parsing the structure of the XML (see page 7344) document, but the corresponding DOM interfaces are not yet available.
3	Interactive: The parser has parsed the structure of the XML (see page 7344) document, the corresponding DOM interfaces are available, but the parser has not finished reading all the node values.
4	Complete: The parser has fully read and parsed the XML (see page 7344) document.

See Also

OnAsyncLoad (see page 7347)

ParseOptions (see page 7342)

82.1.1.5.3 TXMLDocument.ChildNodes Property

Lists all of the child nodes of the document.

Pascal

```
property ChildNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList ChildNodes;
```

Description

Use ChildNodes to access all of the nodes that are children of the document object. In addition to DocumentElement (see page 7335), which is the root of the data hierarchy, ChildNodes can include nodes for comments, processing instructions, and so on.

Note: ChildNodes is not available unless the XML (see page 7344) document is Active (see page 7333).

See Also

DocumentElement (see page 7335)

Active (see page 7333)

82.1.1.5.4 TXMLDocument.DocBindingInfo Property

Pascal

```
property DocBindingInfo: TNodeClassArray;
```

C++

```
__property TNodeClassArray DocBindingInfo;
```

Description

This is DocBindingInfo, a member of class TXMLDocument.

82.1.1.5.5 TXMLDocument.DocSource Property

Pascal

```
property DocSource: TXMLDocumentSource;
```

C++

```
__property TXMLDocumentSource DocSource;
```

Description

This is DocSource, a member of class TXMLDocument.

82.1.1.5.6 TXMLDocument.DocumentElement Property

Provides access to the root node of the XML (see page 7344) document.

Pascal

```
property DocumentElement: IXMLNode;
```

C++

```
__property IXMLNode DocumentElement;
```

Description

Use DocumentElement to access the root node of the XML (see page 7344) document. Because XML (see page 7344) documents are hierarchical in structure, DocumentElement is the entry point to all data in the XML (see page 7344) document. Setting DocumentElement replaces the entire data hierarchy with a new hierarchy of nodes.

Note: For some DOM implementations, if you set DocumentElement, all of the new nodes must already be associated with this document. That is, the new value should be a node that came from the existing node hierarchy or that was created using the CreateNode (see page 7309) method.

The IXMLNode (see page 7615) interface includes properties and methods for examining and changing the text and attributes of a node, for adding and deleting child nodes, and for traversing the hierarchy of nodes rooted at that node.

Note: DocumentElement is not available unless the XML (see page 7344) document is Active (see page 7333).

See Also

DOMDocument (see page 7336)

Active (see page 7333)

DocumentElement

CreateNode (see page 7309)

GetDocBinding (see page 7314)

Using TXMLDocument

Working with XML Nodes

82.1.1.5.7 TXMLDocument.DOMDocument Property

Provides access to the DOM interface for the parsed XML (see page 7344) document.

Pascal

```
property DOMDocument: IDOMDocument;
```

C++

```
__property IDOMDocument DOMDocument;
```

Description

Use DOMDocument to directly access the IDOMDocument (see page 7482) interface for the parsed XML (see page 7344) document. This is the interface supported by the DOM parser for the document that is represented in raw (unparsed) form by the FileName (see page 7339) or XML (see page 7344) property.

DOMDocument provides access to the IDOMImplementation (see page 7504) and IDOMElement (see page 7494) interfaces that are surfaced as the DOMImplementation (see page 7337) and DocumentElement (see page 7335) properties. It also provides access to an IDOMDocumentType (see page 7490) interface that describes the structure of the XML (see page 7344) document, and supports a number of methods for creating elements within the document.

Most applications do not need to use the DOMDocument property directly. Instead, it supplies the underlying support for parsing and manipulating the nodes accessed through DocumentElement (see page 7335). If you do want to make use of DOMDocument's low-level support, you must be familiar with the W3C Document Object Model (DOM) Level 1 Specification.

Note: DOMDocument is not available unless the XML (see page 7344) document is Active (see page 7333).

See Also

Active (see page 7333)

DocumentElement (see page 7335)

domimplementation (see page 7337)

XML (see page 7344)

FileName (see page 7339)

82.1.1.5.8 TXMLDocument.DOMImplementation Property

Pascal

```
property DOMImplementation: IDOMImplementation;
```

C++

```
__property IDOMImplementation DOMImplementation;
```

Description

This is DOMImplementation, a member of class TXMLDocument.

82.1.1.5.9 TXMLDocument.DOMParseOptions Property

Pascal

```
property DOMParseOptions: IDOMParseOptions;
```

C++

```
__property IDOMParseOptions DOMParseOptions;
```

Description

This is DOMParseOptions, a member of class TXMLDocument.

82.1.1.5.10 TXMLDocument.DOMPersist Property

Pascal

```
property DOMPersist: IDOMPersist;
```

C++

```
__property IDOMPersist DOMPersist;
```

Description

This is DOMPersist, a member of class TXMLDocument.

82.1.1.5.11 TXMLDocument.DOMVendor Property

Specifies the DOM implementation to use for parsing and manipulating the XML (see page 7344) document.

Pascal

```
property DOMVendor: TDOMVendor;
```

C++

```
__property TDOMVendor DOMVendor;
```

Description

DOMVendor is the object that represents a registered DOM implementation. TXMLDocument (see page 7299) uses this object to obtain an IDOMImplementation (see page 7504) interface, which it can use to access all the other DOM interfaces needed for parsing and manipulating the XML (see page 7344) document. Once DOMVendor is assigned, TXMLDocument (see page 7299) obtains the IDOMImplementation (see page 7504) interface (when needed) and assigns it to the DOMImplementation (see page 7337) property.

DOMVendor must be registered before it can be used to obtain an IDOMImplementation (see page 7504) interface. For a list of all the currently registered DOM implementations, use the global DOMVendors (see page 7568) variable. To obtain a specific DOM implementation, given its description, use the global GetDOMVendor (see page 7560) function. Use the RegisterDOMVendor (see page 7562) procedure to register a new DOM implementation.

You must assign a value to either DOMVendor or DOMImplementation (see page 7337) before you can set the Active (see page 7333) property to true.

See Also

domimplementation (see page 7337)

DOMVendors

Active (see page 7333)

RegisterDOMVendor

Active (see page 7333)

GetDOMVendor

Using TXMLDocument

82.1.1.5.12 TXMLDocument.Encoding Property

Indicates the character set that the XML (see page 7344) document uses to encode characters.

Pascal

```
property Encoding: DOMString;
```

C++

```
__property DOMString Encoding;
```

Description

Encoding is the encoding name that appears in the document type declaration of the XML (see page 7344) document. It is a string such as 'UTF-8', 'UTF-16', or 'ISO-10646-UCS-2' that indicates the character set used in the document.

See Also

FileName (see page 7339)

DOMDocument (see page 7336)

XML (see page 7344)

82.1.1.5.13 TXMLDocument.FileName Property

Specifies the file name for the XML (see page 7344) document associated with this TXMLDocument (see page 7299) object.

Pascal

```
property FileName: DOMString;
```

C++

```
__property DOMString FileName;
```

Description

Set FileName to specify the XML (see page 7344) document you want to examine or manipulate using the TXMLDocument (see page 7299) object. Once you have set FileName to the name of an XML (see page 7344) document, you can activate the XML (see page 7344) document and examine or manipulate it using the DocumentElement (see page 7335) property.

When you set the value of FileName, the XML (see page 7344) property automatically changes (at runtime) to represent the contents of that file.

Note: Setting the value of FileName automatically sets the Active (see page 7333) property to false.

After activating the XML (see page 7344) document, any changes you make to the document are not saved back to disk until you call the SaveToFile (see page 7325) method.

Tip: If the underlying DOM implementation supports it, you can use FileName to specify an URL rather than a file on disk.

SaveToFile (see page 7325)

DocumentElement (see page 7335)

Using TXMLDocument

Using Code That the XML Data Binding Wizard Generates

82.1.1.5.14 TXMLDocument.Modified Property

Indicates whether the XML (see page 7344) document has been modified.

Pascal

```
property Modified: Boolean;
```

C++

```
__property Boolean Modified;
```

Description

Read (see page 3727) Modified to determine whether the application has made any changes to the nodes in the XML (see page 7344) document. When Modified is true, the value of the XML (see page 7344) property may differ from the contents of the file specified by FileName (see page 7339). You can call the SaveToFile (see page 7325) method to update the XML (see page 7344) document file to reflect the changes.

Note: Modfied changes to false when you call the Refresh (see page 7323) or SaveToFile (see page 7325) method.

See Also

BeforeNodeChange (see page 7346)

AfterNodeChange (see page 7345)

Refresh (see page 7323)

SaveToFile (see page 7325)

XML (see page 7344)

FileName (see page 7339)

82.1.1.5.15 TXMLDocument.Node Property

Provides access to the document node for the XML (see page 7344) document.

Pascal

```
property Node: IXMLNode;
```

C++

```
__property IXMLNode Node;
```

Description

Read (see page 3727) Node to access the document node for the XML (see page 7344) document. The document node represents information about the entire document. It may have several child nodes, which represent comments, processing instructions, and which include the DocumentElement (see page 7335) node that acts as the root of the data hierarchy.

See Also

DocumentElement (see page 7335)

ChildNodes (see page 7335)

82.1.1.5.16 TXMLDocument.NodeIndentStr Property

Indicates the string that is inserted before nested nodes in the formatted XML (see page 7344) text.

Pascal

```
property NodeIndentStr: DOMString;
```

C++

```
__property DOMString NodeIndentStr;
```

Description

Use NodeIndentStr to customize how TXMLDocument (see page 7299) formats nodes that are added. When the Options (see page 7341) property includes doNodeAutoIndent, this string is inserted in the generated XML (see page 7344) before any newly added node, once for each nesting level.

If you do not assign a value to NodeIndentStr, TXMLDocument (see page 7299) inserts two spaces to represent each nesting level.

See Also

Options (see page 7341)

NestingLevel (see page 7380)

FormatXMLData (see page 7441)

XML (see page 7344)

82.1.1.5.17 TXMLDocument.NSPrefixBase Property

Specifies the base string for automatically-generated namespace prefixes.

Pascal

```
property NSPrefixBase: DOMString;
```

C++

```
__property DOMString NSPrefixBase;
```

Description

The AddChild (see page 7307) method for each node allows the caller to specify that the new node should use an automatically-generated namespace prefix. When this option is specified, the node uses NSPrefixBase to generate a unique string to act as a namespace prefix. This unique string consists of NSPrefixBase followed by a number that ensures uniqueness. Thus, for example, if NSPrefixBase is 'NS', automatically-generated namespace prefixes have the form 'NS1', 'NS2', and so on.

The generated namespace prefixes are only unique within a single document. If two document components have the same value for NSPrefixBase, they will generate the same namespace prefixes.

See Also

AddChild (see page 7618)

GeneratePrefix (see page 7312)

82.1.1.5.18 TXMLDocument.Options Property

Influences various aspects of the document's behavior.

Pascal

```
property Options: TXMLDocOptions;
```

C++

```
__property TXMLDocOptions Options;
```

Description

Set Options to configure how you want the document to respond when the application tries to read nodes or attributes that do not exist, when it creates a new namespace when adding a node, when it generates XML (see page 7344) text from the nodes in the document, or whether it saves its value automatically when you close the document. Options can include any of the following values:

Value	Meaning
doNodeAutoCreate	If the application tries to read a node by name, using the Nodes property of an IXMLNodeList (see page 7649) interface, and that node does not exist, then the application creates a new node using the specified name.
doNodeAutoIndent	When formatting the XML (see page 7344) text from the parsed set of nodes, child nodes are automatically indented from their parent nodes.
doAttrNull	When reading the value of an attribute that does not exist, the value is given as a Null (see page 5075) Variant (see page 3430) (as opposed to a value of an empty string).
doAutoPrefix	When generating the name of a new node, the value is automatically given a namespace prefix if a namespace URI is supplied.

doNamespaceDecl	When the AddChild (see page 7307) method must create a new namespace for the node, it also adds a namespace attribute to declare that new namespace. If doNamespaceDecl is not included, AddChild (see page 7307) creates the new namespace but does not add an attribute to declare it.
doAutoSave	When you close the document (set Active (see page 7333) to false), any changes are automatically saved back to the file specified by FileName (see page 7339) or to the XML (see page 7344) property.

See Also

Nodes (see page 7660)

Attributes (see page 7634)

AddChild (see page 7618)

Active (see page 7333)

FileName (see page 7339)

XML (see page 7344)

82.1.1.5.19 TXMLDocument.ParseOptions Property

Specifies implementation-specific options that are followed when parsing the XML (see page 7344) document.

Pascal

```
property ParseOptions: TParseOptions;
```

C++

```
__property TParseOptions ParseOptions;
```

Description

Set ParseOptions to influence the way the DOM implementation parses the XML (see page 7344) document. Different DOM implementations support different options. If you attempt to use an option that is not supported by your DOM implementation, TXMLDocument (see page 7299) raises an EXMLDocError (see page 7585) exception.

See Also

domimplementation (see page 7337)

EXMLDocError (see page 7585)

Using TXMLDocument

82.1.1.5.20 TXMLDocument.PrefixID Property

Pascal

```
property PrefixID: Integer;
```

C++

```
__property int PrefixID;
```

Description

This is PrefixID, a member of class TXMLDocument.

82.1.1.5.21 TXMLDocument.SchemaRef Property

Returns the name of the schema associated with this XML (see page 7344) document.

Pascal

```
property SchemaRef: DOMString;
```

C++

```
__property DOMString SchemaRef;
```

Description

Read (see page 3727) SchemaRef to determine the schema associated with this XML (see page 7344) document. If the document does not have an attribute that identifies an associated schema, the value of SchemaRef is an empty string.

See Also

DOMDocument (see page 7336)

82.1.1.5.22 TXMLDocument.StandAlone Property

Indicates whether the XML (see page 7344) document includes any external markup declarations.

Pascal

```
property StandAlone: DOMString;
```

C++

```
__property DOMString StandAlone;
```

Description

StandAlone is the value of the stand-alone attribute on the document type declaration of the XML (see page 7344) document. StandAlone has a value of 'yes' or 'no'.

When StandAlone is 'yes', the document contains no external markup declarations. It may, however, still contain references to external entities, as long as they are not declarations.

When StandAlone is 'no', the document may or may not contain external markup declarations.

See Also

DOMDocument (see page 7336)

82.1.1.5.23 TXMLDocument.Version Property

Indicates the XML (see page 7344) version that the document uses.

Pascal

```
property Version: DOMString;
```

C++

```
__property DOMString Version;
```

Description

Version indicates the XML (see page 7344) version number that the document uses. An XML (see page 7344) version number is a string of the form 'n.m', where n is the major version number and m is the minor version number.

See Also

XML (see page 7344)

82.1.1.5.24 TXMLDocument.XML Property

Specifies the content of the XML document associated with this TXMLDocument (see page 7299) object.

Pascal

```
property XML: TStrings;
```

C++

```
__property TStrings XML;
```

Description

Read (see page 3727) XML to obtain the contents of the associated XML document. Set XML to specify the XML document you want to examine or manipulate. Once XML is set, you can activate the XML document and examine or manipulate it using the DocumentElement (see page 7335) property.

XML is a TStrings object. This means you can supply a value using the Strings editor at design time, or manipulate the XML line by line at runtime. To read or write the XML in the document as a single string, use the LoadFromXML (see page 7322) or SaveToXML (see page 7326) method.

See Also

FileName (see page 7339)

LoadFromXML (see page 7322)

SaveToXML (see page 7326)

DocumentElement (see page 7335)

Using TXMLDocument

Using Code That the XML Data Binding Wizard Generates

82.1.1.6 TXMLDocument Events

The events of the TXMLDocument class are listed here.

Published Events

	Name	Description
	AfterClose (see page 7344)	Occurs after the XML (see page 7344) document is closed.
	AfterNodeChange (see page 7345)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 7345)	Occurs immediately after the XML (see page 7344) document is opened.
	BeforeClose (see page 7346)	Occurs immediately before the XML (see page 7344) document is closed.
	BeforeNodeChange (see page 7346)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 7347)	Occurs immediately before the XML (see page 7344) document is opened.
	OnAsyncLoad (see page 7347)	Occurs at various stages during the asynchronous parsing of an XML (see page 7344) document.

82.1.1.6.1 TXMLDocument.AfterClose Event

Occurs after the XML (see page 7344) document is closed.

Pascal

```
property AfterClose: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterClose;
```

Description

Write (see page 3789) an AfterClose event handler to take specific action after the XML (see page 7344) document interfaces are released. For example, you can use an AfterClose event to update your user interface to indicate that the XML (see page 7344) document is no longer available.

AfterClose is the last event to occur when the Active (see page 7333) property is set to false.

See Also

BeforeClose (see page 7346)

Active (see page 7333)

82.1.1.6.2 TXMLDocument.AfterNodeChange Event

Occurs after a change is made to one of the nodes in the document.

Pascal

```
property AfterNodeChange: TNodeChangeEvent;
```

C++

```
__property TNodeChangeEvent AfterNodeChange;
```

Description

Write (see page 3789) an AfterNodeChange event handler to take specific action after a change is made to a node in the XML (see page 7344) document. When an application makes a change to one of the nodes, the following steps occur:

1. The Modified (see page 7339) property is set to true.
2. A BeforeNodeChange (see page 7346) event occurs.
3. The change is made to the node.
4. An AfterNodeChange event occurs.

See Also

BeforeNodeChange (see page 7346)

Modified (see page 7339)

ChildNodes (see page 7335)

82.1.1.6.3 TXMLDocument.AfterOpen Event

Occurs immediately after the XML (see page 7344) document is opened.

Pascal

```
property AfterOpen: TNotifyEvent;
```

C++

```
__property TNotifyEvent AfterOpen;
```

Description

Write (see page 3789) an AfterOpen event handler to take specific action once the XML (see page 7344) document interfaces become available. For example, you can use an AfterOpen event to update your user interface to reflect the structure of the XML (see page 7344) document once it is opened.

AfterOpen is the last event to occur when the Active (see page 7333) property is set to true.

See Also

BeforeOpen (see page 7347)

Active (see page 7333)

82.1.1.6.4 TXMLDocument.BeforeClose Event

Occurs immediately before the XML (see page 7344) document is closed.

Pascal

```
property BeforeClose: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeClose;
```

Description

Write (see page 3789) a BeforeClose event handler to take specific action before the XML (see page 7344) document interfaces are released. For example, you can use an BeforeClose event to cache information about the XML (see page 7344) document before it becomes unavailable.

BeforeClose is the first event to occur when the Active (see page 7333) property is set to false.

See Also

AfterClose (see page 7344)

Active (see page 7333)

82.1.1.6.5 TXMLDocument.BeforeNodeChange Event

Occurs before a change is made to one of the nodes in the document.

Pascal

```
property BeforeNodeChange: TNodeChangeEvent;
```

C++

```
__property TNodeChangeEvent BeforeNodeChange;
```

Description

Write (see page 3789) a BeforeNodeChange event handler to take specific action before a change is made to a node in the XML (see page 7344) document. When an application makes a change to one of the nodes, the following steps occur:

1. The Modified (see page 7339) property is set to true.
2. A BeforeNodeChange event occurs.
3. The change is made to the node.
4. An BeforeNodeChange event occurs.

See Also

AfterNodeChange (see page 7345)

Modified (see page 7339)

ChildNodes (see page 7335)

82.1.1.6.6 TXMLDocument.BeforeOpen Event

Occurs immediately before the XML (see page 7344) document is opened.

Pascal

```
property BeforeOpen: TNotifyEvent;
```

C++

```
__property TNotifyEvent BeforeOpen;
```

Description

Write (see page 3789) a BeforeOpen event handler to take specific action before the XML (see page 7344) document interfaces become available. For example, you can use a BeforeOpen event to provide feedback to the user that the XML (see page 7344) document is being parsed (which can be cleared in an AfterOpen (see page 7345) event handler).

BeforeOpen is the first event to occur when the Active (see page 7333) property is set to true.

See Also

AfterOpen (see page 7345)

Active (see page 7333)

82.1.1.6.7 TXMLDocument.OnAsyncLoad Event

Occurs at various stages during the asynchronous parsing of an XML (see page 7344) document.

Pascal

```
property OnAsyncLoad: TAsyncEventHandler;
```

C++

```
__property TAsyncEventHandler OnAsyncLoad;
```

Description

Write (see page 3789) a OnAsyncLoad event handler to respond appropriately during the asynchronous parsing of an XML (see page 7344) document. For example, OnAsyncLoad can update a progress indicator, or initiate operations that can't be performed until the document is fully parsed. OnAsyncLoad occurs every time the AsyncLoadState (see page 7334) property changes to reflect a new stage in the parsing process.

See Also

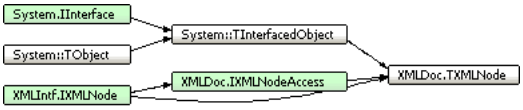
AsyncLoadState (see page 7334)

XML (see page 7344)

82.1.2 TXMLNode Class

TXMLNode represents a node in an XML document.

Class Hierarchy



Pascal

```
TXMLNode = class(TInterfacedObject, IXMLNode, IXMLNodeAccess);
```

C++

```
class TXMLNode : public TInterfacedObject, public IXMLNode, public IXMLNodeAccess;
```

File

XMLDoc

Description

The XML Data Binding Wizard uses TXMLNode as a base class for the classes it generates to represent nodes that have child nodes. For example, if the XML document includes the following:

```
<Address country="US">
  <Name>
    <First> John </First>
    <MI> Q. </MI>
    <Last> Public </Last>
  </Name>
  <Street> 123 Easy Street </Street>
  <City> Anytown </City>
  <State> CA </State>
</Address>
```

then the XML Data Binding Wizard generates TXMLNode descendants for the elements Address and Name. Child nodes and node attributes appear as properties of the TXMLNode descendant.

Note: The XML Data Binding Wizard also generates code that can create TXMLNode objects for attributes as well as element nodes. However, there are no special TXMLNode descendants for attribute nodes. Rather, each attribute is represented directly by TXMLNode.

TXMLNode implements the IXMLNode (see page 7615) interface. Each TXMLNode descendant implements a class-specific interface that descends from IXMLNode (see page 7615). Typically, applications do not work directly with TXMLNode. Instead, they use the IXMLNode (see page 7615) interface or the IXMLNode (see page 7615) descendant that is implemented by a TXMLNode descendant.

See Also

TXMLDocument (see page 7299)

TXMLNodeCollection (see page 7396)

IXMLNode (see page 7615)

TXMLNodeList (see page 7411)

82.1.2.1 TXMLNode Members

The following tables list the members exposed by TXMLNode.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.

	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.
	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.

R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 7352)	Instantiates a Create object.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
V	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
V	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Attributes (see page 7634)	Represents the values of this node's attributes.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

82.1.2.2 TXMLNode.Create Constructor

Instantiates a Create object.

Pascal

```
constructor Create(const ADOMNode: IDOMNode; const AParentNode: TXMLNode; const OwnerDoc:
TXMLDocument);
```

C++

```
__fastcall TXMLNode(const IDOMNode ADOMNode, const TXMLNode AParentNode, const TXMLDocument
OwnerDoc);
```

Description

Create instantiates a new Create object to wrap an existing DOM node implementation. Using the first syntax,

ADOMNode is the interface for the DOM implementation of the node.

AParentNode is the implementation of the parent node of this node.

OwnerDoc represents the XML document in which the new node occurs.

Using the second syntax,

HostNode (see page 7393) is another Create object that represents the host node of this node. In this case, this node is a "hosted" node, which means it shares the same underlying parent and DOM node as the host node, but represents a different view of the host node. For example, a node that contains some child nodes that are all of the same type creates a hosted node to represent only the set of repeating child nodes.

Typically, applications do not directly call the Create constructor. Instead, new nodes are created automatically for an XML document as necessary when the application reads their interfaces, starting with the DocumentElement property of the TXMLDocument (see page 7299) object. To add new nodes to a document, applications call the parent node's AddChild (see page 7356) method.

See Also

OwnerDocument (see page 7394)

ParentNode (see page 7395)

DocumentElement (see page 7335)

AddChild (see page 7356)

82.1.2.3 TXMLNode.CreateHosted Constructor

Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.

Pascal

```
constructor CreateHosted(HostNode: TXMLNode);
```

C++

```
__fastcall TXMLNode(TXMLNode HostNode);
```

Description

CreateHosted instantiates a new TXMLNode (see page 7348) object to represent a specific view on an existing TXMLNode (see page 7348) object.

HostNode (see page 7393) is another TXMLNode (see page 7348) object that represents the host node of this node. The new node becomes a "hosted" node, which means it shares the same underlying parent and DOM node as the host node, but represents a different view of the host node. For example, a node that contains some child nodes that are all of the same type creates a hosted node to represent only the set of repeating child nodes.

Typically, applications do not directly call CreateHosted to create a hosted node. Instead, this method is called in code generated by the XML Data Binding Wizard, or by the CreateCollection (see page 7363) method of the host node.

HostNode (see page 7393) (or, if HostNode (see page 7393) is hosted, the host node of HostNode (see page 7393)) becomes the value of the new node's HostNode (see page 7393) property, and the new node is added to the HostedNodes (see page 7393) property list of the new host node.

See Also

HostedNodes (see page 7393)

HostNode (see page 7393)

OnHostAttrNotify (see page 7395)

OnHostChildNotify (see page 7396)

CreateCollection (see page 7363)

82.1.2.4 TXMLNode.Destroy Destructor

Frees the memory associated with the TXMLNode (see page 7348) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLNode();
```

Description

Do not explicitly destroy TXMLNode (see page 7348) objects. As interfaced objects, XML nodes are destroyed automatically when the reference count of their IXMLNode (see page 7615) interface drops to zero.

See Also

RefCount (see page 3360)

82.1.2.5 TXMLNode Methods

The methods of the TXMLNode class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 7355)	Increments the reference count for this node.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7360)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.

	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7385)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.

82.1.2.5.1 TXMLNode._AddRef Method

Increments the reference count for this node.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

__AddRef implements the IInterface (see page 3503) or IUnknown (see page 3828) method that is called when an application obtains a reference to this node's interface pointer. __AddRef increments the RefCount property. In addition, to ensure that the document object is alive, it also increments the reference count for the owning document.

When the caller is through with the interface, it calls _Release (see page 7356). This allows the node to free itself when it is no longer used (when the reference count goes to zero).

See Also

_Release (see page 7356)

OwnerDocument (see page 7394)

RefCount (see page 3360)

82.1.2.5.2 TXMLNode._Release Method

Decrements the reference count for this node.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

__Release implements the IInterface (see page 3503) or IUnknown (see page 3828) method that is called when an application releases a reference to this node's interface pointer. __Release decrements the RefCount property. In addition, it also decrements the reference count for the owning document, which it incremented when the _AddRef (see page 7355) method was called.

When __Release causes the node's reference count to drop to zero, __Release causes the node to free itself.

See Also

_AddRef (see page 7355)

OwnerDocument (see page 7394)

RefCount (see page 3360)

82.1.2.5.3 AddChild Method

This is the overview for the AddChild method overload.

Overload List

	Name	Description
	TXMLNode.AddChild (DOMString, DOMString, Boolean, Integer) (see page 7356)	Adds a new child node to this node.
	TXMLNode.AddChild (DOMString, DOMString, TXMLNodeClass, Integer) (see page 7356)	Adds a new child node to this node.
	TXMLNode.AddChild (DOMString, Integer) (see page 7356)	Adds a new child node to this node.

82.1.2.5.3.1 TXMLNode.AddChild Method (DOMString, DOMString, Boolean, Integer)

Adds a new child node to this node.

Pascal

```
function AddChild(const TagName: DOMString; Index: Integer = -1): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString; GenPrefix: Boolean
= False; Index: Integer = -1): IXMLNode; overload;
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString; NodeClass:
TXMLNodeClass; Index: Integer = -1): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName, int Index = -1);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI, Boolean
GenPrefix = False, int Index = -1);
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI,
TXMLNodeClass NodeClass, int Index = -1);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected AddChild method. Only the first two versions of AddChild are available on the IXMLNode (see page 7615) interface. The third syntax is used by TXMLNode (see page 7348) descendants that the XML data binding wizard creates.

AddChild creates a new element node as the child of this node.

TagName provides the tag name of the newly created node.

Index indicates the position of the child node in this node's list of children, where 0 is the first position, 1 is the second position, and so on. If Index is –1, the new node is added to the end.

NamespaceURI identifies the namespace that includes the new node's definition. If NamespaceURI is omitted (the first syntax), the namespace of the new node is deduced from the namespace prefix of TagName. If TagName has no namespace prefix and there is no NamespaceURI parameter, the namespace is the same as this node's NamespaceURI property.

GenPrefix controls whether AddChild generates a namespace prefix for the namespace URI when the NamespaceURI parameter identifies a URI that is not already declared in the document. Note that setting GenPrefix to true does not cause AddChild to add a declaration of the new namespace prefix unless the document's Options property includes doNamespaceDecl.

NodeClass identifies the implementation class to use for the new child node. It must be TXMLNode (see page 7348) or one of its descendants.

AddChild returns the interface for the newly created child node.

Tip: AddChild only adds element nodes. To add other types of child nodes, use the XML document's CreateNode method instead, and then add the resulting node to the ChildNodes (see page 7391) property array.

See Also

ChildNodes (see page 7391)

AddChild (see page 7618)

CreateNode (see page 7309)

Options (see page 7341)

CreateElement (see page 7309)

NSPrefixBase (see page 7341)

DeclareNamespace (see page 7364)

82.1.2.5.4 TXMLNode.AddHostedNode Method

Adds a node to the HostedNodes (see page 7393) property list.

Pascal

```
procedure AddHostedNode(Node: TXMLNode);
```

C++

```
__fastcall AddHostedNode(TXMLNode Node);
```

Description

AddHostedNode is used internally to add nodes to the HostedNodes (see page 7393) array.

Node is the node to add to the array.

See Also

HostedNodes (see page 7393)

RemoveHostedNode (see page 7383)

82.1.2.5.5 TXMLNode.AttributeListNotify Method

Responds to notifications of changes in the list of attributes.

Pascal

```
procedure AttributeListNotify(Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean);
```

C++

```
__fastcall AttributeListNotify(TNodeListOperation Operation, IXMLNode Node, const OleVariant
IndexOrName, Boolean BeforeOperation);
```

Description

Applications can't call this protected method. The class that implements the AttributeNodes (see page 7390) property calls AttributeListNotify when attribute nodes are inserted or removed, or when a new attribute node needs to be created. AttributeListNotify generates a BeforeNodeChange or AfterNodeChange event on the document object, and, if the change has not yet occurred, updates the underlying DOM implementation to reflect the change.

Operation indicates what type of change occurred.

Node is the interface for the attribute node that was added or removed. If a new attribute node needs to be created, Node returns the new node.

IndexOrName is the name of the attribute when Operation is nlCreateNode.

BeforeOperation indicates whether the call occurs before the attribute node is added or removed.

See Also

AttributeNodes (see page 7390)

TNodeListNotification (see page 7450)

BeforeNodeChange (see page 7346)

AfterNodeChange (see page 7345)

82.1.2.5.6 TXMLNode.CheckNotHosted Method

Raises an EXMLDocError (see page 7585) exception if this is a hosted node.

Pascal

```
procedure CheckNotHosted;
```

C++

```
__fastcall CheckNotHosted();
```

Description

Applications can't call this protected method. It is used internally in methods that can only be used by the main node that corresponds to an element. If the node represents a hosted node (that is, if the node is used to represent a subset of the main, or host, node), then CheckNotHosted raises an EXMLDocError (see page 7585) exception.

For example, the CreateCollection (see page 7363) method calls CheckNotHosted, because only the main node for an element can host collection nodes.

See Also

HostNode (see page 7393)

HostedNodes (see page 7393)

EXMLDocError (see page 7585)

CreateCollection (see page 7363)

82.1.2.5.7 TXMLNode.CheckReadOnly Method

Raises an EXMLDocError (see page 7585) exception if this is a read-only node.

Pascal

```
procedure CheckReadOnly;
```

C++

```
__fastcall CheckReadOnly();
```

Description

Applications can't call this protected method. It is used internally in methods that change the value, children, or attributes of the node, to check whether the change is permitted, and if not, raise an exception.

See Also

GetReadOnly (see page 7377)

SetReadOnly (see page 7388)

ReadOnly (see page 7642)

EXMLDocError (see page 7585)

82.1.2.5.8 TXMLNode.CheckTextNode Method

Generates a DOM text node implementation if it does not yet exist.

Pascal

```
procedure CheckTextNode;
```

C++

```
__fastcall CheckTextNode();
```

Description

Applications can't call this protected method. It is used internally to generate a DOM node implementation for text values.

If the XML node is an element that has child nodes (other than a single DOM text node), CheckTextNode raises an exception.

82.1.2.5.9 TXMLNode.ChildListNotify Method

Responds to notifications of changes in the list of child nodes.

Pascal

```
procedure ChildListNotify(Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean); virtual;
```

C++

```
virtual __fastcall ChildListNotify(TNodeListOperation Operation, IXMLNode Node, const
OleVariant IndexOrName, Boolean BeforeOperation);
```

Description

Applications can't call this protected method. The class that implements the ChildNodes (see page 7391) property calls ChildListNotify when child nodes are inserted or removed, or when a node needs to be created. ChildListNotify generates a BeforeNodeChange or AfterNodeChange event on the document object, and, if the change has not yet occurred, updates the underlying DOM implementation to reflect the change.

Operation indicates what type of change is occurring.

Node is the interface for the child node about which this method is called. When nodes are added or removed, this is the node that is added or removed. When a node needs to be created, this parameter returns the newly created node.

IndexOrName is the index of the node that is added or removed when Operation is nlInsert or nlRemove. When Operation is nlCreateNode, IndexOrName is the name of the child node to create.

BeforeOperation indicates whether the call occurs before the child node is added or removed.

See Also

ChildNodes (see page 7391)

AddChild (see page 7356)

TNodeListNotification (see page 7450)

BeforeNodeChange (see page 7346)

AfterNodeChange (see page 7345)

82.1.2.5.10 TXMLNode.ClearDocumentRef Method

Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).

Pascal

```
procedure ClearDocumentRef;
```

C++

```
__fastcall ClearDocumentRef();
```

Description

Applications can't call this protected method. The document that contains this node calls ClearDocumentRef when it is freed so that the node does not maintain a reference to a non-existent document.

In addition to setting the OwnerDocument (see page 7394) property to nil (Delphi) or NULL (C++), ClearDocumentRef propagates this call to all of this nodes child nodes and attribute nodes.

See Also

OwnerDocument (see page 7394)

ChildNodes (see page 7391)

AttributeNodes (see page 7390)

82.1.2.5.11 TXMLNode.CloneNode Method

Creates a copy of this node and returns its interface.

Pascal

```
function CloneNode(Deep: Boolean): IXMLNode;
```

C++

```
__fastcall IXMLNode CloneNode(Boolean Deep);
```

Description

Applications can't call the protected CloneNode method. To create a copy of this node, use the CloneNode method of this node's IXMLNode (see page 7615) interface.

CloneNode returns a copy of this node that has no parent. Any attributes of this node are copied as well, including attribute nodes that represent default values.

Deep indicates whether the child nodes of this node should be cloned as well. For example, if an element node contains any text, CloneNode only copies then text when deep is true, because in the underlying DOM implementation, the text is contained in a child node.

See Also

ChildNodes (see page 7391)

AddChild (see page 7356)

ParentNode (see page 7395)

CloneNode (see page 7619)

CloneNode (see page 7512)

82.1.2.5.12 TXMLNode.CreateAttributeList Method

Creates the object that implements the AttributeNodes (see page 7390) property.

Pascal

```
function CreateAttributeList: IXMLNodeList; dynamic;
```

C++

```
__fastcall IXMLNodeList CreateAttributeList();
```

Description

Applications can't call the protected CreateAttributeList method. This method is used internally the first time an application reads the AttributeNodes (see page 7390) property.

CreateAttributeList creates an implementation class for the AttributeNodes (see page 7390) property, telling it to call the AttributeListNotify (see page 7358) method when it changes the list of attributes for this node, and filling it with nodes based on the current attributes of this node.

See Also

AttributeNodes (see page 7390)

AttributeListNotify (see page 7358)

82.1.2.5.13 TXMLNode.CreateAttributeNode Method

Creates a new TXMLNode (see page 7348) object for an attribute of this node.

Pascal

```
function CreateAttributeNode(const ADOMNode: IDOMNode): IXMLNode; virtual;
```

C++

```
virtual __fastcall IXMLNode CreateAttributeNode(const IDOMNode ADOMNode);
```

Description

Applications can't call the protected CreateAttributeNode method. TXMLNode (see page 7348) uses this method internally to generate the nodes that populate the AttributeNodes (see page 7390) property.

CreateAttributeNode creates a new TXMLNode (see page 7348) object for the specified IDOMNode (see page 7509) interface and returns its interface.

ADOMNode is the interface for the DOM implementation's version of the attribute node.

See Also

AttributeNodes (see page 7390)

82.1.2.5.14 TXMLNode.CreateChildList Method

Creates the object that implements the ChildNodes (see page 7391) property.

Pascal

```
function CreateChildList: IXMLNodeList; dynamic;
```

C++

```
__fastcall IXMLNodeList CreateChildList();
```

Description

Applications can't call the protected CreateChildList method. This method is used internally the first time an application reads the ChildNodes (see page 7391) property.

CreateChildList creates an implementation class for the ChildNodes (see page 7391) property, telling it to call the ChildListNotify (see page 7360) method when it changes the list of attributes for this node, and filling it with nodes that are based on the current children of this node.

See Also

ChildNodes (see page 7391)

ChildListNotify (see page 7360)

82.1.2.5.15 TXMLNode.CreateChildNode Method

Creates a new TXMLNode (see page 7348) object for a child node of this node.

Pascal

```
function CreateChildNode(const ADOMNode: IDOMNode): IXMLNode; virtual;
```

C++

```
virtual __fastcall IXMLNode CreateChildNode(const IDOMNode ADOMNode);
```

Description

Applications can't call the protected CreateChildNode method. This method is used internally to create the implementation object for a new child node.

CreateChildNode creates a new TXMLNode (see page 7348) descendant for the specified IDOMNode (see page 7509) interface, with this node as the parent. If the node name of the DOM node matches one of the names listed by the ChildNodeClasses (see page 7390) property, the corresponding descendant of TXMLNode (see page 7348) becomes the implementation class of the new node. Otherwise, the new node is an instance of TXMLNode (see page 7348).

ADOMNode is the interface for the DOM implementation's version of the node.

CreateChildNode returns the interface for the newly created child node.

See Also

Create (see page 7352)

ChildNodeClasses (see page 7390)

CreateDOMNode (see page 7439)

82.1.2.5.16 TXMLNode.CreateCollection Method

Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.

Pascal

```
function CreateCollection(const CollectionClass: TXMLNodeCollectionClass; const ItemInterface:
TGuid; const ItemTag: DOMString; ItemNS: DOMString = ''): TXMLNodeCollection;
```

C++

```
__fastcall TXMLNodeCollection CreateCollection(const TXMLNodeCollectionClass CollectionClass,
const TGuid ItemInterface, const DOMString ItemTag, DOMString ItemNS = '');
```

Description

Applications can't call the protected CreateCollection method. It is used internally to generate the collections that are listed in the HostedNodes (see page 7393) property.

CollectionClass specifies the class (a TXMLNodeCollection (see page 7396) descendant) that implements the collection of child nodes.

ItemInterface specifies the interface for each child node in the collection.

ItemTag specifies the tag name for each child node in the collection.

ItemNS specifies the namespace in which ItemTag is defined.

CreateCollection returns the new hosted collection node. This new node has the same parent node, DOM interface, attribute nodes, and child nodes as this node, but it also maintains a list of only those child nodes with the specified tag and interface. The new collection node lists this node as the value of its HostNode (see page 7393) property.

Note: CreateCollection raises an exception if this is a hosted node.

See Also

HostedNodes (see page 7393)

ChildNodes (see page 7391)

ParentNode (see page 7395)

DOMNode (see page 7392)

HostNode (see page 7393)

ItemInterface (see page 7410)

itemtag (see page 7411)

itemns (see page 7410)

82.1.2.5.17 TXMLNode.DeclareNamespace Method

Adds an attribute to the node that declares a specified namespace URI.

Pascal

```
procedure DeclareNamespace(const Prefix: DOMString; const URI: DOMString);
```

C++

```
__fastcall DeclareNamespace(const DOMString Prefix, const DOMString URI);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected DeclareNamespace method. DeclareNamespace adds an attribute to this node that declares the specified namespace URI as the value of the specified prefix.

Prefix is the namespace prefix that appears in tag names that reference the namespace.

URI is the corresponding namespace URI.

Note: This method is called automatically for newly created nodes when the document's Options property includes doNamespaceDecl.

See Also

Options (see page 7341)

AttributeNodes (see page 7390)

FindNamespaceDecl (see page 7366)

DeclareNamespace (see page 7620)

82.1.2.5.18 TXMLNode.DOMElement Method

Returns the IDOMElement (see page 7494) interface for this node if it exists.

Pascal

```
function DOMElement: IDOMElement;
```

C++

```
__fastcall IDOMElement DOMElement();
```

Description

Application's can't call the protected DOMElement method. TXMLNode (see page 7348) uses this method internally to obtain the DOM element interface, which it uses for working with attributes.

If the TXMLNode (see page 7348) instance does not represent an element node, DOMElement raises an EXMLDocError (see page 7585) exception.

See Also

AttributeNodes (see page 7390)

GetAttribute (see page 7367)

SetAttribute (see page 7384)

82.1.2.5.19 TXMLNode.DoNodeChange Method

Generates a BeforeNodeChange or AfterNodeChange event on this node's document.

Pascal

```
procedure DoNodeChange(ChangeType: TNodeChange; BeforeOperation: Boolean); virtual;
```

C++

```
virtual __fastcall DoNodeChange(TNodeChange ChangeType, Boolean BeforeOperation);
```

Description

Applications can't call the protected DoNodeChange method. It is called internally before and after every change that is made to the node. DoNodeChange checks whether the node's OwnerDocument (see page 7394) property is set, and if so, generates a BeforeNodeChange or AfterNodeChange event on that document, as appropriate.

ChangeType indicates the type of change that is occurring to the node.

BeforeOperation is true if the change is about to occur, false if the change has just occurred.

See Also

AfterNodeChange (see page 7345)

BeforeNodeChange (see page 7346)

OwnerDocument (see page 7394)

82.1.2.5.20 TXMLNode.FindHostedNode Method

Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.

Pascal

```
function FindHostedNode(const NodeClass: TXMLNodeClass): IXMLNode;
```

C++

```
__fastcall IXMLNode FindHostedNode(const TXMLNodeClass NodeClass);
```

Description

Applications can't call the protected FindHostedNode method. Descendant classes call this method to locate a hosted node of a particular class type.

FindHostedNode searches the nodes in the HostedNodes (see page 7393) list and returns the first one it finds that is an instance of descendant of NodeClass. If this node does not have a hosted node of the specified class, FindHostedNode returns

nil (Delphi) or NULL (C++).

See Also

HostedNodes (see page 7393)

CreateCollection (see page 7363)

82.1.2.5.21 TXMLNode.FindNamespaceDecl Method

Returns the attribute node that declares a specified Namespace URI.

Pascal

```
function FindNamespaceDecl(const NamespaceURI: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode FindNamespaceDecl(const DOMString NamespaceURI);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected FindNamespaceDecl method. FindNamespaceDecl searches the node hierarchy that contains this node for an attribute that specifies the mapping between a namespace prefix and the namespace URI specified by NamespaceURI. If it finds such a mapping, FindNamespaceDecl returns the interface for the Attribute node. If it does not find a mapping, FindNamespaceDecl returns nil (Delphi) or NULL (C++).

NamespaceURI is the namespace URI to locate.

See Also

FindNamespaceURI (see page 7366)

DeclareNamespace (see page 7364)

FindNamespaceDecl (see page 7620)

82.1.2.5.22 TXMLNode.FindNamespaceURI Method

Returns the namespace URI for a namespace prefix or qualified tag name.

Pascal

```
function FindNamespaceURI(const TagOrPrefix: DOMString): DOMString;
```

C++

```
__fastcall DOMString FindNamespaceURI(const DOMString TagOrPrefix);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected FindNamespaceURI method. FindNamespaceDecl (see page 7366) searches the node hierarchy that contains this node for an attribute that specifies the mapping between the namespace prefix identified by TagOrPrefix and a namespace URI. If it finds such a mapping, FindNamespaceURI returns the namespace URI. If it does not find a mapping, FindNamespaceURI returns an empty string.

TagOrPrefix is the namespace prefix or a tag name that includes the namespace prefix.

See Also

GetNamespaceURI (see page 7373)

GetPrefix (see page 7376)

FindNamespaceDecl (see page 7366)

FindNamespaceURI (see page 7620)

82.1.2.5.23 TXMLNode.GetAttribute Method

Returns the value of one of this node's attributes.

Pascal

```
function GetAttribute(const AttrName: DOMString): OleVariant;
```

C++

```
__fastcall OleVariant GetAttribute(const DOMString AttrName);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetAttribute method. GetAttribute returns the value of an attribute of this node.

AttrName is the name of the attribute.

GetAttribute returns the value of the specified attribute. Typically, this value is a string. If the node does not have an attribute with the name specified by AttrName, the value that GetAttribute returns is determined by the document's Options property. When Options include doAttrNull, GetAttribute returns a Null (see page 5075) Variant (see page 3430) for missing attributes. When Options does not include doAttrNull, GetAttribute returns an empty string as the value of missing attributes.

If this node is not an element node, GetAttribute raises an EXMLDocError (see page 7585) exception.

See Also

SetAttribute (see page 7384)

AttributeNodes (see page 7390)

GetAttributeNS (see page 7368)

82.1.2.5.24 TXMLNode.GetAttributeNodes Method

Returns the value of the AttributeNodes (see page 7390) property.

Pascal

```
function GetAttributeNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetAttributeNodes();
```

Description

GetAttributeNodes is the read implementation of the AttributeNodes (see page 7390) property on the IXMLNode (see page 7615) interface for this node.

GetAttributeNodes generates the list that implements the AttributeNodes (see page 7390) property the first time an application reads the AttributeNodes (see page 7390) property.

See Also

GetAttribute (see page 7367)

AttributeNodes (see page 7390)

82.1.2.5.25 TXMLNode.GetAttributeNS Method

Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.

Pascal

```
function GetAttributeNS(const AttrName: DOMString; const NamespaceURI: DOMString): OleVariant;
```

C++

```
__fastcall OleVariant GetAttributeNS(const DOMString AttrName, const DOMString NamespaceURI);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetAttributeNS method. GetAttributeNS returns the value of an attribute of this node.

AttrName is the name of the attribute.

NamespaceURI identifies the namespace in which the attribute resides.

GetAttributeNS returns the value of the specified attribute. If AttrName and NamespaceURI do not identify an attribute of this node, GetAttributeNS returns a Null (see page 5075) Variant (see page 3430).

If this node is not an element node, GetAttributeNS raises an EXMLDocError (see page 7585) exception.

See Also

GetAttribute (see page 7367)

Attributes (see page 7634)

GetNamespaceURI (see page 7373)

SetAttributeNS (see page 7385)

AttributeNodes (see page 7390)

82.1.2.5.26 TXMLNode.GetChildNodeClasses Method

Returns a list of the classes that can implement child nodes of this node.

Pascal

```
function GetChildNodeClasses: TNodeClassArray;
```

C++

```
__fastcall TNodeClassArray GetChildNodeClasses();
```

Description

GetChildNodeClasses is used internally to obtain a list of the classes that can be used to represent child nodes of this node.

If this node is not a hosted node, GetChildNodeClasses returns an array containing every class that has been registered using the RegisterChildNode (see page 7382) method. If this node is a hosted node, GetChildNodeClasses returns the ChildNodeClasses (see page 7390) property of the host node.

See Also

ChildNodeClasses (see page 7390)

RegisterChildNode (see page 7382)

HostNode (see page 7393)

82.1.2.5.27 TXMLNode.GetChildNodes Method

Returns the value of the ChildNodes (see page 7391) property.

Pascal

```
function GetChildNodes: IXMLNodeList;
```

C++

```
__fastcall IXMLNodeList GetChildNodes();
```

Description

GetChildNodes is the protected read implementation of the ChildNodes (see page 7391) property.

GetChildNodes generates the list that implements the ChildNodes (see page 7391) property the first time an application reads the ChildNodes (see page 7391) property.

See Also

GetChildValue (see page 7369)

ChildNodes (see page 7391)

82.1.2.5.28 TXMLNode.GetChildValue Method

Returns the value of a specified child node.

Pascal

```
function GetChildValue(const IndexOrName: OleVariant): OleVariant;
```

C++

```
__fastcall OleVariant GetChildValue(const OleVariant IndexOrName);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetChildValue method. GetChildValue returns the value of the node.

IndexOrName identifies the desired child node by either its interface, or by a string that is the local name of the child node.

If IndexOrName does not identify a child of this node, GetChildValue nil (Delphi) or NULL (C++). Otherwise, the return value depends on the type of the child node, as indicated in the following table:

NodeType	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, GetChildValue raises an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntEntityRef	nil (Delphi) or NULL (C++)
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
ntDocFragment	nil (Delphi) or NULL (C++)

Note: Attributes are not considered child nodes of a node. To get the values of this node's attributes, use the GetAttribute (

see page 7367) method instead.

See Also

ChildNodes (see page 7391)

ParentNode (see page 7395)

GetAttribute (see page 7367)

GetNodeValue (see page 7375)

82.1.2.5.29 TXMLNode.GetCollection Method

Returns the value of the Collection (see page 7391) property.

Pascal

```
function GetCollection: IXMLNodeCollection;
```

C++

```
__fastcall IXMLNodeCollection GetCollection();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetCollection method. GetCollection returns the value of the Collection (see page 7391) property. If this node is not a member of a collection (that is, if it does not represent one of a set of child nodes that are all the same type), then GetCollection returns nil (Delphi) or NULL (C++).

See Also

Collection (see page 7391)

82.1.2.5.30 TXMLNode.GetDOMNode Method

Returns the value of the DOMNode (see page 7392) property.

Pascal

```
function GetDOMNode: IDOMNode;
```

C++

```
__fastcall IDOMNode GetDOMNode();
```

Description

GetDOMNode is the protected read implementation of the DOMNode (see page 7392) property.

See Also

DOMNode (see page 7392)

82.1.2.5.31 TXMLNode.GetHasChildNodes Method

Indicates whether this node has any child nodes.

Pascal

```
function GetHasChildNodes: Boolean;
```

C++

```
__fastcall Boolean GetHasChildNodes();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetHasChildNodes method. GetHasChildNodes returns true if the underlying DOM node has any child nodes, false if it doesn't.

Note that even if the underlying DOM node has a child node, there may not be a TXMLNode (see page 7348) object to represent that child. For example, text nodes do not, by default, have corresponding TXMLNode (see page 7348) wrappers. Rather, the text becomes the value of the parent element node.

See Also

ChildNodes (see page 7391)

DOMNode (see page 7392)

GetIsTextElement (see page 7371)

82.1.2.5.32 TXMLNode.GetHostedNodes Method

Returns a list an array of the hosted nodes that share this node's attribute and child node lists.

Pascal

```
function GetHostedNodes: TXMLNodeArray;
```

C++

```
__fastcall TXMLNodeArray GetHostedNodes();
```

Description

GetHostedNodes is the read implementation of the HostedNodes (see page 7393) property. It returns a list an array of all nodes that represent aspects of this node, sharing its attributes and list of child nodes.

See Also

HostedNodes (see page 7393)

82.1.2.5.33 TXMLNode.GetHostNode Method

Returns the value of the HostNode (see page 7393) property.

Pascal

```
function GetHostNode: TXMLNode;
```

C++

```
__fastcall TXMLNode GetHostNode();
```

Description

GetHostNode returns the node that uses this node to represent a particular aspect of it, sharing the same attributes and list of child nodes. If this is not a hosted node, GetHostNode returns nil (Delphi) or NULL (C++).

See Also

HostNode (see page 7393)

82.1.2.5.34 TXMLNode.GetIsTextElement Method

Indicates whether the node has a single text value.

Pascal

```
function GetIsTextElement: Boolean;
```

C++

```
__fastcall Boolean GetIsTextElement();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetIsTextElement method. GetIsTextElement returns true if the node represents an XML fragment such as

```
<Title> Understanding XML </Title>
```

where the node has a tag name (in this case Title) and a single text value (in this case 'Understanding XML').

GetIsTextElement returns false if the node is any other type of node.

Note: In the underlying DOM implementation, nodes for which GetIsTextElement is true are element nodes that have a single child node that is a text node. TXMLNode (see page 7348) flattens this out so that the child text node does not appear as a child node. Instead, the text can be accessed through the GetText (see page 7378) method.

See Also

GetText (see page 7378)

GetHasChildNodes (see page 7370)

82.1.2.5.35 TXMLNode.GetLocalName Method

Returns the name of the node without any namespace prefix.

Pascal

```
function GetLocalName: DOMString;
```

C++

```
__fastcall DOMString GetLocalName();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetLocalName method. GetLocalName returns the local name of the underlying DOM node.

For element nodes, the local name is derived from the name that appears in the XML tag. For example, the local name for <xsi:Name First="John" Last="Doe"> is 'Name'.

For attribute nodes, the local name is derived from the string that appears to the left of the equals sign in the attribute declaration. For example the element <Name First=John Last=Doe> results in two attribute nodes, with the local names 'First' and 'Last'.

For any other node types, the local name is nil (Delphi) or NULL (C++).

Note: If both GetPrefix (see page 7376) and GetLocalName return a value for a node, the node name (returned by GetNodeName (see page 7373)) is the combination of these two values.

See Also

GetNodeName (see page 7373)

GetNodeType (see page 7374)

GetPrefix (see page 7376)

GetNamespaceURI (see page 7373)

LocalName (see page 7521)

82.1.2.5.36 TXMLNode.GetNamespaceURI Method

Returns the URI for the namespace used in the qualified node name.

Pascal

```
function GetNamespaceURI: DOMString;
```

C++

```
__fastcall DOMString GetNamespaceURI();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetNamespaceURI method. GetNamespaceURI returns the URI for the namespace that should be used to interpret the node's name.

Only element and attribute nodes can have a namespace URI value. For any other node type, GetNamespaceURI returns nil (Delphi) or NULL (C++).

The namespace URI is only available if it is explicitly assigned when the node is created. By default, TXMLNode (see page 7348) does not assign namespaces to the new nodes it creates.

See Also

GetNodeName (see page 7373)

GetNodeType (see page 7374)

GetPrefix (see page 7376)

GetLocalName (see page 7372)

CreateDOMNode (see page 7439)

NamespaceURI (see page 7521)

82.1.2.5.37 TXMLNode.GetNodeName Method

Returns the node name.

Pascal

```
function GetNodeName: DOMString;
```

C++

```
__fastcall DOMString GetNodeName();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetNodeName method. GetNodeName returns the name of the underlying DOM node.

The node's name depends on the type of the node, as indicated in the following table:

NodeType	NodeName
ntAttribute	The attribute name
ntElement	The tag name
ntText	'#text'
ntCData	'#cdata-section'

ntEntityRef	The name of the entity reference.
ntEntity	The entity name
ntProcessingInstr	the target of the processing instruction
ntComment	'#comment'
ntDocument	'#document'
ntDocType	The document type name
ntDocFragment	'#document-fragment'
ntNotation	The notation name

Note: If GetPrefix (see page 7376) and GetLocalName (see page 7372) both return values for a node, the node name is the combination of these two values.

See Also

GetNodeType (see page 7374)

GetPrefix (see page 7376)

GetLocalName (see page 7372)

82.1.2.5.38 TXMLNode.GetNodeObject Method

Returns a reference to this TXMLNode (see page 7348) object.

Pascal

```
function GetNodeObject: TXMLNode;
```

C++

```
__fastcall TXMLNode GetNodeObject();
```

Description

GetNodeObject returns Self (Delphi) or this (C++).

82.1.2.5.39 TXMLNode.GetNodeType Method

Returns the type of the node.

Pascal

```
function GetNodeType: TNodeType;
```

C++

```
__fastcall TNodeType GetNodeType();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetNodeType method. GetNodeType returns the type of the underlying DOM node that this TXMLNode (see page 7348) object represents.

See Also

GetIsTextElement (see page 7371)

82.1.2.5.40 TXMLNode.GetNodeValue Method

Returns the value of this node.

Pascal

```
function GetNodeValue: OleVariant;
```

C++

```
__fastcall OleVariant GetNodeValue();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetNodeValue method. GetNodeValue returns the value of the node. This value depends on the type of the node, as indicated in the following table:

NodeType	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, GetNodeValue raises an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntEntityRef	nil (Delphi) or NULL (C++)
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
ntDocFragment	nil (Delphi) or NULL (C++)

See Also

GetChildValue (see page 7369)

GetText (see page 7378)

82.1.2.5.41 TXMLNode.GetOwnerDocument Method

Returns the interface for the document in which this node appears.

Pascal

```
function GetOwnerDocument: IXMLDocument;
```

C++

```
__fastcall IXMLDocument GetOwnerDocument();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetOwnerDocument method. GetOwnerDocument returns the value of the OwnerDocument (see page 7394) property.

See Also

OwnerDocument (see page 7394)

82.1.2.5.42 TXMLNode.GetParentNode Method

Returns the interface for the node's parent node.

Pascal

```
function GetParentNode: IXMLNode;
```

C++

```
__fastcall IXMLNode GetParentNode();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetParentNode method. GetParentNode returns the interface of the node's parent node.

See Also

ParentNode (see page 7395)

82.1.2.5.43 TXMLNode.GetPrefix Method

Returns the namespace prefix of the node's name.

Pascal

```
function GetPrefix: DOMString;
```

C++

```
__fastcall DOMString GetPrefix();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetPrefix method. GetPrefix returns the namespace prefix of an element or attribute node's name. A namespace prefix is a symbolic name for a namespace URI.

For element nodes, the namespace prefix is derived from the name that appears in the XML tag. For example, the namespace prefix for <xsi:Name First="John" Last="Doe"> is 'xsi'.

For attribute nodes, the namespace prefix is derived from the string that appears to the left of the equals sign in the attribute declaration. For example the element <xsi:Name xsn:First="John" Last="Doe"> results in two attribute nodes, with namespace prefixes of 'xsn' and '', respectively. Note that the attribute never inherits a namespace prefix from the node to which it is attached.

For any other node types, the namespace prefix is nil (Delphi) or NULL (C++).

Note: If both GetPrefix and GetLocalName (see page 7372) return a value for a node, the node name (returned by GetNodeName (see page 7373)) is the combination of these two values.

See Also

GetLocalName (see page 7372)

GetNodeType (see page 7374)

GetNamespaceURI (see page 7373)

GetPrefixedName (see page 7377)

82.1.2.5.44 TXMLNode.GetPrefixedName Method

Returns a node name includes a namespace prefix for a specified namespace URI.

Pascal

```
function GetPrefixedName(const Name: DOMString; const NamespaceURI: DOMString): DOMString;
```

C++

```
__fastcall DOMString GetPrefixedName(const DOMString Name, const DOMString NamespaceURI);
```

Description

GetPrefixedName adds a prefix to a local node name based on the specified namespace URI. If there is no corresponding namespace already declared or if the name is already prefixed, GetPrefixedName returns the original node name.

Name is the node name to which the namespace prefix should be added.

NamespaceURI is the URI for the namespace that should be identified by the namespace prefix.

Note: If the document containing this node does not include doAutoPrefix in its Options property, GetPrefixedName always returns the value of Name, without trying to generate or add a namespace prefix.

See Also

GetLocalName (see page 7372)

GetPrefix (see page 7376)

GetNamespaceURI (see page 7373)

Options (see page 7341)

82.1.2.5.45 TXMLNode.GetReadOnly Method

Indicates whether the node can be modified.

Pascal

```
function GetReadOnly: Boolean;
```

C++

```
__fastcall Boolean GetReadOnly();
```

Description

GetReadOnly returns true if the node can't be modified. Read (see page 3727)-only nodes raise an EXMLDocError (see page 7585) exception when an attempt is made to change their value, child nodes, or attributes.

GetReadOnly returns false if the node can be modified.

Note: Use the ReadOnly property on the IXMLNode (see page 7615) interface to specify whether a node is read-only.

See Also

SetReadOnly (see page 7388)

ReadOnly (see page 7642)

EXMLDocError (see page 7585)

82.1.2.5.46 TXMLNode.GetText Method

Returns the text value of the node.

Pascal

```
function GetText: DOMString;
```

C++

```
__fastcall DOMString GetText();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetText method. GetText returns the text of the node. For example, if the node represents an XML fragment such as

```
<Title> Understanding XML </Title>
```

GetText returns the string 'Understanding XML'.

GetText is intended for use when the GetIsTextElement (see page 7371) method returns true. If GetIsTextElement (see page 7371) returns false, GetText returns an empty string if the node has no children, otherwise it raises an exception.

See Also

GetIsTextElement (see page 7371)

GetNodeValue (see page 7375)

SetText (see page 7388)

82.1.2.5.47 TXMLNode.GetXML Method

Returns the XML that corresponds to the subtree rooted at this node.

Pascal

```
function GetXML: DOMString;
```

C++

```
__fastcall DOMString GetXML();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected GetXML method. GetXML returns the XML that corresponds to this node and any child nodes it contains.

Note: GetXML is only available when the DOMVendor used to parse this node's XML document is MSXML.

See Also

GetText (see page 7378)

ChildNodes (see page 7391)

DOMVendor (see page 7337)

82.1.2.5.48 HasAttribute Method

This is the overview for the HasAttribute method overload.

Overload List

	Name	Description
	TXMLNode.HasAttribute (DOMString) (see page 7379)	Indicates whether the node has an attribute with a specified name.
	TXMLNode.HasAttribute (DOMString, DOMString) (see page 7379)	Indicates whether the node has an attribute with a specified name.

82.1.2.5.48.1 TXMLNode.HasAttribute Method (DOMString)

Indicates whether the node has an attribute with a specified name.

Pascal

```
function HasAttribute(const Name: DOMString): Boolean; overload;
function HasAttribute(const Name: DOMString; const NamespaceURI: DOMString): Boolean; overload;
```

C++

```
__fastcall Boolean HasAttribute(const DOMString Name);
__fastcall Boolean HasAttribute(const DOMString Name, const DOMString NamespaceURI);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected HasAttribute method.

Name is the name of the attribute about which you want to know.

NamespaceURI is the namespace of the attribute.

HasAttribute returns true if this node has the specified attribute, false otherwise.

See Also

AttributeNodes (see page 7390)

GetAttribute (see page 7367)

GetAttributeNS (see page 7368)

82.1.2.5.49 HasChildNode Method

This is the overview for the HasChildNode method overload.

Overload List

	Name	Description
	TXMLNode.HasChildNode (DOMString) (see page 7379)	Indicates whether the node has a child node with the specified name.
	TXMLNode.HasChildNode (DOMString, DOMString) (see page 7379)	Indicates whether the node has a child node with the specified name.

82.1.2.5.49.1 TXMLNode.HasChildNode Method (DOMString)

Indicates whether the node has a child node with the specified name.

Pascal

```
function HasChildNode(const ChildTag: DOMString): Boolean; overload;
```

```
function HasChildNode(const ChildTag: DOMString; const NamespaceURI: DOMString): Boolean;
overload;
```

C++

```
__fastcall Boolean HasChildNode(const DOMString ChildTag);
__fastcall Boolean HasChildNode(const DOMString ChildTag, const DOMString NamespaceURI);
```

Description

Applications can't call the protected HasChildNode method. It is used internally to determine when the underlying DOM node has a child with the specified name.

ChildTag is the local tag name of the child to find.

NamespaceURI identifies the namespace in which ChildTag is defined.

HasChildNode returns true if the underlying DOM node includes the specified child node. Otherwise, it returns false.

See Also

ChildNodes (see page 7391)

DOMNode (see page 7392)

82.1.2.5.50 TXMLNode.InternalAddChild Method

Provides the underlying implementation for the AddChild (see page 7356) method.

Pascal

```
function InternalAddChild(NodeClass: TXMLNodeClass; const NodeName: DOMString; const
NamespaceURI: DOMString; Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode InternalAddChild(TXMLNodeClass NodeClass, const DOMString NodeName, const
DOMString NamespaceURI, int Index);
```

Description

Applications can't call the protected InternalAddChild method. It is used internally to perform all the tasks common to the various overloads of the AddChild (see page 7356) method. InternalAddChild creates a new element node as the child of this node and returns its interface.

NodeClass specifies the implementation class to use for the new child node. It must be TXMLNode (see page 7348) or one of its descendants.

NodeName specifies the tag name of the newly created node.

NamespaceURI identifies the namespace that includes the new node's definition.

Index indicates the position of the child node in this node's list of children, where 0 is the first position, 1 is the second position, and so on. If Index is –1, the new node is added to the end.

See Also

AddChild (see page 7356)

82.1.2.5.51 TXMLNode.NestingLevel Method

Returns the number of parents for this node in the node hierarchy.

Pascal

```
function NestingLevel: Integer;
```

C++

```
__fastcall int NestingLevel();
```

Description

Application's can't call the protected NestingLevel property. It is used internally when formatting the XML text that corresponds to this XML document.

NestingLevel returns the number of ancestors for this node in the node hierarchy.

See Also

ParentNode (see page 7395)

ChildNodes (see page 7391)

82.1.2.5.52 TXMLNode.NextSibling Method

Returns the next child of this node's parent.

Pascal

```
function NextSibling: IXMLNode;
```

C++

```
__fastcall IXMLNode NextSibling();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected NextSibling method. NextSibling returns the node that follows this one in the parent node's ChildNodes (see page 7391) property list.

If this node is the last node in its parent's child list, NextSibling raises an exception.

See Also

ParentNode (see page 7395)

PreviousSibling (see page 7382)

ChildNodes (see page 7391)

82.1.2.5.53 TXMLNode.Normalize Method

Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

Pascal

```
procedure Normalize;
```

C++

```
__fastcall Normalize();
```

Description

Use the IXMLNode (see page 7615) interface to call the protected Normalize method. Normalize consolidates adjacent text nodes and remove any empty text nodes in the subtree beneath this node. This method ensures that for all child nodes of this node and of its attributes, only structure nodes (element nodes, comments, processing instructions, CDATA sections, and entity references) separate text nodes and that there are no empty text nodes.

See Also

ChildNodes (see page 7391)

AttributeNodes (see page 7390)

82.1.2.5.54 TXMLNode.PreviousSibling Method

Returns the previous child of this node's parent.

Pascal

```
function PreviousSibling: IXMLNode;
```

C++

```
__fastcall IXMLNode PreviousSibling();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected PreviousSibling method. PreviousSibling returns the node that precedes this one in the parent node's ChildNodes (see page 7391) property list.

If this node is the first node in its parent's child list, PreviousSibling raises an exception.

See Also

ParentNode (see page 7395)

NextSibling (see page 7381)

ChildNodes (see page 7391)

82.1.2.5.55 TXMLNode.RegisterChildNode Method

Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.

Pascal

```
procedure RegisterChildNode(const TagName: DOMString; ChildNodeClass: TXMLNodeClass;
NamespaceURI: DOMString = '');
```

C++

```
__fastcall RegisterChildNode(const DOMString TagName, TXMLNodeClass ChildNodeClass, DOMString
NamespaceURI = '');
```

Description

Applications can't call the protected RegisterChildNode method. It is called by the RegisterChildNodes (see page 7383) method to register a TXMLNode (see page 7348) descendant so that it can be used as a child of this node. Each TXMLNode (see page 7348) descendant is specific to the structure of the XML document, with properties that correspond to the child nodes and attributes of a node.

RegisterChildNode adds an entry to the ChildNodeClasses (see page 7390) property for the specified node class and tag name.

TagName is the tag name of the child node that the class represents.

NodeClass is the TXMLNode (see page 7348) descendant that implements child nodes that have the specified tag name.

NamespaceURI identifies the namespace in which TagName is defined.

Note: RegisterChildNode raises an exception if this is a hosted node.

See Also

RegisterChildNodes (see page 7383)

ChildNodeClasses (see page 7390)

82.1.2.5.56 TXMLNode.RegisterChildNodes Method

Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.

Pascal

```
procedure RegisterChildNodes(const TagNames: array of DOMString; const NodeClasses: array of
TXMLNodeClass);
```

C++

```
__fastcall RegisterChildNodes(const array of DOMString TagNames, const array of TXMLNodeClass
NodeClasses);
```

Description

Applications can't call the protected RegisterChildNodes method. It is used in code that the XML Data Binding wizard generates to register the special TXMLNode (see page 7348) descendants the are created for nodes in the XML document. Each of these descendant classes is specific to the structure of the XML document, with properties that correspond to the child nodes and attributes of the node.

RegisterChildNodes adds an entry to the ChildNodeClasses (see page 7390) property for each specified node class and tag name.

TagNames is an array containing the names of the child nodes that the classes represent.

TagNames_Size is the index of the last name in TagNames (one less than the number of elements).

NodeClasses is an array containing the TXMLNode (see page 7348) descendants that implement child nodes that have the tag names in the corresponding entries in TagNames.

NodeClasses_Size is the index of the last class in NodeClasses (one less than the number of elements).

See Also

RegisterChildNode (see page 7382)

ChildNodeClasses (see page 7390)

82.1.2.5.57 TXMLNode.RemoveHostedNode Method

Removes a node from the HostedNodes (see page 7393) property list.

Pascal

```
procedure RemoveHostedNode(Node: TXMLNode);
```

C++

```
__fastcall RemoveHostedNode(TXMLNode Node);
```

Description

RemoveHostedNode is used internally to remove nodes from the HostedNodes (see page 7393) array.

Node is the node to remove from the array.

See Also

HostedNodes (see page 7393)

AddHostedNode (see page 7357)

82.1.2.5.58 TXMLNode.Resync Method

Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

Pascal

```
procedure Resync;
```

C++

```
__fastcall Resync();
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected Resync method. Resync forces the node to reread the values of its child nodes and attribute nodes, discarding any changes that have not been propagated to the underlying DOM implementation.

See Also

ChildNodes (see page 7391)

AttributeNodes (see page 7390)

Refresh (see page 7323)

82.1.2.5.59 TXMLNode.SetAttribute Method

Sets the value of one of this node's attributes.

Pascal

```
procedure SetAttribute(const AttrName: DOMString; const Value: OleVariant);
```

C++

```
__fastcall SetAttribute(const DOMString AttrName, const OleVariant Value);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected SetAttribute method. SetAttribute sets the value of a specified attribute of this node.

AttrName is the name of the attribute. If the attribute already exists for the node, its value is changed. If the attribute does not already exist, a new attribute is created.

Value is the value to assign to the attribute. This value is a string that is not parsed. Any markup (for example, for an entity reference) is treated as literal text, and must include appropriate escape sequences. If Value is NULL, the attribute is removed from this node. If Value is an empty string, the attribute is assigned an empty value.

See Also

GetAttribute (see page 7367)

AttributeNodes (see page 7390)

SetAttributeNS (see page 7385)

82.1.2.5.60 TXMLNode.SetAttributeNodes Method

Sets the value of the AttributeNodes (see page 7390) property.

Pascal

```
procedure SetAttributeNodes(const Value: IXMLNodeList); virtual;
```

C++

```
virtual __fastcall SetAttributeNodes(const IXMLNodeList Value);
```

Description

Applications can't call this protected method. It is called internally the first time an application reads the AttributeNodes (see page 7390) property to supply the interface that implements that property.

See Also

AttributeNodes (see page 7390)

82.1.2.5.61 TXMLNode.SetAttributeNS Method

Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.

Pascal

```
procedure SetAttributeNS(const AttrName: DOMString; const NamespaceURI: DOMString; const
Value: OleVariant);
```

C++

```
__fastcall SetAttributeNS(const DOMString AttrName, const DOMString NamespaceURI, const
OleVariant Value);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected SetAttributeNS method. SetAttributeNS sets the value of a specified attribute of this node.

AttrName is the name of the attribute. If the attribute already exists for the node, its value is changed. If the attribute does not already exist, a new attribute is created.

NamespaceURI is the namespace for the attribute.

Value is the value to assign to the attribute. This value is a string that is not parsed. Any markup (for example, for an entity reference) is treated as literal text, and must include appropriate escape sequences. If Value is NULL, the attribute is removed from this node. If Value is an empty string, the attribute is assigned an empty value.

See Also

SetAttribute (see page 7384)

GetAttributeNS (see page 7368)

AttributeNodes (see page 7390)

82.1.2.5.62 TXMLNode.SetChildNodes Method

Sets the value of the ChildNodes (see page 7391) property.

Pascal

```
procedure SetChildNodes(const Value: IXMLNodeList); virtual;
```

C++

```
virtual __fastcall SetChildNodes(const IXMLNodeList Value);
```

Description

Applications can't call this protected method. It is called internally the first time an application reads the ChildNodes (see page 7391) property to supply the interface that implements that property.

See Also

ChildNodes (see page 7391)

82.1.2.5.63 TXMLNode.SetChildValue Method

Sets the value of a specified child node.

Pascal

```
procedure SetChildValue(const IndexOrName: OleVariant; const Value: OleVariant);
```

C++

```
__fastcall SetChildValue(const OleVariant IndexOrName, const OleVariant Value);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected SetChildValue method. SetChildValue sets the value of a specified child node to a specified value.

IndexOrName identifies the desired child node by either its interface, or by a string that is the local name of the child node. If IndexOrName does not identify a child of this node, SetChildValue raises an exception.

Value is the value to assign. It's interpretation depends on the type of the child node, as indicated in the following table:

NodeType	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, SetChildValue raises an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
If the child node is any other node type, SetChildValue raises an exception.	

Note: Attributes are not considered child nodes of a node. To set the values of this node's attributes, use the SetAttribute (see page 7384) method instead.

See Also

ChildNodes (see page 7391)

ParentNode (see page 7395)

SetAttribute (see page 7384)

SetNodeValue (see page 7387)

82.1.2.5.64 TXMLNode.SetCollection Method

Sets the value of the Collection (see page 7391) property.

Pascal

```
procedure SetCollection(const Value: TXMLNodeCollection);
```

C++

```
__fastcall SetCollection(const TXMLNodeCollection Value);
```

Description

SetCollection assigns Value as the value of the Collection (see page 7391) property. This protected method is called when this node is added to the collection specified by the Value property.

Value is a TXMLNodeCollection (see page 7396) descendant that represents a repeating set of child nodes, of which this node is a member.

See Also

Collection (see page 7391)

82.1.2.5.65 TXMLNode.SetNodeValue Method

Sets the value of this node.

Pascal

```
procedure SetNodeValue(const Value: OleVariant);
```

C++

```
__fastcall SetNodeValue(const OleVariant Value);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected SetNodeValue method. SetNodeValue sets the value of this node.

Value is the value to assign. It's meaning depends on the type of the node, as indicated in the following table:

NodeType	Value
ntAttribute	The attribute value
ntElement	If the element contains only text, this is that text value. Otherwise, SetNodeValue raises an exception.
ntText	The text
ntCData	The content of the CDATA section.
ntProcessingInstr	The content of the processing instruction except for the target.
ntComment	The value (text) of the comment.
If the node is any other node type, SetNodeValue raises an exception.	

See Also

SetChildValue (see page 7386)

SetText (see page 7388)

82.1.2.5.66 TXMLNode.SetParentNode Method

Sets the value of the ParentNode (see page 7395) property.

Pascal

```
procedure SetParentNode(const Value: TXMLNode); virtual;
```

C++

```
virtual __fastcall SetParentNode(const TXMLNode Value);
```

Description

Applications can't use this protected property. It is used internally when nodes are added to the ChildNodes (see page 7391) or AttributeNodes (see page 7390) property.

See Also

ParentNode (see page 7395)

ChildNodes (see page 7391)

AttributeNodes (see page 7390)

82.1.2.5.67 TXMLNode.SetReadOnly Method

Specifies whether the node can be modified.

Pascal

```
procedure SetReadOnly(const Value: Boolean);
```

C++

```
__fastcall SetReadOnly(const Boolean Value);
```

Description

SetReadOnly assigns the read-only status of the node.

Value is the new read-only status of the node. When Value is true, the node raises an EXMLDocError (see page 7585) exception when an attempt is made to change its value, child nodes, or attributes. When Value is false, the node can be modified.

See Also

GetReadOnly (see page 7377)

ReadOnly (see page 7642)

EXMLDocError (see page 7585)

82.1.2.5.68 TXMLNode.SetText Method

Sets the text value of the node.

Pascal

```
procedure SetText(const Value: DOMString);
```

C++

```
__fastcall SetText(const DOMString Value);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected SetText method. SetText replaces the text of the node.

SetText is intended for use when the GetIsTextElement (see page 7371) method returns true. If GetIsTextElement (see page 7371) returns false, SetText adds a new text value to a node that has no children, otherwise, it raises an exception.

See Also

GetIsTextElement (see page 7371)

SetNodeValue (see page 7387)

GetText (see page 7378)

82.1.2.5.69 TransformNode Method

This is the overview for the TransformNode method overload.

Overload List

	Name	Description
	TXMLNode.TransformNode (IXMLNode, IXMLDocument) (see page 7389)	Transforms the subtree rooted at this node, using a specified XSL interface.
	TXMLNode.TransformNode (IXMLNode, WideString) (see page 7389)	Transforms the subtree rooted at this node, using a specified XSL interface.

82.1.2.5.69.1 TXMLNode.TransformNode Method (IXMLNode, IXMLDocument)

Transforms the subtree rooted at this node, using a specified XSL interface.

Pascal

```
procedure TransformNode(const stylesheet: IXMLNode; var output: WideString); overload;
procedure TransformNode(const stylesheet: IXMLNode; const output: IXMLDocument); overload;
```

C++

```
__fastcall TransformNode(const IXMLNode stylesheet, BSTR output);
__fastcall TransformNode(const IXMLNode stylesheet, const IXMLDocument output);
```

Description

Use the TXMLNode (see page 7348) object's IXMLNode (see page 7615) interface to call the protected TransformNode method.

stylesheet is a node in an XML document that represents an XSL transformation. Typically, it is the document element of that document.

output represents the result of the transformation. If output is a WideString (see page 3476), TransformNode returns a string of XML. If output is the interface to an XML document, TransformNode replaces the content of that document with the results of the transformation.

Note: TransformNode is only available when the DOMVendor used to parse this node's XML document is MSXML.

See Also

GetXML (see page 7378)

82.1.2.6 TXMLNode Properties

The properties of the TXMLNode class are listed here.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

82.1.2.6.1 TXMLNode.AttributeNodes Property

Lists the interfaces for nodes that represent attributes of this node.

Pascal

```
property AttributeNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList AttributeNodes;
```

Description

TXMLNode (see page 7348) uses AttributeNodes to keep track of its attributes. AttributeNodes is an IXMLNodeList (see page 7649) interface, which can be used to access individual attribute nodes or to add attributes to or delete them from this node.

Applications can't use this protected property to access the attributes of a node. Instead, they use the AttributeNodes property of the IXMLNode (see page 7615) interface for this node.

Attributes modify a node in an XML document. For example, given the node

```
<Movie genre=scifi title="Star Wars"> ... </Movie>
```

both genre and title are attributes of the node, with values of "scifi" and "Star Wars", respectively.

Only element nodes have attributes, and not every element node has them. If the node does not have any attributes, AttributeNodes is the interface for an empty list.

Note: Attributes are not considered child nodes of a node and can't be accessed using the ChildNodes (see page 7391) property.

See Also

IXMLNode (see page 7615)

ChildNodes (see page 7391)

AttributeNodes (see page 7634)

82.1.2.6.2 TXMLNode.ChildNodeClasses Property

Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.

Pascal

```
property ChildNodeClasses: TNodeClassArray;
```

C++

```
__property TNodeClassArray ChildNodeClasses;
```

Description

ChildNodeClasses is used internally when creating child nodes for this node. The XML Data Binding wizard defines TXMLNode (see page 7348) descendants for each node in the XML document that represents a node that has (or can have) children. ChildNodeClasses lists only those TXMLNode (see page 7348) descendants that can represent child nodes of this node. These classes become the types of the corresponding properties on the TXMLNode (see page 7348) descendant that represents this node.

Classes are added to ChildNodeClasses by the RegisterChildNode (see page 7382) method.

See Also

RegisterChildNode (see page 7382)

RegisterChildNodes (see page 7383)

ChildNodes (see page 7391)

CreateChildNode (see page 7362)

82.1.2.6.3 TXMLNode.ChildNodes Property

Lists the child nodes of this node.

Pascal

```
property ChildNodes: IXMLNodeList;
```

C++

```
__property IXMLNodeList ChildNodes;
```

Description

TXMLNode (see page 7348) uses ChildNodes to keep track of the subnodes of a node. ChildNodes is an IXMLNodeList (see page 7649) interface, which can be used to access individual child nodes or to add child nodes to or delete them from this node. Each child node specifies this node as its parent node.

Applications can't use this protected property to access the child nodes of a node. Instead, they use the ChildNodes property of the IXMLNode (see page 7615) interface for this node.

Note: Attributes are not considered child nodes of a node. To get the values of this node's attributes, use the Attributes property instead.

See Also

IXMLNode (see page 7615)

ChildNodes (see page 7635)

ParentNode (see page 7395)

82.1.2.6.4 TXMLNode.Collection Property

Indicates the collection in which this node appears.

Pascal

```
property Collection: TXMLNodeCollection;
```

C++

```
__property TXMLNodeCollection Collection;
```

Description

Collection indicates the collection that contains this node if it represents one of a repeating set of child nodes. The node specified by Collection represents the same node in the XML document as this node's ParentNode (see page 7395) property, but it is specialized to work with this node and any other child nodes of the same type.

The node identified by Collection is one of the collections listed by the parent node's HostedNodes (see page 7393) property, and it lists ParentNode (see page 7395) as the value of its HostNode (see page 7393) property.

For example, consider the following XML fragment:

```
<students>
  <student name="John Smith">
    <grade>incomplete</grade>
  </student>
  <student name="Jane Doe">
    <grade>B+</grade>
  </student>
  <auditor name="Bill Jones"></auditor>
</students>
```

If this node represents one of the <student> nodes, then ParentNode (see page 7395) represents the <students> node, and Collection represents a copy of the <students> node that is used for only those children that are <student> nodes, and not the <auditor> nodes.

Applications can't use this protected property to access the Collection that contains this node. Instead, they use the Collection property of the IXMLNode (see page 7615) interface for this node.

See Also

ParentNode (see page 7395)

HostedNodes (see page 7393)

HostNode (see page 7393)

Collection (see page 7636)

82.1.2.6.5 TXMLNode.DOMNode Property

Provides access to the IDOMNode (see page 7509) interface for this node.

Pascal

```
property DOMNode: IDOMNode;
```

C++

```
__property IDOMNode DOMNode;
```

Description

IDOMNode (see page 7509) is the interface for this node provided by the DOM implementation that parsed the XML document. It can be accessed through the DOMNode property of the node's IXMLNode (see page 7615) interface.

Typically, applications that contain TXMLNode (see page 7348) descendants use the IXMLNode (see page 7615) interface to work with a node rather than the IDOMNode (see page 7509) interface. IDOMNode (see page 7509) is used more typically in applications that work directly with the DOM interfaces.

The value of DOMNode is set to the IDOMNode (see page 7509) interface that is provided to the TXMLNode (see page 7348) constructor.

DOMNode (see page 7637)

Create (see page 7352)

82.1.2.6.6 TXMLNode.HostedNodes Property

Lists the nodes that share this node's lists of child and attribute nodes.

Pascal

```
property HostedNodes: TXMLNodeArray;
```

C++

```
__property TXMLNodeArray HostedNodes;
```

Description

TXMLNode (see page 7348) uses HostedNodes to keep track of the nodes it uses to represent this same node, restricted to a specialized purpose. For example, any node that represents a subset of this node's child nodes that are all of the same type is a hosted node.

Each object in the HostedNodes list is a representation of a particular aspect of this node. Each hosted node acts as a sibling to this TXMLNode (see page 7348) object but does not represent a separate element in the XML document. Rather, it represents a different view of this element.

For example, consider the following XML fragment:

```
<students>
  <fulltime student>Joe Smith</fulltime student>
  <fulltime student>Jane Doe</fulltime student>
  <auditor>Bill Jones</auditor>
</students>
```

The TXMLNode (see page 7348) that represents students would define two hosted nodes for collections of repeating child elements, one for the fulltime students, and one for the auditors. The two collections share the same underlying DOM node as students, but each represents only those child elements of a particular type.

See Also

CreateCollection (see page 7363)

ChildNodes (see page 7391)

TXMLNodeCollection (see page 7396)

Collection (see page 7391)

HostNode (see page 7393)

82.1.2.6.7 TXMLNode.HostNode Property

Indicates the main object for the node to which this node corresponds when it represents a specialized view.

Pascal

```
property HostNode: TXMLNode;
```

C++

```
__property TXMLNode HostNode;
```

Description

If this node represents a hosted node, HostNode is the main node for which this node represents a subset or specialized view. For example, if this node represents a set of repeating child elements, HostNode is the node that uses this node to represent its repeating child elements.

For example, consider the following XML fragment:

```
<students>
  <student name="John Smith">
    <grade>incomplete</grade>
  </student>
  <student name="Jane Doe">
    <grade>B+</grade>
  </student>
  <auditor name="Bill Jones"></auditor>
  <auditor name="Susan Brown"></auditor>
</students>
```

The <students> node spawns two hosted nodes to represent the collections of repeating child nodes: one for all of the child nodes of type <student>, and one for all of the child nodes of type <auditor>. If this node represents one of those hosted nodes, then HostNode is the <students> node to which this node belongs. The host node lists this node in its HostedNodes (see page 7393) property.

Applications can't use this protected property to access the host node that created this node. Instead, they use the HostNode property of the IXMLNode (see page 7615) interface for this node.

See Also

Collection (see page 7391)

HostedNodes (see page 7393)

TXMLNodeCollection (see page 7396)

82.1.2.6.8 TXMLNode.OwnerDocument Property

Provides access to the document that contains this node.

Pascal

```
property OwnerDocument: TXMLDocument;
```

C++

```
__property TXMLDocument OwnerDocument;
```

Description

Applications can't use this protected property to access the document that contains this. Instead, they use the OwnerDocument property of the IXMLNode (see page 7615) interface for this node.

The value of OwnerDocument is set to the TXMLDocument (see page 7299) that is provided to the TXMLNode (see page 7348) constructor.

See Also

Create (see page 7352)

OwnerDocument (see page 7641)

82.1.2.6.9 TXMLNode.ParentNode Property

Identifies the object that represents this node's parent node.

Pascal

```
property ParentNode: TXMLNode;
```

C++

```
__property TXMLNode ParentNode;
```

Description

TXMLNode (see page 7348) uses ParentNode to access the implementation of the node's parent, if it exists. Some nodes (for example attribute nodes) do not have parents.

Applications can't use this protected property to access the parent node of a node. Instead, they use the ParentNode property of the IXMLNode (see page 7615) interface for this node.

See Also

ChildNodes (see page 7391)

ParentNode (see page 7641)

82.1.2.7 TXMLNode Events

The events of the TXMLNode class are listed here.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

82.1.2.7.1 TXMLNode.OnHostAttrNotify Event

Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).

Pascal

```
property OnHostAttrNotify: TNodeListNotification;
```

C++

```
__property TNodeListNotification OnHostAttrNotify;
```

Description

Use the OnHostAttrNotify event to update a TXMLNode (see page 7348) descendant that represents a hosted node (such as a collection of repeating child elements) when the host node changes its attribute list.

The AttributeListNotify (see page 7358) method of a host node generates an OnHostAttrNotify event on all of its hosted nodes. This allows the hosted nodes (for example, the nodes that represent a subset of the child nodes that are all the same type) to update their own representation of node attributes so that they reflect the attributes of the host node.

See Also

OnHostChildNotify (see page 7396)

AttributeListNotify (see page 7358)

HostNode (see page 7393)

HostedNodes (see page 7393)

AttributeNodes (see page 7390)

82.1.2.7.2 TXMLNode.OnHostChildNotify Event

Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Pascal

```
property OnHostChildNotify: TNodeListNotification;
```

C++

```
__property TNodeListNotification OnHostChildNotify;
```

Description

Use the OnHostChildNotify event to update a TXMLNode (see page 7348) descendant that represents a hosted node (such as a collection of repeating child elements) when the host node changes its list of child nodes. For example, TXMLNodeCollection (see page 7396) assigns its UpdateCollectionList method as an OnHostChildNotify event handler so that its list of repeating child elements reflects any changes to the host node's list of child nodes.

The ChildListNotify (see page 7360) method of a host node generates an OnHostChildNotify event on all of its hosted nodes.

See Also

OnHostAttrNotify (see page 7395)

ChildListNotify (see page 7360)

HostNode (see page 7393)

HostedNodes (see page 7393)

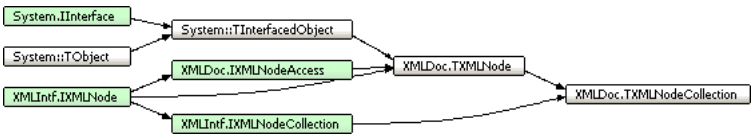
ChildNodes (see page 7391)

UpdateCollectionList (see page 7409)

82.1.3 TXMLNodeCollection Class

TXMLNodeCollection represents a node in an XML document whose children are instances of the same repeating element.

Class Hierarchy



Pascal

```
TXMLNodeCollection = class(TXMLNode, IXMLNodeCollection);
```

C++

```
class TXMLNodeCollection : public TXMLNode, public IXMLNodeCollection;
```

File

XMLDoc

Description

The XML Data Binding Wizard uses TXMLNodeCollection as a base class for the classes it generates to represent nodes that have repeating elements for child nodes. For example, if the XML document includes the following:

```
<students>
  <student name="John Smith">
    <grade>incomplete</grade>
  </student>
  <student name="Jane Doe">
    <grade>B+</grade>
  </student>
  <auditor name="Bill Jones"></auditor>
</students>
```

then the XML Data Binding Wizard generates 3 nodes to represent the <students> node: a TXMLNode (see page 7348) descendant to represent the entire <students> node, and two TXMLNodeCollection descendants to represent the repeating elements: one for the child nodes with the tag <student>, and one for the child nodes with the tag <auditor>.

As with any of the classes the Data Binding Wizard generates to represent nodes in an XML document, child nodes and node attributes appear as properties of the TXMLNodeCollection descendant.

TXMLNodeCollection implements the IXMLNodeCollection (see page 7644) interface. Each TXMLNodeCollection descendant implements a class-specific interface that descends from IXMLNodeCollection (see page 7644). Typically, applications do not work directly with TXMLNodeCollection. Instead, they use the IXMLNodeCollection (see page 7644) interface or the IXMLNodeCollection (see page 7644) descendant that is implemented by a TXMLNodeCollection descendant.

See Also

TXMLDocument (see page 7299)

TXMLNode (see page 7348)

IXMLNodeCollection (see page 7644)

82.1.3.1 TXMLNodeCollection Members

The following tables list the members exposed by TXMLNodeCollection.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7395)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7393).
	OnHostChildNotify (see page 7396)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7393).

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7355)	Increments the reference count for this node.

	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	_Release (see page 7356)	Decrements the reference count for this node.
	AddChild (see page 7356)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7357)	Adds a node to the HostedNodes (see page 7393) property list.
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7358)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7358)	Raises an EXMLDocError (see page 7585) exception if this is a hosted node.
	CheckReadOnly (see page 7359)	Raises an EXMLDocError (see page 7585) exception if this is a read-only node.
	CheckTextNode (see page 7359)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	ClearDocumentRef (see page 7360)	Sets the value of OwnerDocument (see page 7394) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7361)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7361)	Creates the object that implements the AttributeNodes (see page 7390) property.
V	CreateAttributeNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for an attribute of this node.
	CreateChildList (see page 7362)	Creates the object that implements the ChildNodes (see page 7391) property.
V	CreateChildNode (see page 7362)	Creates a new TXMLNode (see page 7348) object for a child node of this node.
	CreateCollection (see page 7363)	Creates an instance of a TXMLNodeCollection (see page 7396) descendant and returns it.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	DeclareNamespace (see page 7364)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7364)	Returns the IDOMElement (see page 7494) interface for this node if it exists.
V	DoNodeChange (see page 7365)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7365)	Returns the IXMLNode (see page 7615) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7366)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7366)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7367)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7367)	Returns the value of the AttributeNodes (see page 7390) property.
	GetAttributeNS (see page 7368)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7368)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7369)	Returns the value of the ChildNodes (see page 7391) property.
	GetChildValue (see page 7369)	Returns the value of a specified child node.
	GetCollection (see page 7370)	Returns the value of the Collection (see page 7391) property.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
	GetDOMNode (see page 7370)	Returns the value of the DOMNode (see page 7392) property.
	GetHasChildNodes (see page 7370)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7371)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7371)	Returns the value of the HostNode (see page 7393) property.
	GetIsTextElement (see page 7371)	Indicates whether the node has a single text value.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetLocalName (see page 7372)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7373)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7373)	Returns the node name.
	GetNodeObject (see page 7374)	Returns a reference to this TXMLNode (see page 7348) object.
	GetNodeType (see page 7374)	Returns the type of the node.
	GetNodeValue (see page 7375)	Returns the value of this node.

	GetOwnerDocument (see page 7375)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7376)	Returns the interface for the node's parent node.
	GetPrefix (see page 7376)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7377)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7377)	Indicates whether the node can be modified.
	GetText (see page 7378)	Returns the text value of the node.
	GetXML (see page 7378)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7378)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7379)	This is the overview for the HasChildNode method overload.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	InternalAddChild (see page 7380)	Provides the underlying implementation for the AddChild (see page 7356) method.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7380)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7381)	Returns the next child of this node's parent.
	Normalize (see page 7381)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7382)	Returns the previous child of this node's parent.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7382)	Registers a descendant of TXMLNode (see page 7348) that can represent the children of this node.
	RegisterChildNodes (see page 7383)	Registers a set of TXMLNode (see page 7348) descendants that can represent the children of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7383)	Removes a node from the HostedNodes (see page 7393) property list.
	Resync (see page 7384)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7384)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7384)	Sets the value of the AttributeNodes (see page 7390) property.
	SetAttributeNS (see page 7385)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	SetChildValue (see page 7386)	Sets the value of a specified child node.
	SetCollection (see page 7386)	Sets the value of the Collection (see page 7391) property.
	SetNodeValue (see page 7387)	Sets the value of this node.
V	SetParentNode (see page 7387)	Sets the value of the ParentNode (see page 7395) property.
	SetReadOnly (see page 7388)	Specifies whether the node can be modified.
	SetText (see page 7388)	Sets the text value of the node.
	TransformNode (see page 7389)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7390)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7390)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7391)	Lists the child nodes of this node.
	Collection (see page 7391)	Indicates the collection in which this node appears.
R	Count (see page 7409)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7392)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HostedNodes (see page 7393)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7393)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.

	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7394)	Provides access to the document that contains this node.
R	ParentNode (see page 7395)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7352)	Instantiates a Create object.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7353)	Creates a TXMLNode (see page 7348) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 7353)	Frees the memory associated with the TXMLNode (see page 7348) object.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.
	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.

	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	ToString (see page 3391)	Returns a string containing the class name.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	Nodes (see page 7649)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
R	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

82.1.3.2 TXMLNodeCollection Methods

The methods of the TXMLNodeCollection class are listed here.

Protected Methods

	Name	Description
V	AddItem (see page 7403)	Adds a new repetition of the repeating child element to this node.
V	ChildListNotify (see page 7404)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7404)	Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.
	CreateItemList (see page 7405)	Creates the object that implements the List (see page 7411) property.
	Delete (see page 7405)	Removes one of the repeating child nodes from this node.
	GetCount (see page 7406)	Returns the value of the Count (see page 7409) property.
V	GetList (see page 7406)	Returns the value of the List (see page 7411) property.
	GetNode (see page 7406)	Returns the interface for one of the repeating child nodes.
	InsertInCollection (see page 7407)	Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.
	IsCollectionItem (see page 7407)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	Remove (see page 7408)	Removes one of the repeating child nodes from this node.
V	SetChildNodes (see page 7408)	Sets the value of the ChildNodes (see page 7391) property.
	UpdateCollectionList (see page 7409)	Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Public Methods

	Name	Description
V	AfterConstruction (see page 7403)	Initializes the node collection object once it is fully created.

82.1.3.2.1 TXMLNodeCollection.AddItem Method

Adds a new repetition of the repeating child element to this node.

Pascal

```
function AddItem(Index: Integer): IXMLNode; virtual;
```

C++

```
virtual __fastcall IXMLNode AddItem(int Index);
```

Description

Applications can't call the protected AddItem method. It is used internally to create a new child node for this node that is an instance of the repeating element. The new child node is given the first tag name listed by the ItemTag (see page 7411) property.

Index indicates the position of the new child node in this node's list of children, where 0 is the first position, 1 is the second position, and so on. If Index is –1, the new node is added to the end.

Note: Index refers to the list of repeating elements (the List (see page 7411) property), not the list of all children (the ChildNodes (see page 7391) property).

AddItem returns the interface for the newly created child node.

See Also

AddChild (see page 7356)

InsertInCollection (see page 7407)

itemtag (see page 7411)

List (see page 7411)

ChildNodes (see page 7391)

82.1.3.2.2 TXMLNodeCollection.AfterConstruction Method

Initializes the node collection object once it is fully created.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

AfterConstruction sets the UpdateCollectionList (see page 7409) method as the event handler for the collection's OnHostChildNotify (see page 7396) event. This allows the collection to update itself when the list of child nodes (for which this collection manages a subset) changes.

See Also

OnHostChildNotify (see page 7396)

UpdateCollectionList (see page 7409)

82.1.3.2.3 TXMLNodeCollection.ChildListNotify Method

Responds to notifications of changes in the list of child nodes.

Pascal

```
procedure ChildListNotify(Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean); override;
```

C++

```
virtual __fastcall ChildListNotify(TNodeListOperation Operation, IXMLNode Node, const
OleVariant IndexOrName, Boolean BeforeOperation);
```

Description

Applications can't call this protected method. The class that implements the ChildNodes (see page 7391) property calls ChildListNotify when child nodes are inserted, removed, or need to be created. ChildListNotify calls the inherited method to generate a BeforeNodeChange or AfterNodeChange event and to ensure that the DOM implementation for this node reflects the change. After calling the inherited method, ChildListNotify updates the List (see page 7411) property so that it stays in sync with the ChildNodes (see page 7391) property.

Operation indicates what type of change is about to occur.

Node is the interface for the child node that is added or removed. If Operation is nlCreateNode, Node returns a newly created child node.

IndexOrName is the index of the node that is added or removed when Operation is nlInsert or nlRemove. When Operation is nlCreateNode, IndexOrName is the name or value of the new node to create.

BeforeOperation indicates whether the call occurs before or after the change.

See Also

ChildNodes (see page 7391)

AddChild (see page 7356)

List (see page 7411)

BeforeNodeChange (see page 7346)

AfterNodeChange (see page 7345)

82.1.3.2.4 TXMLNodeCollection.Clear Method

Removes all child nodes in the List (see page 7411) property from the ChildNodes (see page 7391) and List (see page 7411) properties.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Use the IXMLNodeCollection (see page 7644) interface for this node to call the protected Clear method. Clear deletes every child node from the collection (all the nodes in the List (see page 7411) property), along with the corresponding nodes in the ChildNodes (see page 7391) property.

See Also

List (see page 7411)

Delete (see page 7405)

Remove (see page 7408)

ChildNodes (see page 7391)

Clear (see page 7646)

82.1.3.2.5 TXMLNodeCollection.CreateItemList Method

Creates the object that implements the List (see page 7411) property.

Pascal

```
procedure CreateItemList(CheckFirst: Boolean = False);
```

C++

```
__fastcall CreateItemList(Boolean CheckFirst = False);
```

Description

Applications can't call the protected CreateItemList method. It is used internally when TXMLNodeCollection (see page 7396) needs to create a separate object to implement the List (see page 7411) property. A separate implementation object is only needed if this node contains child nodes that are not in the collection. Otherwise, TXMLNodeCollection (see page 7396) can simply use the ChildNodes (see page 7391) property.

CheckFirst specifies whether CreateItemList should check whether the ChildNodes (see page 7391) property currently includes any nodes that are not in the collection. When CheckFirst is true, CreateItemList first checks the ChildNodes (see page 7391) property, and if all nodes are in the collection, it does not create a separate list to store the nodes of the collection. When CheckFirst is false (or when the ChildNodes (see page 7391) property includes nodes that are not in the collection), CreateItemList instantiates a list to hold the nodes in the collection, and adds to it any nodes listed in ChildNodes (see page 7391) that belong in the collection.

See Also

List (see page 7411)

ChildNodes (see page 7391)

82.1.3.2.6 TXMLNodeCollection.Delete Method

Removes one of the repeating child nodes from this node.

Pascal

```
procedure Delete(Index: Integer);
```

C++

```
__fastcall Delete(int Index);
```

Description

Use the TXMLNodeCollection (see page 7396) object's IXMLNodeCollection (see page 7644) interface to call the protected Delete method. Delete removes a specified child node from this node.

Index identifies the child to remove. It is the index of the child in the list of repeating child nodes (The List (see page 7411) property, not the ChildNodes (see page 7391) property). The index 0 represents the first repetition, 1 represents the second

repetition, and so on.

See Also

Remove (see page 7408)

Delete (see page 7646)

List (see page 7411)

ChildNodes (see page 7391)

82.1.3.2.7 TXMLNodeCollection.GetCount Method

Returns the value of the Count (see page 7409) property.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count (see page 7409) property. It returns the number of nodes in the List (see page 7411) property.

See Also

Count (see page 7409)

List (see page 7411)

82.1.3.2.8 TXMLNodeCollection.GetList Method

Returns the value of the List (see page 7411) property.

Pascal

```
function GetList: IXMLNodeList; virtual;
```

C++

```
virtual __fastcall IXMLNodeList GetList();
```

Description

GetList is the protected read implementation of the List (see page 7411) property.

See Also

List (see page 7411)

82.1.3.2.9 TXMLNodeCollection.GetNode Method

Returns the interface for one of the repeating child nodes.

Pascal

```
function GetNode(Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetNode(int Index);
```

Description

Use the TXMLNodeCollection (see page 7396) object's IXMLNodeCollection (see page 7644) interface to call the protected GetNode method. GetNode returns an interface for working with one of the repeating child nodes.

Index identifies which repetition of the child node is desired, where 0 is the first repetition, 1 is the second repetition, and so on. Note that Index is the index of the node in the List (see page 7411) property, not in the index in the ChildNodes (see page 7391) property.

See Also

Nodes (see page 7649)

GetCount (see page 7406)

GetNode (see page 7647)

ChildNodes (see page 7391)

82.1.3.2.10 TXMLNodeCollection.InsertInCollection Method

Copies a child node from the ChildNodes (see page 7391) property to the List (see page 7411) property.

Pascal

```
procedure InsertInCollection(Node: IXMLNode; Index: Integer);
```

C++

```
__fastcall InsertInCollection(IXMLNode Node, int Index);
```

Description

Applications can't call this protected method. It is called automatically when nodes are added to the ChildNodes (see page 7391) property list.

Node is the node that was just added to the ChildNodes (see page 7391) property.

Index is the index of Node in the ChildNodes (see page 7391) property.

InsertInCollection first checks whether Node belongs in the collection. If so, it adds it to the List (see page 7411) property in the position that corresponds to Index (that is, in the index of Node when you ignore all the nodes in ChildNodes (see page 7391) that do not belong in the collection.)

See Also

ChildNodes (see page 7391)

List (see page 7411)

82.1.3.2.11 TXMLNodeCollection.IsCollectionItem Method

Indicates whether a specified node represents the type of node that appears as a repeating child of this node.

Pascal

```
function IsCollectionItem(const Node: IXMLNode): Boolean;
```

C++

```
__fastcall Boolean IsCollectionItem(const IXMLNode Node);
```

Description

Applications can't call the protected IsCollectionItem method. TXMLNodeCollection (see page 7396) uses this method

internally to distinguish nodes that represent instances of the repeating child node type.

IsCollectionItem checks whether Node implements the interface specified by the ItemInterface (see page 7410) property . If so, it returns true. Otherwise, it returns false.

See Also

List (see page 7411)

ItemInterface (see page 7410)

82.1.3.2.12 TXMLNodeCollection.Remove Method

Removes one of the repeating child nodes from this node.

Pascal

```
function Remove(const AItem: IXMLNode): Integer;
```

C++

```
__fastcall int Remove(const IXMLNode AItem);
```

Description

Use the TXMLNodeCollection (see page 7396) object's IXMLNodeCollection (see page 7644) interface to call the protected Remove method. Remove removes a specified child node from this node.

AItem is the interface of the child to remove. It must represent on of the repeating child nodes.

Remove deletes the child node from both the List (see page 7411) property and from the ChildNodes (see page 7391) property. It returns the index that the child node held in the List (see page 7411) property.

To remove a child that is not one of the repeating child nodes, use the ChildNodes (see page 7391) property instead.

See Also

Delete (see page 7405)

List (see page 7411)

ChildNodes (see page 7391)

82.1.3.2.13 TXMLNodeCollection.SetChildNodes Method

Sets the value of the ChildNodes (see page 7391) property.

Pascal

```
procedure SetChildNodes(const Value: IXMLNodeList); override;
```

C++

```
virtual __fastcall SetChildNodes(const IXMLNodeList Value);
```

Description

Applications can't call this protected method. It is called internally the first time an application reads the ChildNodes (see page 7391) property to supply the interface that implements that property.

TXMLNodeCollection (see page 7396) overrides the inherited method to update the List (see page 7411) property as well.

See Also

ChildNodes (see page 7391)

List (see page 7411)

82.1.3.2.14 TXMLNodeCollection.UpdateCollectionList Method

Updates the List (see page 7411) property to reflect changes to the set of child nodes.

Pascal

```
procedure UpdateCollectionList(Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean);
```

C++

```
__fastcall UpdateCollectionList(TNodeListOperation Operation, IXMLNode Node, const OleVariant
IndexOrName, Boolean BeforeOperation);
```

Description

Applications can't call this protected method. This method is called automatically when the ChildNodes (see page 7391) property changes so that the collection can update the List (see page 7411) property to reflect the repeating elements in the current set of child nodes.

Operation indicates whether the change to ChildNodes (see page 7391) is the addition of a new node (nlInsert) or the deletion of a child node (nlRemove).

Node is the interface for a child node that is added or removed.

IndexOrName is the index or tag name of the node that is added or removed.

BeforeOperation indicates whether this method is called before ChildNodes (see page 7391) has changed or after the change has occurred.

See Also

List (see page 7411)

ChildListNotify (see page 7404)

ChildNodes (see page 7391)

OnHostChildNotify (see page 7396)

82.1.3.3 TXMLNodeCollection Properties

The properties of the TXMLNodeCollection class are listed here.

Protected Properties

	Name	Description
R	Count (see page 7409)	Indicates the number of repeating child nodes.
	ItemInterface (see page 7410)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7410)	This is ItemNS, a member of class TXMLNodeCollection.
	ItemTag (see page 7411)	This is ItemTag, a member of class TXMLNodeCollection.
R	List (see page 7411)	Lists the interfaces for the children that are repeated elements.

82.1.3.3.1 TXMLNodeCollection.Count Property

Indicates the number of repeating child nodes.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use the IXMLNodeCollection (see page 7644) interface to read this protected property. Count is the number of child nodes for this node that are repetitions of the repeating child node type. That is, Count is the number of nodes in the List (see page 7411) property.

Use Count to obtain an upper limit when addressing child nodes by index (for example, when iterating over all nodes in using the GetNode (see page 7406) method).

Count is changed when you add child nodes using the AddChild (see page 7356) method or delete them using the Delete (see page 7405) or Remove (see page 7408) method. You can access the individual repeating child nodes using the GetNode (see page 7406) method.

See Also

GetNode (see page 7406)

AddChild (see page 7618)

Remove (see page 7408)

Delete (see page 7405)

List (see page 7411)

82.1.3.3.2 TXMLNodeCollection.ItemInterface Property

Indicates the interface type for the repeating child nodes.

Pascal

```
property ItemInterface: TGuid;
```

C++

```
__property TGuid ItemInterface;
```

Description

Applications can't use this protected property. It is used internally to identify the interface for all child nodes that represent the repeating child element.

ItemInterface is the GUID for the default interface of the class that implements the nodes in the collection.

See Also

IXMLNode (see page 7615)

IsCollectionItem (see page 7407)

List (see page 7411)

itemtag (see page 7411)

itemns (see page 7410)

82.1.3.3.3 TXMLNodeCollection.ItemNS Property

Pascal

```
property ItemNS: DOMString;
```

C++

```
__property DOMString ItemNS;
```

Description

This is ItemNS, a member of class TXMLNodeCollection.

82.1.3.3.4 TXMLNodeCollection.ItemTag Property

Pascal

```
property ItemTag: DOMString;
```

C++

```
__property DOMString ItemTag;
```

Description

This is ItemTag, a member of class TXMLNodeCollection.

82.1.3.3.5 TXMLNodeCollection.List Property

Lists the interfaces for the children that are repeated elements.

Pascal

```
property List: IXMLNodeList;
```

C++

```
__property IXMLNodeList List;
```

Description

Applications can't use the protected List property. TXMLNodeCollection (see page 7396) uses this property internally to identify those child nodes that are repeated elements. Because TXMLNodeCollection (see page 7396) can correspond to a node in the XML document that has additional children that are not instances of the repeating node type, List is kept separate from the ChildNodes (see page 7391) property, which lists all child nodes.

Applications that need to access the child nodes in this list should use the Nodes property of the IXMLNodeCollection (see page 7644) interface for this node or the Items property of an IXMLNodeCollection (see page 7644) descendant that is generated by the XML Data Binding wizard.

See Also

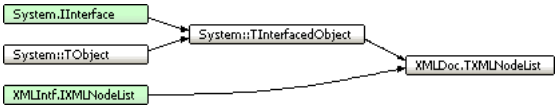
Nodes (see page 7649)

ChildNodes (see page 7391)

82.1.4 TXMLNodeList Class

TXMLNodeList represents a set of nodes in an XML document.

Class Hierarchy



Pascal

```
TXMLNodeList = class(TInterfacedObject, IXMLNodeList);
```

C++

```
class TXMLNodeList : public TInterfacedObject, public IXMLNodeList;
```

File

XMLDoc

Description

TXMLNodeList is used to represent a set of related nodes (IXMLNode (see page 7615) interfaces) in an XML document. For example, TXMLNodeList is used to represent all of the children of a node, or all of the attributes of a node, or all of the nodes in a collection of repeating nodes.

TXMLNodeList can be used to add or delete nodes from the collection, or to access specific nodes.

Typically, applications do not use TXMLNodeList directly. Instead, they access it through the IXMLNodeList (see page 7649) interface.

See Also

ChildNodes

AttributeNodes

TXMLNodeCollection (see page 7396)

IXMLNodeList (see page 7649)

IXMLNode (see page 7615)

TObjectList

TInterfaceList

82.1.4.1 TXMLNodeList Members

The following tables list the members exposed by TXMLNodeList.

Protected Data Members

	Name	Description
	FRefCount (see page 3356)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
R	NotificationProc (see page 7428)	Specifies a callback that TXMLNodeList (see page 7411) calls when nodes are added to or removed from the list, or when new nodes need to be created

Protected Methods

	Name	Description
	_AddRef (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_AddRef method.
	_Release (see page 3357)	Implements the IInterface (see page 3503) System::TInterfacedObject::_Release method.
	Add (see page 7416)	Adds a new node to the end of the list.
	BeginUpdate (see page 7416)	Increments the value of UpdateCount (see page 7427).
	Clear (see page 7417)	Removes all nodes from the list.
	Delete (see page 7417)	This is the overview for the Delete method overload.

	DoNotify (see page 7418)	Executes the callback specified by NotificationProc (see page 7428).
	EndUpdate (see page 7419)	Decrements the value of UpdateCount (see page 7427).
	FindNode (see page 7419)	This is the overview for the FindNode method overload.
	FindSibling (see page 7420)	Returns a node that appears a specified amount before or after another node.
	First (see page 7420)	Returns the first node in the list.
	Get (see page 7421)	Returns a specified node in the list.
	GetCount (see page 7421)	Returns the number of nodes in the list.
	GetNode (see page 7422)	Returns a specified node from the list.
	GetUpdateCount (see page 7422)	Returns the value of the UpdateCount (see page 7427) property.
	IndexOf (see page 7422)	This is the overview for the IndexOf method overload.
	Insert (see page 7423)	Inserts a new node into a specified position in the list.
	InternalInsert (see page 7424)	Provides the underlying implementation of the Insert (see page 7423) method
	Last (see page 7424)	Returns the last node in the list.
	QueryInterface (see page 3359)	Implements the IInterface (see page 3503) System::TInterfacedObject::QueryInterface method.
	Remove (see page 7424)	Removes a specified node from the list.
	ReplaceNode (see page 7425)	Replaces a node in the list with another node.

Protected Properties

	Name	Description
R	Count (see page 7426)	Indicates the number of nodes in the collection.
R	DefaultNamespaceURI (see page 7426)	Identifies the default Namespace for the nodes in this collection.
R	List (see page 7426)	Stores the interfaces for every node in the list.
R	Owner (see page 7427)	Specifies the node that uses this TXMLNodeList (see page 7411) object to manage a set of its child or attribute nodes.
R	UpdateCount (see page 7427)	Indicates the number of times an application has called BeginUpdate (see page 7416) without a matching call to EndUpdate (see page 7419).

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3358)	Responds after the last constructor executes.
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 7414)	Instantiates a TXMLNodeList (see page 7411) object.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Delete (see page 7652)	This is the overview for the Delete method overload.
V	Destroy (see page 7415)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	FindNode (see page 7654)	This is the overview for the FindNode method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.

	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	IndexOf (see page 7657)	This is the overview for the IndexOf method overload.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3358)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3391)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Nodes (see page 7660)	Provides access to the nodes in the list.
	RefCount (see page 3360)	Indicates the number of interface pointers currently dependent upon the object.

82.1.4.2 TXMLNodeList.Create Constructor

Instantiates a TXMLNodeList (see page 7411) object.

Pascal

```
constructor Create(Owner: TXMLNode; const DefaultNamespaceURI: DOMString; NotificationProc:
TNodeListNotification);
```

C++

```
__fastcall TXMLNodeList(TXMLNode Owner, const DOMString DefaultNamespaceURI,
TNodeListNotification NotificationProc);
```

Description

Createinstantiates a new TXMLNodeList (see page 7411) object. Typically, TXMLNodeList (see page 7411) is created by another object that represents a node. The TXMLNodeList (see page 7411) represents a set of nodes that are of interest to the other object that creates it.

AOwner is the node that creates TXMLNodeList (see page 7411) to represent a set of its child nodes or attributes.

DefaultNamespaceURI (see page 7426) identifies the namespace that is used by default for nodes added to this list when no namespace is explicitly specified.

NotificationProc (see page 7428) is a callback that TXMLNodeList (see page 7411) calls when nodes are added to or removed from the list, or when new nodes need to be created.

See Also

DefaultNamespaceURI (see page 7426)

Owner (see page 7427)

NotificationProc (see page 7428)

82.1.4.3 TXMLNodeList.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TXMLNodeList();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3382)

82.1.4.4 TXMLNodeList Methods

The methods of the TXMLNodeList class are listed here.

Protected Methods

	Name	Description
	Add (see page 7416)	Adds a new node to the end of the list.
	BeginUpdate (see page 7416)	Increments the value of UpdateCount (see page 7427).
	Clear (see page 7417)	Removes all nodes from the list.
	Delete (see page 7417)	This is the overview for the Delete method overload.
	DoNotify (see page 7418)	Executes the callback specified by NotificationProc (see page 7428).
	EndUpdate (see page 7419)	Decrements the value of UpdateCount (see page 7427).
	FindNode (see page 7419)	This is the overview for the FindNode method overload.
	FindSibling (see page 7420)	Returns a node that appears a specified amount before or after another node.
	First (see page 7420)	Returns the first node in the list.
	Get (see page 7421)	Returns a specified node in the list.
	GetCount (see page 7421)	Returns the number of nodes in the list.
	GetNode (see page 7422)	Returns a specified node from the list.
	GetUpdateCount (see page 7422)	Returns the value of the UpdateCount (see page 7427) property.
	IndexOf (see page 7422)	This is the overview for the IndexOf method overload.
	Insert (see page 7423)	Inserts a new node into a specified position in the list.

	InternalInsert (see page 7424)	Provides the underlying implementation of the Insert (see page 7423) method
	Last (see page 7424)	Returns the last node in the list.
	Remove (see page 7424)	Removes a specified node from the list.
	ReplaceNode (see page 7425)	Replaces a node in the list with another node.

82.1.4.4.1 TXMLNodeList.Add Method

Adds a new node to the end of the list.

Pascal

```
function Add(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Add(const IXMLNode Node);
```

Description

Call Add to add a node to the end of the list. Add returns the index of the node once it is added, where 0 is the index of the first node in the list, 1 is the index of the second node, and so on.

Node is the node to add to the list.

See Also

Delete (see page 7417)

Remove (see page 7424)

IndexOf (see page 7423)

Insert (see page 7423)

List (see page 7426)

82.1.4.4.2 TXMLNodeList.BeginUpdate Method

Increments the value of UpdateCount (see page 7427).

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

Call BeginUpdate before making several changes to the nodes in the list (such as adding or removing several nodes). BeginUpdate increments the UpdateCount (see page 7427) property, to keep track of the fact that the list is in the middle of an update. When the update is complete, call EndUpdate (see page 7419) to decrement the UpdateCount (see page 7427) property.

Every call to BeginUpdate should be matched by a call to EndUpdate (see page 7419), so that the UpdateCount (see page 7427) property accurately reflects whether an update operation is underway.

See Also

UpdateCount (see page 7427)

EndUpdate (see page 7419)

82.1.4.4.3 TXMLNodeList.Clear Method

Removes all nodes from the list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the list.

Note: Clear does not call the BeginUpdate (see page 7416) and EndUpdate (see page 7419) methods. NotificationProc (see page 7428) is called for every node in the list as it is removed.

See Also

Delete (see page 7417)

Remove (see page 7424)

List (see page 7426)

NotificationProc

82.1.4.4.4 Delete Method

This is the overview for the Delete method overload.

Overload List

	Name	Description
	TXMLNodeList.Delete (DOMString) (see page 7417)	Removes a specified node from the list.
	TXMLNodeList.Delete (DOMString, DOMString) (see page 7417)	Removes a specified node from the list.
	TXMLNodeList.Delete (Integer) (see page 7417)	Removes a specified node from the list.

82.1.4.4.4.1 TXMLNodeList.Delete Method (DOMString)

Removes a specified node from the list.

Pascal

```
function Delete(const Index: Integer): Integer; overload;
function Delete(const Name: DOMString): Integer; overload;
function Delete(const Name: DOMString; const NamespaceURI: DOMString): Integer; overload;
```

C++

```
__fastcall int Delete(const int Index);
__fastcall int Delete(const DOMString Name);
__fastcall int Delete(const DOMString Name, const DOMString NamespaceURI);
```

Description

Delete removes the node specified by the Index or Name parameter.

Name identifies the node to remove from the list. This is the local name of the node to remove.

NamespaceURI identifies the namespace to use when interpreting Name. If the node is identified by Name, but no NamespaceURI parameter is provided, Delete uses DefaultNamespaceURI (see page 7426).

Index identifies the node to remove by index rather than name. Index ranges from 0 to one less than the value of the Count (see page 7426) property.

Delete returns the index of the node that was removed. If there was no node that matched the value of Index or Name, Delete returns –1.

See Also

Remove (see page 7424)

Clear (see page 7417)

IndexOf (see page 7423)

LocalName (see page 7638)

DefaultNamespaceURI (see page 7426)

NamespaceURI (see page 7639)

82.1.4.4.5 TXMLNodeList.DoNotify Method

Executes the callback specified by NotificationProc (see page 7428).

Pascal

```
function DoNotify(Operation: TNodeListOperation; const Node: IXMLNode; const IndexOrName:
OleVariant; BeforeOperation: Boolean): IXMLNode;
```

C++

```
__fastcall IXMLNode DoNotify(TNodeListOperation Operation, const IXMLNode Node, const
OleVariant IndexOrName, Boolean BeforeOperation);
```

Description

DoNotify executes the callback that is assigned to NotificationProc (see page 7428) when the list adds, deletes, or needs to create nodes in the list. The parameters are supplied as parameters to the callback, and DoNotify returns the node that was added, deleted, or created.

Operation indicates what change is about to occur or has just occurred.

Node is the node that is being added or removed from the list, or that acts as a parent if the callback must create a node (when Operation is nlCreateNode).

IndexOrName is the name of the node to be created when Operation is nlCreateNode. Otherwise, it is the name or index of the node being deleted or added.

BeforeOperation indicates whether the call occurs before the indicated operation or after. When nodes are inserted and removed, a call is made first with BeforeOperation set to true, then the operation occurs, and then a second callback is made with BeforeOperation set to false. When nodes must be created, only one call is made, with BeforeOperation set to true.

See Also

NotificationProc (see page 7428)

82.1.4.4.6 TXMLNodeList.EndUpdate Method

Decrements the value of UpdateCount (see page 7427).

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

Call EndUpdate after making several changes to the nodes in the list (such as adding or removing several nodes). EndUpdate decrements the UpdateCount (see page 7427) property, which was incremented by a previous call to BeginUpdate (see page 7416).

Every call to BeginUpdate (see page 7416) should be matched by a call to EndUpdate, so that the UpdateCount (see page 7427) property accurately reflects whether an update operation is underway.

See Also

UpdateCount (see page 7427)

BeginUpdate (see page 7416)

82.1.4.4.7 FindNode Method

This is the overview for the FindNode method overload.

Overload List

	Name	Description
	TXMLNodeList.FindNode (DOMString) (see page 7419)	Returns a specified node from the list.
	TXMLNodeList.FindNode (DOMString, DOMString) (see page 7419)	Returns a specified node from the list.
	TXMLNodeList.FindNode (TGuid) (see page 7419)	Returns a specified node from the list.

82.1.4.4.7.1 TXMLNodeList.FindNode Method (DOMString)

Returns a specified node from the list.

Pascal

```
function FindNode(NodeName: DOMString): IXMLNode; overload;
function FindNode(NodeName: DOMString; NamespaceURI: DOMString): IXMLNode; overload;
function FindNode(ChildNodeType: TGuid): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode FindNode(DOMString NodeName);
__fastcall IXMLNode FindNode(DOMString NodeName, DOMString NamespaceURI);
__fastcall IXMLNode FindNode(TGuid ChildNodeType);
```

Description

Call FindNode to access a particular node in the list.

NodeName is the node to access. It specifies the LocalName property of the desired node.

NamespaceURI identifies the namespace that qualifies NodeName. It is the same as the NamespaceURI property of the desired node. If the first syntax is used (omitting NamespaceURI), FindNode uses the value of the DefaultNamespaceURI (see page 7426) property.

ChildNodeType identifies the node to access by its interface type (GUID), rather than by name. When using ChildNodeType, FindNode returns the first child node it finds that implements the specified interface.

FindNode returns the interface for the node if it is in the list. If NodeName or ChildNodeType does not specify a node in the list, FindNode returns nil (Delphi) or NULL (C++).

See Also

FindSibling (see page 7420)

First (see page 7420)

Last (see page 7424)

IndexOf (see page 7423)

LocalName (see page 7638)

NamespaceURI (see page 7639)

DefaultNamespaceURI (see page 7426)

82.1.4.4.8 TXMLNodeList.FindSibling Method

Returns a node that appears a specified amount before or after another node.

Pascal

```
function FindSibling(const Node: IXMLNode; Delta: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode FindSibling(const IXMLNode Node, int Delta);
```

Description

Call FindSibling to access the node whose position has a specified relationship to another node.

Node is a node in the list to use as a reference point.

Delta indicates where the desired node appears, relative to Node. If Delta is positive, FindSibling returns the node that appears Delta positions after Node. If Delta is negative, FindSibling returns a node that appears before Node.

FindSibling returns the node that appears at the position offset by Delta, relative to the position of Node. If Delta specifies a position before the first node or after the last node in the list, FindSibling returns nil (Delphi) or NULL (C++).

See Also

FindNode (see page 7419)

First (see page 7420)

Last (see page 7424)

IndexOf (see page 7423)

82.1.4.4.9 TXMLNodeList.First Method

Returns the first node in the list.

Pascal

```
function First: IXMLNode;
```

C++

```
__fastcall IXMLNode First();
```

Description

Call First to access the first node in the list. If the list is empty, First raises an exception.

See Also

FindNode (see page 7419)

FindSibling (see page 7420)

Last (see page 7424)

82.1.4.4.10 TXMLNodeList.Get Method

Returns a specified node in the list.

Pascal

```
function Get(Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode Get(int Index);
```

Description

Call Get to retrieve a node from the list, given its index.

Index specifies the node to fetch, where 0 identifies the first node, 1 identifies the second node, and so on. Index should be less than the value of the Count (see page 7426) property.

See Also

List (see page 7426)

GetNode (see page 7422)

Count (see page 7426)

82.1.4.4.11 TXMLNodeList.GetCount Method

Returns the number of nodes in the list.

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

GetCount is the read implementation of the Count (see page 7426) property.

See Also

Count (see page 7426)

82.1.4.4.12 TXMLNodeList.GetNode Method

Returns a specified node from the list.

Pascal

```
function GetNode(const IndexOrName: OleVariant): IXMLNode;
```

C++

```
__fastcall IXMLNode GetNode(const OleVariant IndexOrName);
```

Description

GetNode returns the interface to a node that is identified by name or by position.

IndexOrName identifies the desired node. It can be

The index of the node, where 0 is the index of the first node, 1 is the index of the second node, and so on.

The LocalName property of a node in the list.

If IndexOrName does not identify a node in the list, GetNode tries to create a new node with the name specified by IndexOrName. If it can't create the new node, GetNode raises an exception.

See Also

FindNode (see page 7419)

List (see page 7426)

LocalName (see page 7638)

Get (see page 7421)

82.1.4.4.13 TXMLNodeList.GetUpdateCount Method

Returns the value of the UpdateCount (see page 7427) property.

Pascal

```
function GetUpdateCount: Integer;
```

C++

```
__fastcall int GetUpdateCount();
```

Description

GetUpdateCount is the read implementation of the UpdateCount (see page 7427) property.

See Also

UpdateCount (see page 7427)

82.1.4.4.14 IndexOf Method

This is the overview for the IndexOf method overload.

Overload List

	Name	Description
	TXMLNodeList.IndexOf (DOMString) (see page 7423)	Returns the index of a specified node.

	TXMLNodeList.IndexOf (DOMString, DOMString) (see page 7423)	Returns the index of a specified node.
	TXMLNodeList.IndexOf (IXMLNode) (see page 7423)	Returns the index of a specified node.

82.1.4.4.14.1 TXMLNodeList.IndexOf Method (DOMString)

Returns the index of a specified node.

Pascal

```
function IndexOf(const Node: IXMLNode): Integer; overload;
function IndexOf(const Name: DOMString): Integer; overload;
function IndexOf(const Name: DOMString; const NamespaceURI: DOMString): Integer; overload;
```

C++

```
__fastcall int IndexOf(const IXMLNode Node);
__fastcall int IndexOf(const DOMString Name);
__fastcall int IndexOf(const DOMString Name, const DOMString NamespaceURI);
```

Description

Call IndexOf to locate a node in the list. You can specify which node to locate using its name or its interface.

Name is the LocalName property of the node to locate.

NamespaceURI identifies the namespace to use when interpreting LocalName. If Name is used without a NamespaceURI parameter (the first syntax), IndexOf uses the value of the DefaultNamespaceURI (see page 7426) property.

Node is the interface of the node to locate.

IndexOf returns the index of the specified node, where 0 is the index of the first node, 1 is the index of the second node, and so on. If the specified node is not in the list, IndexOf returns -1.

See Also

FindNode (see page 7419)

LocalName (see page 7638)

NamespaceURI (see page 7639)

DefaultNamespaceURI (see page 7426)

82.1.4.4.15 TXMLNodeList.Insert Method

Inserts a new node into a specified position in the list.

Pascal

```
procedure Insert(Index: Integer; const Node: IXMLNode);
```

C++

```
__fastcall Insert(int Index, const IXMLNode Node);
```

Description

Call Insert to add a node at the position specified by Index.

Index specifies where to insert the node, where 0 is the first position, 1 is second position, and so on. If Index does not specify a valid index, Insert raises an exception.

Node is the node to add to the list.

See Also

Delete (see page 7417)

Remove (see page 7424)

IndexOf (see page 7423)

Add (see page 7416)

82.1.4.4.16 TXMLNodeList.InternalInsert Method

Provides the underlying implementation of the Insert (see page 7423) method

Pascal

```
function InternalInsert(Index: Integer; const Node: IXMLNode): Integer;
```

C++

```
__fastcall int InternalInsert(int Index, const IXMLNode Node);
```

Description

The Insert (see page 7423) method calls InternalInsert to add a node at the position specified by Index.

Index specifies where to insert the node, where 0 is the first position, 1 is second position, and so on. If Index is –1, the node is added to the end of the list.

Node is the node to add to the list.

InternalInsert returns the index of the node after it is inserted. This is the same as the Index parameter when Index is not –1.

See Also

Insert (see page 7423)

82.1.4.4.17 TXMLNodeList.Last Method

Returns the last node in the list.

Pascal

```
function Last: IXMLNode;
```

C++

```
__fastcall IXMLNode Last();
```

Description

Call Last to access the last node in the list. If the list is empty, Last raises an exception.

See Also

FindNode (see page 7419)

FindSibling (see page 7420)

First (see page 7420)

82.1.4.4.18 TXMLNodeList.Remove Method

Removes a specified node from the list.

Pascal

```
function Remove(const Node: IXMLNode): Integer;
```

C++

```
__fastcall int Remove(const IXMLNode Node);
```

Description

Remove removes the specified node from the list.

Node is the node to remove from the list.

Remove returns the index of Node before it was removed. If node is not a node in the list, Remove returns -1.

See Also

Delete (see page 7417)

Clear (see page 7417)

82.1.4.4.19 TXMLNodeList.ReplaceNode Method

Replaces a node in the list with another node.

Pascal

```
function ReplaceNode(const OldNode: IXMLNode; const NewNode: IXMLNode): IXMLNode;
```

C++

```
__fastcall IXMLNode ReplaceNode(const IXMLNode OldNode, const IXMLNode NewNode);
```

Description

Call ReplaceNode to replace the node specified by OldNode with the node specified by NewNode.

OldNode is the node to replace. If OldNode does not appear in the list, then ReplaceNode adds the new node to the end of the list.

NewNode is the node to add to the list in place of OldNode.

ReplaceNode returns OldNode (even if OldNode did not appear in the list).

See Also

List (see page 7426)

82.1.4.5 TXMLNodeList Properties

The properties of the TXMLNodeList class are listed here.

Protected Properties

	Name	Description
R	Count (see page 7426)	Indicates the number of nodes in the collection.
R	DefaultNamespaceURI (see page 7426)	Identifies the default Namespace for the nodes in this collection.
R	List (see page 7426)	Stores the interfaces for every node in the list.
R	Owner (see page 7427)	Specifies the node that uses this TXMLNodeList (see page 7411) object to manage a set of its child or attribute nodes.
R	UpdateCount (see page 7427)	Indicates the number of times an application has called BeginUpdate (see page 7416) without a matching call to EndUpdate (see page 7419).

82.1.4.5.1 TXMLNodeList.Count Property

Indicates the number of nodes in the collection.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read (see page 3727) Count to determine the number of nodes in the list. To change the value of Count, use the IXMLNodeList (see page 7649) interface. Add (see page 7416) nodes using the Add (see page 7416) or Insert (see page 7423) method, or remove them using the Delete (see page 7417) or Remove (see page 7424) method.

See Also

Nodes (see page 7660)

Add (see page 7651)

Delete (see page 7653)

Remove (see page 7659)

Insert (see page 7658)

82.1.4.5.2 TXMLNodeList.DefaultNamespaceURI Property

Identifies the default Namespace for the nodes in this collection.

Pascal

```
property DefaultNamespaceURI: DOMString;
```

C++

```
__property DOMString DefaultNamespaceURI;
```

Description

Read (see page 3727) DefaultNamespaceURI to determine the namespace that is used by default when locating nodes in the list. The IndexOf (see page 7423), FindNode (see page 7419), and Delete (see page 7417) methods all use this namespace when trying to match the name of a node if a namespace is not explicitly supplied.

The value of DefaultNamespaceURI is set by the TXMLNodeList (see page 7411) constructor.

See Also

NamespaceURI (see page 7639)

Create (see page 7414)

IndexOf (see page 7423)

FindNode (see page 7419)

Delete (see page 7417)

82.1.4.5.3 TXMLNodeList.List Property

Stores the interfaces for every node in the list.

Pascal

```
property List: IInterfaceList;
```

C++

```
__property IInterfaceList List;
```

Description

TXMLNodeList (see page 7411) uses List internally to store and manage the interfaces to the nodes it represents.

See Also

Count (see page 7426)

Nodes (see page 7660)

82.1.4.5.4 TXMLNodeList.Owner Property

Specifies the node that uses this TXMLNodeList (see page 7411) object to manage a set of its child or attribute nodes.

Pascal

```
property Owner: TXMLNode;
```

C++

```
__property TXMLNode Owner;
```

Description

Owner designates the node that instantiates TXMLNodeList (see page 7411) to manage a set of its child or attribute nodes. This value is supplied to the TXMLNodeList (see page 7411) constructor.

See Also

ChildNodes (see page 7391)

Create (see page 7414)

AttributeNodes (see page 7390)

82.1.4.5.5 TXMLNodeList.UpdateCount Property

Indicates the number of times an application has called BeginUpdate (see page 7416) without a matching call to EndUpdate (see page 7419).

Pascal

```
property UpdateCount: Integer;
```

C++

```
__property int UpdateCount;
```

Description

UpdateCount keeps track of whether all update operations have been completed. When an application starts making changes to the list, it calls BeginUpdate (see page 7416), which increments UpdateCount. When those changes are complete, it calls EndUpdate (see page 7419), which decrements UpdateCount. Thus, UpdateCount allows calls to BeginUpdate (see page 7416) and EndUpdate (see page 7419) to be nested.

Applications can avoid responding to updates in a piecemeal fashion by checking UpdateCount and only responding when it is 0. For example, the callback that is supplied to the TXMLNodeList (see page 7411) constructor typically checks UpdateCount before responding to change notifications.

See Also

BeginUpdate (see page 7416)

EndUpdate (see page 7419)

Create (see page 7414)

82.1.4.6 TXMLNodeList Events

The events of the TXMLNodeList class are listed here.

Protected Events

	Name	Description
	NotificationProc (see page 7428)	Specifies a callback that TXMLNodeList (see page 7411) calls when nodes are added to or removed from the list, or when new nodes need to be created

82.1.4.6.1 TXMLNodeList.NotificationProc Event

Specifies a callback that TXMLNodeList (see page 7411) calls when nodes are added to or removed from the list, or when new nodes need to be created

Pascal

```
property NotificationProc: TNodeListNotification;
```

C++

```
__property TNodeListNotification NotificationProc;
```

Description

The node that instantiates TXMLNodeList (see page 7411) to manage a set of its child or attribute nodes supplies the value of this callback to the TXMLNodeList (see page 7411) constructor. TXMLNodeList (see page 7411) then calls this callback when its methods are used to add, create, or remove nodes.

ChildListNotify (see page 7360)

Create (see page 7414)

AttributeListNotify (see page 7358)

82.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IXMLDocumentAccess (see page 7429)	This is class XMLDoc.IXMLDocumentAccess.
	IXMLNodeAccess (see page 7431)	This is class XMLDoc.IXMLNodeAccess.

82.2.1 IXMLDocumentAccess Interface

Class Hierarchy

Pascal

```
IXMLDocumentAccess = interface;
```

C++

```
__interface IXMLDocumentAccess;
```

File

XMLDoc

Description

This is class XMLDoc.IXMLDocumentAccess.

82.2.1.1 IXMLDocumentAccess Members

The following tables list the members exposed by IXMLDocumentAccess.

Public Methods

	Name	Description
	GetDocumentObject (see page 7430)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMPersist (see page 7430)	This is GetDOMPersist, a member of class IXMLDocumentAccess.

Public Properties

	Name	Description
R	DocumentObject (see page 7430)	This is DocumentObject, a member of class IXMLDocumentAccess.
R	DOMPersist (see page 7431)	This is DOMPersist, a member of class IXMLDocumentAccess.

82.2.1.2 IXMLDocumentAccess Methods

The methods of the IXMLDocumentAccess class are listed here.

Public Methods

	Name	Description
	GetDocumentObject (see page 7430)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMPersist (see page 7430)	This is GetDOMPersist, a member of class IXMLDocumentAccess.

82.2.1.2.1 IXMLDocumentAccess.GetDocumentObject Method

Pascal

```
function GetDocumentObject: TXMLDocument;
```

C++

```
__fastcall TXMLDocument GetDocumentObject();
```

Description

This is GetDocumentObject, a member of class IXMLDocumentAccess.

82.2.1.2.2 IXMLDocumentAccess.GetDOMPersist Method

Pascal

```
function GetDOMPersist: IDOMPersist;
```

C++

```
__fastcall IDOMPersist GetDOMPersist();
```

Description

This is GetDOMPersist, a member of class IXMLDocumentAccess.

82.2.1.3 IXMLDocumentAccess Properties

The properties of the IXMLDocumentAccess class are listed here.

Public Properties

	Name	Description
R	DocumentObject (see page 7430)	This is DocumentObject, a member of class IXMLDocumentAccess.
R	DOMPersist (see page 7431)	This is DOMPersist, a member of class IXMLDocumentAccess.

82.2.1.3.1 IXMLDocumentAccess.DocumentObject Property

Pascal

```
property DocumentObject: TXMLDocument;
```

C++

```
__property TXMLDocument DocumentObject;
```

Description

This is DocumentObject, a member of class IXMLDocumentAccess.

82.2.1.3.2 IXMLDocumentAccess.DOMPersist Property

Pascal

```
property DOMPersist: IDOMPersist;
```

C++

```
__property IDOMPersist DOMPersist;
```

Description

This is DOMPersist, a member of class IXMLDocumentAccess.

82.2.2 IXMLNodeAccess Interface

Class Hierarchy

Pascal

```
IXMLNodeAccess = interface(IXMLNode);
```

C++

```
__interface IXMLNodeAccess : public IXMLNode;
```

File

XMLDoc

Description

This is class XMLDoc.IXMLNodeAccess.

82.2.2.1 IXMLNodeAccess Members

The following tables list the members exposed by IXMLNodeAccess.

Public Methods

	Name	Description
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7618)	This is the overview for the AddChild method overload.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7619)	Creates a copy of this node and returns its interface.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	DeclareNamespace (see page 7620)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7620)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7620)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7621)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7621)	Returns the value of the AttributeNodes (see page 7634) property.

	GetAttributeNS (see page 7622)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7622)	Returns the value of the ChildNodes (see page 7635) property.
	GetChildValue (see page 7622)	Returns the value of a specified child node.
	GetCollection (see page 7623)	Returns the value of the Collection (see page 7636) property.
	GetDOMNode (see page 7623)	Returns the value of the DOMNode (see page 7637) property.
	GetHasChildNodes (see page 7624)	Indicates whether the node has any child nodes.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetIsTextElement (see page 7624)	Indicates whether the node has a single text value.
	GetLocalName (see page 7624)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7625)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7625)	Returns the name of the node.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7625)	Returns the type of the node.
	GetNodeValue (see page 7626)	Returns the value of the node.
	GetOwnerDocument (see page 7626)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7626)	Returns the interface for the node's parent node.
	GetPrefix (see page 7626)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7627)	Returns the value of the ReadOnly (see page 7642) property.
	GetText (see page 7627)	Returns the text value of the node.
	GetXML (see page 7627)	Returns the value of the XML (see page 7643) property.
	HasAttribute (see page 7628)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	NextSibling (see page 7628)	Returns the next child of this node's parent.
	Normalize (see page 7629)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7629)	Returns the previous child of this node's parent.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7630)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7630)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7630)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7631)	Sets the value of a specified child node.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7631)	Sets the value of this node.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7632)	Specifies whether the node can be modified.
	SetText (see page 7632)	Sets the text value of the node.
	TransformNode (see page 7632)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7634)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7634)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7635)	Represents the child nodes of the node.
	ChildValues (see page 7636)	Represents the values of this node's child nodes.
R	Collection (see page 7636)	Indicates the collection in which this node appears.
R	DOMNode (see page 7637)	Provides access to the IDOMNode (see page 7509) interface for this node.
R	HasChildNodes (see page 7637)	Indicates whether this node has any child nodes.
R	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.

R	IsTextElement (see page 7638)	Indicates whether the node has a single text value.
R	LocalName (see page 7638)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7639)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7639)	Indicates the node name.
R	NodeType (see page 7640)	Indicates the type of the node.
	NodeValue (see page 7641)	Specifies the value of this node.
R	OwnerDocument (see page 7641)	Identifies the document in which this node appears.
R	ParentNode (see page 7641)	Identifies the interface of the node's parent node.
R	Prefix (see page 7642)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7642)	Specifies whether the node can be modified.
	Text (see page 7643)	Represents the Text of the node.
R	XML (see page 7643)	Indicates the XML that corresponds to the subtree rooted at this node.

82.2.2.2 IXMLNodeAccess Methods

The methods of the IXMLNodeAccess class are listed here.

Public Methods

	Name	Description
	AddChild (see page 7433)	This is AddChild, a member of class IXMLNodeAccess.
	CheckTextNode (see page 7434)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClearDocumentRef (see page 7434)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CreateAttributeNode (see page 7434)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7434)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7434)	This is CreateCollection, a member of class IXMLNodeAccess.
	DOMElement (see page 7435)	This is DOMElement, a member of class IXMLNodeAccess.
	FindHostedNode (see page 7435)	This is FindHostedNode, a member of class IXMLNodeAccess.
	GetChildNodeClasses (see page 7435)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetHostNode (see page 7435)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetNodeObject (see page 7436)	This is GetNodeObject, a member of class IXMLNodeAccess.
	HasChildNode (see page 7436)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7436)	This is InternalAddChild, a member of class IXMLNodeAccess.
	NestingLevel (see page 7437)	This is NestingLevel, a member of class IXMLNodeAccess.
	RegisterChildNode (see page 7437)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7437)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	SetCollection (see page 7437)	This is SetCollection, a member of class IXMLNodeAccess.
	SetParentNode (see page 7438)	This is SetParentNode, a member of class IXMLNodeAccess.

82.2.2.2.1 IXMLNodeAccess.AddChild Method

Pascal

```
function AddChild(const TagName: DOMString; const NamespaceURI: DOMString; NodeClass:
TXMLNodeClass; Index: Integer = -1): IXMLNode; overload;
```

C++

```
__fastcall IXMLNode AddChild(const DOMString TagName, const DOMString NamespaceURI,
TXMLNodeClass NodeClass, int Index = -1);
```

Description

This is AddChild, a member of class IXMLNodeAccess.

82.2.2.2.2 IXMLNodeAccess.CheckTextNode Method

Pascal

```
procedure CheckTextNode;
```

C++

```
__fastcall CheckTextNode();
```

Description

This is CheckTextNode, a member of class IXMLNodeAccess.

82.2.2.2.3 IXMLNodeAccess.ClearDocumentRef Method

Pascal

```
procedure ClearDocumentRef;
```

C++

```
__fastcall ClearDocumentRef();
```

Description

This is ClearDocumentRef, a member of class IXMLNodeAccess.

82.2.2.2.4 IXMLNodeAccess.CreateAttributeNode Method

Pascal

```
function CreateAttributeNode(const ADOMNode: IDOMNode): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateAttributeNode(const IDOMNode ADOMNode);
```

Description

This is CreateAttributeNode, a member of class IXMLNodeAccess.

82.2.2.2.5 IXMLNodeAccess.CreateChildNode Method

Pascal

```
function CreateChildNode(const ADOMNode: IDOMNode): IXMLNode;
```

C++

```
__fastcall IXMLNode CreateChildNode(const IDOMNode ADOMNode);
```

Description

This is CreateChildNode, a member of class IXMLNodeAccess.

82.2.2.2.6 IXMLNodeAccess.CreateCollection Method

Pascal

```
function CreateCollection(const CollectionClass: TXMLNodeCollectionClass; const ItemIterface:
TGuid; const ItemTag: DOMString; ItemNS: DOMString = ''): TXMLNodeCollection;
```

C++

```
__fastcall TXMLNodeCollection CreateCollection(const TXMLNodeCollectionClass CollectionClass,
const TGuid ItemIterface, const DOMString ItemTag, DOMString ItemNS = '');
```

Description

This is CreateCollection, a member of class IXMLNodeAccess.

82.2.2.2.7 IXMLNodeAccess.DOMElement Method

Pascal

```
function DOMElement: IDOMElement;
```

C++

```
__fastcall IDOMElement DOMElement();
```

Description

This is DOMElement, a member of class IXMLNodeAccess.

82.2.2.2.8 IXMLNodeAccess.FindHostedNode Method

Pascal

```
function FindHostedNode(const NodeClass: TXMLNodeClass): IXMLNode;
```

C++

```
__fastcall IXMLNode FindHostedNode(const TXMLNodeClass NodeClass);
```

Description

This is FindHostedNode, a member of class IXMLNodeAccess.

82.2.2.2.9 IXMLNodeAccess.GetChildNodeClasses Method

Pascal

```
function GetChildNodeClasses: TNodeClassArray;
```

C++

```
__fastcall TNodeClassArray GetChildNodeClasses();
```

Description

This is GetChildNodeClasses, a member of class IXMLNodeAccess.

82.2.2.2.10 IXMLNodeAccess.GetHostNode Method

Pascal

```
function GetHostNode: TXMLNode;
```

C++

```
__fastcall TXMLNode GetHostNode();
```

Description

This is GetHostNode, a member of class IXMLNodeAccess.

82.2.2.2.11 IXMLNodeAccess.GetNodeObject Method

Pascal

```
function GetNodeObject: TXMLNode;
```

C++

```
__fastcall TXMLNode GetNodeObject();
```

Description

This is GetNodeObject, a member of class IXMLNodeAccess.

82.2.2.2.12 HasChildNode Method

This is the overview for the HasChildNode method overload.

Overload List

	Name	Description
	IXMLNodeAccess.HasChildNode (DOMString) (see page 7436)	This is HasChildNode, a member of class IXMLNodeAccess.
	IXMLNodeAccess.HasChildNode (DOMString, DOMString) (see page 7436)	This is HasChildNode, a member of class IXMLNodeAccess.

82.2.2.2.12.1 IXMLNodeAccess.HasChildNode Method (DOMString)

Pascal

```
function HasChildNode(const ChildTag: DOMString): Boolean; overload;
```

C++

```
__fastcall Boolean HasChildNode(const DOMString ChildTag);
```

Description

This is HasChildNode, a member of class IXMLNodeAccess.

82.2.2.2.12.2 IXMLNodeAccess.HasChildNode Method (DOMString, DOMString)

Pascal

```
function HasChildNode(const ChildTag: DOMString; const NamespaceURI: DOMString): Boolean;
overload;
```

C++

```
__fastcall Boolean HasChildNode(const DOMString ChildTag, const DOMString NamespaceURI);
```

Description

This is HasChildNode, a member of class IXMLNodeAccess.

82.2.2.2.13 IXMLNodeAccess.InternalAddChild Method

Pascal

```
function InternalAddChild(NodeClass: TXMLNodeClass; const NodeName: DOMString; const
NamespaceURI: DOMString; Index: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode InternalAddChild(TXMLNodeClass NodeClass, const DOMString NodeName, const
DOMString NamespaceURI, int Index);
```

Description

This is InternalAddChild, a member of class IXMLNodeAccess.

82.2.2.2.14 IXMLNodeAccess.NestingLevel Method

Pascal

```
function NestingLevel: Integer;
```

C++

```
__fastcall int NestingLevel();
```

Description

This is NestingLevel, a member of class IXMLNodeAccess.

82.2.2.2.15 IXMLNodeAccess.RegisterChildNode Method

Pascal

```
procedure RegisterChildNode(const TagName: DOMString; ChildNodeClass: TXMLNodeClass;
NamespaceURI: DOMString = '');
```

C++

```
__fastcall RegisterChildNode(const DOMString TagName, TXMLNodeClass ChildNodeClass, DOMString
NamespaceURI = '');
```

Description

This is RegisterChildNode, a member of class IXMLNodeAccess.

82.2.2.2.16 IXMLNodeAccess.RegisterChildNodes Method

Pascal

```
procedure RegisterChildNodes(const TagNames: array of DOMString; const NodeClasses: array of
TXMLNodeClass);
```

C++

```
__fastcall RegisterChildNodes(const array of DOMString TagNames, const array of TXMLNodeClass
NodeClasses);
```

Description

This is RegisterChildNodes, a member of class IXMLNodeAccess.

82.2.2.2.17 IXMLNodeAccess.SetCollection Method

Pascal

```
procedure SetCollection(const Value: TXMLNodeCollection);
```

C++

```
__fastcall SetCollection(const TXMLNodeCollection Value);
```

Description

This is SetCollection, a member of class IXMLNodeAccess.

82.2.2.2.18 IXMLNodeAccess.SetParentNode Method

Pascal

```
procedure SetParentNode(const Value: TXMLNode);
```

C++

```
__fastcall SetParentNode(const TXMLNode Value);
```

Description

This is SetParentNode, a member of class IXMLNodeAccess.

82.2.2.3 IXMLNodeAccess Properties

The properties of the IXMLNodeAccess class are listed here.

Public Properties

	Name	Description
	ChildNodeClasses (see page 7438)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
	HostNode (see page 7438)	This is HostNode, a member of class IXMLNodeAccess.

82.2.2.3.1 IXMLNodeAccess.ChildNodeClasses Property

Pascal

```
property ChildNodeClasses: TNodeClassArray;
```

C++

```
__property TNodeClassArray ChildNodeClasses;
```

Description

This is ChildNodeClasses, a member of class IXMLNodeAccess.

82.2.2.3.2 IXMLNodeAccess.HostNode Property

Pascal

```
property HostNode: TXMLNode;
```

C++

```
__property TXMLNode HostNode;
```

Description

This is HostNode, a member of class IXMLNodeAccess.

82.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CheckEncoding (see page 7439)	This is function XMLDoc.CheckEncoding.
	CreateDOMNode (see page 7439)	Creates a new DOM node and returns its interface.
	DetectCharEncoding (see page 7440)	This is function XMLDoc.DetectCharEncoding.
	FormatXMLData (see page 7441)	Formats a string of XML so that it is more readable.
	LoadXMLData (see page 7441)	Creates and returns the interface of an XML document object, given a string of XML.
	LoadXMLData (see page 7441)	Creates and returns the interface of an XML document object, given a string of XML.
	LoadXMLDocument (see page 7442)	Returns the interface for an XML document given the name of an XML file.
	NewXMLDocument (see page 7442)	Returns the interface for a new, empty XML document.
	XMLDocError (see page 7443)	Raises an EXMLDocError (see page 7585) exception.
	XMLDocError (see page 7443)	Raises an EXMLDocError (see page 7585) exception.
	XMLStringToUnicodeString (see page 7443)	This is function XMLDoc.XMLStringToUnicodeString.
	XMLStringToWideString (see page 7443)	This is function XMLDoc.XMLStringToWideString.

82.3.1 XMLDoc.CheckEncoding Function

Pascal

```
procedure CheckEncoding(var XMLData: DOMString; const ValidEncodings: array of string);
```

C++

```
CheckEncoding(DOMString XMLData, const array of string ValidEncodings);
```

File

XMLDoc

Description

This is function XMLDoc.CheckEncoding.

82.3.2 XMLDoc.CreateDOMNode Function

Creates a new DOM node and returns its interface.

Pascal

```
function CreateDOMNode(Doc: IDOMDocument; const NameOrData: DOMString; NodeType: TNodeType =
ntElement; const AddlData: DOMString = ''): IDOMNode;
```

C++

```
IDOMNode CreateDOMNode(IDOMDocument Doc, const DOMString NameOrData, TNodeType NodeType =
ntElement, const DOMString AddlData = '');
```

File

XMLDoc

Description

CreateDOMNode generates a new DOM node.

Doc is the DOM interface for the document to which the new node will belong.

NameOrData provides the tag name or value of the newly created node. Its interpretation depends on the type of node created, as indicated in the following table:

NodeType	NameOrData
ntElement	The tag name.
ntAttribute	The attribute name.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.

NodeType indicates the type of node to create. It can only be one of the types listed in the previous table.

The meaning of AddlData depends on the node type, as indicated in the following table:

NodeType	AddlData
ntElement	The namespace URI that qualifies the tag name.
ntAttribute	The namespace URI that qualifies the attribute name.
ntProcessingInstr	The content of the processing instruction, except for the target.

CreateDOMNode returns the interface for the newly created DOM node.

82.3.3 XMLDoc.DetectCharEncoding Function

Pascal

```
function DetectCharEncoding(S: TStream): TXmlEncodingType;
```

C++

```
TXmlEncodingType DetectCharEncoding(TStream S);
```

File

XMLDoc

Description

This is function XMLDoc.DetectCharEncoding.

82.3.4 XMLDoc.FormatXMLData Function

Formats a string of XML so that it is more readable.

Pascal

```
function FormatXMLData(const XMLData: DOMString): DOMString;
```

C++

```
DOMString FormatXMLData(const DOMString XMLData);
```

File

XMLDoc

Description

Use FormatXMLData to convert a string of XML into a format that represents its structure. FormatXMLData changes the input string (XMLData) so that each element node appears on its own line, indented appropriately to reflect its nesting in the node hierarchy.

82.3.5 XMLDoc.LoadXMLData Function

Creates and returns the interface of an XML document object, given a string of XML.

Pascal

```
function LoadXMLData(const XMLData: DOMString): IXMLDocument; overload;
function LoadXMLData(const XMLData: AnsiString): IXMLDocument; overload;
```

C++

```
IXMLDocument LoadXMLData(const DOMString XMLData);
IXMLDocument LoadXMLData(const AnsiString XMLData);
```

File

XMLDoc

Description

Call LoadXMLData to create an XML document that represents a specified XML string and obtain its interface.

XMLData is the XML for which you want an IXMLDocument (see page 7586) interface.

LoadXMLData returns an interface for the parsed value of XMLData.

LoadXMLData creates a new TXMLDocument (see page 7299) object to parse the XML and returns its IXMLDocument (see page 7586). The TXMLDocument (see page 7299) component is not given an owner, which means that it behaves like an interfaced object. When the application releases the interface that LoadXMLData returns, the TXMLDocument (see page 7299) instance is automatically freed.

See Also

TXMLDocument (see page 7299)

NewXMLDocument (see page 7442)

LoadXMLDocument (see page 7442)

TXMLDocument (see page 7299)

82.3.6 XMLDoc.LoadXMLDocument Function

Returns the interface for an XML document given the name of an XML file.

Pascal

```
function LoadXMLDocument(const FileName: DOMString): IXMLDocument;
```

C++

```
IXMLDocument LoadXMLDocument(const DOMString FileName);
```

File

XMLDoc

Description

Call LoadXMLDocument to load an XML document from a file on disk and obtain its interface. LoadXMLDocument creates a new TXMLDocument (see page 7299) object and uses it to parse the file specified by the FileName parameter. The TXMLDocument (see page 7299) component is not given an owner, which means that it behaves like an interfaced object. When the application releases the interface that LoadXMLDocument returns, the TXMLDocument (see page 7299) instance is automatically freed.

See Also

TXMLDocument (see page 7299)

NewXMLDocument (see page 7442)

LoadXMLData (see page 7441)

82.3.7 XMLDoc.NewXMLDocument Function

Returns the interface for a new, empty XML document.

Pascal

```
function NewXMLDocument(Version: DOMString = '1.0'): IXMLDocument;
```

C++

```
IXMLDocument NewXMLDocument(DOMString Version = '1.0');
```

File

XMLDoc

Description

Call NewXMLDocument to create a TXMLDocument (see page 7299) object for a new, empty XML document.

Version specifies the XML version that the document should use. It becomes the value of the new document's Version property.

See Also

TXMLDocument (see page 7299)

LoadXMLDocument (see page 7442)

IXMLDocument

82.3.8 XMLDoc.XMLDocError Function

Raises an EXMLDocError (see page 7585) exception.

Pascal

```
procedure XMLDocError(const Msg: string); overload;
procedure XMLDocError(const Msg: string; const Args: array of const); overload;
```

C++

```
XMLDocError(const UnicodeString Msg);
XMLDocError(const UnicodeString Msg, const array of const Args);
```

File

XMLDoc

Description

Call XMLDocError to raise an EXMLDocError (see page 7585) exception. Using XMLDocError rather than explicitly creating the EXMLDocError (see page 7585) instance can result in more space-efficient code.

Msg is the error message associated with the EXMLDocError (see page 7585) instance.

Args supplies arguments for any format specifiers embedded in Msg.

Note: Args_Size is the index of the last entry in the Args array. That is one less than the total number of arguments.

See Also

EXMLDocError

82.3.9 XMLDoc.XMLStringToUnicodeString Function

Pascal

```
function XMLStringToUnicodeString(const XMLString: AnsiString): UnicodeString;
```

C++

```
UnicodeString XMLStringToUnicodeString(const AnsiString XMLString);
```

File

XMLDoc

Description

This is function XMLDoc.XMLStringToUnicodeString.

82.3.10 XMLDoc.XMLStringToWideString Function

Pascal

```
function XMLStringToWideString(const XMLString: AnsiString): WideString; deprecated;
```

C++

```
BSTR XMLStringToWideString(const AnsiString XMLString);
```

File

XMLDoc

Description

This is function XMLDoc.XMLStringToWideString.

82.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TNodeChange (see page 7445)	TNodeChange indicates the type of change made to a node in an XML document.
	TNodeListOperation (see page 7446)	TNodeListOperation indicates what type of change is about to occur using an IXMLNodeList (see page 7649) interface.
	TXMLDocumentSource (see page 7447)	This is record XMLDoc.TXMLDocumentSource.
	TXMLPrologItem (see page 7448)	This is record XMLDoc.TXMLPrologItem.

Records

	Name	Description
	TNodeClassInfo (see page 7446)	TNodeClassInfo and TNodeClassArray (see page 7449) represent information about the classes that implement XML node interfaces.

82.4.1 XMLDoc.TNodeChange Enumeration

TNodeChange indicates the type of change made to a node in an XML document.

Pascal

```
TNodeChange = (
  ncUpdateValue,
  ncInsertChild,
  ncRemoveChild,
  ncAddAttribute,
  ncRemoveAttribute
);
```

C++

```
enum TNodeChange {
  ncUpdateValue,
  ncInsertChild,
  ncRemoveChild,
  ncAddAttribute,
  ncRemoveAttribute
};
```

File

XMLDoc

Description

The following table lists the possible values:

Value	Meaning
ncUpdateValue	The value of the node is changed.
ncInsertChild	A new child node is added to the node.
ncRemoveChild	A child node is removed from the node.

ncAddAttribute	A new attribute is added to the node.
ncRemoveAttribute	An attribute is removed from the node.

See Also

TNodeChangeEvent

82.4.2 XMLDoc.TNodeClassInfo Record

TNodeClassInfo and TNodeClassArray (see page 7449) represent information about the classes that implement XML node interfaces.

Pascal

```
TNodeClassInfo = record
  NodeName: DOMString;
  NamespaceURI: DOMString;
  NodeClass: TXMLNodeClass;
end;
```

C++

```
struct TNodeClassInfo {
  DOMString NodeName;
  DOMString NamespaceURI;
  TXMLNodeClass NodeClass;
};
```

File

XMLDoc

Description

TNodeClassArray (see page 7449) is a dynamic array of TNodeClassInfo values. Each element of the array describes the implementation of a node.

TNodeClassInfo describes the name and implementation class for a node in an XML document. It contains the following fields:

Field	Meaning
NodeName	The name of the node. This string describes the identifier or use of the node. For example, on element nodes, this is the tag name. On attribute nodes, this is the name of the attribute. On comment nodes, this is the string "#comment". This is the value returned by a node's NodeName property, and is used as a property name in classes generated by the XML Data Binding Wizard.
NamespaceURI	The namespace of the node's name. This string is a Uniform Resource Identifier that identifies the namespace that contains NodeName. It is used to interpret the value of NodeName.
NodeClass	The class of a TXMLNode (see page 7348) descendant that represents the node.

82.4.3 XMLDoc.TNodeListOperation Enumeration

TNodeListOperation indicates what type of change is about to occur using an IXMLNodeList (see page 7649) interface.

Pascal

```
TNodeListOperation = (
  nlInsert,
  nlRemove,
  nlCreateNode
);
```

C++

```
enum TNodeListOperation {
  nlInsert,
  nlRemove,
  nlCreateNode
};
```

File

XMLDoc

Description

When an application makes a change using the IXMLNodeList (see page 7649) interface, the implementing object sends its owner a notification of that change. TNodeListOperation identifies the type of change that is about to occur. The following table lists the possible values:

Value	Meaning
nlInsert	An existing node is about to be added to the list.
nlRemove	A node is about to be removed from the list.
nlCreateNode	A new node needs to be created so that it can be added to the list.

82.4.4 XMLDoc.TXMLDocumentSource Enumeration

Pascal

```
TXMLDocumentSource = (
  xdsNone,
  xdsXMLProperty,
  xdsXMLData,
  xdsFile,
  xdsStream
);
```

C++

```
enum TXMLDocumentSource {
  xdsNone,
  xdsXMLProperty,
  xdsXMLData,
  xdsFile,
  xdsStream
};
```

File

XMLDoc

Description

This is record XMLDoc.TXMLDocumentSource.

82.4.5 XMLDoc.TXMLPrologItem Enumeration

Pascal

```
TXMLPrologItem = (
  xpVersion,
  xpEncoding,
  xpStandalone
);
```

C++

```
enum TXMLPrologItem {
  xpVersion,
  xpEncoding,
  xpStandalone
};
```

File

XMLDoc

Description

This is record XMLDoc.TXMLPrologItem.

82.5 Types

The following table lists types in this documentation.

Types

Name	Description
TNodeChangeEvent (see page 7449)	TNodeChangeEvent is the type for event handlers that respond when XML nodes are changed.
TNodeClassArray (see page 7449)	This is type XMLDoc.TNodeClassArray.
TNodeListNotification (see page 7450)	TNodeListNotification is the type of the callback the TXMLNodeList (see page 7411) calls when it adds, deletes, or creates XML nodes.
TXMLNodeArray (see page 7451)	TXMLNodeArray is a dynamic array of TXMLNode (see page 7348) objects.
TXMLNodeClass (see page 7451)	TXMLNodeClass is a class reference to a TXMLNode (see page 7348) descendant.
TXMLNodeCollectionClass (see page 7452)	TXMLNodeCollectionClass is a class reference to a TXMLNodeCollection (see page 7396) descendant.

82.5.1 XMLDoc.TNodeChangeEvent Type

TNodeChangeEvent is the type for event handlers that respond when XML nodes are changed.

Pascal

```
TNodeChangeEvent = procedure (const Node: IXMLNode; ChangeType: TNodeChange) of object;
```

C++

```
(const Node: IXMLNode; ChangeType: TNodeChange) ( TNodeChangeEvent)();
```

File

XMLDoc

Description

TNodeChangeEvent is the type for the BeforeNodeChange and AfterNodeChange event handlers. These events occur before and after changes are made to the nodes in an XML document.

Node identifies the node to which the change occurs.

ChangeType indicates the type of change made to Node.

See Also

BeforeNodeChange

AfterNodeChange

82.5.2 XMLDoc.TNodeClassArray Type

Pascal

```
TNodeClassArray = array of TNodeClassInfo;
```

C++

```
array of TNodeClassInfo TNodeClassArray;
```

File

XMLDoc

Description

This is type XMLDoc.TNodeClassArray.

82.5.3 XMLDoc.TNodeListNotification Type

TNodeListNotification is the type of the callback the TXMLNodeList (see page 7411) calls when it adds, deletes, or creates XML nodes.

Pascal

```
TNodeListNotification = procedure (Operation: TNodeListOperation; var Node: IXMLNode; const
IndexOrName: OleVariant; BeforeOperation: Boolean) of object;
```

C++

```
(Operation: TNodeListOperation; var Node: IXMLNode; const IndexOrName: OleVariant;
BeforeOperation: Boolean) ( TNodeListNotification)();
```

File

XMLDoc

Description

TNodeListNotification is the type for the callback supplied to TXMLNodeList (see page 7411) in its constructor. TXMLNodeList (see page 7411) calls this procedure before and after it adds or deletes nodes in the list and when it needs to create a new node.

Operation indicates what change is about to occur or has just occurred.

Node specifies the node that is the focus of that change. It's use depends on the operation, as indicated in the following table:

Operation	Node
nlInsert	The node that is about to be added to the list or that has just been added.
nlRemove	The node that is about to be removed from the list or that has just been removed.
nlCreateNode	The newly-created node. This should be created by the callback and returned as the Node parameter.
ntElement	The tag name.
ntAttribute	The name of the attribute.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.

IndexOrName is used only when Operation is nlCreateNode. It is the value assigned to the Nodes property using the index of a node that does not yet exist. The interpretation of IndexOrName depends on the type of node that the callback creates, as indicated in the following table:

NodeType	IndexOrName
ntElement	The tag name.
ntAttribute	The name of the attribute.
ntText	The value of the node.
ntCData	The value of the CDATA section.
ntEntityRef	The name of the referenced entity.
ntProcessingInstr	The target of the processing instruction.
ntComment	The value (text) of the comment.
ntDocFragment	Not used.

BeforeOperation indicates whether the callback occurs before the indicated operation or after. When nodes are inserted and removed, the callback is called first with BeforeOperation set to true, then the operation occurs, and then a second callback is made with BeforeOperation set to false. When nodes must be created, only one call is made, with BeforeOperation set to true.

TXMLNodeList

TXMLNode

TXMLNode

IXMLNodeList

82.5.4 XMLDoc.TXMLNodeArray Type

TXMLNodeArray is a dynamic array of TXMLNode (see page 7348) objects.

Pascal

```
TXMLNodeArray = array of TXMLNode;
```

C++

```
array of TXMLNode TXMLNodeArray;
```

File

XMLDoc

Description

TXMLNodeArray is a dynamic array of TXMLNode (see page 7348) objects, each of which represents a node in an XML document.

82.5.5 XMLDoc.TXMLNodeClass Type

TXMLNodeClass is a class reference to a TXMLNode (see page 7348) descendant.

Pascal

```
TXMLNodeClass = class of TXMLNode;
```

C++

```
TXMLNode TXMLNodeClass;
```

File

XMLDoc

Description

TXMLNodeClass describes a class that descends from TXMLNode (see page 7348).

82.5.6 XMLDoc.TXMLNodeCollectionClass Type

TXMLNodeCollectionClass is a class reference to a TXMLNodeCollection (see page 7396) descendant.

Pascal

```
TXMLNodeCollectionClass = class of TXMLNodeCollection;
```

C++

```
TXMLNodeCollection TXMLNodeCollectionClass;
```

File

XMLDoc

Description

TXMLNodeCollectionClass describes a class that descends from TXMLNodeCollection (see page 7396).

82.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
UseXSDBooleanStrings (see page 7453)	This is variable XMLDoc.UseXSDBooleanStrings.

82.6.1 XMLDoc.UseXSDBooleanStrings Variable

Pascal

```
UseXSDBooleanStrings: Boolean = True;
```

C++

```
Boolean UseXSDBooleanStrings = True;
```

File

XMLDoc

Description

This is variable XMLDoc.UseXSDBooleanStrings.

83 xmldom Namespace

This is namespace xmldom.

Topics

Name	Description
Classes (see page 7458)	The following table lists classes in this documentation.
Interfaces (see page 7473)	The following table lists interfaces in this documentation.
Functions (see page 7557)	The following table lists functions in this documentation.
Types (see page 7565)	The following table lists types in this documentation.
Variables (see page 7568)	The following table lists variables in this documentation.
Constants (see page 7569)	The following table lists constants in this documentation.

Classes

	Name	Description
	DOMException (see page 7458)	This is class xmldom.DOMException.
	EDOMParseError (see page 7460)	EDOMParseError is the exception class for errors that occur when a DOM implementation parses an XML document.
	TDOMVendor (see page 7466)	TDOMVendor is the base class for components that provide access to a DOM implementation.
	TDOMVendorList (see page 7468)	TDOMVendorList represents a collection of available DOM implementations.

Constants

Name	Description
ATTRIBUTE_NODE (see page 7569)	This is constant xmldom.ATTRIBUTE_NODE.
CDATA_SECTION_NODE (see page 7570)	This is constant xmldom.CDATA_SECTION_NODE.
COMMENT_NODE (see page 7570)	This is constant xmldom.COMMENT_NODE.
DOCUMENT_FRAGMENT_NODE (see page 7570)	This is constant xmldom.DOCUMENT_FRAGMENT_NODE.
DOCUMENT_NODE (see page 7571)	This is constant xmldom.DOCUMENT_NODE.
DOCUMENT_TYPE_NODE (see page 7571)	This is constant xmldom.DOCUMENT_TYPE_NODE.
DOMSTRING_SIZE_ERR (see page 7571)	This is constant xmldom.DOMSTRING_SIZE_ERR.
DOMWrapperVersion (see page 7572)	This is constant xmldom.DOMWrapperVersion.
ELEMENT_NODE (see page 7572)	This is constant xmldom.ELEMENT_NODE.
ENTITY_NODE (see page 7572)	This is constant xmldom.ENTITY_NODE.
ENTITY_REFERENCE_NODE (see page 7573)	This is constant xmldom.ENTITY_REFERENCE_NODE.
HIERARCHY_REQUEST_ERR (see page 7573)	This is constant xmldom.HIERARCHY_REQUEST_ERR.
INDEX_SIZE_ERR (see page 7573)	This is constant xmldom.INDEX_SIZE_ERR.

INUSE_ATTRIBUTE_ERR (see page 7574)	This is constant xmldom.INUSE_ATTRIBUTE_ERR.
INVALID_ACCESS_ERR (see page 7574)	This is constant xmldom.INVALID_ACCESS_ERR.
INVALID_CHARACTER_ERR (see page 7574)	This is constant xmldom.INVALID_CHARACTER_ERR.
INVALID_MODIFICATION_ERR (see page 7575)	This is constant xmldom.INVALID_MODIFICATION_ERR.
INVALID_STATE_ERR (see page 7575)	This is constant xmldom.INVALID_STATE_ERR.
NAMESPACE_ERR (see page 7575)	This is constant xmldom.NAMESPACE_ERR.
NO_DATA_ALLOWED_ERR (see page 7576)	This is constant xmldom.NO_DATA_ALLOWED_ERR.
NO_MODIFICATION_ALLOWED_ERR (see page 7576)	This is constant xmldom.NO_MODIFICATION_ALLOWED_ERR.
NOT_FOUND_ERR (see page 7576)	This is constant xmldom.NOT_FOUND_ERR.
NOT_SUPPORTED_ERR (see page 7577)	This is constant xmldom.NOT_SUPPORTED_ERR.
NOTATION_NODE (see page 7577)	This is constant xmldom.NOTATION_NODE.
NSDelim (see page 7577)	This is constant xmldom.NSDelim.
PROCESSING_INSTRUCTION_NODE (see page 7578)	This is constant xmldom.PROCESSING_INSTRUCTION_NODE.
SEncoding (see page 7578)	This is constant xmldom.SEncoding.
SHttp (see page 7578)	This is constant xmldom.SHttp.
SStandalone (see page 7579)	This is constant xmldom.SStandalone.
SVersion (see page 7579)	This is constant xmldom.SVersion.
SXML (see page 7579)	This is constant xmldom.SXML.
SXMLNamespaceURI (see page 7580)	This is constant xmldom.SXMLNamespaceURI.
SXMLNS (see page 7580)	This is constant xmldom.SXMLNS.
SXMLPrefixNamespaceURI (see page 7580)	This is constant xmldom.SXMLPrefixNamespaceURI.
SYNTAX_ERR (see page 7581)	This is constant xmldom.SYNTAX_ERR.
TEXT_NODE (see page 7581)	This is constant xmldom.TEXT_NODE.
WRONG_DOCUMENT_ERR (see page 7581)	This is constant xmldom.WRONG_DOCUMENT_ERR.

Functions

	Name	Description
	DOMVendorNotSupported (see page 7557)	This is function xmldom.DOMVendorNotSupported.
	ExtractLocalName (see page 7557)	Strips the namespace prefix, if present, from the tag name of an XML node.
	ExtractPrefix (see page 7558)	Returns the namespace prefix of an XML node's tag name.
	GetDOM (see page 7559)	Returns the top-level DOM interface for a registered DOM implementation.
	GetDOMNodeEx (see page 7559)	This is function xmldom.GetDOMNodeEx.
	GetDOMVendor (see page 7560)	Returns the TDOMVendor (see page 7466) object for a specified DOM vendor.
	IsPrefixed (see page 7560)	Indicates whether an XML tag name includes a namespace prefix.
	MakeNodeName (see page 7561)	Assembles a full tag name from a local name and namespace prefix.
	NodeMatches (see page 7561)	Indicates whether a specified node matches a given namespace and tag name.
	RegisterDOMVendor (see page 7562)	Registers an implementation of the DOM interfaces so that it is available to the TXMLDocument class.
	SameNamespace (see page 7562)	Indicates whether a specified node is defined within a specified namespace.
	SameNamespace (see page 7562)	Indicates whether a specified node is defined within a specified namespace.
	UnRegisterDOMVendor (see page 7563)	Unregisters a DOM implementation that was registered using RegisterDOMVendor (see page 7562) .

Interfaces

	Name	Description
	IDOMAttr (see page 7473)	This is class xmldom.IDOMAttr.
	IDOMCDATASection (see page 7477)	This is class xmldom.IDOMCDATASection.
	IDOMCharacterData (see page 7478)	This is class xmldom.IDOMCharacterData.
	IDOMComment (see page 7482)	This is class xmldom.IDOMComment.
	IDOMDocument (see page 7482)	This is class xmldom.IDOMDocument.
	IDOMDocumentFragment (see page 7489)	This is class xmldom.IDOMDocumentFragment.
	IDOMDocumentType (see page 7490)	This is class xmldom.IDOMDocumentType.
	IDOMElement (see page 7494)	This is class xmldom.IDOMElement.
	IDOMEntity (see page 7501)	This is class xmldom.IDOMEntity.
	IDOMEntityReference (see page 7504)	This is class xmldom.IDOMEntityReference.

	IDOMImplementation (see page 7504)	This is class xmldom.IDOMImplementation.
	IDOMNamedNodeMap (see page 7506)	This is class xmldom.IDOMNamedNodeMap.
	IDOMNode (see page 7509)	IDOMNode is the DOM interface for a node in an XML document.
	IDOMNodeEx (see page 7523)	This is class xmldom.IDOMNodeEx.
	IDOMNodeList (see page 7526)	This is class xmldom.IDOMNodeList.
	IDOMNodeSelect (see page 7528)	This is class xmldom.IDOMNodeSelect.
	IDOMNotation (see page 7530)	This is class xmldom.IDOMNotation.
	IDOMParseError (see page 7532)	This is class xmldom.IDOMParseError.
	IDOMParseOptions (see page 7537)	This is class xmldom.IDOMParseOptions.
	IDOMPersist (see page 7541)	This is class xmldom.IDOMPersist.
	IDOMProcessingInstruction (see page 7545)	This is class xmldom.IDOMProcessingInstruction.
	IDOMText (see page 7548)	This is class xmldom.IDOMText.
	IDOMXMLProlog (see page 7550)	This is class xmldom.IDOMXMLProlog.
	IDOMXSLProcessor (see page 7553)	This is class xmldom.IDOMXSLProcessor.

Types

Name	Description
DOMNodeType (see page 7565)	DOMNodeType indicates the type of a node in an XML document, as parsed by a DOM parser.
DOMString (see page 7565)	DOMString is the type for strings that are used by a DOM parser.
DOMTimeStamp (see page 7566)	This is type xmldom.DOMTimeStamp.
TAsyncEventHandler (see page 7566)	TAsyncEventHandler is the type of event handlers that respond when the AsyncLoadState of an XML document changes.
TDOMVendorArray (see page 7567)	This is type xmldom.TDOMVendorArray.

Variables

Name	Description
DefaultDOMVendor (see page 7568)	This is variable xmldom.DefaultDOMVendor.
DOMVendors (see page 7568)	This is variable xmldom.DOMVendors.

83.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	DOMException (see page 7458)	This is class xmldom.DOMException.
	EDOMParseError (see page 7460)	EDOMParseError is the exception class for errors that occur when a DOM implementation parses an XML document.
	TDOMVendor (see page 7466)	TDOMVendor is the base class for components that provide access to a DOM implementation.
	TDOMVendorList (see page 7468)	TDOMVendorList represents a collection of available DOM implementations.

83.1.1 DOMException Class

Class Hierarchy

Pascal

```
DOMException = class(Exception);
```

C++

```
class DOMException : public Exception;
```

File

xmldom

Description

This is class xmldom.DOMException.

83.1.1.1 DOMException Members

The following tables list the members exposed by DOMException.

Protected Methods

	Name	Description
	GetStackTrace (see page 4028)	This is GetStackTrace, a member of class Exception.
	RaisingException (see page 4028)	This is RaisingException, a member of class Exception.
	SetInnerException (see page 4028)	This is SetInnerException, a member of class Exception.
	SetStackInfo (see page 4029)	This is SetStackInfo, a member of class Exception.

Public Fields

	Name	Description
	CleanUpStackInfoProc (see page 4026)	This is CleanUpStackInfoProc, a member of class Exception.
	code (see page 7460)	This is code, a member of class DOMException.
	GetExceptionStackInfoProc (see page 4027)	This is GetExceptionStackInfoProc, a member of class Exception.
	GetStackInfoStringProc (see page 4027)	This is GetStackInfoStringProc, a member of class Exception.

Public Methods

	Name	Description
	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3366)	Constructs an object and initializes its data before the object is first used.
	Create (see page 4018)	Instantiates an instance of an exception with a simple message string.
	CreateFmt (see page 4020)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 4021)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 4021)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 4022)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 4022)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 4023)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 4025)	This is the overview for the CreateResHelp constructor overload.
	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
	Destroy (see page 3366)	Disposes of an object instance.
	Destroy (see page 4026)	Disposes of an object instance.
	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetBaseException (see page 4027)	This is GetBaseException, a member of class Exception.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RaiseOuterException (see page 4028)	This is RaiseOuterException, a member of class Exception.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ThrowOuterException (see page 4029)	This is ThrowOuterException, a member of class Exception.
	ToString (see page 3391)	Returns a string containing the class name.
	ToString (see page 4029)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	BaseException (see page 4030)	This is BaseException, a member of class Exception.
	HelpContext (see page 4030)	Indicates the context ID number for context-sensitive online help associated with the exception.
	InnerException (see page 4031)	This is InnerException, a member of class Exception.
	Message (see page 4031)	Message contains the text string to display in the exception dialog box when the exception is raised.
	StackInfo (see page 4031)	This is StackInfo, a member of class Exception.
	StackTrace (see page 4032)	This is StackTrace, a member of class Exception.

83.1.1.2 DOMException Fields

The fields of the DOMException class are listed here.

Public Fields

	Name	Description
	code (see page 7460)	This is code, a member of class DOMException.

83.1.1.2.1 DOMException.code Field

Pascal

```
code: Word;
```

C++

```
Word code;
```

Description

This is code, a member of class DOMException.

83.1.2 EDOMParseError Class

EDOMParseError is the exception class for errors that occur when a DOM implementation parses an XML document.

Class Hierarchy

Pascal

```
EDOMParseError = class(Exception);
```

C++

```
class EDOMParseError : public Exception;
```

File

xmldom

Description

EDOMParseError is raised when TXMLDocument encounters an error while parsing an XML document. It wraps the information that is available from the DOM implementation's IDOMParseError (see page 7532) interface.

See Also

TXMLDocument (see page 7299)

83.1.2.1 EDOMParseError Members

The following tables list the members exposed by EDOMParseError.

Protected Methods

	Name	Description
	GetStackTrace (see page 4028)	This is GetStackTrace, a member of class Exception.
V	RaisingException (see page 4028)	This is RaisingException, a member of class Exception.
	SetInnerException (see page 4028)	This is SetInnerException, a member of class Exception.
	SetStackInfo (see page 4029)	This is SetStackInfo, a member of class Exception.

Protected Properties

	Name	Description
R	ParseError (see page 7464)	This is ParseError, a member of class EDOMParseError.

Public Fields

	Name	Description
	CleanUpStackInfoProc (see page 4026)	This is CleanUpStackInfoProc, a member of class Exception.
	GetExceptionStackInfoProc (see page 4027)	This is GetExceptionStackInfoProc, a member of class Exception.
	GetStackInfoStringProc (see page 4027)	This is GetStackInfoStringProc, a member of class Exception.

Public Methods

	Name	Description
V	AfterConstruction (see page 3367)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3368)	Responds before the first destructor executes.
	ClassInfo (see page 3368)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3369)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3371)	Determines whether an object is of a specific type.
	ClassParent (see page 3372)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3374)	Returns the class reference for the object's class.
	CleanupInstance (see page 3377)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 7462)	This is Create, a member of class EDOMParseError.
	CreateFmt (see page 4020)	Instantiates an instance of an exception with a formatted message string.
	CreateFmtHelp (see page 4021)	Instantiates an instance of an exception with a formatted message string and a help-context ID.
	CreateHelp (see page 4021)	Creates an instance of an exception with a simple message string and a help-context ID.
	CreateRes (see page 4022)	This is the overview for the CreateRes constructor overload.
	CreateResFmt (see page 4022)	This is the overview for the CreateResFmt constructor overload.
	CreateResFmtHelp (see page 4023)	This is the overview for the CreateResFmtHelp constructor overload.
	CreateResHelp (see page 4025)	This is the overview for the CreateResHelp constructor overload.
V	DefaultHandler (see page 3377)	Provides the interface for a method that processes message records.
V	Destroy (see page 3366)	Disposes of an object instance.
V	Destroy (see page 4026)	Disposes of an object instance.
V	Dispatch (see page 3379)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3381)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3382)	This is the overview for the FieldAddress method overload.
	Free (see page 3382)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 3386)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3391) method.
	GetBaseException (see page 4027)	This is GetBaseException, a member of class Exception.
	GetHashCode (see page 3386)	Returns an integer containing the hash code.
	GetInterface (see page 3387)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3387)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3388)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3388)	Determines the relationship of two object types.
	InitInstance (see page 3389)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3389)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3389)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3390)	Returns the name of a class method by address.
	NewInstance (see page 3391)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	RaiseOuterException (see page 4028)	This is RaiseOuterException, a member of class Exception.
	SafeCallException (see page 3391)	Handles exceptions in methods declared using the safecall calling convention.
	ThrowOuterException (see page 4029)	This is ThrowOuterException, a member of class Exception.
	ToString (see page 3391)	Returns a string containing the class name.
	ToString (see page 4029)	Returns a string containing the class name.
	UnitName (see page 3392)	Returns a string containing the unit name.

Public Properties

	Name	Description
	BaseException (see page 4030)	This is BaseException, a member of class Exception.
	ErrorCode (see page 7463)	Indicates the error code that the DOM parser returned.
	FilePos (see page 7463)	Indicates the offset in the XML document where the parser encountered an error.
	HelpContext (see page 4030)	Indicates the context ID number for context-sensitive online help associated with the exception.
	InnerException (see page 4031)	This is InnerException, a member of class Exception.
	Line (see page 7464)	Indicates the line of the XML document where the parser encountered an error.
	LinePos (see page 7464)	Indicates the position within the problem line where the parser encountered an error.
	Message (see page 4031)	Message contains the text string to display in the exception dialog box when the exception is raised.
	Reason (see page 7465)	Indicates the error code that the DOM parser returned.
	SrcText (see page 7465)	Indicates the text of the line where the parser encountered an error.
	StackInfo (see page 4031)	This is StackInfo, a member of class Exception.
	StackTrace (see page 4032)	This is StackTrace, a member of class Exception.
	URL (see page 7465)	Identifies the source that could not be parsed by its URL.

83.1.2.2 EDOMParseError.Create Constructor

Pascal

```
constructor Create(const ParseError: IDOMParseError; const Msg: string);
```

C++

```
__fastcall EDOMParseError(const IDOMParseError ParseError, const UnicodeString Msg);
```

Description

This is Create, a member of class EDOMParseError.

83.1.2.3 EDOMParseError Properties

The properties of the EDOMParseError class are listed here.

Protected Properties

	Name	Description
	ParseError (see page 7464)	This is ParseError, a member of class EDOMParseError.

Public Properties

	Name	Description
	ErrorCode (see page 7463)	Indicates the error code that the DOM parser returned.
	FilePos (see page 7463)	Indicates the offset in the XML document where the parser encountered an error.
	Line (see page 7464)	Indicates the line of the XML document where the parser encountered an error.
	LinePos (see page 7464)	Indicates the position within the problem line where the parser encountered an error.
	Reason (see page 7465)	Indicates the error code that the DOM parser returned.
	SrcText (see page 7465)	Indicates the text of the line where the parser encountered an error.
	URL (see page 7465)	Identifies the source that could not be parsed by its URL.

83.1.2.3.1 EDOMParseError.ErrorCode Property

Indicates the error code that the DOM parser returned.

Pascal

```
property ErrorCode: Integer;
```

C++

```
__property int ErrorCode;
```

Description

ErrorCode is the error code supplied by the DOM parser when it encountered a problem parsing the XML document.

See Also

Reason (see page 7465)

83.1.2.3.2 EDOMParseError.FilePos Property

Indicates the offset in the XML document where the parser encountered an error.

Pascal

```
property FilePos: Integer;
```

C++

```
__property int FilePos;
```

Description

FilePos is the offset in the XML document where the parser detected the error.

See Also

Line (see page 7464)

LinePos (see page 7464)

SrcText (see page 7465)

URL (see page 7465)

83.1.2.3.3 EDOMParseError.Line Property

Indicates the line of the XML document where the parser encountered an error.

Pascal

```
property Line: Integer;
```

C++

```
__property int Line;
```

Description

Line is the line of the XML document where the parser detected the error.

See Also

FilePos (see page 7463)

LinePos (see page 7464)

SrcText (see page 7465)

URL (see page 7465)

83.1.2.3.4 EDOMParseError.LinePos Property

Indicates the position within the problem line where the parser encountered an error.

Pascal

```
property LinePos: Integer;
```

C++

```
__property int LinePos;
```

Description

LinePos is the offset in the line specified by the Line (see page 7464) property where the DOM parser detected an error.

See Also

Line (see page 7464)

FilePos (see page 7463)

SrcText (see page 7465)

URL (see page 7465)

83.1.2.3.5 EDOMParseError.ParseError Property

Pascal

```
property ParseError: IDOMParseError;
```

C++

```
__property IDOMParseError ParseError;
```

Description

This is ParseError, a member of class EDOMParseError.

83.1.2.3.6 EDOMParseError.Reason Property

Indicates the error code that the DOM parser returned.

Pascal

```
property Reason: DOMString;
```

C++

```
__property DOMString Reason;
```

Description

Reason is a short text string that describes the error that was encountered. It corresponds to the error code specified by ErrorCode (see page 7463).

See Also

ErrorCode (see page 7463)

Message (see page 4031)

83.1.2.3.7 EDOMParseError.SrcText Property

Indicates the text of the line where the parser encountered an error.

Pascal

```
property SrcText: DOMString;
```

C++

```
__property DOMString SrcText;
```

Description

SrcText is the text from the XML document that the DOM parser could not interpret.

See Also

Line (see page 7464)

83.1.2.3.8 EDOMParseError.URL Property

Identifies the source that could not be parsed by its URL.

Pascal

```
property URL: DOMString;
```

C++

```
__property DOMString URL;
```

Description

URL identifies the problem the DOM parser encountered by its URL.

See Also

SrcText (see page 7465)

83.1.3 TDOMVendor Class

TDOMVendor is the base class for components that provide access to a DOM implementation.

Class Hierarchy

Pascal

```
TDOMVendor = class;
```

C++

```
class TDOMVendor;
```

File

xmldom

Description

Note: Use TDOMVendor as a base class for a class that can be used to represent a DOM implementation. TDOMVendor introduces two abstract (pure virtual) methods, which provide information about a specific DOM implementation. One returns the IDOMImplementation (see page 7504) interface that acts as the top-level interface for a DOM vendor's implementation. The other returns a unique string that identifies the DOM implementation.

Once a TDOMVendor object has been registered, TXMLDocument objects can assign the DOM implementation as the value of their DOMVendor property by choosing the identifying string in the Object Inspector.

See Also

RegisterDOMVendor

UnregisterDOMVendor

TXMLDocument (see page 7299)

GetDOMVendor

Using the Document Object Model

83.1.3.1 TDOMVendor Members

The following tables list the members exposed by TDOMVendor.

Public Methods

	Name	Description
	Description (see page 7467)	Returns a string that uniquely identifies the associated DOM implementation.
	DOMImplementation (see page 7467)	Returns the IDOMImplementation (see page 7504) interface for the associated DOM implementation.

83.1.3.2 TDOMVendor Methods

The methods of the TDOMVendor class are listed here.

Public Methods

	Name	Description
	Description (see page 7467)	Returns a string that uniquely identifies the associated DOM implementation.
	DOMImplementation (see page 7467)	Returns the IDOMImplementation (see page 7504) interface for the associated DOM implementation.

83.1.3.2.1 TDOMVendor.Description Method

Returns a string that uniquely identifies the associated DOM implementation.

Pascal

```
function Description: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString Description() = 0;
```

Description

Description returns the name, or description, of the associated DOM implementation. This is the string that appears in the Object Inspector for a TXMLDocument object's DOMVendor property.

Description is an abstract (pure virtual) method in TDOMVendor (see page 7466). Descendant classes override this method to provide a unique identifier for the DOM implementation.

See Also

DOMVendor (see page 7337)

GetDOMVendor

83.1.3.2.2 TDOMVendor.DOMImplementation Method

Returns the IDOMImplementation (see page 7504) interface for the associated DOM implementation.

Pascal

```
function DOMImplementation: IDOMImplementation; virtual; abstract;
```

C++

```
virtual __fastcall IDOMImplementation DOMImplementation() = 0;
```

Description

DOMImplementation returns the top-level interface for a DOM implementation. This interface is the starting point for any application that uses the DOM implementation to parse and edit an XML document.

DOMImplementation is an abstract (pure virtual) method in TDOMVendor (see page 7466). Descendant classes override this method to return the IDOMImplementation (see page 7504) interface for the associated DOM implementation.

Note: For more information about the IDOMImplementation (see page 7504), see the W3C Document Object Model (DOM) Level 2 Specification or the documentation provided by your DOM vendor.

See Also

domimplementation (see page 7337)

Description (see page 7467)

83.1.4 TDOMVendorList Class

TDOMVendorList represents a collection of available DOM implementations.

Class Hierarchy

Pascal

```
TDOMVendorList = class;
```

C++

```
class TDOMVendorList;
```

File

xmldom

Description

TDOMVendorList is the type of the global DOMVendors (see page 7568) variable. It represents a collection of DOM implementations (TDOMVendor (see page 7466) objects).

TDOMVendorList introduces a single property, Vendors (see page 7471), that can be used to iterate through all the DOM vendors in the collection. It also introduces methods that can be used to add, delete, or locate vendors.

Note: Do not explicitly use TDOMVendorList methods to add or delete vendors from the global DOMVendors (see page 7568) variable. Instead, add or remove vendors from this global list by calling the global RegisterDOMVendor (see page 7562) and UnRegisterDOMVendor (see page 7563) procedures.

See Also

DOMVendors

TXMLDocument (see page 7299)

RegisterDOMVendor

TDOMVendor (see page 7466)

UnregisterDOMVendor

83.1.4.1 TDOMVendorList Members

The following tables list the members exposed by TDOMVendorList.

Protected Methods

	Name	Description
	GetVendors (see page 7470)	This is GetVendors, a member of class TDOMVendorList.

Public Methods

	Name	Description
	Add (see page 7469)	Adds a new DOM implementation to the end of the list.
	Count (see page 7469)	Returns the number of DOM vendors in the collection.
	Find (see page 7470)	Returns a vendor from the list, given its description.
	Remove (see page 7471)	Removes a specified vendor from the list.

Public Properties

	Name	Description
	Vendors (see page 7471)	Lists the DOM vendors maintained by this TDOMVendorList (see page 7468) object.

83.1.4.2 TDOMVendorList Methods

The methods of the TDOMVendorList class are listed here.

Protected Methods

	Name	Description
	GetVendors (see page 7470)	This is GetVendors, a member of class TDOMVendorList.

Public Methods

	Name	Description
	Add (see page 7469)	Adds a new DOM implementation to the end of the list.
	Count (see page 7469)	Returns the number of DOM vendors in the collection.
	Find (see page 7470)	Returns a vendor from the list, given its description.
	Remove (see page 7471)	Removes a specified vendor from the list.

83.1.4.2.1 TDOMVendorList.Add Method

Adds a new DOM implementation to the end of the list.

Pascal

```
procedure Add(const Vendor: TDOMVendor);
```

C++

```
__fastcall Add(const TDOMVendor Vendor);
```

Description

Call Add to add a DOM vendor to the end of the list.

Vendor is an object that provides access to the IDOMImplementation (see page 7504) interface for the new DOM vendor.

If the list already includes a DOM vendor with the same description as that supplied by Vendor, Add raises an exception.

See Also

Count

Vendors

Find

Remove

Description (see page 7467)

83.1.4.2.2 TDOMVendorList.Count Method

Returns the number of DOM vendors in the collection.

Pascal

```
function Count: Integer;
```

C++

```
__fastcall int Count();
```

Description

Call Count to determine the number of DOM implementations stored in the list. Count returns a value that can be used as an upper bound when iterating over the vendors using the Vendors (see page 7471) property.

Count increases when the Add (see page 7469) method adds a vendor to the list and decreases when the Remove (see page 7471) method removes a vendor from the list.

See Also

Vendors

Add

Remove

83.1.4.2.3 TDOMVendorList.Find Method

Returns a vendor from the list, given its description.

Pascal

```
function Find(const VendorDesc: string): TDOMVendor;
```

C++

```
__fastcall TDOMVendor Find(const UnicodeString VendorDesc);
```

Description

Call Find to access a vendor in the list, given its description. If there is no vendor in the list with the specified description, Find returns nil (Delphi) or NULL (C++).

VendorDesc is the string that is returned by the TDOMVendor (see page 7466) object's Description method.

Find returns a TDOMVendor (see page 7466) object, which can be used as a value for the DOMVendor property of a TXMLDocument component.

See Also

Vendors

Description (see page 7467)

DOMVendor (see page 7337)

83.1.4.2.4 TDOMVendorList.GetVendors Method

Pascal

```
function GetVendors(Index: Integer): TDOMVendor;
```

C++

```
__fastcall TDOMVendor GetVendors(int Index);
```

Description

This is GetVendors, a member of class TDOMVendorList.

83.1.4.2.5 TDOMVendorList.Remove Method

Removes a specified vendor from the list.

Pascal

```
procedure Remove(const Vendor: TDOMVendor);
```

C++

```
__fastcall Remove(const TDOMVendor Vendor);
```

Description

Remove removes the specified vendor from the list.

Vendor is the DOM vendor to remove from the list. If the list does not include a vendor with the same description as this parameter, Remove does nothing.

See Also

Count

Vendors

Find

Add

Description (see page 7467)

83.1.4.3 TDOMVendorList Properties

The properties of the TDOMVendorList class are listed here.

Public Properties

	Name	Description
	Vendors (see page 7471)	Lists the DOM vendors maintained by this TDOMVendorList (see page 7468) object.

83.1.4.3.1 TDOMVendorList.Vendors Property

Lists the DOM vendors maintained by this TDOMVendorList (see page 7468) object.

Pascal

```
property Vendors [Index: Integer]: TDOMVendor;
```

C++

```
__property TDOMVendor Vendors[int Index];
```

Description

Use Vendors to access the DOM vendors in this collection. Index is the index of the vendor. Its value ranges from 0 to one less than the value returned by the Count (see page 7469) method.

Note: In Delphi, Vendors is the default property for TDOMVendorList (see page 7468). This means that the property name can be omitted in code. That is, the statement

for i := 0 to DOMVendors. Count (see page 7469) do

StringList1.Add (see page 7469)(DOMVendors.Vendors[i].Description);

Can be written

for i := 0 to DOMVendors.Count (see page 7469) do

StringList1.Add (see page 7469)(DOMVendors (see page 7568)[i].Description);

Note: In C++, Vendors can be accessed using the [] operator, to achieve an affect similar to the default property in Delphi.

83.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IDOMAttr (see page 7473)	This is class xmldom.IDOMAttr.
	IDOMCDATASection (see page 7477)	This is class xmldom.IDOMCDATASection.
	IDOMCharacterData (see page 7478)	This is class xmldom.IDOMCharacterData.
	IDOMComment (see page 7482)	This is class xmldom.IDOMComment.
	IDOMDocument (see page 7482)	This is class xmldom.IDOMDocument.
	IDOMDocumentFragment (see page 7489)	This is class xmldom.IDOMDocumentFragment.
	IDOMDocumentType (see page 7490)	This is class xmldom.IDOMDocumentType.
	IDOMElement (see page 7494)	This is class xmldom.IDOMElement.
	IDOMEntity (see page 7501)	This is class xmldom.IDOMEntity.
	IDOMEntityReference (see page 7504)	This is class xmldom.IDOMEntityReference.
	IDOMImplementation (see page 7504)	This is class xmldom.IDOMImplementation.
	IDOMNamedNodeMap (see page 7506)	This is class xmldom.IDOMNamedNodeMap.
	IDOMNode (see page 7509)	IDOMNode is the DOM interface for a node in an XML document.
	IDOMNodeEx (see page 7523)	This is class xmldom.IDOMNodeEx.
	IDOMNodeList (see page 7526)	This is class xmldom.IDOMNodeList.
	IDOMNodeSelect (see page 7528)	This is class xmldom.IDOMNodeSelect.
	IDOMNotation (see page 7530)	This is class xmldom.IDOMNotation.
	IDOMParseError (see page 7532)	This is class xmldom.IDOMParseError.
	IDOMParseOptions (see page 7537)	This is class xmldom.IDOMParseOptions.
	IDOMPersist (see page 7541)	This is class xmldom.IDOMPersist.
	IDOMProcessingInstruction (see page 7545)	This is class xmldom.IDOMProcessingInstruction.
	IDOMText (see page 7548)	This is class xmldom.IDOMText.
	IDOMXMLProlog (see page 7550)	This is class xmldom.IDOMXMLProlog.
	IDOMXSLProcessor (see page 7553)	This is class xmldom.IDOMXSLProcessor.

83.2.1 IDOMAttr Interface

Class Hierarchy

Pascal

```
IDOMAttr = interface(IDOMNode);
```

C++

```
__interface IDOMAttr : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMAttr.

83.2.1.1 IDOMAttr Members

The following tables list the members exposed by IDOMAttr.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_name (see page 7475)	This is get_name, a member of class IDOMAttr.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_ownerElement (see page 7475)	This is get_ownerElement, a member of class IDOMAttr.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	get_specified (see page 7475)	This is get_specified, a member of class IDOMAttr.
	get_value (see page 7476)	This is get_value, a member of class IDOMAttr.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 7519)	Sets the value of the node.
	set_value (see page 7476)	This is set_value, a member of class IDOMAttr.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	name (see page 7476)	This is name, a member of class IDOMAttr.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.

	ownerElement (see page 7476)	This is ownerElement, a member of class IDOMAttr.
	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.
	specified (see page 7477)	This is specified, a member of class IDOMAttr.
	value (see page 7477)	This is value, a member of class IDOMAttr.

83.2.1.2 IDOMAttr Methods

The methods of the IDOMAttr class are listed here.

Public Methods

	Name	Description
	get_name (see page 7475)	This is get_name, a member of class IDOMAttr.
	get_ownerElement (see page 7475)	This is get_ownerElement, a member of class IDOMAttr.
	get_specified (see page 7475)	This is get_specified, a member of class IDOMAttr.
	get_value (see page 7476)	This is get_value, a member of class IDOMAttr.
	set_value (see page 7476)	This is set_value, a member of class IDOMAttr.

83.2.1.2.1 IDOMAttr.get_name Method

Pascal

```
function get_name: DOMString; safecall;
```

C++

```
__fastcall DOMString get_name();
```

Description

This is get_name, a member of class IDOMAttr.

83.2.1.2.2 IDOMAttr.get_ownerElement Method

Pascal

```
function get_ownerElement: IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement get_ownerElement();
```

Description

This is get_ownerElement, a member of class IDOMAttr.

83.2.1.2.3 IDOMAttr.get_specified Method

Pascal

```
function get_specified: WordBool; safecall;
```

C++

```
__fastcall WordBool get_specified();
```

Description

This is get_specified, a member of class IDOMAttr.

83.2.1.2.4 IDOMAttr.get_value Method

Pascal

```
function get_value: DOMString; safecall;
```

C++

```
__fastcall DOMString get_value();
```

Description

This is get_value, a member of class IDOMAttr.

83.2.1.2.5 IDOMAttr.set_value Method

Pascal

```
procedure set_value(const attributeValue: DOMString); safecall;
```

C++

```
__fastcall set_value(const DOMString attributeValue);
```

Description

This is set_value, a member of class IDOMAttr.

83.2.1.3 IDOMAttr Properties

The properties of the IDOMAttr class are listed here.

Public Properties

	Name	Description
R	name (see page 7476)	This is name, a member of class IDOMAttr.
R	ownerElement (see page 7476)	This is ownerElement, a member of class IDOMAttr.
R	specified (see page 7477)	This is specified, a member of class IDOMAttr.
	value (see page 7477)	This is value, a member of class IDOMAttr.

83.2.1.3.1 IDOMAttr.name Property

Pascal

```
property name: DOMString;
```

C++

```
__property DOMString name;
```

Description

This is name, a member of class IDOMAttr.

83.2.1.3.2 IDOMAttr.ownerElement Property

Pascal

```
property ownerElement: IDOMElement;
```

C++

```
__property IDOMElement ownerElement;
```

Description

This is ownerElement, a member of class IDOMAttr.

83.2.1.3.3 IDOMAttr.specified Property

Pascal

```
property specified: WordBool;
```

C++

```
__property WordBool specified;
```

Description

This is specified, a member of class IDOMAttr.

83.2.1.3.4 IDOMAttr.value Property

Pascal

```
property value: DOMString;
```

C++

```
__property DOMString value;
```

Description

This is value, a member of class IDOMAttr.

83.2.2 IDOMCDATASection Interface

Class Hierarchy

Pascal

```
IDOMCDATASection = interface(IDOMText);
```

C++

```
__interface IDOMCDATASection : public IDOMText;
```

File

xmldom

Description

This is class xmldom.IDOMCDATASection.

83.2.3 IDOMCharacterData Interface

Class Hierarchy

Pascal

```
IDOMCharacterData = interface(IDOMNode);
```

C++

```
__interface IDOMCharacterData : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMCharacterData.

83.2.3.1 IDOMCharacterData Members

The following tables list the members exposed by IDOMCharacterData.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	appendData (see page 7479)	This is appendData, a member of class IDOMCharacterData.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	deleteData (see page 7480)	This is deleteData, a member of class IDOMCharacterData.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_data (see page 7480)	This is get_data, a member of class IDOMCharacterData.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_length (see page 7480)	This is get_length, a member of class IDOMCharacterData.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	insertData (see page 7480)	This is insertData, a member of class IDOMCharacterData.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.

	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	replaceData (see page 7480)	This is replaceData, a member of class IDOMCharacterData.
	set_data (see page 7481)	This is set_data, a member of class IDOMCharacterData.
	set_nodeValue (see page 7519)	Sets the value of the node.
	substringData (see page 7481)	This is substringData, a member of class IDOMCharacterData.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
	data (see page 7481)	This is data, a member of class IDOMCharacterData.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	length (see page 7481)	This is length, a member of class IDOMCharacterData.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.

83.2.3.2 IDOMCharacterData Methods

The methods of the IDOMCharacterData class are listed here.

Public Methods

	Name	Description
	appendData (see page 7479)	This is appendData, a member of class IDOMCharacterData.
	deleteData (see page 7480)	This is deleteData, a member of class IDOMCharacterData.
	get_data (see page 7480)	This is get_data, a member of class IDOMCharacterData.
	get_length (see page 7480)	This is get_length, a member of class IDOMCharacterData.
	insertData (see page 7480)	This is insertData, a member of class IDOMCharacterData.
	replaceData (see page 7480)	This is replaceData, a member of class IDOMCharacterData.
	set_data (see page 7481)	This is set_data, a member of class IDOMCharacterData.
	substringData (see page 7481)	This is substringData, a member of class IDOMCharacterData.

83.2.3.2.1 IDOMCharacterData.appendData Method

Pascal

```
procedure appendData(const data: DOMString); safecall;
```

C++

```
__fastcall appendData(const DOMString data);
```

Description

This is appendData, a member of class IDOMCharacterData.

83.2.3.2.2 IDOMCharacterData.deleteData Method

Pascal

```
procedure deleteData(offset: Integer; count: Integer); safecall;
```

C++

```
__fastcall deleteData(int offset, int count);
```

Description

This is deleteData, a member of class IDOMCharacterData.

83.2.3.2.3 IDOMCharacterData.get_data Method

Pascal

```
function get_data: DOMString; safecall;
```

C++

```
__fastcall DOMString get_data();
```

Description

This is get_data, a member of class IDOMCharacterData.

83.2.3.2.4 IDOMCharacterData.get_length Method

Pascal

```
function get_length: Integer; safecall;
```

C++

```
__fastcall int get_length();
```

Description

This is get_length, a member of class IDOMCharacterData.

83.2.3.2.5 IDOMCharacterData.insertData Method

Pascal

```
procedure insertData(offset: Integer; const data: DOMString); safecall;
```

C++

```
__fastcall insertData(int offset, const DOMString data);
```

Description

This is insertData, a member of class IDOMCharacterData.

83.2.3.2.6 IDOMCharacterData.replaceData Method

Pascal

```
procedure replaceData(offset: Integer; count: Integer; const data: DOMString); safecall;
```

C++

```
__fastcall replaceData(int offset, int count, const DOMString data);
```

Description

This is replaceData, a member of class IDOMCharacterData.

83.2.3.2.7 IDOMCharacterData.set_data Method

Pascal

```
procedure set_data(const data: DOMString); safecall;
```

C++

```
__fastcall set_data(const DOMString data);
```

Description

This is set_data, a member of class IDOMCharacterData.

83.2.3.2.8 IDOMCharacterData.substringData Method

Pascal

```
function substringData(offset: Integer; count: Integer): DOMString; safecall;
```

C++

```
__fastcall DOMString substringData(int offset, int count);
```

Description

This is substringData, a member of class IDOMCharacterData.

83.2.3.3 IDOMCharacterData Properties

The properties of the IDOMCharacterData class are listed here.

Public Properties

	Name	Description
	data (see page 7481)	This is data, a member of class IDOMCharacterData.
R	length (see page 7481)	This is length, a member of class IDOMCharacterData.

83.2.3.3.1 IDOMCharacterData.data Property

Pascal

```
property data: DOMString;
```

C++

```
__property DOMString data;
```

Description

This is data, a member of class IDOMCharacterData.

83.2.3.3.2 IDOMCharacterData.length Property

Pascal

```
property length: Integer;
```

C++

```
__property int length;
```

Description

This is length, a member of class IDOMCharacterData.

83.2.4 IDOMComment Interface

Class Hierarchy

Pascal

```
IDOMComment = interface(IDOMCharacterData);
```

C++

```
__interface IDOMComment : public IDOMCharacterData;
```

File

xmldom

Description

This is class xmldom.IDOMComment.

83.2.5 IDOMDocument Interface

Class Hierarchy

Pascal

```
IDOMDocument = interface(IDOMNode);
```

C++

```
__interface IDOMDocument : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMDocument.

83.2.5.1 IDOMDocument Members

The following tables list the members exposed by IDOMDocument.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	createAttribute (see page 7484)	This is createAttribute, a member of class IDOMDocument.
	createAttributeNS (see page 7485)	This is createAttributeNS, a member of class IDOMDocument.
	createCDATASection (see page 7485)	This is createCDATASection, a member of class IDOMDocument.
	createComment (see page 7485)	This is createComment, a member of class IDOMDocument.
	createDocumentFragment (see page 7485)	This is createDocumentFragment, a member of class IDOMDocument.
	createElement (see page 7485)	This is createElement, a member of class IDOMDocument.
	createElementNS (see page 7486)	This is createElementNS, a member of class IDOMDocument.
	createEntityReference (see page 7486)	This is createEntityReference, a member of class IDOMDocument.
	createProcessingInstruction (see page 7486)	This is createProcessingInstruction, a member of class IDOMDocument.
	createTextNode (see page 7486)	This is createTextNode, a member of class IDOMDocument.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_doctype (see page 7487)	This is get_doctype, a member of class IDOMDocument.
	get_documentElement (see page 7487)	This is get_documentElement, a member of class IDOMDocument.
	get_domImplementation (see page 7487)	This is get_domImplementation, a member of class IDOMDocument.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.
	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	getElementById (see page 7487)	This is getElementById, a member of class IDOMDocument.
	getElementsByTagName (see page 7488)	This is getElementsByTagName, a member of class IDOMDocument.
	getElementsByTagNameNS (see page 7488)	This is getElementsByTagNameNS, a member of class IDOMDocument.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	importNode (see page 7488)	This is importNode, a member of class IDOMDocument.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	set_documentElement (see page 7488)	This is set_documentElement, a member of class IDOMDocument.
	set_nodeValue (see page 7519)	Sets the value of the node.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
R	doctype (see page 7489)	This is doctype, a member of class IDOMDocument.
	documentElement (see page 7489)	This is documentElement, a member of class IDOMDocument.

	domImplementation (see page 7489)	This is domImplementation, a member of class IDOMDocument.
	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
	localName (see page 7521)	This is localName, a member of class IDOMNode.
	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.

83.2.5.2 IDOMDocument Methods

The methods of the IDOMDocument class are listed here.

Public Methods

	Name	Description
	createAttribute (see page 7484)	This is createAttribute, a member of class IDOMDocument.
	createAttributeNS (see page 7485)	This is createAttributeNS, a member of class IDOMDocument.
	createCDATASection (see page 7485)	This is createCDATASection, a member of class IDOMDocument.
	createComment (see page 7485)	This is createComment, a member of class IDOMDocument.
	createDocumentFragment (see page 7485)	This is createDocumentFragment, a member of class IDOMDocument.
	createElement (see page 7485)	This is createElement, a member of class IDOMDocument.
	createElementNS (see page 7486)	This is createElementNS, a member of class IDOMDocument.
	createEntityReference (see page 7486)	This is createEntityReference, a member of class IDOMDocument.
	createProcessingInstruction (see page 7486)	This is createProcessingInstruction, a member of class IDOMDocument.
	createTextNode (see page 7486)	This is createTextNode, a member of class IDOMDocument.
	get_doctype (see page 7487)	This is get_doctype, a member of class IDOMDocument.
	get_documentElement (see page 7487)	This is get_documentElement, a member of class IDOMDocument.
	get_domImplementation (see page 7487)	This is get_domImplementation, a member of class IDOMDocument.
	getElementById (see page 7487)	This is getElementById, a member of class IDOMDocument.
	getElementsByTagName (see page 7488)	This is getElementsByTagName, a member of class IDOMDocument.
	getElementsByTagNameNS (see page 7488)	This is getElementsByTagNameNS, a member of class IDOMDocument.
	importNode (see page 7488)	This is importNode, a member of class IDOMDocument.
	set_documentElement (see page 7488)	This is set_documentElement, a member of class IDOMDocument.

83.2.5.2.1 IDOMDocument.createAttribute Method

Pascal

```
function createAttribute(const name: DOMString): IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr createAttribute(const DOMString name);
```

Description

This is createAttribute, a member of class IDOMDocument.

83.2.5.2.2 IDOMDocument.createAttributeNS Method

Pascal

```
function createAttributeNS(const namespaceURI: DOMString; const qualifiedName: DOMString):
IDOMAttr; safecall;
```

C++

```
__fastcall IDOMAttr createAttributeNS(const DOMString namespaceURI, const DOMString
qualifiedName);
```

Description

This is createAttributeNS, a member of class IDOMDocument.

83.2.5.2.3 IDOMDocument.createCDATASection Method

Pascal

```
function createCDATASection(const data: DOMString): IDOMCDATASection; safecall;
```

C++

```
__fastcall IDOMCDATASection createCDATASection(const DOMString data);
```

Description

This is createCDATASection, a member of class IDOMDocument.

83.2.5.2.4 IDOMDocument.createComment Method

Pascal

```
function createComment(const data: DOMString): IDOMComment; safecall;
```

C++

```
__fastcall IDOMComment createComment(const DOMString data);
```

Description

This is createComment, a member of class IDOMDocument.

83.2.5.2.5 IDOMDocument.createDocumentFragment Method

Pascal

```
function createDocumentFragment: IDOMDocumentFragment; safecall;
```

C++

```
__fastcall IDOMDocumentFragment createDocumentFragment();
```

Description

This is createDocumentFragment, a member of class IDOMDocument.

83.2.5.2.6 IDOMDocument.createElement Method

Pascal

```
function createElement(const tagName: DOMString): IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement createElement(const DOMString tagName);
```

Description

This is createElement, a member of class IDOMDocument.

83.2.5.2.7 IDOMDocument.createElementNS Method

Pascal

```
function createElementNS(const namespaceURI: DOMString; const qualifiedName: DOMString):
IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement createElementNS(const DOMString namespaceURI, const DOMString
qualifiedName);
```

Description

This is createElementNS, a member of class IDOMDocument.

83.2.5.2.8 IDOMDocument.createEntityReference Method

Pascal

```
function createEntityReference(const name: DOMString): IDOMEntityReference; safecall;
```

C++

```
__fastcall IDOMEntityReference createEntityReference(const DOMString name);
```

Description

This is createEntityReference, a member of class IDOMDocument.

83.2.5.2.9 IDOMDocument.createProcessingInstruction Method

Pascal

```
function createProcessingInstruction(const target: DOMString; const data: DOMString):
IDOMProcessingInstruction; safecall;
```

C++

```
__fastcall IDOMProcessingInstruction createProcessingInstruction(const DOMString target, const
DOMString data);
```

Description

This is createProcessingInstruction, a member of class IDOMDocument.

83.2.5.2.10 IDOMDocument.createTextNode Method

Pascal

```
function createTextNode(const data: DOMString): IDOMText; safecall;
```

C++

```
__fastcall IDOMText createTextNode(const DOMString data);
```

Description

This is createTextNode, a member of class IDOMDocument.

83.2.5.2.11 IDOMDocument.get_doctype Method

Pascal

```
function get_doctype: IDOMDocumentType; safecall;
```

C++

```
__fastcall IDOMDocumentType get_doctype();
```

Description

This is get_doctype, a member of class IDOMDocument.

83.2.5.2.12 IDOMDocument.get_documentElement Method

Pascal

```
function get_documentElement: IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement get_documentElement();
```

Description

This is get_documentElement, a member of class IDOMDocument.

83.2.5.2.13 IDOMDocument.get_domImplementation Method

Pascal

```
function get_domImplementation: IDOMImplementation; safecall;
```

C++

```
__fastcall IDOMImplementation get_domImplementation();
```

Description

This is get_domImplementation, a member of class IDOMDocument.

83.2.5.2.14 IDOMDocument.getElementById Method

Pascal

```
function getElementById(const elementId: DOMString): IDOMElement; safecall;
```

C++

```
__fastcall IDOMElement getElementById(const DOMString elementId);
```

Description

This is getElementById, a member of class IDOMDocument.

83.2.5.2.15 IDOMDocument.getElementsByTagName Method

Pascal

```
function getElementsByTagName(const tagName: DOMString): IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList getElementsByTagName(const DOMString tagName);
```

Description

This is getElementsByTagName, a member of class IDOMDocument.

83.2.5.2.16 IDOMDocument.getElementsByTagNameNS Method

Pascal

```
function getElementsByTagNameNS(const namespaceURI: DOMString; const localName: DOMString):
IDOMNodeList; safecall;
```

C++

```
__fastcall IDOMNodeList getElementsByTagNameNS(const DOMString namespaceURI, const DOMString
localName);
```

Description

This is getElementsByTagNameNS, a member of class IDOMDocument.

83.2.5.2.17 IDOMDocument.importNode Method

Pascal

```
function importNode(importedNode: IDOMNode; deep: WordBool): IDOMNode; safecall;
```

C++

```
__fastcall IDOMNode importNode(IDOMNode importedNode, WordBool deep);
```

Description

This is importNode, a member of class IDOMDocument.

83.2.5.2.18 IDOMDocument.set_documentElement Method

Pascal

```
procedure set_documentElement(const Element: IDOMElement); safecall;
```

C++

```
__fastcall set_documentElement(const IDOMElement Element);
```

Description

This is set_documentElement, a member of class IDOMDocument.

83.2.5.3 IDOMDocument Properties

The properties of the IDOMDocument class are listed here.

Public Properties

	Name	Description
	doctype (see page 7489)	This is doctype, a member of class IDOMDocument.
	documentElement (see page 7489)	This is documentElement, a member of class IDOMDocument.
	domImplementation (see page 7489)	This is domImplementation, a member of class IDOMDocument.

83.2.5.3.1 IDOMDocument.doctype Property

Pascal

```
property doctype: IDOMDocumentType;
```

C++

```
__property IDOMDocumentType doctype;
```

Description

This is doctype, a member of class IDOMDocument.

83.2.5.3.2 IDOMDocument.documentElement Property

Pascal

```
property documentElement: IDOMElement;
```

C++

```
__property IDOMElement documentElement;
```

Description

This is documentElement, a member of class IDOMDocument.

83.2.5.3.3 IDOMDocument.domImplementation Property

Pascal

```
property domImplementation: IDOMImplementation;
```

C++

```
__property IDOMImplementation domImplementation;
```

Description

This is domImplementation, a member of class IDOMDocument.

83.2.6 IDOMDocumentFragment Interface

Class Hierarchy

Pascal

```
IDOMDocumentFragment = interface(IDOMNode);
```

C++

```
__interface IDOMDocumentFragment : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMDocumentFragment.

83.2.7 IDOMDocumentType Interface

Class Hierarchy

Pascal

```
IDOMDocumentType = interface(IDOMNode);
```

C++

```
__interface IDOMDocumentType : public IDOMNode;
```

File

xmldom

Description

This is class xmldom.IDOMDocumentType.

83.2.7.1 IDOMDocumentType Members

The following tables list the members exposed by IDOMDocumentType.

Public Methods

	Name	Description
	_AddRef (see page 3504)	Increments the reference count for this interface.
	_Release (see page 3504)	Decrements the reference count for this interface.
	appendChild (see page 7511)	This is appendChild, a member of class IDOMNode.
	cloneNode (see page 7512)	This is cloneNode, a member of class IDOMNode.
	get_attributes (see page 7512)	Returns the value of the get_attributes property.
	get_childNodes (see page 7512)	Returns the value of the get_childNodes property.
	get_entities (see page 7492)	This is get_entities, a member of class IDOMDocumentType.
	get_firstChild (see page 7512)	Returns the value of the get_firstChild property.
	get_internalSubset (see page 7492)	This is get_internalSubset, a member of class IDOMDocumentType.
	get_lastChild (see page 7513)	Returns the value of the get_lastChild property.
	get_localName (see page 7513)	Returns the value of the get_localName property.
	get_name (see page 7492)	This is get_name, a member of class IDOMDocumentType.
	get_namespaceURI (see page 7513)	Returns the value of the get_namespaceURI property.
	get_nextSibling (see page 7514)	Returns the value of the get_nextSibling property.
	get_nodeName (see page 7514)	Returns the value of the get_nodeName property.
	get_nodeType (see page 7514)	Returns the value of the get_nodeType property.
	get_nodeValue (see page 7515)	Returns the value of the get_nodeValue property.
	get_notations (see page 7492)	This is get_notations, a member of class IDOMDocumentType.
	get_ownerDocument (see page 7515)	Returns the value of the get_ownerDocument property.
	get_parentNode (see page 7515)	Returns the value of the get_parentNode property.

	get_prefix (see page 7515)	Returns the value of the get_prefix property.
	get_previousSibling (see page 7516)	Returns the value of the get_previousSibling property.
	get_publicId (see page 7492)	This is get_publicId, a member of class IDOMDocumentType.
	get_systemId (see page 7493)	This is get_systemId, a member of class IDOMDocumentType.
	hasChildNodes (see page 7516)	Indicates whether the node has any child nodes.
	insertBefore (see page 7516)	Inserts a new child node before a specified child of the node.
	normalize (see page 7517)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	QueryInterface (see page 3505)	Returns a reference to a specified interface if the object supports that interface.
	removeChild (see page 7518)	Removes a child node from this node.
	replaceChild (see page 7518)	Replaces one of this node's children with a specified node.
	set_nodeValue (see page 7519)	Sets the value of the node.
	supports (see page 7519)	Indicates whether the node supports a specified feature.

Public Properties

	Name	Description
R	attributes (see page 7520)	This is attributes, a member of class IDOMNode.
R	childNodes (see page 7520)	This is childNodes, a member of class IDOMNode.
R	entities (see page 7493)	This is entities, a member of class IDOMDocumentType.
R	firstChild (see page 7520)	This is firstChild, a member of class IDOMNode.
R	internalSubset (see page 7493)	This is internalSubset, a member of class IDOMDocumentType.
R	lastChild (see page 7520)	This is lastChild, a member of class IDOMNode.
R	localName (see page 7521)	This is localName, a member of class IDOMNode.
R	name (see page 7494)	This is name, a member of class IDOMDocumentType.
R	namespaceURI (see page 7521)	This is namespaceURI, a member of class IDOMNode.
R	nextSibling (see page 7521)	This is nextSibling, a member of class IDOMNode.
R	nodeName (see page 7521)	This is nodeName, a member of class IDOMNode.
R	nodeType (see page 7521)	This is nodeType, a member of class IDOMNode.
	nodeValue (see page 7522)	This is nodeValue, a member of class IDOMNode.
R	notations (see page 7494)	This is notations, a member of class IDOMDocumentType.
R	ownerDocument (see page 7522)	This is ownerDocument, a member of class IDOMNode.
R	parentNode (see page 7522)	This is parentNode, a member of class IDOMNode.
R	prefix (see page 7522)	This is prefix, a member of class IDOMNode.
R	previousSibling (see page 7523)	This is previousSibling, a member of class IDOMNode.
R	publicId (see page 7494)	This is publicId, a member of class IDOMDocumentType.
R	systemId (see page 7494)	This is systemId, a member of class IDOMDocumentType.

83.2.7.2 IDOMDocumentType Methods

The methods of the IDOMDocumentType class are listed here.

Public Methods

	Name	Description
	get_entities (see page 7492)	This is get_entities, a member of class IDOMDocumentType.
	get_internalSubset (see page 7492)	This is get_internalSubset, a member of class IDOMDocumentType.
	get_name (see page 7492)	This is get_name, a member of class IDOMDocumentType.
	get_notations (see page 7492)	This is get_notations, a member of class IDOMDocumentType.
	get_publicId (see page 7492)	This is get_publicId, a member of class IDOMDocumentType.
	get_systemId (see page 7493)	This is get_systemId, a member of class IDOMDocumentType.

83.2.7.2.1 IDOMDocumentType.get_entities Method
