Adapter (see page 5418)

HasParent (see page 5414)

54.1.34.2.9 TAdapterSubComponent.GetVariable Method

Returns a child item from this list, given its position in the list of child items with variable names.

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

FindNamedVariable (see page 5409) indexes into the list of child items that have variable names (the VariablesInUse (see page 5419) property) and returns the item in the specified position.

I is the index of the child item, where 0 is the first item that can be reference from server-side script, 1 is the second item, and so on. The GetVariableCount (see page 5413) method returns an upper limit for this index.

See Also

VariablesInUse (see page 5419)

FindNamedVariable (see page 5409)

FindVariable (see page 5410)

GetVariableCount (see page 5413)

54.1.34.2.10 TAdapterSubComponent.GetVariableCount Method

Indicates the number of items in this list that can be accessed from server-side script.

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

GetVariableCount returns the number of child items that have variable names. This is the number of items in the VariablesInUse (see page 5419) proprety. Use GetVariableCount as an upper bound to the I parameter of the GetVariable (see page 5412) method.

See Also

VariablesInUse (see page 5419)

GetVariable (see page 5412)

54.1.34.2.11 TAdapterSubComponent.GetVariablesInUse Method

Returns the value of the VariablesInUse (see page 5419) property.

Pascal

```
function GetVariablesInUse: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList GetVariablesInUse();
```

Description

GetVariablesInUse is the protected read implementation for the VariablesInUse (see page 5419) property.

In TAdapterSubComponent (see page 5406), GetVariablesInUse calls the GetWebComponents method to return a list of all the items in the list. Descendant classes can override this method to return only those items that meet a certain criterion.

See Also

VariablesInUse (see page 5419)

GetWebComponents (see page 6065)

54.1.34.2.12 TAdapterSubComponent.GetWebComponentNodeName Method

Returns a string that indicates the type of items in this collection.

Pascal

```
function GetWebComponentNodeName: string;
```

C++

```
__fastcall UnicodeString GetWebComponentNodeName();
```

Description

GetWebComponentNodeName returns the label for the type of items in the collection. For example, if the TAdapterSubComponent (see page 5406) descendant holds the fields belonging to an adapter, GetWebComponentNodeName returns the string 'Fields'. If the TAdapterSubComponent (see page 5406) descendant holds the actions belonging to an adapter, GetWebComponentNodeName returns the string 'Actions'.

GetWebComponentNodeName delegates the task of supplying a name to the virtual ImplGetWebComponentNodeName (see page 5415) method.

See Also

ImplGetWebComponentNodeName (see page 5415)

54.1.34.2.13 TAdapterSubComponent.HasParent Method

Indicates whether this component has an associated adapter.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TAdapterSubComponent (see page 5406) overrides the HasParent method that is introduced in TComponent for the streaming system that loads and saves components. It returns true if the Adapter (see page 5418) property is not nil (Delphi) or NULL (C++).

If the TAdapterSubComponent (see page 5406) object has a parent, that parent component is responsible for writing this component to a stream.

See Also

HasParent

GetParentComponent (see page 5412)

Adapter (see page 5418)

54.1.34.2.14 TAdapterSubComponent.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass (see page 5408) method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass (see page 5408) method calls ImplCanAddClass to determine whether an object of a specified type can be added to this collection.

AParent is the TAdapterSubComponent (see page 5406) descendant to which the Web item will be added.

AClass is the class of the proposed child item.

ImplCanAddClass returns true if the TAdapterSubComponent (see page 5406) descendant can include a child of type AClass,

false otherwise.

In TAdapterSubComponent (see page 5406), ImplCanAddClass always returns false, disallowing any child items. Descendant classes override this method to conditionally allow those fields or actions that are appropriate to the associated adapter.

See Also

CanAddClass (see page 5408)

Adapter (see page 5418)

54.1.34.2.15 TAdapterSubComponent.ImplGetWebComponentNodeName Method

Provides the underlying implementation for the GetWebComponentNodeName (see page 5413) method.

Pascal

```
function ImplGetWebComponentNodeName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetWebComponentNodeName();
```

Description

The GetWebComponentNodeName (see page 5413) method calls ImplGetWebComponentNodeName to obtain a label for the type of items in the collection.

ImplGetWebComponentNodeName returns the name of the type of items in this list.

In TAdapterSubComponent (see page 5406), ImplGetWebComponentNodeName returns an empty string. Descendant classes created for specific types of elements override this method to return an appropriate string such as 'Fields' or 'Actions'.

See Also

GetWebComponentNodeName (see page 5413)

54.1.34.2.16 TAdapterSubComponent.NextIteration Method

Changes the current object to the next item that has a variable name.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

NextIteration is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method is called to move to the next item in the list. After a call to NextIteration, the GetCurrentObject (see page 5411) method returns the next item in the VariablesInUse (see page 5419) list.

OwnerData is a pointer to object-specific information returned by the last call to the StartIterator (see page 5418) or NextIteration method. TAdapterSubComponent (see page 5406) does not use the OwnerData parameter.

NextIteration returns true if it successfully moves to a new item, false if there was no addition item to which it could move.

See Also

StartIterator (see page 5418)

EndIterator (see page 5409)

GetCurrentObject (see page 5411)

VariablesInUse (see page 5419)

54.1.34.2.17 TAdapterSubComponent.NotifyAdapterChange Method

Notifies the associated adapter when the list of items changes.

Pascal

```
procedure NotifyAdapterChange;
```

C++

```
__fastcall NotifyAdapterChange();
```

Description

TAdapterSubComponent (see page 5406) descendants call NotifyAdapterChange internally when the items in this list change. NotifyAdapterChange passes this notification on to the associated adapter so that it can make any necessary adjustments.

See Also

Adapter (see page 5418)

NotifyAdapterChange (see page 5565)

54.1.34.2.18 TAdapterSubComponent.ReadState Method

Reads the component's published properties, stored data, and owned components from a reader object.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

ReadState is part of a sequence of calls used by the streaming system that loads and saves components. It reads the values of all the component's published properties, stored data, and owned components from the reader object passed in Reader. Do not call ReadState directly.

TAdapterSubComponent (see page 5406) overrides ReadState to obtain the parent component from the reader, which it assigns as the value of the Adapter (see page 5418) property.

Note: Any descendant classes overriding ReadState should end with a call to the inherited ReadState method.

See Also

GetParentComponent (see page 5412)

Adapter (see page 5418)

54.1.34.2.19 TAdapterSubComponent.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); override;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

GetDefaultWebComponents (see page 5411) supplies the default set of child items for this component. As implemented in TAdapterSubComponent (see page 5406), GetDefaultWebComponents (see page 5411) always returns nil (Delphi) or NULL (C++) because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions (see page 5231) and TAdapterDefaultFields (see page 5237)) override this method to return the list of default fields or actions.

SetDefaultWebComponents assigns the default set of child items for this component. As implemented in TWebContainerComponent (see page 6063), SetDefaultWebComponents does nothing because this class represents only a single list of items. Descendants that represent the default fields or actions of the associated adapter (TAdapterDefaultActions (see page 5231) and TAdapterDefaultFields (see page 5237)) override this method to store the list of default fields or actions.

See Also

GetDefaultWebComponents (see page 5411)

IsDefaultField (see page 6042)

54.1.34.2.20 TAdapterSubComponent.SetParentComponent Method

Sets the Adapter (see page 5418) property to be the same as this component's parent.

Pascal

```
procedure SetParentComponent(AParent: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * AParent);
```

Description

TAdapterSubComponent (see page 5406) overrides the SetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It sets the Adapter (see page 5418) property to AParent, so that it is the same as the parent that loads and saves this component.

See Also

SetParentComponent

HasParent (see page 5414)

Adapter (see page 5418)

54.1.34.2.21 TAdapterSubComponent.SetWebParent Method

Introduces a method to associate this component with an adapter.

Pascal

```
procedure SetWebParent(const Value: TComponent); virtual;
```

C++

```
virtual __fastcall SetWebParent(const TComponent * Value);
```

Description

TAdapterSubComponent (see page 5406) introduces SetWebParent as a virtual method for setting the read-only Adapter (

see page 5418) property.

Value is the adapter component that acts as a parent to this collection.

In TAdapterSubComponent (see page 5406), SetWebParent does nothing. Descendant classes override this method to set the Adapter (see page 5418) property and populate the list with actions or fields appropriate to that adapter.

See Also

Adapter (see page 5418)

54.1.34.2.22 TAdapterSubComponent.StartIterator Method

Makes the first child item with a variable name the current object.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

StartIterator is part of the support that allows server-side script to use an enumerator to iterate over all the child items in the collection. This method is called to begin iterating over the items in the list. After a call to StartIterator, the GetCurrentObject (see page 5411) method returns the first item in the VariablesInUse (see page 5419) list.

OwnerData is a pointer to object-specific information returned that should be passed to the NextIteration (see page 5415) or EndIterator (see page 5409) method. TAdapterSubComponent (see page 5406) does not use the OwnerData parameter.

StartIterator returns true if it successfully moves to the first item, false if the VariablesInUse (see page 5419) property does not list any items.

See Also

NextIteration (see page 5415)

EndIterator (see page 5409)

GetCurrentObject (see page 5411)

VariablesInUse (see page 5419)

54.1.34.3 TAdapterSubComponent Properties

The properties of the TAdapterSubComponent class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 5418)	Indicates the adapter that uses this object to manage its fields or actions.
	VariablesInUse (see page 5419)	Lists those fields or actions in the collection for which variables are defined.

54.1.34.3.1 TAdapterSubComponent.Adapter Property

Indicates the adapter that uses this object to manage its fields or actions.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Read (see page 3634) Adapter to access the adapter component that uses this collection. This TAdapterSubComponent (see page 5406) object is the value of the adapter's Data or Actions property.

See Also

Actions (see page 5572)

Data (see page 5572)

Actions (see page 5746)

Data (see page 5747)

54.1.34.3.2 TAdapterSubComponent.VariablesInUse Property

Lists those fields or actions in the collection for which variables are defined.

Pascal

```
property VariablesInUse: TWebComponentList;
```

C++

```
__property TWebComponentList VariablesInUse;
```

Description

Read (see page 3634) VariablesInUse to access the child items (fields or actions) that can be addressed from server-side script.

TAdapterSubComponent (see page 5406) implements VariablesInUse to include all of the fields or actions that have been added to the list. Descendant classes can override this property to provide a different set of items, such as the default fields or actions of the associated adapter.

See Also

FindNamedVariable (see page 5409)

FindVariable (see page 5410)

GetVariable (see page 5412)

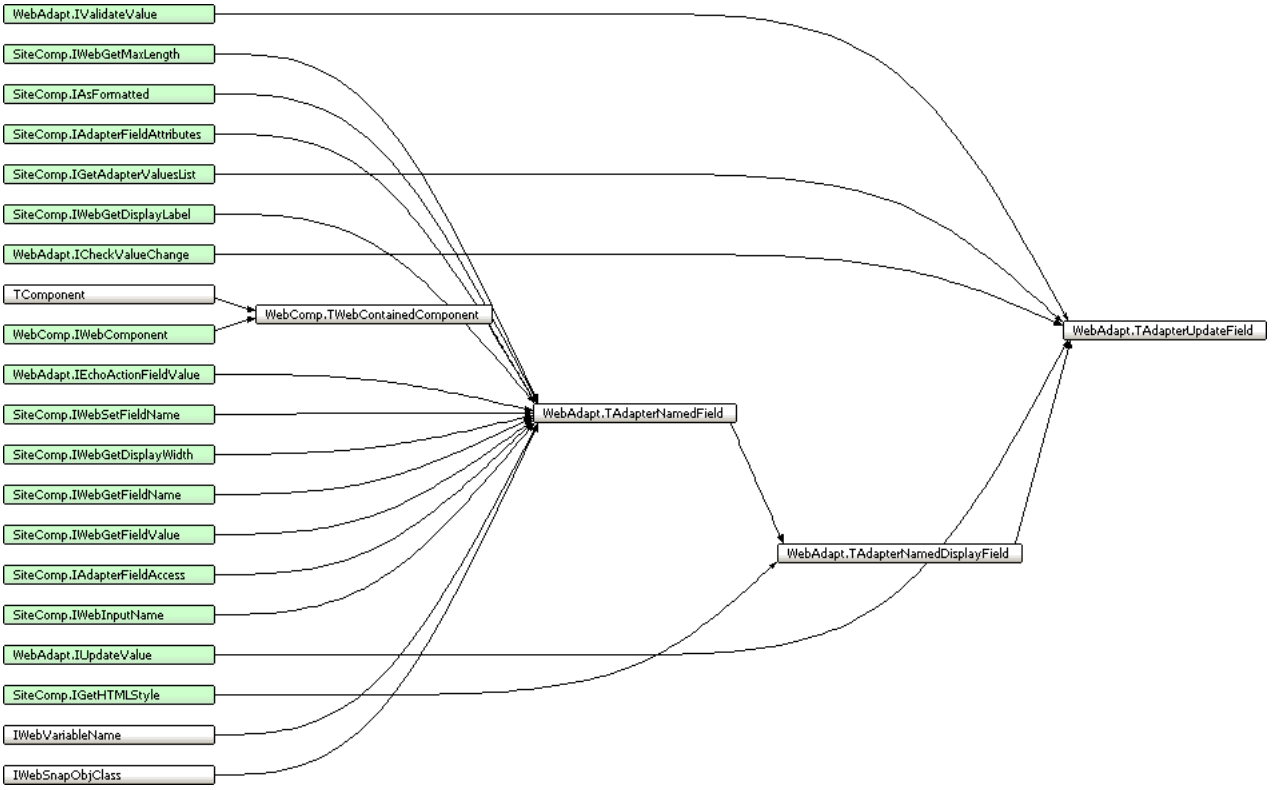
GetVariableCount (see page 5413)

FindVariableContainer (see page 5410)

54.1.35 TAdapterUpdateField Class

TAdapterUpdateField is a base class for adapter field components that support data entry into an HTML form.

Class Hierarchy



Pascal

```
TAdapterUpdateField = class(TAdapterNamedDisplayField, IGetAdapterValuesList, IUpdateValue,
IValidateValue, ICheckValueChange);
```

C++

```
class TAdapterUpdateField : public TAdapterNamedDisplayField, public IGetAdapterValuesList,
public IUpdateValue, public IValidateValue, public ICheckValueChange;
```

File

WebAdapt

Description

TAdapterUpdateField implements the interfaces necessary to support field validation and updating. Descendant classes support different types of data that can be entered by the user (for example, image upload, file upload, single value, multiple value, memo and Boolean).

See Also

TAdapterNamedDisplayField (see page 5343)

TCustomAdapterField (see page 5597)

TAdapter (see page 5190)

54.1.35.1 TAdapterUpdateField Members

The following tables list the members exposed by TAdapterUpdateField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5424)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
	ConvertValue (see page 5425)	Retrieves a value entered by the end-user.
	ConvertValueCount (see page 5425)	Retrieves the number of values entered by the end-user.
	ConvertValues (see page 5425)	Retrieves a value entered by the end-user.
	DoOnValidateValue (see page 5426)	Validates field values entered by the end-user.
	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5426)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5346)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 5347)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5347)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 5426)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetValueCount (see page 5427)	Provides the number of values associated with this adapter field.
	GetValues (see page 5427)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5348)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5348)	Suggests a view mode for this adapter field.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5427)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5428)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetDisplayLabel (see page 5428)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5428)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5429)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.

	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5349)	Implements interface access to the Required (see page 5351) property.
	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5363)	Gets the value of this adapter field as a Variant (see page 3421).
	ImplGetVariableName (see page 5429)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5429)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5429)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5430)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 5430)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5430)	Indicates whether this adapter field can support multiple values.
	Notification (see page 5431)	Clears references to a deleted component.
	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5349)	SetDisplayLabel sets the value of the DisplayLabel (see page 5350) property.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	UpdateValue (see page 5431)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5431)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5368)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5433)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5433)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5423)	Creates an instance of TAdapterUpdateField (see page 5419).
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.

	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5350)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5350)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
	ReadOnly (see page 5351)	Indicates whether this adapter field is read-only.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 5432)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5432)	Associates a list of values with the adapter field.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.35.2 TAdapterUpdateField.Create Constructor

Creates an instance of TAdapterUpdateField (see page 5419).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterUpdateField(TComponent * AOwner);
```

Description

Do not call TAdapterUpdateField (see page 5419). It will be called automatically when the TAdapterUpdateField (see page 5419) object is created.

Create

54.1.35.3 TAdapterUpdateField Methods

The methods of the TAdapterUpdateField class are listed here.

Protected Methods

	Name	Description
	CheckValueChange (see page 5424)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
V	ConvertValue (see page 5425)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5425)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5425)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5426)	Validates field values entered by the end-user.
	GetAdapterValuesList (see page 5426)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
V	GetInputStyleType (see page 5426)	Indicates the preferred HTML element to use when editing this adapter field's value.
V	GetValueCount (see page 5427)	Provides the number of values associated with this adapter field.
V	GetValues (see page 5427)	Returns one of the values provided by this adapter field.
V	ImplAsFormatted (see page 5427)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 5428)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplGetDisplayLabel (see page 5428)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 5428)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 5429)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplGetVariableName (see page 5429)	Gets the name used to access this adapter field with server-side script.
V	ImplSetEchoActionFieldValue (see page 5429)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplSetFieldName (see page 5429)	Sets the name used to access this adapter field with server-side script.
V	ImplUpdateValue (see page 5430)	Updates the adapter field with value(s) entered by the end-user.
V	ImplValidateValue (see page 5430)	Validates values(s) entered by the end-user.
V	IsMultiValueField (see page 5430)	Indicates whether this adapter field can support multiple values.
V	Notification (see page 5431)	Clears references to a deleted component.
	UpdateValue (see page 5431)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5431)	Validates values(s) entered by the end-user.

54.1.35.3.1 TAdapterUpdateField.CheckValueChange Method

Checks the value(s) entered by the end-user against the value associated with this adapter field.

Pascal

```
function CheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean CheckValueChange(IActionRequest AActionRequest, int AFieldIndex);
```

Description

CheckValueChange is called to determine whether the value(s) entered by the user is different from the value(s) provided by the adapter field. CheckValueChange calls the virtual function ImplCheckValueChange (see page 5428).

See Also

ImplCheckValueChange (see page 5428)

54.1.35.3.2 TAdapterUpdateField.ConvertValue Method

Retrieves a value entered by the end-user.

Pascal

```
function ConvertValue(AValue: IActionFieldValue): Variant; virtual;
```

C++

```
virtual __fastcall Variant ConvertValue(IActionFieldValue AValue);
```

Description

ConvertValue is called to retrieve, as a variant, the value entered by the user for this adapter field. ConvertValue using index 0 to retrieve a value from the IActionFieldValue (see page 5904) parameter. Typically, IActionFieldValue (see page 5904) will contain a string value. Descendants may override this function to caste the value into another type.

See Also

ConvertValue (see page 5594)

54.1.35.3.3 TAdapterUpdateField.ConvertValueCount Method

Retrieves the number of values entered by the end-user.

Pascal

```
function ConvertValueCount(AValue: IActionFieldValue): Integer; virtual;
```

C++

```
virtual __fastcall int ConvertValueCount(IActionFieldValue AValue);
```

Description

ConvertValueCount is called to retrieve the number of values entered by the user. ConvertValueCount returns 1. Descendants may override this method.

54.1.35.3.4 TAdapterUpdateField.ConvertValues Method

Retrieves a value entered by the end-user.

Pascal

```
function ConvertValues(AValue: IActionFieldValue; Index: Integer): Variant; virtual;
```

C++

```
virtual __fastcall Variant ConvertValues(IActionFieldValue AValue, int Index);
```

Description

ConvertValues is called to retrieve, as a variant, a particular value entered by the end-user for this adapter field.

54.1.35.3.5 TAdapterUpdateField.DoOnValidateValue Method

Validates field values entered by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); virtual;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue is called when the field value entered by the end-user is to be validated. DoOnValidateValue calls the OnValidateValue (see page 5433) event handler. DoOnValidateValue may be overridden by descendants.

See Also

OnValidateValue (see page 5433)

ImplValidateValue (see page 5430)

54.1.35.3.6 TAdapterUpdateField.GetAdapterValuesList Method

Provides an interface to a component that can be used to generate a list of possible values for this adapter field.

Pascal

```
function GetAdapterValuesList: IValuesListAdapter;
```

C++

```
__fastcall IValuesListAdapter GetAdapterValuesList();
```

Description

GetAdapterValuesList provides an interface to a component that can be used to generate a list of possible values for this adapter field. It does this by returning the value of the ValuesList (see page 5432) property.

See Also

IValuesListAdapter (see page 1072)

54.1.35.3.7 TAdapterUpdateField.GetInputStyleType Method

Indicates the preferred HTML element to use when editing this adapter field's value.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType returns htmliSelect if the ValuesList (see page 5432) property is not nil (Delphi) or NULL (C++). Otherwise, htmliTextInput is returned.

See Also

TAdapterInputHTMLElementType (see page 1124)

ValuesList (see page 5432)

54.1.35.3.8 TAdapterUpdateField.GetValueCount Method

Provides the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount returns the number of values provided by this adapter field. GetValueCount returns 1. Descendant classes override this method.

See Also

TAdapterMultiValueField (see page 5332)

54.1.35.3.9 TAdapterUpdateField.GetValues Method

Returns one of the values provided by this adapter field.

Pascal

```
function GetValues(I: Integer): Variant; virtual;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues returns one of the values provided by this adapter field. GetValues calls GetValue (see page 5359). Descendant classes override this method.

See Also

TAdapterMultiValueField (see page 5332)

54.1.35.3.10 TAdapterUpdateField.ImplAsFormatted Method

Returns a string representation of the adapter field's value that is appropriate for a read-only display.

Pascal

```
function ImplAsFormatted: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplAsFormatted();
```

Description

ImplAsFormatted calls the OnGetDisplayText (see page 5433) event handler, if one is defined. Otherwise, ImplAsFormatted returns the adapter field's value converted to a string. Server-side script accesses the value returned by this function using the AsDisplayText property.

See Also

OnGetDisplayText (see page 5433)

GetValue (see page 5359)

54.1.35.3.11 TAdapterUpdateField.ImplCheckValueChange Method

Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

ImplCheckValueChange compares the number and content of values associated with the adapter field with the number and content of values entered by the end-user.

See Also

CheckValueChange (see page 5424)

54.1.35.3.12 TAdapterUpdateField.ImplGetDisplayLabel Method

Gets the preferred display label for this adapter field.

Pascal

```
function ImplGetDisplayLabel: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the value of the DisplayLabel (see page 5350) property.

See Also

DisplayLabel (see page 5350)

54.1.35.3.13 TAdapterUpdateField.ImplGetDisplayWidth Method

Returns the preferred display width for the HTML element used to edit or display this adapter field's value.

Pascal

```
function ImplGetDisplayWidth: Integer; override;
```

C++

```
virtual __fastcall int ImplGetDisplayWidth();
```

Description

ImplGetDisplayWidth returns the value of the DisplayWidth (see page 5350) property.

See Also

DisplayWidth (see page 5350)

54.1.35.3.14 TAdapterUpdateField.ImplGetEchoActionFieldValue Method

Gets a flag that causes the adapter field to return the value(s) entered by the end-user.

Pascal

```
function ImplGetEchoActionFieldValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValue();
```

Description

Gets a flag that causes the adapter field to return the value(s) entered by the end-user.

See Also

ImplSetEchoActionFieldValue (see page 5429)

54.1.35.3.15 TAdapterUpdateField.ImplGetVariableName Method

Gets the name used to access this adapter field with server-side script.

Pascal

```
function ImplGetVariableName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetVariableName();
```

Description

ImplGetVariableName returns the value of the FieldName (see page 5369) property.

See Also

FieldName (see page 5369)

54.1.35.3.16 TAdapterUpdateField.ImplSetEchoActionFieldValue Method

Sets a flag that causes the adapter field to return the value(s) entered by the end-user.

Pascal

```
procedure ImplSetEchoActionFieldValue(AValue: Boolean); override;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValue(Boolean AValue);
```

Description

ImplSetEchoActionFieldValue is typically called when an error occurs during the execution of an adapter action. It allows the page generated after the error to display the values entered by the user rather than the action adapter field values.

54.1.35.3.17 TAdapterUpdateField.ImplSetFieldName Method

Sets the name used to access this adapter field with server-side script.

Pascal

```
procedure ImplSetFieldName(const Value: string); override;
```

C++

```
virtual __fastcall ImplSetFieldName(const UnicodeString Value);
```

Description

ImplSetVariableName sets the value of the FieldName (see page 5369) property.

See Also

FieldName (see page 5369)

54.1.35.3.18 TAdapterUpdateField.ImplUpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplUpdateValue is a placeholder. Descendants override this method.

See Also

UpdateValue (see page 5431)

54.1.35.3.19 TAdapterUpdateField.ImplValidateValue Method

Validates values(s) entered by the end-user.

Pascal

```
procedure ImplValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); virtual;
```

C++

```
virtual __fastcall ImplValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplValidateValue calls the virtual function DoOnValidateValue (see page 5426) after extracting an IActionFieldValue (see page 5904) that contains the value(s) entered by the user. The AFieldIndex parameter identifies that location of the IActionFieldValue (see page 5904) in the AActionRequest.

See Also

ValidateValue (see page 5431)

DoOnValidateValue (see page 5426)

IActionRequest

54.1.35.3.20 TAdapterUpdateField.IsMultiValueField Method

Indicates whether this adapter field can support multiple values.

Pascal

```
function IsMultiValueField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsMultiValueField();
```

Description

IsMultiValueField return true to indicate that this adapter field can provide multiple values. IsMultiValueField returns false. Descendants may override this function.

See Also

GetValueCount (see page 5427)

GetValues (see page 5427)

TAdapterMultiValueField (see page 5332)

54.1.35.3.21 TAdapterUpdateField.Notification Method

Clears references to a deleted component.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called when a component is inserted or deleted. TAdapterUpdateField (see page 5419) clears the ValuesList (see page 5432) property when the associated component is deleted.

54.1.35.3.22 TAdapterUpdateField.UpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure UpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall UpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

UpdateValue calls the virtual method ImplUpdateValue (see page 5430).

See Also

ImplUpdateValue (see page 5430)

54.1.35.3.23 TAdapterUpdateField.ValidateValue Method

Validates values(s) entered by the end-user.

Pascal

```
procedure ValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall ValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ValidateValue calls the virtual function ImplValidateValue (see page 5430).

See Also

ImplValidateValue (see page 5430)

IActionRequest

54.1.35.4 TAdapterUpdateField Properties

The properties of the TAdapterUpdateField class are listed here.

Public Properties

	Name	Description
	Value (see page 5432)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5432)	Associates a list of values with the adapter field.

54.1.35.4.1 TAdapterUpdateField.Value Property

Retrieves the value associated with this adapter field.

Pascal

```
property Value: Variant;
```

C++

```
__property Variant Value;
```

Description

GetValue (see page 5359) calls the GetValue (see page 5359) method to retrieve the value of the adapter field as a variant.

See Also

GetValue (see page 5359)

54.1.35.4.2 TAdapterUpdateField.ValuesList Property

Associates a list of values with the adapter field.

Pascal

```
property ValuesList: IValuesListAdapter;
```

C++

```
__property IValuesListAdapter ValuesList;
```

Description

Assign a component to the ValuesList property to define possible values for the adapter field. Server-side script can be used to enumerate the name/value pairs of the ValuesList component to generate HTML select lists, check boxes, or radio buttons.

See Also

IValuesListAdapter (see page 1072)

TStringsValuesList (see page 5857)

TDataSetValuesList

54.1.35.5 TAdapterUpdateField Events

The events of the TAdapterUpdateField class are listed here.

Public Events

	Name	Description
	OnGetDisplayText (see page 5433)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5433)	Event handler called to validate value(s) entered by the end-user.

54.1.35.5.1 TAdapterUpdateField.OnGetDisplayText Event

Event handler called to retrieve a string representation of the adapter field's value.

Pascal

```
property OnGetDisplayText: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetDisplayText;
```

Description

The OnGetDisplayText event handler is called to retrieve a string representation an adapter field's value appropriate for a read-only display. If OnGetDisplayText is nil (Delphi) or NULL (C++), then the value of the adapter field will be used (after conversion to a string).

See Also

ImplAsFormatted (see page 5427)

54.1.35.5.2 TAdapterUpdateField.OnValidateValue Event

Event handler called to validate value(s) entered by the end-user.

Pascal

```
property OnValidateValue: TAdapterFieldValidateValueEvent;
```

C++

```
__property TAdapterFieldValidateValueEvent OnValidateValue;
```

Description

This event handler is called by DoOnValidateValue (see page 5426) to validate the value(s) entered by the end-user. The event handler must raise an exception to indicate that the value(s) are not valid.

See Also

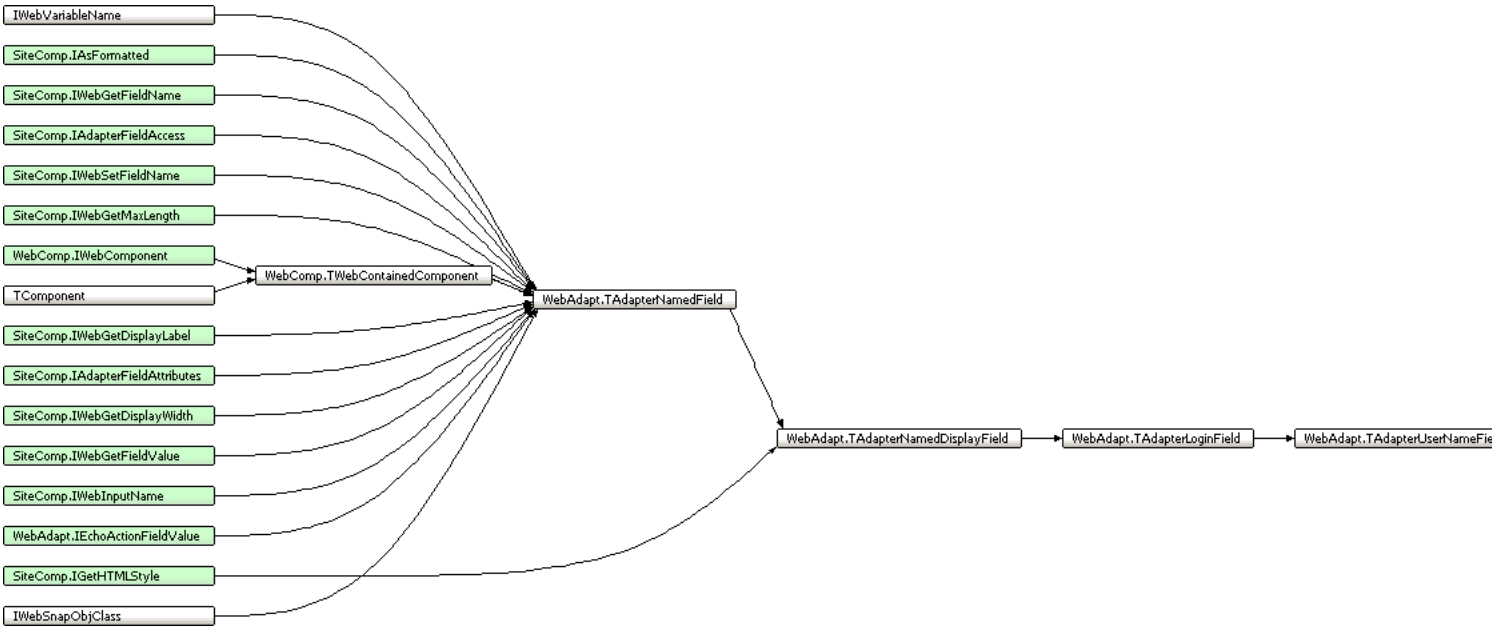
DoOnValidateValue (see page 5426)

IActionFieldValue

54.1.36 TAdapterUserNameField Class

TAdapterUserNameField is an adapter field used to access the user name entered by the end-user.

Class Hierarchy



Pascal

```
TAdapterUserNameField = class(TAdapterLoginField);
```

C++

```
class TAdapterUserNameField : public TAdapterLoginField;
```

File

WebAdapt

Description

TAdapterUserNameField is added to TLoginFormAdapter (see page 5824). TAdapterUserNameField, TAdapterPasswordField (see page 5391), TLoginFormAdapterLoginAction (see page 5835) and TAdapterNextPageField (see page 5379) are used with TLoginFormAdapter (see page 5824) to generate an HTML login form. When the HTML form is submitted, TAdapterUserNameField is used to extract the end user's name from the HTTP request.

See Also

TAdapterLoginField (see page 5320)

TLoginFormAdapter (see page 5824)

TAdapterPasswordField (see page 5391)

TAdapterNextPageField (see page 5379)

TLoginFormAdapterLoginAction (see page 5835)

54.1.36.1 TAdapterUserNameField Members

The following tables list the members exposed by TAdapterUserNameField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5346)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5347)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5347)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5347)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5348)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5348)	Suggests a view mode for this adapter field.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5348)	Implements interface access to the DisplayLabel (see page 5350) property.
V	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5349)	Implements interface access to the DisplayWidth (see page 5350) property.
V	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5349)	Implements interface access to the Required (see page 5351) property.
V	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5437)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.

	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5349)	SetDisplayLabel sets the value of the DisplayLabel (see page 5350) property.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.

Protected Properties

	Name	Description
	Adapter (see page 5368)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 5346)	Creates an instance of TAdapterNamedDisplayField (see page 5343).
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
	Adapter (see page 5323)	Returns the parent adapter of this adapter field.
	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.

	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
	ReadOnly (see page 5351)	Indicates whether this adapter field is read-only.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

Published Properties

	Name	Description
	DisplayLabel (see page 5438)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5438)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5438)	Identifies the name of this field when using server-side script.

54.1.36.2 TAdapterUserNameField Methods

The methods of the TAdapterUserNameField class are listed here.

Protected Methods

	Name	Description
V	ImplGetValue (see page 5437)	Returns the value associated with this adapter field.

54.1.36.2.1 TAdapterUserNameField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns an empty string. Server-side script accesses the result of this function using the EditText or Value (see page 5369) property of the adapter field. These server-side script properties may be used to generate the HTML login form. ImplGetValue returns an empty string so that the generated login form's user name field will be blank. When the login form is submitted, the ActionValue (see page 5368) property can be used to access the user name entered by the end-user.

See Also

ActionValue (see page 5368)

54.1.36.3 TAdapterUserNameField Properties

The properties of the TAdapterUserNameField class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5438)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5438)	Suggests a display width, in characters, for this adapter field.
	FieldName (see page 5438)	Identifies the name of this field when using server-side script.

54.1.36.3.1 TAdapterUserNameField.DisplayLabel Property

Suggests a display label for this adapter field.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this label or not. Server-side script uses the DisplayLabel property to access this value.

See Also

GetDisplayLabel (see page 5357)

54.1.36.3.2 TAdapterUserNameField.DisplayWidth Property

Suggests a display width, in characters, for this adapter field.

Pascal

```
property DisplayWidth: integer;
```

C++

```
__property int DisplayWidth;
```

Description

Set this property to indicate the width, in characters, that is suggested when generating an HTML field to display the value of this adapter field. Typically the adapter field is displayed using server-side script, either generated or custom written. The server-side script may be written to use this width or not. Server-side script uses the DisplayWidth property to access this value.

See Also

GetDisplayWidth (see page 5358)

54.1.36.3.3 TAdapterUserNameField.FieldName Property

Identifies the name of this field when using server-side script.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

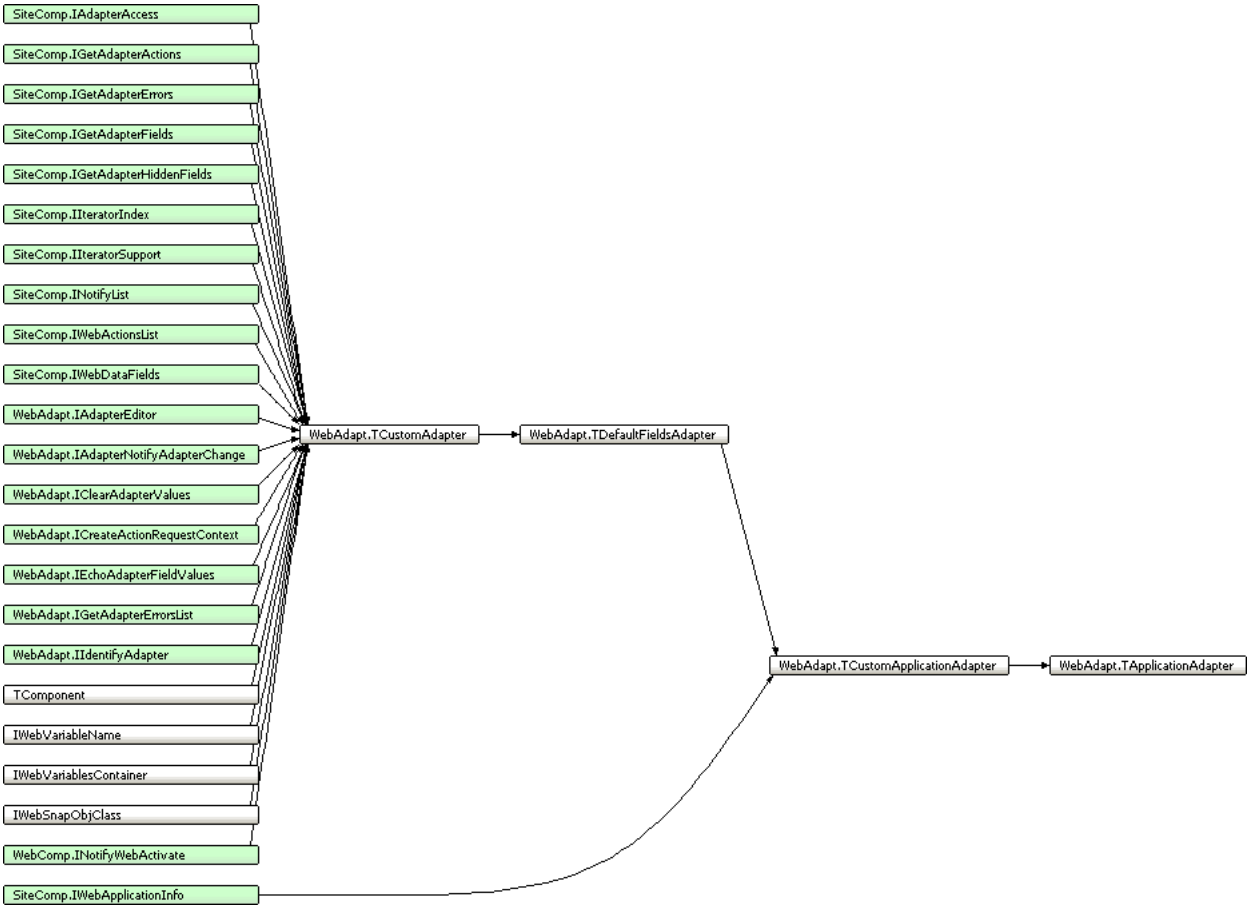
Description

The FieldName property defines the name used to access the adapter field with server-side script. Server-side script can access this value using the Name property.

54.1.37 TApplicationAdapter Class

TApplicationAdapter is a container for field and action components that are available through the Application script variable.

Class Hierarchy



Pascal

```
TApplicationAdapter = class(TCustomApplicationAdapter);
```

C++

```
class TApplicationAdapter : public TCustomApplicationAdapter;
```

File

WebAdapt

Description

By default, TApplicationAdapter contains a single field called Title that gets its value from the ApplicationTitle (see page 5444)

property. The TApplicationAdapter can be customized by adding additional field and action components. When writing server-side script, use the Application variable to access fields and actions of the ApplicationAdapter. For example, <%= Application.Title %> writes the title of the application.

See Also

TAdapter (see page 5190)

54.1.37.1 TApplicationAdapter Members

The following tables list the members exposed by TApplicationAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetApplicationAdapter (see page 5669)	Implements IWebApplicationInfo (see page 1078)'s GetApplicationAdapter method.
	GetApplicationTitle (see page 5669)	Implements IWebApplicationInfo (see page 1078)'s GetApplicationTitle method.

	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	GetWebSnapObjClass (see page 5669)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddActionClass (see page 5669)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
	ImplCanAddFieldClass (see page 5670)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
	ImplGetActionsList (see page 5670)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
	ImplGetFieldsList (see page 5670)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.

	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.

	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetApplicationAdapter (see page 1079)	Returns the value of the ApplicationAdapter (see page 1080) property.
	GetApplicationTitle (see page 1080)	Returns the value of the ApplicationTitle (see page 1080) property.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	ApplicationAdapter (see page 1080)	Provides access to the adapter that implements the fields and actions of the Application variable in server-side scripts.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5445)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5445)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 5446)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5446)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5446)	Supplies name/value pairs needed to execute an adapter action.

Published Properties

	Name	Description
	Actions (see page 5444)	Container for adapter actions components.
	ApplicationTitle (see page 5444)	Defines the title of the application.
	Data (see page 5444)	Container for adapter field components.

54.1.37.2 TApplicationAdapter Properties

The properties of the TApplicationAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 5444)	Container for adapter actions components.
	ApplicationTitle (see page 5444)	Defines the title of the application.
	Data (see page 5444)	Container for adapter field components.

54.1.37.2.1 TApplicationAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 5231)

54.1.37.2.2 TApplicationAdapter.ApplicationTitle Property

Defines the title of the application.

Pascal

```
property ApplicationTitle: string;
```

C++

```
__property UnicodeString ApplicationTitle;__property UnicodeString ApplicationTitle;
```

Description

Set this property to identify an application title that can be accessed with server-side script as the Application.Title property.

54.1.37.2.3 TApplicationAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 5237)

54.1.37.3 TApplicationAdapter Events

The events of the TApplicationAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5445)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5445)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 5446)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5446)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5446)	Supplies name/value pairs needed to execute an adapter action.

54.1.37.3.1 TApplicationAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.37.3.2 TApplicationAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains

the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.37.3.3 TApplicationAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 5478)

OnAfterExecuteAction (see page 5576)

54.1.37.3.4 TApplicationAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 5478)

OnAfterGetActionResponse (see page 5576)

54.1.37.3.5 TApplicationAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

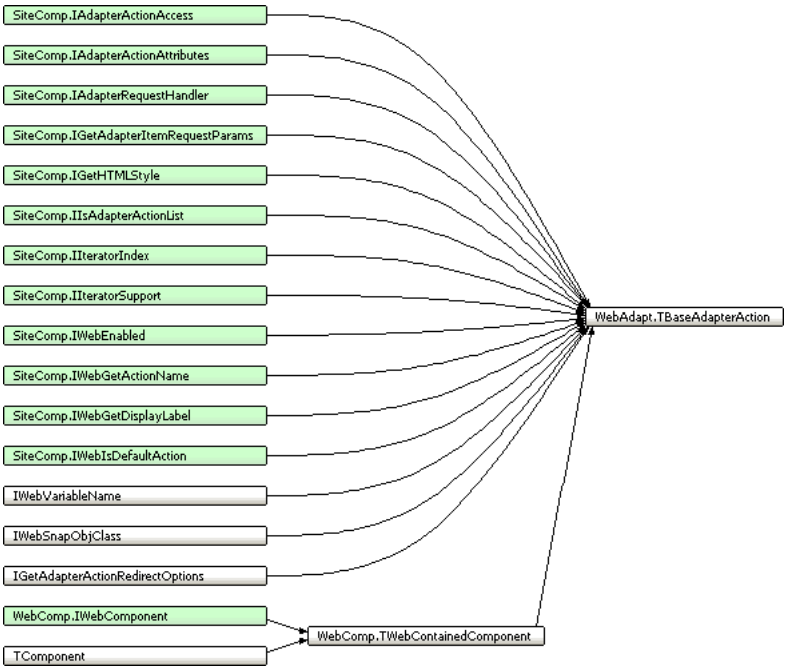
See Also

OnGetParams (see page 5478)

54.1.38 TBaseAdapterAction Class

TBaseAdapterAction is a based class for adapter action components.

Class Hierarchy



Pascal

```
TBaseAdapterAction = class(TWebContainedComponent, IWebVariableName, IWebEnabled,
IGetAdapterItemRequestParams, IWebGetActionName, IWebGetDisplayLabel, IWebSnapObjClass,
IAdapterActionAccess, IAdapterRequestHandler, IGetAdapterActionRedirectOptions, IGetHTMLStyle,
IAdapterActionAttributes, IIteratorSupport, IIteratorIndex, IIsAdapterActionList,
IWebIsDefaultAction);
```

C++

```
class TBaseAdapterAction : public TWebContainedComponent, public IWebVariableName, public
IWebEnabled, public IGetAdapterItemRequestParams, public IWebGetActionName, public
IWebGetDisplayLabel, public IWebSnapObjClass, public IAdapterActionAccess, public
IAdapterRequestHandler, public IGetAdapterActionRedirectOptions, public IGetHTMLStyle, public
IAdapterActionAttributes, public IIteratorSupport, public IIteratorIndex, public
IIsAdapterActionList, public IWebIsDefaultAction;
```

File

WebAdapt

Description

TBaseAdapterAction implements interfaces used to access an adapter action's properties using server-side script. Most of the interface implementation methods call virtual functions. When defining new derived classes, override these virtual functions to customize the behavior of the adapter action class.

See Also

TCustomAdapterAction (see page 5579)

TAdapter (see page 5190)

54.1.38.1 TBaseAdapterAction Members

The following tables list the members exposed by TBaseAdapterAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5456)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
	ImplExecuteActionRequest (see page 5464)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 5465)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5470)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5474)	Provides access to the parent adapter component.
	Errors (see page 5475)	Returns the parent adapter's Errors list.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5477)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5477)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5478)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5478)	Called before the adapter action response is generated.
	OnGetParams (see page 5478)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
R	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5474)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

54.1.38.2 TBaseAdapterAction Methods

The methods of the TBaseAdapterAction class are listed here.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.

	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetDefaultActionName (see page 5456)	Gets the default name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
	ImplExecuteActionRequest (see page 5464)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 5465)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5470)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.

	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
V	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

54.1.38.2.1 TBaseAdapterAction.CheckExecuteAccess Method

Checks end-user rights to execute this adapter action.

Pascal

```
procedure CheckExecuteAccess;
```

C++

```
__fastcall CheckExecuteAccess();
```

Description

This procedure is called to verify that the current user has rights to execute this action. An exception will be raised if access is denied.

See Also

ExecuteAccess (see page 5475)

HasExecuteAccess (see page 5463)

ExecuteActionRequest (see page 5455)

54.1.38.2.2 TBaseAdapterAction.CreateRequestContext Method

Creates an object that describes the adapter action parameters and adapter field values.

Pascal

```
procedure CreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

The adapter dispatcher calls this function before calling HandleRequest (see page 5463). The result of this function is stored in the WebContext (see page 6003) variable. During the course of executing this action, the object returned by CreateRequestContext will be used to access the action parameters and field values that were passed in the HTTP request to execute this action.

See Also

ImplCreateRequestContext (see page 5464)

AdapterRequest (see page 5971)

TAdapterDispatcher (see page 6148)

HandleRequest (see page 5463)

54.1.38.2.3 TBaseAdapterAction.DoAfterExecuteActionRequest Method

Calls event handlers after the adapter action is executed.

Pascal

```
procedure DoAfterExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoAfterExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

DoAfterExecuteActionRequest is called by ExecuteActionRequest (see page 5455). DoAfterExecuteActionRrequest packages the action request parameters into TStrings and calls two event handlers. The parent adapter's OnAfterExecuteAction event handler is called first. If it does not handle the action request then the OnAfterExecute (see page 5477) event handler is called.

See Also

OnAfterExecute (see page 5477)

OnAfterExecuteAction (see page 5576)

ExecuteActionRequest (see page 5455)

54.1.38.2.4 TBaseAdapterAction.DoAfterGetExecuteActionResponse Method

Calls event handlers after the adapter action response is formulated.

Pascal

```
procedure DoAfterGetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoAfterGetExecuteActionResponse(IActionRequest AActionRequest,
IActionResponse AActionResponse);
```

Description

DoAfterGetExecuteActionResponse is called by GetExecuteActionResponse (see page 5458). The parent adapter's OnAfterGetActionResponse event handler is called first. If it does not handle the action response then the OnAfterGetResponse (see page 5477) event handler is called.

See Also

OnAfterGetResponse (see page 5477)

OnAfterGetActionResponse (see page 5576)

DoBeforeGetExecuteActionResponse (see page 5454)

GetExecuteActionResponse (see page 5458)

54.1.38.2.5 TBaseAdapterAction.DoBeforeExecuteActionRequest Method

Calls event handlers before the adapter action is executed.

Pascal

```
procedure DoBeforeExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
```

```
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoBeforeExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

DoBeforeExecuteActionRequest is called by ExecuteActionRequest (see page 5455). DoBeforeExecuteActionRequest packages the action request parameters into TStrings and calls two event handlers. The parent adapter's OnBeforeExecuteAction event handler is called first. If it does not handle the action request then the OnBeforeExecute (see page 5478) event handler is called. If either event handler handles the request then the IActionRequest (see page 5905)'s Handled property is set to true.

See Also

OnBeforeExecute (see page 5478)

OnBeforeExecuteAction (see page 5577)

DoAfterExecuteActionRequest (see page 5453)

ExecuteActionRequest (see page 5455)

54.1.38.2.6 TBaseAdapterAction.DoBeforeGetExecuteActionResponse Method

Calls event handlers before the adapter action response is formulated.

Pascal

```
procedure DoBeforeGetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall DoBeforeGetExecuteActionResponse(IActionRequest AActionRequest,
IActionResponse AActionResponse);
```

Description

DoBeforeGetExecuteActionResponse is called by GetExecuteActionResponse (see page 5458). The parent adapter's OnBeforeGetActionResponse event handler is called first. If it does not handle the action response then the OnBeforeGetResponse (see page 5478) event handler is called. If either event handler handles the action response then the IActionResponse's Handled property is set to true.

See Also

OnBeforeGetResponse (see page 5478)

OnBeforeGetActionResponse (see page 5578)

DoAfterGetExecuteActionResponse (see page 5453)

GetExecuteActionResponse (see page 5458)

54.1.38.2.7 TBaseAdapterAction.EndIterator Method

Implements IIteratorSupport (see page 1054)'s EndIterator method.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

IIteratorSupport (see page 1054) is used to enumerate the list of commands supported by this adapter action. Most adapter actions have a single command. TAdapterGotoPageAction (see page 5291) is an example of an adapter action that supports multiple commands. EndIterator calls ImplNextIteration (see page 5470).

See Also

IIteratorSupport (see page 1054)

IIteratorIndex (see page 1052)

EndIterator (see page 1056)

ImplEndIterator (see page 5464)

54.1.38.2.8 TBaseAdapterAction.ExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse);
```

C++

```
__fastcall ExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ExecuteActionRequest is called by ImplHandleRequest (see page 5468) when a request to execute this adapter action is found in the HTTP request. ExecuteActionRequest first calls CheckExecuteAccess (see page 5452). CheckExecuteAccess (see page 5452) raises an exception if the end-user does not have execute rights. ExecuteActionRequest then calls, in turn, DoBeforeExecuteActionRequest (see page 5453), ImplExecuteActionRequest (see page 5464), and DoAfterExecuteActionRequest (see page 5453).

See Also

DoBeforeExecuteActionRequest (see page 5453)

DoAfterExecuteActionRequest (see page 5453)

CheckExecuteAccess (see page 5452)

ImplExecuteActionRequest (see page 5464)

ImplHandleRequest (see page 5468)

54.1.38.2.9 TBaseAdapterAction.GetActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetActionName: string;
```

C++

```
__fastcall UnicodeString GetActionName();
```

Description

GetActionName is called to retrieve the name used to access this adapter field with server-side script. GetActionName calls ImplGetActionName (see page 5465).

See Also

ActionName (see page 5474)

ImplGetActionName (see page 5465)

54.1.38.2.10 TBaseAdapterAction.GetAdapter Method

GetAdapter returns the parent adapter component.

Pascal

```
function GetAdapter: TCustomAdapter;
```

C++

```
__fastcall TCustomAdapter GetAdapter();
```

Description

To improve the efficiency of this function, a reference to the parent adapter component is cached in an instance variable.

See Also

Adapter (see page 5474)

54.1.38.2.11 TBaseAdapterAction.GetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure GetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(UnicodeString AIdentifier, IAdapterItemRequestParams
Params);
```

Description

The name/value pairs provided by this method will written to the HTTP response when the HTML page is generated and passed back in the HTTP request when this adapter action is to be executed. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted.

See Also

ImplGetAdapterItemRequestParams (see page 5465)

54.1.38.2.12 TBaseAdapterAction.GetDefaultActionName Method

Gets the default name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDefaultActionName();
```

Description

GetDefaultActionName returns the name of the adapter action component. Descendants may override this function.

See Also

ImplGetActionName (see page 5465)

54.1.38.2.13 TBaseAdapterAction.GetDefaultDisplayLabel Method

Provides the default display label for this adapter action.

Pascal

```
function GetDefaultDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDefaultDisplayLabel();
```

Description

When the display label for the action matches this value then the display label property does not need to be stored in the form file.

54.1.38.2.14 TBaseAdapterAction.GetDisplayLabel Method

Returns the suggested display label for this adapter action.

Pascal

```
function GetDisplayLabel: string;
```

C++

```
__fastcall UnicodeString GetDisplayLabel();
```

Description

GetDisplayLabel provides label that may be used when generating HTML to display a button or hyperlink for this adapter action. The value returned by this function can be accessed with server-side script using the DisplayLabel (see page 5474) property. GetDisplayLabel calls ImplGetDisplayLabel (see page 5465).

See Also

DisplayLabel (see page 5474)

ImplGetDisplayLabel (see page 5465)

54.1.38.2.15 TBaseAdapterAction.GetDisplayStyle Method

Returns a string value to suggest an HTML display style for this adapter action.

Pascal

```
function GetDisplayStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetDisplayStyle(const UnicodeString AAdapterMode);
```

Description

GetDisplayStyle implements IGetHTMLStyle (see page 1031)'s GetDisplayStyle method by translating the result value of GetDisplayStyleType (see page 5458) into a string.

See Also

GetDisplayStyle (see page 1032)

GetDisplayStyleType (see page 5458)

54.1.38.2.16 TBaseAdapterAction.GetDisplayStyleType Method

Suggests an HTML display type for this adapter action.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterActionHTMLElementType;
virtual;
```

C++

```
virtual __fastcall TAdapterActionHTMLElementType GetDisplayStyleType(const UnicodeString
AAdapterMode);
```

Description

GetDisplayStyleType returns htmlaButton, indicating that this adapter action should be displayed using a submit button. Descendant classes may override this method to suggest other HTML display types.

See Also

GetDisplayStyle (see page 5457)

54.1.38.2.17 TBaseAdapterAction.GetErrors Method

Returns the parent adapter's errors list.

Pascal

```
function GetErrors: TBaseAdapterErrorsList;
```

C++

```
__fastcall TBaseAdapterErrorsList GetErrors();
```

Description

GetErrors calls TCustomAdapter (see page 5531)'s GetAdapterErrorsList method.

See Also

Errors (see page 5475)

GetAdapterErrorsList (see page 5547)

54.1.38.2.18 TBaseAdapterAction.GetExecuteActionResponse Method

Generates a response after the adapter action has been executed.

Pascal

```
procedure GetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse);
```

C++

```
__fastcall GetExecuteActionResponse(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

GetExecuteActionResponse is called by ImplHandleRequest (see page 5468) after executing an adapter action specified by the HTTP request. GetExecuteActionResponse calls, in turn, DoBeforeGetExecuteActionResponse (see page 5454), ImplGetExecuteActionResponse (see page 5466), and DoAfterGetExecuteActionResponse (see page 5453).

See Also

IActionRequest

IActionResponse

DoBeforeGetExecuteActionResponse (see page 5454)

DoAfterGetExecuteActionResponse (see page 5453)

ImplGetExecuteActionResponse (see page 5466)

ImplHandleRequest (see page 5468)

54.1.38.2.19 TBaseAdapterAction.GetFailureOptions Method

Indicates whether to perform an HTTP redirect after execution of this adapter action fails.

Pascal

```
function GetFailureOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetFailureOptions();
```

Description

Set RedirectOptions (see page 5476) when an HTTP redirect should be performed after execution of this adapter action fails. GetFailureOptions returns the result of ImplGetFailureOptions (see page 5466).

See Also

ImplGetFailureOptions (see page 5466)

GetSuccessOptions (see page 5461)

RedirectOptions (see page 5476)

54.1.38.2.20 TBaseAdapterAction.GetInputStyle Method

Returns a string value to suggest an HTML display style for this adapter action.

Pascal

```
function GetInputStyle(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetInputStyle(const UnicodeString AAdapterMode);
```

Description

GetInputStyle implements IGetHTMLStyle (see page 1031)'s GetInputType method by returning the result of GetDisplayStyle (see page 5457). This method must be implemented as part of IGetHTMLStyle (see page 1031). GetInputStyle is treated as

a synonym of GetDisplayStyle (see page 5457).

See Also

GetInputStyle (see page 1033)

GetDisplayStyle (see page 5457)

54.1.38.2.21 TBaseAdapterAction.GetIsAdapterActionList Method

Indicates whether this adapter action may have multiple commands.

Pascal

```
function GetIsAdapterActionList: Boolean;
```

C++

```
__fastcall Boolean GetIsAdapterActionList();
```

Description

An adapter action may have a list of commands. The TAdapterGotoPageAction (see page 5291) is an example of an adapter action with a list of commands. Each command goes to a different page in the parent TPagedAdapter (see page 5844). GetIsAdapterActionList calls ImplGetIsAdapterActionList (see page 5466).

See Also

ImplGetIsAdapterActionList (see page 5466)

TAdapterGotoPageAction (see page 5291)

54.1.38.2.22 TBaseAdapterAction.GetItemCount Method

Returns the number of commands defined by this adapter action.

Pascal

```
function GetItemCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetItemCount();
```

Description

An adapter action may have a list of commands. The TAdapterGotoPageAction (see page 5291) is an example of an adapter action with a list of commands. Each command goes to a different page in the parent TPagedAdapter (see page 5844). GetItemCount returns 1. GetItemCount may be overridden by a descendant class.

See Also

ItemCount (see page 5475)

ItemIndex (see page 5476)

TAdapterGotoPageAction (see page 5291)

GetIsAdapterActionList (see page 5460)

54.1.38.2.23 TBaseAdapterAction.GetIteratorIndex Method

Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.

Pascal

```
function GetIteratorIndex: Integer;
```

C++

```
__fastcall int GetIteratorIndex();
```

Description

IIteratorIndex (see page 1052) and IIteratorSupport (see page 1054) are used to iterate through the commands supported by an adapter action. Most adapter actions support a single command. TAdapterActionGotoPage is adapter action that supports multiple commands. GetIteratorIndex returns the index of the current command. GetIteratorIndex calls ImplGetIteratorIndex (see page 5467).

See Also

IIteratorIndex (see page 1052)

IIteratorSupport (see page 1054)

GetIteratorIndex (see page 1053)

ImplGetIteratorIndex (see page 5467)

54.1.38.2.24 TBaseAdapterAction.GetSuccessOptions Method

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
function GetSuccessOptions: TAdapterActionRedirectOptions;
```

C++

```
__fastcall TAdapterActionRedirectOptions GetSuccessOptions();
```

Description

Set RedirectOptions (see page 5476) when an HTTP redirect should be performed after executing an action. GetSuccessOptions returns the result of ImplGetSuccessOptions (see page 5467).

See Also

ImplGetSuccessOptions (see page 5467)

GetFailureOptions (see page 5459)

RedirectOptions (see page 5476)

54.1.38.2.25 TBaseAdapterAction.GetVariableName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall UnicodeString GetVariableName();
```

Description

GetVariableName is called to retrieve the name used to access this adapter action with server-side script. GetVariableName calls ImplGetVariableName (see page 5467).

See Also

ImplGetVariableName (see page 5467)

54.1.38.2.26 TBaseAdapterAction.GetViewMode Method

Returns a string value to suggest a view mode for this adapter action.

Pascal

```
function GetViewMode(const AAdapterMode: string): string;
```

C++

```
__fastcall UnicodeString GetViewMode(const UnicodeString AAdapterMode);
```

Description

GetViewMode implements IGetHTMLStyle (see page 1031)'s GetViewMode method by translating the result value of GetViewModeType (see page 5462) into a string.

See Also

GetViewMode (see page 1033)

GetViewModeType (see page 5462)

54.1.38.2.27 TBaseAdapterAction.GetViewModeType Method

Suggests a view mode for this adapter action.

Pascal

```
function GetViewModeType(const AAdapterMode: string): TAdapterDisplayViewModeType; virtual;
```

C++

```
virtual __fastcall TAdapterDisplayViewModeType GetViewModeType(const UnicodeString
AAdapterMode);
```

Description

GetViewModeType returns htmlvmInput.

See Also

ReadOnly (see page 5351)

GetViewMode (see page 5348)

54.1.38.2.28 TBaseAdapterAction.GetVisible Method

Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

Pascal

```
function GetVisible: Boolean;
```

C++

```
__fastcall Boolean GetVisible();
```

Description

The state of the parent adapter may dictate whether a button or hyperlink for a particular adapter action should not be shown. For example, TDataSetAdapterApplyRowAction can be configured to return false when the parent TDataSetAdapter is in browse

mode. GetVisible calls ImplGetVisible (see page 5468). Server-side script can access the value returned by GetVisible using the Visible property of an adapter action object.

See Also

ImplGetVisible (see page 5468)

54.1.38.2.29 TBaseAdapterAction.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

54.1.38.2.30 TBaseAdapterAction.HandleRequest Method

Executes the adapter action and generates a response.

Pascal

```
function HandleRequest(DispatchParams: IAdapterDispatchParams): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

The adapter dispatcher calls HandleRequest to execute the adapter action and generate a response. HandleRequest calls ImplHandleRequest (see page 5468).

See Also

CreateRequestContext (see page 5452)

54.1.38.2.31 TBaseAdapterAction.HasExecuteAccess Method

Checks the end-user's right to execute this adapter action.

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanExecute property. HasExecuteAccess calls ImplHasExecuteAccess (see page 5468).

See Also

CheckExecuteAccess (see page 5452)

ImplHasExecuteAccess (see page 5468)

54.1.38.2.32 TBaseAdapterAction.ImplCreateRequestContext Method

Creates an object that describes the action parameters and field values.

Pascal

```
procedure ImplCreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall ImplCreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

ImplCreateRequestContext is called by CreateRequestContext (see page 5452). ImplCreateRequestContext returns the result of TCustomAdapter (see page 5531)'s CreateActionRequestContext method.

See Also

CreateRequestContext (see page 5452)

CreateActionRequestContext (see page 5541)

54.1.38.2.33 TBaseAdapterAction.ImplEndIterator Method

Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer);
```

C++

```
__fastcall ImplEndIterator(void * OwnerData);
```

Description

ImplEndIterator is called by EndIterator (see page 5454). ImplEndIterator resets internal variables.

See Also

IIteratorIndex (see page 1052)

IIteratorSupport (see page 1054)

EndIterator (see page 5454)

54.1.38.2.34 TBaseAdapterAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest is called by ExecuteActionRequest (see page 5455). ImplExecuteActionRequest must be

overridden by a descendant class.

See Also

IActionRequest

IActionResponse

ExecuteActionRequest (see page 5455)

54.1.38.2.35 TBaseAdapterAction.ImplGetActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function ImplGetActionName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetActionName();
```

Description

This function is called by GetActionName (see page 5455). ImplGetActionName returns the result of GetDefaultActionName (see page 5456). Descendants may override this function.

See Also

GetActionName (see page 5455)

GetDefaultActionName (see page 5456)

54.1.38.2.36 TBaseAdapterAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(UnicodeString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

ImplGetAdapterItemRequestParams is called by GetAdapterItemRequestParams (see page 5456). ImplGetAdapterItemRequestParams calls the OnGetActionParams event handler of the parent adapter and then calls the OnGetParams (see page 5478) event handler.

See Also

GetAdapterItemRequestParams (see page 5456)

OnGetActionParams (see page 5579)

OnGetParams (see page 5478)

54.1.38.2.37 TBaseAdapterAction.ImplGetDisplayLabel Method

Returns the suggested display label for this adapter action.

Pascal

```
function ImplGetDisplayLabel: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the value of the DisplayLabel (see page 5474) property.

See Also

DisplayLabel (see page 5474)

54.1.38.2.38 TBaseAdapterAction.ImplGetExecuteActionResponse Method

Generates a response after the adapter action has been executed.

Pascal

```
procedure ImplGetExecuteActionResponse(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); virtual;
```

C++

```
virtual __fastcall ImplGetExecuteActionResponse(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplGetExecuteActionResponse is called by GetExecuteActionResponse (see page 5458). ImplGetExecuteActionResponse sets properties of IActionResponse to identify the response to this action request.

See Also

GetExecuteActionResponse (see page 5458)

54.1.38.2.39 TBaseAdapterAction.ImplGetFailureOptions Method

Indicates whether to perform an HTTP redirect after execution of this adapter action fails.

Pascal

```
function ImplGetFailureOptions: TAdapterActionRedirectOptions; virtual;
```

C++

```
virtual __fastcall TAdapterActionRedirectOptions ImplGetFailureOptions();
```

Description

ImplGetFailureOptions returns an empty set.

See Also

GetFailureOptions (see page 5459)

54.1.38.2.40 TBaseAdapterAction.ImplGetIsAdapterActionList Method

Indicates whether this adapter action may have multiple commands.

Pascal

```
function ImplGetIsAdapterActionList: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetIsAdapterActionList();
```

Description

ImplGetIsAdapterActionList is called by GetIsAdapterActionList (see page 5460). ImplGetIsAdapterActionList returns false. ImplGetIsAdapterActionList may be overridden by descendant classes.

See Also

GetIsAdapterActionList (see page 5460)

ImplGetIsAdapterActionList (see page 5621)

54.1.38.2.41 TBaseAdapterAction.ImplGetIteratorIndex Method

Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.

Pascal

```
function ImplGetIteratorIndex: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetIteratorIndex();
```

Description

ImplGetIteratorIndex is called by GetIteratorIndex (see page 5460). ImplGetIteratorIndex returns the value of an internal iteration index.

See Also

GetIteratorIndex (see page 1053)

GetIteratorIndex (see page 5460)

54.1.38.2.42 TBaseAdapterAction.ImplGetSuccessOptions Method

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
function ImplGetSuccessOptions: TAdapterActionRedirectOptions; virtual;
```

C++

```
virtual __fastcall TAdapterActionRedirectOptions ImplGetSuccessOptions();
```

Description

ImplGetSuccessOptions returns the value of the RedirectOptions (see page 5476) property.

See Also

GetSuccessOptions (see page 5461)

RedirectOptions (see page 5476)

54.1.38.2.43 TBaseAdapterAction.ImplGetVariableName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function ImplGetVariableName: string;
```

C++

```
__fastcall UnicodeString ImplGetVariableName();
```

Description

This function is called by GetVariableName (see page 5461). GetVariableName (see page 5461) returns the result of GetActionName (see page 5455).

See Also

GetVariableName (see page 5461)

GetActionName (see page 5455)

54.1.38.2.44 TBaseAdapterAction.ImplGetVisible Method

Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

Pascal

```
function ImplGetVisible: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetVisible();
```

Description

ImplGetVisible is called by GetVisible (see page 5462). ImplGetVisible returns true. ImplGetVisible may be overridden by descendant components.

See Also

GetVisible (see page 5462)

54.1.38.2.45 TBaseAdapterAction.ImplHandleRequest Method

Executes the adapter action and generates a response.

Pascal

```
function ImplHandleRequest(DispatchParams: IAdapterDispatchParams): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

ImplHandleRequest is called by HandleRequest (see page 5463). ImplHandleRequest calls ExecuteActionRequest (see page 5455) followed by GetExecuteActionResponse (see page 5458).

See Also

ExecuteActionRequest (see page 5455)

GetExecuteActionResponse (see page 5458)

54.1.38.2.46 TBaseAdapterAction.ImplHasExecuteAccess Method

Checks the end-user's right to execute this adapter action.

Pascal

```
function ImplHasExecuteAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasExecuteAccess();
```

Description

This function is called by HasExecuteAccess (see page 5463) to check the end-user's right to execute the adapter action. First, the parent adapter's HasExecuteAccess (see page 5463) method is called. If the adapter allows execute access and the ExecuteAccess (see page 5475) property is not blank, this function calls the EndUserAdapter HasModifyRights function, passing the ExecuteAccess (see page 5475) property value.

See Also

HasExecuteRights (see page 5509)

ExecuteAccess (see page 5475)

HasExecuteAccess (see page 5463)

HasExecuteAccess (see page 5552)

54.1.38.2.47 TBaseAdapterAction.ImplInIterator Method

Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.

Pascal

```
function ImplInIterator: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplInIterator();
```

Description

ImplInIterator is called by InIterator (see page 5471). ImplInIterator returns the value of an internal flag.

See Also

IIteratorIndex (see page 1052)

IIteratorSupport (see page 1054)

InIterator (see page 1053)

54.1.38.2.48 TBaseAdapterAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction (see page 5471). ImplIsDefaultAction returns true. ImplIsDefaultAction may be overridden by a descendant class.

See Also

IsDefaultAction (see page 5471)

ImplIsDefaultAction (see page 5622)

54.1.38.2.49 TBaseAdapterAction.ImplNextIteration Method

Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

ImplNextIteration is called by NextIteration (see page 5472). ImplNextIteration increments an internal iteration index. true is returned if the iteration index is within the bounds defined by ItemCount (see page 5475).

See Also

IIteratorIndex (see page 1052)

IIteratorSupport (see page 1054)

NextIteration (see page 5472)

54.1.38.2.50 TBaseAdapterAction.ImplStartIterator Method

Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

ImplStartIterator is called by StartIterator (see page 5473). ImplStartIterator initializes the internal iteration index. ImplStartIterator returns true because it is assumed that there is at least one command associated with this adapter action.

See Also

IIteratorIndex (see page 1052)

IIteratorSupport (see page 1054)

StartIterator (see page 1056)

StartIterator (see page 5473)

54.1.38.2.51 TBaseAdapterAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled is called by WebEnabled (see page 5473). ImplWebEnabled returns true. Descendant classes may override this method.

See Also

WebEnabled (see page 5473)

54.1.38.2.52 TBaseAdapterAction.InIterator Method

Implements IIteratorIndex (see page 1052)'s InIterator method.

Pascal

```
function InIterator: Boolean;
```

C++

```
__fastcall Boolean InIterator();
```

Description

IIteratorIndex (see page 1052) and IIteratorSupport (see page 1054) are used to iterate through the commands supported by an adapter action. Most adapter actions support a single command. TAdapterActionGotoPage is adapter action that supports multiple commands. InIterator calls ImplInIterator (see page 5469).

See Also

IIteratorIndex (see page 1052)

IIteratorSupport (see page 1054)

InIterator (see page 1053)

ImplInIterator (see page 5469)

54.1.38.2.53 TBaseAdapterAction.IsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function IsDefaultAction(ADisplay: TObject): Boolean;
```

C++

```
__fastcall Boolean IsDefaultAction(TObject * ADisplay);
```

Description

Some adapter components have built in support for specific types of adapter actions. These actions are often added to the adapter component by default unless the developer explicitly adds one or more adapter actions. IsDefaultAction is called by the adapter while adding default actions to determine whether this adapter action should be added. ADisplay identifies characteristics of the adapter component. IsDefaultAction calls ImplIsDefaultAction (see page 5469).

See Also

ImplIsDefaultAction (see page 5469)

54.1.38.2.54 TBaseAdapterAction.NextIteration Method

Implements IIteratorSupport (see page 1054)'s NextIteration method.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

IIteratorSupport (see page 1054) is used to enumerate the list of commands supported by this adapter action. Most adapter actions have a single command. TAdapterGotoPageAction (see page 5291) is an example of an adapter action that supports multiple commands. NextIterations returns the result of ImplNextIteration (see page 5470).

See Also

IIteratorSupport (see page 1054)

IIteratorIndex (see page 1052)

ImplNextIteration (see page 5470)

NextIteration (see page 1056)

54.1.38.2.55 TBaseAdapterAction.ParentChanged Method

Handles movement of the component to a different parent.

Pascal

```
procedure ParentChanged; override;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

ParentChanged is called when the parent component is changed. TBaseAdapterAction (see page 5447) clears its cached reference to the parent adapter.

54.1.38.2.56 TBaseAdapterAction.SetDisplayLabel Method

Set the value of the DisplayLabel (see page 5474) property.

Pascal

```
procedure SetDisplayLabel(const Value: string);
```

C++

```
__fastcall SetDisplayLabel(const UnicodeString Value);
```

Description

SetDisplayLabel sets the value of the DisplayLabel (see page 5474) property.

See Also

DisplayLabel (see page 5474)

54.1.38.2.57 TBaseAdapterAction.StartIterator Method

Implements IIteratorSupport (see page 1054)'s StartIterator method.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

IIteratorIndex (see page 1052) and IIteratorSupport (see page 1054) are used to iterate through the commands supported by an adapter action. Most adapter actions support a single command. TAdapterActionGotoPage is adapter action that supports multiple commands. StartIterator calls ImplImplInIterator.

See Also

IIteratorIndex (see page 1052)

IIteratorSupport (see page 1054)

StartIterator (see page 1056)

ImplStartIterator (see page 5470)

54.1.38.2.58 TBaseAdapterAction.WebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function WebEnabled: Boolean;
```

C++

```
__fastcall Boolean WebEnabled();
```

Description

The state of the parent adapter may dictate when a button or hyperlink for a particular adapter action should not be enabled. For example, TDataSetAdapterPrevRowAction returns False when the dataset is positioned at BOF. WebEnabled calls ImplWebEnabled (see page 5470). Server-side script can access the value returned by WebEnabled using the Enabled property of an adapter action object.

See Also

ImplWebEnabled (see page 5470)

54.1.38.3 TBaseAdapterAction Properties

The properties of the TBaseAdapterAction class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 5474)	Provides access to the parent adapter component.
	Errors (see page 5475)	Returns the parent adapter's Errors list.

Public Properties

	Name	Description
R	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	DisplayLabel (see page 5474)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
R	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.

54.1.38.3.1 TBaseAdapterAction.ActionName Property

Identifies the name of this action when using server-side script.

Pascal

```
property ActionName: string;
```

C++

```
__property UnicodeString ActionName;
```

Description

The ActionName property defines the name used to access the adapter action with server-side script.

See Also

GetActionName (see page 5455)

54.1.38.3.2 TBaseAdapterAction.Adapter Property

Provides access to the parent adapter component.

Pascal

```
property Adapter: TCustomAdapter;
```

C++

```
__property TCustomAdapter Adapter;
```

Description

Descendant classes use this property to access the parent adapter component.

54.1.38.3.3 TBaseAdapterAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 5465)

SetDisplayLabel (see page 5472)

54.1.38.3.4 TBaseAdapterAction.Errors Property

Returns the parent adapter's Errors list.

Pascal

```
property Errors: TBaseAdapterErrorsList;
```

C++

```
__property TBaseAdapterErrorsList Errors;
```

Description

Descendant classes use this property to access the Errors list of the parent adapter. The Errors list is used to track Errors that occur while executing an adapter action. Server-side script can access the Errors list using the adapter object's Errors property. The server-side script Errors list is used to write the Errors to the HTML page.

See Also

GetErrors (see page 5458)

54.1.38.3.5 TBaseAdapterAction.ExecuteAccess Property

Defines the rights required to execute this action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property UnicodeString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this action. When server-side script accesses the CanExecute property, this value is checked against the end user's rights. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 6796)

HasExecuteAccess (see page 5552)

54.1.38.3.6 TBaseAdapterAction.ItemCount Property

Returns the number of items defined by an adapter action.

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

An adapter action may have a list of commands. The ItemCount property is implemented by GetItemCount (see page 5460). The TAdapterGotoPageAction (see page 5291) is an example of an adapter action with a list of commands. Each command of TAdapterGotoPageAction (see page 5291) displays a different page of the parent TPagedAdapter (see page 5844).

See Also

GetItemCount (see page 5460)

ItemIndex (see page 5476)

TAdapterGotoPageAction (see page 5291)

GetIsAdapterActionList (see page 5460)

54.1.38.3.7 TBaseAdapterAction.ItemIndex Property

Returns the index of the current item of an adapter action.

Pascal

```
property ItemIndex: Integer;
```

C++

```
__property int ItemIndex;
```

Description

An adapter action may have a list of commands. The ItemIndex indicates the current item in the list. The TAdapterGotoPageAction (see page 5291) is an example of an adapter action with a list of commands. Each command of TAdapterGotoPageAction (see page 5291) displays a different page of the parent TPagedAdapter (see page 5844).

See Also

ItemCount (see page 5475)

TAdapterGotoPageAction (see page 5291)

GetIsAdapterActionList (see page 5460)

54.1.38.3.8 TBaseAdapterAction.RedirectOptions Property

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
property RedirectOptions: TAdapterActionRedirectOptions;
```

C++

```
__property TAdapterActionRedirectOptions RedirectOptions;
```

Description

Set RedirectOptions to indicate that HTTP redirect should be performed after executing this adapter action. An HTTP redirect causes the browser to "forget" about the parameters passed when executing the adapter action. Without a redirect, the browser's Refresh or Reload command cause the last HTTP request to be resent, resulting in re-execution of the adapter action.

See Also

SendRedirect

54.1.38.4 TBaseAdapterAction Events

The events of the TBaseAdapterAction class are listed here.

Public Events

	Name	Description
	OnAfterExecute (see page 5477)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5477)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5478)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5478)	Called before the adapter action response is generated.
	OnGetParams (see page 5478)	Specifies name/value pairs needed to execute this adapter action.

54.1.38.4.1 TBaseAdapterAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest (see page 5453).

See Also

DoAfterExecuteActionRequest (see page 5453)

OnAfterExecuteAction (see page 5576)

OnBeforeExecute (see page 5478)

54.1.38.4.2 TBaseAdapterAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnBeforeGetActionResponse (see page 5578)

54.1.38.4.3 TBaseAdapterAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest (see page 5453).

See Also

DoBeforeExecuteActionRequest (see page 5453)

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.38.4.4 TBaseAdapterAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.38.4.5 TBaseAdapterAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

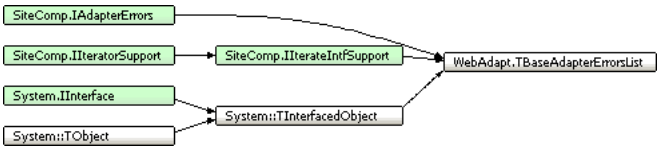
See Also

ImplGetAdapterItemRequestParams (see page 5465)

54.1.39 TBaseAdapterErrorsList Class

TBaseAdapterErrorsList is the base class for adapter error object managers.

Class Hierarchy



Pascal

```
TBaseAdapterErrorsList = class(TInterfacedObject, IAdapterErrors, IIterateIntfSupport);
```

C++

```
class TBaseAdapterErrorsList : public TInterfacedObject, public IAdapterErrors, public
IIterateIntfSupport;
```

File

WebAdapt

Description

TBaseAdapterErrorsList is the base class for objects that manage lists of adapter error objects. Do not instantiate TBaseAdapterErrorsList directly. Use TAdapterErrorsList (see page 5259).

See Also

TAdapterErrorsList (see page 5259)

IAdapterError (see page 992)

54.1.39.1 TBaseAdapterErrorsList Members

The following tables list the members exposed by TBaseAdapterErrorsList.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.

	EndIterator (see page 5483)	Signals the end of the iterating operation.
	GetCurrentIntf (see page 5483)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 5484)	Returns a particular error.
	GetErrorCount (see page 5484)	Return the number of errors in the errors list.
	GetObjectErrors (see page 5484)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 5484)	Indicates whether the errors list contains objects associated with a particular adapter field.
V	ImplClearErrors (see page 5485)	This is ImplClearErrors, a member of class TBaseAdapterErrorsList.
V	ImplDefineLabel (see page 5485)	This is ImplDefineLabel, a member of class TBaseAdapterErrorsList.
V	ImplGetError (see page 5485)	This is ImplGetError, a member of class TBaseAdapterErrorsList.
V	ImplGetErrorCount (see page 5485)	This is ImplGetErrorCount, a member of class TBaseAdapterErrorsList.
V	ImplGetObjectErrors (see page 5486)	This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.
V	ImplHasObjectErrors (see page 5486)	This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.
	NextIteration (see page 5486)	Advances to the objects next item.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	StartIterator (see page 5486)	Positions the object on its first item and starts the iteration process.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AddError (see page 5481)	This is the overview for the AddError method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearErrors (see page 5482)	Clear error list.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	DefineLabel (see page 5483)	Define error label for field.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	ErrorCount (see page 5487)	Number of error objects contained.
R	Errors (see page 5487)	Access to error objects.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.

54.1.39.2 TBaseAdapterErrorsList Methods

The methods of the TBaseAdapterErrorsList class are listed here.

Protected Methods

	Name	Description
	EndIterator (see page 5483)	Signals the end of the iterating operation.
	GetCurrentIntf (see page 5483)	This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.
	GetError (see page 5484)	Returns a particular error.
	GetErrorCount (see page 5484)	Return the number of errors in the errors list.
	GetObjectErrors (see page 5484)	Returns an object that is used to enumerate all errors associated with an adapter field.
	HasObjectErrors (see page 5484)	Indicates whether the errors list contains objects associated with a particular adapter field.
V	ImplClearErrors (see page 5485)	This is ImplClearErrors, a member of class TBaseAdapterErrorsList.
V	ImplDefineLabel (see page 5485)	This is ImplDefineLabel, a member of class TBaseAdapterErrorsList.
V	ImplGetError (see page 5485)	This is ImplGetError, a member of class TBaseAdapterErrorsList.
V	ImplGetErrorCount (see page 5485)	This is ImplGetErrorCount, a member of class TBaseAdapterErrorsList.
V	ImplGetObjectErrors (see page 5486)	This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.
V	ImplHasObjectErrors (see page 5486)	This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.
	NextIteration (see page 5486)	Advances to the objects next item.
	StartIterator (see page 5486)	Positions the object on its first item and starts the iteration process.

Public Methods

	Name	Description
V	AddError (see page 5481)	This is the overview for the AddError method overload.
	ClearErrors (see page 5482)	Clear error list.
	DefineLabel (see page 5483)	Define error label for field.

54.1.39.2.1 AddError Method

This is the overview for the AddError method overload.

Overload List

	Name	Description
	TBaseAdapterErrorsList.AddError (Exception, string) (see page 5482)	Add error to list.
	TBaseAdapterErrorsList.AddError (Exception, TObject) (see page 5482)	Add error to list.
	TBaseAdapterErrorsList.AddError (string, string, Integer) (see page 5482)	Add error to list.
	TBaseAdapterErrorsList.AddError (string, TObject, Integer) (see page 5482)	Add error to list.

54.1.39.2.1.1 TBaseAdapterErrorsList.AddError Method (Exception, TObject)

Add error to list.

Pascal

```
procedure AddError(AException: Exception; const AObjectName: string = ''); virtual; overload;
procedure AddError(const AMessage: string; const AObjectName: string = ''; AID: Integer = 0);
virtual; overload;
procedure AddError(const AMessage: string; AObject: TObject; AID: Integer = 0); virtual;
overload;
procedure AddError(AException: Exception; AObject: TObject); virtual; overload;
```

C++

```
virtual __fastcall AddError(Exception AException, const UnicodeString AObjectName = '');
virtual __fastcall AddError(const UnicodeString AMessage, const UnicodeString AObjectName =
'', int AID = 0);
virtual __fastcall AddError(const UnicodeString AMessage, TObject * AObject, int AID = 0);
virtual __fastcall AddError(Exception AException, TObject * AObject);
```

Description

AddError adds an error to the list maintained by the TBaseAdapterErrorsList (see page 5479) instance. As implemented in TBaseAdapterErrorsList (see page 5479), AddError does nothing. This method must be implemented by descendant classes.

See Also

AddError (see page 5263)

54.1.39.2.2 TBaseAdapterErrorsList.ClearErrors Method

Clear error list.

Pascal

```
procedure ClearErrors;
```

C++

```
__fastcall ClearErrors();
```

Description

Clear errors deletes all error information maintained by the TBaseAdapterErrorsList (see page 5479) instance.

See Also

AddError (see page 5263)

54.1.39.2.3 TBaseAdapterErrorsList.DefineLabel Method

Define error label for field.

Pascal

```
procedure DefineLabel(const AName: string; const ALabel: string);
```

C++

```
__fastcall DefineLabel(const UnicodeString AName, const UnicodeString ALabel);
```

Description

DefineLabel defines a string label that represents a dataset field in error message. AName is the the field name. ALabel is the label.

See Also

AddError (see page 5263)

54.1.39.2.4 TBaseAdapterErrorsList.EndIterator Method

Signals the end of the iterating operation.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

Server-side script calls EndIterator when it stops iterating over the object's items. The object uses this method to perform any clean-up to reflect the fact that it is no longer iterating over its items.

OwnerData is a pointer to information that the object can use to influence the iteration process. Each object stores and uses this information in its own way. This information is first supplied by the initial call to the StartIterator method. It is passed to each NextIteration call (which can modify the information), and finally supplied to the EndIterator method, which can free the memory used to store the information.

See Also

StartIterator (see page 1056)

NextIteration (see page 1056)

54.1.39.2.5 TBaseAdapterErrorsList.GetCurrentIntf Method

Pascal

```
function GetCurrentIntf(OwnerData: Pointer): IUnknown;
```

C++

```
__fastcall IUnknown GetCurrentIntf(void * OwnerData);
```

Description

This is GetCurrentIntf, a member of class TBaseAdapterErrorsList.

54.1.39.2.6 TBaseAdapterErrorsList.GetError Method

Returns a particular error.

Pascal

```
function GetError(I: Integer): IAdapterError;
```

C++

```
__fastcall IAdapterError GetError(int I);
```

Description

I is a zero-based index.

See Also

IAdapterError (see page 992)

54.1.39.2.7 TBaseAdapterErrorsList.GetErrorCount Method

Return the number of errors in the errors list.

Pascal

```
function GetErrorCount: Integer;
```

C++

```
__fastcall int GetErrorCount();
```

Description

Return the number of errors in the errors list.

54.1.39.2.8 TBaseAdapterErrorsList.GetObjectErrors Method

Returns an object that is used to enumerate all errors associated with an adapter field.

Pascal

```
function GetObjectErrors(const AName: string): TObject;
```

C++

```
__fastcall TObject * GetObjectErrors(const UnicodeString AName);
```

Description

AName identifies an adapter field. nil (Delphi) or NULL (C++) is returned if there are no errors associated with the adapter field.

See Also

HasObjectErrors (see page 997)

54.1.39.2.9 TBaseAdapterErrorsList.HasObjectErrors Method

Indicates whether the errors list contains objects associated with a particular adapter field.

Pascal

```
function HasObjectErrors(const AName: string): Boolean;
```

C++

```
__fastcall Boolean HasObjectErrors(const UnicodeString AName);
```

Description

HasObjectErrors returns true if any errors are associated with the given adapter field. AName identifies an adapter field.

See Also

GetObjectErrors (see page 997)

54.1.39.2.10 TBaseAdapterErrorsList.ImplClearErrors Method

Pascal

```
procedure ImplClearErrors; virtual;
```

C++

```
virtual __fastcall ImplClearErrors();
```

Description

This is ImplClearErrors, a member of class TBaseAdapterErrorsList.

54.1.39.2.11 TBaseAdapterErrorsList.ImplDefineLabel Method

Pascal

```
procedure ImplDefineLabel(const AName: string; const ALabel: string); virtual;
```

C++

```
virtual __fastcall ImplDefineLabel(const UnicodeString AName, const UnicodeString ALabel);
```

Description

This is ImplDefineLabel, a member of class TBaseAdapterErrorsList.

54.1.39.2.12 TBaseAdapterErrorsList.ImplGetError Method

Pascal

```
function ImplGetError(I: Integer): IAdapterError; virtual;
```

C++

```
virtual __fastcall IAdapterError ImplGetError(int I);
```

Description

This is ImplGetError, a member of class TBaseAdapterErrorsList.

54.1.39.2.13 TBaseAdapterErrorsList.ImplGetErrorCount Method

Pascal

```
function ImplGetErrorCount: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetErrorCount();
```

Description

This is ImplGetErrorCount, a member of class TBaseAdapterErrorsList.

54.1.39.2.14 TBaseAdapterErrorsList.ImplGetObjectErrors Method

Pascal

```
function ImplGetObjectErrors(const AName: string): TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetObjectErrors(const UnicodeString AName);
```

Description

This is ImplGetObjectErrors, a member of class TBaseAdapterErrorsList.

54.1.39.2.15 TBaseAdapterErrorsList.ImplHasObjectErrors Method

Pascal

```
function ImplHasObjectErrors(const AName: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasObjectErrors(const UnicodeString AName);
```

Description

This is ImplHasObjectErrors, a member of class TBaseAdapterErrorsList.

54.1.39.2.16 TBaseAdapterErrorsList.NextIteration Method

Advances to the objects next item.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Server-side script calls NextIteration to move to the next item.

OwnerData is a pointer to information that the object can use to influence the iteration process. Each object stores and uses this information in its own way. This information is first supplied by the initial call to the StartIterator method. NextIteration can modify the information, after which it is supplied to the next call to the NextIteration or EndIterator method.

NextIteration returns true if it successfully moves to the next item, false if there were no more items.

See Also

StartIterator (see page 1056)

EndIterator (see page 1056)

54.1.39.2.17 TBaseAdapterErrorsList.StartIterator Method

Positions the object on its first item and starts the iteration process.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

Server-side script calls StartIterator to begin iterating over the object's items.

OwnerData returns a pointer to information that the object can use to influence the iteration process. StartIterator initializes this information to reflect what ever information the object needs to communicate to itself as it advances over its items. This pointer is then passed to the next call to the NextIteration or EndIterator method.

StartIterator returns true if it successfully moves to the first item, false if there are no items to iterate.

See Also

NextIteration (see page 1056)

EndIterator (see page 1056)

54.1.39.3 TBaseAdapterErrorsList Properties

The properties of the TBaseAdapterErrorsList class are listed here.

Public Properties

	Name	Description
R	ErrorCount (see page 5487)	Number of error objects contained.
R	Errors (see page 5487)	Access to error objects.

54.1.39.3.1 TBaseAdapterErrorsList.ErrorCount Property

Number of error objects contained.

Pascal

```
property ErrorCount: Integer;
```

C++

```
__property int ErrorCount;
```

Description

ErrorCount returns the number of error objects available.

See Also

Errors (see page 5487)

54.1.39.3.2 TBaseAdapterErrorsList.Errors Property

Access to error objects.

Pascal

```
property Errors [I: Integer]: IAdapterError;
```

C++

```
__property IAdapterError Errors[int I];
```

Description

Errors returns a specific error object.

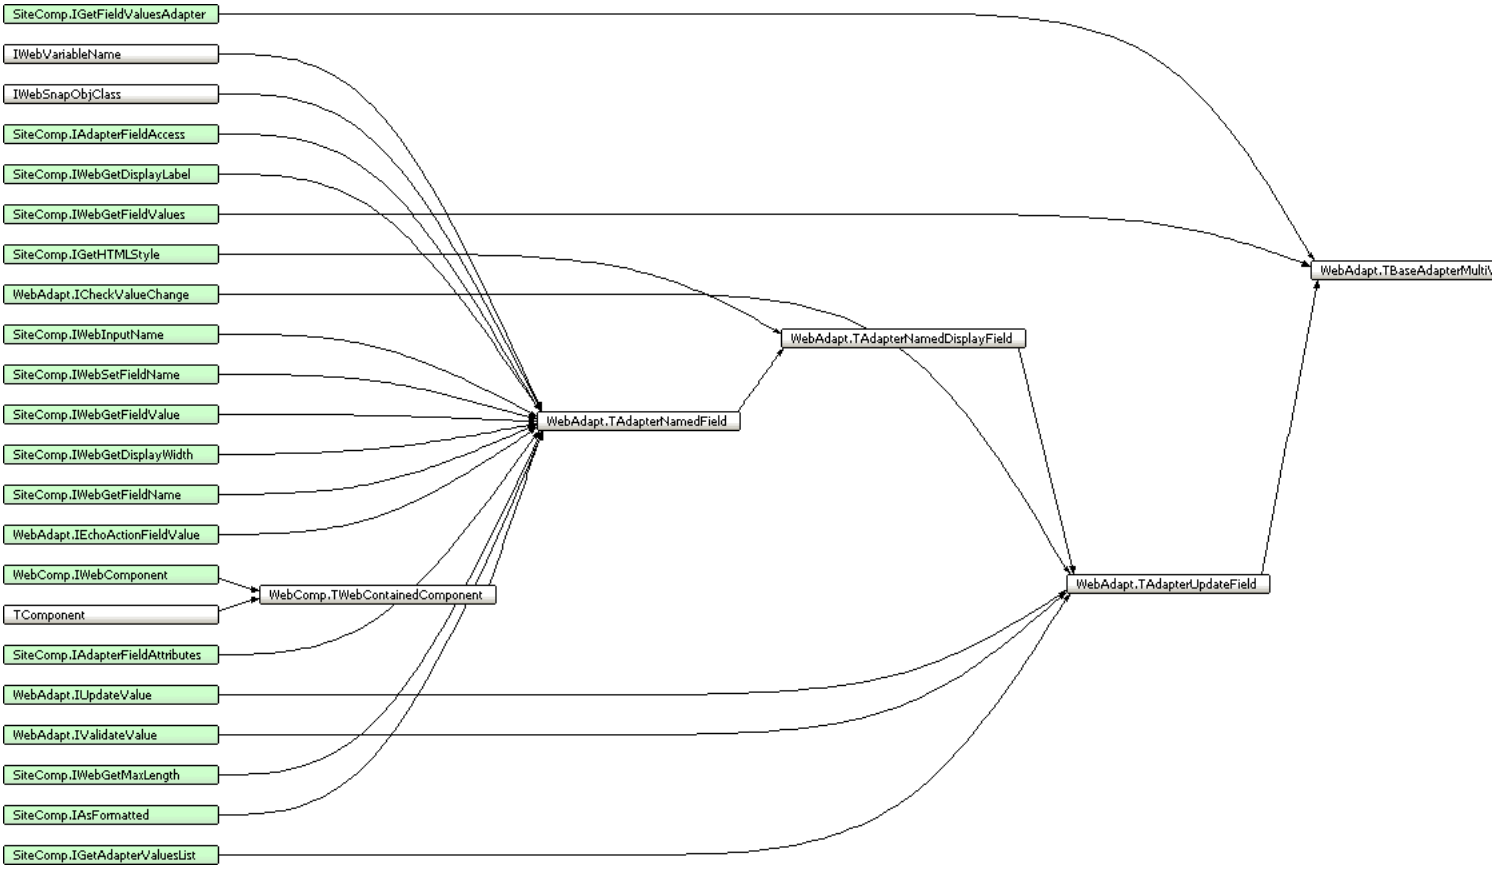
See Also

ErrorCount (see page 5487)

54.1.40 TBaseAdapterMultiValueField Class

TBaseAdapterMultiValueField is a base class for adapter fields that have zero or more values.

Class Hierarchy



Pascal

```
TBaseAdapterMultiValueField = class(TAdapterUpdateField, IGetFieldValuesAdapter,
IWebGetFieldValues);
```

C++

```
class TBaseAdapterMultiValueField : public TAdapterUpdateField, public IGetFieldValuesAdapter,
public IWebGetFieldValues;
```

File

WebAdapt

Description

TBaseAdapterMultiValueField is used to represent a data value that can have multiple values. Server-side script is used to generate a form displaying this field. Typically, the HTML form will contain group check boxes or a select list supporting multiple selection. When an Adapter (see page 5368) action is executed, TBaseAdapterMultiValueField is used to retrieve the submitted field value(s) from the HTTP request.

See Also

TCustomAdapterMultiValueField (see page 5646)

TCustomAdapterFileField (see page 5604)

54.1.40.1 TBaseAdapterMultiValueField Members

The following tables list the members exposed by TBaseAdapterMultiValueField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5424)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5425)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5425)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5425)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5426)	Validates field values entered by the end-user.
	EndValueIterator (see page 5493)	Completes iteration.
V	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5426)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 5494)	Implements IWebGetFieldValues (see page 1092)' GetCurrentValue.
V	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5346)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5347)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 5494)	Returns the adapter object that implements the Values property.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5347)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5347)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 5426)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
V	GetValueCount (see page 5494)	Returns the number of values associated with this adapter field.
V	GetValues (see page 5495)	Returns one of the values associated with the adapter field.

	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5348)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5348)	Suggests a view mode for this adapter field.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 5495)	Implements IWebGetFieldValues (see page 1092)' HasValue method.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 5427)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 5428)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplGetCurrentValue (see page 5495)	Implements IWebGetFieldValues (see page 1092)' GetCurrentValue (see page 5494) method.
V	ImplGetDisplayLabel (see page 5348)	Implements interface access to the DisplayLabel (see page 5350) property.
V	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayLabel (see page 5428)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 5349)	Implements interface access to the DisplayWidth (see page 5350) property.
V	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
V	ImplGetDisplayWidth (see page 5428)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
V	ImplGetEchoActionFieldValue (see page 5429)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplGetFieldValuesAdapter (see page 5496)	Returns the adapter object that implements the Values property.
V	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5349)	Implements interface access to the Required (see page 5351) property.
V	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5363)	Gets the value of this adapter field as a Variant (see page 3421).
V	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVariableName (see page 5429)	Gets the name used to access this adapter field with server-side script.
V	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
V	ImplHasValue (see page 5496)	Implements IWebGetFieldValues (see page 1092)' HasValue (see page 5495) method.
V	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
V	ImplSetEchoActionFieldValue (see page 5429)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
V	ImplSetFieldName (see page 5429)	Sets the name used to access this adapter field with server-side script.
V	ImplUpdateValue (see page 5430)	Updates the adapter field with value(s) entered by the end-user.
V	ImplValidateValue (see page 5430)	Validates values(s) entered by the end-user.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	IsMultiValueField (see page 5430)	Indicates whether this adapter field can support multiple values.
	NextValueIteration (see page 5496)	Implements IWebGetFieldValues (see page 1092)' NextValueIteration method.
V	Notification (see page 5431)	Clears references to a deleted component.
V	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
V	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5349)	SetDisplayLabel sets the value of the DisplayLabel (see page 5350) property.

	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
V	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartValueIterator (see page 5497)	Implements IWebGetFieldValues (see page 1092)' StartValueIterator method.
	UpdateValue (see page 5431)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5431)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
R	Adapter (see page 5368)	Returns the parent adapter component.
R	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
R	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5433)	Event handler called to retrieve a string representation of the adapter field's value.
	OnValidateValue (see page 5433)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5878)	This is CheckValueChange, a member of class ICheckValueChange.
V	Create (see page 5492)	Constructor for TBaseAdapterMultiValueField (see page 5488).
V	Destroy (see page 5492)	Destructor for TBaseAdapterMultiValueField (see page 5488).
	GetAdapterValuesList (see page 1027)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	UpdateValue (see page 5892)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5893)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5350)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5350)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
	ReadOnly (see page 5351)	Indicates whether this adapter field is read-only.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
R	Value (see page 5432)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5432)	Associates a list of values with the adapter field.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.40.2 TBaseAdapterMultiValueField.Create Constructor

Constructor for TBaseAdapterMultiValueField (see page 5488).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TBaseAdapterMultiValueField(TComponent * AOwner);
```

Description

Creates an instance of TFieldValuesAdapter (see page 5803) and calls the inherited creator method. TFieldValuesAdapter (see page 5803) is used to implement the Values property used by server-side script.

See Also

TFieldValuesAdapter (see page 5803)

ImplGetFieldValuesAdapter (see page 5496)

Destroy (see page 5492)

54.1.40.3 TBaseAdapterMultiValueField.Destroy Destructor

Destructor for TBaseAdapterMultiValueField (see page 5488).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TBaseAdapterMultiValueField();
```

Description

Destroys the instance of TFieldValuesAdapter (see page 5803) and calls the inherited destructor. TFieldValuesAdapter (see page 5803) is used to implement the Values property used by server-side script.

See Also

TFieldValuesAdapter (see page 5803)

ImplGetFieldValuesAdapter (see page 5496)

Create (see page 5492)

54.1.40.4 TBaseAdapterMultiValueField Methods

The methods of the TBaseAdapterMultiValueField class are listed here.

Protected Methods

	Name	Description
	EndValueIterator (see page 5493)	Completes iteration.
	GetCurrentValue (see page 5494)	Implements IWebGetFieldValues (see page 1092)' GetCurrentValue.
	GetFieldValuesAdapter (see page 5494)	Returns the adapter object that implements the Values property.
V	GetValueCount (see page 5494)	Returns the number of values associated with this adapter field.
V	GetValues (see page 5495)	Returns one of the values associated with the adapter field.
	HasValue (see page 5495)	Implements IWebGetFieldValues (see page 1092)' HasValue method.
V	ImplGetCurrentValue (see page 5495)	Implements IWebGetFieldValues (see page 1092)' GetCurrentValue (see page 5494) method.
V	ImplGetFieldValuesAdapter (see page 5496)	Returns the adapter object that implements the Values property.
V	ImplHasValue (see page 5496)	Implements IWebGetFieldValues (see page 1092)' HasValue (see page 5495) method.
	NextValueIteration (see page 5496)	Implements IWebGetFieldValues (see page 1092)' NextValueIteration method.
	StartValueIterator (see page 5497)	Implements IWebGetFieldValues (see page 1092)' StartValueIterator method.

54.1.40.4.1 TBaseAdapterMultiValueField.EndValueIterator Method

Completes iteration.

Pascal

```
procedure EndValueIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndValueIterator(void * OwnerData);
```

Description

The EndValueIterator procedure is called when iteration has completed.

See Also

NextValueIteration (see page 5496)

StartValueIterator (see page 5497)

54.1.40.4.2 TBaseAdapterMultiValueField.GetCurrentValue Method

Implements IWebGetFieldValues (see page 1092)' GetCurrentValue.

Pascal

```
function GetCurrentValue: Variant;
```

C++

```
__fastcall Variant GetCurrentValue();
```

Description

GetCurrentValue returns the result of ImplGetCurrentValue (see page 5495).

See Also

GetCurrentValue (see page 1094)

ImplGetCurrentValue (see page 5495)

54.1.40.4.3 TBaseAdapterMultiValueField.GetFieldValuesAdapter Method

Returns the adapter object that implements the Values property.

Pascal

```
function GetFieldValuesAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetFieldValuesAdapter();
```

Description

GetFieldValuesAdapter is called when server-side script references the Values property of this adapter field. GetFieldValuesAdapter calls ImplGetFieldValuesAdapter (see page 5496).

See Also

ImplGetFieldValuesAdapter (see page 5496)

54.1.40.4.4 TBaseAdapterMultiValueField.GetValueCount Method

Returns the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; override;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount returns 0. Descendants of TBaseAdapterMultiValueField (see page 5488) override this method. This method will be called when server-side script is used to iterate over field values using the Values property.

See Also

GetValues (see page 5495)

54.1.40.4.5 TBaseAdapterMultiValueField.GetValues Method

Returns one of the values associated with the adapter field.

Pascal

```
function GetValues(I: Integer): Variant; override;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues returns Unassigned. Descendants override this method. This method will be called when server-side script is used to iterate over field values using the Values property.

See Also

GetValueCount (see page 5494)

54.1.40.4.6 TBaseAdapterMultiValueField.HasValue Method

Implements IWebGetFieldValues (see page 1092)' HasValue method.

Pascal

```
function HasValue(const AValue: Variant): Boolean;
```

C++

```
__fastcall Boolean HasValue(const Variant AValue);
```

Description

HasValue returns the result of ImplHasValue (see page 5496).

See Also

HasValue (see page 1094)

ImplHasValue (see page 5496)

54.1.40.4.7 TBaseAdapterMultiValueField.ImplGetCurrentValue Method

Implements IWebGetFieldValues (see page 1092)' GetCurrentValue (see page 5494) method.

Pascal

```
function ImplGetCurrentValue: Variant; virtual;
```

C++

```
virtual __fastcall Variant ImplGetCurrentValue();
```

Description

ImplGetCurrentValue is called by GetCurrentValue (see page 5494). ImplGetCurrentValue calls GetValues (see page 5495) with the value of the internal iterator index.

See Also

GetCurrentValue (see page 5494)

GetValues (see page 5495)

54.1.40.4.8 TBaseAdapterMultiValueField.ImplGetFieldValuesAdapter Method

Returns the adapter object that implements the Values property.

Pascal

```
function ImplGetFieldValuesAdapter: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetFieldValuesAdapter();
```

Description

ImplGetFieldValuesAdapter returns an instance of TFieldValuesAdapter (see page 5803).

See Also

TFieldValuesAdapter (see page 5803)

GetFieldValuesAdapter (see page 5494)

Create (see page 5492)

Destroy (see page 5492)

54.1.40.4.9 TBaseAdapterMultiValueField.ImplHasValue Method

Implements IWebGetFieldValues (see page 1092)' HasValue (see page 5495) method.

Pascal

```
function ImplHasValue(const Value: Variant): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasValue(const Variant Value);
```

Description

ImplHasValue is called by HasValue (see page 5495). ImplHasValue returns False (indicating that there is no matching value). Descendants override this method.

See Also

HasValue (see page 5495)

54.1.40.4.10 TBaseAdapterMultiValueField.NextValueIteration Method

Implements IWebGetFieldValues (see page 1092)' NextValueIteration method.

Pascal

```
function NextValueIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextValueIteration(void * OwnerData);
```

Description

NextValueIteration increments an internal iterator index. false is returned if the iterator index is not less than the GetValueCount (see page 5494) .

See Also

NextValueIteration (see page 1094)

GetValueCount (see page 5494)

54.1.40.4.11 TBaseAdapterMultiValueField.StartValueIterator Method

Implements IWebGetFieldValues (see page 1092)' StartValueIterator method.

Pascal

```
function StartValueIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartValueIterator(void * OwnerData);
```

Description

StartValueIterator initializes an internal iterator index to zero. false is returned if GetValueCount (see page 5494) is zero.

See Also

StartValueIterator (see page 1095)

GetValueCount (see page 5494)

54.1.41 TBaseEndUserAdapter Class

TBaseEndUserAdapter contains user information.

Class Hierarchy

Pascal

```
TBaseEndUserAdapter = class(TDefaultFieldsAdapter, IWebEndUser);
```

C++

```
class TBaseEndUserAdapter : public TDefaultFieldsAdapter, public IWebEndUser;
```

File

WebAdapt

Description

TBaseEndUserAdapter contains information about a user such as their name, access rights, and whether they are logged in. TBaseEndUserAdapter has default fields to represent the end user's display name and login state. It has default actions for logging a user in and logging a user out. End user adapters are responsible validating end user access. For example, when the end user attempts to access a page, the end-user adapter is called to determine whether the end user has rights to access the page.

See Also

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

54.1.41.1 TBaseEndUserAdapter Members

The following tables list the members exposed by TBaseEndUserAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 5504)	Determines if there is a static login page.
V	CanExecuteLogout (see page 5504)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 5505)	Determines whether there is a static login page or an automatically produced login page.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	DoOnHasRights (see page 5505)	Determines whether the user has view rights.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExecuteLogin (see page 5505)	Starts the server-side login process.
V	ExecuteLoginForm (see page 5506)	Creates the HTML login page.
V	ExecuteLogout (see page 5506)	Performs server-side logout.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.

	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 5506)	Retrieves the display name string.
	GetDisplayNameValue (see page 5507)	Gets the display name of the end user.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 5507)	Gets the end-user adapter.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 5507)	Determines if the user is logged in
	GetLoggedInValue (see page 5508)	Determines if the user is logged in.
	GetLoginFormAction (see page 5508)	Gets the action component for the login form.
	GetLogoutAction (see page 5508)	Gets the action component for the logout form.
	GetUserID (see page 5509)	Gets the UserID from this TBaseEndUserAdapter (see page 5497).
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasExecuteRights (see page 5509)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5497).
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasModifyRights (see page 5509)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5497).
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	HasViewRights (see page 5510)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 5497).
	ImplCanAddActionClass (see page 5510)	Determines if the given action class can be added.
	ImplCanAddFieldClass (see page 5510)	Determines if the given action class can be added.
	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5511)	Lists supported end-user adapter actions.
	ImplGetDisplayName (see page 5511)	Gets the display name for this TBaseEndUserAdapter (see page 5497).
	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
	ImplGetEndUserAdapter (see page 5511)	Returns this TBaseEndUserAdapter (see page 5497).
	ImplGetFieldsList (see page 5512)	Obtains the list of all of the fields for the end-user adapter.
	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
	ImplGetLoggedIn (see page 5512)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 5512)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5497).
	ImplGetLogoutAction (see page 5513)	Gets the Logout action component for this TBaseEndUserAdapter (see page 5497).
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.

	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 5513)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 5513)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplHasViewRights (see page 5514)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplLogIn (see page 5514)	Processes the login for the given user.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 5514)	Generate the HTML login page.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	LogIn (see page 5515)	Processes the server-side login for the given user.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	ProduceLoginPage (see page 5515)	Generates the login page.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	UserList (see page 5515)	Gets the user list.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnHasRights (see page 5516)	Determines if the user rights match the rights being queried.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.
	OnProduceLoginPage (see page 5516)	Allows implementation of a customized login page.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
	Actions (see page 5572)	Actions is the container for adapter actions components.
	Actions (see page 5746)	Container for adapter actions components.
	Data (see page 5572)	Data is the container for adapter field components.
	Data (see page 5747)	Container for adapter field components.
	DisplayName (see page 5994)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
	EndUserAdapter (see page 5994)	Provides access to the end user adapter that implements this interface.
	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
	IteratorIndex (see page 1054)	Indicates the index of the current item.
	LoggedIn (see page 5994)	Indicates whether the current user is logged in.
	LoginFormAction (see page 5995)	Indicates the action component for the login form.
	LoginPage (see page 5516)	Specifies the name of the page that acts as the login page.
	LogoutAction (see page 5996)	Indicates the action component for logging a user out.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.41.2 TBaseEndUserAdapter Methods

The methods of the TBaseEndUserAdapter class are listed here.

Protected Methods

	Name	Description
	CanExecuteLoginForm (see page 5504)	Determines if there is a static login page.
	CanExecuteLogout (see page 5504)	Determines if the user is logged in.
	CanProduceLoginPage (see page 5505)	Determines whether there is a static login page or an automatically produced login page.
	DoOnHasRights (see page 5505)	Determines whether the user has view rights.
	ExecuteLogin (see page 5505)	Starts the server-side login process.
	ExecuteLoginForm (see page 5506)	Creates the HTML login page.
	ExecuteLogout (see page 5506)	Performs server-side logout.
	GetDisplayName (see page 5506)	Retrieves the display name string.
	GetDisplayNameValue (see page 5507)	Gets the display name of the end user.
	GetEndUserAdapter (see page 5507)	Gets the end-user adapter.
	GetLoggedIn (see page 5507)	Determines if the user is logged in
	GetLoggedInValue (see page 5508)	Determines if the user is logged in.
	GetLoginFormAction (see page 5508)	Gets the action component for the login form.
	GetLogoutAction (see page 5508)	Gets the action component for the logout form.
	GetUserID (see page 5509)	Gets the UserID from this TBaseEndUserAdapter (see page 5497).
	HasExecuteRights (see page 5509)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5497).
	HasModifyRights (see page 5509)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5497).
	HasViewRights (see page 5510)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 5497).
	ImplCanAddActionClass (see page 5510)	Determines if the given action class can be added.
	ImplCanAddFieldClass (see page 5510)	Determines if the given action class can be added.
	ImplGetActionsList (see page 5511)	Lists supported end-user adapter actions.

	ImplGetDisplayName (see page 5511)	Gets the display name for this TBaseEndUserAdapter (see page 5497).
	ImplGetEndUserAdapter (see page 5511)	Returns this TBaseEndUserAdapter (see page 5497).
	ImplGetFieldsList (see page 5512)	Obtains the list of all of the fields for the end-user adapter.
	ImplGetLoggedIn (see page 5512)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 5512)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5497).
	ImplGetLogoutAction (see page 5513)	Gets the Logout action component for this TBaseEndUserAdapter (see page 5497).
	ImplHasExecuteRights (see page 5513)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyRights (see page 5513)	Checks user rights and determines if the user has modify rights.
	ImplHasViewRights (see page 5514)	Checks user rights and determines if the user has view rights.
	ImplLogIn (see page 5514)	Processes the login for the given user.
	ImplProduceLoginPage (see page 5514)	Generate the HTML login page.
	LogIn (see page 5515)	Processes the server-side login for the given user.
	ProduceLoginPage (see page 5515)	Generates the login page.
	UserList (see page 5515)	Gets the user list.

54.1.41.2.1 TBaseEndUserAdapter.CanExecuteLoginForm Method

Determines if there is a static login page.

Pascal

```
function CanExecuteLoginForm: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanExecuteLoginForm();
```

Description

The CanExecuteLoginForm calls CanProduceLoginPage (see page 5505) to determine if there is a static login page, or if one can be generated. Then if the user is not already logged in, this function returns true. If the login page cannot be produced or the user is already logged in, then this function returns false.

See Also

CanProduceLoginPage (see page 5505)

54.1.41.2.2 TBaseEndUserAdapter.CanExecuteLogout Method

Determines if the user is logged in.

Pascal

```
function CanExecuteLogout: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanExecuteLogout();
```

Description

The CanExecuteLogout function calls ImplGetLoggedIn (see page 5512) to determine if the user is logged in. If the user is logged in, this function returns true.

See Also

ImplGetLoggedIn (see page 5512)

54.1.41.2.3 TBaseEndUserAdapter.CanProduceLoginPage Method

Determines whether there is a static login page or an automatically produced login page.

Pascal

```
function CanProduceLoginPage: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean CanProduceLoginPage();
```

Description

The CanProduceLoginPage returns true if there is a static login page, or if there is an event handler defined to automatically produce the login page.

See Also

OnProduceLoginPage (see page 5516)

54.1.41.2.4 TBaseEndUserAdapter.DoOnHasRights Method

Determines whether the user has view rights.

Pascal

```
function DoOnHasRights(AEvent: TEndUserRightsEvent; const ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean DoOnHasRights(TEndUserRightsEvent AEvent, const UnicodeString
ARights);
```

Description

The DoOnHasRights function is called from ImplHasViewRights (see page 5514). It matches the given access rights to the rights in the user list and returns true if the user has view rights.

AEvent is the event handler that DoOnHasRights should call first to check access rights.

ARights is a string that represents the rights the user needs.

See Also

ImplHasViewRights (see page 5514)

HasViewRights (see page 5510)

54.1.41.2.5 TBaseEndUserAdapter.ExecuteLogin Method

Starts the server-side login process.

Pascal

```
procedure ExecuteLogin(AUserID: Variant); virtual;
```

C++

```
virtual __fastcall ExecuteLogin(Variant AUserID);
```

Description

The ExecuteLogin function is called from sever-side script to start the login process. This base class version of the function is empty. A customized overridden version of this function can be written to do specific login processing for the application.

See Also

ImplProduceLoginPage (see page 5514)

54.1.41.2.6 TBaseEndUserAdapter.ExecuteLoginForm Method

Creates the HTML login page.

Pascal

```
procedure ExecuteLoginForm; virtual;
```

C++

```
virtual __fastcall ExecuteLoginForm();
```

Description

The ExecuteLoginForm function is called from server-side script to create the HTML login page. This function calls ImplProduceLoginPage (see page 5514) to make the page producer generate the login page.

See Also

ImplProduceLoginPage (see page 5514)

54.1.41.2.7 TBaseEndUserAdapter.ExecuteLogout Method

Performs server-side logout.

Pascal

```
procedure ExecuteLogout; virtual;
```

C++

```
virtual __fastcall ExecuteLogout();
```

Description

The ExecuteLogout function is called from server-side script to perform the logout process. This base class version of the function is empty. A customized overridden version of this function can be written to do specific logout processing for the application.

See Also

CanExecuteLogout (see page 5504)

54.1.41.2.8 TBaseEndUserAdapter.GetDisplayName Method

Retrieves the display name string.

Pascal

```
function GetDisplayName: string;
```

C++

```
__fastcall UnicodeString GetDisplayName();
```

Description

The GetDisplayName function is called from server-side script to get the display name string. It calls ImplGetDisplayName (see page 5511) to get the display name for this TBaseEndUserAdapter (see page 5497).

See Also

ImplGetDisplayName (see page 5511)

GetDisplayNameValue (see page 5507)

54.1.41.2.9 TBaseEndUserAdapter.GetDisplayNameValue Method

Gets the display name of the end user.

Pascal

```
function GetDisplayNameValue: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetDisplayNameValue();
```

Description

The GetDisplayNameValue is called from server-side script to get the display name of the end user. This base class version of the function returns an empty string. A customized overridden version of this function could be written to return the display name for the end user in your application.

See Also

ImplGetDisplayName (see page 5511)

GetDisplayName (see page 5506)

54.1.41.2.10 TBaseEndUserAdapter.GetEndUserAdapter Method

Gets the end-user adapter.

Pascal

```
function GetEndUserAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetEndUserAdapter();
```

Description

The GetEndUserAdapter function is called from server-side script to get the end-user adapter. This function returns itself, that is, this TBaseEndUserAdapter (see page 5497).

See Also

ImplGetEndUserAdapter (see page 5511)

54.1.41.2.11 TBaseEndUserAdapter.GetLoggedIn Method

Determines if the user is logged in

Pascal

```
function GetLoggedIn: Boolean;
```

C++

```
__fastcall Boolean GetLoggedIn();
```

Description

The GetLoggedIn function is called from server-side script to determine if the user is logged in. This function calls

ImplGetLoggedIn (see page 5512) to get the result.

See Also

ImplGetLoggedIn (see page 5512)

GetLoggedInValue (see page 5508)

54.1.41.2.12 TBaseEndUserAdapter.GetLoggedInValue Method

Determines if the user is logged in.

Pascal

```
function GetLoggedInValue: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetLoggedInValue();
```

Description

The GetLoggedInValue function is called from server-side script to determine if the user is logged in. This base class version of the function always returns false. A customized overridden version could be written specifically for your application.

See Also

ImplGetLoggedIn (see page 5512)

GetLoggedIn (see page 5507)

54.1.41.2.13 TBaseEndUserAdapter.GetLoginFormAction Method

Gets the action component for the login form.

Pascal

```
function GetLoginFormAction: TComponent;
```

C++

```
__fastcall TComponent * GetLoginFormAction();
```

Description

The GetLoginFormAction is called from server-side script to get the action component for the login form. This function calls ImplGetLoginFormAction (see page 5512) to get the action component.

See Also

ImplGetLoginFormAction (see page 5512)

54.1.41.2.14 TBaseEndUserAdapter.GetLogoutAction Method

Gets the action component for the logout form.

Pascal

```
function GetLogoutAction: TComponent;
```

C++

```
__fastcall TComponent * GetLogoutAction();
```

Description

The GetLogoutAction is called from server-side script to get the action component for the logout form. This function calls

ImplGetLogoutFormAction to get the action component.

See Also

ImplGetLogoutAction (see page 5513)

54.1.41.2.15 TBaseEndUserAdapter.GetUserID Method

Gets the UserID from this TBaseEndUserAdapter (see page 5497).

Pascal

```
function GetUserID: Variant; virtual;
```

C++

```
virtual __fastcall Variant GetUserID();
```

Description

The GetUserID function is called from server-side script to get the UserID from this TBaseEndUserAdapter (see page 5497). This base class version of the function always returns Unassigned. A customized overridden version of this function could be written specifically for your application.

54.1.41.2.16 TBaseEndUserAdapter.HasExecuteRights Method

Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5497).

Pascal

```
function HasExecuteRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasExecuteRights(UnicodeString ARights);
```

Description

The HasExecuteRights function is called from server-side script to determine if the user has execute rights for the TBaseEndUserAdapter (see page 5497). This function calls ImplHasExecuteRights (see page 5513) to check the user rights.

See Also

ImplHasExecuteRights (see page 5513)

HasModifyRights (see page 5509)

HasViewRights (see page 5510)

54.1.41.2.17 TBaseEndUserAdapter.HasModifyRights Method

Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5497).

Pascal

```
function HasModifyRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasModifyRights(UnicodeString ARights);
```

Description

The HasModifyRights function is called from server-side script to determine if the user has modify rights for the TBaseEndUserAdapter (see page 5497). This function calls ImplHasModifyRights (see page 5513) to check the user rights.

See Also

ImplHasModifyRights (see page 5513)

HasViewRights (see page 5510)

54.1.41.2.18 TBaseEndUserAdapter.HasViewRights Method

Determine if the user has view rights to the TBaseEndUserAdapter (see page 5497).

Pascal

```
function HasViewRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasViewRights(UnicodeString ARights);
```

Description

The HasViewRights function is called from server-side script to determine if the user has view rights for the TBaseEndUserAdapter (see page 5497). This function calls ImplHasViewRights (see page 5514) to check the user rights.

See Also

ImplHasViewRights (see page 5514)

HasModifyRights (see page 5509)

54.1.41.2.19 TBaseEndUserAdapter.ImplCanAddActionClass Method

Determines if the given action class can be added.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

The ImplCanAddActionClass function calls the base class to determine if the given action class can be added. In addition, it allows actions components to be added if they are derived from TCustomEndUserAdapterAction (see page 5687) at some level. This function returns true if the action class is allowed to be added, or false otherwise.

See Also

ImplCanAddActionClass (see page 5553)

TCustomEndUserAdapterAction (see page 5687)

54.1.41.2.20 TBaseEndUserAdapter.ImplCanAddFieldClass Method

Determines if the given action class can be added.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

The ImplCanAddFieldClass function calls the base class to determine if the given action class can be added. In addition to that, it allows fields components to be added if they are derived from TAdapterEndUserField (see page 5248).

See Also

ImplCanAddFieldClass (see page 5553)

TAdapterEndUserField (see page 5248)

54.1.41.2.21 TBaseEndUserAdapter.ImplGetActionsList Method

Lists supported end-user adapter actions.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

The ImplGetActionsList procedure obtains the list of all supported actions for the end-user adapter.

54.1.41.2.22 TBaseEndUserAdapter.ImplGetDisplayName Method

Gets the display name for this TBaseEndUserAdapter (see page 5497).

Pascal

```
function ImplGetDisplayName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetDisplayName();
```

Description

The ImplGetDisplayName function is called from GetDisplayName (see page 5506) to get the display name for this TBaseEndUserAdapter (see page 5497). It gets the display name from the DisplayName field component.

See Also

GetDisplayName (see page 5506)

54.1.41.2.23 TBaseEndUserAdapter.ImplGetEndUserAdapter Method

Returns this TBaseEndUserAdapter (see page 5497).

Pascal

```
function ImplGetEndUserAdapter: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetEndUserAdapter();
```

Description

The ImplGetEndUserAdapter simply returns this TBaseEndUserAdapter (see page 5497).

See Also

GetEndUserAdapter (see page 5507)

54.1.41.2.24 TBaseEndUserAdapter.ImplGetFieldsList Method

Obtains the list of all of the fields for the end-user adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

The ImplGetFieldsList procedure obtains the list of all of the fields for the end-user adapter.

54.1.41.2.25 TBaseEndUserAdapter.ImplGetLoggedIn Method

Checks the value of the LoggedIn field.

Pascal

```
function ImplGetLoggedIn: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetLoggedIn();
```

Description

The ImplGetLoggedIn function is called from GetLoggedIn (see page 5507). It checks the value of the LoggedIn field component and returns the result.

See Also

GetLoggedIn (see page 5507)

54.1.41.2.26 TBaseEndUserAdapter.ImplGetLoginFormAction Method

Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5497).

Pascal

```
function ImplGetLoginFormAction: TComponent;
```

C++

```
__fastcall TComponent * ImplGetLoginFormAction();
```

Description

The ImplGetLoginFormAction function is called from GetLoginFormAction (see page 5508) to get the LoginForm action component for this TBaseEndUserAdapter (see page 5497).

See Also

GetLoginFormAction (see page 5508)

54.1.41.2.27 TBaseEndUserAdapter.ImplGetLogoutAction Method

Gets the Logout action component for this TBaseEndUserAdapter (see page 5497).

Pascal

```
function ImplGetLogoutAction: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetLogoutAction();
```

Description

The ImplGetLogoutAction function is called from GetLogoutAction (see page 5508) to get the Logout action component for this TBaseEndUserAdapter (see page 5497).

See Also

GetLogoutAction (see page 5508)

54.1.41.2.28 TBaseEndUserAdapter.ImplHasExecuteRights Method

Checks user rights and determines if the user has execute rights.

Pascal

```
function ImplHasExecuteRights(ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasExecuteRights(UnicodeString ARights);
```

Description

The ImplHasExecuteRights function is called from the HasExecuteRights (see page 5509) function. It calls the DoOnHasRights (see page 5505) function to check the user rights and determines if the user has execute rights.

See Also

OnHasRights (see page 5516)

54.1.41.2.29 TBaseEndUserAdapter.ImplHasModifyRights Method

Checks user rights and determines if the user has modify rights.

Pascal

```
function ImplHasModifyRights(ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasModifyRights(UnicodeString ARights);
```

Description

The ImplHasModifyRights function is called from the HasModifyRights (see page 5509) function. It calls the DoOnHasRights (see page 5505) function to check the user rights and determine if the user has modify rights.

See Also

OnHasRights (see page 5516)

54.1.41.2.30 TBaseEndUserAdapter.ImplHasViewRights Method

Checks user rights and determines if the user has view rights.

Pascal

```
function ImplHasViewRights(ARights: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasViewRights(UnicodeString ARights);
```

Description

The ImplHasViewRights is called from the HasViewRights (see page 5510) function. It calls the DoOnHasRights (see page 5505) function to check the user rights and determine if the user has view rights.

See Also

DoOnHasRights (see page 5505)

54.1.41.2.31 TBaseEndUserAdapter.ImplLogIn Method

Processes the login for the given user.

Pascal

```
procedure ImplLogIn(AUserID: Variant); virtual;
```

C++

```
virtual __fastcall ImplLogIn(Variant AUserID);
```

Description

The ImplLogIn procedure is called from LogIn (see page 5515). This function calls ExecuteLogin (see page 5505) to process the login for the given user.

See Also

LogIn (see page 5515)

ExecuteLogin (see page 5505)

54.1.41.2.32 TBaseEndUserAdapter.ImplProduceLoginPage Method

Generate the HTML login page.

Pascal

```
function ImplProduceLoginPage: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplProduceLoginPage();
```

Description

The ImplProduceLoginPage is called to generate the HTML login page It first calls the OnProduceLoginPage (see page 5516) event handler to allow for a customized version. If no event handler is defined, it then has default code to generate the page using the page producer.

See Also

OnProduceLoginPage (see page 5516)

54.1.41.2.33 TBaseEndUserAdapter.LogIn Method

Processes the server-side login for the given user.

Pascal

```
procedure LogIn(AUserID: Variant);
```

C++

```
__fastcall LogIn(Variant AUserID);
```

Description

The LogIn procedure is called from server-side script to process the login for the given user. This function calls ImplLogIn (see page 5514) to process the user.

See Also

ImplLogIn (see page 5514)

54.1.41.2.34 TBaseEndUserAdapter.ProduceLoginPage Method

Generates the login page.

Pascal

```
function ProduceLoginPage: Boolean;
```

C++

```
__fastcall Boolean ProduceLoginPage();
```

Description

The ProduceLoginPage function is called from server-side script to generate the login page. This function calls ImplProduceLoginPage (see page 5514) to generate the page.

See Also

ImplProduceLoginPage (see page 5514)

54.1.41.2.35 TBaseEndUserAdapter.UserList Method

Gets the user list.

Pascal

```
function UserList: IWebUserList;
```

C++

```
__fastcall IWebUserList UserList();
```

Description

The UserList function is called from server-side script to get the user list. If the user list is not stored in this TBaseEndUserAdapter (see page 5497), it then attempts to retrieve the user list through the application module.

54.1.41.3 TBaseEndUserAdapter Properties

The properties of the TBaseEndUserAdapter class are listed here.

Public Properties

	Name	Description
	LoginPage (see page 5516)	Specifies the name of the page that acts as the login page.

54.1.41.3.1 TBaseEndUserAdapter.LoginPage Property

Specifies the name of the page that acts as the login page.

Pascal

```
property LoginPage: string;
```

C++

```
__property UnicodeString LoginPage;
```

Description

Use LoginPage to read or set the name of the login page for this TBaseEndUserAdapter (see page 5497). The name of the login page is the name of the Web page module that generates the login page.

54.1.41.4 TBaseEndUserAdapter Events

The events of the TBaseEndUserAdapter class are listed here.

Public Events

	Name	Description
	OnHasRights (see page 5516)	Determines if the user rights match the rights being queried.
	OnProduceLoginPage (see page 5516)	Allows implementation of a customized login page.

54.1.41.4.1 TBaseEndUserAdapter.OnHasRights Event

Determines if the user rights match the rights being queried.

Pascal

```
property OnHasRights: TEndUserRightsEvent;
```

C++

```
__property TEndUserRightsEvent OnHasRights;
```

Description

The OnHasRights event handler is called from DoOnHasRights (see page 5505) to determine if the user rights match the rights being queried. A customized event handler should be written to determine the rights for your specific application.

See Also

DoOnHasRights (see page 5505)

ImplHasExecuteRights (see page 5513)

ImplHasModifyRights (see page 5513)

ImplHasViewRights (see page 5514)

54.1.41.4.2 TBaseEndUserAdapter.OnProduceLoginPage Event

Allows implementation of a customized login page.

Pascal

```
property OnProduceLoginPage: TEndUserHandledEvent;
```

C++

```
__property TEndUserHandledEvent OnProduceLoginPage;
```

Description

The OnProduceLoginPage event is triggered in the ImplProduceLoginPage (see page 5514). If a customized login page is desired for your application, a customized event handler can be written for this event.

See Also

ImplProduceLoginPage (see page 5514)

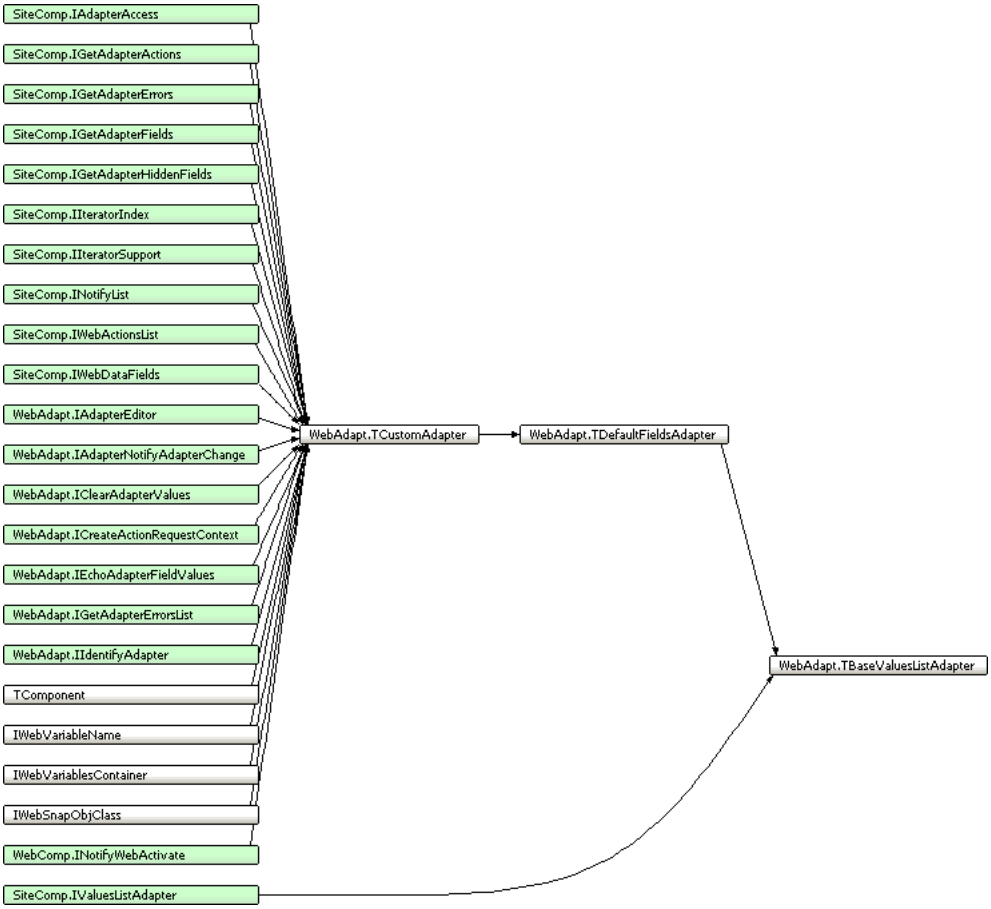
ProduceLoginPage (see page 5515)

CanProduceLoginPage (see page 5505)

54.1.42 TBaseValuesListAdapter Class

TBaseValuesListAdapter is a base class for adapters that provide a list of name/value pairs.

Class Hierarchy



Pascal

```
TBaseValuesListAdapter = class(TDefaultFieldsAdapter, IValuesListAdapter);
```

C++

```
class TBaseValuesListAdapter : public TDefaultFieldsAdapter, public IValuesListAdapter;
```

File

WebAdapt

Description

Descendants of TBaseValuesListAdapter (such as TStringsValuesList (see page 5857) and TDataSetValuesList) are used to provide name/value pairs for an adapter field. Adapter fields reference a values list adapter using the adapter field's ValuesList property. Typically, the list of name/value pairs is used by server-side scripts to populate <select>, <input type=checkbox>, or <input type=radio>.

TBaseValuesListAdapter has two default fields. One field is responsible for providing a value and the other for providing a name.

See Also

TStringsValuesList (see page 5857)

TDataSetValuesList

TAdapterUpdateField (see page 5419)

54.1.42.1 TBaseValuesListAdapter Members

The following tables list the members exposed by TBaseValuesListAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.

	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 5522)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 5523)	Looks up an image for a value.
	GetListName (see page 5523)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 5523)	Looks up a name for a value.
	GetListValue (see page 5524)	Responsible for returning the value of the name/value pair.
	GetNameFieldClass (see page 5524)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetValueFieldClass (see page 5524)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
	GetWebSnapObjClass (see page 5524)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 5525)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5525)	Adds default field components to this adapter.
	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
	ImplGetListImage (see page 5525)	Responsible returning an image associated with the current name/value pair.
	ImplGetListImageOfValue (see page 5526)	Looks up an image for a value.
	ImplGetListName (see page 5526)	Responsible returning the name of the name/value pair.

	ImplGetListNameOfValue (see page 5526)	Looks up a name for a value.
	ImplGetListValue (see page 5527)	Responsible for returning the value of the name/value pair.
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.

	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
	Actions (see page 5572)	Actions is the container for adapter actions components.
	Actions (see page 5746)	Container for adapter actions components.
	Data (see page 5572)	Data is the container for adapter field components.
	Data (see page 5747)	Container for adapter field components.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.42.2 TBaseValuesListAdapter Methods

The methods of the TBaseValuesListAdapter class are listed here.

Protected Methods

	Name	Description
	GetListImage (see page 5522)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 5523)	Looks up an image for a value.
	GetListName (see page 5523)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 5523)	Looks up a name for a value.
	GetListValue (see page 5524)	Responsible for returning the value of the name/value pair.
	GetNameFieldClass (see page 5524)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetValueFieldClass (see page 5524)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetWebSnapObjClass (see page 5524)	Returns the class type for this adapter field.
	ImplCanAddFieldClass (see page 5525)	Indicates whether a type of adapter field can be added to this adapter.
	ImplGetFieldsList (see page 5525)	Adds default field components to this adapter.
	ImplGetListImage (see page 5525)	Responsible returning an image associated with the current name/value pair.
	ImplGetListImageOfValue (see page 5526)	Looks up an image for a value.
	ImplGetListName (see page 5526)	Responsible returning the name of the name/value pair.
	ImplGetListNameOfValue (see page 5526)	Looks up a name for a value.
	ImplGetListValue (see page 5527)	Responsible for returning the value of the name/value pair.

54.1.42.2.1 TBaseValuesListAdapter.GetListImage Method

Returns an image associated with the current name/value pair.

Pascal

```
function GetListImage: TComponent;
```

C++

```
__fastcall TComponent * GetListImage();
```

Description

GetListImage returns the result of ImplGetListImage (see page 5525).

See Also

ImplGetListImage (see page 5525)

54.1.42.2.2 TBaseValuesListAdapter.GetListImageOfValue Method

Looks up an image for a value.

Pascal

```
function GetListImageOfValue(Value: Variant): TComponent;
```

C++

```
__fastcall TComponent * GetListImageOfValue(Variant Value);
```

Description

GetListImageOfValue returns the result of ImplGetListImageOfValue (see page 5526).

See Also

ImplGetListImageOfValue (see page 5526)

54.1.42.2.3 TBaseValuesListAdapter.GetListName Method

Responsible returning the name of the name/value pair.

Pascal

```
function GetListName: string;
```

C++

```
__fastcall UnicodeString GetListName();
```

Description

GetListName returns the result of ImplGetListName (see page 5526).

See Also

ImplGetListValue (see page 5527)

54.1.42.2.4 TBaseValuesListAdapter.GetListNameOfValue Method

Looks up a name for a value.

Pascal

```
function GetListNameOfValue(Value: Variant): string;
```

C++

```
__fastcall UnicodeString GetListNameOfValue(Variant Value);
```

Description

GetListNameOfValue returns the result of ImplGetListNameOfValue (see page 5526).

See Also

ImplGetListNameOfValue (see page 5526)

54.1.42.2.5 TBaseValuesListAdapter.GetListValue Method

Responsible for returning the value of the name/value pair.

Pascal

```
function GetListValue: Variant;
```

C++

```
__fastcall Variant GetListValue();
```

Description

GetListValue returns the result of ImplGetListValue (see page 5527).

See Also

GetListName (see page 5523)

ImplGetListValue (see page 5527)

54.1.42.2.6 TBaseValuesListAdapter.GetNameFieldClass Method

Returns the class of adapter field that is responsible for providing the value of the name/value pair.

Pascal

```
function GetNameFieldClass: TComponentClass; virtual;
```

C++

```
virtual __fastcall TComponentClass GetNameFieldClass();
```

Description

GetNameFieldClass returns nil (Delphi) or NULL (C++). Descendant classes must override this method.

See Also

GetValueFieldClass (see page 5524)

54.1.42.2.7 TBaseValuesListAdapter.GetValueFieldClass Method

Returns the class of adapter field that is responsible for providing the name of the name/value pair.

Pascal

```
function GetValueFieldClass: TComponentClass; virtual;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass();
```

Description

GetValueFieldClass returns nil (Delphi) or NULL (C++). Descendant classes must override this method.

See Also

GetNameFieldClass (see page 5524)

54.1.42.2.8 TBaseValuesListAdapter.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; override;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

54.1.42.2.9 TBaseValuesListAdapter.ImplCanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass check the field class by calling GetNameFieldClass (see page 5524), GetValueFieldClass (see page 5524), and TCustomAdapter (see page 5531)'s ImplCanAddFieldClass method.

See Also

GetNameFieldClass (see page 5524)

GetValueFieldClass (see page 5524)

ImplCanAddFieldClass (see page 5553)

54.1.42.2.10 TBaseValuesListAdapter.ImplGetFieldsList Method

Adds default field components to this adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetFieldsList adds a value field and a name field using the classes returned by GetNameFieldClass (see page 5524) and GetValueFieldClass (see page 5524).

See Also

GetNameFieldClass (see page 5524)

GetValueFieldClass (see page 5524)

54.1.42.2.11 TBaseValuesListAdapter.ImplGetListImage Method

Responsible returning an image associated with the current name/value pair.

Pascal

```
function ImplGetListImage: TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetListImage();
```

Description

ImplGetListImage is a placeholder. Descendant adapters that support images must override this method.

See Also

GetListImage (see page 5522)

54.1.42.2.12 TBaseValuesListAdapter.ImplGetListImageOfValue Method

Looks up an image for a value.

Pascal

```
function ImplGetListImageOfValue(Value: Variant): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetListImageOfValue(Variant Value);
```

Description

ImplGetListImageOfValue is a placeholder. Descendant classes that support image lookups must override this function.

See Also

GetListImageOfValue (see page 5523)

54.1.42.2.13 TBaseValuesListAdapter.ImplGetListName Method

Responsible returning the name of the name/value pair.

Pascal

```
function ImplGetListName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetListName();
```

Description

ImplGetListName returns an empty string. ImplGetListName must be overridden by a descendant class.

See Also

GetListName (see page 5523)

54.1.42.2.14 TBaseValuesListAdapter.ImplGetListNameOfValue Method

Looks up a name for a value.

Pascal

```
function ImplGetListNameOfValue(Value: Variant): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetListNameOfValue(Variant Value);
```

Description

ImplGetListNameOfValue is a placeholder. Descendant classes that support name lookups must override this function.

See Also

GetListNameOfValue (see page 5523)

54.1.42.2.15 TBaseValuesListAdapter.ImplGetListValue Method

Responsible for returning the value of the name/value pair.

Pascal

```
function ImplGetListValue: Variant; virtual;
```

C++

```
virtual __fastcall Variant ImplGetListValue();
```

Description

ImplGetListValue is a placeholder. ImplGetListValue must be overriden by a descendant class.

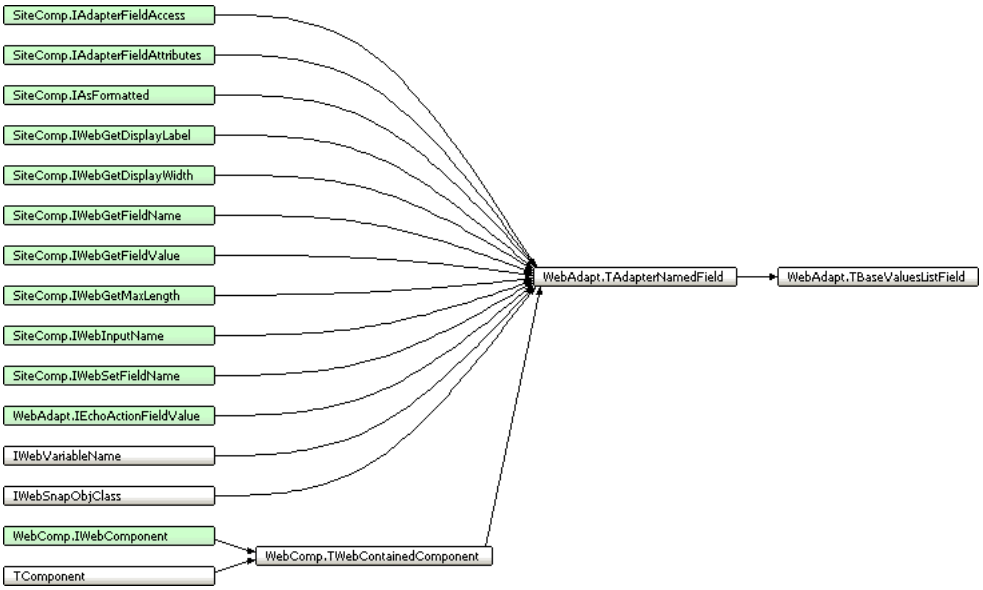
See Also

GetListValue (see page 5524)

54.1.43 TBaseValuesListField Class

TBaseValuesListField is a base class for adapter field components that are children of a values list adapter component.

Class Hierarchy



Pascal

```
TBaseValuesListField = class(TAdapterNamedField);
```

C++

```
class TBaseValuesListField : public TAdapterNamedField;
```

File

WebAdapt

Description

Derive from TBaseValuesListField to declare an adapter field that can be a child of TBaseValuesListAdapter (see page 5517).

See Also

TStringsValuesList (see page 5857)

TBaseValuesListAdapter (see page 5517)

TAdapterNamedField (see page 5351)

TValuesListNameField (see page 5866)

TValuesListValueField (see page 5869)

54.1.43.1 TBaseValuesListField Members

The following tables list the members exposed by TBaseValuesListField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5530)	Retrieves the parent adapter component.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.

	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5363)	Gets the value of this adapter field as a Variant (see page 3421).
	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.

Protected Properties

	Name	Description
	Adapter (see page 5531)	Retrieves the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.

	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.43.2 TBaseValuesListField Methods

The methods of the TBaseValuesListField class are listed here.

Protected Methods

	Name	Description
	GetAdapter (see page 5530)	Retrieves the parent adapter component.

54.1.43.2.1 TBaseValuesListField.GetAdapter Method

Retrieves the parent adapter component.

Pascal

```
function GetAdapter: TBaseValuesListAdapter;
```

C++

```
__fastcall TBaseValuesListAdapter GetAdapter();
```

Description

GetAdapter implements the Adapter (see page 5531) property.

See Also

Adapter (see page 5531)

TBaseValuesListAdapter (see page 5517)

54.1.43.3 TBaseValuesListField Properties

The properties of the TBaseValuesListField class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 5531)	Retrieves the parent adapter component.

54.1.43.3.1 TBaseValuesListField.Adapter Property

Retrieves the parent adapter component.

Pascal

```
property Adapter: TBaseValuesListAdapter;
```

C++

```
__property TBaseValuesListAdapter Adapter;
```

Description

The Adapter property is used by descendants to access the parent adapter component.

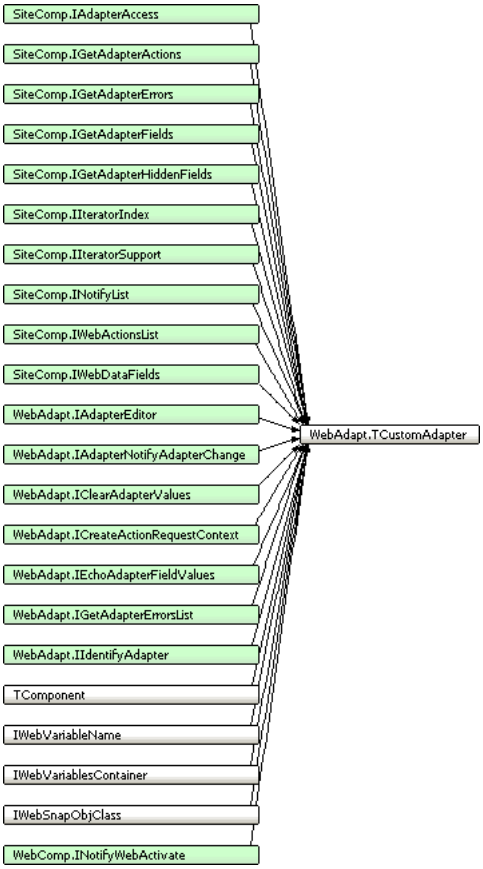
See Also

TBaseValuesListAdapter (see page 5517)

54.1.44 TCustomAdapter Class

TCustomAdapter is a base class for adapter components.

Class Hierarchy



Pascal

```
TCustomAdapter = class(TComponent, IIdentifyAdapter, IWebVariableName, IWebVariablesContainer,
INotifyList, IWebSnapObjClass, IGetAdapterErrors, IGetAdapterErrorsList, INotifyWebActivate,
IAdapterEditor, IGetAdapterFields, IGetAdapterActions, IIteratorSupport, IClearAdapterValues,
IEchoAdapterFieldValues, IAdapterAccess, IGetAdapterHiddenFields, ICreateActionRequestContext,
IWebDataFields, IWebActionsList, IAdapterNotifyAdapterChange, IIteratorIndex);
```

C++

```
class TCustomAdapter : public TComponent, public IIdentifyAdapter, public IWebVariableName,
public IWebVariablesContainer, public INotifyList, public IWebSnapObjClass, public
IGetAdapterErrors, public IGetAdapterErrorsList, public INotifyWebActivate, public
IAdapterEditor, public IGetAdapterFields, public IGetAdapterActions, public IIteratorSupport,
public IClearAdapterValues, public IEchoAdapterFieldValues, public IAdapterAccess, public
IGetAdapterHiddenFields, public ICreateActionRequestContext, public IWebDataFields, public
IWebActionsList, public IAdapterNotifyAdapterChange, public IIteratorIndex;
```

File

WebAdapt

Description

TCustomAdapter implements interfaces used to access an adapter properties using server-side script. Most of the interface implementation methods call virtual functions. When defining new derived classes, override these virtual functions to customize the behavior of the adapter class.

See Also

TAdapter (see page 5190)

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

TFieldValuesAdapter (see page 5803)

TDataSetValuesList

TStringsValuesList (see page 5857)

TApplicationAdapter (see page 5439)

TLoginFormAdapter (see page 5824)

TDataSetAdapter

TPagedAdapter (see page 5844)

54.1.44.1 TCustomAdapter Members

The following tables list the members exposed by TCustomAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>

	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
V	ImplGetVariable (see page 5556)	Returns an action or field.
V	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
V	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
V	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
V	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
V	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
V	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
V	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
V	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
V	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.

	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
V	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
V	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
R	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
R	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
V	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.
R	Data (see page 5572)	Data is the container for adapter field components.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.

	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.

54.1.44.2 TCustomAdapter.Create Constructor

Constructor for TCustomAdapter (see page 5531).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapter(TComponent * AOwner);
```

Description

Creates instance variables that hold interfaces, object references used by TCustomAdapter (see page 5531).

See Also

Create

54.1.44.3 TCustomAdapter.Destroy Destructor

Destructor for TCustomAdapter (see page 5531).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapter();
```

Description

Frees objects used by TCustomAdapter (see page 5531).

See Also

System::TObject::Free (see page 3372)

54.1.44.4 TCustomAdapter Methods

The methods of the TCustomAdapter class are listed here.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.

	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.

	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Public Methods

	Name	Description
	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

54.1.44.4.1 TCustomAdapter.AddAdapterModeHiddenField Method

Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.

Pascal

```
procedure AddAdapterModeHiddenField(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall AddAdapterModeHiddenField(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Descendant adapters may support modes. For example, TDataSetAdapter supports Edit, Insert (see page 3601), and Browse modes. The hidden field defined by AddAdapterModeHiddenField is added to an HTML form using the server-side script method HiddenFields.WriteFields.

See Also

ListHiddenFields (see page 5563)

54.1.44.4.2 TCustomAdapter.AddOrigValueHiddenFields Method

Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.

Pascal

```
procedure AddOrigValueHiddenFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall AddOrigValueHiddenFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

In order to ensure that the data associated with the adapter hasn't been changed by another user, descendant adapters may check that the current values of adapter fields are the same as the original values. For example, TDataSetAdapter raises an exception if the original values are not the same as the dataset's values. The hidden fields defined by AddOrigValueHiddenFields are added to an HTML form using the server-side script method HiddenRecordFields.WriteFields.

See Also

ListHiddenRecordFields (see page 5564)

54.1.44.4.3 TCustomAdapter.AddRecordKeysHiddenFields Method

Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.

Pascal

```
procedure AddRecordKeysHiddenFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall AddRecordKeysHiddenFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Descendant adapters may use key values to define the relationship between values in the HTTP request and adapter data values. For example, TDataSetAdapter supports updates to multiple detail records by using hidden fields to identify the relationship between values in the HTTP request with dataset rows. The hidden fields defined by AddRecordKeysHiddenFields are added to an HTML form using the server-side script method HiddenRecordFields.WriteFields.

See Also

ListHiddenRecordFields (see page 5564)

54.1.44.4.4 TCustomAdapter.CanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function CanAddActionClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

CanAddActionClass is called at design-time when editing an adapter. CanAddActionClass returns the result of ImplCanAddActionClass (see page 5553).

See Also

ImplCanAddActionClass (see page 5553)

54.1.44.4.5 TCustomAdapter.CanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function CanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

CanAddFieldClass is called at design-time when editing an adapter. CanAddFieldClass returns the result of ImplCanAddFieldClass (see page 5553).

See Also

ImplCanAddFieldClass (see page 5553)

54.1.44.4.6 TCustomAdapter.CheckModifyAccess Method

Checks end-user rights to modify the adapter's field values.

Pascal

```
procedure CheckModifyAccess;
```

C++

```
__fastcall CheckModifyAccess();
```

Description

This procedure is called to verify that the current user has rights to modify this adapter's fields. An exception will be raised if access is denied.

See Also

ModifyAccess (see page 5574)

HasModifyAccess (see page 5552)

UpdateRecords (see page 5569)

54.1.44.4.7 TCustomAdapter.ClearAdapterValues Method

Clears adapter state information.

Pascal

```
procedure ClearAdapterValues;
```

C++

```
__fastcall ClearAdapterValues();
```

Description

ClearAdapterValues calls ImplClearAdapterValues (see page 5554).

See Also

ImplNotifyDeactivate (see page 5560)

ImplClearAdapterValues (see page 5554)

54.1.44.4.8 TCustomAdapter.ClearErrors Method

Clears the content of the adapter's Errors (see page 5573) property.

Pascal

```
procedure ClearErrors;
```

C++

```
__fastcall ClearErrors();
```

Description

The errors are cleared when the web module is deactivated. This ensures that the errors encountered during the processing of an HTTP request will not affect another HTTP request.

See Also

Errors (see page 5573)

ClearErrors (see page 5482)

ImplNotifyDeactivate (see page 5560)

54.1.44.4.9 TCustomAdapter.CreateActionRequestContext Method

Creates an object that describes the adapter action parameters and adapter field values.

Pascal

```
procedure CreateActionRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateActionRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

Child adapter actions call this method.

See Also

IAdapterDispatchParams (see page 987)

CreateRequestContext (see page 5452)

WebContext (see page 6003)

54.1.44.4.10 TCustomAdapter.CreateErrorsList Method

Creates the object used to manage errors associated with this adapter.

Pascal

```
function CreateErrorsList: TBaseAdapterErrorsList; virtual;
```

C++

```
virtual __fastcall TBaseAdapterErrorsList CreateErrorsList();
```

Description

CreateErrorsList creates TAdapterErrorsList (see page 5259). Descendants may override this function to create a custom errors list.

See Also

Errors (see page 5573)

TAdapterErrorsList (see page 5259)

54.1.44.4.11 TCustomAdapter.EncodeActionParams Method

Writes name/value pairs that represent adapter state.

Pascal

```
procedure EncodeActionParams(AParams: IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall EncodeActionParams(IAdapterItemRequestParams AParams);
```

Description

EncodeActionParams is called by a child adapter actions when generating the name/value pairs that must be sent in the HTTP request when executing an action. For example, TDefaultFieldsPagedAdapter (see page 5747) writes the current page number as a name/value pair. ExtractRequestParams (see page 5543) and EncodeActionParams work together. ExtractRequestParams (see page 5543) reads name/value pairs that are written by EncodeActionParams.

See Also

EncodeActionParams (see page 5754)

ExtractRequestParams (see page 5543)

54.1.44.4.12 TCustomAdapter.EndIterator Method

Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. EndIterator calls ImplEndIterator (see page 5554).

See Also

EndIterator (see page 1056)

ImplEndIterator (see page 5554)

54.1.44.4.13 TCustomAdapter.ExtractRequestParams Method

Reads name/value pairs from the HTTP request.

Pascal

```
procedure ExtractRequestParams(ARequest: IUnknown); virtual;
```

C++

```
virtual __fastcall ExtractRequestParams(IUnknown ARequest);
```

Description

ExtractRequestParams is called by a child adapter action before executing the action. This gives the adapter an opportunity to extract values from the HTTP request that are important to the behavior of the adapter. For example, TDefaultFieldsPagedAdapter (see page 5747) extracts the current page number from the request. ExtractRequestParams and EncodeActionParams (see page 5542) work together. ExtractRequestParams reads name/value pairs that are written by EncodeActionParams (see page 5542).

See Also

ExtractRequestParams (see page 5754)

EncodeActionParams (see page 5542)

54.1.44.4.14 TCustomAdapter.FindAction Method

Returns an action component with a matching action name.

Pascal

```
function FindAction(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindAction(const UnicodeString AName);
```

Description

The action name is used when a component property references an adapter action by name. Actions (see page 5572) also have a variable name that is used to reference the action with server-side script. The variable name and action name are usually the same. The only time that they need to be different is when the action name is not a valid server-side script identifier.

See Also

FindField (see page 5543)

54.1.44.4.15 TCustomAdapter.FindField Method

Returns an adapter field component with a matching field name.

Pascal

```
function FindField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindField(const UnicodeString AName);
```

Description

The field name is used when a component property references an adapter field by name. Adapter fields also have a variable name that is used to reference the field with server-side script. The variable name and field name are usually the same. The only time that they need to be different is when the field name is not a valid server-side script identifier.

54.1.44.4.16 TCustomAdapter.FindNamedAction Method

Finds an action with a matching variable name.

Pascal

```
function FindNamedAction(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindNamedAction(const UnicodeString AName);
```

Description

The AName parameter contains the name used when referencing an action with server-side script. This name may not be the same as the component name. For example, server-side script accesses actions in a TDataSetAdapter with using the command name (e.g.; DeleteRow) rather than the adapter action component name.

See Also

FindNamedVariable (see page 5544)

54.1.44.4.17 TCustomAdapter.FindNamedField Method

Finds an adapter field with a matching variable name.

Pascal

```
function FindNamedField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindNamedField(const UnicodeString AName);
```

Description

The AName parameter contains the name used when referencing a field with server-side script. This name may not be the same as the component name. For example, server-side script accesses fields in a TDataSetAdapter with using the dataset field name rather than the adapter field component name.

See Also

FindNamedVariable (see page 5544)

54.1.44.4.18 TCustomAdapter.FindNamedVariable Method

Finds a field or action with a matching variable name.

Pascal

```
function FindNamedVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * FindNamedVariable(const UnicodeString AName);
```

Description

FindNamedVariable calls FindNamedField (see page 5544) and FindNamedAction (see page 5544). The AName parameter contains the name used when referencing an action or field with server-side script. This name may not be the same as the component name. For example, server-side script references fields in a TDataSetAdapter using the dataset field name rather than the adapter field component name.

See Also

FindNamedAction (see page 5544)

FindNamedField (see page 5544)

54.1.44.4.19 TCustomAdapter.FindVariable Method

Finds an adapter action or adapter field with the given variable name.

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const UnicodeString AName);
```

Description

FindVariable is called when server side script references a property of an adapter object. FindVariable calls ImplFindVariable (see page 5554).

See Also

ImplFindVariable (see page 5554)

54.1.44.4.20 TCustomAdapter.FindVariableContainer Method

Finds an adapter action or adapter field that is a container for other scriptable objects.

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const UnicodeString AName);
```

Description

FindVariableContainer is called when server side script references a property of a property. FindVariableContainer returns the result of ImplFindVariableContainer (see page 5555).

See Also

FindVariable (see page 5545)

ImplFindVariableContainer (see page 5555)

54.1.44.4.21 TCustomAdapter.GetActionsClass Method

Specifies the class to create as a container for adapter actions components.

Pascal

```
function GetActionsClass: TAdapterActionsClass; virtual;
```

C++

```
virtual __fastcall TAdapterActionsClass GetActionsClass();
```

Description

Descendants override this method to specify a different adapter action container.

See Also

Actions (see page 5572)

54.1.44.4.22 TCustomAdapter.GetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure GetActionsList(AList: TStrings);
```

C++

```
__fastcall GetActionsList(TStrings AList);
```

Description

GetActionsList is called at design time to get a list containing names and objects. Each name identifies an action name to insert and each object identifies a class of adapter action component. When editing the adapter, these action names are displayed in the dialog box that is used to add new actions. For example, when editing a TDataSetAdapter a list of all of the dataset commands are displayed such as NextRow, PrevRow, DeleteRow, etc.

See Also

ImplGetActionsList (see page 5555)

54.1.44.4.23 TCustomAdapter.GetAdapterActions Method

Returns the adapter actions container object.

Pascal

```
function GetAdapterActions: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterActions();
```

Description

Returns the adapter actions container object.

See Also

Actions (see page 5572)

54.1.44.4.24 TCustomAdapter.GetAdapterErrors Method

Returns the adapter's errors object.

Pascal

```
function GetAdapterErrors: TObject;
```

C++

```
__fastcall TObject * GetAdapterErrors();
```

Description

Returns the adapter's errors object.

See Also

Errors (see page 5573)

54.1.44.4.25 TCustomAdapter.GetAdapterErrorsList Method

<insert text here>

Pascal

```
function GetAdapterErrorsList: TBaseAdapterErrorsList;
```

C++

```
__fastcall TBaseAdapterErrorsList GetAdapterErrorsList();
```

Description

Returns an object used to track errors.

See Also

TBaseAdapterErrorsList (see page 5479)

Errors (see page 5573)

54.1.44.4.26 TCustomAdapter.GetAdapterFields Method

Returns the adapter fields container object.

Pascal

```
function GetAdapterFields: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterFields();
```

Description

Returns the adapter fields container object.

See Also

Data (see page 5572)

54.1.44.4.27 TCustomAdapter.GetAdapterHiddenFields Method

Returns a list of hidden fields that hold adapter state information.

Pascal

```
function GetAdapterHiddenFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenFields();
```

Description

GetAdapterHiddenFields populates a list by calling ListHiddenFields (see page 5563).

See Also

ListHiddenFields (see page 5563)

54.1.44.4.28 TCustomAdapter.GetAdapterHiddenRecordFields Method

Returns a list of hidden fields that associate HTML form fields and adapter field.

Pascal

```
function GetAdapterHiddenRecordFields: TObject;
```

C++

```
__fastcall TObject * GetAdapterHiddenRecordFields();
```

Description

GetAdapterHiddenRecordsFields populates a list by calling ListHiddenRecordFields (see page 5564). If the list is empty, nil (Delphi) or NULL (C++) is returned. Otherwise, the list is returned.

See Also

ListHiddenRecordFields (see page 5564)

54.1.44.4.29 TCustomAdapter.GetChildren Method

Provides the interface for a method that adapters use to return their child components.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

TCustomAdapter (see page 5531) overrides the GetChildren method that is introduced in TComponent for the streaming system that loads and saves components. It calls the Proc procedure passing the Actions (see page 5572) and Data (see page 5572) properties. This allows the adapter actions and adapter fields to be loaded and saved with the TCustomAdapter (see page 5531) object.

See Also

Actions (see page 5572)

Data (see page 5572)

54.1.44.4.30 TCustomAdapter.GetDataClass Method

Specifies the class to create as a container for adapter fields components.

Pascal

```
function GetDataClass: TAdapterFieldsClass; virtual;
```

C++

```
virtual __fastcall TAdapterFieldsClass GetDataClass();
```

Description

Descendants override this method to specify a different adapter fields container.

See Also

TAdapterField (see page 5267)

Data (see page 5572)

54.1.44.4.31 TCustomAdapter.GetEchoActionFieldValues Method

Returns the value of the echo flag.

Pascal

```
function GetEchoActionFieldValues: Boolean;
```

C++

```
__fastcall Boolean GetEchoActionFieldValues();
```

Description

EchoActionFieldValues (see page 5572) calls ImplEchoActionFieldValues.

See Also

EchoActionFieldValues (see page 5572)

ImplGetEchoActionFieldValues (see page 5555)

54.1.44.4.32 TCustomAdapter.GetFieldsList Method

Provides a list of field types that can be added to this adapter.

Pascal

```
procedure GetFieldsList(AList: TStrings);
```

C++

```
__fastcall GetFieldsList(TStrings AList);
```

Description

GetFieldsList is called at design time to get a list containing names and objects. Each name identifies a field name to insert and each object identifies a class of adapter field. When editing the adapter, these field names are displayed in the dialog box that is used to add new adapter fields. For example, when editing a TDataSetAdapter a list of all of the dataset's fields are displayed. GetFieldsList calls ImplGetFieldsList (see page 5556).

See Also

ImplGetFieldsList (see page 5556)

54.1.44.4.33 TCustomAdapter.GetHiddenFieldOptions Method

Indicates the types of hidden fields that this adapter requires in a submitted HTML form.

Pascal

```
function GetHiddenFieldOptions: TAdapterHiddenFieldOptions; virtual;
```

C++

```
virtual __fastcall TAdapterHiddenFieldOptions GetHiddenFieldOptions();
```

Description

An adapter may use hidden fields to pass state information down to the client with the HTTP response so that the state

information is available when processing a resulting HTTP response. Descendant classes may override this method.

See Also

ListHiddenFields (see page 5563)

ListHiddenRecordFields (see page 5564)

54.1.44.4.34 TCustomAdapter.GetIteratorIndex Method

Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.

Pascal

```
function GetIteratorIndex: Integer;
```

C++

```
__fastcall int GetIteratorIndex();
```

Description

Adapters may support multiple data records. For example, TDataSetAdapter provides access to the records in a dataset. GetIteratorIndex calls ImplGetIteratorIndex (see page 5556).

See Also

GetIteratorIndex (see page 1053)

ImplGetIteratorIndex (see page 5556)

54.1.44.4.35 TCustomAdapter.GetVariable Method

Returns an action or field.

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

GetVariableCount (see page 5550) and GetVariable is used to iterate over actions and fields in an adapter. The I parameter is a zero-based index that must be less than the result of GetVariableCount (see page 5550). GetVariable calls ImplGetVariable (see page 5556).

See Also

ImplGetVariable (see page 5556)

GetVariableCount (see page 5550)

54.1.44.4.36 TCustomAdapter.GetVariableCount Method

Returns the total count of actions and fields.

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

GetVariableCount and GetVariable (see page 5550) is used to iterate over the actions and fields in an adapter. GetVariableCount calls ImplGetVariableCount (see page 5557).

See Also

GetVariable (see page 5550)

ImplGetVariableCount (see page 5557)

54.1.44.4.37 TCustomAdapter.GetVariableName Method

Gets the name used to reference this adapter with server-side script.

Pascal

```
function GetVariableName: string;
```

C++

```
__fastcall UnicodeString GetVariableName();
```

Description

GetVariableName is called to retrieve the name used to access this adapter with server-side script. GetVariableName calls ImplGetVariableName (see page 5557).

See Also

ImplGetVariableName (see page 5557)

54.1.44.4.38 TCustomAdapter.GetVisibleActions Method

Returns a list of this adapter's action components.

Pascal

```
function GetVisibleActions: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleActions();
```

Description

Some adapters may support default actions. For example, TLoginFormAdapter (see page 5824) has a has a default action for submitting the login form. If no actions have been explicitly added, GetVisibleActions returns a list containing all of the default actions. GetVisibleActions calls ImplGetVisibleActions (see page 5557).

See Also

TWebComponentList (see page 6025)

54.1.44.4.39 TCustomAdapter.GetVisibleFields Method

Returns a list of this adapter's field components.

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

Some adapter may support default fields. For example, TDataSetAdapter has default fields for each field in the dataset. If no adapter fields have been explicitly added, GetVisibleFields returns a list containing all default fields. GetVisibleFields calls ImplGetVisibleFields (see page 5558).

See Also

TWebComponentList (see page 6025)

54.1.44.4.40 TCustomAdapter.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

54.1.44.4.41 TCustomAdapter.HasExecuteAccess Method

Checks the end-user's right to execute this adapter's actions.

Pascal

```
function HasExecuteAccess: Boolean;
```

C++

```
__fastcall Boolean HasExecuteAccess();
```

Description

HasExecuteAccess calls ImplHasExecuteAccess (see page 5558).

See Also

ImplHasExecuteAccess (see page 5558)

54.1.44.4.42 TCustomAdapter.HasModifyAccess Method

Checks the end-user's right to modify this adapter's fields.

Pascal

```
function HasModifyAccess: Boolean;
```

C++

```
__fastcall Boolean HasModifyAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanModify property. HasModifyAccess calls ImplHasModifyAccess (see page 5558).

See Also

ImplHasModifyAccess (see page 5558)

ModifyAccess (see page 5574)

54.1.44.4.43 TCustomAdapter.HasViewAccess Method

Checks the end-user's right to view this adapter's fields.

Pascal

```
function HasViewAccess: Boolean;
```

C++

```
__fastcall Boolean HasViewAccess();
```

Description

The value returned by this function can be accessed with server-side script using the CanView property. HasViewAccess calls ImplHasViewAccess (see page 5559).

See Also

ViewAccess (see page 5574)

54.1.44.4.44 TCustomAdapter.ImplCanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddActionClass returns false. This means that only TAdapterAction (see page 5201) can be added. Descendants override this method to allow additional field types.

See Also

CanAddActionClass (see page 5539)

ImplCanAddClass (see page 5212)

54.1.44.4.45 TCustomAdapter.ImplCanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass returns false. This means that only TAdapterField (see page 5267) can be added. Descendants override this method to allow additional field types.

See Also

CanAddFieldClass (see page 5540)

ImplCanAddClass (see page 5279)

54.1.44.4.46 TCustomAdapter.ImplClearAdapterValues Method

Clears adapter state information.

Pascal

```
procedure ImplClearAdapterValues; virtual;
```

C++

```
virtual __fastcall ImplClearAdapterValues();
```

Description

ClearAdapterValues (see page 5540) clears the echo flag.

See Also

ImplSetEchoActionFieldValues (see page 5561)

ClearAdapterValues (see page 5540)

54.1.44.4.47 TCustomAdapter.ImplEndIterator Method

Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); virtual;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplEndIterator sets the ItemIndex to 0 and the iterator flag to false.

See Also

EndIterator (see page 1056)

EndIterator (see page 5542)

54.1.44.4.48 TCustomAdapter.ImplFindVariable Method

Finds an adapter action or adapter field child with a matching variable name.

Pascal

```
function ImplFindVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplFindVariable(const UnicodeString AName);
```

Description

ImpFindVariable returns the result of FindNamedVariable (see page 5544).

See Also

FindVariable (see page 5545)

54.1.44.4.49 TCustomAdapter.ImplFindVariableContainer Method

Finds an adapter action or adapter field that is a container for other scriptable objects.

Pascal

```
function ImplFindVariableContainer(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplFindVariableContainer(const UnicodeString AName);
```

Description

FindVariableContainer (see page 5545) is called when server side script references a property of a property. ImplFindVariableContainer tries to find an adapter field or adapter action that is a container for other objects.

See Also

FindVariableContainer (see page 5545)

54.1.44.4.50 TCustomAdapter.ImplGetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); virtual;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

ImplGetActionsList is called by GetActionsList (see page 5546). ImplGetActionsList provides an empty list. ImplGetActionsList may be overridden by descendant classes.

See Also

GetActionsList (see page 5546)

54.1.44.4.51 TCustomAdapter.ImplGetEchoActionFieldValues Method

Returns the value of the echo flag.

Pascal

```
function ImplGetEchoActionFieldValues: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetEchoActionFieldValues();
```

Description

ImplGetEchoActionFieldValues returns the value passed to ImplSetEchoActionFieldValues (see page 5561). If ImplSetEchoActionFieldValues (see page 5561) has not been processed during the current HTTP request then False is

returned.

See Also

EchoActionFieldValues (see page 5572)

GetEchoActionFieldValues (see page 5549)

54.1.44.4.52 TCustomAdapter.ImplGetFieldsList Method

Provides a list of field types that can be added to this adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); virtual;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetFieldsList is called by GetFieldsList (see page 5549). ImplGetFieldsList provides an empty list. ImplGetFieldsList may be overridden by descendant classes.

See Also

GetFieldsList (see page 5549)

54.1.44.4.53 TCustomAdapter.ImplGetIteratorIndex Method

Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.

Pascal

```
function ImplGetIteratorIndex: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetIteratorIndex();
```

Description

ImplGetIteratorIndex returns the value ItemIndex. ItemIndex is modified by ImplStartIterator (see page 5562), ImplNextIteration (see page 5560), and ImplEndIterator (see page 5554).

See Also

GetIteratorIndex (see page 1053)

GetIteratorIndex (see page 5550)

ImplStartIterator (see page 5562)

ImplNextIteration (see page 5560)

ImplEndIterator (see page 5554)

54.1.44.4.54 TCustomAdapter.ImplGetVariable Method

Returns an action or field.

Pascal

```
function ImplGetVariable(I: Integer): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * ImplGetVariable(int I);
```

Description

ImplGetVariable is called by GetVariable (see page 5550). ImplGetVariable uses the I parameter to locate an adapter action or adapter field.

See Also

GetVariable (see page 5550)

54.1.44.4.55 TCustomAdapter.ImplGetVariableCount Method

Returns the total count of actions and fields.

Pascal

```
function ImplGetVariableCount: Integer; virtual;
```

C++

```
virtual __fastcall int ImplGetVariableCount();
```

Description

ImplGetVariableCount is called by GetVariableCount (see page 5550).

See Also

GetVariableCount (see page 5550)

54.1.44.4.56 TCustomAdapter.ImplGetVariableName Method

Gets the name used to reference this adapter with server-side script.

Pascal

```
function ImplGetVariableName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetVariableName();
```

Description

ImplGetVariableName returns the component name.

See Also

GetVariableName (see page 5551)

54.1.44.4.57 TCustomAdapter.ImplGetVisibleActions Method

Returns a list of this adapter's action components.

Pascal

```
function ImplGetVisibleActions: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleActions();
```

Description

ImplGetVisibleActions is called by GetVisibleActions (see page 5551). ImplGetVisibleActions may be overriden by descendant classes.

See Also

GetVisibleActions (see page 5551)

54.1.44.4.58 TCustomAdapter.ImplGetVisibleFields Method

Returns a list of this adapter's field components.

Pascal

```
function ImplGetVisibleFields: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleFields();
```

Description

ImplGetVisibleFields is called by GetVisibleFields (see page 5551). ImplGetVisibleFields may be overridden by descendant classes.

See Also

GetVisibleFields (see page 5551)

54.1.44.4.59 TCustomAdapter.ImplHasExecuteAccess Method

Checks the end-user's right to execute this adapter's actions.

Pascal

```
function ImplHasExecuteAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasExecuteAccess();
```

Description

This function is called by HasExecuteAccess (see page 5552) to check the end-user's right to execute the adapter's actions. If the ExecuteAccess (see page 5573) property is not blank, this function calls the EndUserAdapter's HasExecuteRights function, passing the ExecuteAccess (see page 5573) property value.

See Also

HasExecuteAccess (see page 5552)

ExecuteAccess (see page 5573)

HasExecuteAccess (see page 5463)

54.1.44.4.60 TCustomAdapter.ImplHasModifyAccess Method

Checks the end-user's right to modify this adapter's fields.

Pascal

```
function ImplHasModifyAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasModifyAccess();
```

Description

This function is called by HasModifyAccess (see page 5552) to check the end-user's right to modify the adapter field. If the ModifyAccess (see page 5574) property is not blank, this function calls the EndUserAdapter HasModifyRights function, passing the ModifyAccess (see page 5574) property value.

See Also

HasModifyAccess (see page 5552)

ModifyAccess (see page 5574)

54.1.44.4.61 TCustomAdapter.ImplHasViewAccess Method

Checks the end-user's right to view this adapter's fields.

Pascal

```
function ImplHasViewAccess: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHasViewAccess();
```

Description

This function is called by HasViewAccess (see page 5553) to check the end-user's right to view the adapter's fields. If the ViewAccess (see page 5574) property is not blank, this function calls the EndUserAdapter's HasViewRights function, passing the ViewAccess (see page 5574) property value.

See Also

HasViewAccess (see page 5553)

ViewAccess (see page 5574)

54.1.44.4.62 TCustomAdapter.ImplInIterator Method

Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.

Pascal

```
function ImplInIterator: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplInIterator();
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplGetInIterator returns the value of the iteration flag. The iteration flag is set to true by TCustomAdapter (see page 5531)'s ImplStartIterator (see page 5562) method.

See Also

InIterator (see page 1053)

InIterator (see page 5562)

ImplStartIterator (see page 5562)

54.1.44.4.63 TCustomAdapter.ImplNextIteration Method

Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplNextIteration increments ItemIndex and returns true if the iteration index is less than ItemCount.

See Also

NextIteration (see page 1056)

NextIteration (see page 5564)

ImplStartIterator (see page 5562)

ImplEndIterator (see page 5554)

54.1.44.4.64 TCustomAdapter.ImplNotifyActivate Method

Called when the web module is activated.

Pascal

```
procedure ImplNotifyActivate; virtual;
```

C++

```
virtual __fastcall ImplNotifyActivate();
```

Description

A web module is activated when an HTTP request is received. ImplNotifyActivate is a placeholder. Descendant classes override this method to initialize the adapter before an HTTP request processed.

See Also

NotifyActivate (see page 5565)

54.1.44.4.65 TCustomAdapter.ImplNotifyDeactivate Method

Called when the web module is deactivated.

Pascal

```
procedure ImplNotifyDeactivate; virtual;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

A web module is deactivated after the HTTP request has been handled.. ImplNotifyDeactivate discards adapter state information including adapter errors, iteration flag, and iteration index.

See Also

NotifyDeactivate (see page 5566)

54.1.44.4.66 TCustomAdapter.ImplSetActions Method

Initializes the Actions (see page 5572) property.

Pascal

```
procedure ImplSetActions(const Value: TAdapterSubComponent); virtual;
```

C++

```
virtual __fastcall ImplSetActions(const TAdapterSubComponent Value);
```

Description

The Actions (see page 5572) property is the container for adapter action components. Descendants may override this method.

See Also

Actions (see page 5572)

SetActions (see page 5566)

54.1.44.4.67 TCustomAdapter.ImplSetData Method

Initializes the Data (see page 5572) property.

Pascal

```
procedure ImplSetData(const Value: TAdapterSubComponent); virtual;
```

C++

```
virtual __fastcall ImplSetData(const TAdapterSubComponent Value);
```

Description

The Data (see page 5572) property is the container for adapter field components. Descendants may override this method.

See Also

Data (see page 5572)

SetData (see page 5566)

54.1.44.4.68 TCustomAdapter.ImplSetEchoActionFieldValues Method

Sets the echo flag for this adapter's fields.

Pascal

```
procedure ImplSetEchoActionFieldValues(AValue: Boolean); virtual;
```

C++

```
virtual __fastcall ImplSetEchoActionFieldValues(Boolean AValue);
```

Description

ImplEchoActionFieldValues modified the EchoActionFieldValue property of the adapter's fields.

See Also

GetEchoActionFieldValues (see page 5549)

SetEchoActionFieldValues (see page 5567)

EchoActionFieldValue (see page 5368)

54.1.44.4.69 TCustomAdapter.ImplStartIterator Method

Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. ImplStartIterator sets ItemIndex to 0 and sets the iteration flag to true. true is returned.

See Also

StartIterator (see page 1056)

StartIterator (see page 5567)

ImplNextIteration (see page 5560)

ImplEndIterator (see page 5554)

54.1.44.4.70 TCustomAdapter.InIterator Method

Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.

Pascal

```
function InIterator: Boolean;
```

C++

```
__fastcall Boolean InIterator();
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. InIterator calls ImplInIterator (see page 5559).

See Also

InIterator (see page 1053)

ImplInIterator (see page 5559)

54.1.44.4.71 TCustomAdapter.IsActionInUse Method

Indicates whether a particular action has been added to the adapter.

Pascal

```
function IsActionInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsActionInUse(const UnicodeString AName);
```

Description

IsActionInUse is called at design time to determine whether an action with a particular name has been added to the adapter. When editing the adapter, the names of actions in use are not displayed in the dialog box used to add new actions.

See Also

IsFieldInUse (see page 5563)

GetFieldsList (see page 5549)

54.1.44.4.72 TCustomAdapter.IsFieldInUse Method

Indicates whether a particular field has been added to the adapter.

Pascal

```
function IsFieldInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(const UnicodeString AName);
```

Description

IsFieldInUse is called at design time to determine whether a field with a particular name has been added to the adapter. When editing the adapter, the names of these fields if use are not displayed in the dialog box used to add new fields.

See Also

IsActionInUse (see page 5563)

GetFieldsList (see page 5549)

54.1.44.4.73 TCustomAdapter.ListHiddenFields Method

Specifies the HTML form hidden fields needed by the adapter.

Pascal

```
procedure ListHiddenFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall ListHiddenFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Some adapters have state information that must be preserved between HTTP requests. For example, TDataSetAdapter has a mode property. HTML forms that modify TDataSetAdapter datasets include the mode property value as a hidden field. When the HTML form is submitted, the mode property value will be included in the HTTP request. When executing an action TDataSetAdapter extracts the mode property value from the HTTP request and updates it's mode property. ListHiddenRecordFields (see page 5564) may call AddAdapterModeHiddenField (see page 5538) depending on the flags

returned by GetHiddenFieldOptions (see page 5549).

See Also

GetHiddenFieldOptions (see page 5549)

ListHiddenRecordFields (see page 5564)

AddAdapterModeHiddenField (see page 5538)

GetAdapterHiddenFields (see page 5547)

54.1.44.4.74 TCustomAdapter.ListHiddenRecordFields Method

Specifies the HTML form hidden fields needed by the adapter.

Pascal

```
procedure ListHiddenRecordFields(AHiddenFields: TAdapterHiddenFieldsList);
```

C++

```
__fastcall ListHiddenRecordFields(TAdapterHiddenFieldsList AHiddenFields);
```

Description

Some adapters may use hidden fields to define the relationship between input fields in the HTML form and data of the adapter. For example, an HTML form that contains an HTML table for updating 5 detail records of a TDataSetAdapter will have 5 sets of hidden fields. Each set provides state information needed by the adapter to determine the relationship between the input fields in the HTTP request and the dataset.

ListHiddenRecordFields may call AddOrigValueHiddenFields (see page 5539) and/or AddRecordKeysHiddenFields (see page 5539) depending on the flags returned by GetHiddenFieldOptions (see page 5549).

See Also

GetHiddenFieldOptions (see page 5549)

TAdapterHiddenFieldsList (see page 5301)

AddOrigValueHiddenFields (see page 5539)

AddRecordKeysHiddenFields (see page 5539)

GetAdapterHiddenRecordFields (see page 5548)

54.1.44.4.75 TCustomAdapter.NextIteration Method

Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. NextIteration calls ImplNextIteration (see page 5560).

See Also

NextIteration (see page 1056)

ImplNextIteration (see page 5560)

54.1.44.4.76 TCustomAdapter.Notification Method

Clears references to deleted components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called when a component is inserted or deleted.

54.1.44.4.77 TCustomAdapter.NotifyActivate Method

Called when the web module is activated.

Pascal

```
procedure NotifyActivate;
```

C++

```
__fastcall NotifyActivate();
```

Description

A web module is activated when an HTTP request is received. NotifyActivate calls ImplNotifyActivate (see page 5560).

See Also

ImplNotifyActivate (see page 5560)

NotifyDeactivate (see page 5566)

54.1.44.4.78 TCustomAdapter.NotifyAdapterChange Method

Notifies components that the adapter has changed in some way.

Pascal

```
procedure NotifyAdapterChange;
```

C++

```
__fastcall NotifyAdapterChange();
```

Description

NotifyAdapterChange calls components that have registered a notification callback to let them know that the adapter has changed. For example, TAdapterFieldGroup needs to know when an adapter field is added to the adapter component that the TAdapterFieldGroup references.

See Also

NotifyList (see page 5574)

54.1.44.4.79 TCustomAdapter.NotifyDeactivate Method

Called when the web module is deactivated.

Pascal

```
procedure NotifyDeactivate;
```

C++

```
__fastcall NotifyDeactivate();
```

Description

A web module is deactivated after the HTTP request has been handled.. NotifyDeactivate calls ImplNotifyDeactivate (see page 5560).

See Also

ImplNotifyDeactivate (see page 5560)

NotifyActivate (see page 5565)

54.1.44.4.80 TCustomAdapter.SetActions Method

Initializes the Actions (see page 5572) property.

Pascal

```
procedure SetActions(const Value: TAdapterSubComponent);
```

C++

```
__fastcall SetActions(const TAdapterSubComponent Value);
```

Description

The Actions (see page 5572) property is the container for adapter action components. SetActions calls ImplSetActions (see page 5561).

See Also

Actions (see page 5572)

ImplSetActions (see page 5561)

54.1.44.4.81 TCustomAdapter.SetData Method

Initializes the Data (see page 5572) property.

Pascal

```
procedure SetData(const Value: TAdapterSubComponent); virtual;
```

C++

```
virtual __fastcall SetData(const TAdapterSubComponent Value);
```

Description

The Data (see page 5572) property is the container for adapter field components. SetData calls ImplSetData (see page 5561).

See Also

Data (see page 5572)

ImplSetData (see page 5561)

54.1.44.4.82 TCustomAdapter.SetEchoActionFieldValues Method

Sets the echo flag for this adapter's fields.

Pascal

```
procedure SetEchoActionFieldValues(AValue: Boolean);
```

C++

```
__fastcall SetEchoActionFieldValues(Boolean AValue);
```

Description

SetEchoActionFieldValues calls ImplSetActionFieldValues.

See Also

EchoActionFieldValues (see page 5572)

ImplSetEchoActionFieldValues (see page 5561)

54.1.44.4.83 TCustomAdapter.StartIterator Method

Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

Adapters may support multiple records. For example, TDataSetAdapter provides access to the records in a dataset. StartIterator calls ImplStartIterator (see page 5562).

See Also

StartIterator (see page 1056)

ImplStartIterator (see page 5562)

54.1.44.4.84 TCustomAdapter.UpdateFieldsExecuteValues Method

Executes the adapter's fields with values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsExecuteValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateFieldsExecuteValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsExecuteValues loops through the adapter fields passed in the AAdapterFields parameter, calling the ExecuteValue function. Adapter fields raise an exception to indicate an error. If an exception occurs, the exception message is added to the Errors (see page 5573) object and execution continues.

When a field is executable, the field value passed in the HTTP request is used to execute a command rather than update a value. For example, an HTML form may contain a table with a delete row checkbox on each row. When the form is submitted, the values in the HTTP request indicate whether to delete one or more rows. Executable adapter fields must implement the IExecuteValue (see page 5883) interface.

See Also

Errors (see page 5573)

IActionRequest

IExecuteValue (see page 5883)

54.1.44.4.85 TCustomAdapter.UpdateFieldsGetAnyChanges Method

Determines whether the values in the HTTP request change any adapter fields.

Pascal

```
function UpdateFieldsGetAnyChanges(AActionRequest: IActionRequest; AAdapterFields:
TObjectList): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UpdateFieldsGetAnyChanges(IActionRequest AActionRequest,
TObjectList AAdapterFields);
```

Description

TAdapterUpdateField (see page 5419)'s CheckValueChange method loops through the adapter fields passed in the AAdapterFields parameter, calling the CheckValueChange function. UpdateFieldsGetAnyChanges will return true if any adapter field returns true when its CheckValueChange method is called.

See Also

Errors (see page 5573)

ValidateValue (see page 5431)

IActionRequest

CheckValueChange (see page 5424)

54.1.44.4.86 TCustomAdapter.UpdateFieldsUpdateValues Method

Updates the adapter's fields with values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsUpdateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateFieldsUpdateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsUpdateValues loops through the adapter fields passed in the AAdapterFields parameter, calling the UpdateValue function. Adapter fields raise an exception to indicate a update error. If an exception occurs, the exception message is added to the Errors (see page 5573) object and updating continues. OnBeforeUpdateFields (see page 5578) and OnAfterUpdateFields (see page 5576) are at the beginning and end of this method.

See Also

OnBeforeUpdateFields (see page 5578)

OnAfterUpdateFields (see page 5576)

Errors (see page 5573)

UpdateValue (see page 5431)

IActionRequest

54.1.44.4.87 TCustomAdapter.UpdateFieldsValidateValues Method

Validate the adapter's field values passed in the HTTP request.

Pascal

```
procedure UpdateFieldsValidateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateFieldsValidateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsValidateValues loops through the adapter fields passed in the AAdapterFields parameter, calling the ValidateValue function. Adapter fields raise an exception to indicate a validation error. When an exception occurs, th exception messages are added to the Errors (see page 5573) object and validation continues. OnBeforeValidateFields (see page 5578) and OnAfterValidateFields (see page 5577) are at the beginning and end of this method.

See Also

OnBeforeValidateFields (see page 5578)

OnAfterValidateFields (see page 5577)

Errors (see page 5573)

ValidateValue (see page 5431)

IActionRequest

54.1.44.4.88 TCustomAdapter.UpdateRecords Method

Updates the adapter's fields with the field values passed in an HTTP request.

Pascal

```
function UpdateRecords(AActionRequest: IActionRequest = nil): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UpdateRecords(IActionRequest AActionRequest = nil);
```

Description

Call UpdateRecords to update the adapter's fields with the field values passed in an HTTP request. Typically, UpdateRecords will be called by an adapter action that submits an HTML form. UpdatesRecords first verifies that the end-user has rights to modify the adapter by calling CheckModifyAccess (see page 5540). CheckModifyAccess (see page 5540) will raise an exception if access is denied. Next, UpdateRecordsGetAnyChanges (see page 5570) is called to determine whether the values in the HTTP request represent changes to the adapter fields. If there are changes then UpdateRecordsValidateValues (

see page 5571) is called followed by UpdateRecordsUpdateValues (see page 5570). Exceptions raised during validation or update are added to the adapter's errors object. UpdateRecords returns true if the errors object contains no errors. The AActionRequest parameter is optional.

See Also

IActionRequest

CheckModifyAccess (see page 5540)

UpdateRecordsGetAnyChanges (see page 5570)

UpdateRecordsValidateValues (see page 5571)

UpdateRecordsUpdateValues (see page 5570)

Errors (see page 5573)

54.1.44.4.89 TCustomAdapter.UpdateRecordsGetAnyChanges Method

Determines whether values passed in the HTTP request will change any adapter fields.

Pascal

```
function UpdateRecordsGetAnyChanges(AActionRequest: IActionRequest; AAdapterFields:
TObjectList): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean UpdateRecordsGetAnyChanges(IActionRequest AActionRequest,
TObjectList AAdapterFields);
```

Description

The HTTP request may contain values that are associated with multiple adapter records. For example, an HTML form that contains a grid with input fields on each row will generate an HTTP request to update multiple records. UpdateRecordsGetAnyChanges iterates all the records in the HTTP request, calling UpdateFieldsGetAnyChanges (see page 5568) for each record.

See Also

UpdateFieldsGetAnyChanges (see page 5568)

54.1.44.4.90 TCustomAdapter.UpdateRecordsUpdateValues Method

Updates adapter fields with values passed in the HTTP request.

Pascal

```
procedure UpdateRecordsUpdateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateRecordsUpdateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

The HTTP request may contain values that are associated with multiple adapter records. For example, an HTML form that contains a grid with input fields on each row will generate an HTTP request to update multiple records. UpdateRecordsUpdateValues iterates all the records in the HTTP request, calling UpdateFieldUpdateValues for each record.

See Also

UpdateFieldsUpdateValues (see page 5568)

54.1.44.4.91 TCustomAdapter.UpdateRecordsValidateValues Method

Validate the adapter's field values passed in the HTTP request.

Pascal

```
procedure UpdateRecordsValidateValues(AActionRequest: IActionRequest; AAdapterFields:
TObjectList); virtual;
```

C++

```
virtual __fastcall UpdateRecordsValidateValues(IActionRequest AActionRequest, TObjectList
AAdapterFields);
```

Description

UpdateFieldsValidateValues (see page 5569) loops through the adapter fields passed in the AAdapterFields parameter, calling the ValidateValue function. Adapter fields raise an exception to indicate a validation error. When an exception occurs, the exception message is added to the Errors (see page 5573) object and validation continues. OnBeforeValidateFields (see page 5578) and OnAfterValidateFields (see page 5577) are at the beginning and end of this method.

See Also

OnBeforeValidateFields (see page 5578)

OnAfterValidateFields (see page 5577)

Errors (see page 5573)

ValidateValue (see page 5431)

IActionRequest

54.1.44.4.92 TCustomAdapter.WebComponentsChange Method

WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Pascal

```
procedure WebComponentsChange(Sender: TObject);
```

C++

```
__fastcall WebComponentsChange(TObject * Sender);
```

Description

WebComponentsChange will be called, for example, when an adapter field is added to the adapter or when an adapter field is removed from the adapter. WebComponentsChange calls NotifyAdapterChange (see page 5565).

See Also

NotifyAdapterChange (see page 5565)

54.1.44.5 TCustomAdapter Properties

The properties of the TCustomAdapter class are listed here.

Protected Properties

	Name	Description
R	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
R	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.
R	Data (see page 5572)	Data is the container for adapter field components.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.

54.1.44.5.1 TCustomAdapter.Actions Property

Actions is the container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterActions (see page 5209)

54.1.44.5.2 TCustomAdapter.Data Property

Data is the container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterFields (see page 5276)

54.1.44.5.3 TCustomAdapter.EchoActionFieldValues Property

Modifies the adapter's echo flag.

Pascal

```
property EchoActionFieldValues: Boolean;
```

C++

```
__property Boolean EchoActionFieldValues;
```

Description

The echo flag is used to alter the value returned by the adapter's fields. When this flag is set, the adapter's fields retrieves their value from the HTTP request. When this flag is clear, the adapter's fields retrieve their current value. Typically, this flag is set after an error occurs while executing an adapter action. Setting this flag results in generated HTML that displays values entered by the end-user. This allows the end-user to make corrections and resubmit the form.

See Also

SetEchoActionFieldValues (see page 5567)

GetEchoActionFieldValues (see page 5549)

54.1.44.5.4 TCustomAdapter.Errors Property

Returns an object used to track errors on behalf of this adapter.

Pascal

```
property Errors: TBaseAdapterErrorsList;
```

C++

```
__property TBaseAdapterErrorsList Errors;
```

Description

Adapter actions typically catch exceptions raised during execution and add the exception messages to the parent adapter's errors object. Server-side script may enumerate the errors recorded by the Errors property in order to write error messages to an HTML page.

See Also

GetAdapterErrorsList (see page 5547)

TBaseAdapterErrorsList (see page 5479)

TAdapterErrorsList (see page 5259)

54.1.44.5.5 TCustomAdapter.ExecuteAccess Property

Defines the rights required to execute this adapter's action.

Pascal

```
property ExecuteAccess: string;
```

C++

```
__property UnicodeString ExecuteAccess;
```

Description

The ExecuteAccess property defines the access rights required to execute this adapter's actions. Typically, an exception is raised when an end-user attempts to execute an adapter action that does not allow access.

See Also

TWebUserList (see page 6796)

HasExecuteAccess (see page 5552)

54.1.44.5.6 TCustomAdapter.ModifyAccess Property

Identifies the rights required to update this adapter's fields.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this fields of this adapter. When server-side script accesses the CanModify property, this ModifyAccess property value is checked against the end user's rights.

See Also

TWebUserList (see page 6796)

HasModifyAccess (see page 5552)

ImplHasModifyAccess (see page 5558)

54.1.44.5.7 TCustomAdapter.NotifyList Property

Keeps track of components that are to be notified when the adapter is changed.

Pascal

```
property NotifyList: TNotifyList;
```

C++

```
__property TNotifyList NotifyList;
```

Description

Keeps track of components that are to be notified when the adapter is changed.

See Also

NotifyAdapterChange (see page 5565)

TNotifyList (see page 968)

54.1.44.5.8 TCustomAdapter.ViewAccess Property

Identifies the rights required to view this adapter's fields.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view fields of this adapter. When server-side script accesses the CanView property, the ViewAccess property value is checked against the end user's rights.

See Also

TWebUserList (see page 6796)

HasViewAccess (see page 5553)

ImplHasViewAccess (see page 5559)

54.1.44.5.9 TCustomAdapter.VisibleActions Property

Returns a list of this adapter's action components.

Pascal

```
property VisibleActions: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleActions;
```

Description

Some adapters support default actions. For example, TLoginFormAdapter (see page 5824) has a has a defauilt action for submitting the login form. If no actions have been explicitly added, VisibleActions returns a list containing all of the default actions.

See Also

GetVisibleActions (see page 5551)

TWebComponentList (see page 6025)

54.1.44.5.10 TCustomAdapter.VisibleFields Property

Returns a list of this adapter's field components.

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

Some adapter may support default fields. If no fields have been explicitly added, VisibleFields returns a list containing all of the default fields.

See Also

GetVisibleFields (see page 5551)

TWebComponentList (see page 6025)

54.1.44.6 TCustomAdapter Events

The events of the TCustomAdapter class are listed here.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.

	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

54.1.44.6.1 TCustomAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.44.6.2 TCustomAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.44.6.3 TCustomAdapter.OnAfterUpdateFields Event

Occurs after values in the HTTP request are used to update adapter fields.

Pascal

```
property OnAfterUpdateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterUpdateFields;
```

Description

Implement this event handler to perform custom updates. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record update errors.

See Also

UpdateFieldsUpdateValues (see page 5568)

OnBeforeUpdateFields (see page 5578)

Errors (see page 5573)

54.1.44.6.4 TCustomAdapter.OnAfterValidateFields Event

Occurs after values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnAfterValidateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record validation errors.

See Also

UpdateFieldsValidateValues (see page 5569)

OnBeforeValidateFields (see page 5578)

Errors (see page 5573)

54.1.44.6.5 TCustomAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 5478)

OnAfterExecuteAction (see page 5576)

54.1.44.6.6 TCustomAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 5478)

OnAfterGetActionResponse (see page 5576)

54.1.44.6.7 TCustomAdapter.OnBeforeUpdateFields Event

Occurs before values in the HTTP request are used to update adapter fields.

Pascal

```
property OnBeforeUpdateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeUpdateFields;
```

Description

Implement this event handler to perform custom updates of adapter fields. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further updates. Add update errors to the adapter's errors object.

See Also

UpdateFieldsUpdateValues (see page 5568)

OnAfterUpdateFields (see page 5576)

Errors (see page 5573)

54.1.44.6.8 TCustomAdapter.OnBeforeValidateFields Event

Occurs before values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnBeforeValidateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the

adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further validation. Add validation errors to the adapter's errors object.

See Also

UpdateFieldsValidateValues (see page 5569)

OnAfterValidateFields (see page 5577)

Errors (see page 5573)

54.1.44.6.9 TCustomAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 5478)

54.1.44.6.10 TCustomAdapter.OnIterateRecords Event

Occurs when the adapter needs to iterate over its data records.

Pascal

```
property OnIterateRecords: TIterateRecordsEvent;
```

C++

```
__property TIterateRecordsEvent OnIterateRecords;
```

Description

Implement this event when the adapter supports multiple data records. This event handler is called when server-side script iterates over the records in adapter, such as when generating an HTML table displaying all records. The event handler must update an iteration pointer or cursor that adapter fields are also aware of. Adapter fields must use this iteration pointer when called to retrieve their value.

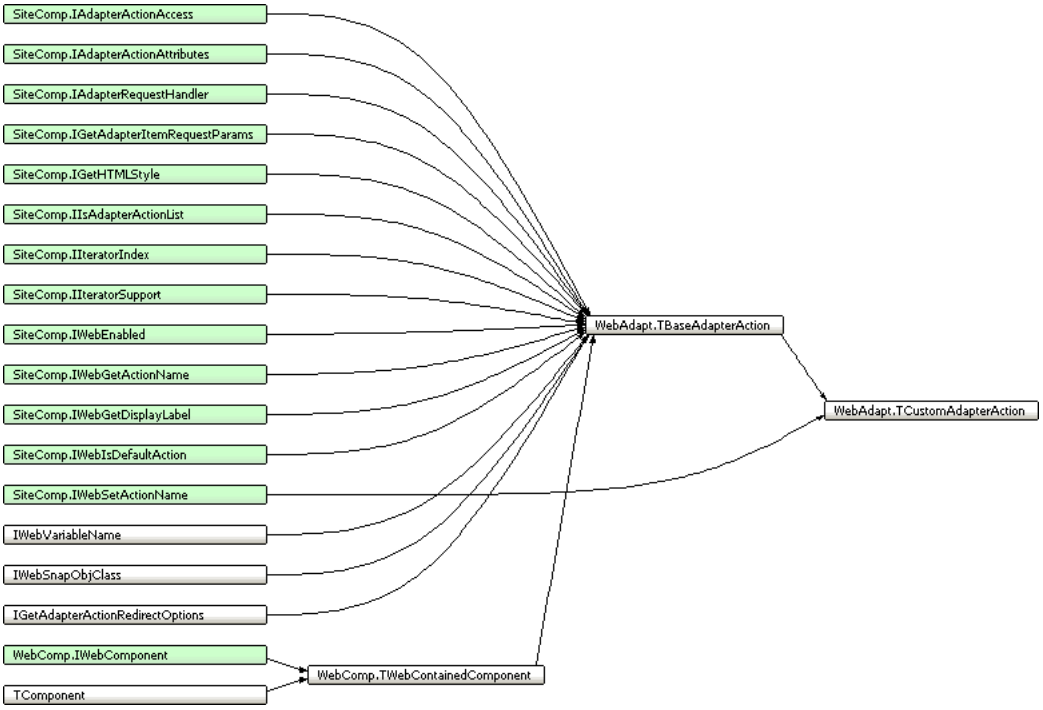
See Also

IIteratorSupport (see page 1054)

54.1.45 TCustomAdapterAction Class

TCustomAdapterAction is a base class for adapter actions.

Class Hierarchy



Pascal

```
TCustomAdapterAction = class(TBaseAdapterAction, IWebSetActionName);
```

C++

```
class TCustomAdapterAction : public TBaseAdapterAction, public IWebSetActionName;
```

File

WebAdapt

Description

TCustomAdapterAction calls event handlers to retrieve the adapter action parameters and execute the adapter action. Derive from TCustomAdapterAction to define an adapter action component that can be added to any adapter. Derive from TImplementAdapterAction to define an adapter action component that works with specific adapter component types.

See Also

TBaseAdapterAction (see page 5447)

TAdapter (see page 5190)

TAdapterAction (see page 5201)

TImplementedAdapterAction (see page 5818)

54.1.45.1 TCustomAdapterAction Members

The following tables list the members exposed by TCustomAdapterAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5456)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
V	ImplExecuteActionRequest (see page 5584)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5584)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
V	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.

	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5585)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5474)	Provides access to the parent adapter component.
	Errors (see page 5475)	Returns the parent adapter's Errors list.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5587)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5587)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5588)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5588)	Called before the adapter action response is generated.
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 5478)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).

	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5474)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

54.1.45.2 TCustomAdapterAction Methods

The methods of the TCustomAdapterAction class are listed here.

Protected Methods

	Name	Description
V	ImplExecuteActionRequest (see page 5584)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.

	ImplGetAdapterItemRequestParams (see page 5584)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplWebEnabled (see page 5585)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.

54.1.45.2.1 TCustomAdapterAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest create a TStrings containing the name/value pairs in AActionRequest and calls the OnExecute (see page 5588) event handler.

See Also

ImplExecuteActionRequest (see page 5464)

OnExecute (see page 5588)

54.1.45.2.2 TCustomAdapterAction.ImplGetActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function ImplGetActionName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetActionName();
```

Description

Gets the name used to reference this adapter action with server-side script.

See Also

ActionName (see page 5586)

ImplGetActionName (see page 5465)

54.1.45.2.3 TCustomAdapterAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(UnicodeString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

When this adapter action is executed, it provides name/value pairs which will be written when the HTML page is generated and passed back in the HTTP request. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted. When the HTML page is generated a hyperlink or button is written that identifies the name and parameters of the action. When the hyperlink or button is clicked the name of the action and parameters are passed back to the web application in the HTTP request.

See Also

ImplGetAdapterItemRequestParams (see page 5465)

54.1.45.2.4 TCustomAdapterAction.ImplGetSuccessOptions Method

Indicates whether to perform an HTTP redirect after successfully executing this action.

Pascal

```
function ImplGetSuccessOptions: TAdapterActionRedirectOptions; override;
```

C++

```
virtual __fastcall TAdapterActionRedirectOptions ImplGetSuccessOptions();
```

Description

ImplGetSuccessOptions returns the value of the RedirectOptions (see page 5476) property.

See Also

RedirectOptions (see page 5476)

54.1.45.2.5 TCustomAdapterAction.ImplSetActionName Method

Sets the name that is used to reference this adapter action with server-side script.

Pascal

```
procedure ImplSetActionName(const Value: string);
```

C++

```
__fastcall ImplSetActionName(const UnicodeString Value);
```

Description

ImplSetActionName is called by SetActionName (see page 5586). ImplSetActionName stores the name in an instance variable.

See Also

SetActionName (see page 5586)

54.1.45.2.6 TCustomAdapterAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled calls the OnGetEnabled (see page 5589) event handler.

See Also

ImplWebEnabled (see page 5470)

OnGetEnabled (see page 5589)

54.1.45.2.7 TCustomAdapterAction.SetActionName Method

Sets the name that is used to reference this adapter action with server-side script.

Pascal

```
procedure SetActionName(const Value: string);
```

C++

```
__fastcall SetActionName(const UnicodeString Value);
```

Description

SetActionName is typically called at design time to set the action name of a new adapter action. SetActionName calls ImplSetActionName (see page 5585).

See Also

ImplSetActionName (see page 5585)

54.1.45.3 TCustomAdapterAction Properties

The properties of the TCustomAdapterAction class are listed here.

Public Properties

	Name	Description
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.

54.1.45.3.1 TCustomAdapterAction.ActionName Property

Identifies the name of this action when using server-side script.

Pascal

```
property ActionName: string;
```

C++

```
__property UnicodeString ActionName;
```

Description

The ActionName property defines the name used to access the adapter action with server-side script.

See Also

ImplGetActionName (see page 5584)

ImplSetActionName (see page 5585)

54.1.45.4 TCustomAdapterAction Events

The events of the TCustomAdapterAction class are listed here.

Public Events

	Name	Description
	OnAfterExecute (see page 5587)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5587)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5588)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5588)	Called before the adapter action response is generated.
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

54.1.45.4.1 TCustomAdapterAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 5453)

OnAfterExecuteAction (see page 5576)

OnBeforeExecute (see page 5478)

54.1.45.4.2 TCustomAdapterAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnBeforeGetActionResponse (see page 5578)

54.1.45.4.3 TCustomAdapterAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 5453)

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.45.4.4 TCustomAdapterAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.45.4.5 TCustomAdapterAction.OnExecute Event

Called to execute this action using parameters passed in the HTTP request.

Pascal

```
property OnExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnExecute;
```

Description

Implement this event handler to execute this adapter action. Params contains the name/value pairs that were passed in the HTTP request. OnExecute is called by ImplExecuteActionRequest (see page 5584).

See Also

ImplExecuteActionRequest (see page 5584)

OnGetParams (see page 5478)

54.1.45.4.6 TCustomAdapterAction.OnGetEnabled Event

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
property OnGetEnabled: TActionGetEnabledEvent;
```

C++

```
__property TActionGetEnabledEvent OnGetEnabled;
```

Description

ImplWebEnabled (see page 5585) calls the OnGetEnabled event handler. Set the Enabled parameter to false to indicate that this adapter action should not be enabled.

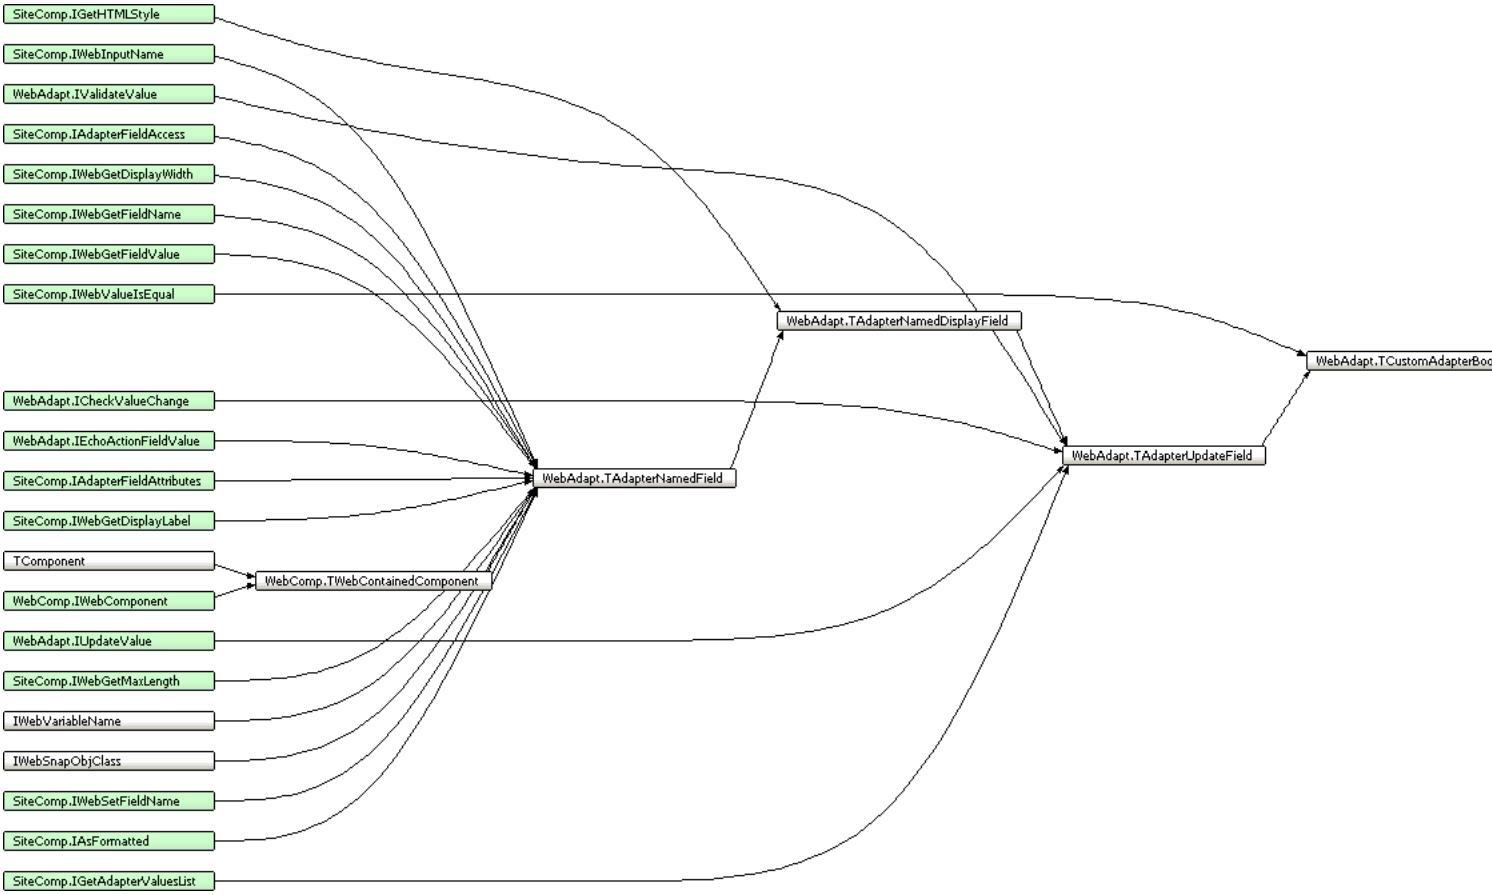
See Also

ImplWebEnabled (see page 5585)

54.1.46 TCustomAdapterBooleanField Class

TCustomAdapterBooleanField is a base class for adapter fields that provide a single Boolean value.

Class Hierarchy



Pascal

```
TCustomAdapterBooleanField = class(TAdapterUpdateField, IWebValueIsEqual);
```

C++

```
class TCustomAdapterBooleanField : public TAdapterUpdateField, public IWebValueIsEqual;
```

File

WebAdapt

Description

TCustomAdapterBooleanField calls event handlers to retrieve the adapter field's value, validate a value entered by the end-user, and update the adapter field's value.

See Also

TAdapterUpdateField (see page 5419)

TAdapterBooleanField (see page 5223)

TAdapter (see page 5190)

54.1.46.1 TCustomAdapterBooleanField Members

The following tables list the members exposed by TCustomAdapterBooleanField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5424)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
	ConvertValue (see page 5594)	Retrieves a Boolean value entered by the end-user.
	ConvertValueCount (see page 5425)	Retrieves the number of values entered by the end-user.
	ConvertValues (see page 5425)	Retrieves a value entered by the end-user.
	DoOnValidateValue (see page 5426)	Validates field values entered by the end-user.
	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5426)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5346)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 5594)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5347)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 5595)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetValueCount (see page 5427)	Provides the number of values associated with this adapter field.
	GetValues (see page 5427)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5348)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5348)	Suggests a view mode for this adapter field.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 5427)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5428)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
	ImplGetDisplayLabel (see page 5348)	Implements interface access to the DisplayLabel (see page 5350) property.
	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 5428)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5349)	Implements interface access to the DisplayWidth (see page 5350) property.

	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 5428)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 5429)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5349)	Implements interface access to the Required (see page 5351) property.
	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5595)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5429)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
	ImplIsEqual (see page 5596)	Indicates whether the value of this field is equal to a particular Variant (see page 3421) value.
	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5429)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5429)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5596)	Called to update the adapter field's value with a value entered by the end-user.
	ImplValidateValue (see page 5430)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsEqual (see page 5596)	Indicates whether the value of this field is equal to a particular Variant (see page 3421) value.
	IsMultiValueField (see page 5430)	Indicates whether this adapter field can support multiple values.
	Notification (see page 5431)	Clears references to a deleted component.
	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5349)	SetDisplayLabel sets the value of the DisplayLabel (see page 5350) property.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	UpdateValue (see page 5431)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5431)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5368)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5433)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 5597)	Called to retrieve the adapter field's value.

	OnUpdateValue (see page 5597)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 5433)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5878)	This is CheckValueChange, a member of class ICheckValueChange.
V	Create (see page 5346)	Creates an instance of TAdapterNamedDisplayField (see page 5343).
V	Create (see page 5423)	Creates an instance of TAdapterUpdateField (see page 5419).
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetAdapterValuesList (see page 1027)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	UpdateValue (see page 5892)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5893)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5350)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5350)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.

	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
	ReadOnly (see page 5351)	Indicates whether this adapter field is read-only.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
R	Value (see page 5432)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5432)	Associates a list of values with the adapter field.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.46.2 TCustomAdapterBooleanField Methods

The methods of the TCustomAdapterBooleanField class are listed here.

Protected Methods

	Name	Description
V	ConvertValue (see page 5594)	Retrieves a Boolean value entered by the end-user.
V	GetDisplayStyleType (see page 5594)	Suggests an HTML display type for this adapter field.
V	GetInputStyleType (see page 5595)	Suggests an HTML input type for this adapter field.
V	ImplGetValue (see page 5595)	Returns the value of this adapter field as a variant.
V	ImplIsEqual (see page 5596)	Indicates whether the value of this field is equal to a particular Variant (see page 3421) value.
V	ImplUpdateValue (see page 5596)	Called to update the adapter field's value with a value entered by the end-user.
	IsEqual (see page 5596)	Indicates whether the value of this field is equal to a particular Variant (see page 3421) value.

54.1.46.2.1 TCustomAdapterBooleanField.ConvertValue Method

Retrieves a Boolean value entered by the end-user.

Pascal

```
function ConvertValue(AValue: IActionFieldValue): Variant; override;
```

C++

```
virtual __fastcall Variant ConvertValue(IActionFieldValue AValue);
```

Description

ConvertValue overrides TAdapterUpdateField (see page 5419)'s ConvertValue method. Convert value attempts to cast the value entered by the end-user to a Boolean. If the cast fails, false is returned.

See Also

ConvertValue (see page 5425)

54.1.46.2.2 TCustomAdapterBooleanField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const UnicodeString
```

```
AAdapterMode);
```

Description

GetDisplayStyleType overrides TAdapterNamedDisplayField (see page 5343)'s GetDisplayStyleType method. GetDispayStyleType returns htmldText, indicating that this adapter field should be displayed by as an HTML text block (paragraph).

See Also

GetDisplayStyleType (see page 5347)

TAdapterDisplayHTMLElementType (see page 1123)

54.1.46.2.3 TCustomAdapterBooleanField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetInputStyleType returns htmliCheckBox indicating that a check box should be used to input this adapter field's value.

See Also

GetInputStyleType (see page 5347)

TAdapterInputHTMLElementType (see page 1124)

54.1.46.2.4 TCustomAdapterBooleanField.ImplGetValue Method

Returns the value of this adapter field as a variant.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the value of this adapter field as a variant. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the EchoActionFieldValue (see page 5368) property is true, then the value entered by end-user is returned. If the EchoActionFieldValue (see page 5368) property is false then the OnGetValue (see page 5597) event handler is called to retrieve the value of the adapter field.

See Also

OnGetValue (see page 5597)

54.1.46.2.5 TCustomAdapterBooleanField.ImplIsEqual Method

Indicates whether the value of this field is equal to a particular Variant (see page 3421) value.

Pascal

```
function ImplIsEqual(const AValue: Variant): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplIsEqual(const Variant AValue);
```

Description

ImplIsEqual is called by IsEqual (see page 5596). ImplIsEqual compares the parameter value with the value associated with this adapter field.

See Also

IsEqual (see page 5596)

54.1.46.2.6 TCustomAdapterBooleanField.ImplUpdateValue Method

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ImplUpdateValue procedure updates the value of this adapter field using the given action request. The AFieldIndex parameter is used to extract the value entered by the user from the action request. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to modify this field, an exception is raised. If the OnUpdateValue (see page 5597) event handler is not nil (Delphi) or NULL (C++), it is called to update the adapter field's value.

See Also

OnUpdateValue (see page 5597)

54.1.46.2.7 TCustomAdapterBooleanField.IsEqual Method

Indicates whether the value of this field is equal to a particular Variant (see page 3421) value.

Pascal

```
function IsEqual(const AValue: Variant): Boolean;
```

C++

```
__fastcall Boolean IsEqual(const Variant AValue);
```

Description

IsEqual is called when server-side script calls the IsEqual method of this adapter field. Server-side script may use the IsEqual function to determine whether to check an HTML checkbox that displays this adapter field's value. IsEqual returns the result of ImplIsEqual (see page 5596).

See Also

ImplIsEqual (see page 5596)

54.1.46.3 TCustomAdapterBooleanField Events

The events of the TCustomAdapterBooleanField class are listed here.

Public Events

	Name	Description
	OnGetValue (see page 5597)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5597)	Called to update the adapter field's value with a value entered by the end-user.

54.1.46.3.1 TCustomAdapterBooleanField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetBooleanEvent;
```

C++

```
__property TAdapterFieldGetBooleanEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue (see page 5595) to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 5595)

54.1.46.3.2 TCustomAdapterBooleanField.OnUpdateValue Event

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldBooleanValueEvent;
```

C++

```
__property TAdapterFieldBooleanValueEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

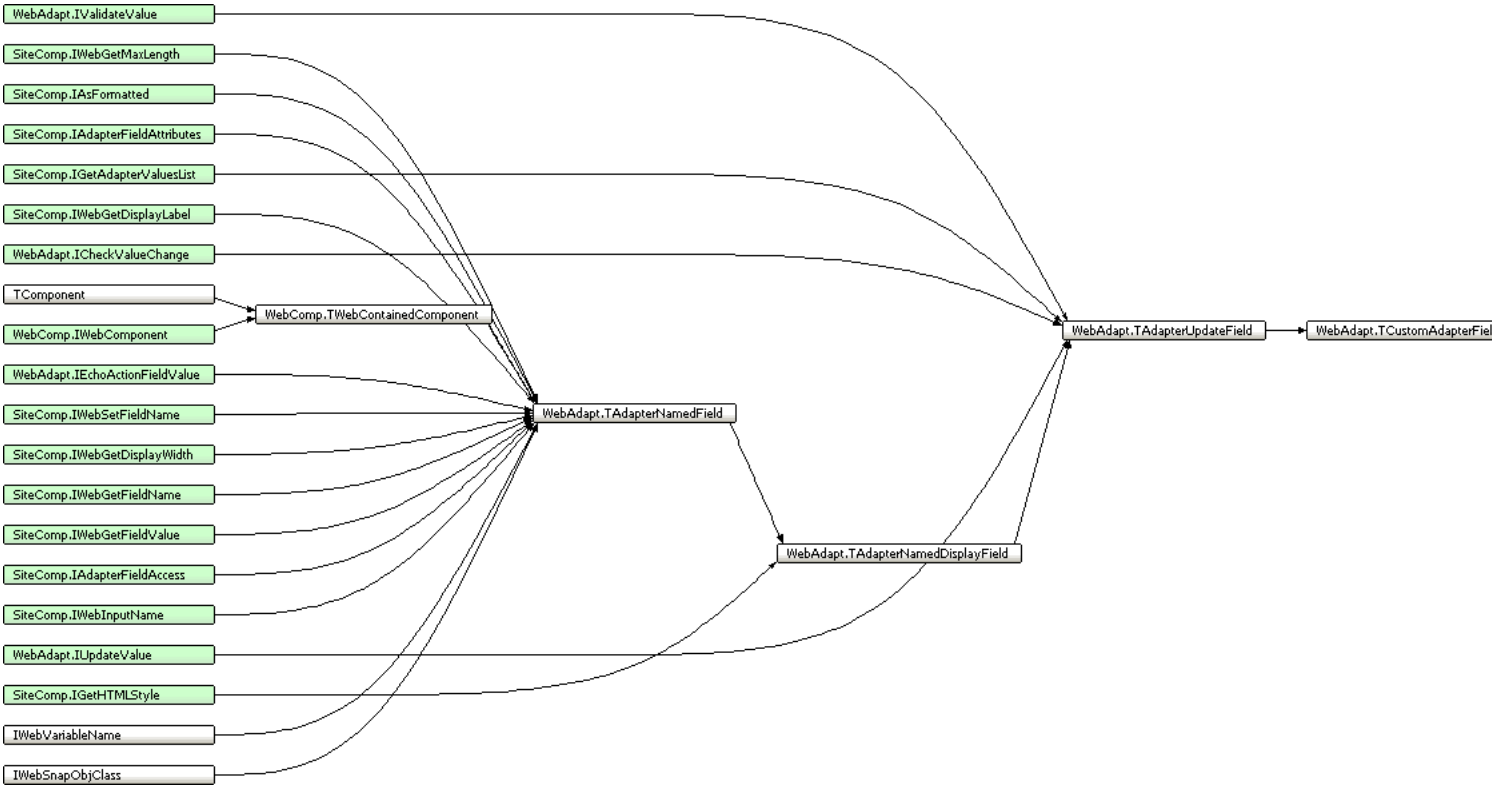
See Also

ImplUpdateValue (see page 5596)

54.1.47 TCustomAdapterField Class

TCustomAdapterField is a base class for adapter fields that provide a single value.

Class Hierarchy



Pascal

```
TCustomAdapterField = class(TAdapterUpdateField);
```

C++

```
class TCustomAdapterField : public TAdapterUpdateField;
```

File

WebAdapt

Description

TCustomAdapterField calls event handlers to retrieve the adapter field's value, validate a value entered by the end-user, and update the adapter field's value.

See Also

TAdapterUpdateField (see page 5419)

TAdapterField (see page 5267)

TAdapter (see page 5190)

54.1.47.1 TCustomAdapterField Members

The following tables list the members exposed by TCustomAdapterField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5424)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5425)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5425)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5425)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5602)	Validates a single value entered by the end-user.
V	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5426)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5346)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5347)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5347)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5347)	Suggests an HTML input type for this adapter field.
V	GetInputStyleType (see page 5426)	Indicates the preferred HTML element to use when editing this adapter field's value.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
V	GetValueCount (see page 5427)	Provides the number of values associated with this adapter field.
V	GetValues (see page 5427)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5348)	Returns a string value to suggest a view mode for this adapter field.
V	GetViewModeType (see page 5348)	Suggests a view mode for this adapter field.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 5427)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 5428)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplGetDisplayLabel (see page 5348)	Implements interface access to the DisplayLabel (see page 5350) property.
V	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayLabel (see page 5428)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 5349)	Implements interface access to the DisplayWidth (see page 5350) property.
V	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
V	ImplGetDisplayWidth (see page 5428)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.

	ImplGetEchoActionFieldValue (see page 5429)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5349)	Implements interface access to the Required (see page 5351) property.
	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5602)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5429)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5429)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5429)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5603)	Called to update the adapter field's value with a value entered by the end-user.
	ImplValidateValue (see page 5430)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5430)	Indicates whether this adapter field can support multiple values.
	Notification (see page 5431)	Clears references to a deleted component.
	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5349)	SetDisplayLabel sets the value of the DisplayLabel (see page 5350) property.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	UpdateValue (see page 5431)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5431)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5368)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5433)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 5603)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5604)	Called to update the adapter field's value with a value entered by the end-user.
	OnValidateValue (see page 5433)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5878)	This is CheckValueChange, a member of class ICheckValueChange.

	Create (see page 5346)	Creates an instance of TAdapterNamedDisplayField (see page 5343).
	Create (see page 5423)	Creates an instance of TAdapterUpdateField (see page 5419).
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetAdapterValuesList (see page 1027)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	UpdateValue (see page 5892)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5893)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5350)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5350)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
	ReadOnly (see page 5351)	Indicates whether this adapter field is read-only.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
R	Value (see page 5432)	Retrieves the value associated with this adapter field.

	ValuesList (see page 5432)	Associates a list of values with the adapter field.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.47.2 TCustomAdapterField Methods

The methods of the TCustomAdapterField class are listed here.

Protected Methods

	Name	Description
V	DoOnValidateValue (see page 5602)	Validates a single value entered by the end-user.
V	ImplGetValue (see page 5602)	Returns the value of this adapter field as a variant.
V	ImplUpdateValue (see page 5603)	Called to update the adapter field's value with a value entered by the end-user.

54.1.47.2.1 TCustomAdapterField.DoOnValidateValue Method

Validates a single value entered by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue calls the inherited DoOnValidateValue. If this succeeds by not raising an exception then additional checks are made. One check tests that the request does not contain more than one value for this adapter field. Another check is performed if the Required (see page 5351) property is True. In this case, the request must contain a value for this adapter field. An exception is raised if any of these checks fail.

See Also

DoOnValidateValue (see page 5426)

Required (see page 5351)

54.1.47.2.2 TCustomAdapterField.ImplGetValue Method

Returns the value of this adapter field as a variant.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue function returns the value of this adapter field as a variant. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the EchoActionFieldValue (see page 5368) property is True, then the value entered by end-user should is returned. If the EchoActionFieldValue (see page 5368) property is False then the OnGetValue (see page 5603) event handler is called to retrieve the value of the adapter field.

See Also

OnGetValue (see page 5603)

CheckViewAccess (see page 5356)

EchoActionFieldValue (see page 5368)

54.1.47.2.3 TCustomAdapterField.ImplUpdateValue Method

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ImplUpdateValue procedure updates the value using the given action request. The AfieldIndex parameter is used to extract the value entered by the user from the action request. First, the access rights defined for this adapter field are validated agains the rights of the end-user. If the end-user does not have rights to modify this field, an exception is raised. If the OnUpdateValue (see page 5604) event handler is not nil, it is called to update the adapter field's value.

See Also

OnUpdateValue (see page 5604)

54.1.47.3 TCustomAdapterField Events

The events of the TCustomAdapterField class are listed here.

Public Events

	Name	Description
	OnGetValue (see page 5603)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5604)	Called to update the adapter field's value with a value entered by the end-user.

54.1.47.3.1 TCustomAdapterField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetValueEvent;
```

C++

```
__property TAdapterFieldGetValueEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue (see page 5602) to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 5602)

54.1.47.3.2 TCustomAdapterField.OnUpdateValue Event

Called to update the adapter field's value with a value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldValueEvent;
```

C++

```
__property TAdapterFieldValueEvent OnUpdateValue;
```

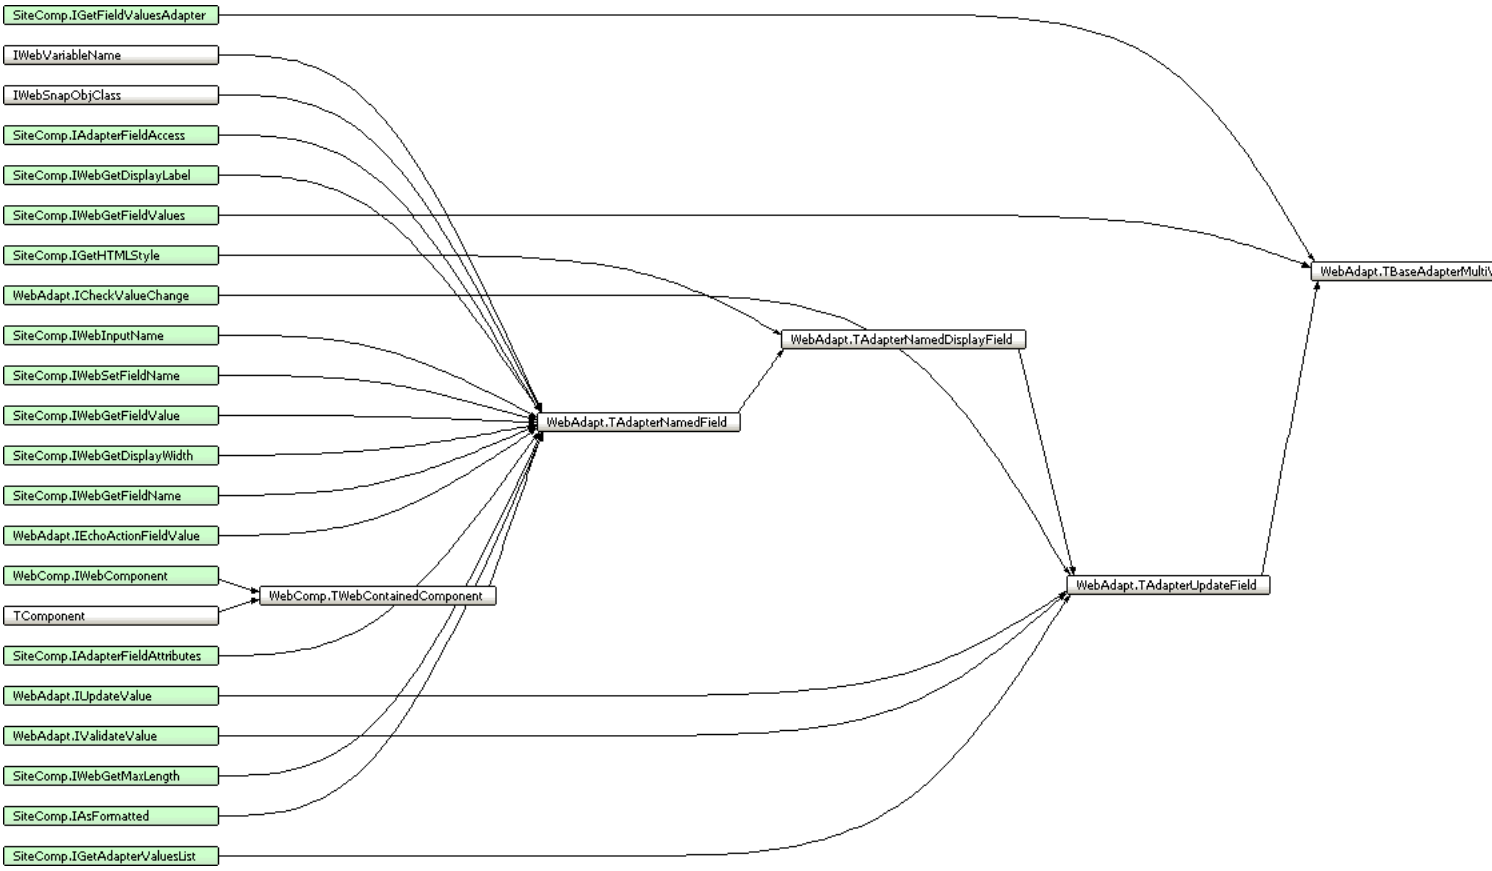
Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

54.1.48 TCustomAdapterFileField Class

TCustomAdapterFileField is a base class for adapter fields that can have associated files.

Class Hierarchy



Pascal

```
TCustomAdapterFileField = class(TBaseAdapterMultiValueField);
```

C++

```
class TCustomAdapterFileField : public TBaseAdapterMultiValueField;
```

File

WebAdapt

Description

Derive from TCustomAdapterFileField when the adapter field can have zero or more associated files. Typically, file input HTML elements are used to upload files. Multiple file input HTML elements having the same name can be used to upload multiple files in a single request.

See Also

TBaseAdapterMultiValueField (see page 5488)

TAdapterFileField (see page 5281)

TAdapterImageField (see page 5308)

54.1.48.1 TCustomAdapterFileField Members

The following tables list the members exposed by TCustomAdapterFileField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5424)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5425)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5425)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5425)	Retrieves a value entered by the end-user.
V	DoOnValidateValue (see page 5609)	Validates files uploaded by the end-user.
	EndValueIterator (see page 5493)	Completes iteration.
V	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5426)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 5494)	Implements IWebGetFieldValues (see page 1092)' GetCurrentValue.
V	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5346)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5609)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 5494)	Returns the adapter object that implements the Values property.
	GetFileNames (see page 5610)	Returns the count of files associated with this adapter field.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5347)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5610)	Suggests an HTML input type for this adapter field.

	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetValueCount (see page 5610)	Returns the number of values associated with this adapter field.
	GetValues (see page 5611)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5348)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5348)	Suggests a view mode for this adapter field.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 5495)	Implements IWebGetFieldValues (see page 1092)' HasValue method.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 5427)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5611)	Indicates whether the end-user may have uploaded new files for this adapter field.
	ImplGetCurrentValue (see page 5495)	Implements IWebGetFieldValues (see page 1092)' GetCurrentValue (see page 5494) method.
	ImplGetDisplayLabel (see page 5348)	Implements interface access to the DisplayLabel (see page 5350) property.
	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 5428)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5349)	Implements interface access to the DisplayWidth (see page 5350) property.
	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 5428)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 5429)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetFieldValuesAdapter (see page 5496)	Returns the adapter object that implements the Values property.
	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5349)	Implements interface access to the Required (see page 5351) property.
	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5363)	Gets the value of this adapter field as a Variant (see page 3421).
	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5429)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
	ImplHasValue (see page 5496)	Implements IWebGetFieldValues (see page 1092)' HasValue (see page 5495) method.
	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5429)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5429)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5611)	Updates the adapter field with value(s) entered by the end-user.
	ImplValidateValue (see page 5430)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5430)	Indicates whether this adapter field can support multiple values.
	NextValueIteration (see page 5496)	Implements IWebGetFieldValues (see page 1092)' NextValueIteration method.
	Notification (see page 5431)	Clears references to a deleted component.

	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5349)	SetDisplayLabel sets the value of the DisplayLabel (see page 5350) property.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartValueIterator (see page 5497)	Implements IWebGetFieldValues (see page 1092)' StartValueIterator method.
	UpdateValue (see page 5431)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5431)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5368)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5433)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetFileCount (see page 5613)	Returns the number of values associated with this adapter field.
	OnGetFileNames (see page 5613)	Returns one of the filenames associated with the adapter field.
	OnUploadFiles (see page 5613)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateFiles (see page 5614)	Validates values entered by the end-user.
	OnValidateValue (see page 5433)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5878)	This is CheckValueChange, a member of class ICheckValueChange.
	Create (see page 5346)	Creates an instance of TAdapterNamedDisplayField (see page 5343).
	Create (see page 5423)	Creates an instance of TAdapterUpdateField (see page 5419).
	Create (see page 5492)	Constructor for TBaseAdapterMultiValueField (see page 5488).
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	Destroy (see page 5492)	Destructor for TBaseAdapterMultiValueField (see page 5488).
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndValueIterator (see page 1093)	Indicate the iteration is finished.
	GetAdapterValuesList (see page 1027)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetCurrentValue (see page 1094)	Retrieves the current value as a variant.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetFieldValuesAdapter (see page 1031)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.

V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasValue (see page 1094)	Indicates whether the adapter field has a matching value.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	NextValueIteration (see page 1094)	Position the iteration pointer on the next value.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartValueIterator (see page 1095)	Reset (see page 3643) the iteration pointer to the first item.
	UpdateValue (see page 5892)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5893)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5350)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5350)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
R	FileCount (see page 5612)	Returns one of the filenames associated with this adapter field.
R	FileNames (see page 5612)	Returns a file associated with this adapter field.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
	ReadOnly (see page 5351)	Indicates whether this adapter field is read-only.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
R	Value (see page 5432)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5432)	Associates a list of values with the adapter field.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.48.2 TCustomAdapterFileField Methods

The methods of the TCustomAdapterFileField class are listed here.

Protected Methods

	Name	Description
	DoOnValidateValue (see page 5609)	Validates files uploaded by the end-user.
	GetDisplayStyleType (see page 5609)	Suggests an HTML display type for this adapter field.
	GetFileNames (see page 5610)	Returns the count of files associated with this adapter field.
	GetInputStyleType (see page 5610)	Suggests an HTML input type for this adapter field.
	GetValueCount (see page 5610)	Returns the number of values associated with this adapter field.
	GetValues (see page 5611)	Returns one of the values associated with the adapter field.
	ImplCheckValueChange (see page 5611)	Indicates whether the end-user may have uploaded new files for this adapter field.
	ImplUpdateValue (see page 5611)	Updates the adapter field with value(s) entered by the end-user.

54.1.48.2.1 TCustomAdapterFileField.DoOnValidateValue Method

Validates files uploaded by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue overrides TAdapterUpdateField (see page 5419)'s DoOnValidateValue method. If the OnValidateFiles (see page 5614) event handler is not nil (Delphi) or NULL (C++), DoOnValidateValue calls it to validate uploaded files. If the Required (see page 5351) property is true, DoOnValidateValues also verifies that 1 of more values have been entered by the end-user. An exception will be raised to indicate a validation error.

See Also

DoOnValidateValue (see page 5426)

OnValidateValue (see page 5433)

Required (see page 5351)

OnValidateFiles (see page 5614)

54.1.48.2.2 TCustomAdapterFileField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const UnicodeString
AAdapterMode);
```

Description

GetDisplayStyleType overrides TAdapterNamedDisplayField (see page 5343)'s GetDisplayStyleType. GetDispayStyleTypereturns htmldList, indicating that this adapter field should be displayed by as a list of read-only values.

See Also

GetDisplayStyle (see page 5346)

TAdapterDisplayHTMLElementType (see page 1123)

54.1.48.2.3 TCustomAdapterFileField.GetFileNames Method

Returns the count of files associated with this adapter field.

Pascal

```
function GetFileNames(I: Integer): string;
```

C++

```
__fastcall UnicodeString GetFileNames(int I);
```

Description

GetFileNames implements the FileNames (see page 5612) property. If the EchoActionFieldValue (see page 5368) flag is true then the filename is extracted from the HTTP request. Otherwise, the OnGetFileNames (see page 5613) event is called. GetFileNames returns and empty string if a value can't be found because OnGetFileNames (see page 5613) is nil (Delphi) or NULL (C++) or the HTTP request does not contain a filename for this adapter field.

See Also

FileNames (see page 5612)

OnGetFileNames (see page 5613)

54.1.48.2.4 TCustomAdapterFileField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetInputStyleType returns htmliFile indicating that file upload HTML elements should be used to input values for this adapter field.

See Also

GetInputStyleType (see page 5347)

TAdapterInputHTMLElementType (see page 1124)

54.1.48.2.5 TCustomAdapterFileField.GetValueCount Method

Returns the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; override;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount implements the FileCount (see page 5612) property. If the EchoActionFieldValue (see page 5368) flag is

true then the result is the number of values in the HTTP request for this adapter field. Otherwise, the OnGetFileCount (see page 5613) event is called. GetValueCount returns zero if a value can't be found because OnGetFileCount (see page 5613) is nil (Delphi) or NULL (C++) or the HTTP request does not contain a value for this adapter field.

See Also

FileCount (see page 5612)

OnGetFileCount (see page 5613)

54.1.48.2.6 TCustomAdapterFileField.GetValues Method

Returns one of the values associated with the adapter field.

Pascal

```
function GetValues(I: Integer): Variant; override;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues returns the result of GetFileNames (see page 5610).

See Also

GetFileNames (see page 5610)

54.1.48.2.7 TCustomAdapterFileField.ImplCheckValueChange Method

Indicates whether the end-user may have uploaded new files for this adapter field.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
override;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

ImplCheckValueChange overrides TAdapterUpdateField (see page 5419)'s ImplCheckValueChange method. ImplCheckValueChange returns true if the end-user has uploaded any files.

See Also

IActionRequest

ImplCheckValueChange (see page 5428)

54.1.48.2.8 TCustomAdapterFileField.ImplUpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplUpdateValue overrides TAdapterUpdateField (see page 5419)'s ImplUpdateValue method. After checking that the end-user has rights to modify this adapter field, the OnUploadFiles (see page 5613) event is called.

See Also

IActionRequest

OnUploadFiles (see page 5613)

ImplUpdateValue (see page 5430)

54.1.48.3 TCustomAdapterFileField Properties

The properties of the TCustomAdapterFileField class are listed here.

Public Properties

	Name	Description
	FileCount (see page 5612)	Returns one of the filenames associated with this adapter field.
	FileNames (see page 5612)	Returns a file associated with this adapter field.

54.1.48.3.1 TCustomAdapterFileField.FileCount Property

Returns one of the filenames associated with this adapter field.

Pascal

```
property FileCount: Integer;
```

C++

```
__property int FileCount;
```

Description

```
__property int FileCount = {read=GetValueCount, nodefault};
```

FileCount can be used with the FileNames (see page 5612) property to access all the filenames associated with this adapter field. FileCount is implemented by GetValueCount (see page 5610).

See Also

FileNames (see page 5612)

GetValueCount (see page 5610)

54.1.48.3.2 TCustomAdapterFileField.FileNames Property

Returns a file associated with this adapter field.

Pascal

```
property FileNames [I: Integer]: string;
```

C++

```
__property UnicodeString FileNames[int I];
```

Description

FileNames can be used with the FileCount (see page 5612) property to access all the filenames associated with this adapter field. FileNames is implemented by GetFileNames (see page 5610).

See Also

FileCount (see page 5612)

GetFileNames (see page 5610)

54.1.48.4 TCustomAdapterFileField Events

The events of the TCustomAdapterFileField class are listed here.

Public Events

	Name	Description
	OnGetFileCount (see page 5613)	Returns the number of values associated with this adapter field.
	OnGetFileNames (see page 5613)	Returns one of the filenames associated with the adapter field.
	OnUploadFiles (see page 5613)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateFiles (see page 5614)	Validates values entered by the end-user.

54.1.48.4.1 TCustomAdapterFileField.OnGetFileCount Event

Returns the number of values associated with this adapter field.

Pascal

```
property OnGetFileCount: TAdapterFieldGetValueCountEvent;
```

C++

```
__property TAdapterFieldGetValueCountEvent OnGetFileCount;
```

Description

Write (see page 3707) an OnGetFileCount event handler to indicate the number of filenames associated with this adapter field.

See Also

GetValueCount (see page 5610)

54.1.48.4.2 TCustomAdapterFileField.OnGetFileNames Event

Returns one of the filenames associated with the adapter field.

Pascal

```
property OnGetFileNames: TAdapterFieldGetMultiValueStringEvent;
```

C++

```
__property TAdapterFieldGetMultiValueStringEvent OnGetFileNames;
```

Description

Write (see page 3707) an OnGetFileNames event handler to provide the names of files associated with this adapter field.

See Also

GetFileNames (see page 5610)

54.1.48.4.3 TCustomAdapterFileField.OnUploadFiles Event

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
property OnUploadFiles: TAdapterFieldFileListEvent;
```

C++

```
__property TAdapterFieldFileListEvent OnUploadFiles;
```

Description

OnUploadFiles is called by ImplUpdateValue (see page 5611). Write (see page 3707) an OnUploadFiles event handler to accept files uploaded by the end-user. Raise an exception to indicate an error.

See Also

ImplUpdateValue (see page 5611)

TUpdateFileList (see page 5864)

54.1.48.4.4 TCustomAdapterFileField.OnValidateFiles Event

Validates values entered by the end-user.

Pascal

```
property OnValidateFiles: TAdapterFieldFileListEvent;
```

C++

```
__property TAdapterFieldFileListEvent OnValidateFiles;
```

Description

OnValidateFiles is called by DoOnValidateValue (see page 5609). Implement this event handler to validate files uploaded by the end-user. Raise an exception to indicate a validation error.

See Also

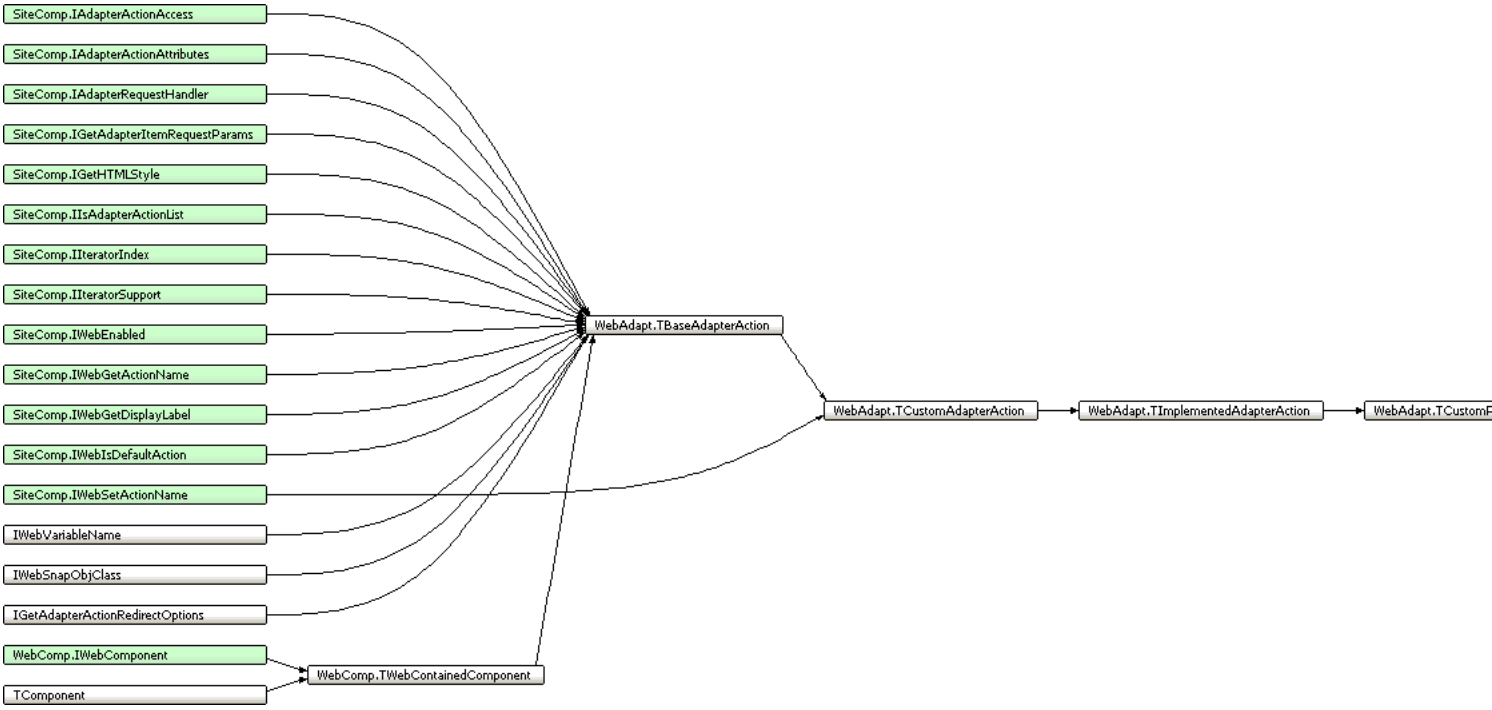
DoOnValidateValue (see page 5609)

TUpdateFileList (see page 5864)

54.1.49 TCustomAdapterGotoPageAction Class

TCustomAdapterGotoPageAction is an adapter action that supports commands to go to a page of a TDefaultFieldsPagedAdapter (see page 5747).

Class Hierarchy



Pascal

```
TCustomAdapterGotoPageAction = class(TCustomPagedAdapterAction);
```

C++

```
class TCustomAdapterGotoPageAction : public TCustomPagedAdapterAction;
```

File

WebAdapt

Description

TCustomAdapterGotoPageAction is an adapter action that has a list of commands. Each command has a parameter that identifies a page in the parent adapter. When executed, TCustomAdapterGotoPageAction examines the parameter and changes the current page in the parent adapter.

See Also

TCustomPagedAdapterAction (see page 5722)

TAdapterGotoPageAction (see page 5291)

54.1.49.1 TCustomAdapterGotoPageAction Members

The following tables list the members exposed by TCustomAdapterGotoPageAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.

	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 5727)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5619)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5619)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5620)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
V	ImplExecuteActionRequest (see page 5620)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5620)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5621)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 5621)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
V	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
V	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
	ImplIsDefaultAction (see page 5622)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5622)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5474)	Provides access to the parent adapter component.
	Adapter (see page 5727)	Returns the parent adapter of this adapter action.
	Errors (see page 5475)	Returns the parent adapter's Errors list.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5477)	Called after the adapter action has executed.
	OnAfterExecute (see page 5587)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5477)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 5587)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5478)	Called before the adapter action is executed.
	OnBeforeExecute (see page 5588)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5478)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 5588)	Called before the adapter action response is generated.
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetPageName (see page 5622)	Provides the display labels for each goto page command.
	OnGetParams (see page 5478)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 1087)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5474)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

54.1.49.2 TCustomAdapterGotoPageAction Methods

The methods of the TCustomAdapterGotoPageAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 5619)	Gets the name used to reference this adapter action with server-side script.
	GetDisplayStyleType (see page 5619)	Suggests an HTML display type for this adapter action.
	GetItemCount (see page 5620)	Returns the number of commands defined by this adapter action.
	ImplExecuteActionRequest (see page 5620)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetAdapterItemRequestParams (see page 5620)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5621)	Returns the suggested display label for this adapter action.
	ImplGetIsAdapterActionList (see page 5621)	Indicates whether this adapter action may have multiple commands.
	ImplIsDefaultAction (see page 5622)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplWebEnabled (see page 5622)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

54.1.49.2.1 TCustomAdapterGotoPageAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultActionName();
```

Description

GetDefaultActionName returns 'GotoPage'.

See Also

GetActionName (see page 5455)

GetDefaultActionName (see page 5456)

54.1.49.2.2 TCustomAdapterGotoPageAction.GetDisplayStyleType Method

Suggests an HTML display type for this adapter action.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterActionHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterActionHTMLElementType GetDisplayStyleType(const UnicodeString
AAdapterMode);
```

Description

GetDisplayStyleType returns htmlaAnchor, indicating that goto page commands should be displayed using a hyperlink.

See Also

GetDisplayStyle (see page 5457)

54.1.49.2.3 TCustomAdapterGotoPageAction.GetItemCount Method

Returns the number of commands defined by this adapter action.

Pascal

```
function GetItemCount: Integer; override;
```

C++

```
virtual __fastcall int GetItemCount();
```

Description

TCustomAdapterGotoPageAction (see page 5614) returns the value of the parent adapter's PageCount property.

See Also

ItemCount (see page 5475)

ItemIndex (see page 5476)

GetIsAdapterActionList (see page 5460)

PageCount (see page 5761)

54.1.49.2.4 TCustomAdapterGotoPageAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest sets the parent adapter's current page using the page index passed in the AActionRequest parameter.

See Also

ImplExecuteActionRequest (see page 5464)

54.1.49.2.5 TCustomAdapterGotoPageAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(UnicodeString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

ImplGetAdapterItemRequestParams is called by GetAdapterItemRequestParams (see page 5456). ImplGetAdapterItemRequestParams adds the value of the iteration index as a parameter. Then the inherited ImplGetAdapterItemRequestParams method is called so that any event handlers that may be defined will be called.

See Also

GetAdapterItemRequestParams (see page 5456)

OnGetActionParams (see page 5579)

OnGetParams (see page 5478)

ItemIndex (see page 5476)

54.1.49.2.6 TCustomAdapterGotoPageAction.ImplGetDisplayLabel Method

Returns the suggested display label for this adapter action.

Pascal

```
function ImplGetDisplayLabel: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetDisplayLabel();
```

Description

ImplGetDisplayLabel returns the display label suggested for the goto page command that is identified by the iteration index. If the OnGetPageName (see page 5622) event handler is not nil (Delphi) or NULL (C++), it is called. Otherwise, the ItemIndex (see page 5476) property is converted to a string and returned.

See Also

DisplayLabel (see page 5474)

ItemIndex (see page 5476)

OnGetPageName (see page 5622)

54.1.49.2.7 TCustomAdapterGotoPageAction.ImplGetIsAdapterActionList Method

Indicates whether this adapter action may have multiple commands.

Pascal

```
function ImplGetIsAdapterActionList: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplGetIsAdapterActionList();
```

Description

ImplGetIsAdapterActionList is called by GetIsAdapterActionList (see page 5460). ImplGetIsAdapterActionList returns true if the parent adapters PageSize property is greater than zero.

See Also

GetIsAdapterActionList (see page 5460)

PageSize (see page 5761)

54.1.49.2.8 TCustomAdapterGotoPageAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction (see page 5471). ImplIsDefaultAction returns true if the display characteristics identified by ADisplay indicate that the goto page commands are appropriate.

See Also

IsDefaultAction (see page 5471)

54.1.49.2.9 TCustomAdapterGotoPageAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled returns the result of false if the iteration index is equal to the parent adapter's current page. In other words, the command that goes to the parent adapter's current page will be disabled. Commands to goto all other pages will be enabled.

See Also

WebEnabled (see page 5473)

CurrentPage (see page 5760)

ItemIndex (see page 5476)

54.1.49.3 TCustomAdapterGotoPageAction Events

The events of the TCustomAdapterGotoPageAction class are listed here.

Public Events

	Name	Description
	OnGetPageName (see page 5622)	Provides the display labels for each goto page command.

54.1.49.3.1 TCustomAdapterGotoPageAction.OnGetPageName Event

Provides the display labels for each goto page command.

Pascal

```
property OnGetPageName: TWebFormGetPageNameEvent;
```

C++

```
__property TWebFormGetPageNameEvent OnGetPageName;
```

Description

Implement this event handler to specify display labels for the commands that goto pages in the parent adapter. APageIndex is the zero-based index of the page to goto.

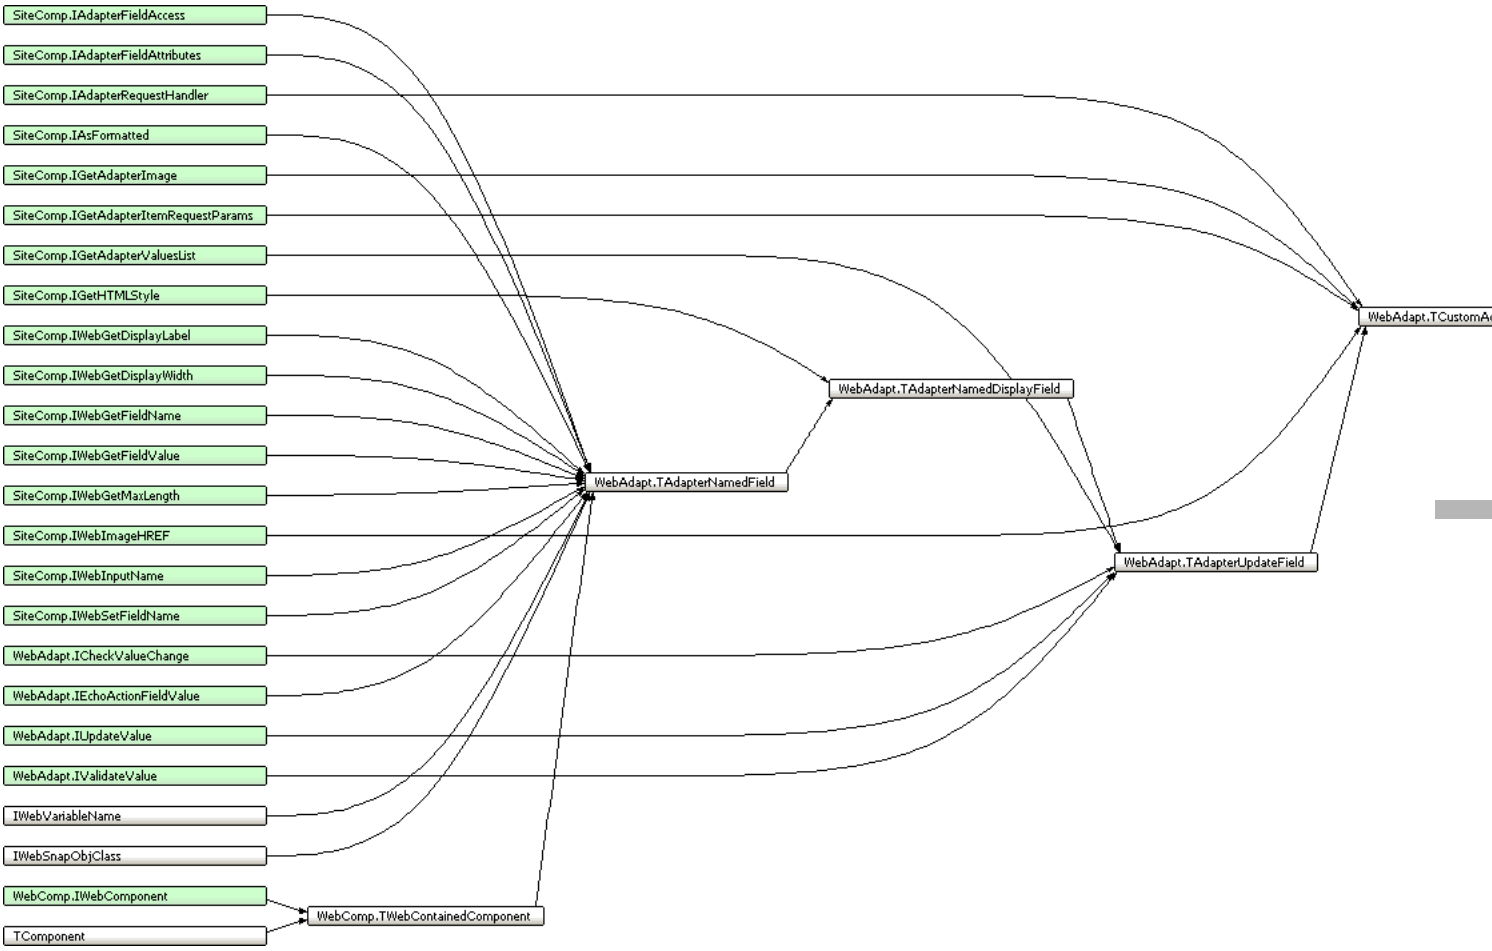
See Also

ImplGetDisplayLabel (see page 5621)

54.1.50 TCustomAdapterImageField Class

TCustomAdapterImageField is a base class for adapter fields that have an associated image file.

Class Hierarchy



Pascal

```
TCustomAdapterImageField = class(TAdapterUpdateField, IGetAdapterImage,
IGetAdapterItemRequestParams, IAdapterRequestHandler, IWebImageHREF);
```

C++

```
class TCustomAdapterImageField : public TAdapterUpdateField, public IGetAdapterImage, public
IGetAdapterItemRequestParams, public IAdapterRequestHandler, public IWebImageHREF;
```

File

WebAdapt

Description

Derived from TCustomAdapterImageField when the adapter field can an associated image file. Typically, a file input HTML element is used to upload an image file. HTML IMG elements are used to display the image.

See Also

TAdapterImageField (see page 5308)

TAdapterFileField (see page 5281)

54.1.50.1 TCustomAdapterImageField Members

The following tables list the members exposed by TCustomAdapterImageField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5424)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
V	ConvertValue (see page 5425)	Retrieves a value entered by the end-user.
V	ConvertValueCount (see page 5425)	Retrieves the number of values entered by the end-user.
V	ConvertValues (see page 5425)	Retrieves a value entered by the end-user.
	CreateRequestContext (see page 5628)	Creates AdapterRequest and AdapterResponse objects.
V	DoOnValidateValue (see page 5628)	Validates files uploaded by the end-user.
V	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetAdapterImage (see page 5629)	Provides an object that can be used to access the image properties of this adapter field.
	GetAdapterItemRequestParams (see page 5629)	Provides a unique identifier and a set of name/value pairs that will be used to create a URL and also be used later when a request is received to generate the adapter field's image file.
	GetAdapterValuesList (see page 5426)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5346)	Returns a string value to suggest an HTML display style for this adapter field.
V	GetDisplayStyleType (see page 5630)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5347)	Returns a string value to suggest an HTML input style for this adapter field.
V	GetInputStyleType (see page 5630)	Suggests an HTML input type for this adapter field.

	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetValueCount (see page 5427)	Provides the number of values associated with this adapter field.
	GetValues (see page 5427)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5348)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5348)	Suggests a view mode for this adapter field.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HandleRequest (see page 5630)	Handles a request for the image file associated with this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 5427)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5631)	Indicates whether the end-user may have uploaded a new image file for this adapter field.
	ImplCreateRequestContext (see page 5631)	Creates AdapterRequest and AdapterResponse objects.
	ImplGetDisplayLabel (see page 5348)	Implements interface access to the DisplayLabel (see page 5350) property.
	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 5428)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5349)	Implements interface access to the DisplayWidth (see page 5350) property.
	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 5428)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 5429)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5349)	Implements interface access to the Required (see page 5351) property.
	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5632)	Returns the name of the image file associated with this adapter field.
	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5429)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHandleRequest (see page 5632)	Handles a request for the image file associated with this adapter field.
	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5429)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5429)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5632)	Updates the adapter field with value entered by the end-user.
	ImplValidateValue (see page 5430)	Validates values(s) entered by the end-user.
	ImplWebImageHREF (see page 5633)	Returns a URL that can be used to access the image file associated with this adapter field.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5430)	Indicates whether this adapter field can support multiple values.
	Notification (see page 5431)	Clears references to a deleted component.
	ParentChanged (see page 5366)	Handles movement of the component to a different parent.

	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	RenderAdapterImage (see page 5633)	Responds to a request for an image file by providing a stream containing the image.
	SetDisplayLabel (see page 5349)	SetDisplayLabel sets the value of the DisplayLabel (see page 5350) property.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	UpdateValue (see page 5431)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5431)	Validates values(s) entered by the end-user.
	WebImageHREF (see page 5634)	Returns a URL that can be used to access the image file associated with this adapter field.

Protected Properties

	Name	Description
	Adapter (see page 5368)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5433)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetHREF (see page 5635)	Provides the URL of an external image file associated with this adapter field.
	OnGetImage (see page 5636)	Retrieves a stream containing the image file associated with this adapter field.
	OnGetImageName (see page 5636)	Returns the name of the image file associated with this adapter field.
	OnGetParams (see page 5636)	Provides name/value pairs that identify this adapter field's image.
	OnUploadFile (see page 5637)	Updates this adapter field with an image file uploaded by the end-user.
	OnValidateFile (see page 5637)	Used to validate files uploaded by the end user.
	OnValidateValue (see page 5433)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5878)	This is CheckValueChange, a member of class ICheckValueChange.
	Create (see page 5346)	Creates an instance of TAdapterNamedDisplayField (see page 5343).
	Create (see page 5423)	Creates an instance of TAdapterUpdateField (see page 5419).
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetAdapterValuesList (see page 1027)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.

	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	UpdateValue (see page 5892)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5893)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5350)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5350)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	HREF (see page 5634)	Defines a URL that references the image associated with the adapter field.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
	ReadOnly (see page 5635)	Indicates whether this adapter field is read-only.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
R	Value (see page 5432)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5432)	Associates a list of values with the adapter field.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.50.2 TCustomAdapterImageField Methods

The methods of the TCustomAdapterImageField class are listed here.

Protected Methods

	Name	Description
	CreateRequestContext (see page 5628)	Creates AdapterRequest and AdapterResponse objects.
V	DoOnValidateValue (see page 5628)	Validates files uploaded by the end-user.
	GetAdapterImage (see page 5629)	Provides an object that can be used to access the image properties of this adapter field.

	GetAdapterItemRequestParams (see page 5629)	Provides a unique identifier and a set of name/value pairs that will be used to create a URL and also be used later when a request is received to generate the adapter field's image file.
V	GetDisplayStyleType (see page 5630)	Suggests an HTML display type for this adapter field.
V	GetInputStyleType (see page 5630)	Suggests an HTML input type for this adapter field.
	HandleRequest (see page 5630)	Handles a request for the image file associated with this adapter field.
V	ImplCheckValueChange (see page 5631)	Indicates whether the end-user may have uploaded a new image file for this adapter field.
	ImplCreateRequestContext (see page 5631)	Creates AdapterRequest and AdapterResponse objects.
V	ImplGetValue (see page 5632)	Returns the name of the image file associated with this adapter field.
V	ImplHandleRequest (see page 5632)	Handles a request for the image file associated with this adapter field.
V	ImplUpdateValue (see page 5632)	Updates the adapter field with value entered by the end-user.
V	ImplWebImageHREF (see page 5633)	Returns a URL that can be used to access the image file associated with this adapter field.
V	RenderAdapterImage (see page 5633)	Responds to a request for an image file by providing a stream containing the image.
	WebImageHREF (see page 5634)	Returns a URL that can be used to access the image file associated with this adapter field.

54.1.50.2.1 TCustomAdapterImageField.CreateRequestContext Method

Creates AdapterRequest and AdapterResponse objects.

Pascal

```
procedure CreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

CreateRequestContext implements IAdapterRequestHandler (see page 1012)'s CreateRequestContext method. CreateRequestContext calls ImplCreateRequestContext (see page 5631).

See Also

IAdapterDispatchParams (see page 987)

IAdapterRequestHandler (see page 1012)

AdapterRequest (see page 5971)

AdapterResponse (see page 5972)

ImplCreateRequestContext (see page 5631)

54.1.50.2.2 TCustomAdapterImageField.DoOnValidateValue Method

Validates files uploaded by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue overrides TAdapterUpdateField (see page 5419)'s DoOnValidateValue method. If the OnValidateFile (see page 5637) event handler is not nil (Delphi) or NULL (C++), DoOnValidateValue calls it to validate an uploaded file. DoOnValidateValues also validates that not more than one image file was uploaded and, if the required property is true, that a

single file was uploaded. An exception is raised to indicate a validation error.

See Also

DoOnValidateValue (see page 5426)

OnValidateValue (see page 5433)

Required (see page 5351)

OnValidateFile (see page 5637)

54.1.50.2.3 TCustomAdapterImageField.GetAdapterImage Method

Provides an object that can be used to access the image properties of this adapter field.

Pascal

```
function GetAdapterImage: TComponent;
```

C++

```
__fastcall TComponent * GetAdapterImage();
```

Description

GetAdapterImage returns Self. GetAdapterImage will be called when server-side script references the Image property of this adapter field.

54.1.50.2.4 TCustomAdapterImageField.GetAdapterItemRequestParams Method

Provides a unique identifier and a set of name/value pairs that will be used to create a URL and also be used later when a request is received to generate the adapter field's image file.

Pascal

```
procedure GetAdapterItemRequestParams(var AIdentifier: string; AParams:
IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(UnicodeString AIdentifier, IAdapterItemRequestParams
AParams);
```

Description

WebImageHREF (see page 5634) and GetAdapterItemRequestParams are used to identify the URL that is used to retrieve the image file associated with this adapter field. These functions are called when server-side script uses the Image.AsHREF property. If WebImageHREF (see page 5634) returns False then GetAdapterItemRequestParams is called. WebImageHREF (see page 5634) is responsible for returning a reference to an external object. GetAdapterItemRequestParams is used to generate a URL that will result in a request to the adapter field to dynamically generate the image file. GetAdapterItemRequestParams calls OnGetParams (see page 5636) to get the name/value pairs.

See Also

IAdapterItemRequestParams (see page 1005)

RenderAdapterImage (see page 5633)

OnGetParams (see page 5636)

WebImageHREF (see page 5634)

TAdapterDispatcher (see page 6148)

54.1.50.2.5 TCustomAdapterImageField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const UnicodeString
AAdapterMode);
```

Description

GetDisplayStyleType overrides TAdapterNamedDisplayField (see page 5343)'s GetDisplayStyleType method. GetDispayStyleType returns htmldImage, indicating that this adapter field should be displayed by an HTML image element.

See Also

GetDisplayStyleType (see page 5347)

54.1.50.2.6 TCustomAdapterImageField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetInputStyleType returns htmliFile indicating that a file upload HTML element should be used to input a value for this adapter field.

See Also

GetInputStyleType (see page 5347)

54.1.50.2.7 TCustomAdapterImageField.HandleRequest Method

Handles a request for the image file associated with this adapter field.

Pascal

```
function HandleRequest(DispatchParams: IAdapterDispatchParams): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

HandleRequest implements IAdapterRequestHandler (see page 1012)'s HandleRequest method. HandleRequest calls ImplHandleRequest (see page 5632).

See Also

IAdapterDispatchParams (see page 987)

ImplHandleRequest (see page 5632)

IAdapterRequestHandler (see page 1012)

54.1.50.2.8 TCustomAdapterImageField.ImplCheckValueChange Method

Indicates whether the end-user may have uploaded a new image file for this adapter field.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
override;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

ImplCheckValueChange overrides TAdapterUpdateField (see page 5419)'s ImplCheckValueChange method. ImplCheckValueChange returns true if the end-user has uploaded an image file.

See Also

IActionRequest

ImplCheckValueChange (see page 5428)

54.1.50.2.9 TCustomAdapterImageField.ImplCreateRequestContext Method

Creates AdapterRequest and AdapterResponse objects.

Pascal

```
procedure ImplCreateRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall ImplCreateRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

ImplCreateRequestContext creates a new request and response objects based on the specified parameters and stores it with the global Web context. The adapter dispatcher calls this function before calling HandleRequest (see page 5630). The WebSnap can access the resulting request and response context by reading the AdapterRequest and AdapterResponse properties of the Web context, which is available through the global WebContext (see page 6003) function.

DispatchParams is an interface that contains the parameters that were included in the incoming request. These parameters can then be used to identify an image for this field's value.

See Also

CreateRequestContext (see page 5628)

AdapterRequest (see page 5971)

AdapterResponse (see page 5972)

IAdapterDispatchParams (see page 987)

WebContext (see page 6003)

54.1.50.2.10 TCustomAdapterImageField.ImplGetValue Method

Returns the name of the image file associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the name of the image file associated with this adapter field

First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the EchoActionFieldValue (see page 5368) property is true, then the file name entered by end-user is returned. If the EchoActionFieldValue (see page 5368) property is false then the OnGetImageName (see page 5636) event handler is called to retrieve the name of the image file. The value returned by ImplGetValue is used when server-side script references the Value (see page 5432) or DisplayText properties.

See Also

OnGetImageName (see page 5636)

EchoActionFieldValue (see page 5368)

54.1.50.2.11 TCustomAdapterImageField.ImplHandleRequest Method

Handles a request for the image file associated with this adapter field.

Pascal

```
function ImplHandleRequest(DispatchParams: IAdapterDispatchParams): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(IAdapterDispatchParams DispatchParams);
```

Description

ImplHandleRequest is called by HandleRequest (see page 5630). ImplHandleRequest extracts IImageRequest and IImageResponse from the AdapterRequest and AdapterResponse. ImplHandleRequest returns the result of RenderAdapterImage (see page 5633).

See Also

IAdapterDispatchParams (see page 987)

AdapterRequest (see page 5971)

AdapterResponse (see page 5972)

RenderAdapterImage (see page 5633)

IImageRequest

54.1.50.2.12 TCustomAdapterImageField.ImplUpdateValue Method

Updates the adapter field with value entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ImplUpdateValue procedure updates the value of this adapter field using the given action request. The AFieldIndex parameter is used to extract the value entered by the user from the action request. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to modify this field, an exception is raised. If action request single file for this adapter field, the OnUploadFile (see page 5637) event handler is called.

See Also

OnUploadFile (see page 5637)

ImplUpdateValue (see page 5430)

54.1.50.2.13 TCustomAdapterImageField.ImplWebImageHREF Method

Returns a URL that can be used to access the image file associated with this adapter field.

Pascal

```
function ImplWebImageHREF(var AHREF: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplWebImageHREF(UnicodeString AHREF);
```

Description

ImplWebImageHREF is called by WebImageHREF (see page 5634). If the OnGetHREF (see page 5635) event handler is not nil (Delphi) or NULL (C++), ImplWebImageHREF will call it passing the value of the HREF (see page 5634) property.

See Also

WebImageHREF (see page 5634)

HREF (see page 5634)

OnGetHREF (see page 5635)

54.1.50.2.14 TCustomAdapterImageField.RenderAdapterImage Method

Responds to a request for an image file by providing a stream containing the image.

Pascal

```
procedure RenderAdapterImage(ARequest: IImageRequest; AResponse: IImageResponse); virtual;
```

C++

```
virtual __fastcall RenderAdapterImage(IImageRequest ARequest, IImageResponse AResponse);
```

Description

RenderAdapterImage is called when the TAdapterDispatcher detects a request for an image from this adapter field. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the OnGetImage (see page 5636) event handler is not nil (Delphi) or NULL (C++), it is called to retrieve the image file as a stream.

See Also

OnGetImage (see page 5636)

TAdapterDispatcher (see page 6148)

ImplHandleRequest (see page 5632)

54.1.50.2.15 TCustomAdapterImageField.WebImageHREF Method

Returns a URL that can be used to access the image file associated with this adapter field.

Pascal

```
function WebImageHREF(var AHREF: string): Boolean;
```

C++

```
__fastcall Boolean WebImageHREF(UnicodeString AHREF);
```

Description

WebImageHREF and GetAdapterItemRequestParams (see page 5629) are used to identify the URL that is used to retrieve an image file associated with this adapter field. These functions are called when server-side script uses the Image.AsHREF property. WebImageHREF returns the result of ImplWebImageHREF (see page 5633).

See Also

ImplWebImageHREF (see page 5633)

GetAdapterItemRequestParams (see page 5629)

54.1.50.3 TCustomAdapterImageField Properties

The properties of the TCustomAdapterImageField class are listed here.

Public Properties

	Name	Description
	HREF (see page 5634)	Defines a URL that references the image associated with the adapter field.
	ReadOnly (see page 5635)	Indicates whether this adapter field is read-only.

54.1.50.3.1 TCustomAdapterImageField.HREF Property

Defines a URL that references the image associated with the adapter field.

Pascal

```
property HREF: string;
```

C++

```
__property UnicodeString HREF;
```

Description

Use the HREF property when this adapter field is associated with an external image file URL. Use the OnGetHREF (see page 5635) event to dynamically define an external image file URL. If the image file will be dynamically generated, use the OnGetImage (see page 5636) and OnGetImageParams event handlers instead of the HREF property or the OnGetHREF (see page 5635) event handler.

See Also

ImplWebImageHREF (see page 5633)

OnGetHREF (see page 5635)

OnGetImage (see page 5636)

OnGetImageName (see page 5636)

54.1.50.3.2 TCustomAdapterImageField.ReadOnly Property

Indicates whether this adapter field is read-only.

Pascal

```
property ReadOnly: Boolean;
```

C++

```
__property Boolean ReadOnly;
```

Description

Set this property to true to indicate that this field should be represented as a read-only field in the HTML form. Set this property to false to indicate that this field should be represented as an editable field in the HTML form. The value of this property affects the value returned by GetViewMode which, in turn, may affect the server-side script generated to represent this adapter field.

See Also

GetViewMode (see page 5348)

54.1.50.4 TCustomAdapterImageField Events

The events of the TCustomAdapterImageField class are listed here.

Public Events

	Name	Description
	OnGetHREF (see page 5635)	Provides the URL of an external image file associated with this adapter field.
	OnGetImage (see page 5636)	Retrieves a stream containing the image file associated with this adapter field.
	OnGetImageName (see page 5636)	Returns the name of the image file associated with this adapter field.
	OnGetParams (see page 5636)	Provides name/value pairs that identify this adapter field's image.
	OnUploadFile (see page 5637)	Updates this adapter field with an image file uploaded by the end-user.
	OnValidateFile (see page 5637)	Used to validate files uploaded by the end user.

54.1.50.4.1 TCustomAdapterImageField.OnGetHREF Event

Provides the URL of an external image file associated with this adapter field.

Pascal

```
property OnGetHREF: TImageFieldGetHREFEvent;
```

C++

```
__property TImageFieldGetHREFEvent OnGetHREF;
```

Description

Implement OnGetHREF to dynamically identify the URL of an external image file associated with this adapter field. When OnGetHREF is called, the HREF (see page 5634) parameter will contain the value of the HREF (see page 5634) property.

To dynamically generate an image file for this adapter file, implement the OnGetImage (see page 5636) event handler instead.

See Also

ImplWebImageHREF (see page 5633)

HREF (see page 5634)

OnGetImage (see page 5636)

54.1.50.4.2 TCustomAdapterImageField.OnGetImage Event

Retrieves a stream containing the image file associated with this adapter field.

Pascal

```
property OnGetImage: TImageFieldGetImageEvent;
```

C++

```
__property TImageFieldGetImageEvent OnGetImage;
```

Description

Implement OnGetImage to dynamically generate an image file associated with this adapter field. Don't implement OnGetImage if the image file is external. Instead implement OnGetHREF (see page 5635) event handler or use the HREF (see page 5634) property to specify the URL of an external image.

See Also

RenderAdapterImage (see page 5633)

OnGetParams (see page 5636)

OnGetHREF (see page 5635)

HREF (see page 5634)

54.1.50.4.3 TCustomAdapterImageField.OnGetImageName Event

Returns the name of the image file associated with this adapter field.

Pascal

```
property OnGetImageName: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetImageName;
```

Description

Implement this event handler to identify the name of the image file associated with this adapter field.

See Also

ImplGetValue (see page 5632)

54.1.50.4.4 TCustomAdapterImageField.OnGetParams Event

Provides name/value pairs that identify this adapter field's image.

Pascal

```
property OnGetParams: TImageFieldGetParamsEvent;
```

C++

```
__property TImageFieldGetParamsEvent OnGetParams;
```

Description

Implement this event handler to provide name/value pairs that are needed to identify this adapter field's image file. OnGetParams is called while generating an HTML page with a URL reference to this adapter field's image. The parameters returned by OnGetParams will be passed to OnGetImage (see page 5636) when the image file is requested.

See Also

GetAdapterItemRequestParams (see page 5629)

OnGetImage (see page 5636)

54.1.50.4.5 TCustomAdapterImageField.OnUploadFile Event

Updates this adapter field with an image file uploaded by the end-user.

Pascal

```
property OnUploadFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnUploadFile;
```

Description

This event handler is called by ImplUpdateValue (see page 5632). This event handler should store the uploaded image file. Raise an exception to indicate an error.

See Also

ImplUpdateValue (see page 5632)

TAbstractWebRequestFile

54.1.50.4.6 TCustomAdapterImageField.OnValidateFile Event

Used to validate files uploaded by the end user.

Pascal

```
property OnValidateFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnValidateFile;
```

Description

Validates the file uploaded by the end-user. Raise an exception to indicate an error. For example, it raises an exception if the Mime type of the file is not supported.

See Also

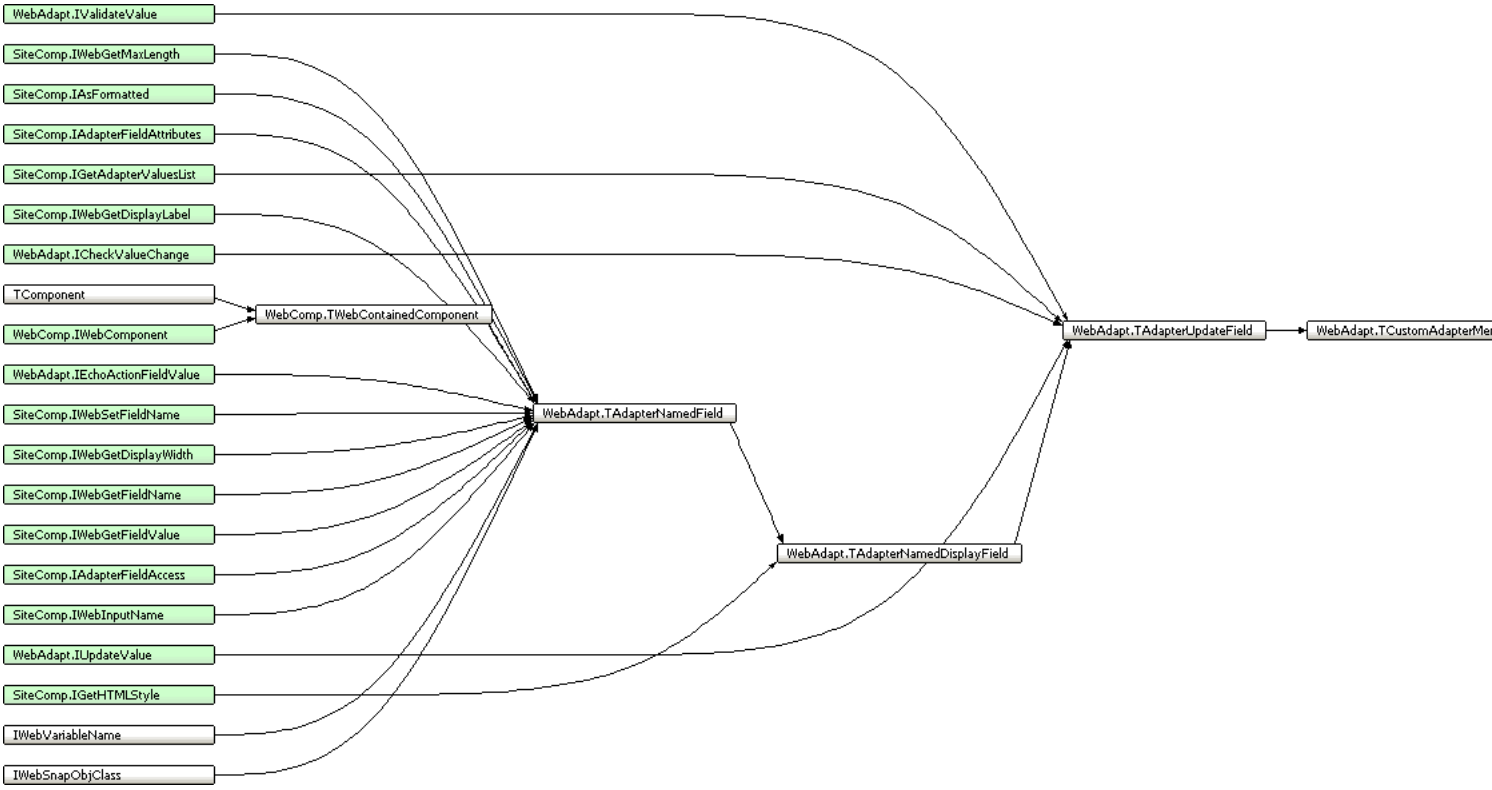
DoOnValidateValue (see page 5628)

TAbstractWebRequestFile

54.1.51 TCustomAdapterMemoField Class

TCustomAdapterMemoField is a base class for adapter fields that have a multi-line text value.

Class Hierarchy



Pascal

```
TCustomAdapterMemoField = class(TAdapterUpdateField);
```

C++

```
class TCustomAdapterMemoField : public TAdapterUpdateField;
```

File

WebAdapt

Description

Derive from TCustomAdapterMemoField when the adapter field has a multi-line text value. Typically, a text area HTML element is used to edit the value of this adapter field.

See Also

TAdapterUpdateField (see page 5419)

TAdapterMemoField (see page 5323)

54.1.51.1 TCustomAdapterMemoField Members

The following tables list the members exposed by TCustomAdapterMemoField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5424)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
	ConvertValue (see page 5425)	Retrieves a value entered by the end-user.
	ConvertValueCount (see page 5425)	Retrieves the number of values entered by the end-user.
	ConvertValues (see page 5425)	Retrieves a value entered by the end-user.
	DoOnValidateValue (see page 5642)	Validates a value entered by the end user.
	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5426)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5346)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 5642)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5347)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 5643)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetValueCount (see page 5427)	Provides the number of values associated with this adapter field.
	GetValues (see page 5427)	Returns one of the values provided by this adapter field.
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5348)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5348)	Suggests a view mode for this adapter field.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
	ImplAsFormatted (see page 5427)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
	ImplCheckValueChange (see page 5643)	Indicates whether the end-user may have entered a new value for this adapter field.
	ImplGetDisplayLabel (see page 5348)	Implements interface access to the DisplayLabel (see page 5350) property.
	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
	ImplGetDisplayLabel (see page 5428)	Gets the preferred display label for this adapter field.
	ImplGetDisplayWidth (see page 5349)	Implements interface access to the DisplayWidth (see page 5350) property.

	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
	ImplGetDisplayWidth (see page 5428)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
	ImplGetEchoActionFieldValue (see page 5429)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	ImplGetRequired (see page 5349)	Implements interface access to the Required (see page 5351) property.
	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
	ImplGetValue (see page 5644)	Returns the value of this adapter field as a variant.
	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
	ImplGetVariableName (see page 5429)	Gets the name used to access this adapter field with server-side script.
	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
	ImplSetEchoActionFieldValue (see page 5429)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
	ImplSetFieldName (see page 5429)	Sets the name used to access this adapter field with server-side script.
	ImplUpdateValue (see page 5644)	Updates the adapter field with value entered by the end-user.
	ImplValidateValue (see page 5430)	Validates values(s) entered by the end-user.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	IsMultiValueField (see page 5430)	Indicates whether this adapter field can support multiple values.
	Notification (see page 5431)	Clears references to a deleted component.
	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5349)	SetDisplayLabel sets the value of the DisplayLabel (see page 5350) property.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	UpdateValue (see page 5431)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5431)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5368)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5433)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValue (see page 5645)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5645)	Called to update the adapter field's value with a text value entered by the end-user.
	OnUploadFile (see page 5645)	Called to update the adapter field's value with a file uploaded by the end-user.
	OnValidateValue (see page 5433)	Event handler called to validate value(s) entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5878)	This is CheckValueChange, a member of class ICheckValueChange.
V	Create (see page 5346)	Creates an instance of TAdapterNamedDisplayField (see page 5343).
V	Create (see page 5423)	Creates an instance of TAdapterUpdateField (see page 5419).
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetAdapterValuesList (see page 1027)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	UpdateValue (see page 5892)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5893)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5350)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5350)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
	ReadOnly (see page 5351)	Indicates whether this adapter field is read-only.

	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
	Value (see page 5369)	Provides the value of an adapter field as a variant.
	Value (see page 5432)	Retrieves the value associated with this adapter field.
	ValuesList (see page 5432)	Associates a list of values with the adapter field.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.51.2 TCustomAdapterMemoField Methods

The methods of the TCustomAdapterMemoField class are listed here.

Protected Methods

	Name	Description
	DoOnValidateValue (see page 5642)	Validates a value entered by the end user.
	GetDisplayStyleType (see page 5642)	Suggests an HTML display type for this adapter field.
	GetInputStyleType (see page 5643)	Suggests an HTML input type for this adapter field.
	ImplCheckValueChange (see page 5643)	Indicates whether the end-user may have entered a new value for this adapter field.
	ImplGetValue (see page 5644)	Returns the value of this adapter field as a variant.
	ImplUpdateValue (see page 5644)	Updates the adapter field with value entered by the end-user.

54.1.51.2.1 TCustomAdapterMemoField.DoOnValidateValue Method

Validates a value entered by the end user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue overrides TAdapterUpdateField (see page 5419)'s DoOnValidateValue method. After calling TAdapterUpdateField (see page 5419)'s DoOnValidateValue, DoOnValidate checks that only a single text file or file has been uploaded for this field. An exception will be raised to indicate a validation error.

See Also

DoOnValidateValue (see page 5426)

Required (see page 5351)

IActionFieldValue

OnValidateFiles (see page 5614)

54.1.51.2.2 TCustomAdapterMemoField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const UnicodeString
AAdapterMode);
```

Description

GetDisplayStyleType overrides TAdapterNamedDisplayField (see page 5343)'s GetDisplayStyleType method. GetDispayStyleType returns htmldText, indicating that this adapter field should be displayed by as an HTML text block.

See Also

GetDisplayStyleType (see page 5347)

TAdapterDisplayHTMLElementType (see page 1123)

54.1.51.2.3 TCustomAdapterMemoField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. GetDispayStyleTypereturns htmliTextArea, indicating that this adapter field's value should be input with an HTML multiline input field.

See Also

GetInputStyleType (see page 5347)

TAdapterInputHTMLElementType (see page 1124)

54.1.51.2.4 TCustomAdapterMemoField.ImplCheckValueChange Method

Indicates whether the end-user may have entered a new value for this adapter field.

Pascal

```
function ImplCheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
override;
```

C++

```
virtual __fastcall Boolean ImplCheckValueChange(IActionRequest AActionRequest, int
AFieldIndex);
```

Description

ImplCheckValueChange overrides TAdapterUpdateField (see page 5419)'s ImplCheckValueChange method. ImplCheckValueChange returns true if the HTTP request has a new value for this adapter field.

See Also

ImplCheckValueChange (see page 5428)

54.1.51.2.5 TCustomAdapterMemoField.ImplGetValue Method

Returns the value of this adapter field as a variant.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue function returns the value of this adapter field as a variant. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to view this field, an exception is raised. If the EchoActionFieldValue (see page 5368) property is true, then the value entered by end-user should is returned. If the EchoActionFieldValue (see page 5368) property is false then the OnGetValue (see page 5645) event handler is called to retrieve the value of the adapter field.

See Also

OnGetValue (see page 5645)

EchoActionFieldValue (see page 5368)

54.1.51.2.6 TCustomAdapterMemoField.ImplUpdateValue Method

Updates the adapter field with value entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

The ImplUpdateValue procedure updates the value of this adapter field using the given action request. The AFieldIndex parameter is used to extract the value entered by the user from the action request. First, the access rights defined for this adapter field are validated against the rights of the end-user. If the end-user does not have rights to modify this field, an exception is raised. If action request contains a string value for this adapter field, the OnUpdateValue (see page 5645) event handler is called. If the action request contains an uploaded file for this adapter field, the OnUploadFile (see page 5645) event handler is called.

See Also

OnUpdateValue (see page 5645)

OnUploadFile (see page 5645)

ImplUpdateValue (see page 5430)

54.1.51.3 TCustomAdapterMemoField Events

The events of the TCustomAdapterMemoField class are listed here.

Public Events

	Name	Description
	OnGetValue (see page 5645)	Called to retrieve the adapter field's value.
	OnUpdateValue (see page 5645)	Called to update the adapter field's value with a text value entered by the end-user.
	OnUploadFile (see page 5645)	Called to update the adapter field's value with a file uploaded by the end-user.

54.1.51.3.1 TCustomAdapterMemoField.OnGetValue Event

Called to retrieve the adapter field's value.

Pascal

```
property OnGetValue: TAdapterFieldGetStringEvent;
```

C++

```
__property TAdapterFieldGetStringEvent OnGetValue;
```

Description

OnGetValue is called by ImplGetValue (see page 5644) to retrieve the value associated with this adapter field.

See Also

ImplGetValue (see page 5644)

54.1.51.3.2 TCustomAdapterMemoField.OnUpdateValue Event

Called to update the adapter field's value with a text value entered by the end-user.

Pascal

```
property OnUpdateValue: TAdapterFieldStringEvent;
```

C++

```
__property TAdapterFieldStringEvent OnUpdateValue;
```

Description

OnUpdateValue is called when an action request contains a value for this adapter field. If this event handler is not implemented, the value entered by the end-user will be ignored.

See Also

ImplUpdateValue (see page 5644)

54.1.51.3.3 TCustomAdapterMemoField.OnUploadFile Event

Called to update the adapter field's value with a file uploaded by the end-user.

Pascal

```
property OnUploadFile: TAdapterFieldFileEvent;
```

C++

```
__property TAdapterFieldFileEvent OnUploadFile;
```

Description

OnUploadFile is called when an action request contains an uploaded file for this adapter field. If this event handler is not implemented, the file uploaded by the end-user will be ignored.

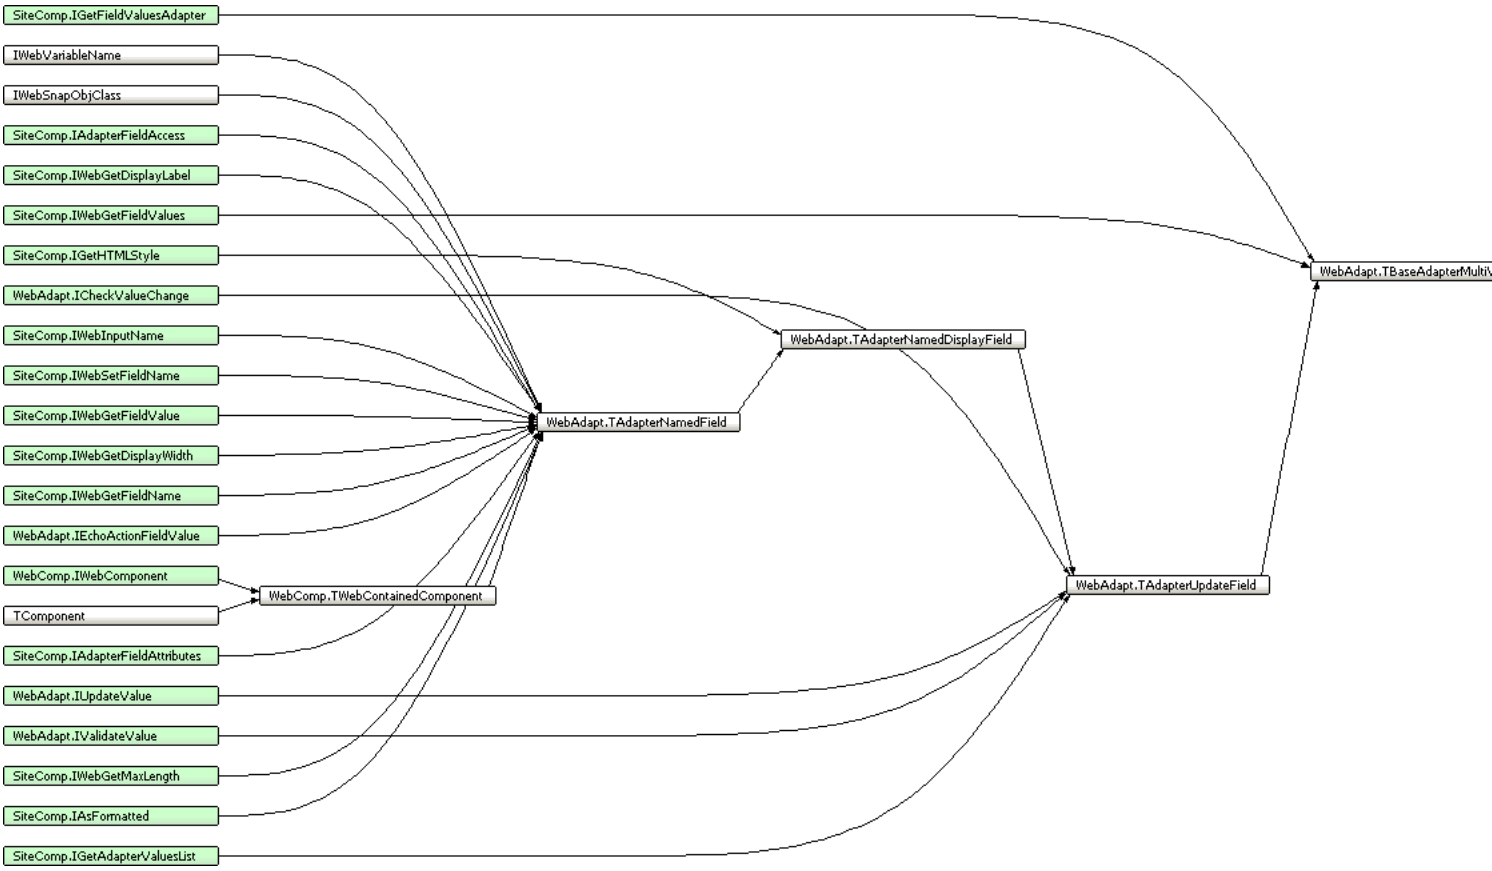
See Also

ImplUpdateValue (see page 5644)

54.1.52 TCustomAdapterMultiValueField Class

TCustomAdapterMultiValueField is a base class for adapter fields that have one or more values.

Class Hierarchy



Pascal

```
TCustomAdapterMultiValueField = class(TBaseAdapterMultiValueField);
```

C++

```
class TCustomAdapterMultiValueField : public TBaseAdapterMultiValueField;
```

File

WebAdapt

Description

Derive from TCustomAdapterMultiValueField when the adapter field can have multiple values. Typically, multi-value fields are represented in HTML with multiple selection select lists or check boxes.

See Also

TBaseAdapterMultiValueField (see page 5488)

TAdapterMultiValueField (see page 5332)

54.1.52.1 TCustomAdapterMultiValueField Members

The following tables list the members exposed by TCustomAdapterMultiValueField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckValueChange (see page 5424)	Checks the value(s) entered by the end-user against the value associated with this adapter field.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
	ConvertValue (see page 5425)	Retrieves a value entered by the end-user.
	ConvertValueCount (see page 5425)	Retrieves the number of values entered by the end-user.
	ConvertValues (see page 5425)	Retrieves a value entered by the end-user.
	DoOnValidateValue (see page 5651)	Validates values entered by the end-user.
	EndValueIterator (see page 5493)	Completes iteration.
	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetAdapterValuesList (see page 5426)	Provides an interface to a component that can be used to generate a list of possible values for this adapter field.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetCurrentValue (see page 5494)	Implements IWebGetFieldValues (see page 1092)' GetCurrentValue.
	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
	GetDefaultFieldName (see page 5357)	Gets the default name used to reference this adapter field with server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayStyle (see page 5346)	Returns a string value to suggest an HTML display style for this adapter field.
	GetDisplayStyleType (see page 5651)	Suggests an HTML display type for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetFieldValuesAdapter (see page 5494)	Returns the adapter object that implements the Values property.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetInputStyle (see page 5347)	Returns a string value to suggest an HTML input style for this adapter field.
	GetInputStyleType (see page 5651)	Suggests an HTML input type for this adapter field.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetValueCount (see page 5652)	Returns the number of values associated with this adapter field.
	GetValues (see page 5652)	Returns one of the values associated with the adapter field.
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetViewMode (see page 5348)	Returns a string value to suggest a view mode for this adapter field.
	GetViewModeType (see page 5348)	Suggests a view mode for this adapter field.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasValue (see page 5495)	Implements IWebGetFieldValues (see page 1092)' HasValue method.

	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
V	ImplAsFormatted (see page 5427)	Returns a string representation of the adapter field's value that is appropriate for a read-only display.
V	ImplCheckValueChange (see page 5428)	Checks the value(s) entered by the end-user against the value(s) associated with this adapter field.
V	ImplGetCurrentValue (see page 5495)	Implements IWebGetFieldValues (see page 1092)' GetCurrentValue (see page 5494) method.
V	ImplGetDisplayLabel (see page 5348)	Implements interface access to the DisplayLabel (see page 5350) property.
V	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayLabel (see page 5428)	Gets the preferred display label for this adapter field.
V	ImplGetDisplayWidth (see page 5349)	Implements interface access to the DisplayWidth (see page 5350) property.
V	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
V	ImplGetDisplayWidth (see page 5428)	Returns the preferred display width for the HTML element used to edit or display this adapter field's value.
V	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
V	ImplGetEchoActionFieldValue (see page 5429)	Gets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplGetFieldValuesAdapter (see page 5496)	Returns the adapter object that implements the Values property.
V	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5349)	Implements interface access to the Required (see page 5351) property.
V	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5363)	Gets the value of this adapter field as a Variant (see page 3421).
V	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVariableName (see page 5429)	Gets the name used to access this adapter field with server-side script.
V	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
V	ImplHasValue (see page 5653)	Implements IWebGetFieldValues (see page 1092)' HasValue (see page 5495) method.
V	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
V	ImplSetEchoActionFieldValue (see page 5429)	Sets a flag that causes the adapter field to return the value(s) entered by the end-user.
V	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
V	ImplSetFieldName (see page 5429)	Sets the name used to access this adapter field with server-side script.
V	ImplUpdateValue (see page 5653)	Updates the adapter field with value(s) entered by the end-user.
V	ImplValidateValue (see page 5430)	Validates values(s) entered by the end-user.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	IsMultiValueField (see page 5430)	Indicates whether this adapter field can support multiple values.
	NextValueIteration (see page 5496)	Implements IWebGetFieldValues (see page 1092)' NextValueIteration method.
V	Notification (see page 5431)	Clears references to a deleted component.
V	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
V	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetDisplayLabel (see page 5349)	SetDisplayLabel sets the value of the DisplayLabel (see page 5350) property.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
V	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartValueIterator (see page 5497)	Implements IWebGetFieldValues (see page 1092)' StartValueIterator method.
	UpdateValue (see page 5431)	Updates the adapter field with value(s) entered by the end-user.
	ValidateValue (see page 5431)	Validates values(s) entered by the end-user.

Protected Properties

	Name	Description
	Adapter (see page 5368)	Returns the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnGetDisplayText (see page 5433)	Event handler called to retrieve a string representation of the adapter field's value.
	OnGetValueCount (see page 5654)	Responsible for returning the count of values associated with the adapter field.
	OnGetValues (see page 5655)	Responsible for returning one of the values associated with the adapter field.
	OnHasValue (see page 5655)	Indicates whether a particular value is associated with this adapter field.
	OnUpdateValues (see page 5656)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateValue (see page 5433)	Event handler called to validate value(s) entered by the end-user.
	OnValidateValues (see page 5656)	Validates field values entered by the end-user.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	CheckValueChange (see page 5878)	This is CheckValueChange, a member of class ICheckValueChange.
	Create (see page 5346)	Creates an instance of TAdapterNamedDisplayField (see page 5343).
	Create (see page 5423)	Creates an instance of TAdapterUpdateField (see page 5419).
	Create (see page 5492)	Constructor for TBaseAdapterMultiValueField (see page 5488).
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	Destroy (see page 5492)	Destructor for TBaseAdapterMultiValueField (see page 5488).
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndValueIterator (see page 1093)	Indicate the iteration is finished.
	GetAdapterValuesList (see page 1027)	This is GetAdapterValuesList, a member of class IGetAdapterValuesList.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetCurrentValue (see page 1094)	Retrieves the current value as a variant.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetFieldValuesAdapter (see page 1031)	This is GetFieldValuesAdapter, a member of class IGetFieldValuesAdapter.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasValue (see page 1094)	Indicates whether the adapter field has a matching value.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	NextValueIteration (see page 1094)	Position the iteration pointer on the next value.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.

	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartValueIterator (see page 1095)	Reset (see page 3643) the iteration pointer to the first item.
	UpdateValue (see page 5892)	This is UpdateValue, a member of class IUpdateValue.
	ValidateValue (see page 5893)	This is ValidateValue, a member of class IValidateValue.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5350)	Suggests a display label for this adapter field.
	DisplayWidth (see page 5350)	Suggests a display width, in characters, for this adapter field.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
	ReadOnly (see page 5351)	Indicates whether this adapter field is read-only.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Required (see page 5351)	Indicates whether the end-user must enter a value for this adapter field.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
R	Value (see page 5432)	Retrieves the value associated with this adapter field.
R	ValueCount (see page 5653)	Returns the number of values associated with this adapter field.
R	Values (see page 5654)	Returns one of the values associated with the adapter field.
	ValuesList (see page 5432)	Associates a list of values with the adapter field.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.52.2 TCustomAdapterMultiValueField Methods

The methods of the TCustomAdapterMultiValueField class are listed here.

Protected Methods

	Name	Description
V	DoOnValidateValue (see page 5651)	Validates values entered by the end-user.
V	GetDisplayStyleType (see page 5651)	Suggests an HTML display type for this adapter field.
V	GetInputStyleType (see page 5651)	Suggests an HTML input type for this adapter field.
V	GetValueCount (see page 5652)	Returns the number of values associated with this adapter field.
V	GetValues (see page 5652)	Returns one of the values associated with the adapter field.
V	ImplHasValue (see page 5653)	Implements IWebGetFieldValues (see page 1092)' HasValue (see page 5495) method.
V	ImplUpdateValue (see page 5653)	Updates the adapter field with value(s) entered by the end-user.

54.1.52.2.1 TCustomAdapterMultiValueField.DoOnValidateValue Method

Validates values entered by the end-user.

Pascal

```
procedure DoOnValidateValue(AValue: IActionFieldValue; var AHandled: Boolean); override;
```

C++

```
virtual __fastcall DoOnValidateValue(IActionFieldValue AValue, Boolean AHandled);
```

Description

DoOnValidateValue overrides TAdapterUpdateField (see page 5419)'s DoOnValidateValue method. If the OnValidateValues (see page 5656) event handler is not nil (Delphi) or NULL (C++), it is called it to validate values. If the Required (see page 5351) property is true, DoOnValidateValues also validates that 1 of more values have been entered by the end user. An exception will be raised to indicate a validation error.

See Also

DoOnValidateValue (see page 5426)

Required (see page 5351)

OnValidateValues (see page 5656)

54.1.52.2.2 TCustomAdapterMultiValueField.GetDisplayStyleType Method

Suggests an HTML display type for this adapter field.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterDisplayHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterDisplayHTMLElementType GetDisplayStyleType(const UnicodeString
AAdapterMode);
```

Description

GetDisplayStyleType returns the display type for an adapter field. Here, it returns htmldList to indicate a list.

See Also

GetDisplayStyleType (see page 5347)

54.1.52.2.3 TCustomAdapterMultiValueField.GetInputStyleType Method

Suggests an HTML input type for this adapter field.

Pascal

```
function GetInputStyleType(const AAdapterMode: string): TAdapterInputHTMLElementType; override;
```

C++

```
virtual __fastcall TAdapterInputHTMLElementType GetInputStyleType(const UnicodeString
AAdapterMode);
```

Description

GetInputStyleType overrides TAdaperNamedDisplayField's GetInputStyleType method. If the ValuesList (see page 5432) property is not nil (Delphi) or NULL (C++), GetInputStyleType returns htmliCheckBox indicating that this adapter field should be

edited using a group of check boxes. If the ValuesList (see page 5432) property is nil (Delphi) or NULL (C++), then htmliTextInput is returned. htmliTextInput indicates that the adapter field value should be edited with a single line input.

See Also

GetInputStyleType (see page 5347)

ValuesList (see page 5432)

54.1.52.2.4 TCustomAdapterMultiValueField.GetValueCount Method

Returns the number of values associated with this adapter field.

Pascal

```
function GetValueCount: Integer; override;
```

C++

```
virtual __fastcall int GetValueCount();
```

Description

GetValueCount implements the ValueCount (see page 5653) property. If the EchoActionFieldValue (see page 5368) flag is true then the result is extracted from the HTTP request. Otherwise, the OnGetValueCount (see page 5654) event is called. GetValueCount returns zero if a value can't be found because OnGetValueCount (see page 5654) is nil (Delphi) or NULL (C++) or the HTTP request does not contain a value for this adapter field.

See Also

ValueCount (see page 5653)

Values (see page 5654)

EchoActionFieldValue (see page 5368)

54.1.52.2.5 TCustomAdapterMultiValueField.GetValues Method

Returns one of the values associated with the adapter field.

Pascal

```
function GetValues(I: Integer): Variant; override;
```

C++

```
virtual __fastcall Variant GetValues(int I);
```

Description

GetValues implements the Values (see page 5654) property. If the EchoActionFieldValue (see page 5368) flag is true then the result is extracted from the HTTP request. Otherwise, the OnGetValues (see page 5655) event is called. GetValues returns Unassigned if a value can't be found because OnGetValues (see page 5655) is nil (Delphi) or NULL (C++) or the HTTP request does not contain a value for this adapter field.

See Also

Values (see page 5654)

OnGetValues (see page 5655)

EchoActionFieldValue (see page 5368)

54.1.52.2.6 TCustomAdapterMultiValueField.ImplHasValue Method

Implements IWebGetFieldValues (see page 1092)' HasValue (see page 5495) method.

Pascal

```
function ImplHasValue(const Value: Variant): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHasValue(const Variant Value);
```

Description

ImplHasValue overrides TBaseAdapterMultiValueField (see page 5488)'s ImplHasValue method. If the OnHasValue (see page 5655) event is not nil (Delphi) or NULL (C++), it will be called for the result of ImplHasValue. Otherwise, ImplHasValue will loop through the values of the adapter field, looking for a matching value.

See Also

ImplHasValue (see page 5496)

HasValue (see page 1094)

54.1.52.2.7 TCustomAdapterMultiValueField.ImplUpdateValue Method

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
procedure ImplUpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer); override;
```

C++

```
virtual __fastcall ImplUpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

ImplUpdateValue overrides TAdapterUpdateField (see page 5419)'s ImplUpdateValue method. After checking that the end-user has rights to modify this adapter field, the OnUpdateValues (see page 5656) event is called.

See Also

OnUpdateValues (see page 5656)

ImplUpdateValue (see page 5430)

54.1.52.3 TCustomAdapterMultiValueField Properties

The properties of the TCustomAdapterMultiValueField class are listed here.

Public Properties

	Name	Description
	ValueCount (see page 5653)	Returns the number of values associated with this adapter field.
	Values (see page 5654)	Returns one of the values associated with the adapter field.

54.1.52.3.1 TCustomAdapterMultiValueField.ValueCount Property

Returns the number of values associated with this adapter field.

Pascal

```
property ValueCount: Integer;
```

C++

```
__property int ValueCount;
```

Description

ValueCount can be used with the Values (see page 5654) property to access all the values associated with this adapter field. ValueCount is implemented by GetValueCount (see page 5652).

See Also

GetValueCount (see page 5652)

Values (see page 5654)

54.1.52.3.2 TCustomAdapterMultiValueField.Values Property

Returns one of the values associated with the adapter field.

Pascal

```
property Values [I: Integer]: Variant;
```

C++

```
__property Variant Values[int I];
```

Description

Values can be used with the ValueCount (see page 5653) property to access all the values associated with this adapter field. Values is implemented by GetValues (see page 5652).

See Also

GetValues (see page 5652)

ValueCount (see page 5653)

54.1.52.4 TCustomAdapterMultiValueField Events

The events of the TCustomAdapterMultiValueField class are listed here.

Public Events

	Name	Description
	OnGetValueCount (see page 5654)	Responsible for returning the count of values associated with the adapter field.
	OnGetValues (see page 5655)	Responsible for returning one of the values associated with the adapter field.
	OnHasValue (see page 5655)	Indicates whether a particular value is associated with this adapter field.
	OnUpdateValues (see page 5656)	Updates the adapter field with value(s) entered by the end-user.
	OnValidateValues (see page 5656)	Validates field values entered by the end-user.

54.1.52.4.1 TCustomAdapterMultiValueField.OnGetValueCount Event

Responsible for returning the count of values associated with the adapter field.

Pascal

```
property OnGetValueCount: TAdapterFieldGetValueCountEvent;
```

C++

```
__property TAdapterFieldGetValueCountEvent OnGetValueCount;
```

Description

Implement this event handler to provide the count of values associated with an adapter field. Also implement OnGetValues (see page 5655) to provide the individual values.

See Also

GetValueCount (see page 5652)

OnGetValues (see page 5655)

54.1.52.4.2 TCustomAdapterMultiValueField.OnGetValues Event

Responsible for returning one of the values associated with the adapter field.

Pascal

```
property OnGetValues: TAdapterFieldGetMultiValueEvent;
```

C++

```
__property TAdapterFieldGetMultiValueEvent OnGetValues;
```

Description

Implement this event handler to provide the values associated with an adapter field. The Index parameter is zero-based. Also implement OnGetValueCount (see page 5654) to provide the count of values associated with this adapter field.

See Also

GetValues (see page 5652)

OnGetValueCount (see page 5654)

54.1.52.4.3 TCustomAdapterMultiValueField.OnHasValue Event

Indicates whether a particular value is associated with this adapter field.

Pascal

```
property OnHasValue: TAdapterFieldHasValueEvent;
```

C++

```
__property TAdapterFieldHasValueEvent OnHasValue;
```

Description

ImplHasValue (see page 5653) calls this event handler. Implement this event handler to lookup a matching value. Implementation of this event handler is optional. If OnHasValue is nil, ImplHasValue (see page 5653) will search for a matching value the Values (see page 5654) and ValueCount (see page 5653) properties.

See Also

ImplHasValue (see page 5653)

ValueCount (see page 5653)

Values (see page 5654)

54.1.52.4.4 TCustomAdapterMultiValueField.OnUpdateValues Event

Updates the adapter field with value(s) entered by the end-user.

Pascal

```
property OnUpdateValues: TAdapterFieldStringsEvent;
```

C++

```
__property TAdapterFieldStringsEvent OnUpdateValues;
```

Description

Implement this event handler to process values entered by the end-user. Raise an exception if an error occurs.

See Also

OnValidateValues (see page 5656)

ImplUpdateValue (see page 5653)

54.1.52.4.5 TCustomAdapterMultiValueField.OnValidateValues Event

Validates field values entered by the end-user.

Pascal

```
property OnValidateValues: TAdapterFieldStringsEvent;
```

C++

```
__property TAdapterFieldStringsEvent OnValidateValues;
```

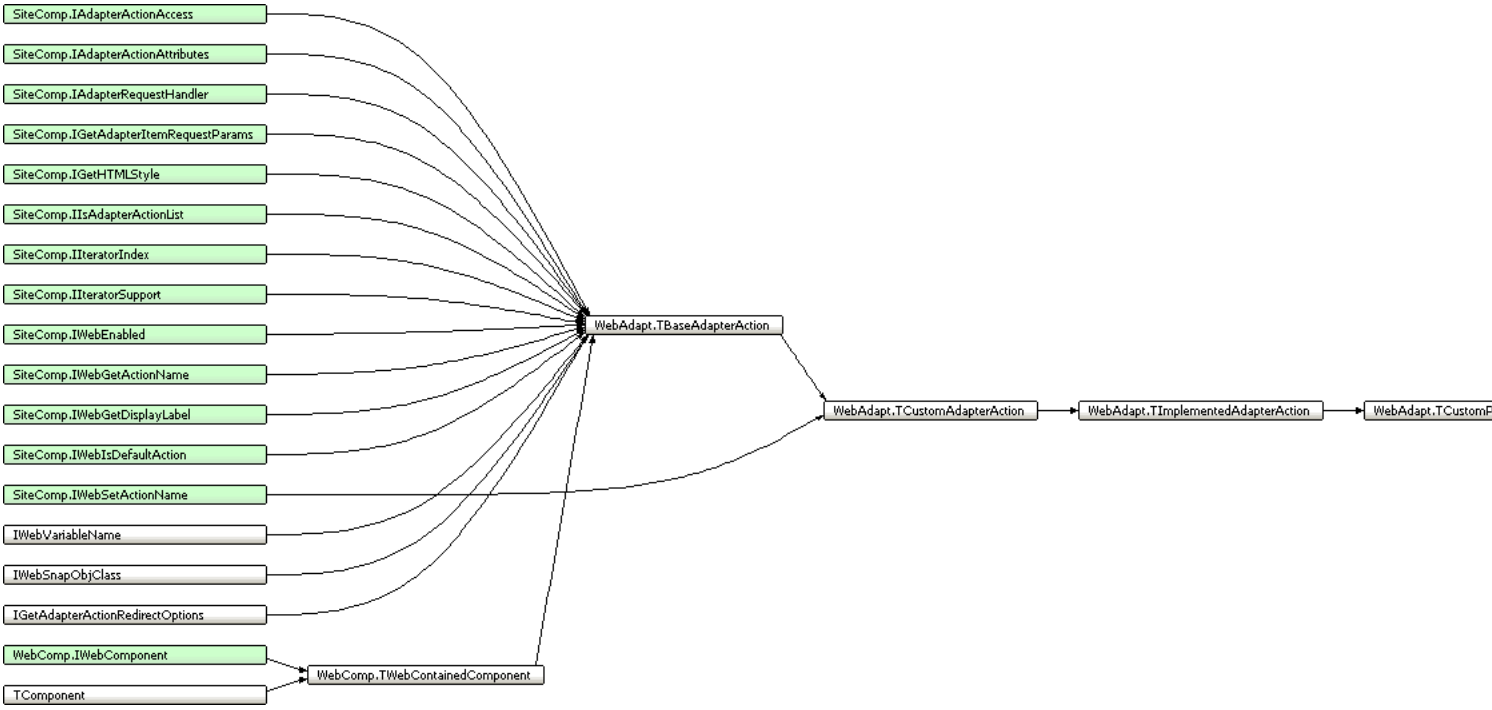
Description

Implement this event handler to validate values entered by the end-user. Raise an exception if an error occurs.

54.1.53 TCustomAdapterPageAction Class

TCustomPagedAdapterAction (see page 5722) is a base class for adapter actions that execute the next or previous page commands.

Class Hierarchy



Pascal

```
TCustomAdapterPageAction = class(TCustomPagedAdapterAction);
```

C++

```
class TCustomAdapterPageAction : public TCustomPagedAdapterAction;
```

File

WebAdapt

Description

TCustomPagedAdapterAction (see page 5722) provide methods that are used by TAdapterNextPageAction (see page 5370) and TAdapterPrevPageAction (see page 5396).

See Also

TDefaultFieldsPagedAdapter (see page 5747)

TCustomPagedAdapterAction (see page 5722)

TAdapterNextPageAction (see page 5370)

TAdapterPrevPageAction (see page 5396)

54.1.53.1 TCustomAdapterPageAction Members

The following tables list the members exposed by TCustomAdapterPageAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 5727)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5456)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5661)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
V	GetNewPage (see page 5661)	Indicates the page to display when this action is executed.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
V	ImplExecuteActionRequest (see page 5662)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5662)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.

	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
	ImplIsDefaultAction (see page 5663)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5663)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5474)	Provides access to the parent adapter component.
	Adapter (see page 5727)	Returns the parent adapter of this adapter action.
	Errors (see page 5475)	Returns the parent adapter's Errors list.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5477)	Called after the adapter action has executed.
	OnAfterExecute (see page 5587)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5477)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 5587)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5478)	Called before the adapter action is executed.
	OnBeforeExecute (see page 5588)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5478)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 5588)	Called before the adapter action response is generated.

	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 5478)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 1087)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5474)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.

	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

54.1.53.2 TCustomAdapterPageAction Methods

The methods of the TCustomAdapterPageAction class are listed here.

Protected Methods

	Name	Description
	GetDisplayStyleType (see page 5661)	Suggests an HTML display type for this adapter action.
	GetNewPage (see page 5661)	Indicates the page to display when this action is executed.
	ImplExecuteActionRequest (see page 5662)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetAdapterItemRequestParams (see page 5662)	Provides the name/value pairs needed to execute this adapter action.
	ImplIsDefaultAction (see page 5663)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplWebEnabled (see page 5663)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

54.1.53.2.1 TCustomAdapterPageAction.GetDisplayStyleType Method

Suggests an HTML display type for this adapter action.

Pascal

```
function GetDisplayStyleType(const AAdapterMode: string): TAdapterActionHTMLElementType;
override;
```

C++

```
virtual __fastcall TAdapterActionHTMLElementType GetDisplayStyleType(const UnicodeString
AAdapterMode);
```

Description

GetDisplayStyleType returns htmlaAnchor, indicating that next page and previous page commands should be displayed using a hyperlink.

See Also

GetDisplayStyle (see page 5457)

54.1.53.2.2 TCustomAdapterPageAction.GetNewPage Method

Indicates the page to display when this action is executed.

Pascal

```
function GetNewPage(var AValue: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetNewPage(int AValue);
```

Description

This is a placeholder. Descendant classes must override this method. true is returned if the action can move to a new page. The AValue parameter identifies the new page. GetNewPage is called by ImplExecuteActionRequest (see page 5662).

See Also

GetNewPage (see page 5375)

GetNewPage (see page 5402)

ImplExecuteActionRequest (see page 5662)

54.1.53.2.3 TCustomAdapterPageAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest is called by ExecuteActionRequest (see page 5455). ImplExecuteActionRequest calls ExtractRequestParams followed by GetNewPage (see page 5661). If GetNewPage (see page 5661) returns true then the parent adapter's current page is changed.

See Also

ExecuteActionRequest (see page 5455)

ExtractRequestParams (see page 5754)

GetNewPage (see page 5661)

CurrentPage (see page 5760)

54.1.53.2.4 TCustomAdapterPageAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(UnicodeString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

ImplGetAdapterItemRequestParams is called by GetAdapterItemRequestParams (see page 5456). ImplGetAdapterItemRequestParams calls the parent adapter's EncodeActionParams method to add the current page as a parameter. Then the inherited ImplGetAdapterItemRequestParams method is called so that any event handlers that may be defined will be called.

See Also

ImplGetAdapterItemRequestParams (see page 5465)

GetAdapterItemRequestParams (see page 5456)

EncodeActionParams (see page 5754)

OnGetActionParams (see page 5579)

OnGetParams (see page 5478)

54.1.53.2.5 TCustomAdapterPageAction.ImplIsDefaultAction Method

Indicates whether this adapter action should be added, by default, to the parent adapter.

Pascal

```
function ImplIsDefaultAction(ADisplay: TObject): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplIsDefaultAction(TObject * ADisplay);
```

Description

ImplIsDefaultAction is called by IsDefaultAction (see page 5471). ImplIsDefaultAction returns true if the display characteristics identified by ADisplay indicate the a previous or next page command is appropriate.

See Also

IsDefaultAction (see page 5471)

ImplIsDefaultAction (see page 5622)

54.1.53.2.6 TCustomAdapterPageAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled is called by WebEnabled (see page 5473). ImplWebEnabled returns the result of GetNewPage (see page 5661).

See Also

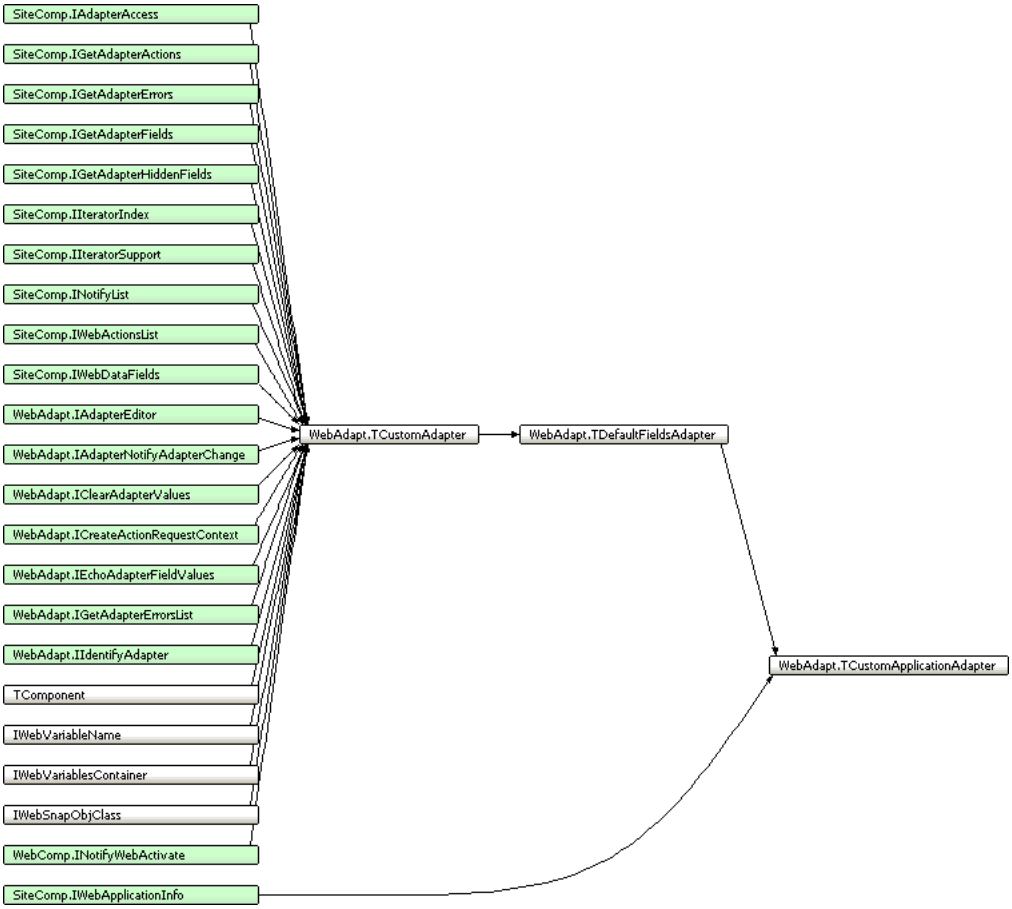
WebEnabled (see page 5473)

GetNewPage (see page 5661)

54.1.54 TCustomApplicationAdapter Class

TCustomApplicationAdapter is a base class for components that implement the server-side script Application object.

Class Hierarchy



Pascal

```
TCustomApplicationAdapter = class(TDefaultFieldsAdapter, IWebApplicationInfo);
```

C++

```
class TCustomApplicationAdapter : public TDefaultFieldsAdapter, public IWebApplicationInfo;
```

File

WebAdapt

Description

TCustomApplicationAdapter implements IWebApplicationInfo (see page 1078). This interface is used to support server-side scripting. TCustomApplicationAdapter automatically adds an adapter field that provides the application title. Additional fields and actions may be added to this adapter. They are accessed as named properties of the server-side script Application object.

54.1.54.1 TCustomApplicationAdapter Members

The following tables list the members exposed by TCustomApplicationAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetApplicationAdapter (see page 5669)	Implements IWebApplicationInfo (see page 1078)'s GetApplicationAdapter method.
	GetApplicationTitle (see page 5669)	Implements IWebApplicationInfo (see page 1078)'s GetApplicationTitle method.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.

	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5669)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5669)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5670)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5670)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 5670)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
V	ImplGetVariable (see page 5556)	Returns an action or field.
V	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
V	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
V	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
V	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
V	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
V	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
V	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
V	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
V	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
V	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
V	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
V	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
V	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
V	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.

	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
V	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
R	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
R	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.

	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.
R	Actions (see page 5746)	Container for adapter actions components.
R	ApplicationAdapter (see page 1080)	Provides access to the adapter that implements the fields and actions of the Application variable in server-side scripts.
	ApplicationTitle (see page 5671)	Defines the title of the application.
R	Data (see page 5572)	Data is the container for adapter field components.
R	Data (see page 5747)	Container for adapter field components.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.54.2 TCustomApplicationAdapter Methods

The methods of the TCustomApplicationAdapter class are listed here.

Protected Methods

	Name	Description
	GetApplicationAdapter (see page 5669)	Implements IWebApplicationInfo (see page 1078)'s GetApplicationAdapter method.
	GetApplicationTitle (see page 5669)	Implements IWebApplicationInfo (see page 1078)'s GetApplicationTitle method.
V	GetWebSnapObjClass (see page 5669)	Returns the class type for this adapter field.
V	ImplCanAddActionClass (see page 5669)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5670)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplGetActionsList (see page 5670)	Provides a list of action types that can be added to this adapter.
V	ImplGetFieldsList (see page 5670)	Provides a list of field types that can be added to this adapter.

54.1.54.2.1 TCustomApplicationAdapter.GetApplicationAdapter Method

Implements IWebApplicationInfo (see page 1078)'s GetApplicationAdapter method.

Pascal

```
function GetApplicationAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetApplicationAdapter();
```

Description

GetApplicationAdapter returns Self.

See Also

GetApplicationAdapter (see page 1079)

54.1.54.2.2 TCustomApplicationAdapter.GetApplicationTitle Method

Implements IWebApplicationInfo (see page 1078)'s GetApplicationTitle method.

Pascal

```
function GetApplicationTitle: string;
```

C++

```
__fastcall UnicodeString GetApplicationTitle();
```

Description

GetApplicationTitle returns the application title that can be accessed with server-side script as the Application.Title property.

See Also

GetApplicationTitle (see page 1080)

54.1.54.2.3 TCustomApplicationAdapter.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; override;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

54.1.54.2.4 TCustomApplicationAdapter.ImplCanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddActionClass allows actions classes that derive from TCustomApplicationAdapterAction (see page 5671) in addition to those allows by TCustomAdapter (see page 5531)'s ImplCanAddActionsClass method.

See Also

ImplCanAddActionClass (see page 5553)

TCustomApplicationAdapterAction (see page 5671)

54.1.54.2.5 TCustomApplicationAdapter.ImplCanAddFieldClass Method

Indicates whether a type of adapter field can be added to this adapter.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass allows field classes that derive from TApplicationAdapterField in addition to those allowed by TCustomAdapter (see page 5531)'s ImplCanAddFieldClass method.

See Also

ImplCanAddFieldClass (see page 5553)

54.1.54.2.6 TCustomApplicationAdapter.ImplGetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

ImplGetActionsList clears the list. There are no default actions.

54.1.54.2.7 TCustomApplicationAdapter.ImplGetFieldsList Method

Provides a list of field types that can be added to this adapter.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetActionsList (see page 5670) lists the title field.

See Also

TAdapterApplicationTitleField (see page 5218)

54.1.54.3 TCustomApplicationAdapter Properties

The properties of the TCustomApplicationAdapter class are listed here.

Public Properties

	Name	Description
	ApplicationTitle (see page 5671)	Defines the title of the application.

54.1.54.3.1 TCustomApplicationAdapter.ApplicationTitle Property

Defines the title of the application.

Pascal

```
property ApplicationTitle: string;
```

C++

```
__property UnicodeString ApplicationTitle;
```

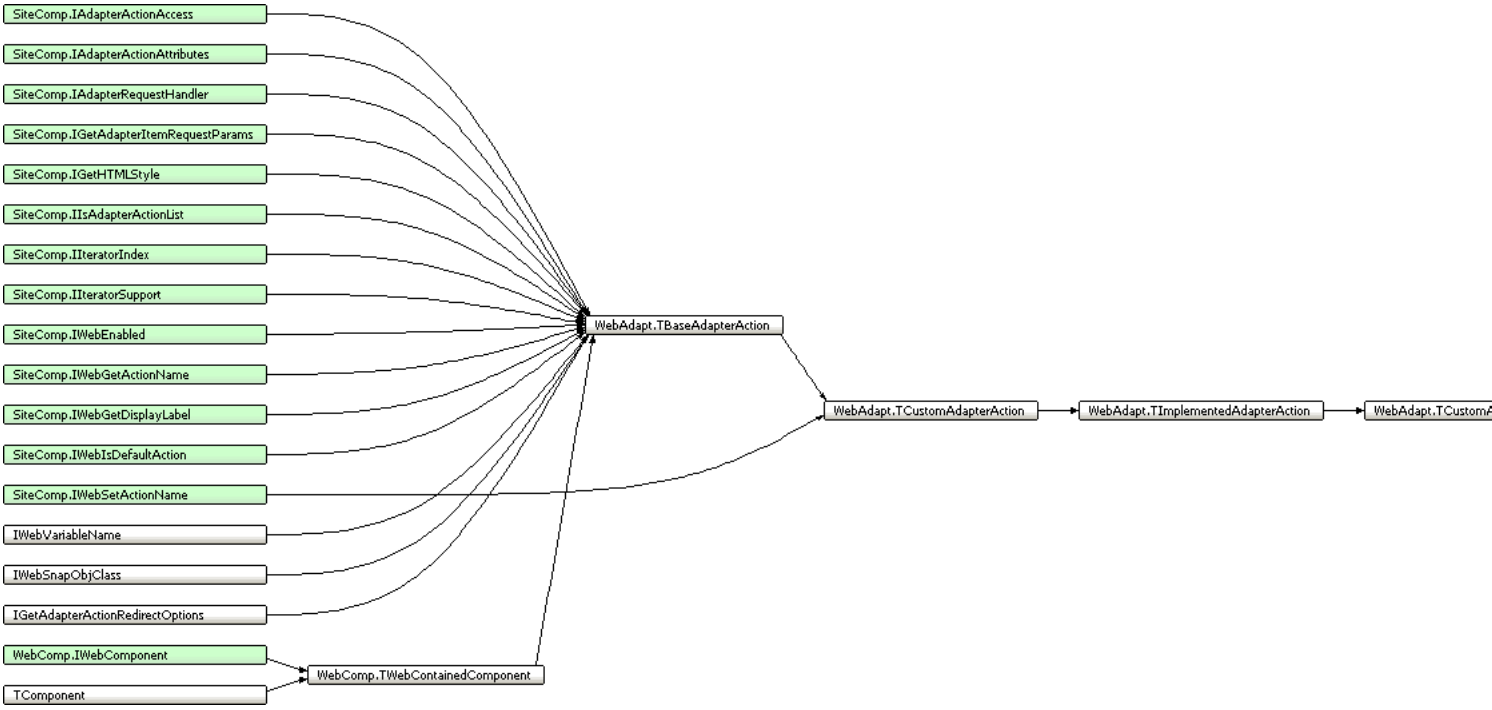
Description

Set this property to identify an application title that can be accessed with server-side script as the Application.Title property.

54.1.55 TCustomApplicationAdapterAction Class

TCustomApplicationAdapterAction is a base class for adapter actions that work with descendants of TCustomApplicationAdapter (see page 5663).

Class Hierarchy



Pascal

```
TCustomApplicationAdapterAction = class(TImplementedAdapterAction);
```

C++

```
class TCustomApplicationAdapterAction : public TImplementedAdapterAction;
```

File

WebAdapt

Description

TCustomApplicationAdapterAction has two purposes. First, it provides a property that is used by descendants to access the parent adapter. Second, it defines a base class that TCustomApplicationAdapter (see page 5663) checks for when determining whether an adapter action can be added as a child.

See Also

TImplementedAdapterAction (see page 5818)

TCustomAdapterAction (see page 5579)

TAdapter (see page 5190)

TApplicationAdapter (see page 5439)

54.1.55.1 TCustomApplicationAdapterAction Members

The following tables list the members exposed by TCustomApplicationAdapterAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5456)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
V	ImplExecuteActionRequest (see page 5464)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplExecuteActionRequest (see page 5584)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5465)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 5584)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.

	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5470)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 5585)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5676)	Returns the parent adapter of this adapter action.
	Errors (see page 5475)	Returns the parent adapter's Errors list.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5477)	Called after the adapter action has executed.
	OnAfterExecute (see page 5587)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5477)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 5587)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5478)	Called before the adapter action is executed.
	OnBeforeExecute (see page 5588)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5478)	Called before the adapter action response is generated.

	OnBeforeGetResponse (see page 5588)	Called before the adapter action response is generated.
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 5478)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 1087)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5474)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.

	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

54.1.55.2 TCustomApplicationAdapterAction Properties

The properties of the TCustomApplicationAdapterAction class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 5676)	Returns the parent adapter of this adapter action.

54.1.55.2.1 TCustomApplicationAdapterAction.Adapter Property

Returns the parent adapter of this adapter action.

Pascal

```
property Adapter: TCustomApplicationAdapter;
```

C++

```
__property TCustomApplicationAdapter Adapter;
```

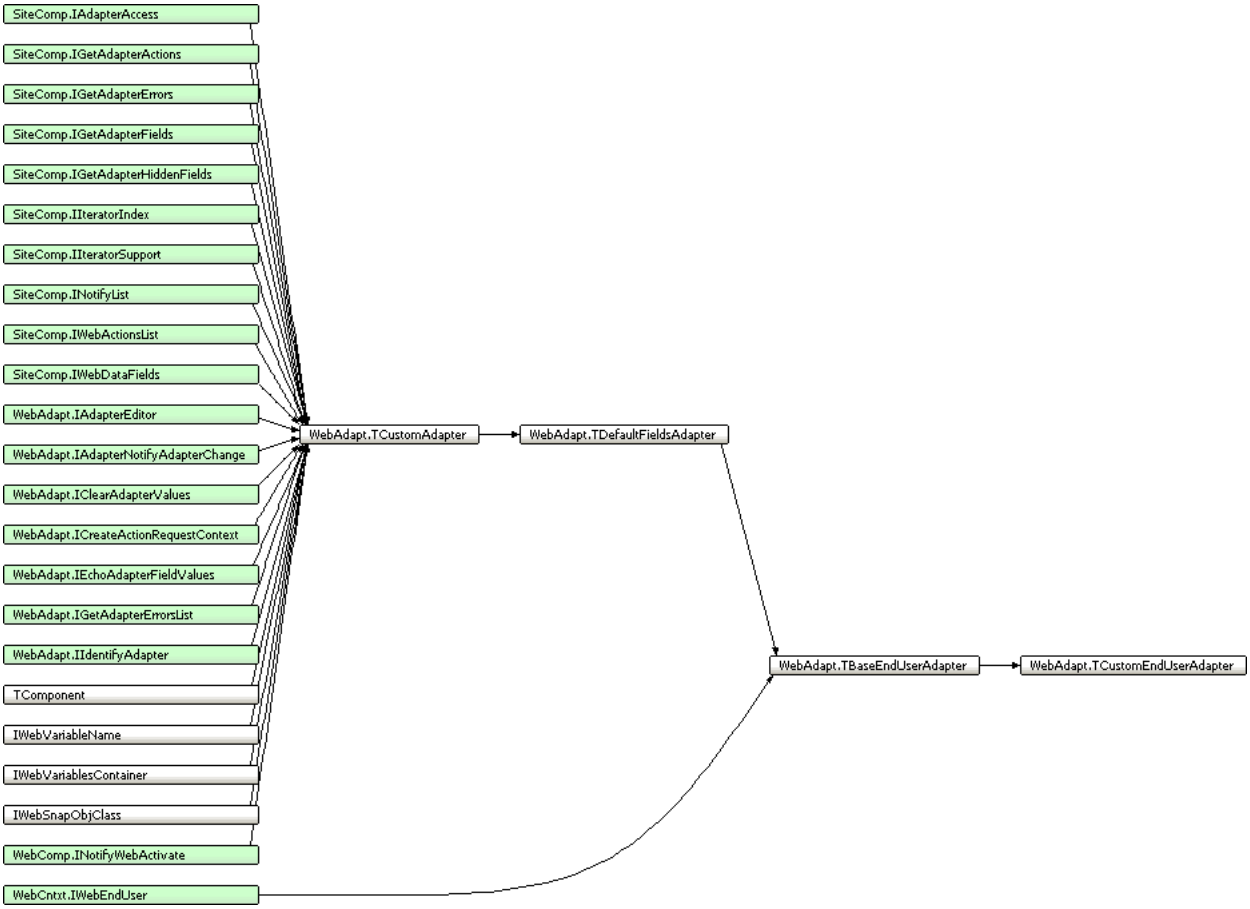
Description

Descendant classes use this property to access the parent adapter.

54.1.56 TCustomEndUserAdapter Class

TCustomEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.

Class Hierarchy



Pascal

```
TCustomEndUserAdapter = class(TBaseEndUserAdapter);
```

C++

```
class TCustomEndUserAdapter : public TBaseEndUserAdapter;
```

File

WebAdapt

Description

TCustomEndUserAdapter is the base class for end user adapters that use event handlers to implement the default adapter fields and actions. It introduces events to provide values for the default end user fields (DisplayName and LoggedIn) and to implement the default end user actions (logging in and logging out).

As with any end user adapter, TCustomEndUserAdapter has a LoginPage (see page 5516) property that lets you specify the page name of the Web page that handles the login process. As an end user adapter, it also handles validation of end user access. When the end user attempts to access a page, the end-user adapter is called to determine whether the end user has rights to access that page.

Do not create instances of TCustomEndUserAdapter. Instead, use a descendant such as the TEndUserAdapter (see page 5764) component, which publishes the events whose handlers you must supply to make this adapter work.

See Also

TEndUserAdapter (see page 5764)

54.1.56.1 TCustomEndUserAdapter Members

The following tables list the members exposed by TCustomEndUserAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 5504)	Determines if there is a static login page.
V	CanExecuteLogout (see page 5504)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 5505)	Determines whether there is a static login page or an automatically produced login page.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	DoOnHasRights (see page 5505)	Determines whether the user has view rights.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExecuteLogin (see page 5683)	Generates an OnLogin (see page 5686) event.
V	ExecuteLoginForm (see page 5506)	Creates the HTML login page.
V	ExecuteLogout (see page 5683)	Generates an OnLogout (see page 5687) event.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.

	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 5506)	Retrieves the display name string.
V	GetDisplayNameValue (see page 5683)	Generates an OnGetDisplayName (see page 5685) event.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 5507)	Gets the end-user adapter.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 5507)	Determines if the user is logged in
V	GetLoggedInValue (see page 5684)	Generates an OnIsLoggedIn (see page 5686) event.
	GetLoginFormAction (see page 5508)	Gets the action component for the login form.
	GetLogoutAction (see page 5508)	Gets the action component for the logout form.
V	GetUserID (see page 5684)	Generates an OnGetUserID (see page 5685) event.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasExecuteRights (see page 5509)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5497).
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasModifyRights (see page 5509)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5497).
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	HasViewRights (see page 5510)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 5497).
V	ImplCanAddActionClass (see page 5510)	Determines if the given action class can be added.
V	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5510)	Determines if the given action class can be added.
V	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5511)	Lists supported end-user adapter actions.
V	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
V	ImplGetDisplayName (see page 5511)	Gets the display name for this TBaseEndUserAdapter (see page 5497).
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetEndUserAdapter (see page 5511)	Returns this TBaseEndUserAdapter (see page 5497).
V	ImplGetFieldsList (see page 5512)	Obtains the list of all of the fields for the end-user adapter.
V	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
V	ImplGetLoggedIn (see page 5512)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 5512)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5497).
V	ImplGetLogoutAction (see page 5513)	Gets the Logout action component for this TBaseEndUserAdapter (see page 5497).

	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 5513)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 5513)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplHasViewRights (see page 5514)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplLogIn (see page 5514)	Processes the login for the given user.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 5514)	Generate the HTML login page.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	LogIn (see page 5515)	Processes the server-side login for the given user.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	ProduceLoginPage (see page 5515)	Generates the login page.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	UserList (see page 5515)	Gets the user list.

	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
R	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
R	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnGetDisplayName (see page 5685)	Occurs when the adapter needs to provide the name of the current end user.
	OnGetUserID (see page 5685)	Occurs when the adapter needs to provide the ID of the current end user.
	OnHasRights (see page 5516)	Determines if the user rights match the rights being queried.
	OnIsLoggedIn (see page 5686)	Occurs when the adapter needs to indicate whether the current end user has logged in.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.
	OnLogin (see page 5686)	Logs in the current end user.
	OnLogout (see page 5687)	Occurs when the current user logs out.
	OnProduceLoginPage (see page 5516)	Allows implementation of a customized login page.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetDisplayName (see page 5989)	Returns the value of the DisplayName (see page 5994) property.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEndUserAdapter (see page 5990)	Returns the value of the EndUserAdapter (see page 5994) property.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.

	GetLoggedIn (see page 5990)	Returns the value of the LoggedIn (see page 5994) property.
	GetLoginFormAction (see page 5990)	Returns the value of the LoginFormAction (see page 5995) property.
	GetLogoutAction (see page 5991)	Returns the value of the LogoutAction (see page 5996) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasExecuteRights (see page 5991)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasModifyRights (see page 5992)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	HasViewRights (see page 5992)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	LogIn (see page 5993)	Logs in a specified user.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	ProduceLoginPage (see page 5993)	Generates the Web page for logging in users.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.
R	Actions (see page 5746)	Container for adapter actions components.
R	Data (see page 5572)	Data is the container for adapter field components.
R	Data (see page 5747)	Container for adapter field components.
R	DisplayName (see page 5994)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 5994)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
R	LoggedIn (see page 5994)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 5995)	Indicates the action component for the login form.
	LoginPage (see page 5516)	Specifies the name of the page that acts as the login page.
R	LogoutAction (see page 5996)	Indicates the action component for logging a user out.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.56.2 TCustomEndUserAdapter Methods

The methods of the TCustomEndUserAdapter class are listed here.

Protected Methods

	Name	Description
	ExecuteLogin (see page 5683)	Generates an OnLogin (see page 5686) event.
	ExecuteLogout (see page 5683)	Generates an OnLogout (see page 5687) event.
	GetDisplayNameValue (see page 5683)	Generates an OnGetDisplayName (see page 5685) event.
	GetLoggedInValue (see page 5684)	Generates an OnIsLoggedIn (see page 5686) event.
	GetUserID (see page 5684)	Generates an OnGetUserID (see page 5685) event.

54.1.56.2.1 TCustomEndUserAdapter.ExecuteLogin Method

Generates an OnLogin (see page 5686) event.

Pascal

```
procedure ExecuteLogin(AUserID: Variant); override;
```

C++

```
virtual __fastcall ExecuteLogin(Variant AUserID);
```

Description

ExecuteLogin is the implementation of the LogIn (see page 5515) action. When a server-side script executes the login action, it generates a call to ExecuteLogin to start the login process. TCustomEndUserAdapter (see page 5676) responds by generating an OnLogin (see page 5686) event, where you can take whatever action is necessary to log in the specified user.

AUserID is the user ID of the user to log in.

See Also

OnLogin (see page 5686)

54.1.56.2.2 TCustomEndUserAdapter.ExecuteLogout Method

Generates an OnLogout (see page 5687) event.

Pascal

```
procedure ExecuteLogout; override;
```

C++

```
virtual __fastcall ExecuteLogout();
```

Description

ExecuteLogout is the implementation of the Logout action. When a server-side script executes the logout action, it generates a call to ExecuteLogout. TCustomEndUserAdapter (see page 5676) responds by generating an OnLogout (see page 5687) event, where you can take whatever action is necessary to log the specified user out.

See Also

OnLogout (see page 5687)

54.1.56.2.3 TCustomEndUserAdapter.GetDisplayNameValue Method

Generates an OnGetDisplayName (see page 5685) event.

Pascal

```
function GetDisplayNameValue: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayNameValue();
```

Description

GetDisplayNameValue is the implementation of the DisplayName adapter field. When a server-side script references the display name of the current user, it generates a call to GetDisplayNameValue. TCustomEndUserAdapter (see page 5676) responds by generating an OnGetDisplayName (see page 5685) event, where you can take supply the name of the current user.

GetDisplayNameValue returns the display name that the OnGetDisplayName (see page 5685) event handler provides. If you do not supply an OnGetDisplayName (see page 5685) event handler, GetDisplayNameValue returns an empty string.

See Also

OnGetDisplayName (see page 5685)

54.1.56.2.4 TCustomEndUserAdapter.GetLoggedInValue Method

Generates an OnIsLoggedIn (see page 5686) event.

Pascal

```
function GetLoggedInValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetLoggedInValue();
```

Description

GetLoggedInValue is the implementation of the LoggedIn adapter field. When a server-side script references the LoggedIn field for the current user, it generates a call to GetLoggedInValue. TCustomEndUserAdapter (see page 5676) responds by generating an OnIsLoggedIn (see page 5686) event, where you can indicate whether the current user has logged in.

GetLoggedInValue returns the value that the OnGetLoggedIn event handler provides. If you do not supply an OnGetLoggedIn event handler, GetLoggedInValue returns false.

See Also

OnIsLoggedIn (see page 5686)

54.1.56.2.5 TCustomEndUserAdapter.GetUserID Method

Generates an OnGetUserID (see page 5685) event.

Pascal

```
function GetUserID: Variant; override;
```

C++

```
virtual __fastcall Variant GetUserID();
```

Description

GetUserIDValue is the implementation of the UserID adapter field. When a server-side script references the user ID of the current user, it generates a call to GetUserIDValue. TCustomEndUserAdapter (see page 5676) responds by generating an OnGetUserID (see page 5685) event, where you can take supply the ID of the current user.

GetUserIDValue returns the user ID that the OnGetUserID (see page 5685) event handler provides. If you do not supply an OnGetUserID (see page 5685) event handler, GetUserIDValue returns an unassigned Variant (see page 3421).

See Also

OnGetUserID (see page 5685)

54.1.56.3 TCustomEndUserAdapter Events

The events of the TCustomEndUserAdapter class are listed here.

Public Events

	Name	Description
	OnGetDisplayName (see page 5685)	Occurs when the adapter needs to provide the name of the current end user.
	OnGetUserID (see page 5685)	Occurs when the adapter needs to provide the ID of the current end user.
	OnIsLoggedIn (see page 5686)	Occurs when the adapter needs to indicate whether the current end user has logged in.
	OnLogin (see page 5686)	Logs in the current end user.
	OnLogout (see page 5687)	Occurs when the current user logs out.

54.1.56.3.1 TCustomEndUserAdapter.OnGetDisplayName Event

Occurs when the adapter needs to provide the name of the current end user.

Pascal

```
property OnGetDisplayName: TEndUserGetNameEvent;
```

C++

```
__property TEndUserGetNameEvent OnGetDisplayName;
```

Description

Write (see page 3707) an OnGetDisplayName event handler to provide the value of the DisplayName field. When a server-side script (or a caller of the IWebEndUser (see page 5988) interface) requests the display name for the current end user, TCustomEndUserAdapter (see page 5676) generates an OnGetDisplayName event to retrieve that value.

Note: If you do not supply an OnGetDisplayName event handler, TCustomEndUserAdapter (see page 5676) always returns an empty string as the display name for the current end user.

See Also

DisplayName (see page 5994)

EndUser (see page 5973)

WebContext (see page 6003)

54.1.56.3.2 TCustomEndUserAdapter.OnGetUserID Event

Occurs when the adapter needs to provide the ID of the current end user.

Pascal

```
property OnGetUserID: TEndUserGetUserIDEvent;
```

C++

```
__property TEndUserGetUserIDEvent OnGetUserID;
```

Description

Write (see page 3707) an OnGetDisplayName (see page 5685) event handler to provide the user ID for the current user.

When a server-side script requests ID for the current end user, TCustomEndUserAdapter (see page 5676) generates an OnGetUserID event to retrieve that value.

Note: If you do not supply an OnGetUserID event handler, TCustomEndUserAdapter (see page 5676) always returns an unassigned Variant (see page 3421) as the user ID.

See Also

GetDisplayNameValue (see page 5683)

TWebUserList (see page 6796)

OnLogin (see page 5686)

54.1.56.3.3 TCustomEndUserAdapter.OnIsLoggedIn Event

Occurs when the adapter needs to indicate whether the current end user has logged in.

Pascal

```
property OnIsLoggedIn: TEndUserIsLoggedInEvent;
```

C++

```
__property TEndUserIsLoggedInEvent OnIsLoggedIn;
```

Description

Write (see page 3707) an OnIsLoggedIn event handler to provide the value of the LoggedIn field. When a server-side script (or a caller of the IWebEndUser (see page 5988) interface) inquires whether the current user has logged in, TCustomEndUserAdapter (see page 5676) generates an OnIsLoggedIn event to retrieve that information.

Note: If you do not supply an OnIsLoggedIn event handler, TCustomEndUserAdapter (see page 5676) always returns false, indicating that the current end user has not logged in.

See Also

LoggedIn (see page 5994)

EndUser (see page 5973)

WebContext (see page 6003)

OnLogin (see page 5686)

OnLogout (see page 5687)

54.1.56.3.4 TCustomEndUserAdapter.OnLogin Event

Logs in the current end user.

Pascal

```
property OnLogin: TEndUserUserIDEvent;
```

C++

```
__property TEndUserUserIDEvent OnLogin;
```

Description

Write (see page 3707) an OnLogin event handler to allow the TCustomEndUserAdapter (see page 5676) object to log users in. When a server-side script (or a caller of the IWebEndUser (see page 5988) interface) attempts to log in a user, TCustomEndUserAdapter (see page 5676) generates an OnLogin event to perform whatever steps are involved in the login process.

Note: If you do not supply an OnLogin event handler, TCustomEndUserAdapter (see page 5676) does nothing to log users in.

See Also

LogIn (see page 5993)

EndUser (see page 5973)

WebContext (see page 6003)

OnIsLoggedIn (see page 5686)

OnLogout (see page 5687)

TWebUserList (see page 6796)

OnGetUserID (see page 5685)

54.1.56.3.5 TCustomEndUserAdapter.OnLogout Event

Occurs when the current user logs out.

Pascal

```
property OnLogout: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnLogout;
```

Description

Write (see page 3707) an OnLogout event handler to allow the TCustomEndUserAdapter (see page 5676) object to log users out. When a server-side script attempts to log a user out, TCustomEndUserAdapter (see page 5676) generates an OnLogout event to perform whatever steps are involved in the logout process.

Note: If you do not supply an OnLogin (see page 5686) event handler, TCustomEndUserAdapter (see page 5676) does nothing to log users out.

See Also

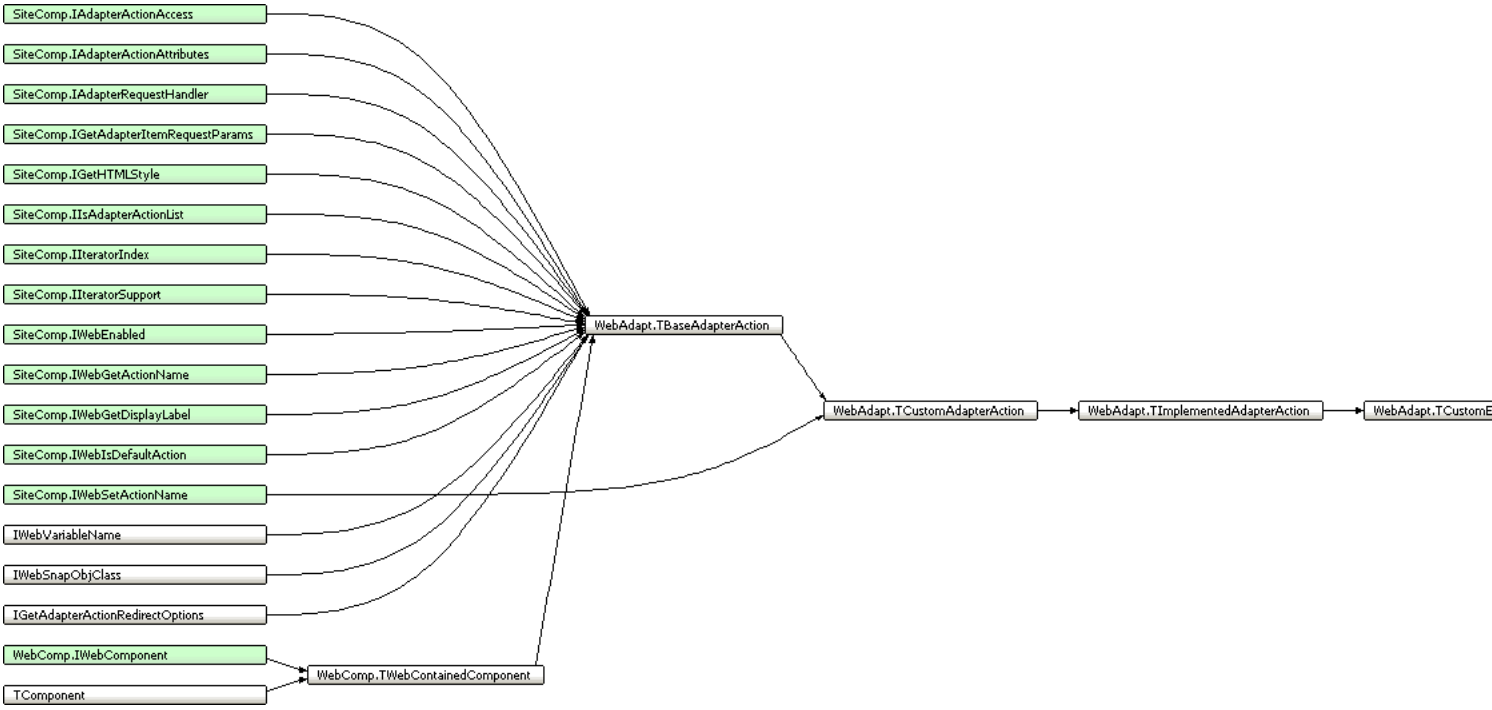
OnIsLoggedIn (see page 5686)

OnLogin (see page 5686)

54.1.57 TCustomEndUserAdapterAction Class

TCustomEndUserAdapterAction is a base class for adapter actions that work with descendants of TCustomEndUserAdapter (see page 5676).

Class Hierarchy



Pascal

```
TCustomEndUserAdapterAction = class(TImplementedAdapterAction);
```

C++

```
class TCustomEndUserAdapterAction : public TImplementedAdapterAction;
```

File

WebAdapt

Description

TCustomEndUserAdapterAction has two purposes. First, it provides a property that descendants use to access the parent adapter. Second, it defines a base class that TCustomEndUserAdapter (see page 5676) checks for when determining whether an adapter action can be added as a child.

54.1.57.1 TCustomEndUserAdapterAction Members

The following tables list the members exposed by TCustomEndUserAdapterAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.

	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetDefaultActionName (see page 5456)	Gets the default name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
	ImplExecuteActionRequest (see page 5464)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 5584)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 5465)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 5584)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.

	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5470)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 5585)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5692)	Returns the parent adapter of this adapter action.
	Errors (see page 5475)	Returns the parent adapter's Errors list.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5477)	Called after the adapter action has executed.
	OnAfterExecute (see page 5587)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5477)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 5587)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5478)	Called before the adapter action is executed.
	OnBeforeExecute (see page 5588)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5478)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 5588)	Called before the adapter action response is generated.
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 5478)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).

	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 1087)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5474)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

54.1.57.2 TCustomEndUserAdapterAction Properties

The properties of the TCustomEndUserAdapterAction class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 5692)	Returns the parent adapter of this adapter action.

54.1.57.2.1 TCustomEndUserAdapterAction.Adapter Property

Returns the parent adapter of this adapter action.

Pascal

```
property Adapter: TBaseEndUserAdapter;
```

C++

```
__property TBaseEndUserAdapter Adapter;
```

Description

Descendant classes use this property to access the parent adapter.

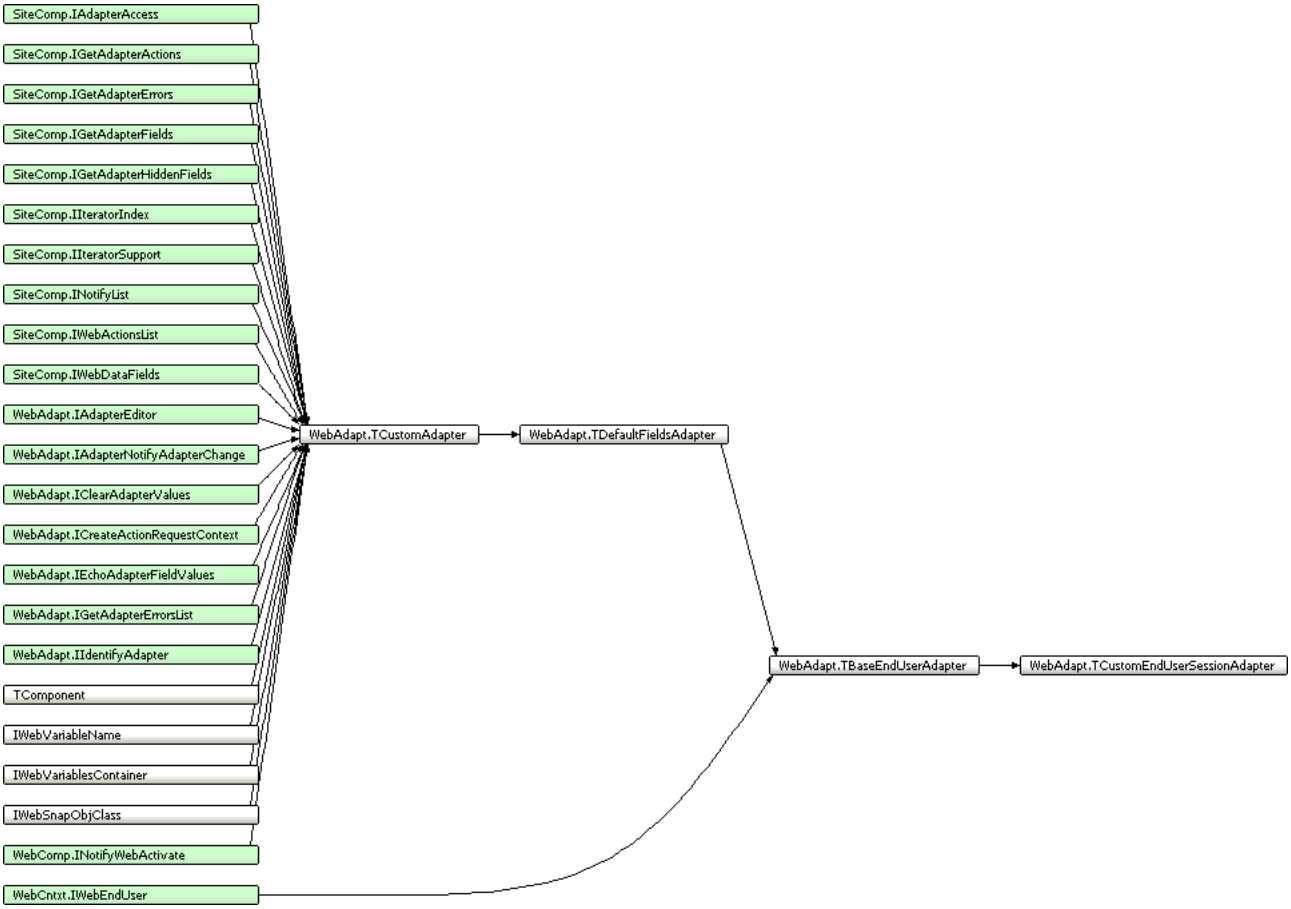
See Also

TCustomEndUserAdapter (see page 5676)

54.1.58 TCustomEndUserSessionAdapter Class

TCustomEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.

Class Hierarchy



Pascal

```
TCustomEndUserSessionAdapter = class(TBaseEndUserAdapter);
```

C++

```
class TCustomEndUserSessionAdapter : public TBaseEndUserAdapter;
```

File

WebAdapt

Description

TCustomEndUserSessionAdapter is the base class for end user adapters that use a TSessionsService object to implement the default adapter fields and actions. It handles login and logout actions on behalf of the end user, and uses the TSessionsService component to store information about the current end user. The WebSnap application must contain a TSessionsService component (or equivalent) in order for the TCustomEndUserSessionAdapter to work properly.

As with any end user adapter, TCustomEndUserSessionAdapter has a LoginPage (see page 5516) property that lets you specify the page name of the Web page that handles the login process. As an end user adapter, it also handles validation of end user access. When the end user attempts to access a page, the end-user adapter is called to determine whether the end user has rights to access that page.

See Also

TEndUserSessionAdapter (see page 5792)

TSessionsService (see page 6756)

54.1.58.1 TCustomEndUserSessionAdapter Members

The following tables list the members exposed by TCustomEndUserSessionAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 5504)	Determines if there is a static login page.
V	CanExecuteLogout (see page 5504)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 5505)	Determines whether there is a static login page or an automatically produced login page.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	DoOnHasRights (see page 5505)	Determines whether the user has view rights.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExecuteLogin (see page 5699)	Logs in an end user.
V	ExecuteLoginForm (see page 5506)	Creates the HTML login page.
V	ExecuteLogout (see page 5699)	Logs out the current user.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.

	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 5506)	Retrieves the display name string.
V	GetDisplayNameValue (see page 5699)	Returns the name of the current end user.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 5507)	Gets the end-user adapter.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 5507)	Determines if the user is logged in
V	GetLoggedInValue (see page 5700)	Indicates whether the current end user has logged in.
	GetLoginFormAction (see page 5508)	Gets the action component for the login form.
	GetLogoutAction (see page 5508)	Gets the action component for the logout form.
V	GetUserID (see page 5700)	Returns the user ID of the current user.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasExecuteRights (see page 5509)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5497).
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasModifyRights (see page 5509)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5497).
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	HasViewRights (see page 5510)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 5497).
V	ImplCanAddActionClass (see page 5510)	Determines if the given action class can be added.
V	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5510)	Determines if the given action class can be added.
V	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5511)	Lists supported end-user adapter actions.
V	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
V	ImplGetDisplayName (see page 5511)	Gets the display name for this TBaseEndUserAdapter (see page 5497).
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetEndUserAdapter (see page 5511)	Returns this TBaseEndUserAdapter (see page 5497).
V	ImplGetFieldsList (see page 5512)	Obtains the list of all of the fields for the end-user adapter.
V	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
V	ImplGetLoggedIn (see page 5512)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 5512)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5497).

	ImplGetLogoutAction (see page 5513)	Gets the Logout action component for this TBaseEndUserAdapter (see page 5497).
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 5513)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 5513)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplHasViewRights (see page 5514)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplLogIn (see page 5514)	Processes the login for the given user.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 5514)	Generate the HTML login page.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	LogIn (see page 5515)	Processes the server-side login for the given user.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	ProduceLoginPage (see page 5515)	Generates the login page.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.

	UserList (see page 5515)	Gets the user list.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
R	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
R	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnHasRights (see page 5516)	Determines if the user rights match the rights being queried.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.
	OnProduceLoginPage (see page 5516)	Allows implementation of a customized login page.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetDisplayName (see page 5989)	Returns the value of the DisplayName (see page 5994) property.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEndUserAdapter (see page 5990)	Returns the value of the EndUserAdapter (see page 5994) property.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetLoggedIn (see page 5990)	Returns the value of the LoggedIn (see page 5994) property.
	GetLoginFormAction (see page 5990)	Returns the value of the LoginFormAction (see page 5995) property.
	GetLogoutAction (see page 5991)	Returns the value of the LogoutAction (see page 5996) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.

	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasExecuteRights (see page 5991)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasModifyRights (see page 5992)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	HasViewRights (see page 5992)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	LogIn (see page 5993)	Logs in a specified user.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	ProduceLoginPage (see page 5993)	Generates the Web page for logging in users.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.
R	Actions (see page 5746)	Container for adapter actions components.
R	Data (see page 5572)	Data is the container for adapter field components.
R	Data (see page 5747)	Container for adapter field components.
R	DisplayName (see page 5994)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 5994)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
R	LoggedIn (see page 5994)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 5995)	Indicates the action component for the login form.
	LoginPage (see page 5516)	Specifies the name of the page that acts as the login page.
R	LogoutAction (see page 5996)	Indicates the action component for logging a user out.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	UserID (see page 5701)	Specifies the user ID of the current end user.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.58.2 TCustomEndUserSessionAdapter Methods

The methods of the TCustomEndUserSessionAdapter class are listed here.

Protected Methods

	Name	Description
V	ExecuteLogin (see page 5699)	Logs in an end user.

	ExecuteLogout (see page 5699)	Logs out the current user.
	GetDisplayNameValue (see page 5699)	Returns the name of the current end user.
	GetLoggedInValue (see page 5700)	Indicates whether the current end user has logged in.
	GetUserID (see page 5700)	Returns the user ID of the current user.

54.1.58.2.1 TCustomEndUserSessionAdapter.ExecuteLogin Method

Logs in an end user.

Pascal

```
procedure ExecuteLogin(AUserID: Variant); override;
```

C++

```
virtual __fastcall ExecuteLogin(Variant AUserID);
```

Description

ExecuteLogin is the implementation of the LogIn (see page 5515) action. When a server-side script executes the login action, it generates a call to ExecuteLogin to start the login process.

In TCustomEndUserAdapter (see page 5676), ExecuteLogin assigns the supplied user ID to the UserID (see page 5701) property, which saves the current user ID with the current session.

AUserID is the user ID of the user to log in.

54.1.58.2.2 TCustomEndUserSessionAdapter.ExecuteLogout Method

Logs out the current user.

Pascal

```
procedure ExecuteLogout; override;
```

C++

```
virtual __fastcall ExecuteLogout();
```

Description

ExecuteLogout is the implementation of the Logout action. When a server-side script executes the logout action, it generates a call to ExecuteLogout.

In TCustomEndUserAdapter (see page 5676), ExecuteLogout terminates the current Web session.

54.1.58.2.3 TCustomEndUserSessionAdapter.GetDisplayNameValue Method

Returns the name of the current end user.

Pascal

```
function GetDisplayNameValue: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDisplayNameValue();
```

Description

GetDisplayNameValue is the implementation of the DisplayName adapter field. When a server-side script references the display name of the current user, it generates a call to GetDisplayNameValue.

In TCustomEndUserSessionAdapter (see page 5692), GetDisplayNameValue returns the value of the UserID (see page

5701) property, formatted as a string.

54.1.58.2.4 TCustomEndUserSessionAdapter.GetLoggedInValue Method

Indicates whether the current end user has logged in.

Pascal

```
function GetLoggedInValue: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetLoggedInValue();
```

Description

GetLoggedInValue is the implementation of the LoggedIn adapter field. When a server-side script references the LoggedIn field for the current user, it generates a call to GetLoggedInValue.

In TCustomEndUserAdapter (see page 5676), GetLoggedInValue checks whether the UserID (see page 5701) property has been assigned. If UserID (see page 5701) is an assigned Variant (see page 3421) other than an empty string, GetLoggedInValue returns true, indicating that the user has logged in. Otherwise, GetLoggedInValue returns false.

54.1.58.2.5 TCustomEndUserSessionAdapter.GetUserID Method

Returns the user ID of the current user.

Pascal

```
function GetUserID: Variant; override;
```

C++

```
virtual __fastcall Variant GetUserID();
```

Description

GetUserIDValue is the implementation of the UserID (see page 5701) adapter field. When a server-side script references the user ID of the current user, it generates a call to GetUserIDValue.

In TCustomEndUserSessionAdapter (see page 5692), GetUserID fetches the value of the UserID (see page 5701) property from the current Web session. This value is set when the user first logs in.

See Also

GetUserID (see page 5684)

ExecuteLogin (see page 5683)

TWebSession (see page 6251)

54.1.58.3 TCustomEndUserSessionAdapter Properties

The properties of the TCustomEndUserSessionAdapter class are listed here.

Public Properties

	Name	Description
	UserID (see page 5701)	Specifies the user ID of the current end user.

54.1.58.3.1 TCustomEndUserSessionAdapter.UserID Property

Specifies the user ID of the current end user.

Pascal

```
property UserID: Variant;
```

C++

```
__property Variant UserID;
```

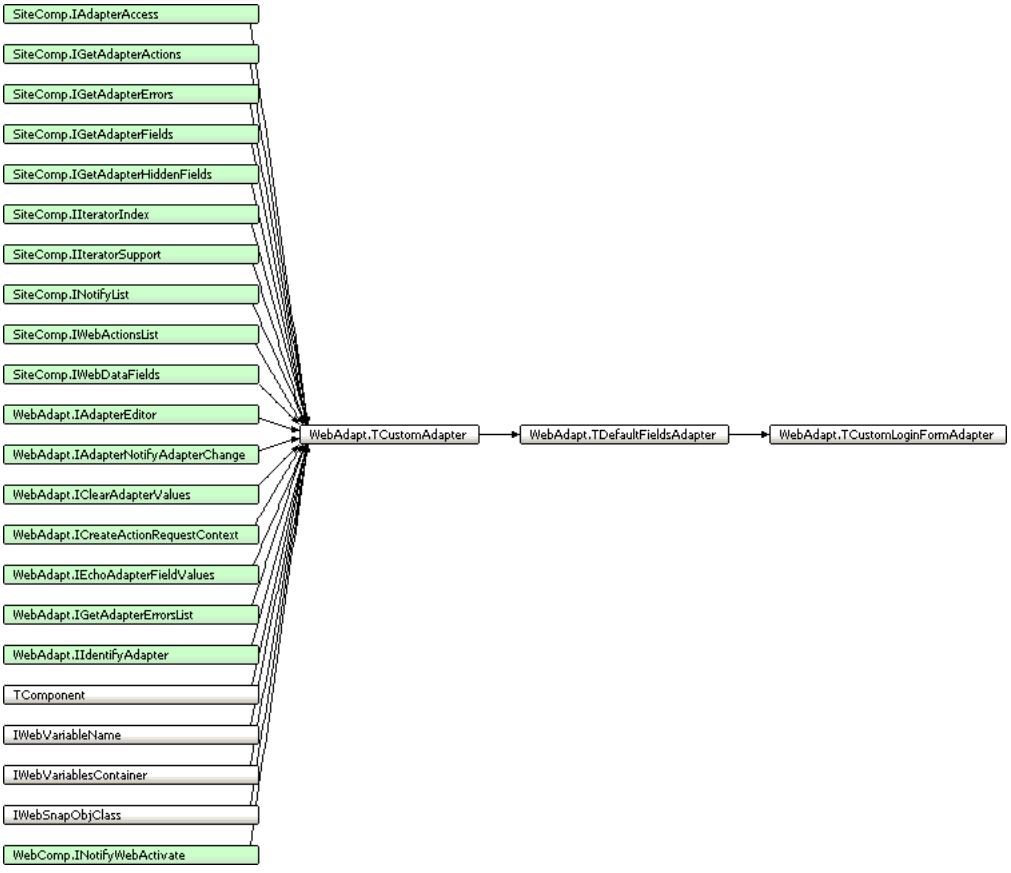
Description

Use UserID to get or set the user ID of the current user. When a user logs in (that is, when TCustomEndUserSessionAdapter (see page 5692) executes the LogIn (see page 5515) action), TCustomEndUserSessionAdapter (see page 5692) assigns the user's ID as the value of UserID. TCustomEndUserSessionAdapter (see page 5692) stores this value with the current session.

54.1.59 TCustomLoginFormAdapter Class

TCustomLoginFormAdapter is the base class for adapters that manage the fields and actions of a login form.

Class Hierarchy



Pascal

```
TCustomLoginFormAdapter = class(TDefaultFieldsAdapter);
```

C++

```
class TCustomLoginFormAdapter : public TDefaultFieldsAdapter;
```

File

WebAdapt

Description

TCustomLoginFormAdapter introduces default fields and actions that support building a login form. The adapter fields include user name (UserName (see page 5714)), password (Password (see page 5714)), and next page (NextPage (see page 5713)). The next page field lists the Web pages in the application. The properties of TCustomLoginFormAdapter reflect the values that are assigned to those fields. TCustomLoginFormAdapter implements a single default action for logging in. If the WebSnap application also contains an end user adapter such as TEndUserAdapter (see page 5764) or TEndUserSessionAdapter (see page 5792), TLoginFormAdapter (see page 5824) calls the end user adapter's LogIn method to log the user in. As an alternate approach, you can provide an OnLogin (see page 5715) event handler.

Do not create instances of TCustomLoginFormAdapter. It is intended only as a base class. Instead, use a TCustomLoginFormAdapter descendant such as TLoginFormAdapter (see page 5824).

See Also

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

TAdapterPageProducer (see page 1136)

TLoginFormAdapter (see page 5824)

54.1.59.1 TCustomLoginFormAdapter Members

The following tables list the members exposed by TCustomLoginFormAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.

	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
	EndUser (see page 5707)	Returns the interface of the WebSnap application's end user adapter.
	ExecuteLogin (see page 5707)	Logs in the user after the user name and password have been validated.
	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetNextPage (see page 5708)	Returns the value of the NextPage (see page 5713) property.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 5708)	Provides the underlying implementation for the CanAddActionClass (see page 5539) method.
	ImplCanAddFieldClass (see page 5709)	Provides the underlying implementation for the CanAddFieldClass (see page 5540) method.
	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5709)	Provides the underlying implementation for the GetActionsList (see page 5546) method.
	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5710)	Provides the underlying implementation for the GetFieldsList (see page 5549) method.

	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5710)	Provides the underlying implementation for the NotifyDeactivate (see page 5566) method.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	RaiseBlankPassword (see page 5711)	Raises an EAdapterFieldException (see page 5178) with a message that the supplied password is blank.
	RaiseBlankUserName (see page 5711)	Raises an EAdapterFieldException (see page 5178) with a message that the supplied user name is blank.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	UserList (see page 5711)	Returns the interface of the WebSnap application's Web user list.
	ValidatePassword (see page 5712)	Validates the password that the user supplied to the login form.
	ValidateUserName (see page 5712)	Validates the name that the user supplied to the login form.

	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
R	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
R	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.
	OnLogin (see page 5715)	Occurs after the password and user ID are validated.
	OnValidatePassword (see page 5716)	Occurs when the login form adapter must validate the password that the user supplied.
	OnValidateUserName (see page 5716)	Occurs when the login form adapter must validate the name that the user supplied.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.

	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.
R	Actions (see page 5746)	Container for adapter actions components.
R	Data (see page 5572)	Data is the container for adapter field components.
R	Data (see page 5747)	Container for adapter field components.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	NextPage (see page 5713)	Names the Web page the user should see after successfully logging in.
R	Password (see page 5714)	Indicates the password that the user supplied to the login form.
	PasswordRequired (see page 5714)	Indicates whether the user must supply a password to log in.
R	UserName (see page 5714)	Indicates the name that the user supplied to the login form.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.59.2 TCustomLoginFormAdapter Methods

The methods of the TCustomLoginFormAdapter class are listed here.

Protected Methods

	Name	Description
	EndUser (see page 5707)	Returns the interface of the WebSnap application's end user adapter.
	ExecuteLogin (see page 5707)	Logs in the user after the user name and password have been validated.
V	GetNextPage (see page 5708)	Returns the value of the NextPage (see page 5713) property.
V	ImplCanAddActionClass (see page 5708)	Provides the underlying implementation for the CanAddActionClass (see page 5539) method.
V	ImplCanAddFieldClass (see page 5709)	Provides the underlying implementation for the CanAddFieldClass (see page 5540) method.
V	ImplGetActionsList (see page 5709)	Provides the underlying implementation for the GetActionsList (see page 5546) method.
V	ImplGetFieldsList (see page 5710)	Provides the underlying implementation for the GetFieldsList (see page 5549) method.
V	ImplNotifyDeactivate (see page 5710)	Provides the underlying implementation for the NotifyDeactivate (see page 5566) method.
	RaiseBlankPassword (see page 5711)	Raises an EAdapterFieldException (see page 5178) with a message that the supplied password is blank.
	RaiseBlankUserName (see page 5711)	Raises an EAdapterFieldException (see page 5178) with a message that the supplied user name is blank.

	UserList (see page 5711)	Returns the interface of the WebSnap application's Web user list.
	ValidatePassword (see page 5712)	Validates the password that the user supplied to the login form.
	ValidateUserName (see page 5712)	Validates the name that the user supplied to the login form.

54.1.59.2.1 TCustomLoginFormAdapter.EndUser Method

Returns the interface of the WebSnap application's end user adapter.

Pascal

```
function EndUser: IWebEndUser;
```

C++

```
__fastcall IWebEndUser EndUser();
```

Description

TCustomLoginFormAdapter (see page 5701) uses EndUser internally to interact with the WebSnap application's end user adapter. For example, the login form adapter calls the LogIn method on this interface to log in an end user after validating the user name and password.

EndUser returns the interface of an end user adapter such as TEndUserAdapter (see page 5764) or TEndUserSessionAdapter (see page 5792). If the WebSnap application does not include an end user adapter, EndUser returns nil (Delphi) or NULL (C++).

See Also

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

LogIn (see page 5993)

54.1.59.2.2 TCustomLoginFormAdapter.ExecuteLogin Method

Logs in the user after the user name and password have been validated.

Pascal

```
procedure ExecuteLogin(AUserID: Variant);
```

C++

```
__fastcall ExecuteLogin(Variant AUserID);
```

Description

The LogIn action calls ExecuteLogin to log the user in after validating the user name and password. This method first generates an OnLogin (see page 5715) event, so that the OnLogin (see page 5715) event handler can perform any application-specific tasks to log the user in. Then, if the EndUser (see page 5707) property is not nil (Delphi) or NULL (C++), ExecuteLogin calls the end user adapter's LogIn method, so that the end user adapter can log the user in.

AUserID is the user ID of the end user. If the WebSnap application includes a TWebUserList component, this is the user ID that the Web user list associates with the current user name and password. Otherwise, AUserID is the value of the UserName (see page 5714) property.

See Also

EndUser (see page 5707)

OnLogin (see page 5715)

LogIn (see page 5993)

UserName (see page 5714)

TWebUserList (see page 6796)

54.1.59.2.3 TCustomLoginFormAdapter.GetNextPage Method

Returns the value of the NextPage (see page 5713) property.

Pascal

```
function GetNextPage: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetNextPage();
```

Description

GetNextPage is the getter method for the NextPage (see page 5713) property. See the NextPage (see page 5713) property for more information.

See Also

NextPage (see page 5713)

54.1.59.2.4 TCustomLoginFormAdapter.ImplCanAddActionClass Method

Provides the underlying implementation for the CanAddActionClass (see page 5539) method.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddActionClass provides the underlying implementation of the CanAddActionClass (see page 5539) method that is introduced in TCustomAdapter (see page 5531). At design time, the Actions (see page 5746) editor calls this method to determine what actions it can add to the login form adapter.

AParent is the adapter that will act as a parent to the added action.

AClass is the class of the proposed action.

ImplCanAddActionClass returns true if the login form adapter can act as a parent to an action of the specified class.

In TCustomLoginFormAdapter (see page 5701), ImplCanAddActionClass returns true if AClass is (or descends from) TLoginFormAdapterLoginAction (see page 5835) (the LogIn action).

See Also

ImplCanAddFieldClass (see page 5709)

CanAddActionClass (see page 5539)

TLoginFormAdapterLoginAction (see page 5835)

ImplGetActionsList (see page 5709)

54.1.59.2.5 TCustomLoginFormAdapter.ImplCanAddFieldClass Method

Provides the underlying implementation for the CanAddFieldClass (see page 5540) method.

Pascal

```
function ImplCanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddFieldClass provides the underlying implementation of the CanAddFieldClass (see page 5540) method that is introduced in TCustomAdapter (see page 5531). At design time, the Fields editor calls this method to determine what fields it can add to the login form adapter.

AParent is the adapter that will act as a parent to the added field.

AClass is the class of the proposed field.

ImplCanAddFieldClass returns true if the login form adapter can act as a parent to a field of the specified class.

In TCustomLoginFormAdapter (see page 5701), ImplCanAddFieldClass returns true if AClass is (or descends from) TAdapterPasswordField (see page 5391), TAdapterUserNameField (see page 5433) or TAdapterNextPageField (see page 5379) (the Password (see page 5714), UserName (see page 5714), or NextPage (see page 5713) field).

See Also

ImplCanAddActionClass (see page 5708)

CanAddFieldClass (see page 5540)

TAdapterNextPageField (see page 5379)

TAdapterPasswordField (see page 5391)

TAdapterUserNameField (see page 5433)

ImplGetFieldsList (see page 5710)

54.1.59.2.6 TCustomLoginFormAdapter.ImplGetActionsList Method

Provides the underlying implementation for the GetActionsList (see page 5546) method.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

ImplGetActionsList provides the underlying implementation of the GetActionsList (see page 5546) method that is introduced in TCustomAdapter (see page 5531). This method fills a string list with the names of all the actions an adapter can support, associating each action name with a class reference to the corresponding action class.

AList is an existing string list instance to fill with the names of the actions that this adapter supports.

In TCustomLoginFormAdapter (see page 5701), ImplGetActionsList clears the list of any strings it may contain on entry, and adds a single string, 'Login', which is the name of the login action. It associates this string with TLoginFormAdapterLoginAction (see page 5835).

See Also

ImplGetFieldsList (see page 5710)

GetActionsList (see page 5546)

TLoginFormAdapterLoginAction (see page 5835)

54.1.59.2.7 TCustomLoginFormAdapter.ImplGetFieldsList Method

Provides the underlying implementation for the GetFieldsList (see page 5549) method.

Pascal

```
procedure ImplGetFieldsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetFieldsList(TStrings AList);
```

Description

ImplGetFieldsList provides the underlying implementation of the GetFieldsList (see page 5549) method that is introduced in TCustomAdapter (see page 5531). This method fills a string list with the names of all the fields an adapter can support, associating each field name with a class reference to the corresponding field class.

AList is an existing string list instance to fill with the names of the fields that this adapter supports.

In TCustomLoginFormAdapter (see page 5701), ImplGetFieldsList clears the list of any strings it may contain on entry, and adds the strings, 'UserName (see page 5714)', 'Password (see page 5714)', and 'NextPage (see page 5713)', which it associates with TAdapterUserNameField (see page 5433), TAdapterPasswordField (see page 5391), and TAdapterNextPageField (see page 5379), respectively.

See Also

ImplGetActionsList (see page 5709)

GetFieldsList (see page 5549)

TAdapterNextPageField (see page 5379)

TAdapterPasswordField (see page 5391)

TAdapterUserNameField (see page 5433)

54.1.59.2.8 TCustomLoginFormAdapter.ImplNotifyDeactivate Method

Provides the underlying implementation for the NotifyDeactivate (see page 5566) method.

Pascal

```
procedure ImplNotifyDeactivate; override;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

ImplNotifyDeactivate provides the underlying implementation of the NotifyDeactivate (see page 5566) method that is introduced in TCustomAdapter (see page 5531). This method is called when the WebSnap application deactivates the Web module that contains the adapter after processing an HTTP request message.

In TCustomLoginFormAdapter (see page 5701), ImplNotifyDeactivate clears the NextPage (see page 5713) property so that

the next time a request message arrives from the login form, it can be redirected to an appropriate next page.

See Also

NotifyDeactivate (see page 5566)

NextPage (see page 5713)

54.1.59.2.9 TCustomLoginFormAdapter.RaiseBlankPassword Method

Raises an EAdapterFieldException (see page 5178) with a message that the supplied password is blank.

Pascal

```
procedure RaiseBlankPassword;
```

C++

```
__fastcall RaiseBlankPassword();
```

Description

TCustomLoginFormAdapter (see page 5701) calls RaiseBlankPassword internally when it is trying to validate a password that is an empty string and the PasswordRequired (see page 5714) property is true.

See Also

PasswordRequired (see page 5714)

EAdapterFieldException (see page 5178)

ValidatePassword (see page 5712)

54.1.59.2.10 TCustomLoginFormAdapter.RaiseBlankUserName Method

Raises an EAdapterFieldException (see page 5178) with a message that the supplied user name is blank.

Pascal

```
procedure RaiseBlankUserName;
```

C++

```
__fastcall RaiseBlankUserName();
```

Description

TCustomLoginFormAdapter (see page 5701) calls RaiseBlankUserName internally when it is trying to validate a user name that is an empty string.

See Also

EAdapterFieldException (see page 5178)

ValidateUserName (see page 5712)

54.1.59.2.11 TCustomLoginFormAdapter.UserList Method

Returns the interface of the WebSnap application's Web user list.

Pascal

```
function UserList: IWebUserList;
```

C++

```
__fastcall IWebUserList UserList();
```

Description

TCustomLoginFormAdapter (see page 5701) uses UserList internally to interact with the WebSnap application's Web user list. For example, the login form adapter calls the ValidateUser method on this interface when validating the user name and password.

UserList returns the interface of a Web user list such as TWebUserList. If the WebSnap application does not include a Web user list, UserList returns nil (Delphi) or NULL (C++).

See Also

TWebUserList (see page 6796)

ValidateUser (see page 1117)

54.1.59.2.12 TCustomLoginFormAdapter.ValidatePassword Method

Validates the password that the user supplied to the login form.

Pascal

```
procedure ValidatePassword;
```

C++

```
__fastcall ValidatePassword();
```

Description

The LogIn action associated with this adapter calls ValidatePassword to validate the password that the user supplies. ValidatePassword first generates an OnValidatePassword (see page 5716) event. If the event handler does not exist, or does not handle the validation, ValidatePassword checks whether the password is an empty string. If so, and if the PasswordRequired (see page 5714) property is true, ValidatePassword raises an EAdapterFieldException (see page 5178) exception.

See Also

OnValidatePassword (see page 5716)

PasswordRequired (see page 5714)

EAdapterFieldException (see page 5178)

Password (see page 5714)

54.1.59.2.13 TCustomLoginFormAdapter.ValidateUserName Method

Validates the name that the user supplied to the login form.

Pascal

```
procedure ValidateUserName;
```

C++

```
__fastcall ValidateUserName();
```

Description

The LogIn action associated with this adapter calls ValidateUserName to validate the name that the user supplies. ValidateUserName first generates an OnValidateUserName (see page 5716) event. If the event handler does not exist, or does not handle the validation, ValidateUserName checks whether the user name is an empty string. If so, it raises an

EAdapterFieldException (see page 5178) exception.

See Also

OnValidateUserName (see page 5716)

EAdapterFieldException (see page 5178)

UserName (see page 5714)

54.1.59.3 TCustomLoginFormAdapter Properties

The properties of the TCustomLoginFormAdapter class are listed here.

Public Properties

	Name	Description
	NextPage (see page 5713)	Names the Web page the user should see after successfully logging in.
R	Password (see page 5714)	Indicates the password that the user supplied to the login form.
	PasswordRequired (see page 5714)	Indicates whether the user must supply a password to log in.
R	UserName (see page 5714)	Indicates the name that the user supplied to the login form.

54.1.59.3.1 TCustomLoginFormAdapter.NextPage Property

Names the Web page the user should see after successfully logging in.

Pascal

```
property NextPage: string;
```

C++

```
__property UnicodeString NextPage;
```

Description

NextPage specifies the page that the WebSnap application presents to end users after they successfully log in.

The NextPage adapter field supplies a value for the NextPage property. This is a page that the user selects using the login form. If NextPage is unassigned (that is, the if the login form does not contain a NextPage field or the user does not select a next page), TCustomLoginFormAdapter (see page 5701) checks whether the request parameters include a "success page", and if so, uses that. If there is no "success page" parameter, TCustomLoginFormAdapter (see page 5701) checks the Web context to see if there is a currently requested page the user was trying to reach before being diverted to the login page. If there is no "success page" parameter and no currently requested page, TCustomLoginFormAdapter (see page 5701) uses the application's default page.

See Also

DefaultPage (see page 6195)

RequestedPageName (see page 5974)

TAdapterPageProducer (see page 1136)

TLoginFormAdapter (see page 5824)

SuccessPage (see page 1009)

GetNextPage (see page 5708)

54.1.59.3.2 TCustomLoginFormAdapter.Password Property

Indicates the password that the user supplied to the login form.

Pascal

```
property Password: Variant;
```

C++

```
__property Variant Password;
```

Description

Read (see page 3634) Password to obtain the password that the user supplied to the login form. The login form adapter reads this value from the current request message.

See Also

PasswordRequired (see page 5714)

OnValidatePassword (see page 5716)

54.1.59.3.3 TCustomLoginFormAdapter.PasswordRequired Property

Indicates whether the user must supply a password to log in.

Pascal

```
property PasswordRequired: Boolean;
```

C++

```
__property Boolean PasswordRequired;
```

Description

Set PasswordRequired to indicate whether users must supply a password to log in. If PasswordRequired is true and the OnValidatePassword (see page 5716) event handler does not handle the validation of the password, then the login form adapter checks that the value of Password (see page 5714) is not an empty string. If Password (see page 5714) is an empty string, the login form adapter raises an EAdapterFieldException (see page 5178) exception when it tries to validate the password. If the OnValidatePassword (see page 5716) event handler takes care of validating the password, PasswordRequired is ignored.

Note: The login form adapter validates the password (and hence checks PasswordRequired) when the WebSnap application executes this adapter's LogIn action.

See Also

Password (see page 5714)

OnValidatePassword (see page 5716)

TLoginFormAdapterLoginAction (see page 5835)

EAdapterFieldException (see page 5178)

54.1.59.3.4 TCustomLoginFormAdapter.UserName Property

Indicates the name that the user supplied to the login form.

Pascal

```
property UserName: Variant;
```

C++

```
__property Variant UserName;
```

Description

Read (see page 3634) UserName to obtain the name that the user supplied when logging in. The login form adapter reads this value from the current request message.

See Also

Password (see page 5714)

OnValidateUserName (see page 5716)

54.1.59.4 TCustomLoginFormAdapter Events

The events of the TCustomLoginFormAdapter class are listed here.

Public Events

	Name	Description
	OnLogin (see page 5715)	Occurs after the password and user ID are validated.
	OnValidatePassword (see page 5716)	Occurs when the login form adapter must validate the password that the user supplied.
	OnValidateUserName (see page 5716)	Occurs when the login form adapter must validate the name that the user supplied.

54.1.59.4.1 TCustomLoginFormAdapter.OnLogin Event

Occurs after the password and user ID are validated.

Pascal

```
property OnLogin: TLoginUserIDEvent;
```

C++

```
__property TLoginUserIDEvent OnLogin;
```

Description

Write (see page 3707) an OnLogin event handler to respond when a user has successfully logged in. This event allows your application to record the user login in an application-specific manner.

When the login form adapter's LogIn action executes, the adapter first receives an OnValidatePassword (see page 5716) and an OnValidateUserName (see page 5716) event. After validating the password and user name, the login form adapter receives an OnLogin event so that it can log the user in. After the OnLogin event, if the WebSnap application includes an end user adapter, the login form adapter calls the end user adapter's LogIn method. Thus, it may not be necessary to write an OnLogin event handler if the application includes an end user adapter.

See Also

OnValidatePassword (see page 5716)

OnValidateUserName (see page 5716)

LogIn (see page 5993)

TWebUserList (see page 6796)

UserName (see page 5714)

54.1.59.4.2 TCustomLoginFormAdapter.OnValidatePassword Event

Occurs when the login form adapter must validate the password that the user supplied.

Pascal

```
property OnValidatePassword: TValidateAdapterFieldEvent;
```

C++

```
__property TValidateAdapterFieldEvent OnValidatePassword;
```

Description

Write (see page 3707) an OnValidatePassword event handler to validate the password that the user supplies to the login form. This event is especially important if the WebSnap application does not include a TWebUserList component for checking passwords against user names. The supplied Password (see page 5714) is the value of the Value parameter on the event handler. You can check this against the user's name by reading the UserName (see page 5714) property.

When the login form adapter's LogIn action executes, the adapter first receives an OnValidatePassword event to check the password. If the event handler sets the Handled parameter to true, indicating that the password is valid, the adapter goes on to validate the user name using an OnValidateUserName (see page 5716) event, and then to log the user in using an OnLogin (see page 5715) event (and, if the application includes an end user adapter, by calling the end user adapter's LogIn method). If the event handler finds the password to be invalid, it should raise an exception. If the event handler does not validate the supplied password (that is, if it sets the Handled parameter to false), the login form adapter validates the password by checking whether it is non-blank if the PasswordRequired (see page 5714) property is true.

See Also

OnLogin (see page 5715)

OnValidateUserName (see page 5716)

Password (see page 5714)

UserName (see page 5714)

PasswordRequired (see page 5714)

54.1.59.4.3 TCustomLoginFormAdapter.OnValidateUserName Event

Occurs when the login form adapter must validate the name that the user supplied.

Pascal

```
property OnValidateUserName: TValidateAdapterFieldEvent;
```

C++

```
__property TValidateAdapterFieldEvent OnValidateUserName;
```

Description

Write (see page 3707) an OnValidateUserName event handler to validate the name that the user supplies when logging in. This event occurs after the OnValidatePassword (see page 5716) event and before the OnLogin (see page 5715) event.

If the event handler sets the Handled parameter to true, the login form adapter assumes that the user name (which is the value of the Value parameter and of the UserName (see page 5714) property) is valid. In this case, the adapter checks whether the WebSnap application includes a TWebUserList component, and if so, checks the user name against the password. If the event handler sets the Handled parameter to false, the adapter validates the user name by checking whether it is nonempty. In this case, the adapter raises an EAdapterFieldException (see page 5178) exception if the value of UserName (see page 5714) is an empty string. If the OnValidateUserName event handler finds the user name to be invalid, it should raise an exception.

See Also

OnLogin (see page 5715)

OnValidatePassword (see page 5716)

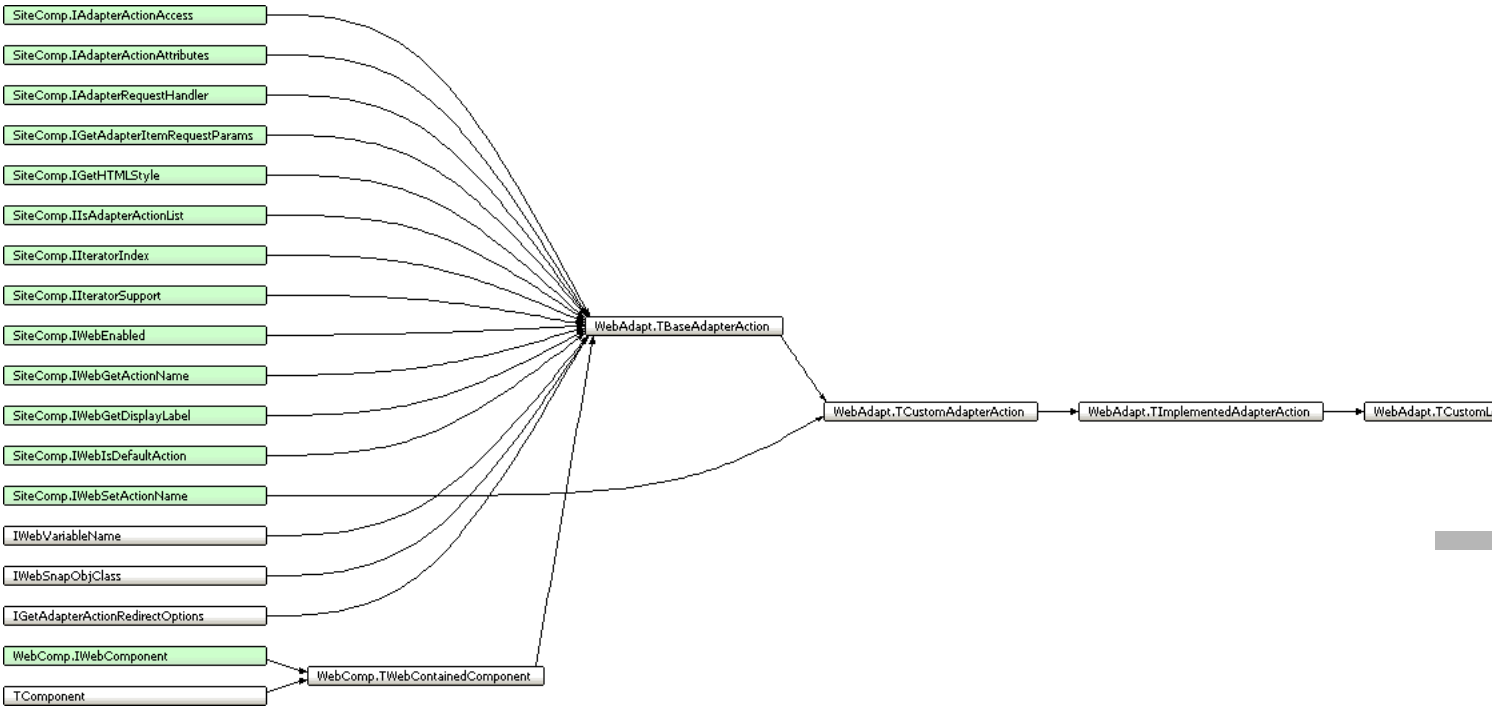
UserName (see page 5714)

EAdapterFieldException (see page 5178)

54.1.60 TCustomLoginFormAdapterAction Class

TCustomEndUserAdapterAction (see page 5687) is a base class for adapter actions that work with descendants of TCustomLoginFormAdapter (see page 5701).

Class Hierarchy



Pascal

```
TCustomLoginFormAdapterAction = class(TImplementedAdapterAction);
```

C++

```
class TCustomLoginFormAdapterAction : public TImplementedAdapterAction;
```

File

WebAdapt

Description

TCustomLoginFormAdapterAction has two purposes. First, it implements a property that descendants use to access the parent adapter. Second, it defines a base class that TCustomLoginFormAdapter (see page 5701) checks for when determining whether an adapter action can be added as a child.

See Also

TImplementedAdapterAction (see page 5818)

TCustomLoginFormAdapter (see page 5701)

54.1.60.1 TCustomLoginFormAdapterAction Members

The following tables list the members exposed by TCustomLoginFormAdapterAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5456)	Gets the default name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
V	ImplExecuteActionRequest (see page 5464)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplExecuteActionRequest (see page 5584)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.

	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 5465)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 5584)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5470)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 5585)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5721)	Returns the adapter that acts as a parent to this action.
	Errors (see page 5475)	Returns the parent adapter's Errors list.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5477)	Called after the adapter action has executed.
	OnAfterExecute (see page 5587)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5477)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 5587)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5478)	Called before the adapter action is executed.
	OnBeforeExecute (see page 5588)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5478)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 5588)	Called before the adapter action response is generated.
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 5478)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 1087)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.

W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5474)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
R	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
R	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
R	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

54.1.60.2 TCustomLoginFormAdapterAction Properties

The properties of the TCustomLoginFormAdapterAction class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 5721)	Returns the adapter that acts as a parent to this action.

54.1.60.2.1 TCustomLoginFormAdapterAction.Adapter Property

Returns the adapter that acts as a parent to this action.

Pascal

```
property Adapter: TCustomLoginFormAdapter;
```

C++

```
__property TCustomLoginFormAdapter Adapter;
```

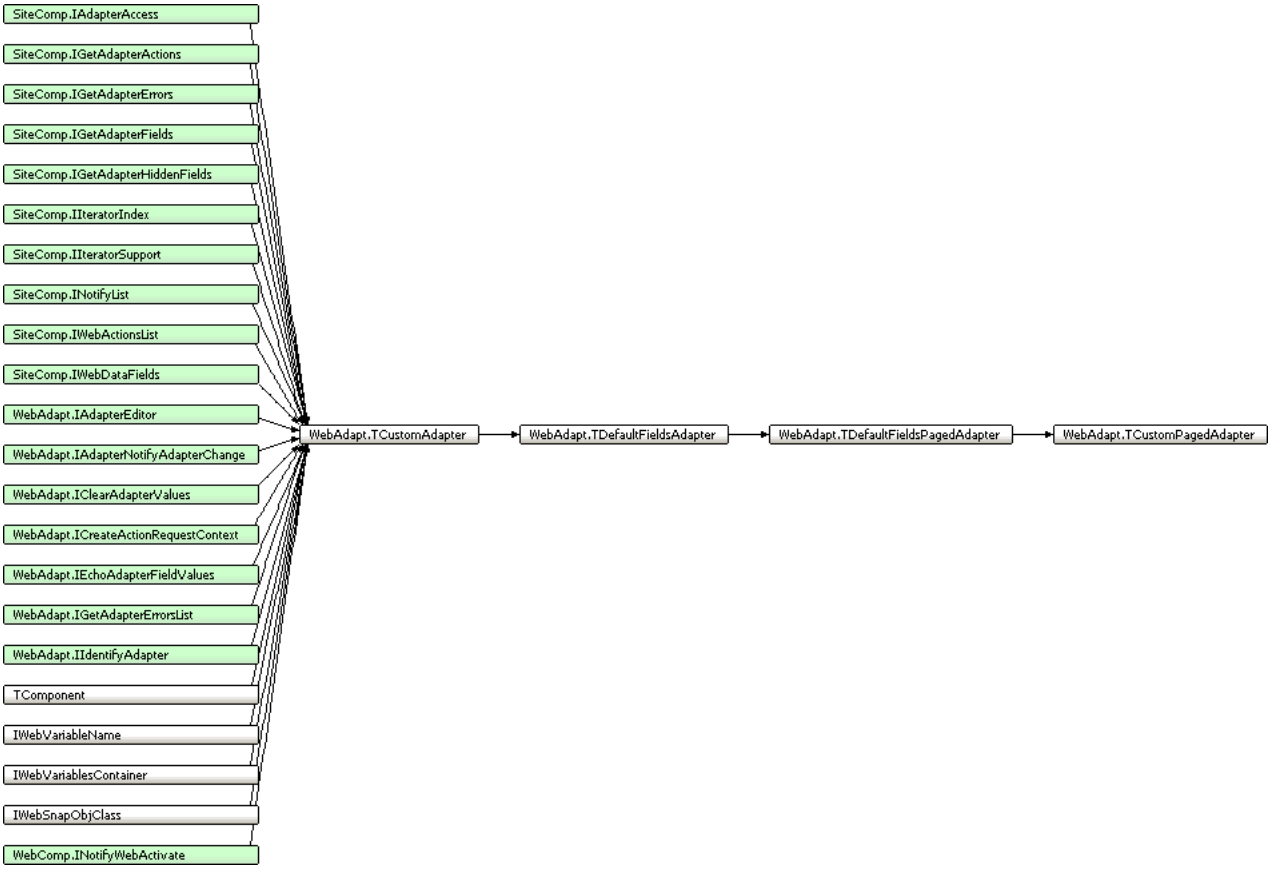
Description

Descendant classes use this property to access the parent adapter.

54.1.61 TCustomPagedAdapter Class

TCustomPagedAdapter is a base class for adapters that support paging.

Class Hierarchy



Pascal

```
TCustomPagedAdapter = class(TDefaultFieldsPagedAdapter);
```

C++

```
class TCustomPagedAdapter : public TDefaultFieldsPagedAdapter;
```

File

WebAdapt

Description

Derive from TCustomPagedAdapter to define a new adapter class that support paging. Paging is enabled when the PageSize (see page 5761) property is set.

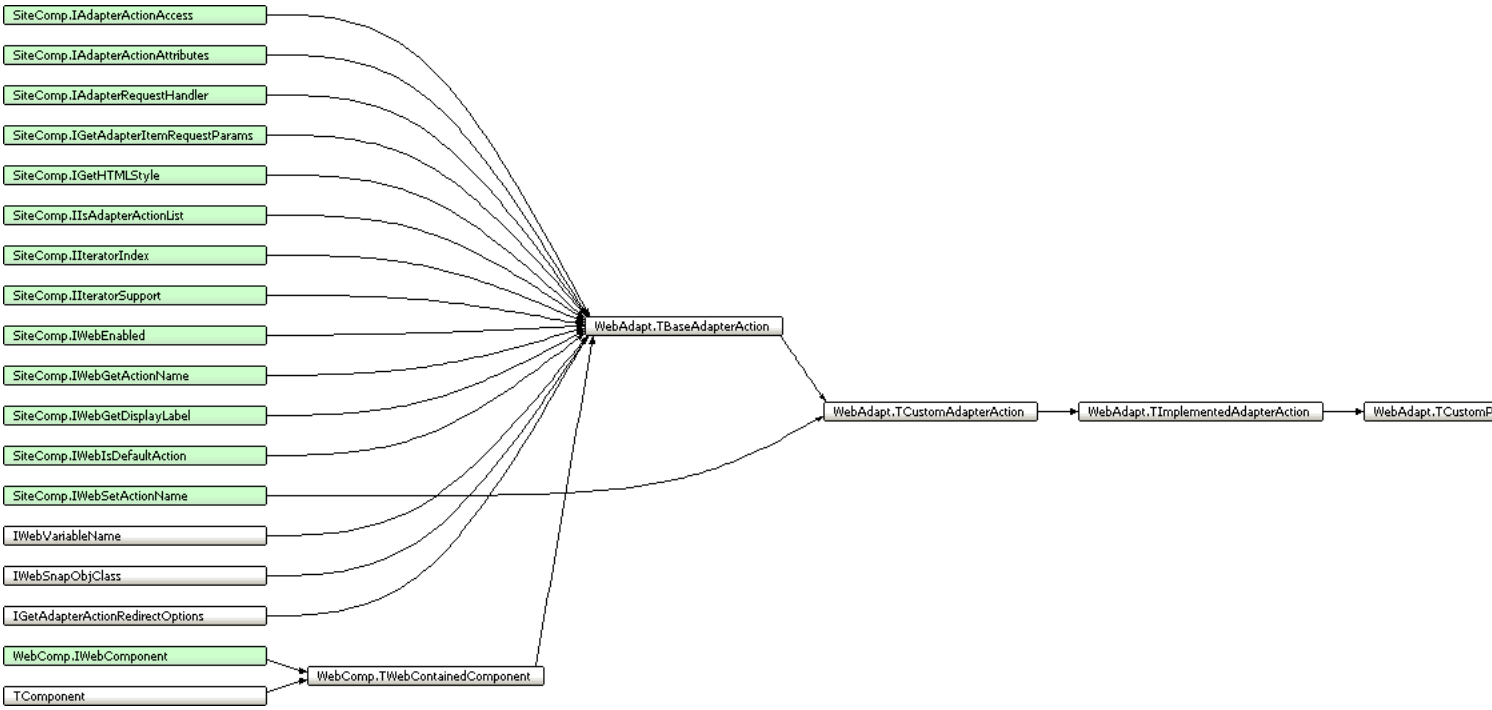
See Also

TPagedAdapter (see page 5844)

54.1.62 TCustomPagedAdapterAction Class

TCustomPagedAdapterAction is a base class for adapter actions that work with descendants of TDefaultFieldsPagedAdapter (see page 5747).

Class Hierarchy



Pascal

```
TCustomPagedAdapterAction = class(TImplementedAdapterAction);
```

C++

```
class TCustomPagedAdapterAction : public TImplementedAdapterAction;
```

File

WebAdapt

Description

TCustomPagedAdapterAction has two purposes. First, it provides a property that is used by descendants to access the parent adapter. Second, it defines a base class that TDefaultFieldsPagedAdapter (see page 5747) checks for when determining whether an adapter action can be added as a child.

See Also

TImplementedAdapterAction (see page 5818)

TDefaultFieldsPagedAdapter (see page 5747)

54.1.62.1 TCustomPagedAdapterAction Members

The following tables list the members exposed by TCustomPagedAdapterAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.

	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5727)	Returns the parent adapter of this adapter action.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetDefaultActionName (see page 5456)	Gets the default name used to reference this adapter action with server-side script.
	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
	ImplExecuteActionRequest (see page 5464)	Executes the adapter action using parameters passed in the HTTP request.
	ImplExecuteActionRequest (see page 5584)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 5465)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 5584)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.

	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5470)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	ImplWebEnabled (see page 5585)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
	Adapter (see page 5727)	Returns the parent adapter of this adapter action.
	Errors (see page 5475)	Returns the parent adapter's Errors list.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnAfterExecute (see page 5477)	Called after the adapter action has executed.
	OnAfterExecute (see page 5587)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5477)	Called after the adapter action response is generated.
	OnAfterGetResponse (see page 5587)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5478)	Called before the adapter action is executed.
	OnBeforeExecute (see page 5588)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5478)	Called before the adapter action response is generated.
	OnBeforeGetResponse (see page 5588)	Called before the adapter action response is generated.
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	OnGetParams (see page 5478)	Specifies name/value pairs needed to execute this adapter action.

Public Methods

	Name	Description
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 1087)	This is ActionName, a member of class IWebGetActionName.
	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.
	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	DisplayLabel (see page 5474)	Suggests a display label for this adapter action.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

54.1.62.2 TCustomPagedAdapterAction Methods

The methods of the TCustomPagedAdapterAction class are listed here.

Protected Methods

	Name	Description
	GetAdapter (see page 5727)	Returns the parent adapter of this adapter action.

54.1.62.2.1 TCustomPagedAdapterAction.GetAdapter Method

Returns the parent adapter of this adapter action.

Pascal

```
function GetAdapter: TDefaultFieldsPagedAdapter;
```

C++

```
__fastcall TDefaultFieldsPagedAdapter GetAdapter();
```

Description

GetAdapter implements the Adapter (see page 5727) property.

See Also

TDefaultFieldsPagedAdapter (see page 5747)

Adapter (see page 5727)

54.1.62.3 TCustomPagedAdapterAction Properties

The properties of the TCustomPagedAdapterAction class are listed here.

Protected Properties

	Name	Description
R	Adapter (see page 5727)	Returns the parent adapter of this adapter action.

54.1.62.3.1 TCustomPagedAdapterAction.Adapter Property

Returns the parent adapter of this adapter action.

Pascal

```
property Adapter: TDefaultFieldsPagedAdapter;
```

C++

```
__property TDefaultFieldsPagedAdapter Adapter;
```

Description

Descendant classes use this property to access the parent adapter.

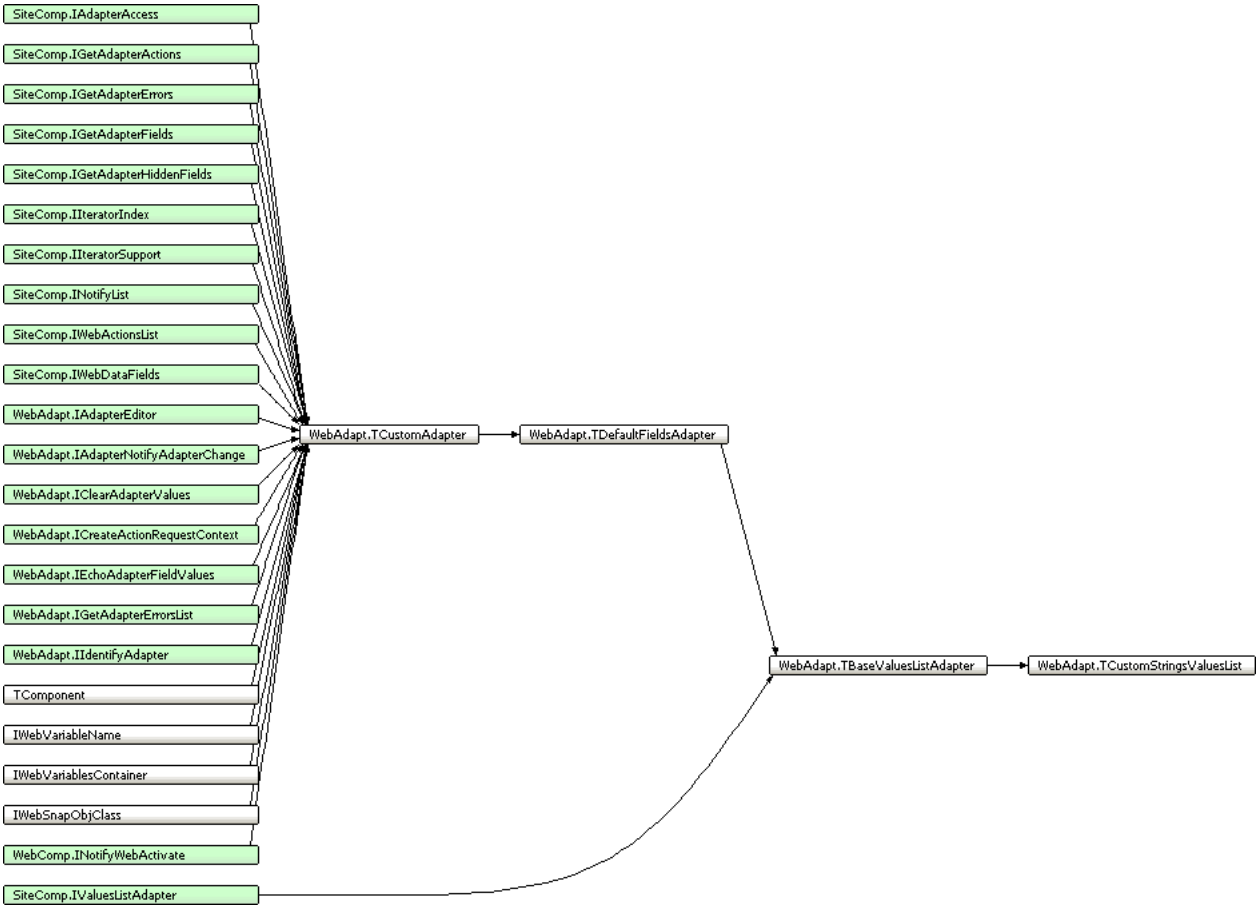
See Also

GetAdapter (see page 5727)

54.1.63 TCustomStringsValuesList Class

TCustomStringsValuesList is a base class for a values list that defines it's name/value pairs using a string list.

Class Hierarchy



Pascal

```
TCustomStringsValuesList = class(TBaseValuesListAdapter);
```

C++

```
class TCustomStringsValuesList : public TBaseValuesListAdapter;
```

File

WebAdapt

Description

Use descendants of TCustomStringsValuesList with adapter fields to define a list of name/value pairs that are possible values for the adapter field. Adapter fields reference a values list adapter using the adapter field's ValuesList property.

See Also

TBaseValuesListAdapter (see page 5517)

TStringsValuesList (see page 5857)

TAdapterUpdateField (see page 5419)

54.1.63.1 TCustomStringsValuesList Members

The following tables list the members exposed by TCustomStringsValuesList.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.

	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 5522)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 5523)	Looks up an image for a value.
	GetListName (see page 5523)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 5523)	Looks up a name for a value.
	GetListValue (see page 5524)	Responsible for returning the value of the name/value pair.
V	GetNameFieldClass (see page 5734)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetValueFieldClass (see page 5734)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5524)	Returns the class type for this adapter field.
V	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5525)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5734)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the records of the adapter.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 5525)	Adds default field components to this adapter.
V	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
V	ImplGetListImage (see page 5525)	Responsible returning an image associated with the current name/value pair.
V	ImplGetListImageOfValue (see page 5526)	Looks up an image for a value.
V	ImplGetListName (see page 5735)	Responsible returning the name of the name/value pair.
V	ImplGetListNameOfValue (see page 5735)	Looks up a name for a value.
V	ImplGetListValue (see page 5735)	Responsible for returning the value of the name/value pair.
V	ImplGetVariable (see page 5556)	Returns an action or field.
V	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
V	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
V	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
V	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
V	ImplNextIteration (see page 5736)	Implements IteratorSupport's NextIteration (see page 5564) method to support iterating over the records of the adapter.
V	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
V	ImplNotifyDeactivate (see page 5736)	Clears the iteration index.

	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5736)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	PrepareStrings (see page 5737)	Customizes the content of the strings list.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	StringsPrepared (see page 5737)	This flag indicates whether the strings list has been prepared or customized.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.
	OnPrepareStrings (see page 5738)	Implement OnPrepareStrings to customize the content of the strings list.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5733)	Create is the constructor for TCustomStringsValuesList (see page 5728).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5733)	Destroy is the destructor for TCustomStringsList.
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetListImage (see page 1074)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 1074)	Returns the image object associated with a specified value.
	GetListName (see page 1075)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 1075)	Returns the name associated with a specified value.
	GetListValue (see page 1076)	Returns the value of the current name/value pair.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.
R	Actions (see page 5746)	Container for adapter actions components.
R	Data (see page 5572)	Data is the container for adapter field components.
R	Data (see page 5747)	Container for adapter field components.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.

	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	Strings (see page 5737)	This string list defines the list of name/value pairs.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.63.2 TCustomStringsValuesList.Create Constructor

Create is the constructor for TCustomStringsValuesList (see page 5728).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomStringsValuesList(TComponent * AOwner);
```

Description

Create creates the strings list.

See Also

Strings (see page 5737)

54.1.63.3 TCustomStringsValuesList.Destroy Destructor

Destroy is the destructor for TCustomStringsList.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomStringsValuesList();
```

Description

Destroy frees the strings list.

See Also

Strings (see page 5737)

54.1.63.4 TCustomStringsValuesList Methods

The methods of the TCustomStringsValuesList class are listed here.

Protected Methods

	Name	Description
	GetNameFieldClass (see page 5734)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetValueFieldClass (see page 5734)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.

	ImplEndIterator (see page 5734)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the records of the adapter.
	ImplGetListName (see page 5735)	Responsible returning the name of the name/value pair.
	ImplGetListNameOfValue (see page 5735)	Looks up a name for a value.
	ImplGetListValue (see page 5735)	Responsible for returning the value of the name/value pair.
	ImplNextIteration (see page 5736)	Implements IteratorSupport's NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyDeactivate (see page 5736)	Clears the iteration index.
	ImplStartIterator (see page 5736)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	PrepareStrings (see page 5737)	Customizes the content of the strings list.

54.1.63.4.1 TCustomStringsValuesList.GetNameFieldClass Method

Returns the class of adapter field that is responsible for providing the value of the name/value pair.

Pascal

```
function GetNameFieldClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetNameFieldClass();
```

Description

GetNameFieldClass returns a TValuesListNameField (see page 5866).

See Also

GetValueFieldClass (see page 5734)

TValuesListNameField (see page 5866)

54.1.63.4.2 TCustomStringsValuesList.GetValueFieldClass Method

Returns the class of adapter field that is responsible for providing the name of the name/value pair.

Pascal

```
function GetValueFieldClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass();
```

Description

GetValueFieldClass returns TValuesListValueField (see page 5869).

See Also

GetNameFieldClass (see page 5734)

TValuesListValueField (see page 5869)

54.1.63.4.3 TCustomStringsValuesList.ImplEndIterator Method

Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the records of the adapter.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the records of the adapter.

See Also

EndIterator (see page 1056)

54.1.63.4.4 TCustomStringsValuesList.ImplGetListName Method

Responsible returning the name of the name/value pair.

Pascal

```
function ImplGetListName: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetListName();
```

Description

ImplGetListName uses the iteration index to retrieve a name from the strings list. The name may be blank.

See Also

Strings (see page 5737)

54.1.63.4.5 TCustomStringsValuesList.ImplGetListNameOfValue Method

Looks up a name for a value.

Pascal

```
function ImplGetListNameOfValue(Value: Variant): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplGetListNameOfValue(Variant Value);
```

Description

ImplGetListNameOfValue searches the string list for a matching value and returns the name associated with this value. An empty string is returned if the value is not found or if the name associated with the value is blank.

See Also

Strings (see page 5737)

54.1.63.4.6 TCustomStringsValuesList.ImplGetListValue Method

Responsible for returning the value of the name/value pair.

Pascal

```
function ImplGetListValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetListValue();
```

Description

ImplGetListValue uses the iteration index to retrieve a value from the strings list.

See Also

Strings (see page 5737)

54.1.63.4.7 TCustomStringsValuesList.ImplNextIteration Method

Implements IteratorSupport's NextIteration (see page 5564) method to support iterating over the records of the adapter.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

ImplNextIteration increments the iteration index. false is returned if the iteration index is out of the range defined by the Strings (see page 5737) property's Count property. The iteration index is used when retrieving a name or value from the strings list.

See Also

NextIteration (see page 1056)

54.1.63.4.8 TCustomStringsValuesList.ImplNotifyDeactivate Method

Clears the iteration index.

Pascal

```
procedure ImplNotifyDeactivate; override;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

The StringsPrepared (see page 5737) property is cleared. This ensures that the strings list will be prepared during the processing of the next HTTP request.

54.1.63.4.9 TCustomStringsValuesList.ImplStartIterator Method

Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

ImplStartIterator initializes the iteration index to 0. false is returned if the iteration index is out of the range defined by the Strings (see page 5737) property's Count property. The iteration index is used when retrieving a name or value from the strings list.

See Also

StartIterator (see page 1056)

54.1.63.4.10 TCustomStringsValuesList.PrepareStrings Method

Customizes the content of the strings list.

Pascal

```
procedure PrepareStrings; virtual;
```

C++

```
virtual __fastcall PrepareStrings();
```

Description

PrepareStrings calls the OnPrepareStrings (see page 5738) event handler.

See Also

StringsPrepared (see page 5737)

OnPrepareStrings (see page 5738)

54.1.63.5 TCustomStringsValuesList Properties

The properties of the TCustomStringsValuesList class are listed here.

Protected Properties

	Name	Description
	StringsPrepared (see page 5737)	This flag indicates whether the strings list has been prepared or customized.

Public Properties

	Name	Description
	Strings (see page 5737)	This string list defines the list of name/value pairs.

54.1.63.5.1 TCustomStringsValuesList.Strings Property

This string list defines the list of name/value pairs.

Pascal

```
property Strings: TStrings;
```

C++

```
__property TStrings Strings;
```

Description

Each line in the string list represents a name/value pair. The name is optional. To specify a name/value enter a line with the name following by "=" followed by the value. For example, "Joe Smith=EMP111" is a named value. "EMP111" is an unnamed value.

54.1.63.5.2 TCustomStringsValuesList.StringsPrepared Property

This flag indicates whether the strings list has been prepared or customized.

Pascal

```
property StringsPrepared: Boolean;
```

C++

```
__property Boolean StringsPrepared;
```

Description

This flag is checked before calling PrepareStrings (see page 5737).

See Also

PrepareStrings (see page 5737)

54.1.63.6 TCustomStringsValuesList Events

The events of the TCustomStringsValuesList class are listed here.

Public Events

	Name	Description
	OnPrepareStrings (see page 5738)	Implement OnPrepareStrings to customize the content of the strings list.

54.1.63.6.1 TCustomStringsValuesList.OnPrepareStrings Event

Implement OnPrepareStrings to customize the content of the strings list.

Pascal

```
property OnPrepareStrings: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPrepareStrings;
```

Description

OnPrepareStrings is called before the name/value pairs are retrieved by server-side script.

See Also

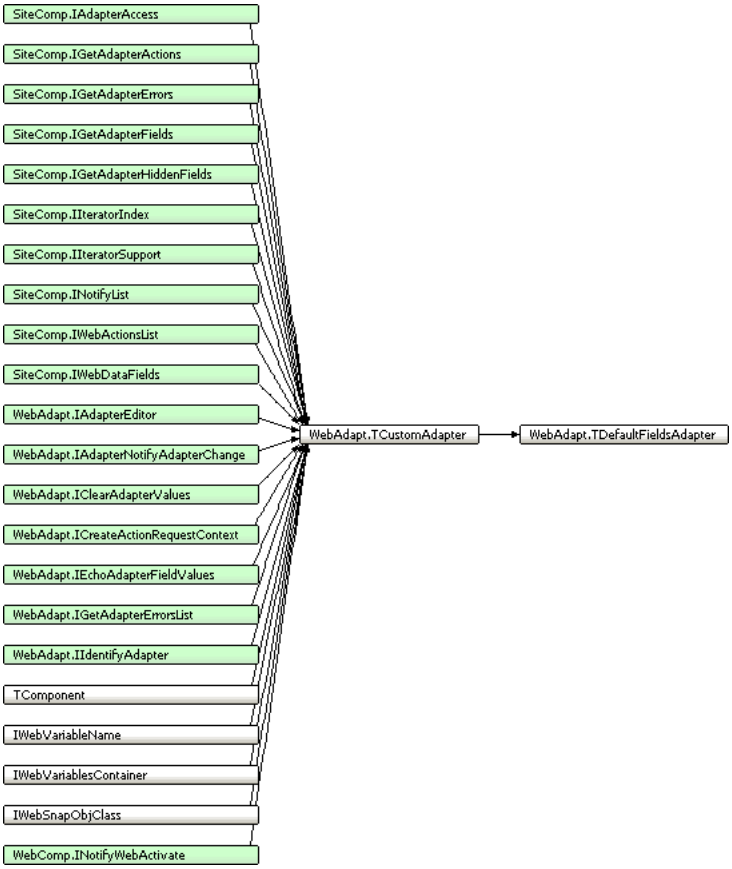
TNotifyEvent

PrepareStrings (see page 5737)

54.1.64 TDefaultFieldsAdapter Class

TDefaultFieldsAdapter is a base class for adapters that automatically adds default fields and/or actions.

Class Hierarchy



Pascal

```
TDefaultFieldsAdapter = class(TCustomAdapter);
```

C++

```
class TDefaultFieldsAdapter : public TCustomAdapter;
```

File

WebAdapt

Description

Derive from TDefaultFieldsAdapter to define adapter components that automatically add adapter field and/or adapter action components. Default fields are added to the adapter unless one or more field has been explicitly added.

Default actions are added to the adapter unless one or more action has been explicitly added.

See Also

TCustomAdapter (see page 5531)

54.1.64.1 TDefaultFieldsAdapter Members

The following tables list the members exposed by TDefaultFieldsAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.

	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.

	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.

	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5746)	Container for adapter actions components.
R	Data (see page 5747)	Container for adapter field components.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.64.2 TDefaultFieldsAdapter Methods

The methods of the TDefaultFieldsAdapter class are listed here.

Protected Methods

	Name	Description
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
V	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
V	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
V	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.

54.1.64.2.1 TDefaultFieldsAdapter.AddDefaultActions Method

Adds default action components to this adapter.

Pascal

```
procedure AddDefaultActions(AComponents: TWebComponentList); virtual;
```

C++

```
virtual __fastcall AddDefaultActions(TWebComponentList AComponents);
```

Description

AddDefaultActions calls ImplGetActionsList (see page 5555). Descendant classes should override TCustomAdapter (see page 5531)'s ImplGetActionsList (see page 5555) method to provide the list of default actions that will be automatically added to this adapter.

See Also

TWebComponentList (see page 6025)

ImplGetActionsList (see page 5555)

54.1.64.2.2 TDefaultFieldsAdapter.AddDefaultFields Method

Adds default field components to this adapter.

Pascal

```
procedure AddDefaultFields(AComponents: TWebComponentList); virtual;
```

C++

```
virtual __fastcall AddDefaultFields(TWebComponentList AComponents);
```

Description

AddDefaultFields calls ImplGetFieldList. Descendant classes should override TCustomAdapter (see page 5531)'s ImplGetFieldList method to provide the list of default fields that will be automatically added to this adapter.

See Also

TWebComponentList (see page 6025)

ImplGetFieldsList (see page 5556)

54.1.64.2.3 TDefaultFieldsAdapter.DefaultWebComponentsChange Method

Notifies other components of changes to the list of default actions or fields.

Pascal

```
procedure DefaultWebComponentsChange(Sender: TObject);
```

C++

```
__fastcall DefaultWebComponentsChange(TObject * Sender);
```

Description

The list of default fields or actions may be based on properties of the adapter or properties of other components. For example, the default fields of TDataSetAdapter are based on the fields in the dataset. If the TDataSetAdapter references a different dataset then the default fields list will change. If the dataset's field list changes then TDataSetAdapter's default fields will change. DefaultWebCompoentsChange is called in these circumstances so that components that are using this adapter can be notified of changes to the list of fields or actions. DefaultWebComponentsChange calls NotifyAdapterChange (see page 5565).

See Also

NotifyAdapterChange (see page 5565)

54.1.64.2.4 TDefaultFieldsAdapter.GetActionsClass Method

Specifies the class to create as a container for adapter actions components.

Pascal

```
function GetActionsClass: TAdapterActionsClass; override;
```

C++

```
virtual __fastcall TAdapterActionsClass GetActionsClass();
```

Description

GetActionsClass returns TAdapterDefaultActions (see page 5231).

See Also

TAdapterDefaultActions (see page 5231)

54.1.64.2.5 TDefaultFieldsAdapter.GetDataClass Method

Specifies the class to create as a container for adapter field components.

Pascal

```
function GetDataClass: TAdapterFieldsClass; override;
```

C++

```
virtual __fastcall TAdapterFieldsClass GetDataClass();
```

Description

GetDataClass returns TAdapterDefaultFields (see page 5237).

See Also

TAdapterDefaultFields (see page 5237)

54.1.64.2.6 TDefaultFieldsAdapter.ImplGetVisibleActions Method

Returns a list of this adapter's action components.

Pascal

```
function ImplGetVisibleActions: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleActions();
```

Description

ImplGetVisibleActions returns a list of actions that have been added to the adapter. If no adapter fields have been explicitly added, ImplGetVisibleActions returns a list containing all default actions.

See Also

TWebComponentList (see page 6025)

ImplGetVisibleActions (see page 5557)

54.1.64.2.7 TDefaultFieldsAdapter.ImplGetVisibleFields Method

Returns a list of this adapter's field components.

Pascal

```
function ImplGetVisibleFields: TWebComponentList; override;
```

C++

```
virtual __fastcall TWebComponentList ImplGetVisibleFields();
```

Description

ImplGetVisibleFields returns a list of fields that have been added to the adapter. If no adapter fields have been explicitly added,

ImplGetVisibleFields returns a list containing all default fields.

See Also

TWebComponentList (see page 6025)

ImplGetVisibleFields (see page 5558)

54.1.64.2.8 TDefaultFieldsAdapter.ImplSetActions Method

Initializes the Actions (see page 5746) property.

Pascal

```
procedure ImplSetActions(const Value: TAdapterSubComponent); override;
```

C++

```
virtual __fastcall ImplSetActions(const TAdapterSubComponent Value);
```

Description

The Actions (see page 5746) property is the container for adapter action components.

See Also

ImplSetActions (see page 5561)

54.1.64.2.9 TDefaultFieldsAdapter.ImplSetData Method

Initializes the Data (see page 5747) property.

Pascal

```
procedure ImplSetData(const Value: TAdapterSubComponent); override;
```

C++

```
virtual __fastcall ImplSetData(const TAdapterSubComponent Value);
```

Description

The Data (see page 5747) property is the container for adapter field components.

See Also

ImplSetData (see page 5561)

54.1.64.3 TDefaultFieldsAdapter Properties

The properties of the TDefaultFieldsAdapter class are listed here.

Public Properties

	Name	Description
R	Actions (see page 5746)	Container for adapter actions components.
R	Data (see page 5747)	Container for adapter field components.

54.1.64.3.1 TDefaultFieldsAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterDefaultActions;
```

C++

```
__property TAdapterDefaultActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 5231)

54.1.64.3.2 TDefaultFieldsAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterDefaultFields;
```

C++

```
__property TAdapterDefaultFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

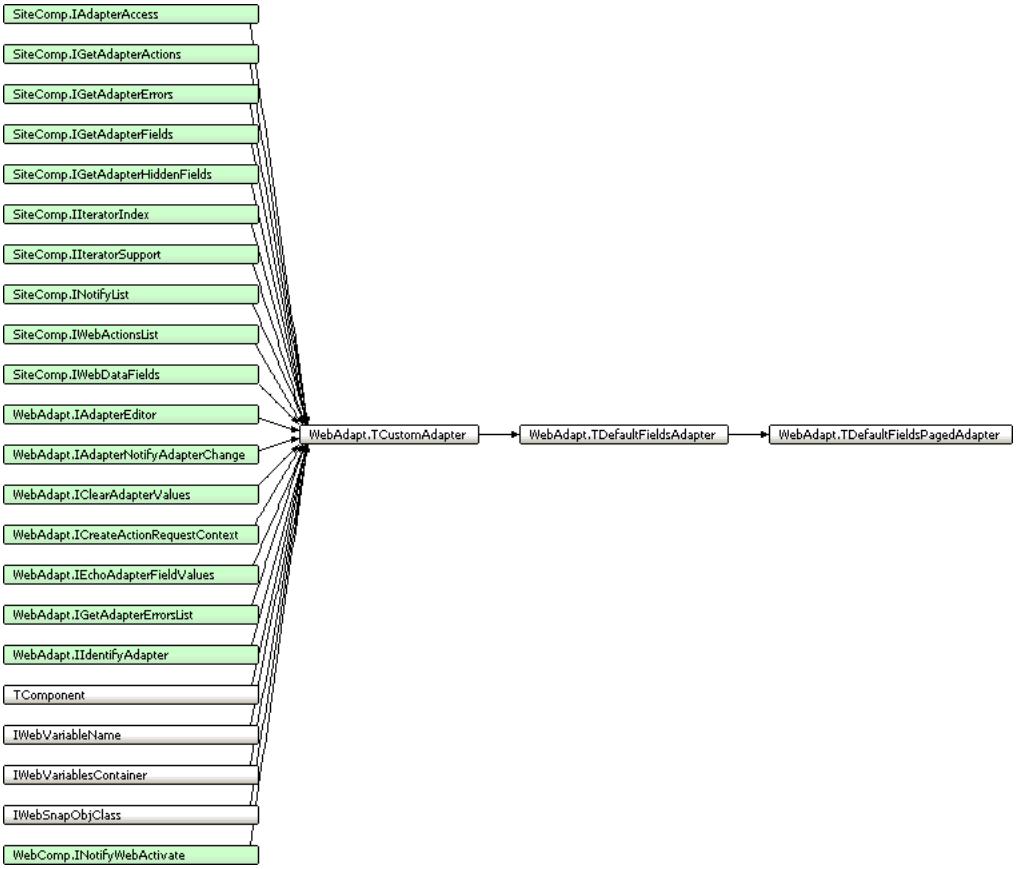
See Also

TAdapterDefaultFields (see page 5237)

54.1.65 TDefaultFieldsPagedAdapter Class

TDefaultFieldsPagedAdapter is a base class for adapters that support paging.

Class Hierarchy



Pascal

```
TDefaultFieldsPagedAdapter = class(TDefaultFieldsAdapter);
```

C++

```
class TDefaultFieldsPagedAdapter : public TDefaultFieldsAdapter;
```

File

WebAdapt

Description

Enable paging by setting the PageSize (see page 5761) property. When paging is enabled, the way that the adapter enumerates records is affected. The adapter calculates the number of pages by dividing the number of records by the page size. It keeps track of a current page number. When the enumerating records, the records on the current page are enumerated. Server-side script simply enumerates the records. Server-side script does not need to be aware of the page size or current page number. When paging is enabled, default actions for moving between pages are automatically added to the adapter.

See Also

TDefaultFieldsAdapter (see page 5738)

TAdapterNextPageAction (see page 5370)

TAdapterPrevPageAction (see page 5396)

TAdapterGotoPageAction (see page 5291)

54.1.65.1 TDefaultFieldsPagedAdapter Members

The following tables list the members exposed by TDefaultFieldsPagedAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5753)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5754)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
	EndOfPage (see page 5754)	Indicates whether the record index has gone past the last record in the current page.
V	ExtractRequestParams (see page 5754)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
V	GetEOF (see page 5755)	Indicates whether the record position has passed the last record.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetFirstRecord (see page 5755)	Set the record position to the first record.

	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetNextRecord (see page 5755)	Increments the record position.
	GetPageCount (see page 5756)	Calculates the number of pages needed to display all adapter records.
	GetRecordCount (see page 5756)	Returns the total number of records.
	GetRecordIndex (see page 5756)	Returns the index of the current record.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 5757)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
	ImplEndIterator (see page 5757)	Implements IteratorSupport's EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5757)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5758)	Implements IteratorSupport's NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5758)	Clears the current page variable.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5759)	Implements IteratorSupport.StartIterator (see page 5567) to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.

	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
V	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	SetPageSize (see page 5759)	Updates the pagesize variable.
	SkipToPage (see page 5760)	Skips records until the current record is within the current page.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
V	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
R	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
R	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnGetEOF (see page 5762)	Implement this event to indicate when the current record index has exceeded the total record count.
	OnGetFirstRecord (see page 5763)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 5763)	Implement this method to increment the iteration index.
	OnGetRecordCount (see page 5763)	Implement this event to identify the total number of records that can be iterated.
	OnGetRecordIndex (see page 5763)	Implement this event to identify the zero-based current record.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.

	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.
R	Actions (see page 5746)	Container for adapter actions components.
	CurrentPage (see page 5760)	Sets or gets the current page index.
R	Data (see page 5572)	Data is the container for adapter field components.
R	Data (see page 5747)	Container for adapter field components.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
R	PageCount (see page 5761)	Calculates the number of pages needed to display all adapter records.
	PageSize (see page 5761)	Sets or gets the page size variable.
R	RecordCount (see page 5761)	Returns the total number of records.
R	RecordIndex (see page 5762)	Returns the index of the current record.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.

	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.65.2 TDefaultFieldsPagedAdapter Methods

The methods of the TDefaultFieldsPagedAdapter class are listed here.

Protected Methods

	Name	Description
	AddDefaultActions (see page 5753)	Adds default action components to this adapter.
	EncodeActionParams (see page 5754)	Writes name/value pairs that represent adapter state.
	EndOfPage (see page 5754)	Indicates whether the record index has gone past the last record in the current page.
	ExtractRequestParams (see page 5754)	Reads name/value pairs from the HTTP request.
	GetEOF (see page 5755)	Indicates whether the record position has passed the last record.
	GetFirstRecord (see page 5755)	Set the record position to the first record.
	GetNextRecord (see page 5755)	Increments the record position.
	GetPageCount (see page 5756)	Calculates the number of pages needed to display all adapter records.
	GetRecordCount (see page 5756)	Returns the total number of records.
	GetRecordIndex (see page 5756)	Returns the index of the current record.
	ImplCanAddActionClass (see page 5757)	Indicates whether a type of adapter action can be added to this adapter.
	ImplEndIterator (see page 5757)	Implements IteratorSupport's EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplGetActionsList (see page 5757)	Provides a list of action types that can be added to this adapter.
	ImplNextIteration (see page 5758)	Implements IteratorSupport's NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyDeactivate (see page 5758)	Clears the current page variable.
	ImplStartIterator (see page 5759)	Implements IteratorSupport.StartIterator (see page 5567) to support iterating over the records of the adapter.
	SetPageSize (see page 5759)	Updates the pagesize variable.
	SkipToPage (see page 5760)	Skips records until the current record is within the current page.

54.1.65.2.1 TDefaultFieldsPagedAdapter.AddDefaultActions Method

Adds default action components to this adapter.

Pascal

```
procedure AddDefaultActions(AComponents: TWebComponentList); override;
```

C++

```
virtual __fastcall AddDefaultActions(TWebComponentList AComponents);
```

Description

AddDefaultActions adds TAdapterNextPageAction (see page 5370), TAdapterGotoPageAction (see page 5291), and TAdapterPrevPageAction (see page 5396).

See Also

TWebComponentList (see page 6025)

TAdapterNextPageAction (see page 5370)

TAdapterGotoPageAction (see page 5291)

TAdapterPrevPageAction (see page 5396)

54.1.65.2.2 TDefaultFieldsPagedAdapter.EncodeActionParams Method

Writes name/value pairs that represent adapter state.

Pascal

```
procedure EncodeActionParams(AParams: IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall EncodeActionParams(IAdapterItemRequestParams AParams);
```

Description

ExtractRequestParams (see page 5754) writes the current page number as a name/value pair.

See Also

ExtractRequestParams (see page 5543)

ExtractRequestParams (see page 5754)

54.1.65.2.3 TDefaultFieldsPagedAdapter.EndOfPage Method

Indicates whether the record index has gone past the last record in the current page.

Pascal

```
function EndOfPage: Boolean;
```

C++

```
__fastcall Boolean EndOfPage();
```

Description

EndOfPage tests for the end of page using PageSize (see page 5761), RecordIndex (see page 5762), and CurrentPage (see page 5760).

See Also

PageSize (see page 5761)

RecordIndex (see page 5762)

CurrentPage (see page 5760)

54.1.65.2.4 TDefaultFieldsPagedAdapter.ExtractRequestParams Method

Reads name/value pairs from the HTTP request.

Pascal

```
procedure ExtractRequestParams(ARequest: IUnknown); override;
```

C++

```
virtual __fastcall ExtractRequestParams(IUnknown ARequest);
```

Description

ExtractRequestParams is called by a child adapter action before executing the action. This gives the adapter an opportunity to extract values from the HTTP request that are important to the behavior of the adapter. ExtractRequestParams extracts the current page number from the request.

See Also

EncodeActionParams (see page 5754)

ExtractRequestParams (see page 5543)

54.1.65.2.5 TDefaultFieldsPagedAdapter.GetEOF Method

Indicates whether the record position has passed the last record.

Pascal

```
function GetEOF: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetEOF();
```

Description

GetEOF calls the OnGetFirstRecord (see page 5763) event handler. If OnGetFirstRecord (see page 5763) is not implemented then the RecordIndex (see page 5762) is compared to the RecordCount (see page 5761). Descendant classes may override this method. For example, TDataSetAdapter tests the dataset's EOF.

See Also

OnGetEOF (see page 5762)

RecordIndex (see page 5762)

RecordCount (see page 5761)

54.1.65.2.6 TDefaultFieldsPagedAdapter.GetFirstRecord Method

Set the record position to the first record.

Pascal

```
function GetFirstRecord: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetFirstRecord();
```

Description

GetFirstRecord calls the OnGetFirstRecord (see page 5763) event handler. Descendant classes may override this method. For example, TDataSetAdapter sets the record position of a dataset.

See Also

OnGetFirstRecord (see page 5763)

54.1.65.2.7 TDefaultFieldsPagedAdapter.GetNextRecord Method

Increments the record position.

Pascal

```
function GetNextRecord: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean GetNextRecord();
```

Description

GetNextRecord calls the OnGetNextRecord (see page 5763) event handler. Descendant classes may override this method. For example, TDataSetAdapter increments the record position of a dataset.

See Also

OnGetNextRecord (see page 5763)

54.1.65.2.8 TDefaultFieldsPagedAdapter.GetPageCount Method

Calculates the number of pages needed to display all adapter records.

Pascal

```
function GetPageCount: Integer;
```

C++

```
__fastcall int GetPageCount();
```

Description

GetPageCount calculates the page count using PageCount (see page 5761), PageSize (see page 5761), and RecordCount (see page 5761).

See Also

RecordCount (see page 5761)

PageCount (see page 5761)

PageSize (see page 5761)

54.1.65.2.9 TDefaultFieldsPagedAdapter.GetRecordCount Method

Returns the total number of records.

Pascal

```
function GetRecordCount: Integer; virtual;
```

C++

```
virtual __fastcall int GetRecordCount();
```

Description

GetRecordCount calls the OnGetRecordCount (see page 5763) event handler. Descendant classes may override this method. For example, TDataSetAdapter returns the number of records in the dataset.

See Also

OnGetRecordCount (see page 5763)

RecordCount (see page 5761)

54.1.65.2.10 TDefaultFieldsPagedAdapter.GetRecordIndex Method

Returns the index of the current record.

Pascal

```
function GetRecordIndex: Integer; virtual;
```

C++

```
virtual __fastcall int GetRecordIndex();
```

Description

GetRecordIndex calls the OnGetRecordIndex (see page 5763) event handler.

See Also

OnGetRecordIndex (see page 5763)

54.1.65.2.11 TDefaultFieldsPagedAdapter.ImplCanAddActionClass Method

Indicates whether a type of adapter action can be added to this adapter.

Pascal

```
function ImplCanAddActionClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

ImplCanAddActionClass allows action classes that derive from TCustomPagedAdapterAction (see page 5722) in addition to those allowed by TCustomAdapter (see page 5531)'s ImplCanAddActionsClass method.

See Also

ImplCanAddActionClass (see page 5553)

ImplCanAddClass (see page 5212)

TCustomPagedAdapterAction (see page 5722)

54.1.65.2.12 TDefaultFieldsPagedAdapter.ImplEndIterator Method

Implements IteratorSupport's EndIterator (see page 5542) method to support iterating over the data records of the adapter.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

EndIterator (see page 5542) is called when record iteration is complete.

See Also

EndIterator (see page 1056)

54.1.65.2.13 TDefaultFieldsPagedAdapter.ImplGetActionsList Method

Provides a list of action types that can be added to this adapter.

Pascal

```
procedure ImplGetActionsList(AList: TStrings); override;
```

C++

```
virtual __fastcall ImplGetActionsList(TStrings AList);
```

Description

ImplGetActionsList lists PrevPage, GotoPage, and NextPage actions.

See Also

TAdapterNextPageAction (see page 5370)

TAdapterGotoPageAction (see page 5291)

TAdapterPrevPageAction (see page 5396)

ImplGetActionsList (see page 5555)

54.1.65.2.14 TDefaultFieldsPagedAdapter.ImplNextIteration Method

Implements IteratorSupport's NextIteration (see page 5564) method to support iterating over the records of the adapter.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

ImplNextIteration calls GetNextRecord (see page 5755) if the RecordIndex (see page 5762) can be incremented without running past the end of the current page. false is returned if RecordIndex (see page 5762) can't be incremented.

See Also

NextIteration (see page 1056)

RecordIndex (see page 5762)

RecordCount (see page 5761)

GetNextRecord (see page 5755)

GetEOF (see page 5755)

EndOfPage (see page 5754)

54.1.65.2.15 TDefaultFieldsPagedAdapter.ImplNotifyDeactivate Method

Clears the current page variable.

Pascal

```
procedure ImplNotifyDeactivate; override;
```

C++

```
virtual __fastcall ImplNotifyDeactivate();
```

Description

The current page is reset to zero when the module is deactivated. This ensures that the current page set during the processing of an HTTP request will not affect another HTTP request. To keep track of the current page for a particular end-user, the current page is typically passed between end-user requests using action parameters.

See Also

ImplNotifyDeactivate (see page 5560)

EncodeActionParams (see page 5754)

ExtractRequestParams (see page 5754)

54.1.65.2.16 TDefaultFieldsPagedAdapter.ImplStartIterator Method

Implements IteratorSupport.StartIterator (see page 5567) to support iterating over the records of the adapter.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

ImplStartIterator locates the first record in the current page using the GetFirstRecord (see page 5755) and SkipToPage (see page 5760) methods.

See Also

StartIterator (see page 1056)

ImplNextIteration (see page 5758)

GetFirstRecord (see page 5755)

SkipToPage (see page 5760)

CurrentPage (see page 5760)

54.1.65.2.17 TDefaultFieldsPagedAdapter.SetPageSize Method

Updates the pagesize variable.

Pascal

```
procedure SetPageSize(const Value: Integer);
```

C++

```
__fastcall SetPageSize(const int Value);
```

Description

If the pagesize variable is not zero and no actions have been explicitly added to the adapter then the NextPage, PrevPage, and GotoPage are automatically added. If the pagesize variable is changed back to zero then the these actions are removed.

See Also

PageSize (see page 5761)

TAdapterNextPageAction (see page 5370)

TAdapterPrevPageAction (see page 5396)

TAdapterGotoPageAction (see page 5291)

54.1.65.2.18 TDefaultFieldsPagedAdapter.SkipToPage Method

Skips records until the current record is within the current page.

Pascal

```
procedure SkipToPage;
```

C++

```
__fastcall SkipToPage();
```

Description

SkipToPage calls GetNextRecord (see page 5755) to reach the first record in the current page.

See Also

CurrentPage (see page 5760)

GetNextRecord (see page 5755)

54.1.65.3 TDefaultFieldsPagedAdapter Properties

The properties of the TDefaultFieldsPagedAdapter class are listed here.

Public Properties

	Name	Description
	CurrentPage (see page 5760)	Sets or gets the current page index.
R	PageCount (see page 5761)	Calculates the number of pages needed to display all adapter records.
	PageSize (see page 5761)	Sets or gets the page size variable.
R	RecordCount (see page 5761)	Returns the total number of records.
R	RecordIndex (see page 5762)	Returns the index of the current record.

54.1.65.3.1 TDefaultFieldsPagedAdapter.CurrentPage Property

Sets or gets the current page index.

Pascal

```
property CurrentPage: Integer;
```

C++

```
__property int CurrentPage;
```

Description

Current page is a zero-based index that must be less than PageCount (see page 5761). Current page is used by the NextPage, GotoPage, and PrevPage actions to move between page.

See Also

PageCount (see page 5761)

TAdapterNextPageAction (see page 5370)

TAdapterPrevPageAction (see page 5396)

TAdapterGotoPageAction (see page 5291)

EncodeActionParams (see page 5754)

ExtractRequestParams (see page 5754)

54.1.65.3.2 TDefaultFieldsPagedAdapter.PageCount Property

Calculates the number of pages needed to display all adapter records.

Pascal

```
property PageCount: Integer;
```

C++

```
__property int PageCount;
```

Description

PageCount returns the result of GetPageCount (see page 5756).

See Also

GetPageCount (see page 5756)

RecordCount (see page 5761)

PageSize (see page 5761)

54.1.65.3.3 TDefaultFieldsPagedAdapter.PageSize Property

Sets or gets the page size variable.

Pascal

```
property PageSize: Integer;
```

C++

```
__property int PageSize;
```

Description

If the page size variable is set to a value greater than zero and no actions have been explicitly added to the adapter then the NextPage, PrevPage, and GotoPage are automatically added. If the page size variable is changed back to zero then the these actions are removed.

See Also

TAdapterNextPageAction (see page 5370)

TAdapterPrevPageAction (see page 5396)

TAdapterGotoPageAction (see page 5291)

54.1.65.3.4 TDefaultFieldsPagedAdapter.RecordCount Property

Returns the total number of records.

Pascal

```
property RecordCount: Integer;
```

C++

```
__property int RecordCount;
```

Description

The RecordCount property returns the result of GetRecordCount (see page 5756).

See Also

GetRecordCount (see page 5756)

54.1.65.3.5 TDefaultFieldsPagedAdapter.RecordIndex Property

Returns the index of the current record.

Pascal

```
property RecordIndex: Integer;
```

C++

```
__property int RecordIndex;
```

Description

RecordIndex returns the result of GetRecordIndex (see page 5756).

See Also

OnGetRecordIndex (see page 5763)

GetRecordIndex (see page 5756)

54.1.65.4 TDefaultFieldsPagedAdapter Events

The events of the TDefaultFieldsPagedAdapter class are listed here.

Public Events

	Name	Description
	OnGetEOF (see page 5762)	Implement this event to indicate when the current record index has exceeded the total record count.
	OnGetFirstRecord (see page 5763)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 5763)	Implement this method to increment the iteration index.
	OnGetRecordCount (see page 5763)	Implement this event to identify the total number of records that can be iterated.
	OnGetRecordIndex (see page 5763)	Implement this event to identify the zero-based current record.

54.1.65.4.1 TDefaultFieldsPagedAdapter.OnGetEOF Event

Implement this event to indicate when the current record index has exceeded the total record count.

Pascal

```
property OnGetEOF: TGetEOFEvent;
```

C++

```
__property TGetEOFEvent OnGetEOF;
```

Description

OnGetEOF is called to determine when to stop the iteration. If OnGetEOF is not implemented, the result of the OnGetRecordCount (see page 5763) event handler will be compared to the result of the OnGetRecordIndex (see page 5763) event handler.

54.1.65.4.2 TDefaultFieldsPagedAdapter.OnGetFirstRecord Event

Implement this method to initialize the iteration index to zero.

Pascal

```
property OnGetFirstRecord: TGetRecordEvent;
```

C++

```
__property TGetRecordEvent OnGetFirstRecord;
```

Description

This method is called when the iteration is started. If there are no records then set the EOF flag.

54.1.65.4.3 TDefaultFieldsPagedAdapter.OnGetNextRecord Event

Implement this method to increment the iteration index.

Pascal

```
property OnGetNextRecord: TGetRecordEvent;
```

C++

```
__property TGetRecordEvent OnGetNextRecord;
```

Description

This method is called when the next record is requested. This method is not a next then set the EOF flag.

54.1.65.4.4 TDefaultFieldsPagedAdapter.OnGetRecordCount Event

Implement this event to identify the total number of records that can be iterated.

Pascal

```
property OnGetRecordCount: TGetRecordCountEvent;
```

C++

```
__property TGetRecordCountEvent OnGetRecordCount;
```

Description

OnGetRecordCount is called to calculate the number of pages.

54.1.65.4.5 TDefaultFieldsPagedAdapter.OnGetRecordIndex Event

Implement this event to identify the zero-based current record.

Pascal

```
property OnGetRecordIndex: TGetRecordIndexEvent;
```

C++

```
__property TGetRecordIndexEvent OnGetRecordIndex;
```

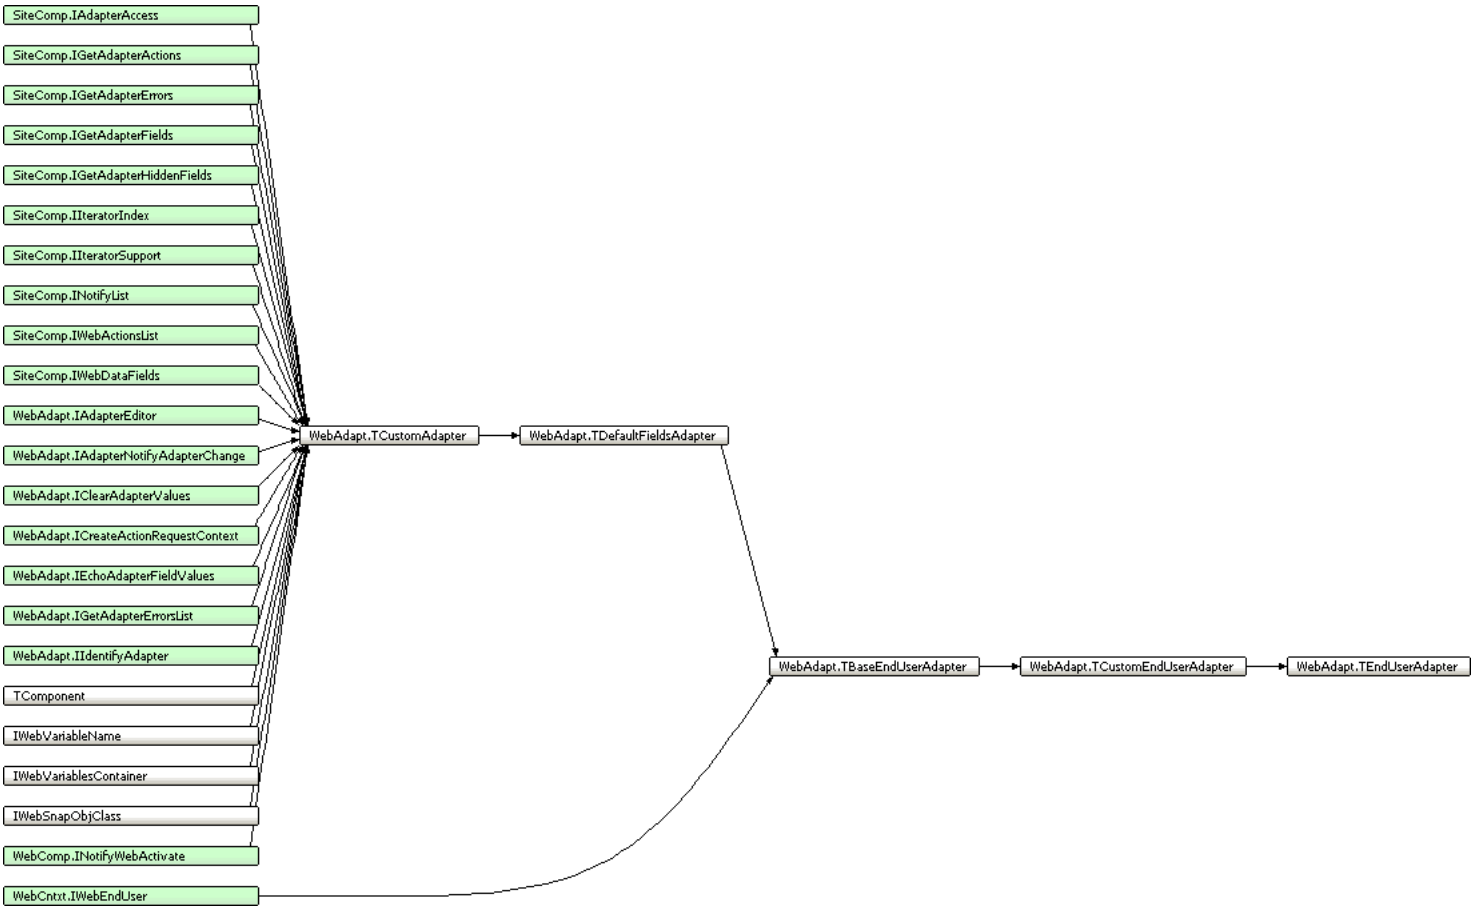
Description

OnGetRecordIndex is called to calculate the current page.

54.1.66 TEndUserAdapter Class

TEndUserAdapter provides information about the current end user such as the user name, user ID, and whether the user is logged in.

Class Hierarchy



Pascal

```
TEndUserAdapter = class(TCustomEndUserAdapter);
```

C++

```
class TEndUserAdapter : public TCustomEndUserAdapter;
```

File

WebAdapt

Description

Add TEndUserSessionAdapter (see page 5792) to a WebSnap application where users must log in before accessing Web pages. TEndUserSessionAdapter (see page 5792) handles login and logout actions on behalf of the end user by generating events where you can retrieve user information and execute user actions

TEndUserAdapter supports two default Adapter fields: DisplayName and LoggedIn. These fields provide access to the user's

name and login state. Implement the OnGetDisplayName (see page 5773) and OnIsLoggedIn (see page 5774) events to provide values for these fields.

TEndUserAdapter contains two default actions: LoginForm and LogoutOut. These actions are used to display a login form and to log the user out. Use the LoginPage (see page 5771) property to specify the name of the login page. Implement the OnLogin (see page 5775) and OnLogout (see page 5775) events to change the login state of an end user.

The EndUser script variable is used to by server-side script to display end user information and execute end user actions. The following JavaScript displays the name of the logged in end user, if any.

```
<% if (EndUser.LoggedIn) { %>
<h1>Welcome <%= EndUser.DisplayName %> </h1>
<% } %>
```

The following JavaScript displays a login or logout hyperlink.

```
<%   if (EndUser.Logout.Enabled) { %>
  <a href="<%=EndUser.Logout.AsHREF%>">Logout</a>
<%   } %>
<%   if (EndUser.LoginForm.Enabled) { %>
  <a href=<%=EndUser.LoginForm.AsHREF%>>Login</a>
<%   } %>
```

TEndUserAdapter also determines access rights for a user. If the WebSnap application contains a TWebUserList or equivalent, TEndUserAdapter calls the TWebUserList component to check rights for a particular user ID. Implement the OnHasRights (see page 5774) event to check rights in an event handler.

54.1.66.1 TEndUserAdapter Members

The following tables list the members exposed by TEndUserAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 5504)	Determines if there is a static login page.
V	CanExecuteLogout (see page 5504)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 5505)	Determines whether there is a static login page or an automatically produced login page.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	DoOnHasRights (see page 5505)	Determines whether the user has view rights.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExecuteLogin (see page 5505)	Starts the server-side login process.

	ExecuteLogin (see page 5683)	Generates an OnLogin (see page 5686) event.
	ExecuteLoginForm (see page 5506)	Creates the HTML login page.
	ExecuteLogout (see page 5506)	Performs server-side logout.
	ExecuteLogout (see page 5683)	Generates an OnLogout (see page 5687) event.
	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 5506)	Retrieves the display name string.
	GetDisplayNameValue (see page 5507)	Gets the display name of the end user.
	GetDisplayNameValue (see page 5683)	Generates an OnGetDisplayName (see page 5685) event.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 5507)	Gets the end-user adapter.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 5507)	Determines if the user is logged in
	GetLoggedInValue (see page 5508)	Determines if the user is logged in.
	GetLoggedInValue (see page 5684)	Generates an OnIsLoggedIn (see page 5686) event.
	GetLoginFormAction (see page 5508)	Gets the action component for the login form.
	GetLogoutAction (see page 5508)	Gets the action component for the logout form.
	GetUserID (see page 5509)	Gets the UserID from this TBaseEndUserAdapter (see page 5497).
	GetUserID (see page 5684)	Generates an OnGetUserID (see page 5685) event.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasExecuteRights (see page 5509)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5497).
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasModifyRights (see page 5509)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5497).
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.

	HasViewRights (see page 5510)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 5497).
	ImplCanAddActionClass (see page 5510)	Determines if the given action class can be added.
	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 5510)	Determines if the given action class can be added.
	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5511)	Lists supported end-user adapter actions.
	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
	ImplGetDisplayName (see page 5511)	Gets the display name for this TBaseEndUserAdapter (see page 5497).
	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
	ImplGetEndUserAdapter (see page 5511)	Returns this TBaseEndUserAdapter (see page 5497).
	ImplGetFieldsList (see page 5512)	Obtains the list of all of the fields for the end-user adapter.
	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
	ImplGetLoggedIn (see page 5512)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 5512)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5497).
	ImplGetLogoutAction (see page 5513)	Gets the Logout action component for this TBaseEndUserAdapter (see page 5497).
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasExecuteRights (see page 5513)	Checks user rights and determines if the user has execute rights.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasModifyRights (see page 5513)	Checks user rights and determines if the user has modify rights.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplHasViewRights (see page 5514)	Checks user rights and determines if the user has view rights.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplLogIn (see page 5514)	Processes the login for the given user.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplProduceLoginPage (see page 5514)	Generate the HTML login page.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.

	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	LogIn (see page 5515)	Processes the server-side login for the given user.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
V	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	ProduceLoginPage (see page 5515)	Generates the login page.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
V	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
V	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
V	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
V	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
V	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
V	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
V	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	UserList (see page 5515)	Gets the user list.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
R	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
R	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
R	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetUserID (see page 5685)	Occurs when the adapter needs to provide the ID of the current end user.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.

	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetDisplayName (see page 5989)	Returns the value of the DisplayName (see page 5994) property.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEndUserAdapter (see page 5990)	Returns the value of the EndUserAdapter (see page 5994) property.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetLoggedIn (see page 5990)	Returns the value of the LoggedIn (see page 5994) property.
	GetLoginFormAction (see page 5990)	Returns the value of the LoginFormAction (see page 5995) property.
	GetLogoutAction (see page 5991)	Returns the value of the LogoutAction (see page 5996) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasExecuteRights (see page 5991)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasModifyRights (see page 5992)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	HasViewRights (see page 5992)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	LogIn (see page 5993)	Logs in a specified user.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	ProduceLoginPage (see page 5993)	Generates the Web page for logging in users.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	DisplayName (see page 5994)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 5994)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
R	LoggedIn (see page 5994)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 5995)	Indicates the action component for the login form.
R	LogoutAction (see page 5996)	Indicates the action component for logging a user out.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.

	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5771)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5772)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 5772)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5772)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5773)	Supplies name/value pairs needed to execute an adapter action.
	OnGetDisplayName (see page 5773)	Occurs when the adapter needs to provide the name of the current end user.
	OnHasRights (see page 5774)	Determines if the user rights match the rights being queried.
	OnIsLoggedIn (see page 5774)	Occurs when the adapter needs to indicate whether the current end user has logged in.
	OnLogin (see page 5775)	Logs in the current end user.
	OnLogout (see page 5775)	Occurs when the current user logs out.
	OnProduceLoginPage (see page 5776)	Allows implementation of a customized login page.

Published Properties

	Name	Description
	Actions (see page 5770)	Container for adapter actions components.
	Data (see page 5770)	Container for adapter field components.
	LoginPage (see page 5771)	Specifies the name of the page that acts as the login page.

54.1.66.2 TEndUserAdapter Properties

The properties of the TEndUserAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 5770)	Container for adapter actions components.
	Data (see page 5770)	Container for adapter field components.
	LoginPage (see page 5771)	Specifies the name of the page that acts as the login page.

54.1.66.2.1 TEndUserAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 5231)

54.1.66.2.2 TEndUserAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 5237)

54.1.66.2.3 TEndUserAdapter.LoginPage Property

Specifies the name of the page that acts as the login page.

Pascal

```
property LoginPage: string;
```

C++

```
__property UnicodeString LoginPage;
```

Description

Use LoginPage to read or set the name of the login page for this TBaseEndUserAdapter. The name of the login page is the name of the Web page module that generates the login page.

54.1.66.3 TEndUserAdapter Events

The events of the TEndUserAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5771)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5772)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 5772)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5772)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5773)	Supplies name/value pairs needed to execute an adapter action.
	OnGetDisplayName (see page 5773)	Occurs when the adapter needs to provide the name of the current end user.
	OnHasRights (see page 5774)	Determines if the user rights match the rights being queried.
	OnIsLoggedIn (see page 5774)	Occurs when the adapter needs to indicate whether the current end user has logged in.
	OnLogin (see page 5775)	Logs in the current end user.
	OnLogout (see page 5775)	Occurs when the current user logs out.
	OnProduceLoginPage (see page 5776)	Allows implementation of a customized login page.

54.1.66.3.1 TEndUserAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.66.3.2 TEndUserAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.66.3.3 TEndUserAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 5478)

OnAfterExecuteAction (see page 5576)

54.1.66.3.4 TEndUserAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 5478)

OnAfterGetActionResponse (see page 5576)

54.1.66.3.5 TEndUserAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 5478)

54.1.66.3.6 TEndUserAdapter.OnGetDisplayName Event

Occurs when the adapter needs to provide the name of the current end user.

Pascal

```
property OnGetDisplayName: TEndUserGetNameEvent;
```

C++

```
__property TEndUserGetNameEvent OnGetDisplayName;
```

Description

Write an OnGetDisplayName event handler to provide the value of the DisplayName field. When a server-side script (or a caller of the IWebEndUser interface) requests the display name for the current end user, TCustomEndUserAdapter generates an OnGetDisplayName event to retrieve that value.

Note: If you do not supply an OnGetDisplayName event handler, TCustomEndUserAdapter always returns an empty string as the display name for the current end user.

See Also

DisplayName (see page 5994)

EndUser (see page 5973)

WebContext (see page 6003)

54.1.66.3.7 TEndUserAdapter.OnHasRights Event

Determines if the user rights match the rights being queried.

Pascal

```
property OnHasRights: TEndUserRightsEvent;
```

C++

```
__property TEndUserRightsEvent OnHasRights;
```

Description

The OnHasRights event handler is called from DoOnHasRights to determine if the user rights match the rights being queried. A customized event handler should be written to determine the rights for your specific application.

See Also

DoOnHasRights (see page 5505)

ImplHasExecuteRights (see page 5513)

ImplHasModifyRights (see page 5513)

ImplHasViewRights (see page 5514)

54.1.66.3.8 TEndUserAdapter.OnIsLoggedIn Event

Occurs when the adapter needs to indicate whether the current end user has logged in.

Pascal

```
property OnIsLoggedIn: TEndUserIsLoggedInEvent;
```

C++

```
__property TEndUserIsLoggedInEvent OnIsLoggedIn;
```

Description

Write an OnIsLoggedIn event handler to provide the value of the LoggedIn field. When a server-side script (or a caller of the IWebEndUser interface) inquires whether the current user has logged in, TCustomEndUserAdapter generates an OnIsLoggedIn event to retrieve that information.

Note: If you do not supply an OnIsLoggedIn event handler, TCustomEndUserAdapter always returns false, indicating that the current end user has not logged in.

See Also

LoggedIn (see page 5994)

EndUser (see page 5973)

WebContext (see page 6003)

OnLogin (see page 5686)

OnLogout (see page 5687)

54.1.66.3.9 TEndUserAdapter.OnLogin Event

Logs in the current end user.

Pascal

```
property OnLogin: TEndUserUserIDEvent;
```

C++

```
__property TEndUserUserIDEvent OnLogin;
```

Description

Write an OnLogin event handler to allow the TCustomEndUserAdapter object to log users in. When a server-side script (or a caller of the IWebEndUser interface) attempts to log in a user, TCustomEndUserAdapter generates an OnLogin event to perform whatever steps are involved in the login process.

Note: If you do not supply an OnLogin event handler, TCustomEndUserAdapter does nothing to log users in.

See Also

LogIn (see page 5993)

EndUser (see page 5973)

WebContext (see page 6003)

OnIsLoggedIn (see page 5686)

OnLogout (see page 5687)

TWebUserList (see page 6796)

OnGetUserID (see page 5685)

54.1.66.3.10 TEndUserAdapter.OnLogout Event

Occurs when the current user logs out.

Pascal

```
property OnLogout: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnLogout;
```

Description

Write an OnLogout event handler to allow the TCustomEndUserAdapter object to log users out. When a server-side script attempts to log a user out, TCustomEndUserAdapter generates an OnLogout event to perform whatever steps are involved in the logout process.

Note: If you do not supply an OnLogin event handler, TCustomEndUserAdapter does nothing to log users out.

See Also

OnIsLoggedIn (see page 5686)

OnLogin (see page 5686)

54.1.66.3.11 TEndUserAdapter.OnProduceLoginPage Event

Allows implementation of a customized login page.

Pascal

```
property OnProduceLoginPage: TEndUserHandledEvent;
```

C++

```
__property TEndUserHandledEvent OnProduceLoginPage;
```

Description

The OnProduceLoginPage event is triggered in the ImplProduceLoginPage. If a customized login page is desired for your application, a customized event handler can be written for this event.

See Also

ImplProduceLoginPage (see page 5514)

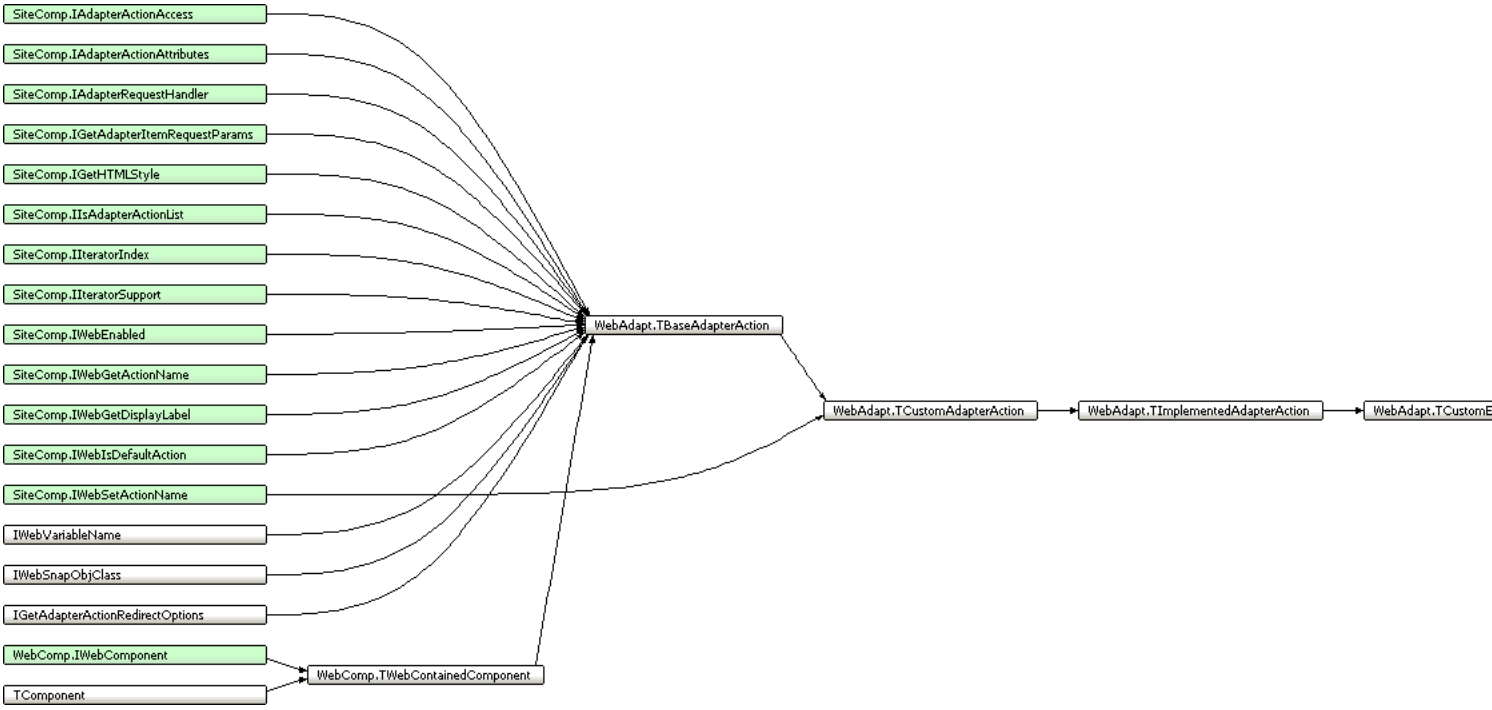
ProduceLoginPage (see page 5515)

CanProduceLoginPage (see page 5505)

54.1.67 TEndUserAdapterLoginFormAction Class

TEndUserAdapterLoginFormAction is an adapter action that displays a login form when executed.

Class Hierarchy



Pascal

```
TEndUserAdapterLoginFormAction = class(TCustomEndUserAdapterAction);
```

C++

```
class TEndUserAdapterLoginFormAction : public TCustomEndUserAdapterAction;
```

File

WebAdapt

Description

This adapter action is typically executed when the end-user clicks on a "Login" hyperlink displayed at the top of a web page. The parent adapter's LoginPage property is used to specify the page displayed when this adapter action is executed.

See Also

TCustomEndUserAdapterAction (see page 5687)

TBaseEndUserAdapter (see page 5497)

TLoginFormAdapter (see page 5824)

54.1.67.1 TEndUserAdapterLoginFormAction Members

The following tables list the members exposed by TEndUserAdapterLoginFormAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5780)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.

	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
	ImplExecuteActionRequest (see page 5781)	Executes the adapter action.
	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
	ImplGetAdapterItemRequestParams (see page 5465)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetAdapterItemRequestParams (see page 5584)	Provides the name/value pairs needed to execute this adapter action.
	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
	ImplWebEnabled (see page 5781)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
R	Adapter (see page 5474)	Provides access to the parent adapter component.
R	Adapter (see page 5692)	Returns the parent adapter of this adapter action.
R	Errors (see page 5475)	Returns the parent adapter's Errors list.
R	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
R	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
R	ActionName (see page 1087)	This is ActionName, a member of class IWebGetActionName.
R	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.

	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 5782)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5783)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5783)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5783)	Called before the adapter action response is generated.
	OnGetParams (see page 5784)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 5782)	Suggests a display label for this adapter action.

54.1.67.2 TEndUserAdapterLoginFormAction Methods

The methods of the TEndUserAdapterLoginFormAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 5780)	Gets the name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 5781)	Executes the adapter action.
	ImplWebEnabled (see page 5781)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

54.1.67.2.1 TEndUserAdapterLoginFormAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultActionName();
```

Description

GetDefaultActionName returns "LoginForm".

See Also

GetActionName (see page 5455)

GetDefaultActionName (see page 5456)

54.1.67.2.2 TEndUserAdapterLoginFormAction.ImplExecuteActionRequest Method

Executes the adapter action.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest calls the parent adapter's ExecuteLogin method. If an exception is raised, the exception message is added to the parent adapter's errors object.

See Also

IActionRequest

IActionResponse

ImplExecuteActionRequest (see page 5464)

ExecuteLogin (see page 5505)

Errors (see page 5573)

54.1.67.2.3 TEndUserAdapterLoginFormAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled returns the result of the parent adapter's CanExecuteLoginForm function.

See Also

CanExecuteLoginForm (see page 5504)

WebEnabled (see page 5473)

54.1.67.3 TEndUserAdapterLoginFormAction Properties

The properties of the TEndUserAdapterLoginFormAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5782)	Suggests a display label for this adapter action.

54.1.67.3.1 TEndUserAdapterLoginFormAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 5465)

SetDisplayLabel (see page 5472)

54.1.67.4 TEndUserAdapterLoginFormAction Events

The events of the TEndUserAdapterLoginFormAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 5782)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5783)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5783)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5783)	Called before the adapter action response is generated.
	OnGetParams (see page 5784)	Specifies name/value pairs needed to execute this adapter action.

54.1.67.4.1 TEndUserAdapterLoginFormAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 5453)

OnAfterExecuteAction (see page 5576)

OnBeforeExecute (see page 5478)

54.1.67.4.2 TEndUserAdapterLoginFormAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnBeforeGetActionResponse (see page 5578)

54.1.67.4.3 TEndUserAdapterLoginFormAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 5453)

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.67.4.4 TEndUserAdapterLoginFormAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains

the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.67.4.5 TEndUserAdapterLoginFormAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

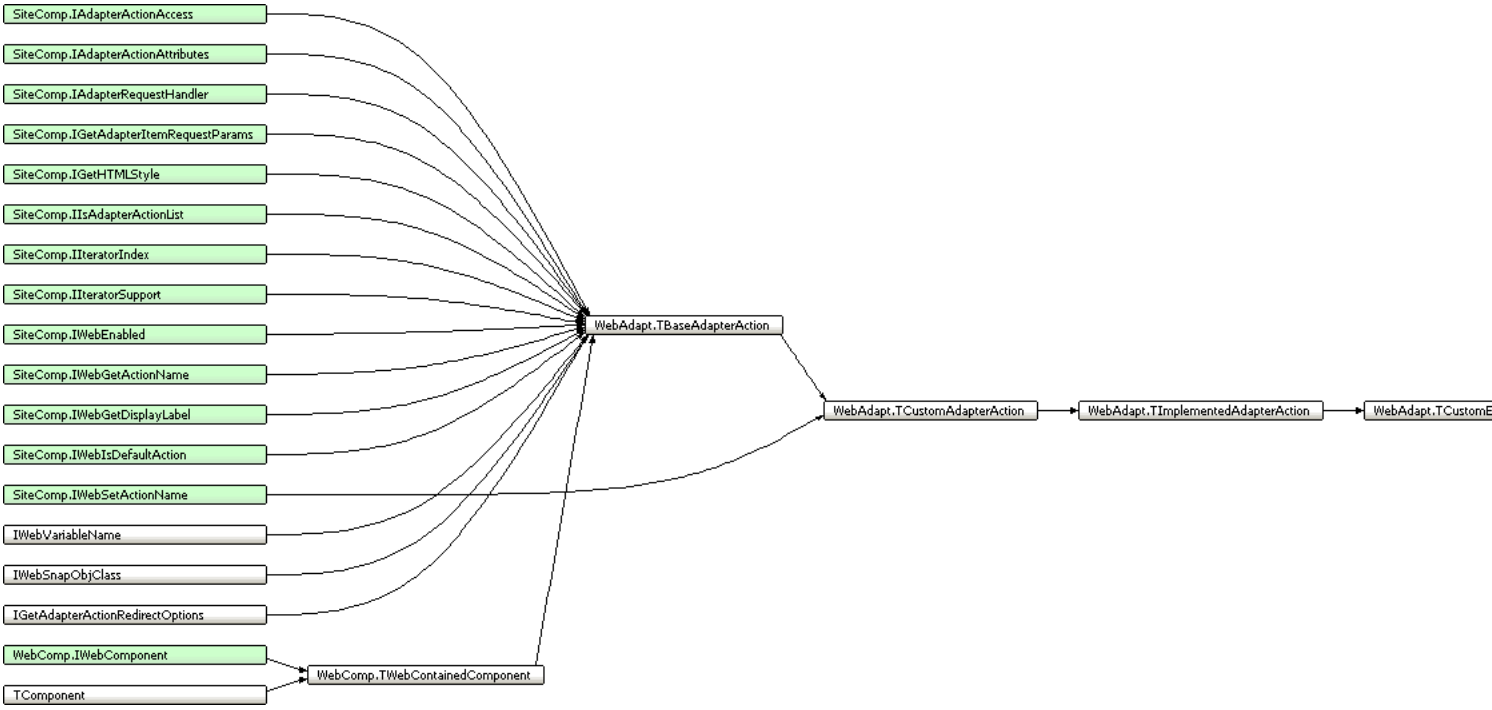
See Also

ImplGetAdapterItemRequestParams (see page 5465)

54.1.68 TEndUserAdapterLogoutAction Class

TEndUserAdapterLogoutAction is an adapter action that logs the end-user out.

Class Hierarchy



Pascal

```
TEndUserAdapterLogoutAction = class(TCustomEndUserAdapterAction);
```

C++

```
class TEndUserAdapterLogoutAction : public TCustomEndUserAdapterAction;
```

File

WebAdapt

Description

This action is typically executed when the end-user clicks on a "Logout" hyperlink displayed at the top of a web page.

54.1.68.1 TEndUserAdapterLogoutAction Members

The following tables list the members exposed by TEndUserAdapterLogoutAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.

	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5789)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
V	ImplExecuteActionRequest (see page 5789)	Executes the adapter action.
V	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5465)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetAdapterItemRequestParams (see page 5584)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
V	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
V	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
V	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
V	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
V	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.

	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
V	ImplWebEnabled (see page 5789)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
V	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
V	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
V	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
R	Adapter (see page 5474)	Provides access to the parent adapter component.
R	Adapter (see page 5692)	Returns the parent adapter of this adapter action.
R	Errors (see page 5475)	Returns the parent adapter's Errors list.
R	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
R	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.

	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 1087)	This is ActionName, a member of class IWebGetActionName.
	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.
	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 5791)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5791)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5791)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5792)	Called before the adapter action response is generated.
	OnGetParams (see page 5792)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 5790)	Suggests a display label for this adapter action.

54.1.68.2 TEndUserAdapterLogoutAction Methods

The methods of the TEndUserAdapterLogoutAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 5789)	Gets the name used to reference this adapter action with server-side script.

	ImplExecuteActionRequest (see page 5789)	Executes the adapter action.
	ImplWebEnabled (see page 5789)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

54.1.68.2.1 TEndUserAdapterLogoutAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultActionName();
```

Description

GetDefaultActionName returns "Logout".

See Also

GetActionName (see page 5455)

GetDefaultActionName (see page 5456)

54.1.68.2.2 TEndUserAdapterLogoutAction.ImplExecuteActionRequest Method

Executes the adapter action.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest calls the parent adapter's ExecuteLogout method. If an exception is raised, the exception message is added to the parent adapter's errors object.

See Also

IActionRequest

IActionResponse

ImplExecuteActionRequest (see page 5464)

ExecuteLogout (see page 5506)

Errors (see page 5573)

54.1.68.2.3 TEndUserAdapterLogoutAction.ImplWebEnabled Method

Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Pascal

```
function ImplWebEnabled: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplWebEnabled();
```

Description

ImplWebEnabled returns the result of the parent adapter's CanExecuteLogout function.

See Also

CanExecuteLogout (see page 5504)

WebEnabled (see page 5473)

54.1.68.3 TEndUserAdapterLogoutAction Properties

The properties of the TEndUserAdapterLogoutAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5790)	Suggests a display label for this adapter action.

54.1.68.3.1 TEndUserAdapterLogoutAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

See Also

ImplGetDisplayLabel (see page 5465)

SetDisplayLabel (see page 5472)

54.1.68.4 TEndUserAdapterLogoutAction Events

The events of the TEndUserAdapterLogoutAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 5791)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5791)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5791)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5792)	Called before the adapter action response is generated.
	OnGetParams (see page 5792)	Specifies name/value pairs needed to execute this adapter action.

54.1.68.4.1 TEndUserAdapterLogoutAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 5453)

OnAfterExecuteAction (see page 5576)

OnBeforeExecute (see page 5478)

54.1.68.4.2 TEndUserAdapterLogoutAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnBeforeGetActionResponse (see page 5578)

54.1.68.4.3 TEndUserAdapterLogoutAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action

parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 5453)

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.68.4.4 TEndUserAdapterLogoutAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.68.4.5 TEndUserAdapterLogoutAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

See Also

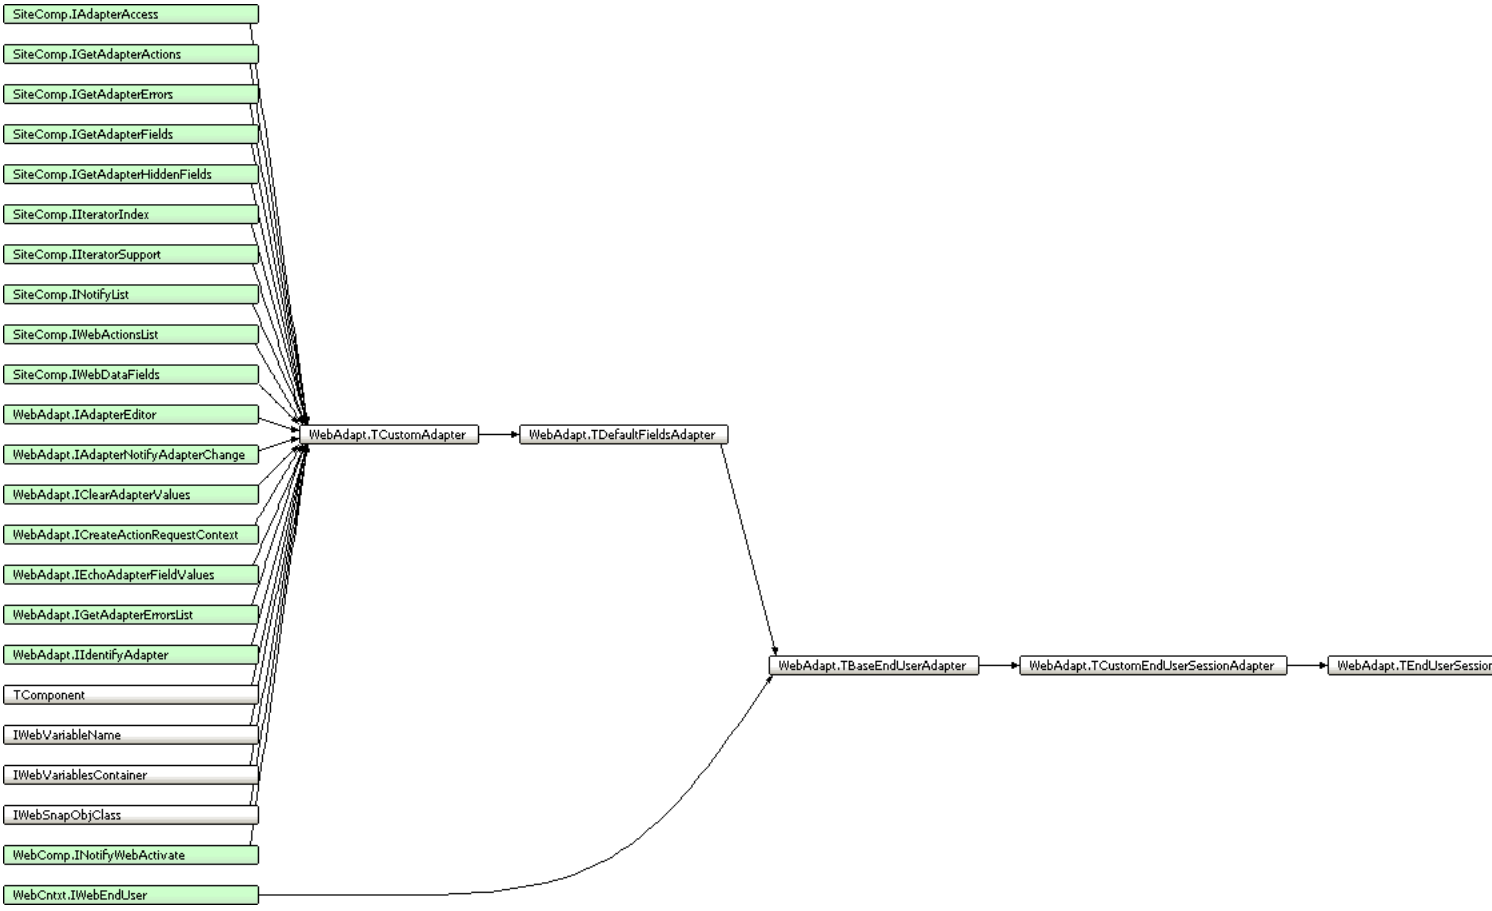
ImplGetAdapterItemRequestParams (see page 5465)

54.1.69 TEndUserSessionAdapter Class

TEndUserSessionAdapter provides information about the current end user such as the user name, user ID, and whether the user

is logged in.

Class Hierarchy



Pascal

```
TEndUserSessionAdapter = class(TCustomEndUserSessionAdapter);
```

C++

```
class TEndUserSessionAdapter : public TCustomEndUserSessionAdapter;
```

File

WebAdapt

Description

Add TEndUserSessionAdapter to a WebSnap application where users must log in before accessing Web pages. TEndUserSessionAdapter handles login and logout actions on behalf of the end user. TEndUserSessionAdapter uses the TSessionsService component to store information about the current end user. The WebSnap application must contain a TSessionsService component (or equivalent) in order for the TEndUserSessionAdapter to work properly.

TEndUserSessionAdapter supports two default Adapter fields: DisplayName and LoggedIn. These fields provide access to the user's name and login state. TEndUserSessionAdapter retrieves the values for these fields from a Web session, which is maintained by the TSessionsService component.

TEndUserSessionAdapter supports two default actions: LoginForm and LogoutOut. These actions are used to display a login form and to log the user out. Use the LoginPage (see page 5800) property to specify the name of the login page. The default

implementation of the logout action terminates the session.

The EndUser script variable is used by server-side script to display end user information and execute end user actions. The following JavaScript displays the name of the logged in end user, if any.

```
<% if (EndUser.LoggedIn) { %>
<h1>Welcome <%= EndUser.DisplayName %> </h1>
<% } %>
```

The following JavaScript displays a login or logout hyperlink.

```
<%   if (EndUser.Logout.Enabled) { %>
  <a href="<%=EndUser.Logout.AsHREF%>">Logout</a>
<%   } %>
<%   if (EndUser.LoginForm.Enabled) { %>
  <a href=<%=EndUser.LoginForm.AsHREF%>>Login</a>
<%   } %>
```

TEndUserSessionAdapter also determines access rights for a user. If the WebSnap application contains a TWebUserList or equivalent, TEndUserAdapter (see page 5764) calls the TWebUserList component to check rights for a particular user ID. Implement the OnHasRights (see page 5802) event to check rights in an event handler.

See Also

TEndUserAdapter (see page 5764)

TSessionsService (see page 6756)

TLoginFormAdapter (see page 5824)

TWebUserList (see page 6796)

IWebEndUser (see page 5988)

Adding Login Support

54.1.69.1 TEndUserSessionAdapter Members

The following tables list the members exposed by TEndUserSessionAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
V	CanExecuteLoginForm (see page 5504)	Determines if there is a static login page.
V	CanExecuteLogout (see page 5504)	Determines if the user is logged in.
V	CanProduceLoginPage (see page 5505)	Determines whether there is a static login page or an automatically produced login page.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.

	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
	DoOnHasRights (see page 5505)	Determines whether the user has view rights.
	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
	ExecuteLogin (see page 5505)	Starts the server-side login process.
	ExecuteLogin (see page 5699)	Logs in an end user.
	ExecuteLoginForm (see page 5506)	Creates the HTML login page.
	ExecuteLogout (see page 5506)	Performs server-side logout.
	ExecuteLogout (see page 5699)	Logs out the current user.
	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetDisplayName (see page 5506)	Retrieves the display name string.
	GetDisplayNameValue (see page 5507)	Gets the display name of the end user.
	GetDisplayNameValue (see page 5699)	Returns the name of the current end user.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetEndUserAdapter (see page 5507)	Gets the end-user adapter.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetLoggedIn (see page 5507)	Determines if the user is logged in
	GetLoggedInValue (see page 5508)	Determines if the user is logged in.
	GetLoggedInValue (see page 5700)	Indicates whether the current end user has logged in.
	GetLoginFormAction (see page 5508)	Gets the action component for the login form.
	GetLogoutAction (see page 5508)	Gets the action component for the logout form.
	GetUserID (see page 5509)	Gets the UserID from this TBaseEndUserAdapter (see page 5497).
	GetUserID (see page 5700)	Returns the user ID of the current user.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.

	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasExecuteRights (see page 5509)	Determines if the user has execute rights for the TBaseEndUserAdapter (see page 5497).
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasModifyRights (see page 5509)	Determines if the user has modify rights for the TBaseEndUserAdapter (see page 5497).
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	HasViewRights (see page 5510)	Determine if the user has view rights to the TBaseEndUserAdapter (see page 5497).
V	ImplCanAddActionClass (see page 5510)	Determines if the given action class can be added.
V	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5510)	Determines if the given action class can be added.
V	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5511)	Lists supported end-user adapter actions.
V	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
V	ImplGetDisplayName (see page 5511)	Gets the display name for this TBaseEndUserAdapter (see page 5497).
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetEndUserAdapter (see page 5511)	Returns this TBaseEndUserAdapter (see page 5497).
V	ImplGetFieldsList (see page 5512)	Obtains the list of all of the fields for the end-user adapter.
V	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
V	ImplGetLoggedIn (see page 5512)	Checks the value of the LoggedIn field.
	ImplGetLoginFormAction (see page 5512)	Gets the LoginForm action component for this TBaseEndUserAdapter (see page 5497).
V	ImplGetLogoutAction (see page 5513)	Gets the Logout action component for this TBaseEndUserAdapter (see page 5497).
V	ImplGetVariable (see page 5556)	Returns an action or field.
V	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
V	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
V	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasExecuteRights (see page 5513)	Checks user rights and determines if the user has execute rights.
V	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasModifyRights (see page 5513)	Checks user rights and determines if the user has modify rights.
V	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
V	ImplHasViewRights (see page 5514)	Checks user rights and determines if the user has view rights.
V	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
V	ImplLogIn (see page 5514)	Processes the login for the given user.
V	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
V	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
V	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
V	ImplProduceLoginPage (see page 5514)	Generate the HTML login page.
V	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
V	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
V	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.

	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	LogIn (see page 5515)	Processes the server-side login for the given user.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	ProduceLoginPage (see page 5515)	Generates the login page.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	UserList (see page 5515)	Gets the user list.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).

	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetDisplayName (see page 5989)	Returns the value of the DisplayName (see page 5994) property.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetEndUserAdapter (see page 5990)	Returns the value of the EndUserAdapter (see page 5994) property.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetLoggedIn (see page 5990)	Returns the value of the LoggedIn (see page 5994) property.
	GetLoginFormAction (see page 5990)	Returns the value of the LoginFormAction (see page 5995) property.
	GetLogoutAction (see page 5991)	Returns the value of the LogoutAction (see page 5996) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasExecuteRights (see page 5991)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasModifyRights (see page 5992)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	HasViewRights (see page 5992)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	LogIn (see page 5993)	Logs in a specified user.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	ProduceLoginPage (see page 5993)	Generates the Web page for logging in users.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	DisplayName (see page 5994)	Indicates the name of the end user as it should be used for display in Web pages.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	EndUserAdapter (see page 5994)	Provides access to the end user adapter that implements this interface.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.

	LoggedIn (see page 5994)	Indicates whether the current user is logged in.
	LoginFormAction (see page 5995)	Indicates the action component for the login form.
	LogoutAction (see page 5996)	Indicates the action component for logging a user out.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	UserID (see page 5701)	Specifies the user ID of the current end user.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5800)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5801)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 5801)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5801)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5802)	Supplies name/value pairs needed to execute an adapter action.
	OnHasRights (see page 5802)	Determines if the user rights match the rights being queried.
	OnProduceLoginPage (see page 5803)	Allows implementation of a customized login page.

Published Properties

	Name	Description
	Actions (see page 5799)	Container for adapter actions components.
	Data (see page 5800)	Container for adapter field components.
	LoginPage (see page 5800)	Specifies the name of the page that acts as the login page.

54.1.69.2 TEndUserSessionAdapter Properties

The properties of the TEndUserSessionAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 5799)	Container for adapter actions components.
	Data (see page 5800)	Container for adapter field components.
	LoginPage (see page 5800)	Specifies the name of the page that acts as the login page.

54.1.69.2.1 TEndUserSessionAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 5231)

54.1.69.2.2 TEndUserSessionAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 5237)

54.1.69.2.3 TEndUserSessionAdapter.LoginPage Property

Specifies the name of the page that acts as the login page.

Pascal

```
property LoginPage: string;
```

C++

```
__property UnicodeString LoginPage;
```

Description

Use LoginPage to read or set the name of the login page for this TBaseEndUserAdapter. The name of the login page is the name of the Web page module that generates the login page.

54.1.69.3 TEndUserSessionAdapter Events

The events of the TEndUserSessionAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5800)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5801)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 5801)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5801)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5802)	Supplies name/value pairs needed to execute an adapter action.
	OnHasRights (see page 5802)	Determines if the user rights match the rights being queried.
	OnProduceLoginPage (see page 5803)	Allows implementation of a customized login page.

54.1.69.3.1 TEndUserSessionAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.69.3.2 TEndUserSessionAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.69.3.3 TEndUserSessionAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 5478)

OnAfterExecuteAction (see page 5576)

54.1.69.3.4 TEndUserSessionAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 5478)

OnAfterGetActionResponse (see page 5576)

54.1.69.3.5 TEndUserSessionAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 5478)

54.1.69.3.6 TEndUserSessionAdapter.OnHasRights Event

Determines if the user rights match the rights being queried.

Pascal

```
property OnHasRights: TEndUserRightsEvent;
```

C++

```
__property TEndUserRightsEvent OnHasRights;
```

Description

The OnHasRights event handler is called from DoOnHasRights to determine if the user rights match the rights being queried. A customized event handler should be written to determine the rights for your specific application.

See Also

DoOnHasRights (see page 5505)

ImplHasExecuteRights (see page 5513)

ImplHasModifyRights (see page 5513)

ImplHasViewRights (see page 5514)

54.1.69.3.7 TEndUserSessionAdapter.OnProduceLoginPage Event

Allows implementation of a customized login page.

Pascal

```
property OnProduceLoginPage: TEndUserHandledEvent;
```

C++

```
__property TEndUserHandledEvent OnProduceLoginPage;
```

Description

The OnProduceLoginPage event is triggered in the ImplProduceLoginPage. If a customized login page is desired for your application, a customized event handler can be written for this event.

See Also

ImplProduceLoginPage (see page 5514)

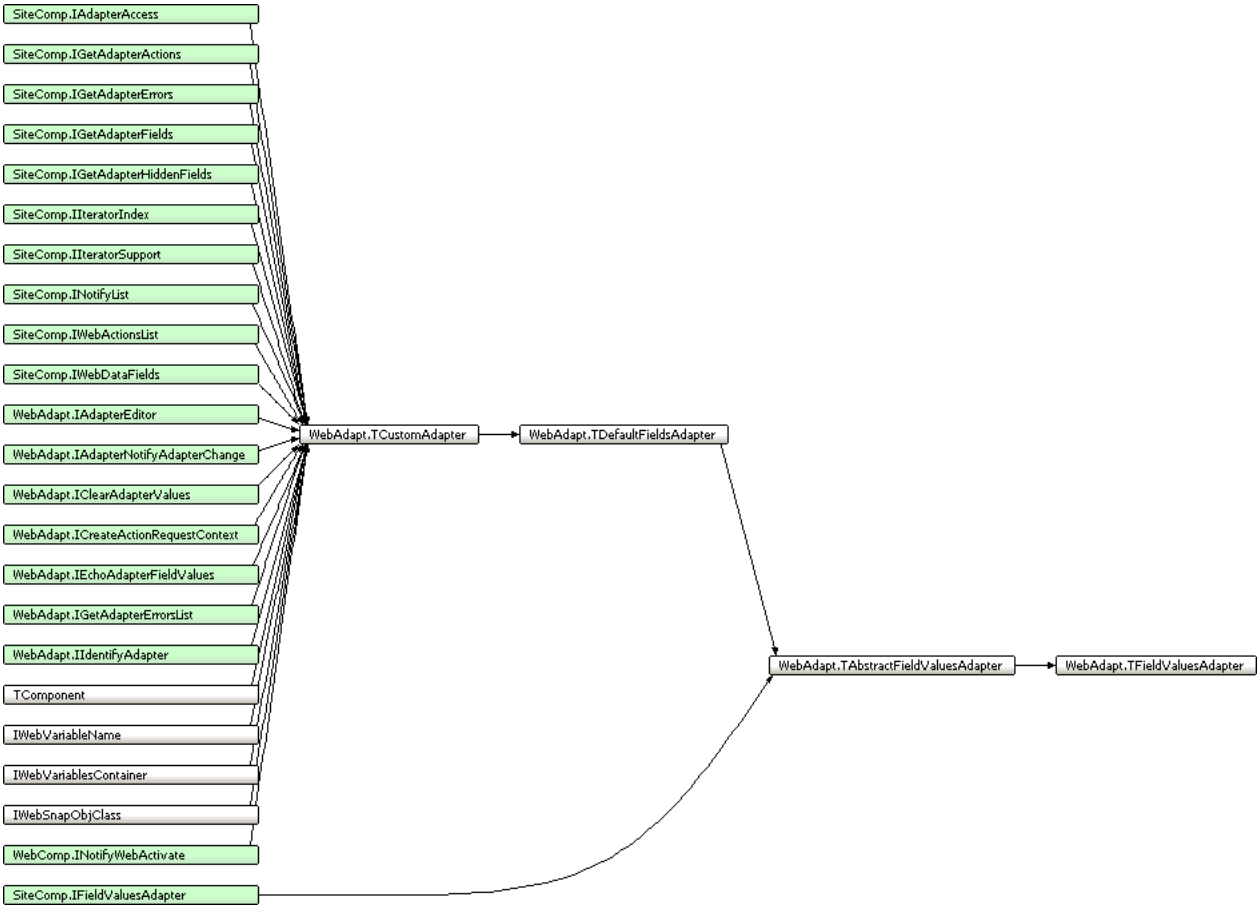
ProduceLoginPage (see page 5515)

CanProduceLoginPage (see page 5505)

54.1.70 TFieldValuesAdapter Class

TFieldValuesAdapter is an adapter that includes a single field value.

Class Hierarchy



Pascal

```
TFieldValuesAdapter = class(TAbstractFieldValuesAdapter);
```

C++

```
class TFieldValuesAdapter : public TAbstractFieldValuesAdapter;
```

File

WebAdapt

Description

Use TFieldValuesAdapter to represent a single field value, which is available as a field with the name 'ValueField'. The single field is represented by an adapter field object that is of type TFieldValuesValueField (see page 5813), or one of its descendants. This adapter field object is supplied to the TFieldValuesAdapter constructor.

The 'ValueField' field can have multiple values, such as when it represents a value in the column of a table. For example, the following server-side script iterates over the values of the 'ValueField' field and adds them to a table:

```
<table border=1>
<%
   var e = new Enumerator(FieldValuesAdapter1)
   for (; !e.atEnd(); e.moveNext())
   {
%>
```

```
  <tr><td><%=e.item().ValueField%></td></tr>
<%
   }
%>
</table>
```

See Also

TStringsValuesList (see page 5857)

TPagedAdapter (see page 5844)

TDataSetValuesList

TFieldValuesValueField (see page 5813)

54.1.70.1 TFieldValuesAdapter Members

The following tables list the members exposed by TFieldValuesAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.

	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetField (see page 5186)	Returns the object that represents the single field of this adapter.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
V	GetValueFieldClass (see page 5809)	Returns the class of the object that represents this adapter's ValueField field.
	GetValueIndex (see page 5187)	Returns an index that identifies the current adapter field value.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5187)	Provides the underlying implementation for the CanAddFieldClass (see page 5540) method.
V	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5810)	Provides the underlying implementation for the EndIterator (see page 5542) method.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetField (see page 5810)	Provides the underlying implementation for the GetField (see page 5186) method.
V	ImplGetFieldsList (see page 5188)	Provides the underlying implementation for the GetFieldsList (see page 5549) method.
V	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
V	ImplGetValueIndex (see page 5811)	Provides the underlying implementation for the GetValueIndex (see page 5187) method.
V	ImplGetVariable (see page 5556)	Returns an action or field.
V	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
V	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
V	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
V	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
V	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
V	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
V	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
V	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
V	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.

	ImplNextIteration (see page 5811)	Provides the underlying implementation for the NextIteration (see page 5564) method.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5812)	Provides the underlying implementation for the StartIterator (see page 5567) method.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	Field (see page 5812)	Indicates the object that represents this adapter's single field.
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.

	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5809)	Creates and initializes an instance of TFieldValuesAdapter (see page 5803).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetField (see page 1016)	This is GetField, a member of class IFieldValuesAdapter.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetValueIndex (see page 1016)	This is GetValueIndex, a member of class IFieldValuesAdapter.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.
R	Actions (see page 5746)	Container for adapter actions components.
R	Data (see page 5572)	Data is the container for adapter field components.
R	Data (see page 5747)	Container for adapter field components.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.

	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.70.2 TFieldValuesAdapter.Create Constructor

Creates and initializes an instance of TFieldValuesAdapter (see page 5803).

Pascal

```
constructor Create(AOwner: TComponent; AField: TObject); virtual; reintroduce;
```

C++

```
virtual __fastcall TFieldValuesAdapter(TComponent * AOwner, TObject * AField);
```

Description

Call Create to Create an instance of TFieldValuesAdapter (see page 5803) at runtime.

AOwner is the component that becomes the value of this adapter's Owner property. Typically, this is the Web module. The owner is responsible for freeing the TFieldValuesAdapter (see page 5803) object.

AField is the object that represents the 'ValueField' field of this adapter. It becomes the value of the protected Field (see page 5812) property.

See Also

Owner

Field (see page 5812)

54.1.70.3 TFieldValuesAdapter Methods

The methods of the TFieldValuesAdapter class are listed here.

Protected Methods

	Name	Description
	GetValueFieldClass (see page 5809)	Returns the class of the object that represents this adapter's ValueField field.
	ImplEndIterator (see page 5810)	Provides the underlying implementation for the EndIterator (see page 5542) method.
	ImplGetField (see page 5810)	Provides the underlying implementation for the GetField (see page 5186) method.
	ImplGetValueIndex (see page 5811)	Provides the underlying implementation for the GetValueIndex (see page 5187) method.
	ImplNextIteration (see page 5811)	Provides the underlying implementation for the NextIteration (see page 5564) method.
	ImplStartIterator (see page 5812)	Provides the underlying implementation for the StartIterator (see page 5567) method.

54.1.70.3.1 TFieldValuesAdapter.GetValueFieldClass Method

Returns the class of the object that represents this adapter's ValueField field.

Pascal

```
function GetValueFieldClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetValueFieldClass();
```

Description

GetValueFieldClass returns the class reference for the type of the single adapter field (ValueField) that is the value of the Field (see page 5812) property. This is TFieldValuesValueField (see page 5813).

See Also

Field (see page 5812)

TFieldValuesValueField (see page 5813)

54.1.70.3.2 TFieldValuesAdapter.ImplEndIterator Method

Provides the underlying implementation for the EndIterator (see page 5542) method.

Pascal

```
procedure ImplEndIterator(OwnerData: Pointer); override;
```

C++

```
virtual __fastcall ImplEndIterator(void * OwnerData);
```

Description

The EndIterator (see page 5542) method calls ImplEndIterator to stop the process of iterating through the adapter's field's possible values. This provides the underlying support that allows server-side script to iterate through adapter field values.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. Each adapter can interpret this value in its own way.

ImplEndIterator obtains an IWebGetFieldValues (see page 1092) interface for the adapter field that is the value of the Field (see page 5812) property and calls its EndValueIterator method, passing on the value of the OwnerData parameter.

See Also

EndIterator (see page 5542)

ImplStartIterator (see page 5812)

ImplNextIteration (see page 5811)

EndValueIterator (see page 1093)

Field (see page 5812)

54.1.70.3.3 TFieldValuesAdapter.ImplGetField Method

Provides the underlying implementation for the GetField (see page 5186) method.

Pascal

```
function ImplGetField: TObject; override;
```

C++

```
virtual __fastcall TObject * ImplGetField();
```

Description

The GetField (see page 5186) method calls ImplGetField to obtain the object that represents this adapter's single field. This method returns the value of the Field (see page 5812) property.

See Also

GetField (see page 5186)

Field (see page 5812)

54.1.70.3.4 TFieldValuesAdapter.ImplGetValueIndex Method

Provides the underlying implementation for the GetValueIndex (see page 5187) method.

Pascal

```
function ImplGetValueIndex: Integer; override;
```

C++

```
virtual __fastcall int ImplGetValueIndex();
```

Description

The GetValueIndex (see page 5187) method calls ImplGetValueIndex to obtain the index of current value of the ValueField field. The first value has an index of 0, the second an index of 1, and so on.

This method returns the index of the current value, as indicated by the index that the GetIteratorIndex (see page 5550) method returns.

See Also

GetValueIndex (see page 5187)

GetIteratorIndex (see page 5550)

54.1.70.3.5 TFieldValuesAdapter.ImplNextIteration Method

Provides the underlying implementation for the NextIteration (see page 5564) method.

Pascal

```
function ImplNextIteration(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplNextIteration(void * OwnerData);
```

Description

The NextIteration (see page 5564) method calls ImplNextIteration when iterating over field values to determine whether there is another field value after the current one and if so, to change the current value to the next one.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. On entry, this value is typically the same as the value returned by the last call to NextIteration (see page 5564) or to StartIterator (see page 5567).

ImplNextIteration returns true if it moves to the next field value, false if it can't change to a new field value (usually because the field is on its last value).

In TFieldValuesAdapter (see page 5803), ImplNextIteration obtains an IWebGetFieldValues (see page 1092) interface for the adapter field that is the value of the Field (see page 5812) property and calls its NextValueIteration method, passing on the value of the OwnerData parameter.

See Also

NextIteration (see page 5564)

ImplStartIterator (see page 5812)

ImplEndIterator (see page 5810)

NextValueIteration (see page 1094)

54.1.70.3.6 TFieldValuesAdapter.ImplStartIterator Method

Provides the underlying implementation for the StartIterator (see page 5567) method.

Pascal

```
function ImplStartIterator(var OwnerData: Pointer): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplStartIterator(void * OwnerData);
```

Description

The StartIterator (see page 5567) method calls ImplStartIterator to start the process of iterating through the adapter's field's possible values. The return value indicates whether the adapter's field has any values over which to iterate.

OwnerData is a pointer to adapter-specific data that can affect the way it iterates over field values. Depending on the adapter field object, it may be supplied by the caller, or created by the adapter field object inside this method.

ImplStartIterator returns true if it positions the ValueField field on its first value, false if the adapter field can't supply a first value.

In TFieldValuesAdapter (see page 5803), ImplStartIterator obtains an IWebGetFieldValues (see page 1092) interface for the adapter field that is the value of the Field (see page 5812) property and calls its StartValueIterator method, passing on the value of the OwnerData parameter.

See Also

StartIterator (see page 5567)

ImplEndIterator (see page 5810)

ImplNextIteration (see page 5811)

StartValueIterator (see page 1095)

Field (see page 5812)

54.1.70.4 TFieldValuesAdapter Properties

The properties of the TFieldValuesAdapter class are listed here.

Protected Properties

	Name	Description
	Field (see page 5812)	Indicates the object that represents this adapter's single field.

54.1.70.4.1 TFieldValuesAdapter.Field Property

Indicates the object that represents this adapter's single field.

Pascal

```
property Field: TObject;
```

C++

```
__property TObject * Field;
```

Description

Read (see page 3634) Field to access the object that represents this adapter's ValueField field. Field is an instance of TFieldValuesValueField (see page 5813) or one of its descendants.

The TFieldValuesAdapter (see page 5803) constructor supplies the value for this property.

See Also

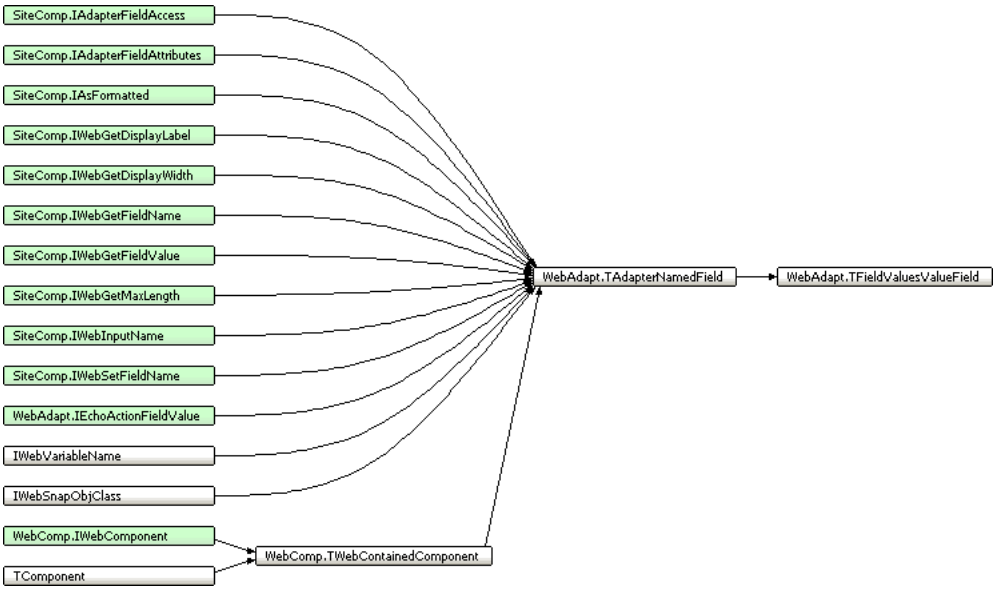
TFieldValuesValueField (see page 5813)

Create (see page 5809)

54.1.71 TFieldValuesValueField Class

TFieldValuesValueField is a adapter field child of TFieldValuesAdapter (see page 5803).

Class Hierarchy



Pascal

```
TFieldValuesValueField = class(TAdapterNamedField);
```

C++

```
class TFieldValuesValueField : public TAdapterNamedField;
```

File

WebAdapt

Description

The parent adapter, TFieldValuesAdapter (see page 5803), is used to iterate over the values associated with an adapter field. TFieldValuesValueField provides the value and display text of the current item.

See Also

TFieldValuesAdapter (see page 5803)

TBaseAdapterMultiValueField (see page 5488)

54.1.71.1 TFieldValuesValueField Members

The following tables list the members exposed by TFieldValuesValueField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5816)	Returns the name used to access this adapter field using server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5816)	Returns text used to display a read-only representation of the value associated with this adapter field.
V	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5817)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
V	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.

	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
V	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.

Protected Properties

	Name	Description
R	Adapter (see page 5368)	Returns the parent adapter component.
R	Field (see page 5817)	Returns the adapter field that is using TFieldValueAdapter.
R	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
R	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.

	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
	Value (see page 5369)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.71.2 TFieldValuesValueField Methods

The methods of the TFieldValuesValueField class are listed here.

Protected Methods

	Name	Description
	GetDefaultFieldName (see page 5816)	Returns the name used to access this adapter field using server-side script.
	ImplAsFormatted (see page 5816)	Returns text used to display a read-only representation of the value associated with this adapter field.
	ImplGetValue (see page 5817)	Returns the value associated with this adapter field.

54.1.71.2.1 TFieldValuesValueField.GetDefaultFieldName Method

Returns the name used to access this adapter field using server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'ValueField'. This allows server-side script to access this adapter field using the parent adapter's ValueField property.

See Also

ImplGetVariableName (see page 5364)

ImplSetFieldName (see page 5366)

GetDefaultFieldName (see page 5357)

54.1.71.2.2 TFieldValuesValueField.ImplAsFormatted Method

Returns text used to display a read-only representation of the value associated with this adapter field.

Pascal

```
function ImplAsFormatted: string; override;
```

C++

```
virtual __fastcall UnicodeString ImplAsFormatted();
```

Description

ImplAsFormatted determines whether the adapter field using TFieldValuesAdapter (see page 5803) has a values list. If a values list is available, the values list is used to look up a value name to return. If there is no values list or no value name, the result of ImplGetValue (see page 5817) is returned. Server-side script accesses the result of this function using the DisplayText property of this adapter field. ImplAsFormatted overrides TAdapterNamedField (see page 5351)'s ImplAsFormatted method.

See Also

Value (see page 5369)

ImplAsFormatted (see page 5361)

GetAdapterValuesList (see page 5426)

ImplGetValue (see page 5817)

54.1.71.2.3 TFieldValuesValueField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue returns the result of GetCurrentValue. GetCurrentValue is implemented by the adapter field using TFieldValuesAdapter (see page 5803). Server-side script accesses the result of this function using the Value (see page 5369) property of this adapter field.

See Also

GetCurrentValue (see page 5494)

Value (see page 5369)

54.1.71.3 TFieldValuesValueField Properties

The properties of the TFieldValuesValueField class are listed here.

Protected Properties

	Name	Description
	Field (see page 5817)	Returns the adapter field that is using TFieldValueAdapter.

54.1.71.3.1 TFieldValuesValueField.Field Property

Returns the adapter field that is using TFieldValueAdapter.

Pascal

```
property Field: TObject;
```

C++

```
__property TObject * Field;
```

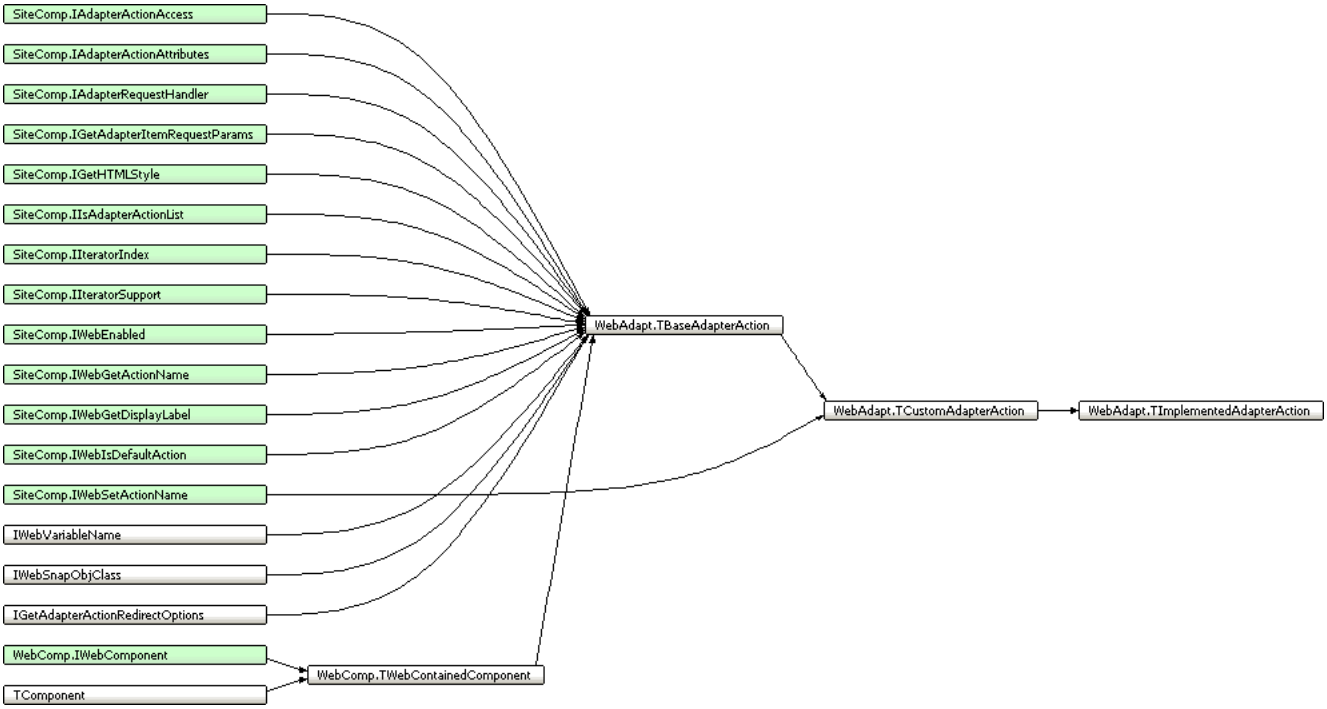
Description

Adapter (see page 5368) fields use the TFieldValuesAdapter (see page 5803) component to iterate over the values associated with the adapter field. The Field property returns the adapter field that is using the TFieldValuesAdapter (see page 5803).

54.1.72 TImplementedAdapterAction Class

TImplementedAdapterAction is a base class for adapter actions.

Class Hierarchy



Pascal

```
TImplementedAdapterAction = class(TCustomAdapterAction);
```

C++

```
class TImplementedAdapterAction : public TCustomAdapterAction;
```

File

WebAdapt

Description

Derive from TImplementedAdapterAction to define an adapter action component that works with specific adapter component types. Classes derived from TImplementedAdapterAction can only be added to adapter components that allow the particular class. On the other hand, classes derived from TCustomAdapterAction (see page 5579) (such as TAdapter (see page 5190)) can be added to any adapter component class.

See Also

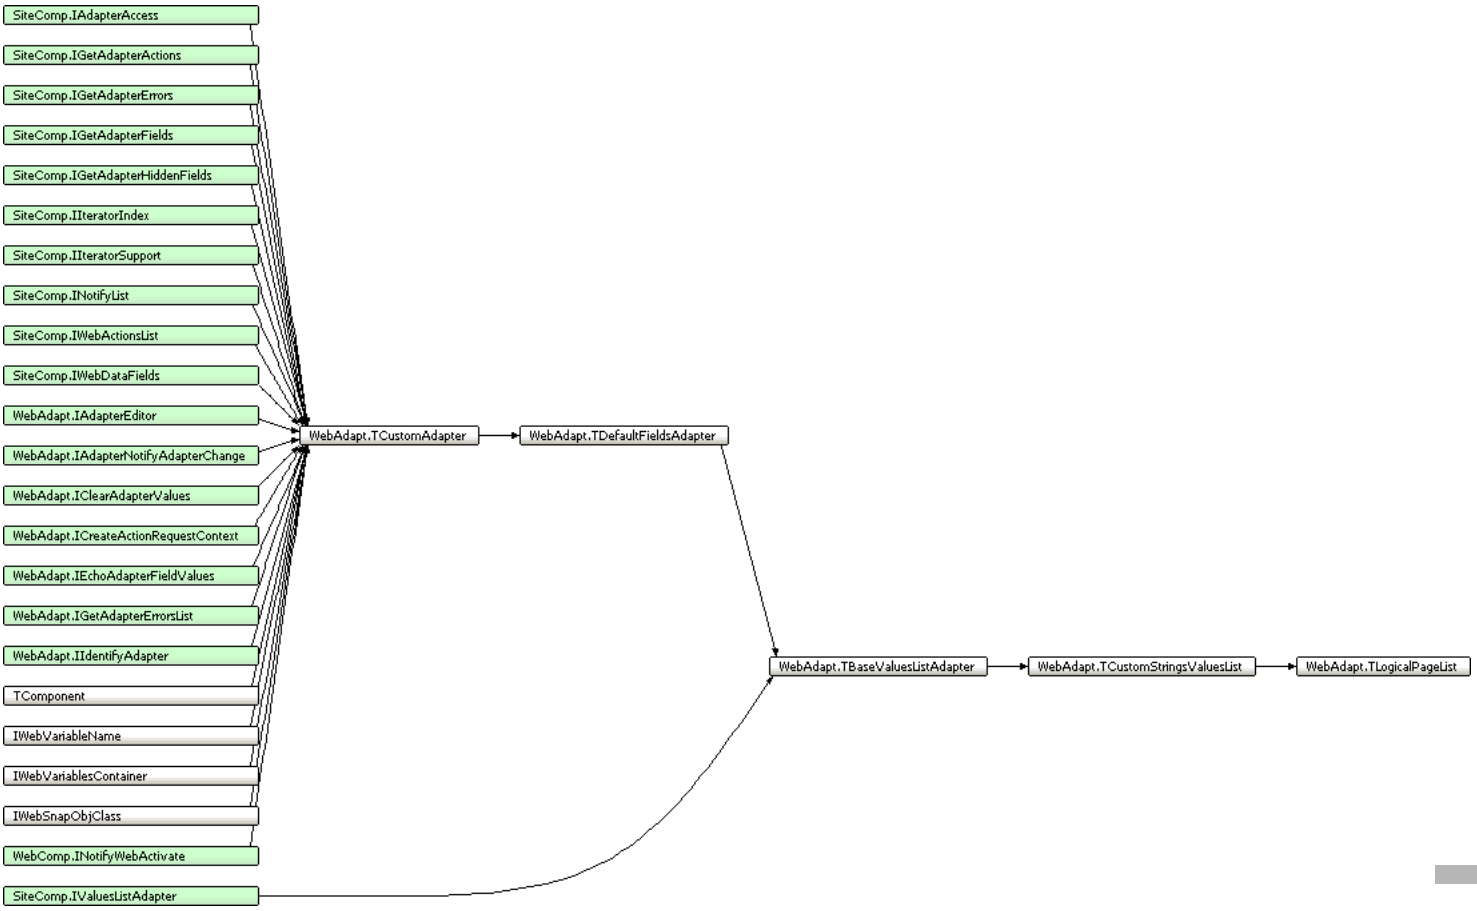
TCustomAdapterAction (see page 5579)

TAdapter (see page 5190)

TAdapterActions (see page 5209)

54.1.73 TLogicalPageList Class

Class Hierarchy



Pascal

```
TLogicalPageList = class(TCustomStringsValuesList);
```

C++

```
class TLogicalPageList : public TCustomStringsValuesList;
```

File

WebAdapt

Description

This is class WebAdapt.TLogicalPageList.

54.1.73.1 TLogicalPageList Members

The following tables list the members exposed by TLogicalPageList.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 5522)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 5523)	Looks up an image for a value.
	GetListName (see page 5523)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 5523)	Looks up a name for a value.
	GetListValue (see page 5524)	Responsible for returning the value of the name/value pair.
V	GetNameFieldClass (see page 5524)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.

	GetNameFieldClass (see page 5734)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
	GetValueFieldClass (see page 5524)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetValueFieldClass (see page 5734)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
	GetWebSnapObjClass (see page 5524)	Returns the class type for this adapter field.
	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 5525)	Indicates whether a type of adapter field can be added to this adapter.
	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplEndIterator (see page 5734)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the records of the adapter.
	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5525)	Adds default field components to this adapter.
	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
	ImplGetListImage (see page 5525)	Responsible returning an image associated with the current name/value pair.
	ImplGetListImageOfValue (see page 5526)	Looks up an image for a value.
	ImplGetListName (see page 5526)	Responsible returning the name of the name/value pair.
	ImplGetListName (see page 5735)	Responsible returning the name of the name/value pair.
	ImplGetListNameOfValue (see page 5526)	Looks up a name for a value.
	ImplGetListNameOfValue (see page 5735)	Looks up a name for a value.
	ImplGetListValue (see page 5527)	Responsible for returning the value of the name/value pair.
	ImplGetListValue (see page 5735)	Responsible for returning the value of the name/value pair.
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNextIteration (see page 5736)	Implements IteratorSupport's NextIteration (see page 5564) method to support iterating over the records of the adapter.

	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplNotifyDeactivate (see page 5736)	Clears the iteration index.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	ImplStartIterator (see page 5736)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	PrepareStrings (see page 5737)	Customizes the content of the strings list.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	StringsPrepared (see page 5737)	This flag indicates whether the strings list has been prepared or customized.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.

	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.
	OnPrepareStrings (see page 5738)	Implement OnPrepareStrings to customize the content of the strings list.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5824)	Create is the constructor for TCustomStringsValuesList.
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
V	Destroy (see page 5733)	Destroy is the destructor for TCustomStringsList.
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetListImage (see page 1074)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 1074)	Returns the image object associated with a specified value.
	GetListName (see page 1075)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 1075)	Returns the name associated with a specified value.
	GetListValue (see page 1076)	Returns the value of the current name/value pair.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
R	Actions (see page 5572)	Actions is the container for adapter actions components.

	Actions (see page 5746)	Container for adapter actions components.
	Data (see page 5572)	Data is the container for adapter field components.
	Data (see page 5747)	Container for adapter field components.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	Strings (see page 5737)	This string list defines the list of name/value pairs.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

54.1.73.2 TLogicalPageList.Create Constructor

Create is the constructor for TCustomStringsValuesList.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TLogicalPageList(TComponent * AOwner);
```

Description

Create creates the strings list.

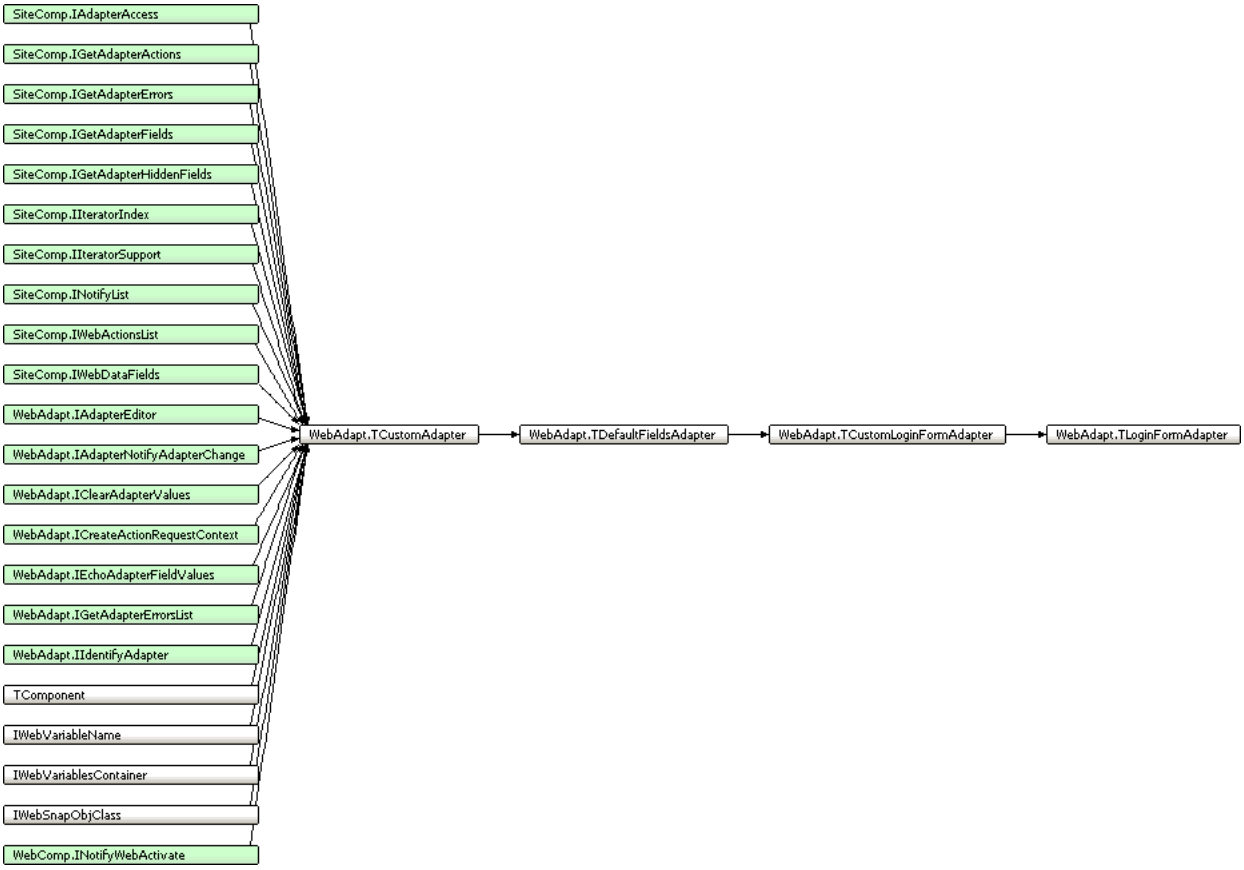
See Also

Strings (see page 5737)

54.1.74 TLoginFormAdapter Class

TLoginFormAdapter contains the adapter fields and adapter actions used to generate a login form.

Class Hierarchy



Pascal

```
TLoginFormAdapter = class(TCustomLoginFormAdapter);
```

C++

```
class TLoginFormAdapter : public TCustomLoginFormAdapter;
```

File

WebAdapt

Description

Use TLoginFormAdapter to generate a login form. TLoginFormAdapter has default fields for user name, password, and next page. The next page field lets the user select a Web page to see after logging in. TLoginFormAdapter has a single default action for logging in. If the WebSnap application also contains an end user adapter such as TEndUserAdapter (see page 5764) or TEndUserSessionAdapter (see page 5792), TLoginFormAdapter calls the end user adapter's LogIn method to log the user in. You can also implement an OnLogin (see page 5834) event handler to provide custom login support.

To build a simple login form

1. Create (see page 5536) a new Web page module that contains a TAdapterPageProducer component.
2. Add a TLoginFormAdapter component to that module.
3. Right click on the TAdapterPageProducer object and display the Web page editor.

4. In the Web page editor, add an adapter form, and to that form add an adapter field group and an adapter command group.
5. Select the field group, and set its Adapter property to the TLoginFormAdapter object.
6. Select the command group, and set its display component to the adapter field group.

You can embellish this simple form as you like. When you are done, connect the form to an end user adapter by setting the end user adapter's LoginPage property to the name of the page module.

To provide complete login support, add TWebUserList, TEndUserSessionAdapter (see page 5792), and TSessionsService components to the web application module to identify user names and passwords and to keep track of end user login state.

See Also

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

TAdapterPageProducer (see page 1136)

TWebUserList (see page 6796)

TSessionsService (see page 6756)

TAdapterControlGroup (see page 6341)

TAdapterFieldGroup (see page 6399)

54.1.74.1 TLoginFormAdapter Members

The following tables list the members exposed by TLoginFormAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
	EndUser (see page 5707)	Returns the interface of the WebSnap application's end user adapter.
	ExecuteLogin (see page 5707)	Logs in the user after the user name and password have been validated.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.

	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
V	GetNextPage (see page 5708)	Returns the value of the NextPage (see page 5713) property.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddActionClass (see page 5708)	Provides the underlying implementation for the CanAddActionClass (see page 5539) method.
V	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplCanAddFieldClass (see page 5709)	Provides the underlying implementation for the CanAddFieldClass (see page 5540) method.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
V	ImplGetActionsList (see page 5709)	Provides the underlying implementation for the GetActionsList (see page 5546) method.
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
V	ImplGetFieldsList (see page 5710)	Provides the underlying implementation for the GetFieldsList (see page 5549) method.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
V	ImplGetVariable (see page 5556)	Returns an action or field.
V	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
V	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.

	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplNotifyDeactivate (see page 5710)	Provides the underlying implementation for the NotifyDeactivate (see page 5566) method.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	RaiseBlankPassword (see page 5711)	Raises an EAdapterFieldException (see page 5178) with a message that the supplied password is blank.
	RaiseBlankUserName (see page 5711)	Raises an EAdapterFieldException (see page 5178) with a message that the supplied user name is blank.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	UserList (see page 5711)	Returns the interface of the WebSnap application's Web user list.
	ValidatePassword (see page 5712)	Validates the password that the user supplied to the login form.
	ValidateUserName (see page 5712)	Validates the name that the user supplied to the login form.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	NextPage (see page 5713)	Names the Web page the user should see after successfully logging in.
R	Password (see page 5714)	Indicates the password that the user supplied to the login form.
R	UserName (see page 5714)	Indicates the name that the user supplied to the login form.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5832)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5832)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 5833)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5833)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5833)	Supplies name/value pairs needed to execute an adapter action.
	OnLogin (see page 5834)	Occurs after the password and user ID are validated.
	OnValidatePassword (see page 5834)	Occurs when the login form adapter must validate the password that the user supplied.
	OnValidateUserName (see page 5835)	Occurs when the login form adapter must validate the name that the user supplied.

Published Properties

	Name	Description
	Actions (see page 5830)	Container for adapter actions components.
	Data (see page 5831)	Container for adapter field components.
	PasswordRequired (see page 5831)	Indicates whether the user must supply a password to log in.

54.1.74.2 TLoginFormAdapter Properties

The properties of the TLoginFormAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 5830)	Container for adapter actions components.
	Data (see page 5831)	Container for adapter field components.
	PasswordRequired (see page 5831)	Indicates whether the user must supply a password to log in.

54.1.74.2.1 TLoginFormAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 5231)

54.1.74.2.2 TLoginFormAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 5237)

54.1.74.2.3 TLoginFormAdapter.PasswordRequired Property

Indicates whether the user must supply a password to log in.

Pascal

```
property PasswordRequired: Boolean;
```

C++

```
__property Boolean PasswordRequired;
```

Description

Set PasswordRequired to indicate whether users must supply a password to log in. If PasswordRequired is true and the OnValidatePassword event handler does not handle the validation of the password, then the login form adapter checks that the value of Password is not an empty string. If Password is an empty string, the login form adapter raises an EAdapterFieldException exception when it tries to validate the password. If the OnValidatePassword event handler takes care of validating the password, PasswordRequired is ignored.

Note: The login form adapter validates the password (and hence checks PasswordRequired) when the WebSnap application executes this adapter's LogIn action.

See Also

Password (see page 5714)

OnValidatePassword (see page 5716)

TLoginFormAdapterLoginAction (see page 5835)

EAdapterFieldException (see page 5178)

54.1.74.3 TLoginFormAdapter Events

The events of the TLoginFormAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5832)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5832)	Occurs after the adapter action response is generated.
	OnBeforeExecuteAction (see page 5833)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5833)	Occurs before the adapter action response is generated.
	OnGetActionParams (see page 5833)	Supplies name/value pairs needed to execute an adapter action.
	OnLogin (see page 5834)	Occurs after the password and user ID are validated.
	OnValidatePassword (see page 5834)	Occurs when the login form adapter must validate the password that the user supplied.
	OnValidateUserName (see page 5835)	Occurs when the login form adapter must validate the name that the user supplied.

54.1.74.3.1 TLoginFormAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.74.3.2 TLoginFormAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.74.3.3 TLoginFormAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 5478)

OnAfterExecuteAction (see page 5576)

54.1.74.3.4 TLoginFormAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 5478)

OnAfterGetActionResponse (see page 5576)

54.1.74.3.5 TLoginFormAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 5478)

54.1.74.3.6 TLoginFormAdapter.OnLogin Event

Occurs after the password and user ID are validated.

Pascal

```
property OnLogin: TLoginUserIDEvent;
```

C++

```
__property TLoginUserIDEvent OnLogin;
```

Description

Write an OnLogin event handler to respond when a user has successfully logged in. This event allows your application to record the user login in an application-specific manner.

When the login form adapter's LogIn action executes, the adapter first receives an OnValidatePassword and an OnValidateUserName event. After validating the password and user name, the login form adapter receives an OnLogin event so that it can log the user in. After the OnLogin event, if the WebSnap application includes an end user adapter, the login form adapter calls the end user adapter's LogIn method. Thus, it may not be necessary to write an OnLogin event handler if the application includes an end user adapter.

See Also

OnValidatePassword (see page 5716)

OnValidateUserName (see page 5716)

LogIn (see page 5993)

TWebUserList (see page 6796)

UserName (see page 5714)

54.1.74.3.7 TLoginFormAdapter.OnValidatePassword Event

Occurs when the login form adapter must validate the password that the user supplied.

Pascal

```
property OnValidatePassword: TValidateAdapterFieldEvent;
```

C++

```
__property TValidateAdapterFieldEvent OnValidatePassword;
```

Description

Write an OnValidatePassword event handler to validate the password that the user supplies to the login form. This event is especially important if the WebSnap application does not include a TWebUserList component for checking passwords against user names. The supplied Password is the value of the Value parameter on the event handler. You can check this against the user's name by reading the UserName property.

When the login form adapter's LogIn action executes, the adapter first receives an OnValidatePassword event to check the password. If the event handler sets the Handled parameter to true, indicating that the password is valid, the adapter goes on to validate the user name using an OnValidateUserName event, and then to log the user in using an OnLogin event (and, if the application includes an end user adapter, by calling the end user adapter's LogIn method). If the event handler finds the password to be invalid, it should raise an exception. If the event handler does not validate the supplied password (that is, if it sets

the Handled parameter to false), the login form adapter validates the password by checking whether it is non-blank if the PasswordRequired property is true.

See Also

OnLogin (see page 5715)

OnValidateUserName (see page 5716)

Password (see page 5714)

UserName (see page 5714)

PasswordRequired (see page 5714)

54.1.74.3.8 TLoginFormAdapter.OnValidateUserName Event

Occurs when the login form adapter must validate the name that the user supplied.

Pascal

```
property OnValidateUserName: TValidateAdapterFieldEvent;
```

C++

```
__property TValidateAdapterFieldEvent OnValidateUserName;
```

Description

Write an OnValidateUserName event handler to validate the name that the user supplies when logging in. This event occurs after the OnValidatePassword event and before the OnLogin event.

If the event handler sets the Handled parameter to true, the login form adapter assumes that the user name (which is the value of the Value parameter and of the UserName property) is valid. In this case, the adapter checks whether the WebSnap application includes a TWebUserList component, and if so, checks the user name against the password. If the event handler sets the Handled parameter to false, the adapter validates the user name by checking whether it is nonempty. In this case, the adapter raises an EAdapterFieldException exception if the value of UserName is an empty string. If the OnValidateUserName event handler finds the user name to be invalid, it should raise an exception.

See Also

OnLogin (see page 5715)

OnValidatePassword (see page 5716)

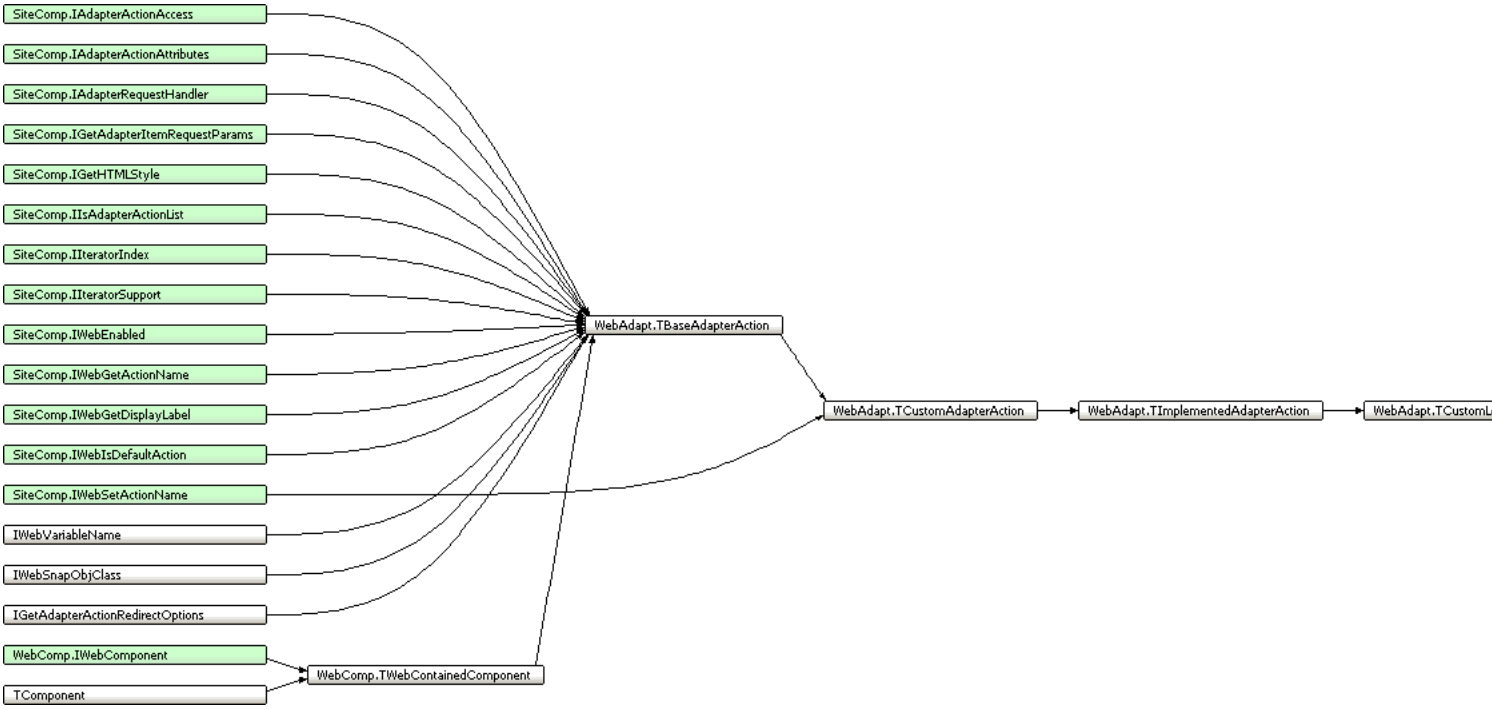
UserName (see page 5714)

EAdapterFieldException (see page 5178)

54.1.75 TLoginFormAdapterLoginAction Class

TLoginFormAdapterLoginAction executes the login command of a login form generated with TLoginFormAdapter (see page 5824).

Class Hierarchy



Pascal

```
TLoginFormAdapterLoginAction = class(TCustomLoginFormAdapterAction);
```

C++

```
class TLoginFormAdapterLoginAction : public TCustomLoginFormAdapterAction;
```

File

WebAdapt

Description

Add TLoginFormAdapterLoginAction to TLoginFormAdapter (see page 5824). The login form typically contains three fields: user name, password, and next page.

See Also

TCustomLoginFormAdapter (see page 5701)

TAdapterNextPageField (see page 5379)

TAdapterUserNameField (see page 5433)

TAdapterPasswordField (see page 5391)

54.1.75.1 TLoginFormAdapterLoginAction Members

The following tables list the members exposed by TLoginFormAdapterLoginAction.

Protected Methods

	Name	Description
	CheckExecuteAccess (see page 5452)	Checks end-user rights to execute this adapter action.
	CreateRequestContext (see page 5452)	Creates an object that describes the adapter action parameters and adapter field values.
V	DoAfterExecuteActionRequest (see page 5453)	Calls event handlers after the adapter action is executed.
V	DoAfterGetExecuteActionResponse (see page 5453)	Calls event handlers after the adapter action response is formulated.
V	DoBeforeExecuteActionRequest (see page 5453)	Calls event handlers before the adapter action is executed.
V	DoBeforeGetExecuteActionResponse (see page 5454)	Calls event handlers before the adapter action response is formulated.
	EndIterator (see page 5454)	Implements IIteratorSupport (see page 1054)'s EndIterator method.
	ExecuteActionRequest (see page 5455)	Executes the adapter action using parameters passed in the HTTP request.
	GetActionName (see page 5455)	Gets the name used to reference this adapter action with server-side script.
	GetAdapter (see page 5456)	GetAdapter returns the parent adapter component.
	GetAdapterItemRequestParams (see page 5456)	Provides the name/value pairs needed to execute this adapter action.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultActionName (see page 5840)	Gets the name used to reference this adapter action with server-side script.
V	GetDefaultDisplayLabel (see page 5457)	Provides the default display label for this adapter action.
	GetDisplayLabel (see page 5457)	Returns the suggested display label for this adapter action.
	GetDisplayStyle (see page 5457)	Returns a string value to suggest an HTML display style for this adapter action.
V	GetDisplayStyleType (see page 5458)	Suggests an HTML display type for this adapter action.
	GetErrors (see page 5458)	Returns the parent adapter's errors list.
	GetExecuteActionResponse (see page 5458)	Generates a response after the adapter action has been executed.
	GetFailureOptions (see page 5459)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
	GetInputStyle (see page 5459)	Returns a string value to suggest an HTML display style for this adapter action.
	GetIsAdapterActionList (see page 5460)	Indicates whether this adapter action may have multiple commands.
V	GetItemCount (see page 5460)	Returns the number of commands defined by this adapter action.
	GetIteratorIndex (see page 5460)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method.
	GetSuccessOptions (see page 5461)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	GetVariableName (see page 5461)	Gets the name used to reference this adapter action with server-side script.
	GetViewMode (see page 5462)	Returns a string value to suggest a view mode for this adapter action.
V	GetViewModeType (see page 5462)	Suggests a view mode for this adapter action.
	GetVisible (see page 5462)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	GetWebSnapObjClass (see page 5463)	Returns the class type for this adapter field.
	HandleRequest (see page 5463)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 5463)	Checks the end-user's right to execute this adapter action.
	ImplCreateRequestContext (see page 5464)	Creates an object that describes the action parameters and field values.
	ImplEndIterator (see page 5464)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5454) method.
V	ImplExecuteActionRequest (see page 5840)	Executes the adapter action using parameters passed in the HTTP request.
V	ImplGetActionName (see page 5465)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetActionName (see page 5584)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetAdapterItemRequestParams (see page 5841)	Provides the name/value pairs needed to execute this adapter action.
V	ImplGetDisplayLabel (see page 5465)	Returns the suggested display label for this adapter action.
V	ImplGetExecuteActionResponse (see page 5466)	Generates a response after the adapter action has been executed.
V	ImplGetFailureOptions (see page 5466)	Indicates whether to perform an HTTP redirect after execution of this adapter action fails.
V	ImplGetIsAdapterActionList (see page 5466)	Indicates whether this adapter action may have multiple commands.
V	ImplGetIteratorIndex (see page 5467)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5460) method.
V	ImplGetSuccessOptions (see page 5467)	Indicates whether to perform an HTTP redirect after successfully executing this action.
V	ImplGetSuccessOptions (see page 5585)	Indicates whether to perform an HTTP redirect after successfully executing this action.

	ImplGetVariableName (see page 5467)	Gets the name used to reference this adapter action with server-side script.
V	ImplGetVisible (see page 5468)	Indicates whether a button or hyperlink for this adapter action should be displayed on the HTML page.
V	ImplHandleRequest (see page 5468)	Executes the adapter action and generates a response.
V	ImplHasExecuteAccess (see page 5468)	Checks the end-user's right to execute this adapter action.
V	ImplInIterator (see page 5469)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5471) method.
V	ImplIsDefaultAction (see page 5469)	Indicates whether this adapter action should be added, by default, to the parent adapter.
	ImplNextIteration (see page 5470)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5472) method.
	ImplSetActionName (see page 5585)	Sets the name that is used to reference this adapter action with server-side script.
	ImplStartIterator (see page 5470)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5473) method.
V	ImplWebEnabled (see page 5470)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
V	ImplWebEnabled (see page 5585)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.
	InIterator (see page 5471)	Implements IIteratorIndex (see page 1052)'s InIterator method.
	IsDefaultAction (see page 5471)	Indicates whether this adapter action should be added, by default, to the parent adapter.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	NextIteration (see page 5472)	Implements IIteratorSupport (see page 1054)'s NextIteration method.
V	NextPage (see page 5841)	Identifies the name of the next page to display after login.
V	ParentChanged (see page 5472)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
V	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetActionName (see page 5586)	Sets the name that is used to reference this adapter action with server-side script.
	SetDisplayLabel (see page 5472)	Set the value of the DisplayLabel (see page 5474) property.
V	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.
	StartIterator (see page 5473)	Implements IIteratorSupport (see page 1054)'s StartIterator method.
	WebEnabled (see page 5473)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Protected Properties

	Name	Description
R	Adapter (see page 5474)	Provides access to the parent adapter component.
R	Adapter (see page 5721)	Returns the adapter that acts as a parent to this action.
R	Errors (see page 5475)	Returns the parent adapter's Errors list.
R	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
R	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Events

	Name	Description
	OnExecute (see page 5588)	Called to execute this action using parameters passed in the HTTP request.
	OnGetEnabled (see page 5589)	Indicates whether a button or hyperlink for this adapter action should be enabled on the HTML page.

Public Methods

	Name	Description
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	CreateRequestContext (see page 1013)	Creates an object that describes the adapter action parameters and adapter field values.

	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterItemRequestParams (see page 1024)	This is GetAdapterItemRequestParams, a member of class IGetAdapterItemRequestParams.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayStyle (see page 1032)	Returns the preferred display style for an adapter field or adapter action.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputStyle (see page 1033)	Returns the preferred editing style for an adapter field.
	GetIsAdapterActionList (see page 1050)	This is GetIsAdapterActionList, a member of class IIsAdapterActionList.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetViewMode (see page 1033)	Returns the preferred mode of an adapter field.
	GetVisible (see page 984)	This is GetVisible, a member of class IAdapterActionAttributes.
	HandleRequest (see page 1013)	Executes the adapter action and generates a response.
	HasExecuteAccess (see page 983)	This is HasExecuteAccess, a member of class IAdapterActionAccess.
	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsDefaultAction (see page 1101)	This is IsDefaultAction, a member of class IWebIsDefaultAction.
	NextIteration (see page 1056)	Advances to the objects next item.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
	WebEnabled (see page 1084)	This is WebEnabled, a member of class IWebEnabled.

Public Properties

	Name	Description
	ActionName (see page 1087)	This is ActionName, a member of class IWebGetActionName.
	ActionName (see page 5474)	Identifies the name of this action when using server-side script.
	ActionName (see page 5586)	Identifies the name of this action when using server-side script.
	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	ExecuteAccess (see page 5475)	Defines the rights required to execute this action.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
	IsAdapterActionList (see page 1050)	This is IsAdapterActionList, a member of class IIsAdapterActionList.
	ItemCount (see page 5475)	Returns the number of items defined by an adapter action.
	ItemIndex (see page 5476)	Returns the index of the current item of an adapter action.
	IteratorIndex (see page 1054)	Indicates the index of the current item.
	RedirectOptions (see page 5476)	Indicates whether to perform an HTTP redirect after successfully executing this action.
	Visible (see page 984)	This is Visible, a member of class IAdapterActionAttributes.

Published Events

	Name	Description
	OnAfterExecute (see page 5842)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5843)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5843)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5844)	Called before the adapter action response is generated.
	OnGetParams (see page 5844)	Specifies name/value pairs needed to execute this adapter action.

Published Properties

	Name	Description
	DisplayLabel (see page 5842)	Suggests a display label for this adapter action.

54.1.75.2 TLoginFormAdapterLoginAction Methods

The methods of the TLoginFormAdapterLoginAction class are listed here.

Protected Methods

	Name	Description
	GetDefaultActionName (see page 5840)	Gets the name used to reference this adapter action with server-side script.
	ImplExecuteActionRequest (see page 5840)	Executes the adapter action using parameters passed in the HTTP request.
	ImplGetAdapterItemRequestParams (see page 5841)	Provides the name/value pairs needed to execute this adapter action.
	NextPage (see page 5841)	Identifies the name of the next page to display after login.

54.1.75.2.1 TLoginFormAdapterLoginAction.GetDefaultActionName Method

Gets the name used to reference this adapter action with server-side script.

Pascal

```
function GetDefaultActionName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultActionName();
```

Description

GetDefaultActionName returns "Login".

See Also

GetActionName (see page 5455)

GetDefaultActionName (see page 5456)

54.1.75.2.2 TLoginFormAdapterLoginAction.ImplExecuteActionRequest Method

Executes the adapter action using parameters passed in the HTTP request.

Pascal

```
procedure ImplExecuteActionRequest(AActionRequest: IActionRequest; AActionResponse:
IActionResponse); override;
```

C++

```
virtual __fastcall ImplExecuteActionRequest(IActionRequest AActionRequest, IActionResponse
AActionResponse);
```

Description

ImplExecuteActionRequest uses the user name and password passed in the HTTP request to log the user in. Exceptions are raised if the user name or password contain invalid values or if the user name/password is not known. If an exception is raised the exception message is added to the parent adapter's error list and the echo flag is set to true. If the login is successful then ImplExecuteActionRequest causes an HTTP redirect to the page specified in the next page field.

See Also

ImplExecuteActionRequest (see page 5464)

IActionRequest

IActionResponse

ValidatePassword (see page 5712)

ValidateUserName (see page 5712)

ValidateUser (see page 1117)

Errors (see page 5573)

EchoActionFieldValues (see page 5572)

54.1.75.2.3 TLoginFormAdapterLoginAction.ImplGetAdapterItemRequestParams Method

Provides the name/value pairs needed to execute this adapter action.

Pascal

```
procedure ImplGetAdapterItemRequestParams(var AIdentifier: string; Params:
IAdapterItemRequestParams); override;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(UnicodeString AIdentifier,
IAdapterItemRequestParams Params);
```

Description

ImplGetAdapterItemRequestParams adds a name/value pair identifying the name of the next page that should be displayed after login. When the login action is executed, the name/value specified by ImplGetAdapterItemRequestParams will be used to generate the HTTP response unless the login form contains a next page field. In that case, the value entered by the end-user will be used to the generate the HTTP response.

See Also

NextPage (see page 5713)

RequestedPageName (see page 5974)

ImplGetAdapterItemRequestParams (see page 5465)

IAdapterItemRequestParams (see page 1005)

TAdapterNextPageField (see page 5379)

54.1.75.2.4 TLoginFormAdapterLoginAction.NextPage Method

Identifies the name of the next page to display after login.

Pascal

```
function NextPage: string; virtual;
```

C++

```
virtual __fastcall UnicodeString NextPage();
```

Description

This value is used when generating the login form. NextPage returns the result of TCustomLoginFormAdapter.NextPage.

See Also

NextPage (see page 5713)

54.1.75.3 TLoginFormAdapterLoginAction Properties

The properties of the TLoginFormAdapterLoginAction class are listed here.

Published Properties

	Name	Description
	DisplayLabel (see page 5842)	Suggests a display label for this adapter action.

54.1.75.3.1 TLoginFormAdapterLoginAction.DisplayLabel Property

Suggests a display label for this adapter action.

Pascal

```
property DisplayLabel: string;
```

C++

```
__property UnicodeString DisplayLabel;
```

Description

Use this property to suggest a display label to use when generating HTML to display the a button or hyperlink to execute this adapter action. Typically the adapter action is displayed using server-side script, either generated or custom written. Server-side script uses the DisplayLabel property to access this value.

SetDisplayLabel (see page 5472)

54.1.75.4 TLoginFormAdapterLoginAction Events

The events of the TLoginFormAdapterLoginAction class are listed here.

Published Events

	Name	Description
	OnAfterExecute (see page 5842)	Called after the adapter action has executed.
	OnAfterGetResponse (see page 5843)	Called after the adapter action response is generated.
	OnBeforeExecute (see page 5843)	Called before the adapter action is executed.
	OnBeforeGetResponse (see page 5844)	Called before the adapter action response is generated.
	OnGetParams (see page 5844)	Specifies name/value pairs needed to execute this adapter action.

54.1.75.4.1 TLoginFormAdapterLoginAction.OnAfterExecute Event

Called after the adapter action has executed.

Pascal

```
property OnAfterExecute: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterExecute;
```

Description

Implement OnAfterExecute to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterExecute is called by DoAfterExecuteActionRequest.

See Also

DoAfterExecuteActionRequest (see page 5453)

OnAfterExecuteAction (see page 5576)

OnBeforeExecute (see page 5478)

54.1.75.4.2 TLoginFormAdapterLoginAction.OnAfterGetResponse Event

Called after the adapter action response is generated.

Pascal

```
property OnAfterGetResponse: TActionExecuteEvent;
```

C++

```
__property TActionExecuteEvent OnAfterGetResponse;
```

Description

Implement OnAfterGetResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. OnAfterGetResponse is called by DoAfterGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnBeforeGetActionResponse (see page 5578)

54.1.75.4.3 TLoginFormAdapterLoginAction.OnBeforeExecute Event

Called before the adapter action is executed.

Pascal

```
property OnBeforeExecute: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeExecute;
```

Description

Implement OnBeforeExecute to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed. OnBeforeExecute is called by DoBeforeExecuteActionRequest.

See Also

DoBeforeExecuteActionRequest (see page 5453)

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.75.4.4 TLoginFormAdapterLoginAction.OnBeforeGetResponse Event

Called before the adapter action response is generated.

Pascal

```
property OnBeforeGetResponse: TActionExecuteHandledEvent;
```

C++

```
__property TActionExecuteHandledEvent OnBeforeGetResponse;
```

Description

Implement OnBeforeGetResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed. OnBeforeGetResponse is called by DoBeforeGetExecuteActionReponse.

See Also

DoBeforeGetExecuteActionResponse (see page 5454)

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.75.4.5 TLoginFormAdapterLoginAction.OnGetParams Event

Specifies name/value pairs needed to execute this adapter action.

Pascal

```
property OnGetParams: TActionGetParamsEvent;
```

C++

```
__property TActionGetParamsEvent OnGetParams;
```

Description

Implement this event handler to specify the name/value needed to execute this action. For example, an action that deletes a row in a table will need a name/value pair that identifies the row to be deleted such as "Key=123".

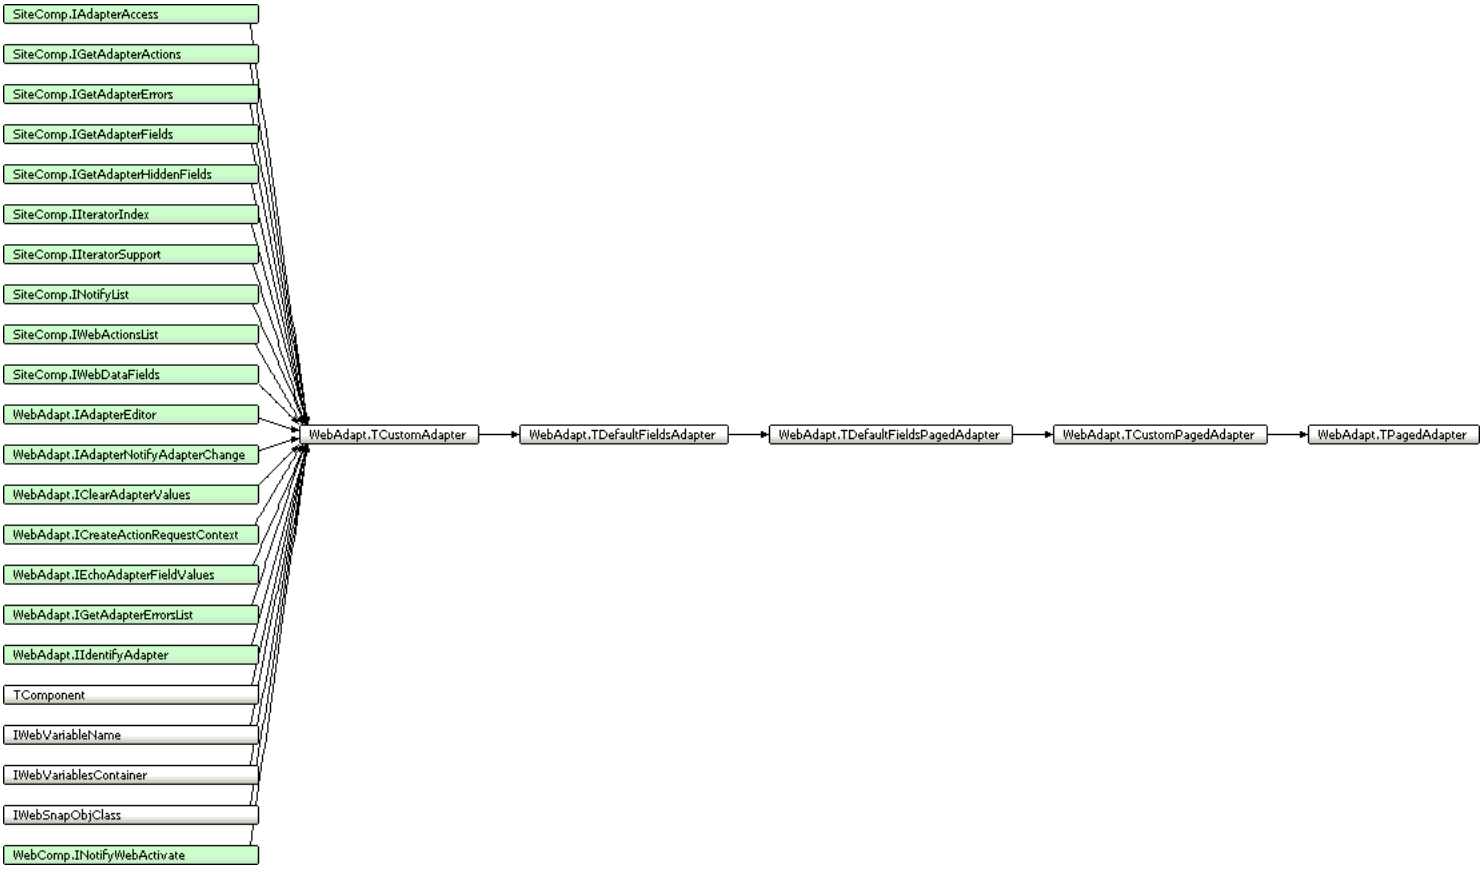
See Also

ImplGetAdapterItemRequestParams (see page 5465)

54.1.76 TPagedAdapter Class

TPagedAdapter divides a large amount of data into several pages, each page displaying a portion of the data records.

Class Hierarchy



Pascal

```
TPagedAdapter = class(TCustomPagedAdapter);
```

C++

```
class TPagedAdapter : public TCustomPagedAdapter;
```

File

WebAdapt

Description

Use TPagedAdapter like TAdapter (see page 5190) to define a custom interface to application logic. Set the PageSize (see page 5851) property to indicate the number of rows that a page displays. When the PageSize (see page 5851) is not 0, the TPagedAdapter component automatically adds built-in actions called TAdapterNextPageAction (see page 5370), TAdapterPrevPageAction (see page 5396), and TAdapterGotoPageAction (see page 5291) for moving between pages. To generate HTML buttons for these actions, use TAdapterPageProducer.

The TDataSetAdapter component also supports paging.

54.1.76.1 TPagedAdapter Members

The following tables list the members exposed by TPagedAdapter.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultActions (see page 5753)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
V	EncodeActionParams (see page 5754)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
	EndOfPage (see page 5754)	Indicates whether the record index has gone past the last record in the current page.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
V	ExtractRequestParams (see page 5754)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.
	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
V	GetEOF (see page 5755)	Indicates whether the record position has passed the last record.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetFirstRecord (see page 5755)	Set the record position to the first record.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.

	GetNextRecord (see page 5755)	Increments the record position.
	GetPageCount (see page 5756)	Calculates the number of pages needed to display all adapter records.
	GetRecordCount (see page 5756)	Returns the total number of records.
	GetRecordIndex (see page 5756)	Returns the index of the current record.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddActionClass (see page 5757)	Indicates whether a type of adapter action can be added to this adapter.
	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplEndIterator (see page 5757)	Implements IteratorSupport's EndIterator (see page 5542) method to support iterating over the data records of the adapter.
	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
	ImplGetActionsList (see page 5757)	Provides a list of action types that can be added to this adapter.
	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNextIteration (see page 5758)	Implements IteratorSupport's NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplNotifyDeactivate (see page 5758)	Clears the current page variable.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.

	ImplStartIterator (see page 5759)	Implements IteratorSupport.StartIterator (see page 5567) to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	SetPageSize (see page 5759)	Updates the pagesize variable.
	SkipToPage (see page 5760)	Skips records until the current record is within the current page.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.
	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.

	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
	CurrentPage (see page 5760)	Sets or gets the current page index.
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
R	PageCount (see page 5761)	Calculates the number of pages needed to display all adapter records.
R	RecordCount (see page 5761)	Returns the total number of records.
R	RecordIndex (see page 5762)	Returns the index of the current record.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5852)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5853)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5853)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5853)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5854)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5854)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5854)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5855)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5855)	Supplies name/value pairs needed to execute an adapter action.
	OnGetEOF (see page 5856)	Implement this event to indicate when the current record index has exceeded the total record count.
	OnGetFirstRecord (see page 5856)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 5856)	Implement this method to increment the iteration index.

	OnGetRecordCount (see page 5856)	Implement this event to identify the total number of records that can be iterated.
	OnGetRecordIndex (see page 5857)	Implement this event to identify the zero-based current record.

Published Properties

	Name	Description
	Actions (see page 5850)	Container for adapter actions components.
	Data (see page 5850)	Container for adapter field components.
	ModifyAccess (see page 5851)	Identifies the rights required to update this adapter's fields.
	PageSize (see page 5851)	Sets or gets the page size variable.
	ViewAccess (see page 5851)	Identifies the rights required to view this adapter's fields.

54.1.76.2 TPagedAdapter Properties

The properties of the TPagedAdapter class are listed here.

Published Properties

	Name	Description
	Actions (see page 5850)	Container for adapter actions components.
	Data (see page 5850)	Container for adapter field components.
	ModifyAccess (see page 5851)	Identifies the rights required to update this adapter's fields.
	PageSize (see page 5851)	Sets or gets the page size variable.
	ViewAccess (see page 5851)	Identifies the rights required to view this adapter's fields.

54.1.76.2.1 TPagedAdapter.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 5231)

54.1.76.2.2 TPagedAdapter.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 5237)

54.1.76.2.3 TPagedAdapter.ModifyAccess Property

Identifies the rights required to update this adapter's fields.

Pascal

```
property ModifyAccess: string;
```

C++

```
__property UnicodeString ModifyAccess;
```

Description

The ModifyAccess property defines the access rights required to modify this fields of this adapter. When server-side script accesses the CanModify property, this ModifyAccess property value is checked against the end user's rights.

See Also

TWebUserList (see page 6796)

HasModifyAccess (see page 5552)

ImplHasModifyAccess (see page 5558)

54.1.76.2.4 TPagedAdapter.PageSize Property

Sets or gets the page size variable.

Pascal

```
property PageSize: Integer;
```

C++

```
__property int PageSize;
```

Description

If the page size variable is set to a value greater than zero and no actions have been explicitly added to the adapter then the NextPage, PrevPage, and GotoPage are automatically added. If the page size variable is changed back to zero then the these actions are removed.

See Also

TAdapterNextPageAction (see page 5370)

TAdapterPrevPageAction (see page 5396)

TAdapterGotoPageAction (see page 5291)

54.1.76.2.5 TPagedAdapter.ViewAccess Property

Identifies the rights required to view this adapter's fields.

Pascal

```
property ViewAccess: string;
```

C++

```
__property UnicodeString ViewAccess;
```

Description

The ViewAccess property identifies the access rights required to view fields of this adapter. When server-side script accesses the CanView property, the ViewAccess property value is checked against the end user's rights.

See Also

TWebUserList (see page 6796)

HasViewAccess (see page 5553)

ImplHasViewAccess (see page 5559)

54.1.76.3 TPagedAdapter Events

The events of the TPagedAdapter class are listed here.

Published Events

	Name	Description
	OnAfterExecuteAction (see page 5852)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5853)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5853)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5853)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5854)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5854)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5854)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5855)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5855)	Supplies name/value pairs needed to execute an adapter action.
	OnGetEOF (see page 5856)	Implement this event to indicate when the current record index has exceeded the total record count.
	OnGetFirstRecord (see page 5856)	Implement this method to initialize the iteration index to zero.
	OnGetNextRecord (see page 5856)	Implement this method to increment the iteration index.
	OnGetRecordCount (see page 5856)	Implement this event to identify the total number of records that can be iterated.
	OnGetRecordIndex (see page 5857)	Implement this event to identify the zero-based current record.

54.1.76.3.1 TPagedAdapter.OnAfterExecuteAction Event

Occurs after an adapter action has executed.

Pascal

```
property OnAfterExecuteAction: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterExecuteAction;
```

Description

Implement OnAfterExecuteAction to do something after the action has executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterExecute (see page 5477)

OnBeforeExecuteAction (see page 5577)

54.1.76.3.2 TPagedAdapter.OnAfterGetActionResponse Event

Occurs after the adapter action response is generated.

Pascal

```
property OnAfterGetActionResponse: TAdapterActionExecuteEvent;
```

C++

```
__property TAdapterActionExecuteEvent OnAfterGetActionResponse;
```

Description

Implement OnAfterGetActionResponse to do something after the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request.

See Also

OnAfterGetResponse (see page 5477)

OnBeforeGetActionResponse (see page 5578)

54.1.76.3.3 TPagedAdapter.OnAfterUpdateFields Event

Occurs after values in the HTTP request are used to update adapter fields.

Pascal

```
property OnAfterUpdateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterUpdateFields;
```

Description

Implement this event handler to perform custom updates. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record update errors.

See Also

UpdateFieldsUpdateValues (see page 5568)

OnBeforeUpdateFields (see page 5578)

Errors (see page 5573)

54.1.76.3.4 TPagedAdapter.OnAfterValidateFields Event

Occurs after values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnAfterValidateFields: TActionRequestFieldsEvent;
```

C++

```
__property TActionRequestFieldsEvent OnAfterValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. The adapter's errors object is used to record validation errors.

See Also

UpdateFieldsValidateValues (see page 5569)

OnBeforeValidateFields (see page 5578)

Errors (see page 5573)

54.1.76.3.5 TPagedAdapter.OnBeforeExecuteAction Event

Occurs before an adapter action is executed.

Pascal

```
property OnBeforeExecuteAction: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeExecuteAction;
```

Description

Implement OnBeforeExecuteAction to do something before the action is executed. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to prevent the action from being executed.

See Also

OnBeforeExecute (see page 5478)

OnAfterExecuteAction (see page 5576)

54.1.76.3.6 TPagedAdapter.OnBeforeGetActionResponse Event

Occurs before the adapter action response is generated.

Pascal

```
property OnBeforeGetActionResponse: TAdapterActionExecuteHandledEvent;
```

C++

```
__property TAdapterActionExecuteHandledEvent OnBeforeGetActionResponse;
```

Description

Implement OnBeforeGetActionResponse to do something before the action response is generated. The Params parameter contains the adapter action parameters (name/value pairs) that were passed in the HTTP request. Set the Handled flag to indicate that the response has been generated and no further processing is needed.

See Also

OnBeforeGetResponse (see page 5478)

OnAfterGetActionResponse (see page 5576)

54.1.76.3.7 TPagedAdapter.OnBeforeUpdateFields Event

Occurs before values in the HTTP request are used to update adapter fields.

Pascal

```
property OnBeforeUpdateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeUpdateFields;
```

Description

Implement this event handler to perform custom updates of adapter fields. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further updates. Add update errors to the adapter's errors object.

See Also

UpdateFieldsUpdateValues (see page 5568)

OnAfterUpdateFields (see page 5576)

Errors (see page 5573)

54.1.76.3.8 TPagedAdapter.OnBeforeValidateFields Event

Occurs before values in the HTTP request are validated by the adapter's fields.

Pascal

```
property OnBeforeValidateFields: TActionRequestFieldsHandledEvent;
```

C++

```
__property TActionRequestFieldsHandledEvent OnBeforeValidateFields;
```

Description

Implement this event handler to perform custom validation of the HTTP request. The AdapterFields parameter lists all of the adapter fields that have corresponding values in the HTTP request. Set the Handled flag to prevent any further validation. Add validation errors to the adapter's errors object.

See Also

UpdateFieldsValidateValues (see page 5569)

OnAfterValidateFields (see page 5577)

Errors (see page 5573)

54.1.76.3.9 TPagedAdapter.OnGetActionParams Event

Supplies name/value pairs needed to execute an adapter action.

Pascal

```
property OnGetActionParams: TAdapterActionGetParamsEvent;
```

C++

```
__property TAdapterActionGetParamsEvent OnGetActionParams;
```

Description

Implement this event handler to specify the name/value pairs needed to execute an action.

See Also

OnGetParams (see page 5478)

54.1.76.3.10 TPagedAdapter.OnGetEOF Event

Implement this event to indicate when the current record index has exceeded the total record count.

Pascal

```
property OnGetEOF: TGetEOFEvent;
```

C++

```
__property TGetEOFEvent OnGetEOF;
```

Description

OnGetEOF is called to determine when to stop the iteration. If OnGetEOF is not implemented, the result of the OnGetRecordCount event handler will be compared to the result of the OnGetRecordIndex event handler.

54.1.76.3.11 TPagedAdapter.OnGetFirstRecord Event

Implement this method to initialize the iteration index to zero.

Pascal

```
property OnGetFirstRecord: TGetRecordEvent;
```

C++

```
__property TGetRecordEvent OnGetFirstRecord;
```

Description

This method is called when the iteration is started. If there are no records then set the EOF flag.

54.1.76.3.12 TPagedAdapter.OnGetNextRecord Event

Implement this method to increment the iteration index.

Pascal

```
property OnGetNextRecord: TGetRecordEvent;
```

C++

```
__property TGetRecordEvent OnGetNextRecord;
```

Description

This method is called when the next record is requested. This method is not a next then set the EOF flag.

54.1.76.3.13 TPagedAdapter.OnGetRecordCount Event

Implement this event to identify the total number of records that can be iterated.

Pascal

```
property OnGetRecordCount: TGetRecordCountEvent;
```

C++

```
__property TGetRecordCountEvent OnGetRecordCount;
```

Description

OnGetRecordCount is called to calculate the number of pages.

54.1.76.3.14 TPagedAdapter.OnGetRecordIndex Event

Implement this event to identify the zero-based current record.

Pascal

```
property OnGetRecordIndex: TGetRecordIndexEvent;
```

C++

```
__property TGetRecordIndexEvent OnGetRecordIndex;
```

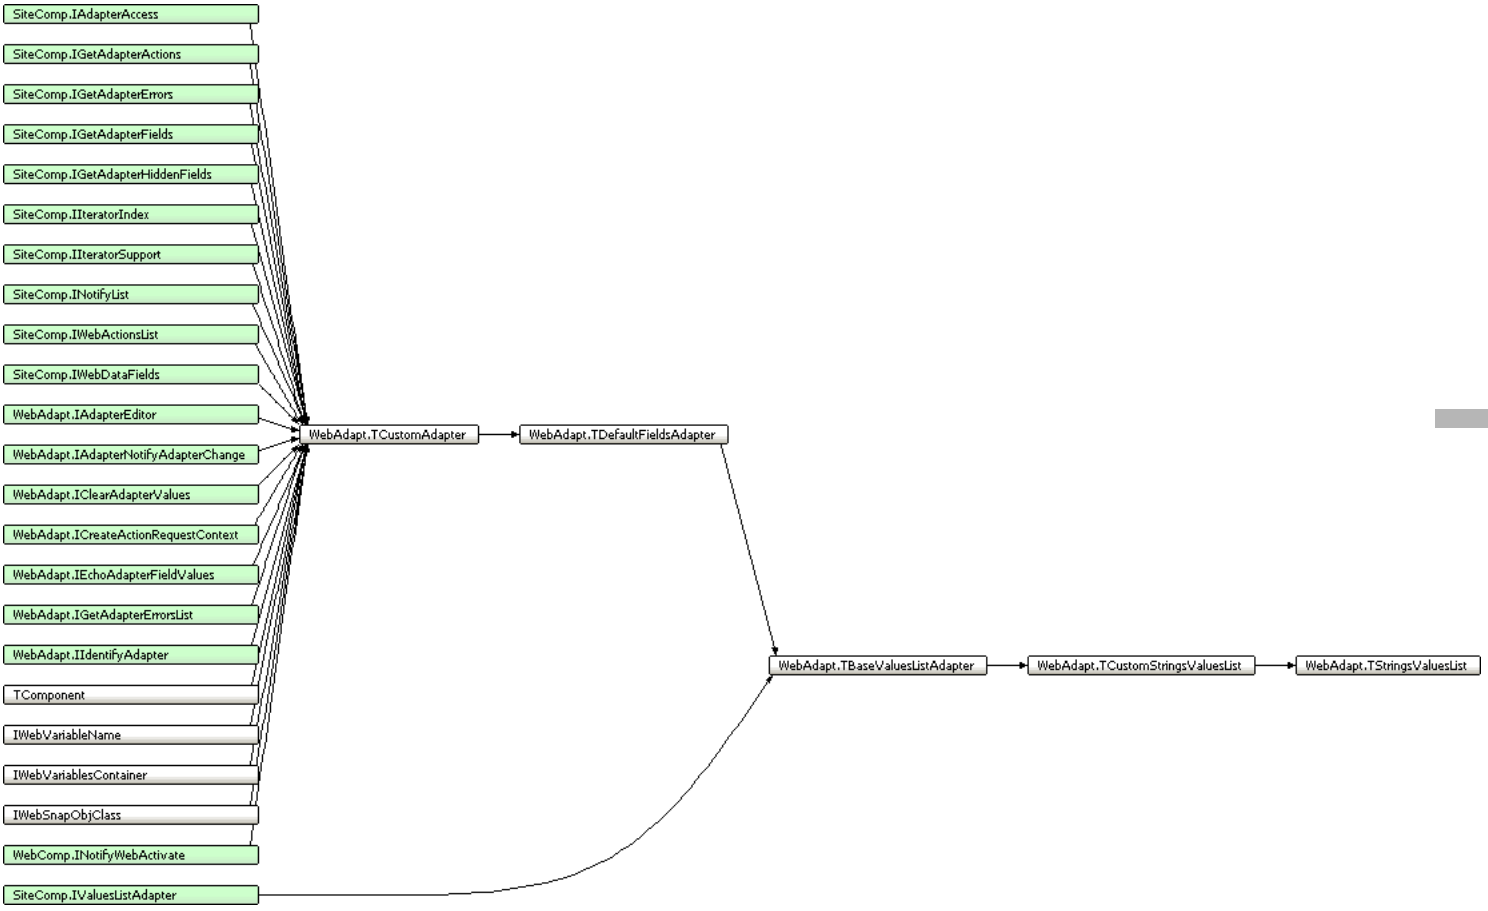
Description

OnGetRecordIndex is called to calculate the current page.

54.1.77 TStringsValuesList Class

TStringsValuesList is an adapter component that provides a list of name/value pairs defined by items in a TStrings property.

Class Hierarchy



Pascal

```
TStringsValuesList = class(TCustomStringsValuesList);
```

C++

```
class TStringsValuesList : public TCustomStringsValuesList;
```

File

WebAdapt

Description

TStringsValuesList defines a list of possible values for an adapter field by assigning the TStringsValuesList component to the ValuesList property of the adapter field. Typically, the values are used to populate HTML elements, such as a select list or radio buttons, when generating HTML to edit an adapter field. The TAdapterPageProducer will automatically generate appropriate HTML/JavaScript for an editable field when the ValuesList is set.

54.1.77.1 TStringsValuesList Members

The following tables list the members exposed by TStringsValuesList.

Protected Methods

	Name	Description
	AddAdapterModeHiddenField (see page 5538)	Defines a hidden field that passes the adapter's mode value in the HTTP request when an HTML form is submitted.
V	AddDefaultActions (see page 5743)	Adds default action components to this adapter.
V	AddDefaultFields (see page 5744)	Adds default field components to this adapter.
	AddOrigValueHiddenFields (see page 5539)	Defines hidden field(s) that pass the original values of adapter fields in the HTTP request when an HTML form is submitted.
	AddRecordKeysHiddenFields (see page 5539)	Defines hidden field(s) that pass key values in the HTTP request when an HTML form is submitted.
	CanAddActionClass (see page 5539)	Indicates whether a type of adapter action can be added to this adapter.
	CanAddFieldClass (see page 5540)	Indicates whether a type of adapter field can be added to this adapter.
	CheckModifyAccess (see page 5540)	Checks end-user rights to modify the adapter's field values.
	ClearAdapterValues (see page 5540)	Clears adapter state information.
	ClearErrors (see page 5541)	Clears the content of the adapter's Errors (see page 5573) property.
	CreateActionRequestContext (see page 5541)	Creates an object that describes the adapter action parameters and adapter field values.
V	CreateErrorsList (see page 5542)	Creates the object used to manage errors associated with this adapter.
	DefaultWebComponentsChange (see page 5744)	Notifies other components of changes to the list of default actions or fields.
V	EncodeActionParams (see page 5542)	Writes name/value pairs that represent adapter state.
	EndIterator (see page 5542)	Implements IIteratorSupport (see page 1054)'s EndIterator method to support iterating over the data records of the adapter.
V	ExtractRequestParams (see page 5543)	Reads name/value pairs from the HTTP request.
	FindAction (see page 5543)	Returns an action component with a matching action name.
	FindField (see page 5543)	Returns an adapter field component with a matching field name.
	FindNamedAction (see page 5544)	Finds an action with a matching variable name.
	FindNamedField (see page 5544)	Finds an adapter field with a matching variable name.
V	FindNamedVariable (see page 5544)	Finds a field or action with a matching variable name.
	FindVariable (see page 5545)	Finds an adapter action or adapter field with the given variable name.
	FindVariableContainer (see page 5545)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	GetActionsClass (see page 5545)	Specifies the class to create as a container for adapter actions components.
V	GetActionsClass (see page 5744)	Specifies the class to create as a container for adapter actions components.
	GetActionsList (see page 5546)	Provides a list of action types that can be added to this adapter.
	GetAdapterActions (see page 5546)	Returns the adapter actions container object.
	GetAdapterErrors (see page 5546)	Returns the adapter's errors object.
	GetAdapterErrorsList (see page 5547)	<insert text here>
	GetAdapterFields (see page 5547)	Returns the adapter fields container object.

	GetAdapterHiddenFields (see page 5547)	Returns a list of hidden fields that hold adapter state information.
	GetAdapterHiddenRecordFields (see page 5548)	Returns a list of hidden fields that associate HTML form fields and adapter field.
V	GetChildren (see page 5548)	Provides the interface for a method that adapters use to return their child components.
V	GetDataClass (see page 5548)	Specifies the class to create as a container for adapter fields components.
V	GetDataClass (see page 5745)	Specifies the class to create as a container for adapter field components.
	GetEchoActionFieldValues (see page 5549)	Returns the value of the echo flag.
	GetFieldsList (see page 5549)	Provides a list of field types that can be added to this adapter.
V	GetHiddenFieldOptions (see page 5549)	Indicates the types of hidden fields that this adapter requires in a submitted HTML form.
	GetIteratorIndex (see page 5550)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex method to support iterating over the data records of the adapter.
	GetListImage (see page 5522)	Returns an image associated with the current name/value pair.
	GetListImageOfValue (see page 5523)	Looks up an image for a value.
	GetListName (see page 5523)	Responsible returning the name of the name/value pair.
	GetListNameOfValue (see page 5523)	Looks up a name for a value.
	GetListValue (see page 5524)	Responsible for returning the value of the name/value pair.
V	GetNameFieldClass (see page 5524)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetNameFieldClass (see page 5734)	Returns the class of adapter field that is responsible for providing the value of the name/value pair.
V	GetValueFieldClass (see page 5524)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
V	GetValueFieldClass (see page 5734)	Returns the class of adapter field that is responsible for providing the name of the name/value pair.
	GetVariable (see page 5550)	Returns an action or field.
	GetVariableCount (see page 5550)	Returns the total count of actions and fields.
	GetVariableName (see page 5551)	Gets the name used to reference this adapter with server-side script.
	GetVisibleActions (see page 5551)	Returns a list of this adapter's action components.
	GetVisibleFields (see page 5551)	Returns a list of this adapter's field components.
V	GetWebSnapObjClass (see page 5524)	Returns the class type for this adapter field.
V	GetWebSnapObjClass (see page 5552)	Returns the class type for this adapter field.
	HasExecuteAccess (see page 5552)	Checks the end-user's right to execute this adapter's actions.
	HasModifyAccess (see page 5552)	Checks the end-user's right to modify this adapter's fields.
	HasViewAccess (see page 5553)	Checks the end-user's right to view this adapter's fields.
V	ImplCanAddActionClass (see page 5553)	Indicates whether a type of adapter action can be added to this adapter.
V	ImplCanAddFieldClass (see page 5525)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplCanAddFieldClass (see page 5553)	Indicates whether a type of adapter field can be added to this adapter.
V	ImplClearAdapterValues (see page 5554)	Clears adapter state information.
V	ImplEndIterator (see page 5554)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the data records of the adapter.
V	ImplEndIterator (see page 5734)	Implements IIteratorSupport (see page 1054)'s EndIterator (see page 5542) method to support iterating over the records of the adapter.
V	ImplFindVariable (see page 5554)	Finds an adapter action or adapter field child with a matching variable name.
V	ImplFindVariableContainer (see page 5555)	Finds an adapter action or adapter field that is a container for other scriptable objects.
V	ImplGetActionsList (see page 5555)	Provides a list of action types that can be added to this adapter.
V	ImplGetEchoActionFieldValues (see page 5555)	Returns the value of the echo flag.
V	ImplGetFieldsList (see page 5525)	Adds default field components to this adapter.
V	ImplGetFieldsList (see page 5556)	Provides a list of field types that can be added to this adapter.
V	ImplGetIteratorIndex (see page 5556)	Implements IIteratorIndex (see page 1052)'s GetIteratorIndex (see page 5550) method to support iterating over the data records of the adapter.
V	ImplGetListImage (see page 5525)	Responsible returning an image associated with the current name/value pair.
V	ImplGetListImageOfValue (see page 5526)	Looks up an image for a value.
V	ImplGetListName (see page 5526)	Responsible returning the name of the name/value pair.
V	ImplGetListName (see page 5735)	Responsible returning the name of the name/value pair.
V	ImplGetListNameOfValue (see page 5526)	Looks up a name for a value.
V	ImplGetListNameOfValue (see page 5735)	Looks up a name for a value.

	ImplGetListValue (see page 5527)	Responsible for returning the value of the name/value pair.
	ImplGetListValue (see page 5735)	Responsible for returning the value of the name/value pair.
	ImplGetVariable (see page 5556)	Returns an action or field.
	ImplGetVariableCount (see page 5557)	Returns the total count of actions and fields.
	ImplGetVariableName (see page 5557)	Gets the name used to reference this adapter with server-side script.
	ImplGetVisibleActions (see page 5557)	Returns a list of this adapter's action components.
	ImplGetVisibleActions (see page 5745)	Returns a list of this adapter's action components.
	ImplGetVisibleFields (see page 5558)	Returns a list of this adapter's field components.
	ImplGetVisibleFields (see page 5745)	Returns a list of this adapter's field components.
	ImplHasExecuteAccess (see page 5558)	Checks the end-user's right to execute this adapter's actions.
	ImplHasModifyAccess (see page 5558)	Checks the end-user's right to modify this adapter's fields.
	ImplHasViewAccess (see page 5559)	Checks the end-user's right to view this adapter's fields.
	ImplInIterator (see page 5559)	Implements IIteratorIndex (see page 1052)'s InIterator (see page 5562) to support iterating over the data records of the adapter.
	ImplNextIteration (see page 5560)	Implements IIteratorSupport (see page 1054)'s NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNextIteration (see page 5736)	Implements IteratorSupport's NextIteration (see page 5564) method to support iterating over the records of the adapter.
	ImplNotifyActivate (see page 5560)	Called when the web module is activated.
	ImplNotifyDeactivate (see page 5560)	Called when the web module is deactivated.
	ImplNotifyDeactivate (see page 5736)	Clears the iteration index.
	ImplSetActions (see page 5561)	Initializes the Actions (see page 5572) property.
	ImplSetActions (see page 5746)	Initializes the Actions (see page 5746) property.
	ImplSetData (see page 5561)	Initializes the Data (see page 5572) property.
	ImplSetData (see page 5746)	Initializes the Data (see page 5747) property.
	ImplSetEchoActionFieldValues (see page 5561)	Sets the echo flag for this adapter's fields.
	ImplStartIterator (see page 5562)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	ImplStartIterator (see page 5736)	Implements IIteratorSupport (see page 1054)'s StartIterator (see page 5567) method to support iterating over the records of the adapter.
	InIterator (see page 5562)	Implements IIteratorIndex (see page 1052)'s InIterator method to support iterating over the data records of the adapter.
	IsActionInUse (see page 5563)	Indicates whether a particular action has been added to the adapter.
	IsFieldInUse (see page 5563)	Indicates whether a particular field has been added to the adapter.
	ListHiddenFields (see page 5563)	Specifies the HTML form hidden fields needed by the adapter.
	ListHiddenRecordFields (see page 5564)	Specifies the HTML form hidden fields needed by the adapter.
	NextIteration (see page 5564)	Implements IIteratorSupport (see page 1054)'s NextIteration method to support iterating over the data records of the adapter.
	Notification (see page 5565)	Clears references to deleted components.
	NotifyActivate (see page 5565)	Called when the web module is activated.
	NotifyAdapterChange (see page 5565)	Notifies components that the adapter has changed in some way.
	NotifyDeactivate (see page 5566)	Called when the web module is deactivated.
	PrepareStrings (see page 5737)	Customizes the content of the strings list.
	SetActions (see page 5566)	Initializes the Actions (see page 5572) property.
	SetData (see page 5566)	Initializes the Data (see page 5572) property.
	SetEchoActionFieldValues (see page 5567)	Sets the echo flag for this adapter's fields.
	StartIterator (see page 5567)	Implements IIteratorSupport (see page 1054)'s StartIterator method to support iterating over the records of the adapter.
	UpdateFieldsExecuteValues (see page 5567)	Executes the adapter's fields with values passed in the HTTP request.
	UpdateFieldsGetAnyChanges (see page 5568)	Determines whether the values in the HTTP request change any adapter fields.
	UpdateFieldsUpdateValues (see page 5568)	Updates the adapter's fields with values passed in the HTTP request.
	UpdateFieldsValidateValues (see page 5569)	Validate the adapter's field values passed in the HTTP request.
	UpdateRecordsGetAnyChanges (see page 5570)	Determines whether values passed in the HTTP request will change any adapter fields.
	UpdateRecordsUpdateValues (see page 5570)	Updates adapter fields with values passed in the HTTP request.
	UpdateRecordsValidateValues (see page 5571)	Validate the adapter's field values passed in the HTTP request.

	WebComponentsChange (see page 5571)	WebComponentsChange is called when the list of adapter fields or adapter actions changes.

Protected Properties

	Name	Description
R	NotifyList (see page 5574)	Keeps track of components that are to be notified when the adapter is changed.
	StringsPrepared (see page 5737)	This flag indicates whether the strings list has been prepared or customized.
R	VisibleActions (see page 5575)	Returns a list of this adapter's action components.
R	VisibleFields (see page 5575)	Returns a list of this adapter's field components.

Public Events

	Name	Description
	OnAfterExecuteAction (see page 5576)	Occurs after an adapter action has executed.
	OnAfterGetActionResponse (see page 5576)	Occurs after the adapter action response is generated.
	OnAfterUpdateFields (see page 5576)	Occurs after values in the HTTP request are used to update adapter fields.
	OnAfterValidateFields (see page 5577)	Occurs after values in the HTTP request are validated by the adapter's fields.
	OnBeforeExecuteAction (see page 5577)	Occurs before an adapter action is executed.
	OnBeforeGetActionResponse (see page 5578)	Occurs before the adapter action response is generated.
	OnBeforeUpdateFields (see page 5578)	Occurs before values in the HTTP request are used to update adapter fields.
	OnBeforeValidateFields (see page 5578)	Occurs before values in the HTTP request are validated by the adapter's fields.
	OnGetActionParams (see page 5579)	Supplies name/value pairs needed to execute an adapter action.
	OnIterateRecords (see page 5579)	Occurs when the adapter needs to iterate over its data records.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.
V	Create (see page 5536)	Constructor for TCustomAdapter (see page 5531).
V	Create (see page 5733)	Create is the constructor for TCustomStringsValuesList (see page 5728).
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.
V	Destroy (see page 5536)	Destructor for TCustomAdapter (see page 5531).
V	Destroy (see page 5733)	Destroy is the destructor for TCustomStringsList.
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterActions (see page 1018)	This is GetAdapterActions, a member of class IGetAdapterActions.
	GetAdapterErrors (see page 1020)	This is GetAdapterErrors, a member of class IGetAdapterErrors.
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.
	GetAdapterFields (see page 1021)	This is GetAdapterFields, a member of class IGetAdapterFields.
	GetAdapterHiddenFields (see page 1022)	This is GetAdapterHiddenFields, a member of class IGetAdapterHiddenFields.
	GetAdapterHiddenRecordFields (see page 1022)	This is GetAdapterHiddenRecordFields, a member of class IGetAdapterHiddenFields.
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetIteratorIndex (see page 1053)	Returns the value of the IteratorIndex (see page 1054) property.
	GetListImage (see page 1074)	Returns the image object associated with the current name/value pair.
	GetListImageOfValue (see page 1074)	Returns the image object associated with a specified value.
	GetListName (see page 1075)	Returns the name part of the current name/value pair.
	GetListNameOfValue (see page 1075)	Returns the name associated with a specified value.
	GetListValue (see page 1076)	Returns the value of the current name/value pair.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.

	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	HasExecuteAccess (see page 982)	This is HasExecuteAccess, a member of class IAdapterAccess.
	HasModifyAccess (see page 982)	This is HasModifyAccess, a member of class IAdapterAccess.
	HasViewAccess (see page 982)	This is HasViewAccess, a member of class IAdapterAccess.
	InIterator (see page 1053)	Indicates whether the object is iterating over its items.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.
V	UpdateRecords (see page 5569)	Updates the adapter's fields with the field values passed in an HTTP request.

Public Properties

	Name	Description
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	EchoActionFieldValues (see page 5572)	Modifies the adapter's echo flag.
R	Errors (see page 5573)	Returns an object used to track errors on behalf of this adapter.
	ExecuteAccess (see page 5573)	Defines the rights required to execute this adapter's action.
R	IteratorIndex (see page 1054)	Indicates the index of the current item.
	ModifyAccess (see page 5574)	Identifies the rights required to update this adapter's fields.
	ViewAccess (see page 5574)	Identifies the rights required to view this adapter's fields.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.

Published Events

	Name	Description
	OnPrepareStrings (see page 5864)	Implement OnPrepareStrings to customize the content of the strings list.

Published Properties

	Name	Description
	Actions (see page 5862)	Container for adapter actions components.
	Data (see page 5863)	Container for adapter field components.
	Strings (see page 5863)	This string list defines the list of name/value pairs.

54.1.77.2 TStringsValuesList Properties

The properties of the TStringsValuesList class are listed here.

Published Properties

	Name	Description
	Actions (see page 5862)	Container for adapter actions components.
	Data (see page 5863)	Container for adapter field components.
	Strings (see page 5863)	This string list defines the list of name/value pairs.

54.1.77.2.1 TStringsValuesList.Actions Property

Container for adapter actions components.

Pascal

```
property Actions: TAdapterActions;
```

C++

```
__property TAdapterDefaultActions Actions;__property TAdapterActions Actions;
```

Description

The Actions property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter actions by name.

See Also

TAdapterDefaultActions (see page 5231)

54.1.77.2.2 TStringsValuesList.Data Property

Container for adapter field components.

Pascal

```
property Data: TAdapterFields;
```

C++

```
__property TAdapterDefaultFields Data;__property TAdapterFields Data;
```

Description

The Data property is responsible for managing a list of child adapter fields. Responsibilities include streaming, insertion, deletion, and lookup of adapter fields by name.

See Also

TAdapterDefaultFields (see page 5237)

54.1.77.2.3 TStringsValuesList.Strings Property

This string list defines the list of name/value pairs.

Pascal

```
property Strings: TStrings;
```

C++

```
__property TStrings Strings;
```

Description

Each line in the string list represents a name/value pair. The name is optional. To specify a name/value enter a line with the name following by "=" followed by the value. For example, "Joe Smith=EMP111" is a named value. "EMP111" is an unnamed value.

54.1.77.3 TStringsValuesList Events

The events of the TStringsValuesList class are listed here.

Published Events

	Name	Description
	OnPrepareStrings (see page 5864)	Implement OnPrepareStrings to customize the content of the strings list.

54.1.77.3.1 TStringsValuesList.OnPrepareStrings Event

Implement OnPrepareStrings to customize the content of the strings list.

Pascal

```
property OnPrepareStrings: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnPrepareStrings;
```

Description

OnPrepareStrings is called before the name/value pairs are retrieved by server-side script.

See Also

TNotifyEvent

PrepareStrings (see page 5737)

54.1.78 TUpdateFileList Class

TUpdateFileList is a container for uploaded files.

Class Hierarchy

Pascal

```
TUpdateFileList = class;
```

C++

```
class TUpdateFileList;
```

File

WebAdapt

Description

TUpdateFileList contains the files that are being uploaded to a particular adapter field. TUpdateFileList is passed as a parameter to event handlers that operate on a list of uploaded files.

See Also

TCustomAdapterFileField (see page 5604)

54.1.78.1 TUpdateFileList Members

The following tables list the members exposed by TUpdateFileList.

Public Methods

	Name	Description
	Create (see page 5865)	Creates an instance of TUpdateFileList (see page 5864).

Public Properties

	Name	Description
	Count (see page 5865)	Returns the count of uploaded files.
	Files (see page 5865)	Returns a particular uploaded file.

54.1.78.2 TUpdateFileList.Create Constructor

Creates an instance of TUpdateFileList (see page 5864).

Pascal

```
constructor Create(AValue: IActionFieldValue);
```

C++

```
__fastcall TUpdateFileList(IActionFieldValue AValue);
```

Description

```
constructor Create(AValue: IActionFieldValueIActionFieldValue);
```

Create initializes an instance of TUpdateFileList (see page 5864) and calls the inherited Create method.

54.1.78.3 TUpdateFileList Properties

The properties of the TUpdateFileList class are listed here.

Public Properties

	Name	Description
	Count (see page 5865)	Returns the count of uploaded files.
	Files (see page 5865)	Returns a particular uploaded file.

54.1.78.3.1 TUpdateFileList.Count Property

Returns the count of uploaded files.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Use Count with the Files (see page 5865) property to loop through the uploaded files.

See Also

Files (see page 5865)

54.1.78.3.2 TUpdateFileList.Files Property

Returns a particular uploaded file.

Pascal

```
property Files [I: Integer]: TAbstractWebRequestFile;
```

C++

```
__property TAbstractWebRequestFile Files[int I];
```

Description

Use Files with the Count (see page 5865) property to loop through the uploaded files.

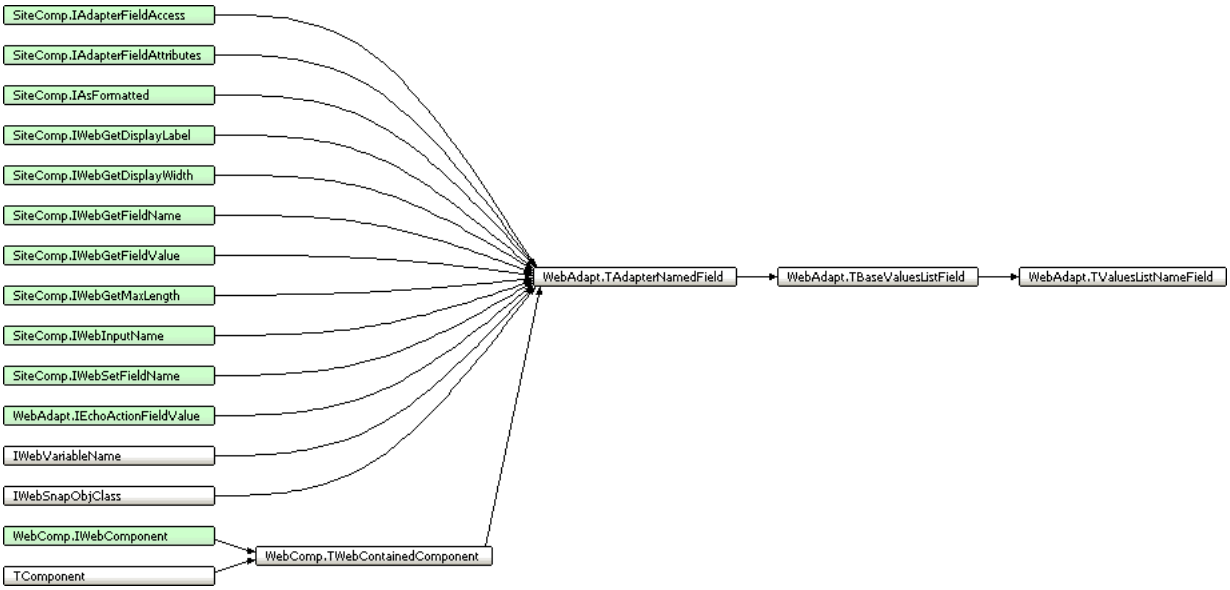
See Also

Count (see page 5865)

54.1.79 TValuesListNameField Class

TValuesListNameField is an adapter field used to access the Name of the current list item of a values list adapter.

Class Hierarchy



Pascal

```
TValuesListNameField = class(TBaseValuesListField);
```

C++

```
class TValuesListNameField : public TBaseValuesListField;
```

File

WebAdapt

Description

Values list adapters such as TStringValuesList contain at least two adapter fields. One adapter field is responsible for name of the current list item. The other adapter field is responsible for providing the value of the current list item. TValuesListNameField is an adapter field that returns the name of the current list item.

See Also

TBaseValuesListField (see page 5527)

TStringsValuesList (see page 5857)

TValuesListValueField (see page 5869)

54.1.79.1 TValuesListNameField Members

The following tables list the members exposed by TValuesListNameField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
V	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.
	GetAdapter (see page 5530)	Retrieves the parent adapter component.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5869)	Returns the name used to access this adapter field using server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5869)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.

	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.

Protected Properties

	Name	Description
	Adapter (see page 5368)	Returns the parent adapter component.
	Adapter (see page 5531)	Retrieves the parent adapter component.
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.

	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.79.2 TValuesListNameField Methods

The methods of the TValuesListNameField class are listed here.

Protected Methods

	Name	Description
V	GetDefaultFieldName (see page 5869)	Returns the name used to access this adapter field using server-side script.
V	ImplGetValue (see page 5869)	Returns the value associated with this adapter field.

54.1.79.2.1 TValuesListNameField.GetDefaultFieldName Method

Returns the name used to access this adapter field using server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'NameField'. Server-side script can access this adapter field using the NameField property.

54.1.79.2.2 TValuesListNameField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue calls the parent adapter's GetListName function to retrieve the name of the current list item.

See Also

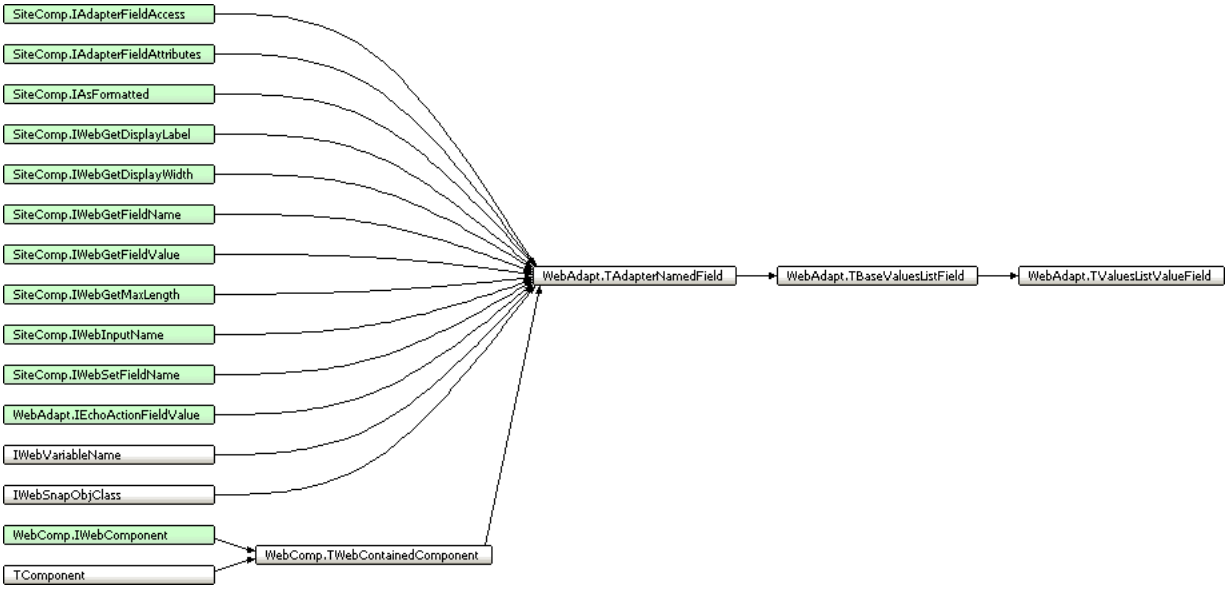
GetListName (see page 5523)

54.1.80 TValuesListValueField Class

TValuesListValueField is an adapter field used to access the Value (see page 5369) of the current list item of a values list

adapter.

Class Hierarchy



Pascal

```
TValuesListValueField = class(TBaseValuesListField);
```

C++

```
class TValuesListValueField : public TBaseValuesListField;
```

File

WebAdapt

Description

Values list adapters such as TStringValuesList contain at least two adapter fields. One adapter field is responsible for name of the current list item. The other adapter field is responsible for providing the value of the current list item. TValuesListValueField is an adapter field that returns the value of the current list item.

See Also

TBaseValuesListField (see page 5527)

TCustomStringsValuesList (see page 5728)

54.1.80.1 TValuesListValueField Members

The following tables list the members exposed by TValuesListValueField.

Protected Methods

	Name	Description
	AsFormatted (see page 5355)	Returns text used to generate a representation of the adapter field value.
	CheckModifyAccess (see page 5355)	Checks end-user rights to modify the adapter field value.
	CheckViewAccess (see page 5356)	Checks end-user rights to view the adapter field value.
	FullyQualifyInputName (see page 5356)	Indicates whether the HTML input names must be qualified with the name of the adapter.
	GetAdapter (see page 5356)	GetAdapter returns the parent adapter component.

	GetAdapter (see page 5530)	Retrieves the parent adapter component.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	GetDefaultDisplayLabel (see page 5357)	Provides the default display label for this adapter field.
V	GetDefaultFieldName (see page 5873)	Returns the name used to access this adapter field using server-side script.
	GetDisplayLabel (see page 5357)	Returns the suggested display label for this adapter field.
	GetDisplayWidth (see page 5358)	Returns the suggested display width for this adapter field.
	GetEchoActionFieldValue (see page 5358)	Returns the value of the echo flag.
	GetInputName (see page 5358)	Identifies the name to use when generating an HTML input for this adapter field.
	GetMaxLength (see page 5359)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
	GetRequired (see page 5359)	Indicates whether the end-user must enter a value for this adapter field.
	GetValue (see page 5359)	Gets the value of this adapter field as a Variant (see page 3421).
	GetVariableName (see page 5360)	Gets the name used to reference this adapter field with server-side script.
	GetVisible (see page 5360)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	GetWebSnapObjClass (see page 5360)	Returns the class type for this adapter field.
	HasModifyAccess (see page 5361)	Checks the end-user's right to modify this adapter field.
	HasViewAccess (see page 5361)	Checks the end-user's right to view this adapter field.
V	ImplAsFormatted (see page 5361)	Returns text used to generate a representation of the adapter field value.
V	ImplGetDisplayLabel (see page 5361)	Returns the suggested display label for this adapter field.
V	ImplGetDisplayWidth (see page 5362)	Returns the suggested display width for this adapter field.
V	ImplGetEchoActionFieldValue (see page 5362)	Returns the value of the echo flag.
V	ImplGetInputName (see page 5362)	Identifies the name to use when generating the HTML input for this adapter field.
V	ImplGetMaxLength (see page 5363)	Returns the maximum length, in characters, that the user should be allowed to enter when entering a value for this adapter field.
V	ImplGetRequired (see page 5363)	Indicates whether the end-user must enter a value for this adapter field.
V	ImplGetValue (see page 5873)	Returns the value associated with this adapter field.
V	ImplGetVariableName (see page 5364)	Gets the name used to reference this adapter field with server-side script.
V	ImplGetVisible (see page 5364)	Indicates whether the value of this adapter field should be displayed to the end-user.
V	ImplHasModifyAccess (see page 5365)	Checks the end-user's right to modify this adapter field.
V	ImplHasViewAccess (see page 5365)	Checks the end-user's right to view this adapter field.
V	ImplSetEchoActionFieldValue (see page 5365)	Sets the echo flag for this adapter field.
V	ImplSetFieldName (see page 5366)	Sets the name that is used to reference this adapter field with server-side script.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 5366)	Handles movement of the component to a different parent.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
V	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetEchoActionFieldValue (see page 5366)	Sets the echo flag for this adapter field.
	SetFieldName (see page 5367)	Sets the name that is used to reference this adapter field with server-side script.
V	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.

Protected Properties

	Name	Description
R	Adapter (see page 5368)	Returns the parent adapter component.
R	Adapter (see page 5531)	Retrieves the parent adapter component.
R	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
R	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Methods

	Name	Description
	AsFormatted (see page 1014)	This is AsFormatted, a member of class IAsFormatted.
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDisplayLabel (see page 1088)	This is GetDisplayLabel, a member of class IWebGetDisplayLabel.
	GetDisplayWidth (see page 1089)	This is GetDisplayWidth, a member of class IWebGetDisplayWidth.
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetInputName (see page 1099)	This is GetInputName, a member of class IWebInputName.
	GetMaxLength (see page 1096)	This is GetMaxLength, a member of class IWebGetMaxLength.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	GetRequired (see page 1000)	This is GetRequired, a member of class IAdapterFieldAttributes.
	GetValue (see page 1092)	This is GetValue, a member of class IWebGetFieldValue.
	GetVisible (see page 1000)	This is GetVisible, a member of class IAdapterFieldAttributes.
	HasModifyAccess (see page 999)	This is HasModifyAccess, a member of class IAdapterFieldAccess.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	HasViewAccess (see page 999)	This is HasViewAccess, a member of class IAdapterFieldAccess.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
R	ActionOrigValue (see page 5367)	Retrieve the original value of this adapter field.
R	ActionValue (see page 5368)	Retrieve the value for this adapter field entered by the end-user.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.
	EchoActionFieldValue (see page 5368)	Used to echo the value(s) entered by the end-user when generating an HTML form.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 5369)	Identifies the name of this field when using server-side script.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.
R	InputName (see page 1100)	This is InputName, a member of class IWebInputName.
	ModifyAccess (see page 5369)	Identifies the rights required to update this field.
R	Required (see page 1001)	This is Required, a member of class IAdapterFieldAttributes.
R	Value (see page 1092)	This is Value, a member of class IWebGetFieldValue.
R	Value (see page 5369)	Provides the value of an adapter field as a variant.
	ViewAccess (see page 5370)	Identifies the rights required to view this field.
R	Visible (see page 1001)	This is Visible, a member of class IAdapterFieldAttributes.

54.1.80.2 TValuesListValueField Methods

The methods of the TValuesListValueField class are listed here.

Protected Methods

	Name	Description
	GetDefaultFieldName (see page 5873)	Returns the name used to access this adapter field using server-side script.
	ImplGetValue (see page 5873)	Returns the value associated with this adapter field.

54.1.80.2.1 TValuesListValueField.GetDefaultFieldName Method

Returns the name used to access this adapter field using server-side script.

Pascal

```
function GetDefaultFieldName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDefaultFieldName();
```

Description

GetDefaultFieldName returns 'ValueField'. Server-side script can access this adapter field using the ValueField property.

54.1.80.2.2 TValuesListValueField.ImplGetValue Method

Returns the value associated with this adapter field.

Pascal

```
function ImplGetValue: Variant; override;
```

C++

```
virtual __fastcall Variant ImplGetValue();
```

Description

ImplGetValue calls the parent adapter's GetListValue function to retrieve the value of the current list item.

See Also

GetListValue (see page 5524)

54.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAdapterEditor (see page 5874)	This is class WebAdapt.IAdapterEditor.
	IAdapterNotifyAdapterChange (see page 5875)	This is class WebAdapt.IAdapterNotifyAdapterChange.
	ICheckOrigValue (see page 5876)	This is class WebAdapt.ICheckOrigValue.
	ICheckValueChange (see page 5877)	This is class WebAdapt.ICheckValueChange.
	IClearAdapterValues (see page 5878)	This is class WebAdapt.IClearAdapterValues.
	ICreateActionRequestContext (see page 5879)	This is class WebAdapt.ICreateActionRequestContext.
	IEchoActionFieldValue (see page 5880)	This is class WebAdapt.IEchoActionFieldValue.
	IEchoAdapterFieldValues (see page 5882)	This is class WebAdapt.IEchoAdapterFieldValues.
	IExecuteValue (see page 5883)	IExecuteValue is the interface for executing an adapter's fields with values passed in an HTTP request.
	IFullyQualifyInputNames (see page 5885)	This is class WebAdapt.IFullyQualifyInputNames.
	IGetAdapterErrorsList (see page 5886)	This is class WebAdapt.IGetAdapterErrorsList.
	IGetAdapterModeNames (see page 5887)	This is class WebAdapt.IGetAdapterModeNames.
	IGetRecordKeys (see page 5888)	This is class WebAdapt.IGetRecordKeys.
	IIdentifyAdapter (see page 5889)	This is class WebAdapt.IIdentifyAdapter.
	ISetSubComponents (see page 5889)	This is class WebAdapt.ISetSubComponents.
	ISetWebFieldValue (see page 5890)	This is class WebAdapt.ISetWebFieldValue.
	IUpdateValue (see page 5891)	This is class WebAdapt.IUpdateValue.
	IValidateValue (see page 5892)	This is class WebAdapt.IValidateValue.
	IWebActionsSubcomponent (see page 5893)	This is class WebAdapt.IWebActionsSubcomponent.
	IWebFieldsSubcomponent (see page 5893)	This is class WebAdapt.IWebFieldsSubcomponent.
	IWebGetFieldPrevValue (see page 5894)	This is class WebAdapt.IWebGetFieldPrevValue.

54.2.1 IAdapterEditor Interface

Class Hierarchy

Pascal

```
IAdapterEditor = interface;
```

C++

```
__interface IAdapterEditor;
```

File

WebAdapt

Description

This is class WebAdapt.IAdapterEditor.

54.2.1.1 IAdapterEditor Members

The following tables list the members exposed by IAdapterEditor.

Public Methods

	Name	Description
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.

54.2.1.2 IAdapterEditor Methods

The methods of the IAdapterEditor class are listed here.

Public Methods

	Name	Description
	CanAddActionClass (see page 5875)	This is CanAddActionClass, a member of class IAdapterEditor.
	CanAddFieldClass (see page 5875)	This is CanAddFieldClass, a member of class IAdapterEditor.

54.2.1.2.1 IAdapterEditor.CanAddActionClass Method

Pascal

```
function CanAddActionClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddActionClass(TComponent * AParent, TClass AClass);
```

Description

This is CanAddActionClass, a member of class IAdapterEditor.

54.2.1.2.2 IAdapterEditor.CanAddFieldClass Method

Pascal

```
function CanAddFieldClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddFieldClass(TComponent * AParent, TClass AClass);
```

Description

This is CanAddFieldClass, a member of class IAdapterEditor.

54.2.2 IAdapterNotifyAdapterChange Interface

Class Hierarchy

Pascal

```
IAdapterNotifyAdapterChange = interface;
```

C++

```
__interface IAdapterNotifyAdapterChange;
```

File

WebAdapt

Description

This is class WebAdapt.IAdapterNotifyAdapterChange.

54.2.2.1 IAdapterNotifyAdapterChange Members

The following tables list the members exposed by IAdapterNotifyAdapterChange.

Public Methods

	Name	Description
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.

54.2.2.2 IAdapterNotifyAdapterChange Methods

The methods of the IAdapterNotifyAdapterChange class are listed here.

Public Methods

	Name	Description
	NotifyAdapterChange (see page 5876)	This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.

54.2.2.2.1 IAdapterNotifyAdapterChange.NotifyAdapterChange Method

Pascal

```
procedure NotifyAdapterChange;
```

C++

```
__fastcall NotifyAdapterChange();
```

Description

This is NotifyAdapterChange, a member of class IAdapterNotifyAdapterChange.

54.2.3 ICheckOrigValue Interface

Class Hierarchy

Pascal

```
ICheckOrigValue = interface;
```

C++

```
__interface ICheckOrigValue;
```

File

WebAdapt

Description

This is class WebAdapt.ICheckOrigValue.

54.2.3.1 ICheckOrigValue Members

The following tables list the members exposed by ICheckOrigValue.

Public Methods

	Name	Description
	CheckOrigValue (see page 5877)	This is CheckOrigValue, a member of class ICheckOrigValue.

54.2.3.2 ICheckOrigValue Methods

The methods of the ICheckOrigValue class are listed here.

Public Methods

	Name	Description
	CheckOrigValue (see page 5877)	This is CheckOrigValue, a member of class ICheckOrigValue.

54.2.3.2.1 ICheckOrigValue.CheckOrigValue Method

Pascal

```
procedure CheckOrigValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall CheckOrigValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

This is CheckOrigValue, a member of class ICheckOrigValue.

54.2.4 ICheckValueChange Interface

Class Hierarchy

Pascal

```
ICheckValueChange = interface;
```

C++

```
__interface ICheckValueChange;
```

File

WebAdapt

Description

This is class WebAdapt.ICheckValueChange.

54.2.4.1 ICheckValueChange Members

The following tables list the members exposed by ICheckValueChange.

Public Methods

	Name	Description
	CheckValueChange (see page 5878)	This is CheckValueChange, a member of class ICheckValueChange.

54.2.4.2 ICheckValueChange Methods

The methods of the ICheckValueChange class are listed here.

Public Methods

	Name	Description
	CheckValueChange (see page 5878)	This is CheckValueChange, a member of class ICheckValueChange.

54.2.4.2.1 ICheckValueChange.CheckValueChange Method

Pascal

```
function CheckValueChange(AActionRequest: IActionRequest; AFieldIndex: Integer): Boolean;
```

C++

```
__fastcall Boolean CheckValueChange(IActionRequest AActionRequest, int AFieldIndex);
```

Description

This is CheckValueChange, a member of class ICheckValueChange.

54.2.5 IClearAdapterValues Interface

Class Hierarchy

WebAdapt.IClearAdapterValues

Pascal

```
IClearAdapterValues = interface;
```

C++

```
__interface IClearAdapterValues;
```

File

WebAdapt

Description

This is class WebAdapt.IClearAdapterValues.

54.2.5.1 IClearAdapterValues Members

The following tables list the members exposed by IClearAdapterValues.

Public Methods

	Name	Description
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.

54.2.5.2 IClearAdapterValues Methods

The methods of the IClearAdapterValues class are listed here.

Public Methods

	Name	Description
	ClearAdapterValues (see page 5879)	This is ClearAdapterValues, a member of class IClearAdapterValues.

54.2.5.2.1 IClearAdapterValues.ClearAdapterValues Method

Pascal

```
procedure ClearAdapterValues;
```

C++

```
__fastcall ClearAdapterValues();
```

Description

This is ClearAdapterValues, a member of class IClearAdapterValues.

54.2.6 ICreateActionRequestContext Interface

Class Hierarchy

WebAdapt.ICreateActionRequestContext

Pascal

```
ICreateActionRequestContext = interface;
```

C++

```
__interface ICreateActionRequestContext;
```

File

WebAdapt

Description

This is class WebAdapt.ICreateActionRequestContext.

54.2.6.1 ICreateActionRequestContext Members

The following tables list the members exposed by ICreateActionRequestContext.

Public Methods

	Name	Description
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.

54.2.6.2 ICreateActionRequestContext Methods

The methods of the ICreateActionRequestContext class are listed here.

Public Methods

	Name	Description
	CreateActionRequestContext (see page 5880)	This is CreateActionRequestContext, a member of class ICreateActionRequestContext.

54.2.6.2.1 ICreateActionRequestContext.CreateActionRequestContext Method

Pascal

```
procedure CreateActionRequestContext(DispatchParams: IAdapterDispatchParams);
```

C++

```
__fastcall CreateActionRequestContext(IAdapterDispatchParams DispatchParams);
```

Description

This is CreateActionRequestContext, a member of class ICreateActionRequestContext.

54.2.7 IEchoActionFieldValue Interface

Class Hierarchy

WebAdapt.IEchoActionFieldValue

Pascal

```
IEchoActionFieldValue = interface;
```

C++

```
__interface IEchoActionFieldValue;
```

File

WebAdapt

Description

This is class WebAdapt.IEchoActionFieldValue.

54.2.7.1 IEchoActionFieldValue Members

The following tables list the members exposed by IEchoActionFieldValue.

Public Methods

	Name	Description
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.

Public Properties

	Name	Description
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.

54.2.7.2 IEchoActionFieldValue Methods

The methods of the IEchoActionFieldValue class are listed here.

Public Methods

	Name	Description
	GetEchoActionFieldValue (see page 5881)	This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.
	SetEchoActionFieldValue (see page 5881)	This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.

54.2.7.2.1 IEchoActionFieldValue.GetEchoActionFieldValue Method

Pascal

```
function GetEchoActionFieldValue: Boolean;
```

C++

```
__fastcall Boolean GetEchoActionFieldValue();
```

Description

This is GetEchoActionFieldValue, a member of class IEchoActionFieldValue.

54.2.7.2.2 IEchoActionFieldValue.SetEchoActionFieldValue Method

Pascal

```
procedure SetEchoActionFieldValue(AValue: Boolean);
```

C++

```
__fastcall SetEchoActionFieldValue(Boolean AValue);
```

Description

This is SetEchoActionFieldValue, a member of class IEchoActionFieldValue.

54.2.7.3 IEchoActionFieldValue Properties

The properties of the IEchoActionFieldValue class are listed here.

Public Properties

	Name	Description
	EchoActionFieldValue (see page 5882)	This is EchoActionFieldValue, a member of class IEchoActionFieldValue.

54.2.7.3.1 IEchoActionFieldValue.EchoActionFieldValue Property

Pascal

```
property EchoActionFieldValue: Boolean;
```

C++

```
__property Boolean EchoActionFieldValue;
```

Description

This is EchoActionFieldValue, a member of class IEchoActionFieldValue.

54.2.8 IEchoAdapterFieldValues Interface

Class Hierarchy

Pascal

```
IEchoAdapterFieldValues = interface;
```

C++

```
__interface IEchoAdapterFieldValues;
```

File

WebAdapt

Description

This is class WebAdapt.IEchoAdapterFieldValues.

54.2.8.1 IEchoAdapterFieldValues Members

The following tables list the members exposed by IEchoAdapterFieldValues.

Public Methods

	Name	Description
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.
	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

Public Properties

	Name	Description
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.

54.2.8.2 IEchoAdapterFieldValues Methods

The methods of the IEchoAdapterFieldValues class are listed here.

Public Methods

	Name	Description
	GetEchoActionFieldValues (see page 5883)	This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

	SetEchoActionFieldValues (see page 5883)	This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

54.2.8.2.1 IEchoAdapterFieldValues.GetEchoActionFieldValues Method

Pascal

```
function GetEchoActionFieldValues: Boolean;
```

C++

```
__fastcall Boolean GetEchoActionFieldValues();
```

Description

This is GetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

54.2.8.2.2 IEchoAdapterFieldValues.SetEchoActionFieldValues Method

Pascal

```
procedure SetEchoActionFieldValues(AValue: Boolean);
```

C++

```
__fastcall SetEchoActionFieldValues(Boolean AValue);
```

Description

This is SetEchoActionFieldValues, a member of class IEchoAdapterFieldValues.

54.2.8.3 IEchoAdapterFieldValues Properties

The properties of the IEchoAdapterFieldValues class are listed here.

Public Properties

	Name	Description
	EchoActionFieldValues (see page 5883)	This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.

54.2.8.3.1 IEchoAdapterFieldValues.EchoActionFieldValues Property

Pascal

```
property EchoActionFieldValues: Boolean;
```

C++

```
__property Boolean EchoActionFieldValues;
```

Description

This is EchoActionFieldValues, a member of class IEchoAdapterFieldValues.

54.2.9 IExecuteValue Interface

IExecuteValue is the interface for executing an adapter's fields with values passed in an HTTP request.

Class Hierarchy

Pascal

```
IExecuteValue = interface;
```

C++

```
__interface IExecuteValue;
```

File

WebAdapt

Description

Adapter fields implement the IExecuteValue interface when they are executable. When a field is executable, HTTP requests can supply field values that are used to execute a command rather than update a value. For example, an HTML form may contain a check box or radio button control that indicates an action the user wants to take. When the form is submitted, the values for the field that underlies the check box or radio buttons indicate the user's choice. When the WebSnap application receives the HTTP request, it uses the IExecuteValue interface to call the field's ExecuteValue (see page 5884) method.

Note: Method declarations that use IExecuteValue use the _di_IExecuteValue type instead. This type is a DelphiInterface (see page 3256) wrapper around the IExecuteValue interface:

Note: typedef System::DelphiInterface (see page 3256)< IExecuteValue > _di_IExecuteValue;

See Also

TCustomAdapter (see page 5531)

54.2.9.1 IExecuteValue Members

The following tables list the members exposed by IExecuteValue.

Public Methods

	Name	Description
	ExecuteValue (see page 5884)	Executes the field based on a value supplied in the current HTTP request.

54.2.9.2 IExecuteValue Methods

The methods of the IExecuteValue class are listed here.

Public Methods

	Name	Description
	ExecuteValue (see page 5884)	Executes the field based on a value supplied in the current HTTP request.

54.2.9.2.1 IExecuteValue.ExecuteValue Method

Executes the field based on a value supplied in the current HTTP request.

Pascal

```
procedure ExecuteValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall ExecuteValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

An adapter calls ExecuteValue when responding to an HTTP request that supplies values from executable fields.

AActionRequest is the current request object. ExecuteValue uses this interface to extract the value to use when executing the field.

AFieldIndex is the index of the target field in the list of field values that the request object supplies.

See Also

UpdateFieldsExecuteValues (see page 5567)

54.2.10 IFullyQualifyInputNames Interface

Class Hierarchy

WebAdapt.IFullyQualifyInputNames

Pascal

```
IFullyQualifyInputNames = interface;
```

C++

```
__interface IFullyQualifyInputNames;
```

File

WebAdapt

Description

This is class WebAdapt.IFullyQualifyInputNames.

54.2.10.1 IFullyQualifyInputNames Members

The following tables list the members exposed by IFullyQualifyInputNames.

Public Methods

	Name	Description
	FullyQualifyInputNames (see page 5885)	This is FullyQualifyInputNames, a member of class IFullyQualifyInputNames.

54.2.10.2 IFullyQualifyInputNames Methods

The methods of the IFullyQualifyInputNames class are listed here.

Public Methods

	Name	Description
	FullyQualifyInputNames (see page 5885)	This is FullyQualifyInputNames, a member of class IFullyQualifyInputNames.

54.2.10.2.1 IFullyQualifyInputNames.FullyQualifyInputNames Method

Pascal

```
function FullyQualifyInputNames: Boolean;
```

C++

```
__fastcall Boolean FullyQualifyInputNames();
```

Description

This is FullyQualifyInputNames, a member of class IFullyQualifyInputNames.

54.2.11 IGetAdapterErrorsList Interface

Class Hierarchy

Pascal

```
IGetAdapterErrorsList = interface;
```

C++

```
__interface IGetAdapterErrorsList;
```

File

WebAdapt

Description

This is class WebAdapt.IGetAdapterErrorsList.

54.2.11.1 IGetAdapterErrorsList Members

The following tables list the members exposed by IGetAdapterErrorsList.

Public Methods

	Name	Description
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.

54.2.11.2 IGetAdapterErrorsList Methods

The methods of the IGetAdapterErrorsList class are listed here.

Public Methods

	Name	Description
	GetAdapterErrorsList (see page 5886)	This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.

54.2.11.2.1 IGetAdapterErrorsList.GetAdapterErrorsList Method

Pascal

```
function GetAdapterErrorsList: TBaseAdapterErrorsList;
```

C++

```
__fastcall TBaseAdapterErrorsList GetAdapterErrorsList();
```

Description

This is GetAdapterErrorsList, a member of class IGetAdapterErrorsList.

54.2.12 IGetAdapterModeNames Interface

Class Hierarchy

Pascal

```
IGetAdapterModeNames = interface;
```

C++

```
__interface IGetAdapterModeNames;
```

File

WebAdapt

Description

This is class WebAdapt.IGetAdapterModeNames.

54.2.12.1 IGetAdapterModeNames Members

The following tables list the members exposed by IGetAdapterModeNames.

Public Methods

	Name	Description
	GetAdapterModeNames (see page 5887)	This is GetAdapterModeNames, a member of class IGetAdapterModeNames.

54.2.12.2 IGetAdapterModeNames Methods

The methods of the IGetAdapterModeNames class are listed here.

Public Methods

	Name	Description
	GetAdapterModeNames (see page 5887)	This is GetAdapterModeNames, a member of class IGetAdapterModeNames.

54.2.12.2.1 IGetAdapterModeNames.GetAdapterModeNames Method

Pascal

```
procedure GetAdapterModeNames(AStrings: TStrings);
```

C++

```
__fastcall GetAdapterModeNames(TStrings AStrings);
```

Description

This is GetAdapterModeNames, a member of class IGetAdapterModeNames.

54.2.13 IGetRecordKeys Interface

Class Hierarchy

Pascal

```
IGetRecordKeys = interface;
```

C++

```
__interface IGetRecordKeys;
```

File

WebAdapt

Description

This is class WebAdapt.IGetRecordKeys.

54.2.13.1 IGetRecordKeys Members

The following tables list the members exposed by IGetRecordKeys.

Public Methods

	Name	Description
	GetRecordKeys (see page 5888)	This is GetRecordKeys, a member of class IGetRecordKeys.

54.2.13.2 IGetRecordKeys Methods

The methods of the IGetRecordKeys class are listed here.

Public Methods

	Name	Description
	GetRecordKeys (see page 5888)	This is GetRecordKeys, a member of class IGetRecordKeys.

54.2.13.2.1 IGetRecordKeys.GetRecordKeys Method

Pascal

```
procedure GetRecordKeys(AParams: TStrings; var AFullyQualify: Boolean);
```

C++

```
__fastcall GetRecordKeys(TStrings AParams, Boolean AFullyQualify);
```

Description

This is GetRecordKeys, a member of class IGetRecordKeys.

54.2.14 IIdentifyAdapter Interface

Class Hierarchy

Pascal

```
IIdentifyAdapter = interface;
```

C++

```
__interface IIdentifyAdapter;
```

File

WebAdapt

Description

This is class WebAdapt.IIdentifyAdapter.

54.2.15 ISetSubComponents Interface

Class Hierarchy

Pascal

```
ISetSubComponents = interface;
```

C++

```
__interface ISetSubComponents;
```

File

WebAdapt

Description

This is class WebAdapt.ISetSubComponents.

54.2.15.1 ISetSubComponents Members

The following tables list the members exposed by ISetSubComponents.

Public Methods

	Name	Description
	SetActions (see page 5890)	This is SetActions, a member of class ISetSubComponents.
	SetData (see page 5890)	This is SetData, a member of class ISetSubComponents.

54.2.15.2 ISetSubComponents Methods

The methods of the ISetSubComponents class are listed here.

Public Methods

	Name	Description
	SetActions (see page 5890)	This is SetActions, a member of class ISetSubComponents.
	SetData (see page 5890)	This is SetData, a member of class ISetSubComponents.

54.2.15.2.1 ISetSubComponents.SetActions Method

Pascal

```
procedure SetActions(const Value: TAdapterSubComponent);
```

C++

```
__fastcall SetActions(const TAdapterSubComponent Value);
```

Description

This is SetActions, a member of class ISetSubComponents.

54.2.15.2.2 ISetSubComponents.SetData Method

Pascal

```
procedure SetData(const Value: TAdapterSubComponent);
```

C++

```
__fastcall SetData(const TAdapterSubComponent Value);
```

Description

This is SetData, a member of class ISetSubComponents.

54.2.16 ISetWebFieldValue Interface

Class Hierarchy

Pascal

```
ISetWebFieldValue = interface;
```

C++

```
__interface ISetWebFieldValue;
```

File

WebAdapt

Description

This is class WebAdapt.ISetWebFieldValue.

54.2.16.1 ISetWebFieldValue Members

The following tables list the members exposed by ISetWebFieldValue.

Public Methods

	Name	Description
	SetValue (see page 5891)	This is SetValue, a member of class ISetWebFieldValue.

54.2.16.2 ISetWebFieldValue Methods

The methods of the ISetWebFieldValue class are listed here.

Public Methods

	Name	Description
	SetValue (see page 5891)	This is SetValue, a member of class ISetWebFieldValue.

54.2.16.2.1 ISetWebFieldValue.SetValue Method

Pascal

```
procedure SetValue(const AValue: Variant);
```

C++

```
__fastcall SetValue(const Variant AValue);
```

Description

This is SetValue, a member of class ISetWebFieldValue.

54.2.17 IUpdateValue Interface

Class Hierarchy

Pascal

```
IUpdateValue = interface;
```

C++

```
__interface IUpdateValue;
```

File

WebAdapt

Description

This is class WebAdapt.IUpdateValue.

54.2.17.1 IUpdateValue Members

The following tables list the members exposed by IUpdateValue.

Public Methods

	Name	Description
	UpdateValue (see page 5892)	This is UpdateValue, a member of class IUpdateValue.

54.2.17.2 IUpdateValue Methods

The methods of the IUpdateValue class are listed here.

Public Methods

	Name	Description
	UpdateValue (see page 5892)	This is UpdateValue, a member of class IUpdateValue.

54.2.17.2.1 IUpdateValue.UpdateValue Method

Pascal

```
procedure UpdateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall UpdateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

This is UpdateValue, a member of class IUpdateValue.

54.2.18 IValidateValue Interface

Class Hierarchy

Pascal

```
IValidateValue = interface;
```

C++

```
__interface IValidateValue;
```

File

WebAdapt

Description

This is class WebAdapt.IValidateValue.

54.2.18.1 IValidateValue Members

The following tables list the members exposed by IValidateValue.

Public Methods

	Name	Description
	ValidateValue (see page 5893)	This is ValidateValue, a member of class IValidateValue.

54.2.18.2 IValidateValue Methods

The methods of the IValidateValue class are listed here.

Public Methods

	Name	Description
	ValidateValue (see page 5893)	This is ValidateValue, a member of class IValidateValue.

54.2.18.2.1 IValidateValue.ValidateValue Method

Pascal

```
procedure ValidateValue(AActionRequest: IActionRequest; AFieldIndex: Integer);
```

C++

```
__fastcall ValidateValue(IActionRequest AActionRequest, int AFieldIndex);
```

Description

This is ValidateValue, a member of class IValidateValue.

54.2.19 IWebActionsSubcomponent Interface

Class Hierarchy

Pascal

```
IWebActionsSubcomponent = interface;
```

C++

```
__interface IWebActionsSubcomponent;
```

File

WebAdapt

Description

This is class WebAdapt.IWebActionsSubcomponent.

54.2.20 IWebFieldsSubcomponent Interface

Class Hierarchy

Pascal

```
IWebFieldsSubcomponent = interface;
```

C++

```
__interface IWebFieldsSubcomponent;
```

File

WebAdapt

Description

This is class WebAdapt.IWebFieldsSubcomponent.

54.2.21 IWebGetFieldPrevValue Interface

Class Hierarchy

Pascal

```
IWebGetFieldPrevValue = interface;
```

C++

```
__interface IWebGetFieldPrevValue;
```

File

WebAdapt

Description

This is class WebAdapt.IWebGetFieldPrevValue.

54.2.21.1 IWebGetFieldPrevValue Members

The following tables list the members exposed by IWebGetFieldPrevValue.

Public Methods

	Name	Description
	GetNeedPrevValue (see page 5895)	This is GetNeedPrevValue, a member of class IWebGetFieldPrevValue.
	GetPrevValue (see page 5895)	This is GetPrevValue, a member of class IWebGetFieldPrevValue.

Public Properties

	Name	Description
R	NeedPrevValue (see page 5895)	This is NeedPrevValue, a member of class IWebGetFieldPrevValue.
R	PrevValue (see page 5895)	This is PrevValue, a member of class IWebGetFieldPrevValue.

54.2.21.2 IWebGetFieldPrevValue Methods

The methods of the IWebGetFieldPrevValue class are listed here.

Public Methods

	Name	Description
	GetNeedPrevValue (see page 5895)	This is GetNeedPrevValue, a member of class IWebGetFieldPrevValue.
	GetPrevValue (see page 5895)	This is GetPrevValue, a member of class IWebGetFieldPrevValue.

54.2.21.2.1 IWebGetFieldPrevValue.GetNeedPrevValue Method

Pascal

```
function GetNeedPrevValue: Boolean;
```

C++

```
__fastcall Boolean GetNeedPrevValue();
```

Description

This is GetNeedPrevValue, a member of class IWebGetFieldPrevValue.

54.2.21.2.2 IWebGetFieldPrevValue.GetPrevValue Method

Pascal

```
function GetPrevValue: Variant;
```

C++

```
__fastcall Variant GetPrevValue();
```

Description

This is GetPrevValue, a member of class IWebGetFieldPrevValue.

54.2.21.3 IWebGetFieldPrevValue Properties

The properties of the IWebGetFieldPrevValue class are listed here.

Public Properties

	Name	Description
	NeedPrevValue (see page 5895)	This is NeedPrevValue, a member of class IWebGetFieldPrevValue.
	PrevValue (see page 5895)	This is PrevValue, a member of class IWebGetFieldPrevValue.

54.2.21.3.1 IWebGetFieldPrevValue.NeedPrevValue Property

Pascal

```
property NeedPrevValue: Boolean;
```

C++

```
__property Boolean NeedPrevValue;
```

Description

This is NeedPrevValue, a member of class IWebGetFieldPrevValue.

54.2.21.3.2 IWebGetFieldPrevValue.PrevValue Property

Pascal

```
property PrevValue: Variant;
```

C++

```
__property Variant PrevValue;
```

Description

This is PrevValue, a member of class IWebGetFieldPrevValue.

54.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AddDefaultActions (see page 5897)	This is function WebAdapt.AddDefaultActions.
	AddDefaultFields (see page 5897)	This is function WebAdapt.AddDefaultFields.
	FindAdapterAction (see page 5898)	This is function WebAdapt.FindAdapterAction.
	FindAdapterField (see page 5898)	This is function WebAdapt.FindAdapterField.
	FindAdapterInParent (see page 5898)	This is function WebAdapt.FindAdapterInParent.
	MakeAdapterRequestIdentifier (see page 5899)	This is function WebAdapt.MakeAdapterRequestIdentifier.
	MakeValidAdapterFieldName (see page 5899)	This is function WebAdapt.MakeValidAdapterFieldName.
	RaiseFileUploadNotSupported (see page 5899)	This is function WebAdapt.RaiseFileUploadNotSupported.
	RaiseMultipleFilesException (see page 5900)	This is function WebAdapt.RaiseMultipleFilesException.
	RaiseMultipleValuesException (see page 5900)	This is function WebAdapt.RaiseMultipleValuesException.

54.3.1 WebAdapt.AddDefaultActions Function

Pascal

```
procedure AddDefaultActions(AList: TStrings; AComponents: TWebComponentList);
```

C++

```
AddDefaultActions(TStrings AList, TWebComponentList AComponents);
```

File

WebAdapt

Description

This is function WebAdapt.AddDefaultActions.

54.3.2 WebAdapt.AddDefaultFields Function

Pascal

```
procedure AddDefaultFields(AList: TStrings; AComponents: TWebComponentList);
```

C++

```
AddDefaultFields(TStrings AList, TWebComponentList AComponents);
```

File

WebAdapt

Description

This is function WebAdapt.AddDefaultFields.

54.3.3 WebAdapt.FindAdapterAction Function

Pascal

```
function FindAdapterAction(AWebComponents: TWebComponentList; const AName: string): TComponent;
```

C++

```
TComponent * FindAdapterAction(TWebComponentList AWebComponents, const UnicodeString AName);
```

File

WebAdapt

Description

This is function WebAdapt.FindAdapterAction.

54.3.4 WebAdapt.FindAdapterField Function

Pascal

```
function FindAdapterField(AWebComponents: TWebComponentList; const AName: string): TComponent;
```

C++

```
TComponent * FindAdapterField(TWebComponentList AWebComponents, const UnicodeString AName);
```

File

WebAdapt

Description

This is function WebAdapt.FindAdapterField.

54.3.5 WebAdapt.FindAdapterInParent Function

Pascal

```
function FindAdapterInParent(AComponent: TComponent): TComponent;
```

C++

```
TComponent * FindAdapterInParent(TComponent * AComponent);
```

File

WebAdapt

Description

This is function WebAdapt.FindAdapterInParent.

54.3.6 WebAdapt.MakeAdapterRequestIdentifier Function

Pascal

```
function MakeAdapterRequestIdentifier(AComponent: TComponent): string;
```

C++

```
UnicodeString MakeAdapterRequestIdentifier(TComponent * AComponent);
```

File

WebAdapt

Description

This is function WebAdapt.MakeAdapterRequestIdentifier.

54.3.7 WebAdapt.MakeValidAdapterFieldName Function

Pascal

```
function MakeValidAdapterFieldName(const AFieldName: string): string;
```

C++

```
UnicodeString MakeValidAdapterFieldName(const UnicodeString AFieldName);
```

File

WebAdapt

Description

This is function WebAdapt.MakeValidAdapterFieldName.

54.3.8 WebAdapt.RaiseFileUploadNotSupported Function

Pascal

```
procedure RaiseFileUploadNotSupported(AFieldName: string);
```

C++

```
RaiseFileUploadNotSupported(UnicodeString AFieldName);
```

File

WebAdapt

Description

This is function WebAdapt.RaiseFileUploadNotSupported.

54.3.9 WebAdapt.RaiseMultipleFilesException Function

Pascal

```
procedure RaiseMultipleFilesException(AFieldName: string);
```

C++

```
RaiseMultipleFilesException(UnicodeString AFieldName);
```

File

WebAdapt

Description

This is function WebAdapt.RaiseMultipleFilesException.

54.3.10 WebAdapt.RaiseMultipleValuesException Function

Pascal

```
procedure RaiseMultipleValuesException(AFieldName: string);
```

C++

```
RaiseMultipleValuesException(UnicodeString AFieldName);
```

File

WebAdapt

Description

This is function WebAdapt.RaiseMultipleValuesException.

54.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TAdapterHiddenFieldOption (see page 5901)	TAdapterHiddenFieldOptions (see page 5919) identifies the types of hidden fields an adapter adds to generated HTML forms.
	TIteratorMethod (see page 5902)	TIteratorMethod identifies a record of data to which an adapter should navigate.

54.4.1 WebAdapt.TAdapterHiddenFieldOption Enumeration

TAdapterHiddenFieldOptions (see page 5919) identifies the types of hidden fields an adapter adds to generated HTML forms.

Pascal

```
TAdapterHiddenFieldOption = (
  hoOrigValues,
  hoMode,
  hoRecordKeys
);
```

C++

```
enum TAdapterHiddenFieldOption {
  hoOrigValues,
  hoMode,
  hoRecordKeys
};
```

File

WebAdapt

Description

Adapters can add hidden fields to HTML forms that are then passed back in HTML request messages that originate from the form. TAdapterHiddenFieldOptions (see page 5919) describes the types of hidden fields that an adapter needs to add to function properly. It represents zero or more TAdapterHiddenFieldOption values.

The following table lists the possible values:

Value	Meaning
hoOrigValues	Hidden fields represent fields from the adapter and the values of those fields at the point when the form is generated.
hoMode	Hidden fields indicate the mode of the adapter.
hoRecordKeys	Hidden fields represent name/value pairs that allow the adapter to locate a record.

54.4.2 WebAdapt.TIteratorMethod Enumeration

TIteratorMethod identifies a record of data to which an adapter should navigate.

Pascal

```
TIteratorMethod = (
  itStart,
  itNext,
  itEnd
);
```

C++

```
enum TIteratorMethod {
  itStart,
  itNext,
  itEnd
};
```

File

WebAdapt

Description

TIteratorMethod indicates a target record from the set of all data records that belong to an adapter. The following table describes the possible values:

The different values of TIteratorMethod are explained below:

Value	Action
itStart	Reset (see page 3643) the iteration pointer to the first record. Set EOF if there are no records.
itNext	Increment the iteration pointer to the next record. Set EOF if the iteration pointer is out of range.
itEnd	The iteration has completed.

54.5 Types

The following table lists types in this documentation.

Types

Name	Description
IActionFieldValue (see page 5904)	This is type WebAdapt.IActionFieldValue.
IActionRequest (see page 5905)	This is type WebAdapt.IActionRequest.
TAbstractWebRequestFile (see page 5905)	This is type WebAdapt.TAbstractWebRequestFile.
TActionExecuteEvent (see page 5905)	TActionExecuteEvent is the type for event handlers on adapter action objects that are called when the action executes.
TActionExecuteHandledEvent (see page 5906)	TActionExecuteHandledEvent is the type for event handlers on adapter action objects that can handle the execution of the action.
TActionGetEnabledEvent (see page 5906)	TActionGetEnabledEvent is the type for event handlers on adapter action objects that are called when the action executes.
TActionGetParamsEvent (see page 5907)	TActionGetParamsEvent is the type for event handlers that supply the parameters for an adapter action.
TActionRequestFieldsEvent (see page 5907)	TActionRequestFieldsEvent is the type for event handlers on adapter action objects that are called after the adapter performs some operation on its fields in response to an HTTP request.
TActionRequestFieldsHandledEvent (see page 5908)	TActionRequestFieldsHandledEvent is the type for event handlers on adapter action objects that are called when the adapter performs some operation on its fields in response to an HTTP request.
TAdapterActionExecuteEvent (see page 5909)	TAdapterActionExecuteEvent is the type for event handlers on adapter objects that are called after one of its actions executes.
TAdapterActionExecuteHandledEvent (see page 5909)	TAdapterActionExecuteHandledEvent is the type for event handlers on adapter objects that are called when one of its actions executes.
TAdapterActionGetParamsEvent (see page 5910)	TAdapterActionGetParamsEvent is the type for event handlers that supply the parameters needed to execute an adapter action.
TAdapterActionsClass (see page 5911)	TAdapterActionsClass defines the metaclass for TAdapterActions (see page 5209).
TAdapterFieldBooleanValueEvent (see page 5911)	TAdapterFieldBooleanValueEvent is the type for event handlers that respond when a boolean value is assigned to an adapter field.
TAdapterFieldFileEvent (see page 5912)	TAdapterFieldFileEvent is the type for event handlers that perform some action on an uploaded file.
TAdapterFieldFileListEvent (see page 5912)	TAdapterFieldFileListEvent is the type for event handlers that perform some action on a set of uploaded files.
TAdapterFieldGetBooleanEvent (see page 5913)	TAdapterFieldGetBooleanEvent is the type for event handlers that provide a boolean value associated with an adapter field.
TAdapterFieldGetMultiValueEvent (see page 5913)	TAdapterFieldGetMultiValueEvent is the type for event handlers that supply a set of values for an adapter field.
TAdapterFieldGetMultiValueStringEvent (see page 5914)	TAdapterFieldGetMultiValueStringEvent is the type for event handlers that supply a set of string values for an adapter field.
TAdapterFieldGetStringEvent (see page 5914)	TAdapterFieldGetStringEvent is the type for event handlers that provide a string associated with an adapter field.
TAdapterFieldGetValueCountEvent (see page 5915)	TAdapterFieldGetValueCountEvent is the type for event handlers that indicate the number of values associated with an adapter field.
TAdapterFieldGetValueEvent (see page 5915)	TAdapterFieldGetValueEvent is the type for event handlers that provide the value associated with an adapter field.
TAdapterFieldHasValueEvent (see page 5916)	TAdapterFieldHasValueEvent is the type for event handlers that indicate whether a value is assigned to an adapter field.
TAdapterFieldsClass (see page 5916)	This is type WebAdapt.TAdapterFieldsClass.
TAdapterFieldStringEvent (see page 5917)	TAdapterFieldStringEvent is the type for event handlers that respond when a string value is assigned to an adapter field.
TAdapterFieldStringsEvent (see page 5917)	TAdapterFieldStringsEvent is the type for event handlers that respond when a set of string values is assigned to an adapter field.
TAdapterFieldValidateValueEvent (see page 5918)	TAdapterFieldValidateValueEvent is the type for event handlers that validate a value for an adapter field.

TAdapterFieldValueEvent (see page 5918)	TAdapterFieldValueEvent is the type for event handlers that respond when an adapter field's value changes.
TAdapterHiddenFieldOptions (see page 5919)	This is type WebAdapt.TAdapterHiddenFieldOptions.
TEndUserGetNameEvent (see page 5919)	TEndUserGetNameEvent is the type for event handlers that supply the name of the current end user.
TEndUserGetUserIDEvent (see page 5920)	TEndUserGetUserIDEvent is the type for event handlers that supply the user ID of the current end user.
TEndUserHandledEvent (see page 5920)	TEndUserHandledEvent is the type for event handlers that can optionally handle a task for an end user adapter.
TEndUserIsLoggedInEvent (see page 5921)	TEndUserIsLoggedInEvent is the type for event handlers that indicate whether the current end user has logged in.
TEndUserRightsEvent (see page 5921)	TEndUserRightsEvent is the type for event handlers that check whether a user has rights to perform a specific operation.
TEndUserUserIDEvent (see page 5922)	TEndUserUserIDEvent is the type for event handlers that log in a user given the user ID.
TGetEOFEvent (see page 5922)	TGetEOFEvent is the type for event handlers on adapters that indicate when to stop iterating over values.
TGetRecordCountEvent (see page 5923)	TGetRecordCountEvent is the type for event handlers that indicate how many values an adapter has.
TGetRecordEvent (see page 5923)	TGetRecordEvent is the type for event handlers on adapters that position the adapter on one of multiple values.
TGetRecordIndexEvent (see page 5924)	TGetRecordIndexEvent is the type for event handlers that indicate which of multiple values an adapter is positioned on.
THandledEvent (see page 5924)	This is type WebAdapt.THandledEvent.
TImageFieldGetHREFEvent (see page 5925)	TImageFieldGetHREFEvent is the type for event handlers that supply an URL that can be used to access an image field associated with an adapter field..
TImageFieldGetImageEvent (see page 5925)	TImageFieldGetImageEvent is the type for event handlers that supply a stream from which to read an image.
TImageFieldGetParamsEvent (see page 5926)	TImageFieldGetParamsEvent is the type for event handlers that supply a set of parameters to identify the value of an image field.
TIterateRecordsEvent (see page 5926)	TIterateRecordsEvent is the type for event handlers that navigate the records of an adapter.
TLoginUserIDEvent (see page 5927)	TLoginUserIDEvent is the type for event handlers that respond after a user logs in.
TObjectList (see page 5928)	This is type WebAdapt.TObjectList.
TValidateAdapterFieldEvent (see page 5928)	TValidateAdapterFieldEvent is the type for event handlers that validate the values supplied for adapter fields.
TWebFormGetPageNameEvent (see page 5928)	TWebFormGetPageNameEvent is the type for event handlers that supply labels for the controls that navigate to Web pages.

54.5.1 WebAdapt.IActionFieldValue Type

Pascal

```
IActionFieldValue = AdaptReq.IActionFieldValue;
```

C++

```
AdaptReq.IActionFieldValue IActionFieldValue;
```

File

WebAdapt

Description

This is type WebAdapt.IActionFieldValue.

54.5.2 WebAdapt.IActionRequest Type

Pascal

```
IActionRequest = AdaptReq.IActionRequest;
```

C++

```
AdaptReq.IActionRequest IActionRequest;
```

File

WebAdapt

Description

This is type WebAdapt.IActionRequest.

54.5.3 WebAdapt.TAbstractWebRequestFile Type

Pascal

```
TAbstractWebRequestFile = HTTPApp.TAbstractWebRequestFile;
```

C++

```
HTTPApp.TAbstractWebRequestFile TAbstractWebRequestFile;
```

File

WebAdapt

Description

This is type WebAdapt.TAbstractWebRequestFile.

54.5.4 WebAdapt.TActionExecuteEvent Type

TActionExecuteEvent is the type for event handlers on adapter action objects that are called when the action executes.

Pascal

```
TActionExecuteEvent = procedure (Sender: TObject; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Params: TStrings) ( TActionExecuteEvent)();
```

File

WebAdapt

Description

TActionExecuteEvent is the type for event handlers of an adapter action that can perform some or all of the action's tasks when the action executes.

Sender is the object that represents the adapter action.

Params lists the parameters for the action, in 'Name=Value' format.

See Also

TCustomDataSetAdapterAction

TBaseAdapterAction (see page 5447)

TCustomAdapterAction (see page 5579)

Procedural types

Creating events

54.5.5 WebAdapt.TActionExecuteHandledEvent Type

TActionExecuteHandledEvent is the type for event handlers on adapter action objects that can handle the execution of the action.

Pascal

```
TActionExecuteHandledEvent = procedure (Sender: TObject; Params: TStrings; var Handled:
Boolean) of object;
```

C++

```
(Sender: TObject; Params: TStrings; var Handled: Boolean) ( TActionExecuteHandledEvent)();
```

File

WebAdapt

Description

TActionExecuteHandledEvent is the type for event handlers of an adapter action that can perform some or all of the action's tasks when the action executes and prevent the default execution.

Sender is the object that represents the adapter action.

Params lists the parameters for the action, in 'Name=Value' format.

Handled returns true if the event handler fully handled the response. If Handled returns false, the adapter action object proceeds with its default response.

See Also

TBaseAdapterAction (see page 5447)

Procedural types

Creating events

54.5.6 WebAdapt.TActionGetEnabledEvent Type

TActionGetEnabledEvent is the type for event handlers on adapter action objects that are called when the action executes.

Pascal

```
TActionGetEnabledEvent = procedure (Sender: TObject; var Enabled: Boolean) of object;
```

C++

```
(Sender: TObject; var Enabled: Boolean) ( TActionGetEnabledEvent)();
```

File

WebAdapt

Description

TActionGetEnabledEvent is the type for event handlers that let you enable or disable controls that represent an adapter action.

Sender is the object that represents the adapter action.

Enabled returns true if the control for the action should be enabled in the current HTML form, false if it should be disabled.

See Also

TCustomDataSetAdapterAction

TCustomAdapterAction (see page 5579)

Procedural types

Creating events

54.5.7 WebAdapt.TActionGetParamsEvent Type

TActionGetParamsEvent is the type for event handlers that supply the parameters for an adapter action.

Pascal

```
TActionGetParamsEvent = procedure (Sender: TObject; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Params: TStrings) ( TActionGetParamsEvent)();
```

File

WebAdapt

Description

TActionGetParamsEvent is the type for event handlers of an adapter action that supply the parameters needed to execute the action.

Sender is the object that represents the adapter action.

Params is a string list that the event handler can fill with parameters. Each parameter should have the format ParamName=ParamValue.

See Also

TBaseAdapterAction (see page 5447)

Procedural types

Creating events

54.5.8 WebAdapt.TActionRequestFieldsEvent Type

TActionRequestFieldsEvent is the type for event handlers on adapter action objects that are called after the adapter performs some operation on its fields in response to an HTTP request.

Pascal

```
TActionRequestFieldsEvent = procedure (Sender: TObject; ActionRequest: IActionRequest;
AdapterFields: TObjectList) of object;
```

C++

```
(Sender: TObject; ActionRequest: IActionRequest; AdapterFields: TObjectList) (
TActionRequestFieldsEvent)();
```

File

WebAdapt

Description

TActionRequestFieldsEvent is the type for event handlers that let you perform your own operations on adapter fields in response to an HTTP request.

Sender is the adapter to which the fields belong.

ActionRequest is an interface to the request object for the current HTTP request.

AdapterFields lists the fields of the adapter for which the current HTTP request includes values.

See Also

TCustomAdapter (see page 5531)

Procedural types

Creating events

54.5.9 WebAdapt.TActionRequestFieldsHandledEvent Type

TActionRequestFieldsHandledEvent is the type for event handlers on adapter action objects that are called when the adapter performs some operation on its fields in response to an HTTP request.

Pascal

```
TActionRequestFieldsHandledEvent = procedure (Sender: TObject; ActionRequest: IActionRequest;
AdapterFields: TObjectList; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; ActionRequest: IActionRequest; AdapterFields: TObjectList; var Handled:
Boolean) ( TActionRequestFieldsHandledEvent)();
```

File

WebAdapt

Description

TActionRequestFieldsHandledEvent is the type for event handlers that let you augment or replace the default operations on adapter fields in response to an HTTP request.

Sender is the adapter to which the fields belong.

ActionRequest is an interface to the request object for the current HTTP request.

AdapterFields lists the fields of the adapter for which the current HTTP request includes values.

Handled returns true if the event handler performs the operation on the field, false if the adapter should continue with its default processing.

See Also

TCustomAdapter (see page 5531)

Procedural types

Creating events

54.5.10 WebAdapt.TAdapterActionExecuteEvent Type

TAdapterActionExecuteEvent is the type for event handlers on adapter objects that are called after one of its actions executes.

Pascal

```
TAdapterActionExecuteEvent = procedure (Sender: TObject; Action: TObject; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings) ( TAdapterActionExecuteEvent)();
```

File

WebAdapt

Description

TAdapterActionExecuteEvent is the type for event handlers of an adapter that can perform some or all of the tasks required after an action executes.

Sender is the adapter component.

Action is the action object that is executing.

Params lists the parameters for the action, in 'Name=Value' format.

See Also

TCustomAdapter (see page 5531)

Procedural types

Creating events

54.5.11 WebAdapt.TAdapterActionExecuteHandledEvent Type

TAdapterActionExecuteHandledEvent is the type for event handlers on adapter objects that are called when one of its actions executes.

Pascal

```
TAdapterActionExecuteHandledEvent = procedure (Sender: TObject; Action: TObject; Params: TStrings; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings; var Handled: Boolean) ( TAdapterActionExecuteHandledEvent)();
```

File

WebAdapt

Description

TAdapterActionExecuteHandledEvent is the type for event handlers of an adapter that can perform some or all of the tasks required when an action executes.

Sender is the adapter component.

Action is the action object that is executing.

Params lists the parameters for the action, in 'Name=Value' format.

Handled returns true if the event handler executes the action, false if the adapter should continue with its default processing of the action.

See Also

TCustomAdapter (see page 5531)

Procedural types

Creating events

54.5.12 WebAdapt.TAdapterActionGetParamsEvent Type

TAdapterActionGetParamsEvent is the type for event handlers that supply the parameters needed to execute an adapter action.

Pascal

```
TAdapterActionGetParamsEvent = procedure (Sender: TObject; Action: TObject; Params: TStrings)
of object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings) ( TAdapterActionGetParamsEvent)();
```

File

WebAdapt

Description

TAdapterActionGetParamsEvent is the type for event handlers of an adapter that can supply the parameters needed to execute one of the adapter's actions.

Sender is the adapter to which the action belongs.

Action is the adapter whose parameters are requested.

Params is a string list to which you can add parameter values in Name=Value format.

See Also

TCustomAdapter (see page 5531)

Procedural types

Creating events

54.5.13 WebAdapt.TAdapterActionsClass Type

TAdapterActionsClass defines the metaclass for TAdapterActions (see page 5209).

Pascal

```
TAdapterActionsClass = class of TAdapterActions;
```

C++

```
TAdapterActions TAdapterActionsClass;
```

File

WebAdapt

Description

TAdapterActionsClass is the metaclass for TAdapterActions (see page 5209). Its value is the class reference for TAdapterActions (see page 5209) or for one of its descendants.

See Also

Class References

54.5.14 WebAdapt.TAdapterFieldBooleanValueEvent Type

TAdapterFieldBooleanValueEvent is the type for event handlers that respond when a boolean value is assigned to an adapter field.

Pascal

```
TAdapterFieldBooleanValueEvent = procedure (Sender: TObject; Value: Boolean) of object;
```

C++

```
(Sender: TObject; Value: Boolean) ( TAdapterFieldBooleanValueEvent)();
```

File

WebAdapt

Description

TAdapterFieldBooleanValueEvent is the type for event handlers that let you store a boolean value that is assigned to an adapter field.

Sender is the adapter field component whose value has just been assigned.

Value is the boolean value assigned to Sender.

See Also

Procedural types

Creating events

54.5.15 WebAdapt.TAdapterFieldFileEvent Type

TAdapterFieldFileEvent is the type for event handlers that perform some action on an uploaded file.

Pascal

```
TAdapterFieldFileEvent = procedure (Sender: TObject; AFile: TAbstractWebRequestFile) of object;
```

C++

```
(Sender: TObject; AFile: TAbstractWebRequestFile) ( TAdapterFieldFileEvent)();
```

File

WebAdapt

Description

TAdapterFieldFileEvent is the type for event handlers that let you perform some function on a file uploaded to an adapter field.

Sender is the adapter field component to which the file is directed.

AFile describes the uploaded file.

See Also

Procedural types

Creating events

54.5.16 WebAdapt.TAdapterFieldFileListEvent Type

TAdapterFieldFileListEvent is the type for event handlers that perform some action on a set of uploaded files.

Pascal

```
TAdapterFieldFileListEvent = procedure (Sender: TObject; Files: TUpdateFileList) of object;
```

C++

```
(Sender: TObject; Files: TUpdateFileList) ( TAdapterFieldFileListEvent)();
```

File

WebAdapt

Description

TAdapterFieldFileListEvent is the type for event handlers that let you perform some function on a set of files uploaded to an adapter field.

Sender is the adapter field component to which the files are directed.

Files lists the uploaded files.

54.5.17 WebAdapt.TAdapterFieldGetBooleanEvent Type

TAdapterFieldGetBooleanEvent is the type for event handlers that provide a boolean value associated with an adapter field.

Pascal

```
TAdapterFieldGetBooleanEvent = procedure (Sender: TObject; var Value: Boolean) of object;
```

C++

```
(Sender: TObject; var Value: Boolean) ( TAdapterFieldGetBooleanEvent)();
```

File

WebAdapt

Description

TAdapterFieldGetBooleanEvent is the type for event handlers that let you provide a boolean value that is associated with an adapter field component.

Sender is the adapter field component whose value is requested.

Value returns the boolean value associated with Sender. Typically, this is the value of the adapter field.

Procedural types

Creating events

54.5.18 WebAdapt.TAdapterFieldGetMultiValueEvent Type

TAdapterFieldGetMultiValueEvent is the type for event handlers that supply a set of values for an adapter field.

Pascal

```
TAdapterFieldGetMultiValueEvent = procedure (Sender: TObject; Index: Integer; var Value:
Variant) of object;
```

C++

```
(Sender: TObject; Index: Integer; var Value: Variant) ( TAdapterFieldGetMultiValueEvent)();
```

File

WebAdapt

Description

TAdapterFieldGetMultiValueEvent is the type for event handlers that let you provide multiple values associated with an adapter field.

Sender is the adapter field component for which you are supplying values.

Index indicates which value the event handler should supply, where 0 indicates the first value, 1 indicates the second value, and so on.

Value returns the value indicated by the Index parameter.

54.5.20 WebAdapt.TAdapterFieldGetStringEvent Type

TAdapterFieldGetStringEvent is the type for event handlers that provide a string associated with an adapter field.

Pascal

```
TAdapterFieldGetStringEvent = procedure (Sender: TObject; var Value: string) of object;
```

C++

```
(Sender: TObject; var Value: string) ( TAdapterFieldGetStringEvent)();
```

File

WebAdapt

Description

TAdapterFieldGetStringEvent is the type for event handlers that let you provide a string that is associated with an adapter field component.

Sender is the adapter field component whose string is requested.

Value returns the string associated with Sender. Typically, this is the value of the adapter field.

See Also

Procedural types

Creating events

54.5.21 WebAdapt.TAdapterFieldGetValueCountEvent Type

TAdapterFieldGetValueCountEvent is the type for event handlers that indicate the number of values associated with an adapter field.

Pascal

```
TAdapterFieldGetValueCountEvent = procedure (Sender: TObject; var Count: Integer) of object;
```

C++

```
(Sender: TObject; var Count: Integer) ( TAdapterFieldGetValueCountEvent)();
```

File

WebAdapt

Description

TAdapterFieldGetValueCountEvent is the type for event handlers that let you provide a count of the values associated with an adapter field.

Sender is the adapter field component for which you want a count of values.

Count returns the number of values associated with Sender.

See Also

Creating events

54.5.22 WebAdapt.TAdapterFieldGetValueEvent Type

TAdapterFieldGetValueEvent is the type for event handlers that provide the value associated with an adapter field.

Pascal

```
TAdapterFieldGetValueEvent = procedure (Sender: TObject; var Value: Variant) of object;
```

C++

```
(Sender: TObject; var Value: Variant) ( TAdapterFieldGetValueEvent)();
```

File

WebAdapt

Description

TAdapterFieldGetValueEvent is the type for event handlers that let you provide the value of an adapter field component.

Sender is the adapter field component whose value is requested.

Value returns a Variant (see page 3421) that contains the current value.

See Also

Procedural types

Creating events

54.5.23 WebAdapt.TAdapterFieldHasValueEvent Type

TAdapterFieldHasValueEvent is the type for event handlers that indicate whether a value is assigned to an adapter field.

Pascal

```
TAdapterFieldHasValueEvent = procedure (Sender: TObject; const Value: Variant; var HasValue:
Boolean) of object;
```

C++

```
(Sender: TObject; const Value: Variant; var HasValue: Boolean) ( TAdapterFieldHasValueEvent)();
```

File

WebAdapt

Description

TAdapterFieldHasValueEvent is the type for event handlers that let you indicate whether a specified value is assigned to an adapter field.

Sender is the adapter field component to check.

Value is the value that may or may not be one of the adapter field's values.

HasValue returns true if Value specifies a value of the adapter field, false otherwise.

Creating events

54.5.24 WebAdapt.TAdapterFieldsClass Type

Pascal

```
TAdapterFieldsClass = class of TAdapterFields;
```

C++

```
TAdapterFields TAdapterFieldsClass;
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterFieldsClass.

54.5.25 WebAdapt.TAdapterFieldStringEvent Type

TAdapterFieldStringEvent is the type for event handlers that respond when a string value is assigned to an adapter field.

Pascal

```
TAdapterFieldStringEvent = procedure (Sender: TObject; Value: string) of object;
```

C++

```
(Sender: TObject; Value: string) ( TAdapterFieldStringEvent)();
```

File

WebAdapt

Description

TAdapterFieldStringEvent is the type for event handlers that let you respond when a string is assigned to an adapter field component.

Sender is the adapter field component to which the string is assigned.

Value is the newly-assigned string.

See Also

Procedural types

Creating events

54.5.26 WebAdapt.TAdapterFieldStringsEvent Type

TAdapterFieldStringsEvent is the type for event handlers that respond when a set of string values is assigned to an adapter field.

Pascal

```
TAdapterFieldStringsEvent = procedure (Sender: TObject; Values: TStrings) of object;
```

C++

```
(Sender: TObject; Values: TStrings) ( TAdapterFieldStringsEvent)();
```

File

WebAdapt

Description

TAdapterFieldStringsEvent is the type for event handlers that let you respond when a string list is assigned to an adapter field component.

Sender is the adapter field component to which the strings are assigned.

Values is a string list that contains the new set of string values.

See Also

Procedural types

Creating events

54.5.27 WebAdapt.TAdapterFieldValidateValueEvent Type

TAdapterFieldValidateValueEvent is the type for event handlers that validate a value for an adapter field.

Pascal

```
TAdapterFieldValidateValueEvent = procedure (Sender: TObject; AValue: IActionFieldValue; var
Handled: Boolean) of object;
```

C++

```
(Sender: TObject; AValue: IActionFieldValue; var Handled: Boolean) (
TAdapterFieldValidateValueEvent)();
```

File

WebAdapt

Description

TAdapterFieldValidateValueEvent is the type for event handlers that let you check whether a value is valid for a given adapter field. The event handler raises an exception if the value is not valid.

Sender is the adapter field component whose value needs to be validated.

AValue is an interface for obtaining the value of the adapter field.

Handled returns true if the event handler has checked the value, false if the event handler did not validate the value. Note that if the event handler checks the value and finds it invalid, it does not set Handled to false: rather, it raises an exception.

See Also

Procedural types

Creating events

54.5.28 WebAdapt.TAdapterFieldValueEvent Type

TAdapterFieldValueEvent is the type for event handlers that respond when an adapter field's value changes.

Pascal

```
TAdapterFieldValueEvent = procedure (Sender: TObject; Value: Variant) of object;
```

C++

```
(Sender: TObject; Value: Variant) ( TAdapterFieldValueEvent)();
```

File

WebAdapt

Description

TAdapterFieldValueEvent is the type for event handlers that let you respond when a new value has been assigned to an adapter field component.

Sender is the adapter field component whose value was just changed.

Value contains the newly-assigned value.

See Also

Procedural types

Creating events

54.5.29 WebAdapt.TAdapterHiddenFieldOptions Type

Pascal

```
TAdapterHiddenFieldOptions = set of TAdapterHiddenFieldOption;
```

C++

```
TAdapterHiddenFieldOption TAdapterHiddenFieldOptions;
```

File

WebAdapt

Description

This is type WebAdapt.TAdapterHiddenFieldOptions.

54.5.30 WebAdapt.TEndUserGetNameEvent Type

TEndUserGetNameEvent is the type for event handlers that supply the name of the current end user.

Pascal

```
TEndUserGetNameEvent = procedure (Sender: TObject; var Name: string) of object;
```

C++

```
(Sender: TObject; var Name: string) ( TEndUserGetNameEvent)();
```

File

WebAdapt

Description

TEndUserGetNameEvent is the type for event handlers of an adapter that can supply the name that should appear in Web pages for the current end user.

Sender is the end user adapter.

Name returns the display name of the current end user.

See Also

Procedural types

Creating events

54.5.31 WebAdapt.TEndUserGetUserIDEvent Type

TEndUserGetUserIDEvent is the type for event handlers that supply the user ID of the current end user.

Pascal

```
TEndUserGetUserIDEvent = procedure (Sender: TObject; var UserID: Variant) of object;
```

C++

```
(Sender: TObject; var UserID: Variant) ( TEndUserGetUserIDEvent)();
```

File

WebAdapt

Description

TEndUserGetUserIDEvent is the type for event handlers of an adapter that can supply the user ID that identifies the current end user.

Sender is the end user adapter.

UserID returns the ID of the current end user. In applications that include a TWebUserList component, this is the ID of a user maintained by that TWebUserList object.

See Also

Procedural types

Creating events

54.5.32 WebAdapt.TEndUserHandledEvent Type

TEndUserHandledEvent is the type for event handlers that can optionally handle a task for an end user adapter.

Pascal

```
TEndUserHandledEvent = procedure (Sender: TObject; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; var Handled: Boolean) ( TEndUserHandledEvent)();
```

File

WebAdapt

Description

TEndUserHandledEvent is the type for event handlers that can perform some task that is otherwise handled by an end user adapter.

Sender is the end user adapter that will perform the task if the event handler does not do so.

Handled returns true if the event handler peformed the task. It returns false if the event handler did not perform the task. If Handled returns false, the end user adapter performs the task in its default manner.

Procedural types

Creating events

54.5.33 WebAdapt.TEndUserIsLoggedInEvent Type

TEndUserIsLoggedInEvent is the type for event handlers that indicate whether the current end user has logged in.

Pascal

```
TEndUserIsLoggedInEvent = procedure (Sender: TObject; var IsLoggedIn: Boolean) of object;
```

C++

```
(Sender: TObject; var IsLoggedIn: Boolean) ( TEndUserIsLoggedInEvent)();
```

File

WebAdapt

Description

TEndUserIsLoggedInEvent is the type for event handlers of an adapter that indicate whether the current end user has logged in.

Sender is the end user adapter.

IsLoggedIn returns true of the current user has logged in, false if the current user has not logged in.

See Also

Procedural types

Creating events

54.5.34 WebAdapt.TEndUserRightsEvent Type

TEndUserRightsEvent is the type for event handlers that check whether a user has rights to perform a specific operation.

Pascal

```
TEndUserRightsEvent = procedure (Sender: TObject; Rights: TStrings; var HasRights, Handled:
Boolean) of object;
```

C++

```
(Sender: TObject; Rights: TStrings; var HasRights, Handled: Boolean) ( TEndUserRightsEvent)();
```

File

WebAdapt

Description

TEndUserRightsEvent is the type for event handlers that indicate whether the current end user has the rights that match a specified set of rights strings. Note that the event handler can obtain a reference to the current end user information from the global WebContext (see page 6003).

Sender is the end user adapter that needs to check the current end user's rights.

Rights is a string list, where each string in the list indicates the access rights being queried. Typically, these values come from

the ViewRights property of a Web page information object that describes the page that the user wants to access or of an adapter that the user wants to call.

HasRights returns true if the event handler verifies that the current end user has the rights indicated by the Rights parameter, false if the user does not have sufficient rights.

Handled returns true if the event handler ascertained whether the user had the desired rights, false if the event handler did not determine the current user's rights. If Handled returns false, the end user adapter attempts its own mechanism for verifying rights. Typically, if the application contains a Web user list (TWebUserList), the end user adapter uses that Web user list to check rights; otherwise, it simply grants the user rights.

See Also

WebContext (see page 6003)

Procedural types

Creating events

54.5.35 WebAdapt.TEndUserUserIDEvent Type

TEndUserUserIDEvent is the type for event handlers that log in a user given the user ID.

Pascal

```
TEndUserUserIDEvent = procedure (Sender: TObject; UserID: Variant) of object;
```

C++

```
(Sender: TObject; UserID: Variant) ( TEndUserUserIDEvent)();
```

File

WebAdapt

Description

TEndUserUserIDEvent is the type for event handlers of an adapter that take a user ID and log in the identified user.

Sender is the end user adapter.

UserID is the identifier of the user to log in. If the application includes a TWebUserList object, it is the value of the UserID property of the entry for the user in the WebUserList component.

See Also

Procedural types

Creating events

54.5.36 WebAdapt.TGetEOFEvent Type

TGetEOFEvent is the type for event handlers on adapters that indicate when to stop iterating over values.

Pascal

```
TGetEOFEvent = procedure (Sender: TObject; var Eof: Boolean) of object;
```

C++

```
(Sender: TObject; var Eof: Boolean) ( TGetEOFEvent)();
```

File

WebAdapt

Description

Sender is the adapter over whose values the application is iterating.

EOF returns true if the adapter is positioned on the last value, false if it can move to another value.

See Also

Procedural types

Creating events

54.5.37 WebAdapt.TGetRecordCountEvent Type

TGetRecordCountEvent is the type for event handlers that indicate how many values an adapter has.

Pascal

```
TGetRecordCountEvent = procedure (Sender: TObject; var Count: Integer) of object;
```

C++

```
(Sender: TObject; var Count: Integer) ( TGetRecordCountEvent)();
```

File

WebAdapt

Description

Sender is the adapter that has multiple values over which the application can iterate.

Count returns the number of values that the adapter has.

See Also

Procedural types

Creating events

54.5.38 WebAdapt.TGetRecordEvent Type

TGetRecordEvent is the type for event handlers on adapters that position the adapter on one of multiple values.

Pascal

```
TGetRecordEvent = procedure (Sender: TObject; var Eof: Boolean) of object;
```

C++

```
(Sender: TObject; var Eof: Boolean) ( TGetRecordEvent)();
```

File

WebAdapt

Description

Sender is the adapter over whose values the application is iterating.

EOF returns true if, after moving to a new value, the adapter is positioned on the last value.

See Also

Procedural types

Creating events

54.5.39 WebAdapt.TGetRecordIndexEvent Type

TGetRecordIndexEvent is the type for event handlers that indicate which of multiple values an adapter is positioned on.

Pascal

```
TGetRecordIndexEvent = procedure (Sender: TObject; var Index: Integer) of object;
```

C++

```
(Sender: TObject; var Index: Integer) ( TGetRecordIndexEvent)();
```

File

WebAdapt

Description

Sender is the adapter that has multiple values over which the application can iterate.

Index returns the index of the current value. This is 0 if the adapter is positioned on the first value, 1 if it is positioned on the second value, and so on.

54.5.40 WebAdapt.THandledEvent Type

Pascal

```
THandledEvent = procedure (Sender: TObject; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; var Handled: Boolean) ( THandledEvent)();
```

File

WebAdapt

Description

This is type WebAdapt.THandledEvent.

54.5.41 WebAdapt.TImageFieldGetHREFEvent Type

TImageFieldGetHREFEvent is the type for event handlers that supply an URL that can be used to access an image field associated with an adapter field..

Pascal

```
TImageFieldGetHREFEvent = procedure (Sender: TObject; var HREF: string) of object;
```

C++

```
(Sender: TObject; var HREF: string) ( TImageFieldGetHREFEvent)();
```

File

WebAdapt

Description

TImageFieldGetHREFEvent is the type for the OnGetHREF event handler of an adapter field whose value is an image. This event handler lets you supply the URL that clients use to retrieve the image associated with the adapter field. The event occurs when server-side script uses the AsHREF property of the adapter field.

Sender is the adapter field object that represents an image.

Handled returns an indication of how the adapter dispatcher should proceed after the event handler exits. If the HREF returns the URL that clients use to request the field's image from the adapter field. If the TImageFieldGetHREFEvent event handler does not supply a URL, the adapter field generates an URL automatically based on the request parameters for the image file.

See Also

OnGetHREF (see page 5317)

Procedural types

Creating events

54.5.42 WebAdapt.TImageFieldGetImageEvent Type

TImageFieldGetImageEvent is the type for event handlers that supply a stream from which to read an image.

Pascal

```
TImageFieldGetImageEvent = procedure (Sender: TObject; Params: TStrings; var MimeType: string;
var Image: TStream; var Owned: Boolean) of object;
```

C++

```
(Sender: TObject; Params: TStrings; var MimeType: string; var Image: TStream; var Owned:
Boolean) ( TImageFieldGetImageEvent)();
```

File

WebAdapt

Description

TImageFieldGetImageEvent is the type for the OnGetImage event handler of an adapter field whose value is an image. This event handler lets you supply an image that is encoded using a MIME format.

Sender is the adapter field object that represents an image.

Params is a string list containing parameters that identify the desired image. This list contains strings of the form ParamName=ParamValue.

MimeType is the MIME type/subtype string that indicates how the image is encoded.

Image returns a stream from which the adapter field can read the image.

Owned returns true if the adapter field is not responsible for freeing the stream that Image returns. Owned returns false if the adapter field should free the stream after reading the image.

See Also

OnGetImage (see page 5318)

Procedural types

Creating events

54.5.43 WebAdapt.TImageFieldGetParamsEvent Type

TImageFieldGetParamsEvent is the type for event handlers that supply a set of parameters to identify the value of an image field.

Pascal

```
TImageFieldGetParamsEvent = procedure (Sender: TObject; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Params: TStrings) ( TImageFieldGetParamsEvent)();
```

File

WebAdapt

Description

TImageFieldGetParamsEvent is the type for the OnGetParams event handler of an adapter field whose value is an image. This event handler lets you supply a set of parameters that uniquely identify the image that is the adapter field's value.

Sender is the adapter field object that represents an image.

Params is a string list to which the event handler adds parameter values. The strings should have the form ParamName=ParamValue.

See Also

OnGetParams (see page 5318)

Procedural types

Creating events

54.5.44 WebAdapt.TIterateRecordsEvent Type

TIterateRecordsEvent is the type for event handlers that navigate the records of an adapter.

Pascal

```
TIterateRecordsEvent = procedure (Sender: TObject; Action: TIteratorMethod; var Eof: Boolean)
of object;
```

C++

```
(Sender: TObject; Action: TIteratorMethod; var Eof: Boolean) ( TIterateRecordsEvent)();
```

File

WebAdapt

Description

TIterateRecordsEvent is the type for event handlers that allow an adapter to iterate over multiple records of data.

Sender is the adapter to which the action belongs.

Action indicates which record the event handler should move to.

EOF returns true if the event handler moved to the last record of the adapter, false otherwise.

See Also

Procedural types

Creating events

54.5.45 WebAdapt.TLoginUserIDEvent Type

TLoginUserIDEvent is the type for event handlers that respond after a user logs in.

Pascal

```
TLoginUserIDEvent = procedure (Sender: TObject; UserID: Variant) of object;
```

C++

```
(Sender: TObject; UserID: Variant) ( TLoginUserIDEvent)();
```

File

WebAdapt

Description

Sender is the login form adapter.

UserID is the ID of the user that just logged in. If the WebSnap application includes a TWebUserList component, this is the ID that the Web user list associates with the supplied password and user name. If the WebSnap application does not include a TWebUserList component, this is the same as the value of the UserName property.

54.5.46 WebAdapt.TObjectList Type

Pascal

```
TObjectList = Contnrs.TObjectList;
```

C++

```
Contnrs.TObjectList TObjectList;
```

File

WebAdapt

Description

This is type WebAdapt.TObjectList.

54.5.47 WebAdapt.TValidateAdapterFieldEvent Type

TValidateAdapterFieldEvent is the type for event handlers that validate the values supplied for adapter fields.

Pascal

```
TValidateAdapterFieldEvent = procedure (Sender: TObject; Value: Variant; var Handled: Boolean)
of object;
```

C++

```
(Sender: TObject; Value: Variant; var Handled: Boolean) ( TValidateAdapterFieldEvent)();
```

File

WebAdapt

Description

TValidateAdapterFieldEvent is the type for event handlers that check whether the value supplied for an adapter field is valid.

ASender is the adapter component that needs to check the field value.

Value is the value supplied for the adapter field. (The particular field to which this value is assigned is determined by the specific event that uses this type for its event handler.)

Handled returns true if the event handler found Value to be valid. If Value is not valid, the event handler raises an exception. If the event handler can't determine whether Value is valid or invalid, Handled returns false.

See Also

Procedural types

Creating events

54.5.48 WebAdapt.TWebFormGetPageNameEvent Type

TWebFormGetPageNameEvent is the type for event handlers that supply labels for the controls that navigate to Web pages.

Pascal

```
TWebFormGetPageNameEvent = procedure (Sender: TObject; APageIndex: Integer; var Value: string)
of object;
```

C++

```
(Sender: TObject; APageIndex: Integer; var Value: string) ( TWebFormGetPageNameEvent)();
```

File

WebAdapt

Description

TWebFormGetPageNameEvent is the type for event handlers of an adapter that return the name of a Web page.

Sender is the adapter action that needs the Web page name.

APageIndex is the index of the Web page for which a name is needed..

Value returns the name of the specified Web page.

54.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
NotifyPossibleHTMLChange (see page 5930)	This is variable WebAdapt.NotifyPossibleHTMLChange.

54.6.1 WebAdapt.NotifyPossibleHTMLChange Variable

Pascal

```
NotifyPossibleHTMLChange: procedure;
```

C++

```
procedure NotifyPossibleHTMLChange;
```

File

WebAdapt

Description

This is variable WebAdapt.NotifyPossibleHTMLChange.

54.7 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sActionRequestLong (see page 5931)	This is constant WebAdapt.sActionRequestLong.
sCurrentPage (see page 5931)	This is constant WebAdapt.sCurrentPage.
sGotoPageAction (see page 5932)	This is constant WebAdapt.sGotoPageAction.
sImageRequest (see page 5932)	This is constant WebAdapt.sImageRequest.
sLoginPassword (see page 5932)	This is constant WebAdapt.sLoginPassword.
sLoginUserName (see page 5933)	This is constant WebAdapt.sLoginUserName.
sNextPageAction (see page 5933)	This is constant WebAdapt.sNextPageAction.
sPrevPageAction (see page 5933)	This is constant WebAdapt.sPrevPageAction.

54.7.1 WebAdapt.sActionRequestLong Constant

Pascal

```
sActionRequestLong = '__action';
```

C++

```
sActionRequestLong = '__action';
```

File

WebAdapt

Description

This is constant WebAdapt.sActionRequestLong.

54.7.2 WebAdapt.sCurrentPage Constant

Pascal

```
sCurrentPage = '_cp';
```

C++

```
sCurrentPage = '_cp';
```

File

WebAdapt

Description

This is constant WebAdapt.sCurrentPage.

54.7.3 WebAdapt.sGotoPageAction Constant

Pascal

```
sGotoPageAction = 'GotoPage';
```

C++

```
sGotoPageAction = 'GotoPage';
```

File

WebAdapt

Description

This is constant WebAdapt.sGotoPageAction.

54.7.4 WebAdapt.sImageRequest Constant

Pascal

```
sImageRequest = '__img';
```

C++

```
sImageRequest = '__img';
```

File

WebAdapt

Description

This is constant WebAdapt.sImageRequest.

54.7.5 WebAdapt.sLoginPassword Constant

Pascal

```
sLoginPassword = 'Password';
```

C++

```
sLoginPassword = 'Password';
```

File

WebAdapt

Description

This is constant WebAdapt.sLoginPassword.

54.7.6 WebAdapt.sLoginUserName Constant

Pascal

```
sLoginUserName = 'UserName';
```

C++

```
sLoginUserName = 'UserName';
```

File

WebAdapt

Description

This is constant WebAdapt.sLoginUserName.

54.7.7 WebAdapt.sNextPageAction Constant

Pascal

```
sNextPageAction = 'NextPage';
```

C++

```
sNextPageAction = 'NextPage';
```

File

WebAdapt

Description

This is constant WebAdapt.sNextPageAction.

54.7.8 WebAdapt.sPrevPageAction Constant

Pascal

```
sPrevPageAction = 'PrevPage';
```

C++

```
sPrevPageAction = 'PrevPage';
```

File

WebAdapt

Description

This is constant WebAdapt.sPrevPageAction.

55 WebBroker Namespace

This is namespace WebBroker.

55.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWebApplication (see page 5936)	TWebApplication encapsulates a Web server application.

55.1.1 TWebApplication Class

TWebApplication encapsulates a Web server application.

Class Hierarchy

Pascal

```
TWebApplication = class(TWebRequestHandler);
```

C++

```
class TWebApplication : public TWebRequestHandler;
```

File

WebBroker

Description

TWebApplication provides the fundamental behavior of a Web server application. TWebApplication provides methods to create TWebRequest and TWebResponse objects that represent HTTP request messages and their responses, pass these objects to the dispatcher so that the response can be filled in, and send the response back to the Web client.

Each Web server project automatically declares an Application (see page 5942) variable of type TWebApplication as the instance of the application. For CGI applications, this variable is initialized to a TCGIApplication object in the CGIApp unit. For Apache applications, this variable is initialized to a TApacheApplication object in the ApacheApp unit. For ISAPI applications, this variable is initialized to a TISAPIApplication object in the ISAPIApp unit.

The Application (see page 5942) variable is added to a project by selecting File | New (see page 3619) from the menu of the IDE main window and selecting Web Server Application (see page 5942) in the New (see page 3619) Items dialog. Do not add the Forms unit to the uses list of the project (Delphi) or include Forms.hpp in the project source file (C++). These actions declare a conflicting Application (see page 5942) variable of type TApplication.In addition, do not add the ApacheApp or ISAPIApp unit to a CGI application or the CGIApp unit to an Apache, ISAPI or NSAPI application. The CGIApp unit, the ISAPIApp unit, and the ApacheApp unit each create the initial instance of the Application (see page 5942) variable. Including more than one of these units in the uses list causes the memory for the object created in the first unit to be lost.

TWebResponse

55.1.1.1 TWebApplication Members

The following tables list the members exposed by TWebApplication.

Protected Methods

	Name	Description
	ActivateWebModules (see page 6636)	Activates a Web module for the application and returns it.
	DeactivateWebModules (see page 6636)	Deactivates the Web module of the application.
	HandleRequest (see page 6637)	Responds to an HTTP request message received by the server.

Public Methods

	Name	Description
	AddWebModuleFactory (see page 6636)	Adds a Web module factory to the request handler.
V	Create (see page 5937)	Creates an instance of TWebApplication (see page 5936).
V	CreateForm (see page 5938)	Registers the single Web module with the Web application.
V	Destroy (see page 5938)	Destroys an instance of TWebApplication (see page 5936).
	HandleException (see page 6637)	Responds to exceptions related to TWebRequestHandler (see page 6633) objects.
V	Initialize (see page 5939)	Introduces an interface for a method that initializes the application.
V	Run (see page 5939)	Executes the Web application.

Public Properties

	Name	Description
R	ActiveCount (see page 6638)	Indicates the number of active connections currently being serviced by the application.
	CacheConnections (see page 6638)	Determines whether the Web modules used by the application are cached for re-use.
R	InactiveCount (see page 6639)	Indicates the number of Web modules cached for later reuse.
	MaxConnections (see page 6640)	Sets or returns the MaxConnections used by the socket.
	Title (see page 5940)	Specifies a title for the Web application.
	WebModuleClass (see page 6640)	Contains a reference to a Web module.
R	WebModuleFactory (see page 6640)	A list of Web module factory objects.
R	WebModuleFactoryCount (see page 6641)	The number of Web module factories in use by the request handler.

55.1.1.2 TWebApplication.Create Constructor

Creates an instance of TWebApplication (see page 5936).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebApplication(TComponent * AOwner);
```

Description

Do not call Create. The single Web application object named Application (see page 5942) is instantiated automatically when the CGIApp unit, the ISAPIApp unit, or the ApacheApp unit is included in the uses list of the project.

Create allocates the helper objects used by TWebApplication (see page 5936).

See Also

Create

55.1.1.3 TWebApplication.Destroy Destructor

Destroys an instance of TWebApplication (see page 5936).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebApplication();
```

Description

Never call the Destroy or Free method. The application is freed automatically when the application stops running.

Destroy frees the helper objects that were created at startup, as well as all Web modules created by the application.

See Also

System::TObject::Free (see page 3372)

Run (see page 5939)

55.1.1.4 TWebApplication Methods

The methods of the TWebApplication class are listed here.

Public Methods

	Name	Description
	CreateForm (see page 5938)	Registers the single Web module with the Web application.
	Initialize (see page 5939)	Introduces an interface for a method that initializes the application.
	Run (see page 5939)	Executes the Web application.

55.1.1.4.1 TWebApplication.CreateForm Method

Registers the single Web module with the Web application.

Pascal

```
procedure CreateForm(InstanceClass: TComponentClass; var Reference); virtual;
```

C++

```
virtual __fastcall CreateForm(TComponentClass InstanceClass,  Reference);
```

Description

Do not call CreateForm in an application. The module manager calls CreateForm internally to register the Web module for the Web application.

CreateForm registers the class of the Web module for the application.

See Also

TWebModule

55.1.1.4.2 TWebApplication.Initialize Method

Introduces an interface for a method that initializes the application.

Pascal

```
procedure Initialize; virtual;
```

C++

```
virtual __fastcall Initialize();
```

Description

The Initialize method for TWebApplication (see page 5936) does nothing. Initialize is the first method called for every project. Descendants of TWebApplication (see page 5936) that must perform any initialization before the application starts running override this method for that purpose.

Note: Although Initialize is the first method called in the project source code, it is not the first code that is executed in an application.

See Also

Run (see page 5939)

55.1.1.4.3 TWebApplication.Run Method

Executes the Web application.

Pascal

```
procedure Run; virtual;
```

C++

```
virtual __fastcall Run();
```

Description

When the application is executed, the application's Run method is calledautomatically.

The Run method for TWebApplication (see page 5936) sets up the default error handler and shut down sequence for the application. Descendants of TWebApplication (see page 5936) override the Run method to receive HTTP request messages, create the TWebRequest and TWebResponse objects for incoming requests, and call the HandleRequest method to process those requests.

See Also

TWebRequest

TWebResponse

55.1.1.5 TWebApplication Properties

The properties of the TWebApplication class are listed here.

Public Properties

	Name	Description
	Title (see page 5940)	Specifies a title for the Web application.

55.1.1.5.1 TWebApplication.Title Property

Specifies a title for the Web application.

Pascal

```
property Title: string;
```

C++

```
__property UnicodeString Title;
```

Description

Use the Title property to assign a title to your Web application. This title can be used in HTTP messages that the application sends to identify the application. The default value is taken from the executable DLL/EXE .so filename at runtime.

Do not confuse Title with the Name property. Name is the identifier for the Web application when it is referred to in code.

See Also

Name

55.2 Types

The following table lists types in this documentation.

Types

Name	Description
THandleShutdownException (see page 5941)	This is type WebBroker.THandleShutdownException.
TServerExceptionEvent (see page 5941)	This is type WebBroker.TServerExceptionEvent.

55.2.1 WebBroker.THandleShutdownException Type

Pascal

```
THandleShutdownException = procedure (E: Exception);
```

C++

```
(E: Exception) ( THandleShutdownException)();
```

File

WebBroker

Description

This is type WebBroker.THandleShutdownException.

55.2.2 WebBroker.TServerExceptionEvent Type

Pascal

```
TServerExceptionEvent = procedure (E: Exception; wr: TWebResponse) of object;
```

C++

```
(E: Exception; wr: TWebResponse) ( TServerExceptionEvent)();
```

File

WebBroker

Description

This is type WebBroker.TServerExceptionEvent.

55.3 Variables

The following table lists variables in this documentation.

Variables

Name	Description
Application (see page 5942)	Represents a web server application for an Internet project.
HandleShutdownException (see page 5942)	This is variable WebBroker.HandleShutdownException.

55.3.1 WebBroker.Application Variable

Represents a web server application for an Internet project.

Pascal

```
Application: TWebApplication = nil;
```

C++

```
TWebApplication Application = nil;
```

File

WebBroker

Description

By default, when a new Internet server project is created, an Application object is created and assigned to Application. If the project represents a CGI or Win-CGI server Application, Application is initialized to a TCGIApplication object. If the project represents an Apache server Application, Application is initialized to a TApacheApplication object. If the project represents an ISAPI or NSAPI server Application, Application is initialized to a TISAPIApplication object. Which type of TWebApplication (see page 5936) object gets created depends on whether the project includes the ISAPIApp unit, the ApacheApp unit, or the CGIApp unit.

See Also

TISAPIApplication

TCGIApplication

55.3.2 WebBroker.HandleShutdownException Variable

Pascal

```
HandleShutdownException: THandleShutdownException;
```

C++

```
THandleShutdownException HandleShutdownException;
```

File

WebBroker

Description

This is variable WebBroker.HandleShutdownException.

56 WebBrokerSOAP Namespace

This is namespace WebBrokerSOAP.

Topics

Name	Description
Classes (see page 5946)	The following table lists classes in this documentation.
Functions (see page 5951)	The following table lists functions in this documentation.

Classes

	Name	Description
	THTTPSoapDispatcher (see page 5946)	THTTPSoapDispatcher responds to SOAP messages by forwarding them to an invoker for interpretation.

Functions

	Name	Description
	GetSOAPWebModule (see page 5951)	Returns the Web module that contains the SOAP dispatcher that is processing the current request.

56.1 Classes

The following table lists classes in this documentation.

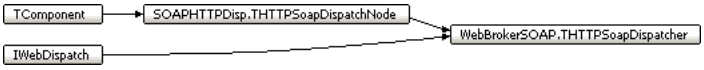
Classes

	Name	Description
	THTTPSoapDispatcher (see page 5946)	THTTPSoapDispatcher responds to SOAP messages by forwarding them to an invoker for interpretation.

56.1.1 THTTPSoapDispatcher Class

THTTPSoapDispatcher responds to SOAP messages by forwarding them to an invoker for interpretation.

Class Hierarchy



Pascal

```
THTTPSoapDispatcher = class(THTTPSoapDispatchNode, IWebDispatch);
```

C++

```
class THTTPSoapDispatcher : public THTTPSoapDispatchNode, public IWebDispatch;
```

File

WebBrokerSOAP

Description

Use THTTPSoapDispatcher in an application that publishes a Web Service using SOAP. THTTPSoapDispatcher responds to all SOAP-based calls made to the invokable interfaces that are registered in the application. These interfaces are registered by calling the RegisterInterface method of the invocation registry (InvRegistry).

THTTPSoapDispatcher only acts as a dispatcher, receiving incoming messages and forwarding them on to another component that handles the task of interpreting and executing them. The component that interprets and executes SOAP message is identified by the Dispatcher property. Dispatcher is the interface of an invoker component, which interprets the SOAP message, identifies the invokable interface that is the target of the call, executes the call, and assembles the content of the response message.

THTTPSoapDispatcher automatically registers itself with the Web module (or Web dispatcher) as an auto-dispatching object. This means that the Web module or Web dispatcher forwards all incoming HTTP messages directed to the SOAP dispatcher without requiring the use of Web action items.

Writing Servers that Support Web Services

56.1.1.1 THTTPSoapDispatcher Members

The following tables list the members exposed by THTTPSoapDispatcher.

Protected Fields

	Name	Description
	FSoapDispatcher (see page 1259)	This is FSoapDispatcher, a member of class THTTPSoapDispatchNode.

Protected Methods

	Name	Description
	DispatchEnabled (see page 5948)	Indicates whether the HTTP SOAP dispatcher is enabled to respond to incoming SOAP messages.
	DispatchMask (see page 5949)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 5949)	Returns the method type of all HTTP messages to which this component responds.
	DispatchRequest (see page 5949)	Responds to an incoming message and generates the appropriate response message.
V	Notification (see page 1260)	Responds when objects are added or removed from the Web module.

Public Methods

	Name	Description
V	Create (see page 5947)	Creates a new THTTPSoapDispatcher (see page 5946) object.
V	Destroy (see page 5948)	Frees the memory associated with the THTTPSoapDispatcher (see page 5946) object.
V	DispatchSOAP (see page 1259)	Forwards the SOAP message on to the invoker for interpretation and execution.

Published Properties

	Name	Description
	Dispatcher (see page 1261)	Specifies the interface of the component that interprets SOAP messages.
	WebDispatch (see page 5950)	Lets the Web dispatcher identify what HTTP messages should be forwarded to the HTTP SOAP dispatcher.

56.1.1.2 THTTPSoapDispatcher.Create Constructor

Creates a new THTTPSoapDispatcher (see page 5946) object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall THTTPSoapDispatcher(TComponent * AOwner);
```

Description

Most applications do not need to call the THTTPSoapDispatcher (see page 5946) constructor. Typically the HTTP SOAP dispatcher is added to a Web module at design time, so that the constructor is called automatically.

The Owner parameter specifies the component (usually the Web module) that is responsible for freeing the THTTPSoapDispatcher (see page 5946) instance.

See Also

Owner

56.1.1.3 THTTPSoapDispatcher.Destroy Destructor

Frees the memory associated with the THTTPSoapDispatcher (see page 5946) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THTTPSoapDispatcher();
```

Description

Do not call Destroy directly. Instead,call Free, which verifies that the THTTPSoapDispatcher (see page 5946) reference is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

56.1.1.4 THTTPSoapDispatcher Methods

The methods of the THTTPSoapDispatcher class are listed here.

Protected Methods

	Name	Description
	DispatchEnabled (see page 5948)	Indicates whether the HTTP SOAP dispatcher is enabled to respond to incoming SOAP messages.
	DispatchMask (see page 5949)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 5949)	Returns the method type of all HTTP messages to which this component responds.
	DispatchRequest (see page 5949)	Responds to an incoming message and generates the appropriate response message.

56.1.1.4.1 THTTPSoapDispatcher.DispatchEnabled Method

Indicates whether the HTTP SOAP dispatcher is enabled to respond to incoming SOAP messages.

Pascal

```
function DispatchEnabled: Boolean;
```

C++

```
__fastcall Boolean DispatchEnabled();
```

Description

The DispatchEnabled method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to determine whether it can receive incoming messages. In THTTPSoapDispatcher (see page 5946), DispatchEnabled always returns true, because the HTTP SOAP dispatcher can't be disabled.

See Also

WebDispatch (see page 5950)

56.1.1.4.2 THTTPSoapDispatcher.DispatchMask Method

Returns a mask that matches the path portion of any URL to which this object responds.

Pascal

```
function DispatchMask: TMask;
```

C++

```
__fastcall TMask DispatchMask();
```

Description

The DispatchMask method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to the this component. It returns the Mask property of the TWebDispatch object specified by the WebDispatch (see page 5950) property.

See Also

WebDispatch (see page 5950)

Mask

56.1.1.4.3 THTTPSoapDispatcher.DispatchMethodType Method

Returns the method type of all HTTP messages to which this component responds.

Pascal

```
function DispatchMethodType: TMethodType;
```

C++

```
__fastcall TMethodType DispatchMethodType();
```

Description

The DispatchMethodType method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to the this component. It returns the MethodType property of the TWebDispatch object specified by the WebDispatch (see page 5950) property.

See Also

MethodType

WebDispatch (see page 5950)

56.1.1.4.4 THTTPSoapDispatcher.DispatchRequest Method

Responds to an incoming message and generates the appropriate response message.

Pascal

```
function DispatchRequest(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean DispatchRequest(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

Description

The Web Module (or Web Dispatcher) calls DispatchRequest when it identifies an HTTP message that matches the properties of

the WebDispatch (see page 5950) property. DispatchRequest passes the request on to the component whose interface is the value of the Dispatcher property. That object interprets the request message, calls the appropriate invokable interface, and returns the content of the response message.

Sender is not used in the DispatchRequest method.

Request contains information about the incoming SOAP message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

DispatchRequest returns true if it successfully passes the request on to an invoker and that invoker handles the request and fills out the Response parameter. It returns false if it could not handle the request.

See Also

Dispatcher (see page 1261)

WebDispatch (see page 5950)

56.1.1.5 THTTPSoapDispatcher Properties

The properties of the THTTPSoapDispatcher class are listed here.

Published Properties

	Name	Description
	WebDispatch (see page 5950)	Lets the Web dispatcher identify what HTTP messages should be forwarded to the HTTP SOAP dispatcher.

56.1.1.5.1 THTTPSoapDispatcher.WebDispatch Property

Lets the Web dispatcher identify what HTTP messages should be forwarded to the HTTP SOAP dispatcher.

Pascal

```
property WebDispatch: TWebDispatch;
```

C++

```
__property TWebDispatch WebDispatch;
```

Description

Use WebDispatch to specify the SOAP messages to which this component responds.

The TWebDispatch object that implements WebDispatch includes properties that let you specify the path portion of URLs to which the Web Service application responds, as well as the values allowed in the types of messages it accepts. By default, WebDispatch enables the HTTP SOAP dispatcher to respond to any URL whose path portion begins with the string "soap".

Note: You can't use WebDispatch to disable the THTTPSoapDispatcher (see page 5946) object. Setting its Enabled property to false does nothing.

See Also

TWebModule

TWebDispatcher

56.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetSOAPWebModule (see page 5951)	Returns the Web module that contains the SOAP dispatcher that is processing the current request.

56.2.1 WebBrokerSOAP.GetSOAPWebModule Function

Returns the Web module that contains the SOAP dispatcher that is processing the current request.

Pascal

```
function GetSOAPWebModule: TWebModule;
```

C++

```
TWebModule GetSOAPWebModule();
```

File

WebBrokerSOAP

Description

Call GetSOAPWebModule to access the application Web module of a Web Services application. This is the Web module that contains the SOAP dispatcher (THTTPSoapDispatcher (see page 5946)).

See Also

THTTPSoapDispatcher (see page 5946)

57 WebCntxt Namespace

This is namespace WebCntxt.

Topics

Name	Description
Classes (see page 5955)	The following table lists classes in this documentation.
Interfaces (see page 5988)	The following table lists interfaces in this documentation.
Functions (see page 6003)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 6004)	The following table lists structs, records, enums in this documentation.
Types (see page 6005)	The following table lists types in this documentation.
Variables (see page 6007)	The following table lists variables in this documentation.

Classes

	Name	Description
	TAbstractAdapterRequest (see page 5955)	TAbstractAdapterRequest is the base class for adapter request objects.
	TAbstractAdapterResponse (see page 5958)	TAbstractAdapterResponse is the base class for adapter response objects.
	TAbstractWebContext (see page 5960)	TAbstractWebContext is the base class for objects that represent the current state of a WebSnap application.
	TWebContext (see page 5976)	TWebContext represents the current state of a WebSnap application.

Functions

	Name	Description
	WebContext (see page 6003)	Returns the current Web context

Interfaces

	Name	Description
	IWebEndUser (see page 5988)	IWebEndUser provides access information about the current end user in a WebSnap application.
	IWebPageInfo (see page 5996)	IWebPageInfo describes a Web page in a WebSnap application.

Structs, Records, Enums

	Name	Description
	TFindPageOption (see page 6004)	TFindPageOptions (see page 6005) indicates the attributes that must be present on a Web page module that is the target of a search.

Types

Name	Description
TFindPageOptions (see page 6005)	This is type WebCntxt.TFindPageOptions.
TGetWebContextProc (see page 6005)	This is type WebCntxt.TGetWebContextProc.
TGetWebEndUserProc (see page 6006)	This is type WebCntxt.TGetWebEndUserProc.
TSetWebContextProc (see page 6006)	This is type WebCntxt.TSetWebContextProc.

Variables

Name	Description
GetModuleFileNameProc (see page 6007)	This is variable WebCntxt.GetModuleFileNameProc.
GetWebContextProc (see page 6007)	This is variable WebCntxt.GetWebContextProc.
GetWebEndUserProc (see page 6008)	This is variable WebCntxt.GetWebEndUserProc.
SetWebContextProc (see page 6008)	This is variable WebCntxt.SetWebContextProc.

57.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAbstractAdapterRequest (see page 5955)	TAbstractAdapterRequest is the base class for adapter request objects.
	TAbstractAdapterResponse (see page 5958)	TAbstractAdapterResponse is the base class for adapter response objects.
	TAbstractWebContext (see page 5960)	TAbstractWebContext is the base class for objects that represent the current state of a WebSnap application.
	TWebContext (see page 5976)	TWebContext represents the current state of a WebSnap application.

57.1.1 TAbstractAdapterRequest Class

TAbstractAdapterRequest is the base class for adapter request objects.

Class Hierarchy

Pascal

```
TAbstractAdapterRequest = class(TInterfacedObject);
```

C++

```
class TAbstractAdapterRequest : public TInterfacedObject;
```

File

WebCntxt

Description

TAbstractAdapterRequest is the base class for the object that adapters use to obtain information about the current HTTP request message. An application interacts with an adapter request object through interfaces implemented by various descendants of TAbstractAdapterRequest. These descendant classes are considered internal to WebSnap and are not documented.

IActionFieldValues

IEnumActionFieldValueRecords

IAdapterRecordKeys

IActionFieldValuesOfAdapter

IAdapterDispatchParams (see page 987)

57.1.1.1 TAbstractAdapterRequest Members

The following tables list the members exposed by TAbstractAdapterRequest.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	Request (see page 5957)	This is Request, a member of class TAbstractAdapterRequest.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5957)	Create an adapter request object.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.

	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.

57.1.1.2 TAbstractAdapterRequest.Create Constructor

Create an adapter request object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAbstractAdapterRequest();
```

Description

Creating an adapter request object automatically assigns that object to the AdapterRequest property of the WebContext (see page 6003) object.

57.1.1.3 TAbstractAdapterRequest Properties

The properties of the TAbstractAdapterRequest class are listed here.

Protected Properties

	Name	Description
R	Request (see page 5957)	This is Request, a member of class TAbstractAdapterRequest.

57.1.1.3.1 TAbstractAdapterRequest.Request Property

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

This is Request, a member of class TAbstractAdapterRequest.

57.1.2 TAbstractAdapterResponse Class

TAbstractAdapterResponse is the base class for adapter response objects.

Class Hierarchy

Pascal

```
TAbstractAdapterResponse = class(TInterfacedObject);
```

C++

```
class TAbstractAdapterResponse : public TInterfacedObject;
```

File

WebCntxt

Description

TAbstractAdapterResponse is the base class for the object that adapters use to obtain information about the current HTTP response message. An application interacts with an adapter response object through interfaces implemented by various descendants of TAbstractAdapterResponse. These descendant classes are considered internal to WebSnap and are not documented.

57.1.2.1 TAbstractAdapterResponse Members

The following tables list the members exposed by TAbstractAdapterResponse.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.

Protected Properties

	Name	Description
R	Response (see page 5960)	This is Response, a member of class TAbstractAdapterResponse.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AfterConstruction (see page 3345)	Responds after the last constructor executes.
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5959)	Create an adapter response object.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.

57.1.2.2 TAbstractAdapterResponse.Create Constructor

Create an adapter response object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAbstractAdapterResponse();
```

Description

Creating an adapter response object automatically assigns that object to the AdapterResponse property of the WebContext (see page 6003) object.

57.1.2.3 TAbstractAdapterResponse Properties

The properties of the TAbstractAdapterResponse class are listed here.

Protected Properties

	Name	Description
	Response (see page 5960)	This is Response, a member of class TAbstractAdapterResponse.

57.1.2.3.1 TAbstractAdapterResponse.Response Property

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

This is Response, a member of class TAbstractAdapterResponse.

57.1.3 TAbstractWebContext Class

TAbstractWebContext is the base class for objects that represent the current state of a WebSnap application.

Class Hierarchy

Pascal

```
TAbstractWebContext = class(TObject);
```

C++

```
class TAbstractWebContext : public TObject;
```

File

WebCntxt

Description

A Web context stores information about the components that are available in a WebSnap application and about the current request that is being processed. Applications do not create instances of the Web context. Rather, they access the current Web context object by calling the global WebContext (see page 6003) function.

See Also

WebContext (see page 6003)

TWebContext (see page 5976)

57.1.3.1 TAbstractWebContext Members

The following tables list the members exposed by TAbstractWebContext.

Protected Methods

	Name	Description
	GetAdapterRequest (see page 5967)	This is GetAdapterRequest, a member of class TAbstractWebContext.
	GetAdapterResponse (see page 5967)	This is GetAdapterResponse, a member of class TAbstractWebContext.
	GetDispatchedPageName (see page 5968)	This is GetDispatchedPageName, a member of class TAbstractWebContext.
	GetEndUser (see page 5968)	This is GetEndUser, a member of class TAbstractWebContext.
	GetPageCount (see page 5968)	
	GetPageInfo (see page 5968)	
	GetRequestedPageName (see page 5969)	
	GetSession (see page 5969)	
	GetWebModules (see page 5969)	
	GetWebRequest (see page 5969)	
	GetWebResponse (see page 5970)	
	SetAdapterRequest (see page 5970)	This is SetAdapterRequest, a member of class TAbstractWebContext.
	SetAdapterResponse (see page 5970)	This is SetAdapterResponse, a member of class TAbstractWebContext.
	SetDispatchedPageName (see page 5970)	This is SetDispatchedPageName, a member of class TAbstractWebContext.
	SetRequestedPageName (see page 5970)	This is SetRequestedPageName, a member of class TAbstractWebContext.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5962)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 5963)	Frees an instance of TAbstractWebContext (see page 5960).
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindApplicationModule (see page 5964)	Returns the application module instance.
	FindDefaultPageInfo (see page 5964)	Retrieves the Web page information object for a specified class of Web module.
	FindModuleClass (see page 5965)	Returns an instance of a Web module, given its class reference.
	FindModuleName (see page 5965)	Returns an instance of a Web module, given its class name.
	FindPage (see page 5966)	Retrieves a Web page module given its name.
	FindPageInfo (see page 5966)	Retrieves a Web page information object given the name of the corresponding Web page module.
	FindVariableContainer (see page 5967)	Returns an instance of a Web data module, given its class name.

	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AdapterRequest (see page 5971)	Provides access to the adapter request object that manages access to the current request.
R	AdapterResponse (see page 5972)	Provides access to the adapter response object that manages access to the current response.
	DispatchedPageName (see page 5972)	Specifies the name of the Web page module that is producing content to respond to the current request.
R	EndUser (see page 5973)	Provides access to information about the end user that sent the current request.
R	PageCount (see page 5973)	Indicates the number of registered Web pages available in the WebSnap application.
R	Pages (see page 5973)	Lists the page information interfaces of the registered Web pages available in the WebSnap application.
R	Request (see page 5974)	Represents the current HTTP request that the application is handling.
	RequestedPageName (see page 5974)	Indicates the name of the Web page module to which the current request is addressed.
R	Response (see page 5975)	Represents the current HTTP response that the application is assembling.
R	Session (see page 5975)	Provides access to the current Web session.
R	WebModules (see page 5975)	Lists all the Modules in the WebSnap application.

57.1.3.2 TAbstractWebContext.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAbstractWebContext();
```

Description

Do not create instances of Create. Instead, construct descendants of Create using the new keyword, passing any arguments for the descendant object's constructor.

Descendant objects usually define a constructor that Creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

new

57.1.3.3 TAbstractWebContext.Destroy Destructor

Frees an instance of TAbstractWebContext (see page 5960).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAbstractWebContext();
```

Description

Do not free the global Web context object. This object is automatically maintained by the WebSnap application.

The TAbstractWebContext (see page 5960) destructor unregisters itself with the global WebContext (see page 6003) function so that the WebContext (see page 6003) function never returns a Web context that no longer exists.

See Also

WebContext (see page 6003)

57.1.3.4 TAbstractWebContext Methods

The methods of the TAbstractWebContext class are listed here.

Protected Methods

	Name	Description
	GetAdapterRequest (see page 5967)	This is GetAdapterRequest, a member of class TAbstractWebContext.
	GetAdapterResponse (see page 5967)	This is GetAdapterResponse, a member of class TAbstractWebContext.
	GetDispatchedPageName (see page 5968)	This is GetDispatchedPageName, a member of class TAbstractWebContext.
	GetEndUser (see page 5968)	This is GetEndUser, a member of class TAbstractWebContext.
	GetPageCount (see page 5968)	
	GetPageInfo (see page 5968)	
	GetRequestedPageName (see page 5969)	
	GetSession (see page 5969)	
	GetWebModules (see page 5969)	
	GetWebRequest (see page 5969)	
	GetWebResponse (see page 5970)	
	SetAdapterRequest (see page 5970)	This is SetAdapterRequest, a member of class TAbstractWebContext.
	SetAdapterResponse (see page 5970)	This is SetAdapterResponse, a member of class TAbstractWebContext.
	SetDispatchedPageName (see page 5970)	This is SetDispatchedPageName, a member of class TAbstractWebContext.
	SetRequestedPageName (see page 5970)	This is SetRequestedPageName, a member of class TAbstractWebContext.

Public Methods

	Name	Description
	FindApplicationModule (see page 5964)	Returns the application module instance.
	FindDefaultPageInfo (see page 5964)	Retrieves the Web page information object for a specified class of Web module.
	FindModuleClass (see page 5965)	Returns an instance of a Web module, given its class reference.

	FindModuleName (see page 5965)	Returns an instance of a Web module, given its class name.
	FindPage (see page 5966)	Retrieves a Web page module given its name.
	FindPageInfo (see page 5966)	Retrieves a Web page information object given the name of the corresponding Web page module.
	FindVariableContainer (see page 5967)	Returns an instance of a Web data module, given its class name.

57.1.3.4.1 TAbstractWebContext.FindApplicationModule Method

Returns the application module instance.

Pascal

```
function FindApplicationModule(WebModuleContext: TWebModuleContext): TComponent; virtual;
abstract;
```

C++

```
virtual __fastcall TComponent * FindApplicationModule(TWebModuleContext WebModuleContext) = 0;
```

Description

Call FindApplicationModule to access the main Web module in the WebSnap application. FindApplicationModule returns a reference to the module that the WebSnap application wizard creates. This can be an instance of TWebAppPageModule or TWebAppDataModule.

The Application module is the module that holds the application-wide components such as the page dispatcher, end user adapter, application adapter, and so on.

WebModuleContext is a context object that holds design-time information about the application modules. It is only used at design time.

See Also

WebModules (see page 5975)

TWebAppPageModule (see page 6588)

TWebAppDataModule (see page 6585)

57.1.3.4.2 TAbstractWebContext.FindDefaultPageInfo Method

Retrieves the Web page information object for a specified class of Web module.

Pascal

```
function FindDefaultPageInfo(AComponentClass: TComponentClass; out APageInfo:
TAbstractWebPageInfo): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean FindDefaultPageInfo(TComponentClass AComponentClass,
TAbstractWebPageInfo APageInfo) = 0;
```

Description

Call FindDefaultPageInfo to obtain the Web page information object for a Web module. FindDefaultPageInfo retrieves the information object that is registered for the Web page module class specified by AComponentClass. The Web page information object describes the characteristics of the Web page, including its name, title, HREF, view access string, an indication of whether users must log in to access the page, and so on.

AComponentClass is a class reference to the class that implements the Web page module. This class is declared in code that the Web page module wizard generates.

APageInfo returns the Web page information object that describes the characteristics of the specified Web page module, and

that provides access to the factory object that you can use to create instances of the Web page module.

FindDefaultPageInfo returns false if it can't return a value for the APageInfo parameter. FindDefaultPageInfo returns true if it locates a registered Web page module for the class specified by AComponentClass.

See Also

FindPageInfo (see page 5966)

57.1.3.4.3 TAbstractWebContext.FindModuleClass Method

Returns an instance of a Web module, given its class reference.

Pascal

```
function FindModuleClass(AClass: TComponentClass): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * FindModuleClass(TComponentClass AClass) = 0;
```

Description

Call FindModuleClass to obtain a reference to a Web module given its class reference. If an instance of the specified class already exists, FindModuleClass returns that instance. Otherwise, if the specified class represents a registered Web module class, FindModuleClass creates an instance of the specified class and returns the new instance.

AClass is the class reference to a registered Web module class. This class is declared in code that the Web page module wizard or Web data module wizard generates.

See Also

FindModuleName (see page 5965)

FindPage (see page 5966)

57.1.3.4.4 TAbstractWebContext.FindModuleName Method

Returns an instance of a Web module, given its class name.

Pascal

```
function FindModuleName(const AClass: string): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * FindModuleName(const UnicodeString AClass) = 0;
```

Description

Call FindModuleName to obtain a reference to a Web module given the name of its implementation class. If an instance of the specified class already exists, FindModuleName returns that instance. Otherwise, if the specified class represents a registered Web module class, FindModuleClass (see page 5965) creates an instance of the specified class and returns the new instance.

AClass is the name of a registered Web module class. This class is declared in code that the Web page module wizard or Web data module wizard generates.

See Also

FindModuleClass (see page 5965)

FindPage (see page 5966)

FindVariableContainer (see page 5967)

57.1.3.4.5 TAbstractWebContext.FindPage Method

Retrieves a Web page module given its name.

Pascal

```
function FindPage(const APage: string; AOptions: TFindPageOptions; out AComponent: TObject):
Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean FindPage(const UnicodeString APage, TFindPageOptions AOptions,
TObject * AComponent) = 0;
```

Description

Call FindPage to obtain an instance of a registered Web page module given its name. If an instance of the specified Web page module already exists, FindPage returns that instance. Otherwise, if the named Web page module is registered, FindPage creates an instance of the module and returns the new instance.

APage is the name of the desired Web page module. The name is specified using the Web page module wizard, and forms the basis of the Web page module's class name. Thus, a Web page module with a name MyPage has the class name TMyPage.

AOptions is a set of options that can limit the page modules that FindPage considers. For any option included in this set, FindPage only considers Web page modules that have the corresponding attribute.

AComponent returns the instance of the specified Web page module.

FindPage returns true if it can find or create an instance of the specified Web page module, false otherwise.

See Also

FindModuleName (see page 5965)

FindPageInfo (see page 5966)

FindModuleClass (see page 5965)

57.1.3.4.6 TAbstractWebContext.FindPageInfo Method

Retrieves a Web page information object given the name of the corresponding Web page module.

Pascal

```
function FindPageInfo(const APage: string; AOptions: TFindPageOptions; out APageInfo:
TAbstractWebPageInfo): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean FindPageInfo(const UnicodeString APage, TFindPageOptions AOptions,
TAbstractWebPageInfo APageInfo) = 0;
```

Description

Call FindPageInfo to obtain the Web page information object for a Web page module. FindPageInfo retrieves the information object that is registered for the Web page module that has a specified name. The Web page information object describes the characteristics of the Web page, including its name, title, HREF, view access string, an indication of whether users must log in to access the page, and so on.

APage is the name of the desired Web page module. The name is specified using the Web page module wizard, and forms the basis of the Web page module's class name. Thus, a Web page module with a name MyPage has the class name TMyPage.

AOptions is a set of options that can limit the page modules that FindPageInfo considers. For any option included in this set, FindPageInfo only considers Web page modules that have the corresponding attribute.

APageInfo returns the Web page information object that describes the characteristics of the specified Web page module, and that provides access to the factory object that you can use to create instances of the Web page module.

FindPageInfo returns false if it can't return a value for the APageInfo parameter. FindPageInfo returns true if it locates a registered Web page module with the specified name and attributes.

See Also

FindPage (see page 5966)

FindDefaultPageInfo (see page 5964)

Pages (see page 5973)

57.1.3.4.7 TAbstractWebContext.FindVariableContainer Method

Returns an instance of a Web data module, given its class name.

Pascal

```
function FindVariableContainer(const AIdent: string): TComponent; virtual; abstract;
```

C++

```
virtual __fastcall TComponent * FindVariableContainer(const UnicodeString AIdent) = 0;
```

Description

Call FindVariableContainer to obtain a reference to a Web data module given the name of its implementation class. If an instance of the specified class already exists, FindVariableContainer returns that instance. Otherwise, if the specified class represents a registered Web module class, FindVariableContainer creates an instance of the specified class and returns the new instance.

AIdent is the name of a registered Web data module class. This class is declared in code that the Web data module wizard generates.

See Also

FindModuleName (see page 5965)

57.1.3.4.8 TAbstractWebContext.GetAdapterRequest Method

Pascal

```
function GetAdapterRequest: IUnknown; virtual; abstract;
```

C++

```
virtual __fastcall IUnknown GetAdapterRequest() = 0;
```

Description

This is GetAdapterRequest, a member of class TAbstractWebContext.

57.1.3.4.9 TAbstractWebContext.GetAdapterResponse Method

Pascal

```
function GetAdapterResponse: IUnknown; virtual; abstract;
```

C++

```
virtual __fastcall IUnknown GetAdapterResponse() = 0;
```

Description

This is GetAdapterResponse, a member of class TAbstractWebContext.

57.1.3.4.10 TAbstractWebContext.GetDispatchedPageName Method

Pascal

```
function GetDispatchedPageName: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetDispatchedPageName() = 0;
```

Description

This is GetDispatchedPageName, a member of class TAbstractWebContext.

57.1.3.4.11 TAbstractWebContext.GetEndUser Method

Pascal

```
function GetEndUser: IWebEndUser; virtual; abstract;
```

C++

```
virtual __fastcall IWebEndUser GetEndUser() = 0;
```

Description

This is GetEndUser, a member of class TAbstractWebContext.

57.1.3.4.12 TAbstractWebContext.GetPageCount Method

Pascal

```
function GetPageCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetPageCount() = 0;
```

See Also

GetPageInfo (see page 5968)

PageCount (see page 5973)

57.1.3.4.13 TAbstractWebContext.GetPageInfo Method

Pascal

```
function GetPageInfo(I: Integer): IWebPageInfo; virtual; abstract;
```

C++

```
virtual __fastcall IWebPageInfo GetPageInfo(int I) = 0;
```

See Also

GetPageCount (see page 5968)

Pages (see page 5973)

57.1.3.4.14 TAbstractWebContext.GetRequestedPageName Method

Pascal

```
function GetRequestedPageName: string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString GetRequestedPageName() = 0;
```

See Also

GetPageCount (see page 5968)

Pages (see page 5973)

57.1.3.4.15 TAbstractWebContext.GetSession Method

Pascal

```
function GetSession: TAbstractWebSession; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractWebSession GetSession() = 0;
```

See Also

GetPageCount (see page 5968)

Pages (see page 5973)

57.1.3.4.16 TAbstractWebContext.GetWebModules Method

Pascal

```
function GetWebModules: TAbstractWebModuleList; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractWebModuleList GetWebModules() = 0;
```

See Also

WebModules (see page 5975)

57.1.3.4.17 TAbstractWebContext.GetWebRequest Method

Pascal

```
function GetWebRequest: TWebRequest; virtual; abstract;
```

C++

```
virtual __fastcall TWebRequest GetWebRequest() = 0;
```

See Also

GetWebResponse (see page 5970)

Request (see page 5974)

57.1.3.4.18 TAbstractWebContext.GetWebResponse Method

Pascal

```
function GetWebResponse: TWebResponse; virtual; abstract;
```

C++

```
virtual __fastcall TWebResponse GetWebResponse() = 0;
```

See Also

GetWebRequest (see page 5969)

Response (see page 5975)

57.1.3.4.19 TAbstractWebContext.SetAdapterRequest Method

Pascal

```
procedure SetAdapterRequest(Intf: IUnknown); virtual; abstract;
```

C++

```
virtual __fastcall SetAdapterRequest(IUnknown Intf) = 0;
```

Description

This is SetAdapterRequest, a member of class TAbstractWebContext.

57.1.3.4.20 TAbstractWebContext.SetAdapterResponse Method

Pascal

```
procedure SetAdapterResponse(Intf: IUnknown); virtual; abstract;
```

C++

```
virtual __fastcall SetAdapterResponse(IUnknown Intf) = 0;
```

Description

This is SetAdapterResponse, a member of class TAbstractWebContext.

57.1.3.4.21 TAbstractWebContext.SetDispatchedPageName Method

Pascal

```
procedure SetDispatchedPageName(const APageName: string); virtual; abstract;
```

C++

```
virtual __fastcall SetDispatchedPageName(const UnicodeString APageName) = 0;
```

Description

This is SetDispatchedPageName, a member of class TAbstractWebContext.

57.1.3.4.22 TAbstractWebContext.SetRequestedPageName Method

Pascal

```
procedure SetRequestedPageName(const APageName: string); virtual; abstract;
```

C++

```
virtual __fastcall SetRequestedPageName(const UnicodeString APageName) = 0;
```

Description

This is SetRequestedPageName, a member of class TAbstractWebContext.

57.1.3.5 TAbstractWebContext Properties

The properties of the TAbstractWebContext class are listed here.

Public Properties

	Name	Description
R	AdapterRequest (see page 5971)	Provides access to the adapter request object that manages access to the current request.
R	AdapterResponse (see page 5972)	Provides access to the adapter response object that manages access to the current response.
	DispatchedPageName (see page 5972)	Specifies the name of the Web page module that is producing content to respond to the current request.
R	EndUser (see page 5973)	Provides access to information about the end user that sent the current request.
R	PageCount (see page 5973)	Indicates the number of registered Web pages available in the WebSnap application.
R	Pages (see page 5973)	Lists the page information interfaces of the registered Web pages available in the WebSnap application.
R	Request (see page 5974)	Represents the current HTTP request that the application is handling.
	RequestedPageName (see page 5974)	Indicates the name of the Web page module to which the current request is addressed.
R	Response (see page 5975)	Represents the current HTTP response that the application is assembling.
R	Session (see page 5975)	Provides access to the current Web session.
R	WebModules (see page 5975)	Lists all the Modules in the WebSnap application.

57.1.3.5.1 TAbstractWebContext.AdapterRequest Property

Provides access to the adapter request object that manages access to the current request.

Pascal

```
property AdapterRequest: IUnknown;
```

C++

```
__property IUnknown AdapterRequest;
```

Description

AdapterRequest is the interface of the object that adapters use to obtain information about the current HTTP request message. The adapter request object obtains its information from the TWebRequest object that is the value of the Request (see page 5974) property.

Note: In Delphi, this interface can typically be cast to an IActionRequest interface.

Note: In C++, you can generally obtain an IActionRequest interface from this interface.

See Also

AdapterResponse (see page 5972)

TAbstractAdapterRequest (see page 5955)

Request (see page 5974)

IActionRequest

57.1.3.5.2 TAbstractWebContext.AdapterResponse Property

Provides access to the adapter response object that manages access to the current response.

Pascal

```
property AdapterResponse: IUnknown;
```

C++

```
__property IUnknown AdapterResponse;
```

Description

AdapterResponse is the interface of the object that adapters use to obtain information about the current HTTP response message. The adapter response object obtains its information from the TWebResponse object that is the value of the Response (see page 5975) property.

Note: In Delphi, this interface can typically be cast to an IActionResponse interface.

Note: In C++, you can generally obtain an IActionResponse interface from this interface.

See Also

AdapterRequest (see page 5971)

TAbstractAdapterResponse (see page 5958)

Response (see page 5975)

IActionResponse

57.1.3.5.3 TAbstractWebContext.DispatchedPageName Property

Specifies the name of the Web page module that is producing content to respond to the current request.

Pascal

```
property DispatchedPageName: string;
```

C++

```
__property UnicodeString DispatchedPageName;
```

Description

Read (see page 3634) DispatchedPageName to determine the Web page module that is handling the current HTTP request message. Although this is typically the same as the page that the RequestedPageName (see page 5974) property specifies, it can differ if the request was redirected to another Web page or if its use was delayed because the caller had not yet logged in.

See Also

RequestedPageName (see page 5974)

FindPageInfo (see page 5966)

PageName

57.1.3.5.4 TAbstractWebContext.EndUser Property

Provides access to information about the end user that sent the current request.

Pascal

```
property EndUser: IWebEndUser;
```

C++

```
__property IWebEndUser EndUser;
```

Description

Use EndUser to obtain information about the caller that sent the current request. You can use the IWebEndUser (see page 5988) interface to determine whether the end user has logged in, whether the user has access rights to perform specified operations on pages that have a specified access string, the display name for the end user, and so on.

EndUser is nil (Delphi) or NULL (C++) if the WebSnap application does not include an end user adapter such as TEndUserAdapter or TEndUserSessionAdapter.

See Also

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

57.1.3.5.5 TAbstractWebContext.PageCount Property

Indicates the number of registered Web pages available in the WebSnap application.

Pascal

```
property PageCount: Integer;
```

C++

```
__property int PageCount;
```

Description

PageCount indicates the number of entries in the Pages (see page 5973) property array. Use this value as an upper bound for the index when iterating over all the pages in the WebSnap application.

See Also

Pages (see page 5973)

57.1.3.5.6 TAbstractWebContext.Pages Property

Lists the page information interfaces of the registered Web pages available in the WebSnap application.

Pascal

```
property Pages [I: Integer]: IWebPageInfo;
```

C++

```
__property IWebPageInfo Pages[int I];
```

Description

Use Pages to obtain an IWebPageInfo (see page 5996) interface for a registered Web page module. The IWebPageInfo (see page 5996) interface describes the characteristics of a Web page, including its name, title, HREF, description, an indication of whether users must log in to access the page, an indication of whether the current user has access rights to view the page,

and so on.

Pages provides indexed access to page information interfaces. To access the information about a Web page given its name, use the FindPageInfo (see page 5966) method instead. To access the information given the class of the Web page module, use the FindDefaultPageInfo (see page 5964) method instead. To access the page module itself (rather than the page information interface), use the WebModules (see page 5975) property instead.

See Also

PageCount (see page 5973)

FindPageInfo (see page 5966)

WebModules (see page 5975)

FindDefaultPageInfo (see page 5964)

57.1.3.5.7 TAbstractWebContext.Request Property

Represents the current HTTP request that the application is handling.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Read (see page 3634) Request to obtain information about the current HTTP request message. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 5975)

57.1.3.5.8 TAbstractWebContext.RequestedPageName Property

Indicates the name of the Web page module to which the current request is addressed.

Pascal

```
property RequestedPageName: string;
```

C++

```
__property UnicodeString RequestedPageName;
```

Description

When the page dispatcher receives an HTTP request message, it sets RequestedPageName to the name of the target Web page module. This is taken from the pathinfo portion of the request message's target URL.

Note: There is no guarantee that RequestedPageName refers to a registered Web page module, because this property is set before the dispatcher verifies that the requested page exists.

See Also

DispatchedPageName (see page 5972)

FindPageInfo (see page 5966)

Request (see page 5974)

TPageDispatcher (see page 6236)

57.1.3.5.9 TAbstractWebContext.Response Property

Represents the current HTTP response that the application is assembling.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Read (see page 3634) Response to obtain information about or add to the response message that the application builds as a reply to the message that the Request (see page 5974) property specifies. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 5974)

57.1.3.5.10 TAbstractWebContext.Session Property

Provides access to the current Web session.

Pascal

```
property Session: TAbstractWebSession;
```

C++

```
__property TAbstractWebSession Session;
```

Description

Use Session to get or set information about the current session. Sessions store information about an end user that is needed for a short period of time. This can be used for such tasks as login/logout support, recording user preferences, and so on.

Note: If you want to use a session to store end user information, the WebSnap application should include a TSessionsService component.

See Also

TSessionsService (see page 6756)

57.1.3.5.11 TAbstractWebContext.WebModules Property

Lists all the Modules in the WebSnap application.

Pascal

```
property WebModules: TAbstractWebModuleList;
```

C++

```
__property TAbstractWebModuleList WebModules;
```

Description

Use WebModules to access one of the Web modules that make up the WebSnap application. WebModules lists all of the currently instantiated Web modules. It also provides access to the factory objects for all Web modules in the application, including those that are not yet instantiated.

See Also

Pages (see page 5973)

FindModuleClass (see page 5965)

FindModuleName (see page 5965)

FindApplicationModule (see page 5964)

57.1.4 TWebContext Class

TWebContext represents the current state of a WebSnap application.

Class Hierarchy

Pascal

```
TWebContext = class(TAbstractWebContext);
```

C++

```
class TWebContext : public TAbstractWebContext;
```

File

WebCntxt

Description

A Web context stores information about the components that are available in a WebSnap application and about the current request that is being processed. Applications do not create instances of the Web context. Rather, they access the current Web context object by calling the global WebContext (see page 6003) function.

TWebContext provides the implementation of the abstract or (in C++ terminology) pure virtual methods introduced by its immediate ancestor, TAbstractWebContext (see page 5960).

See Also

WebContext (see page 6003)

Dispatching Requests and Responses

57.1.4.1 TWebContext Members

The following tables list the members exposed by TWebContext.

Protected Methods

	Name	Description
	GetAdapterRequest (see page 5983)	This is GetAdapterRequest, a member of class TWebContext.
	GetAdapterResponse (see page 5983)	This is GetAdapterResponse, a member of class TWebContext.
	GetDispatchedPageName (see page 5984)	This is GetDispatchedPageName, a member of class TWebContext.
	GetEndUser (see page 5984)	This is GetEndUser, a member of class TWebContext.
	GetPageCount (see page 5984)	
	GetPageInfo (see page 5984)	
	GetRequestedPageName (see page 5985)	

	GetSession (see page 5985)	
	GetWebModules (see page 5985)	
	GetWebRequest (see page 5985)	
	GetWebResponse (see page 5986)	
	SetAdapterRequest (see page 5986)	This is SetAdapterRequest, a member of class TWebContext.
	SetAdapterResponse (see page 5986)	This is SetAdapterResponse, a member of class TWebContext.
	SetDispatchedPageName (see page 5986)	This is SetDispatchedPageName, a member of class TWebContext.
	SetRequestedPageName (see page 5986)	This is SetRequestedPageName, a member of class TWebContext.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 5978)	Creates an initializes an instance of TWebContext (see page 5976).
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 5979)	Frees an instance of TWebContext (see page 5976).
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindApplicationModule (see page 5980)	Returns the application module instance.
	FindDefaultPageInfo (see page 5980)	Retrieves the Web page information object for a specified class of Web module.
	FindModuleClass (see page 5981)	Returns an instance of a Web module, given its class reference.
	FindModuleName (see page 5981)	Returns an instance of a Web module, given its class name.
	FindPage (see page 5982)	Retrieves a Web page module given its name.
	FindPageInfo (see page 5982)	Retrieves a Web page information object given the name of the corresponding Web page module.
	FindVariableContainer (see page 5983)	Returns an instance of a Web data module, given its class name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	AdapterRequest (see page 5971)	Provides access to the adapter request object that manages access to the current request.
	AdapterResponse (see page 5972)	Provides access to the adapter response object that manages access to the current response.
	DispatchedPageName (see page 5972)	Specifies the name of the Web page module that is producing content to respond to the current request.
	EndUser (see page 5973)	Provides access to information about the end user that sent the current request.
	PageCount (see page 5973)	Indicates the number of registered Web pages available in the WebSnap application.
	Pages (see page 5973)	Lists the page information interfaces of the registered Web pages available in the WebSnap application.
	Request (see page 5974)	Represents the current HTTP request that the application is handling.
	RequestedPageName (see page 5974)	Indicates the name of the Web page module to which the current request is addressed.
	Response (see page 5975)	Represents the current HTTP response that the application is assembling.
	Session (see page 5975)	Provides access to the current Web session.
	WebModules (see page 5975)	Lists all the Modules in the WebSnap application.

57.1.4.2 TWebContext.Create Constructor

Creates an initializes an instance of TWebContext (see page 5976).

Pascal

```
constructor Create(AWebModuleList: TAbstractWebModuleList; ARequest: TWebRequest; AResponse:
TWebResponse; ASession: TAbstractWebSession);
```

C++

```
__fastcall TWebContext(TAbstractWebModuleList AWebModuleList, TWebRequest ARequest,
TWebResponse AResponse, TAbstractWebSession ASession);
```

Description

Do not create instances of TWebContext (see page 5976). WebSnap applications create a global Web context automatically to represent the current state of the application. To access this global Web context object, use the global WebContext (see page 6003) function.

The TWebContext (see page 5976) constructor registers itself with the global WebContext (see page 6003) function so that the application can access the Web context using that function, and initializes the properties of the Web context to the values passed in as parameters.

AWebModuleList is the component that manages the Web modules in the application. It becomes the value of the WebModules (see page 5975) property.

ARequest is the current HTTP request message. It becomes the value of the Request (see page 5974) property.

AResponse is the current response object that the application is filling out. It becomes the value of the Response (see page 5975) property.

ASession is the Session (see page 5975) object associated with ARequest. It becomes the value of the Session (see page 5975) property.

See Also

WebContext (see page 6003)

WebModules (see page 5975)

Request (see page 5974)

Response (see page 5975)

Session (see page 5975)

57.1.4.3 TWebContext.Destroy Destructor

Frees an instance of TWebContext (see page 5976).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContext();
```

Description

Do not free the global Web context object. This object is automatically maintained by the WebSnap application.

The TWebContext (see page 5976) destructor unregisters itself with the global WebContext (see page 6003) function so that the WebContext (see page 6003) function never returns a Web context that no longer exists.

See Also

WebContext (see page 6003)

57.1.4.4 TWebContext Methods

The methods of the TWebContext class are listed here.

Protected Methods

	Name	Description
	GetAdapterRequest (see page 5983)	This is GetAdapterRequest, a member of class TWebContext.
	GetAdapterResponse (see page 5983)	This is GetAdapterResponse, a member of class TWebContext.
	GetDispatchedPageName (see page 5984)	This is GetDispatchedPageName, a member of class TWebContext.
	GetEndUser (see page 5984)	This is GetEndUser, a member of class TWebContext.
	GetPageCount (see page 5984)	
	GetPageInfo (see page 5984)	
	GetRequestedPageName (see page 5985)	
	GetSession (see page 5985)	
	GetWebModules (see page 5985)	
	GetWebRequest (see page 5985)	
	GetWebResponse (see page 5986)	
	SetAdapterRequest (see page 5986)	This is SetAdapterRequest, a member of class TWebContext.
	SetAdapterResponse (see page 5986)	This is SetAdapterResponse, a member of class TWebContext.
	SetDispatchedPageName (see page 5986)	This is SetDispatchedPageName, a member of class TWebContext.
	SetRequestedPageName (see page 5986)	This is SetRequestedPageName, a member of class TWebContext.

Public Methods

	Name	Description
	FindApplicationModule (see page 5980)	Returns the application module instance.
	FindDefaultPageInfo (see page 5980)	Retrieves the Web page information object for a specified class of Web module.
	FindModuleClass (see page 5981)	Returns an instance of a Web module, given its class reference.
	FindModuleName (see page 5981)	Returns an instance of a Web module, given its class name.
	FindPage (see page 5982)	Retrieves a Web page module given its name.

	FindPageInfo (see page 5982)	Retrieves a Web page information object given the name of the corresponding Web page module.
	FindVariableContainer (see page 5983)	Returns an instance of a Web data module, given its class name.

57.1.4.4.1 TWebContext.FindApplicationModule Method

Returns the application module instance.

Pascal

```
function FindApplicationModule(WebModuleContext: TWebModuleContext): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindApplicationModule(TWebModuleContext WebModuleContext);
```

Description

Call FindApplicationModule to access the main Web module in the WebSnap application. FindApplicationModule returns a reference to the module that the WebSnap application wizard creates. This can be an instance of TWebAppPageModule or TWebAppDataModule.

The Application module is the module that holds the application-wide components such as the page dispatcher, end user adapter, application adapter, and so on.

WebModuleContext is a context object that holds design-time information about the application modules. It is only used at design time.

See Also

WebModules (see page 5975)

TWebAppPageModule (see page 6588)

TWebAppDataModule (see page 6585)

57.1.4.4.2 TWebContext.FindDefaultPageInfo Method

Retrieves the Web page information object for a specified class of Web module.

Pascal

```
function FindDefaultPageInfo(AComponentClass: TComponentClass; out APageInfo:
TAbstractWebPageInfo): Boolean; override;
```

C++

```
virtual __fastcall Boolean FindDefaultPageInfo(TComponentClass AComponentClass,
TAbstractWebPageInfo APageInfo);
```

Description

Call FindDefaultPageInfo to obtain the Web page information object for a Web module. FindDefaultPageInfo retrieves the information object that is registered for the Web page module class specified by AComponentClass. The Web page information object describes the characteristics of the Web page, including its name, title, HREF, view access string, an indication of whether users must log in to access the page, and so on.

AComponentClass is a class reference to the class that implements the Web page module. This class is declared in code that the Web page module wizard generates.

APageInfo returns the Web page information object that describes the characteristics of the specified Web page module, and that provides access to the factory object that you can use to create instances of the Web page module.

FindDefaultPageInfo returns false if it can't return a value for the APageInfo parameter. FindDefaultPageInfo returns true if it

locates a registered Web page module for the class specified by AComponentClass.

See Also

FindPageInfo (see page 5982)

57.1.4.4.3 TWebContext.FindModuleClass Method

Returns an instance of a Web module, given its class reference.

Pascal

```
function FindModuleClass(AClass: TComponentClass): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleClass(TComponentClass AClass);
```

Description

Call FindModuleClass to obtain a reference to a Web module given its class reference. If an instance of the specified class already exists, FindModuleClass returns that instance. Otherwise, if the specified class represents a registered Web module class, FindModuleClass creates an instance of the specified class and returns the new instance.

AClass is the class reference to a registered Web module class. This class is declared in code that the Web page module wizard or Web data module wizard generates.

See Also

FindModuleName (see page 5981)

FindPage (see page 5982)

57.1.4.4.4 TWebContext.FindModuleName Method

Returns an instance of a Web module, given its class name.

Pascal

```
function FindModuleName(const AName: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleName(const UnicodeString AName);
```

Description

Call FindModuleName to obtain a reference to a Web module given the name of its implementation class. If an instance of the specified class already exists, FindModuleName returns that instance. Otherwise, if the specified class represents a registered Web module class, FindModuleClass (see page 5981) creates an instance of the specified class and returns the new instance.

AClass is the name of a registered Web module class. This class is declared in code that the Web page module wizard or Web data module wizard generates.

See Also

FindModuleClass (see page 5981)

FindPage (see page 5982)

FindVariableContainer (see page 5983)

57.1.4.4.5 TWebContext.FindPage Method

Retrieves a Web page module given its name.

Pascal

```
function FindPage(const APage: string; AOptions: TFindPageOptions; out AComponent: TObject):
Boolean; override;
```

C++

```
virtual __fastcall Boolean FindPage(const UnicodeString APage, TFindPageOptions AOptions,
TObject * AComponent);
```

Description

Call FindPage to obtain an instance of a registered Web page module given its name. If an instance of the specified Web page module already exists, FindPage returns that instance. Otherwise, if the named Web page module is registered, FindPage creates an instance of the module and returns the new instance.

APage is the name of the desired Web page module. The name is specified using the Web page module wizard, and forms the basis of the Web page module's class name. Thus, a Web page module with a name MyPage has the class name TMyPage.

AOptions is a set of options that can limit the page modules that FindPage considers. For any option included in this set, FindPage only considers Web page modules that have the corresponding attribute.

AComponent returns the instance of the specified Web page module.

FindPage returns true if it can find or create an instance of the specified Web page module, false otherwise.

See Also

FindModuleName (see page 5981)

FindPageInfo (see page 5982)

FindModuleClass (see page 5981)

57.1.4.4.6 TWebContext.FindPageInfo Method

Retrieves a Web page information object given the name of the corresponding Web page module.

Pascal

```
function FindPageInfo(const APage: string; AOptions: TFindPageOptions; out APageInfo:
TAbstractWebPageInfo): Boolean; override;
```

C++

```
virtual __fastcall Boolean FindPageInfo(const UnicodeString APage, TFindPageOptions AOptions,
TAbstractWebPageInfo APageInfo);
```

Description

Call FindPageInfo to obtain the Web page information object for a Web page module. FindPageInfo retrieves the information object that is registered for the Web page module that has a specified name. The Web page information object describes the characteristics of the Web page, including its name, title, HREF, view access string, an indication of whether users must log in to access the page, and so on.

APage is the name of the desired Web page module. The name is specified using the Web page module wizard, and forms the basis of the Web page module's class name. Thus, a Web page module with a name MyPage has the class name TMyPage.

AOptions is a set of options that can limit the page modules that FindPageInfo considers. For any option included in this set, FindPageInfo only considers Web page modules that have the corresponding attribute.

APageInfo returns the Web page information object that describes the characteristics of the specified Web page module, and that provides access to the factory object that you can use to create instances of the Web page module.

FindPageInfo returns false if it can't return a value for the APageInfo parameter. FindPageInfo returns true if it locates a registered Web page module with the specified name and attributes.

See Also

FindPage (see page 5982)

FindDefaultPageInfo (see page 5980)

Pages (see page 5973)

57.1.4.4.7 TWebContext.FindVariableContainer Method

Returns an instance of a Web data module, given its class name.

Pascal

```
function FindVariableContainer(const AIdent: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindVariableContainer(const UnicodeString AIdent);
```

Description

Call FindVariableContainer to obtain a reference to a Web data module given the name of its implementation class. If an instance of the specified class already exists, FindVariableContainer returns that instance. Otherwise, if the specified class represents a registered Web module class, FindVariableContainer creates an instance of the specified class and returns the new instance.

AIdent is the name of a registered Web data module class. This class is declared in code that the Web data module wizard generates.

See Also

FindModuleName (see page 5981)

57.1.4.4.8 TWebContext.GetAdapterRequest Method

Pascal

```
function GetAdapterRequest: IUnknown; override;
```

C++

```
virtual __fastcall IUnknown GetAdapterRequest();
```

Description

This is GetAdapterRequest, a member of class TWebContext.

57.1.4.4.9 TWebContext.GetAdapterResponse Method

Pascal

```
function GetAdapterResponse: IUnknown; override;
```

C++

```
virtual __fastcall IUnknown GetAdapterResponse();
```

Description

This is GetAdapterResponse, a member of class TWebContext.

57.1.4.4.10 TWebContext.GetDispatchedPageName Method

Pascal

```
function GetDispatchedPageName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDispatchedPageName();
```

Description

This is GetDispatchedPageName, a member of class TWebContext.

57.1.4.4.11 TWebContext.GetEndUser Method

Pascal

```
function GetEndUser: IWebEndUser; override;
```

C++

```
virtual __fastcall IWebEndUser GetEndUser();
```

Description

This is GetEndUser, a member of class TWebContext.

57.1.4.4.12 TWebContext.GetPageCount Method

Pascal

```
function GetPageCount: Integer; override;
```

C++

```
virtual __fastcall int GetPageCount();
```

See Also

GetPageInfo (see page 5968)

PageCount (see page 5973)

57.1.4.4.13 TWebContext.GetPageInfo Method

Pascal

```
function GetPageInfo(I: Integer): IWebPageInfo; override;
```

C++

```
virtual __fastcall IWebPageInfo GetPageInfo(int I);
```

See Also

GetPageCount (see page 5968)

Pages (see page 5973)

57.1.4.4.14 TWebContext.GetRequestedPageName Method

Pascal

```
function GetRequestedPageName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetRequestedPageName();
```

See Also

GetPageCount (see page 5968)

Pages (see page 5973)

57.1.4.4.15 TWebContext.GetSession Method

Pascal

```
function GetSession: TAbstractWebSession; override;
```

C++

```
virtual __fastcall TAbstractWebSession GetSession();
```

See Also

GetPageCount (see page 5968)

Pages (see page 5973)

57.1.4.4.16 TWebContext.GetWebModules Method

Pascal

```
function GetWebModules: TAbstractWebModuleList; override;
```

C++

```
virtual __fastcall TAbstractWebModuleList GetWebModules();
```

See Also

WebModules (see page 5975)

57.1.4.4.17 TWebContext.GetWebRequest Method

Pascal

```
function GetWebRequest: TWebRequest; override;
```

C++

```
virtual __fastcall TWebRequest GetWebRequest();
```

See Also

GetWebResponse (see page 5970)

Request (see page 5974)

57.1.4.4.18 TWebContext.GetWebResponse Method

Pascal

```
function GetWebResponse: TWebResponse; override;
```

C++

```
virtual __fastcall TWebResponse GetWebResponse();
```

See Also

GetWebRequest (see page 5969)

Response (see page 5975)

57.1.4.4.19 TWebContext.SetAdapterRequest Method

Pascal

```
procedure SetAdapterRequest(Intf: IUnknown); override;
```

C++

```
virtual __fastcall SetAdapterRequest(IUnknown Intf);
```

Description

This is SetAdapterRequest, a member of class TWebContext.

57.1.4.4.20 TWebContext.SetAdapterResponse Method

Pascal

```
procedure SetAdapterResponse(Intf: IUnknown); override;
```

C++

```
virtual __fastcall SetAdapterResponse(IUnknown Intf);
```

Description

This is SetAdapterResponse, a member of class TWebContext.

57.1.4.4.21 TWebContext.SetDispatchedPageName Method

Pascal

```
procedure SetDispatchedPageName(const APageName: string); override;
```

C++

```
virtual __fastcall SetDispatchedPageName(const UnicodeString APageName);
```

Description

This is SetDispatchedPageName, a member of class TWebContext.

57.1.4.4.22 TWebContext.SetRequestedPageName Method

Pascal

```
procedure SetRequestedPageName(const APageName: string); override;
```

C++

```
virtual __fastcall SetRequestedPageName(const UnicodeString APageName);
```

Description

This is SetRequestedPageName, a member of class TWebContext.

57.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebEndUser (see page 5988)	IWebEndUser provides access information about the current end user in a WebSnap application.
	IWebPageInfo (see page 5996)	IWebPageInfo describes a Web page in a WebSnap application.

57.2.1 IWebEndUser Interface

IWebEndUser provides access information about the current end user in a WebSnap application.

Class Hierarchy

Pascal

```
IWebEndUser = interface;
```

C++

```
__interface IWebEndUser;
```

File

WebCntxt

Description

Use IWebEndUser to obtain information about the current end user, such as the user name, user ID, and whether the user is logged in. In addition to properties that provide information about the current end user, IWebEndUser has methods to log in an end user.

End user adapter components such as TEndUserAdapter and TEndUserSessionAdapter implement the IWebEndUser interface. If a WebSnap application includes an end user adapter, you can access its IWebEndUser interface by reading the EndUser property of the Web context.

Note: In C++, method declarations that use IWebEndUser use the _di_IWebEndUser type instead. This type is a DelphiInterface (see page 3256) wrapper around the IWebEndUser interface:

Note: typedef System::DelphiInterface (see page 3256)< IWebEndUser > _di_IWebEndUser;

See Also

TAbstractWebContext (see page 5960)

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

57.2.1.1 IWebEndUser Members

The following tables list the members exposed by IWebEndUser.

Public Methods

	Name	Description
	GetDisplayName (see page 5989)	Returns the value of the DisplayName (see page 5994) property.
	GetEndUserAdapter (see page 5990)	Returns the value of the EndUserAdapter (see page 5994) property.
	GetLoggedIn (see page 5990)	Returns the value of the LoggedIn (see page 5994) property.
	GetLoginFormAction (see page 5990)	Returns the value of the LoginFormAction (see page 5995) property.
	GetLogoutAction (see page 5991)	Returns the value of the LogoutAction (see page 5996) property.
	HasExecuteRights (see page 5991)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyRights (see page 5992)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasViewRights (see page 5992)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	LogIn (see page 5993)	Logs in a specified user.
	ProduceLoginPage (see page 5993)	Generates the Web page for logging in users.

Public Properties

	Name	Description
R	DisplayName (see page 5994)	Indicates the name of the end user as it should be used for display in Web pages.
R	EndUserAdapter (see page 5994)	Provides access to the end user adapter that implements this interface.
R	LoggedIn (see page 5994)	Indicates whether the current user is logged in.
R	LoginFormAction (see page 5995)	Indicates the action component for the login form.
R	LogoutAction (see page 5996)	Indicates the action component for logging a user out.

57.2.1.2 IWebEndUser Methods

The methods of the IWebEndUser class are listed here.

Public Methods

	Name	Description
	GetDisplayName (see page 5989)	Returns the value of the DisplayName (see page 5994) property.
	GetEndUserAdapter (see page 5990)	Returns the value of the EndUserAdapter (see page 5994) property.
	GetLoggedIn (see page 5990)	Returns the value of the LoggedIn (see page 5994) property.
	GetLoginFormAction (see page 5990)	Returns the value of the LoginFormAction (see page 5995) property.
	GetLogoutAction (see page 5991)	Returns the value of the LogoutAction (see page 5996) property.
	HasExecuteRights (see page 5991)	Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.
	HasModifyRights (see page 5992)	Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.
	HasViewRights (see page 5992)	Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.
	LogIn (see page 5993)	Logs in a specified user.
	ProduceLoginPage (see page 5993)	Generates the Web page for logging in users.

57.2.1.2.1 IWebEndUser.GetDisplayName Method

Returns the value of the DisplayName (see page 5994) property.

Pascal

```
function GetDisplayName: string;
```

C++

```
__fastcall UnicodeString GetDisplayName();
```

Description

GetDisplayName is the read implementation of the DisplayName (see page 5994) property.

See Also

DisplayName (see page 5994)

57.2.1.2.2 IWebEndUser.GetEndUserAdapter Method

Returns the value of the EndUserAdapter (see page 5994) property.

Pascal

```
function GetEndUserAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetEndUserAdapter();
```

Description

GetEndUserAdapter is the read implementation of the EndUserAdapter (see page 5994) property.

See Also

EndUserAdapter (see page 5994)

57.2.1.2.3 IWebEndUser.GetLoggedIn Method

Returns the value of the LoggedIn (see page 5994) property.

Pascal

```
function GetLoggedIn: Boolean;
```

C++

```
__fastcall Boolean GetLoggedIn();
```

Description

GetLoggedIn is the read implementation of the LoggedIn (see page 5994) property.

See Also

LoggedIn (see page 5994)

57.2.1.2.4 IWebEndUser.GetLoginFormAction Method

Returns the value of the LoginFormAction (see page 5995) property.

Pascal

```
function GetLoginFormAction: TComponent;
```

C++

```
__fastcall TComponent * GetLoginFormAction();
```

Description

GetLoginFormAction is the read implementation of the LoginFormAction (see page 5995) property.

See Also

LoginFormAction (see page 5995)

57.2.1.2.5 IWebEndUser.GetLogoutAction Method

Returns the value of the LogoutAction (see page 5996) property.

Pascal

```
function GetLogoutAction: TComponent;
```

C++

```
__fastcall TComponent * GetLogoutAction();
```

Description

GetLogoutAction is the read implementation of the LogoutAction (see page 5996) property.

See Also

LogoutAction (see page 5996)

57.2.1.2.6 IWebEndUser.HasExecuteRights Method

Indicates whether the current user has access rights to execute Web pages or adapters associated with a specified access string.

Pascal

```
function HasExecuteRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasExecuteRights(UnicodeString ARights);
```

Description

Call HasExecuteRights to determine whether the current end user is authorized to execute Web pages or adapters whose ViewRights property is the value specified by ARights.

Typically, the end user adapter that implements this interface implements HasExecuteRights by checking the AccessRightsStrings property of the entry for this end user in a TWebUserList component. Note that in this case, the end user must be logged in before HasExecuteRights can determine the user's access rights.

See Also

LoggedIn (see page 5994)

HasViewRights (see page 5992)

HasModifyRights (see page 5992)

ViewAccess

ViewAccess (see page 5574)

TWebUserList (see page 6796)

AccessRightsStrings (see page 6791)

57.2.1.2.7 IWebEndUser.HasModifyRights Method

Indicates whether the current user has access rights to modify Web pages or adapters associated with a specified access string.

Pascal

```
function HasModifyRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasModifyRights(UnicodeString ARights);
```

Description

Call HasModifyRights to determine whether the current end user is authorized to modify Web pages or adapters whose ViewRights property is the value specified by ARights.

Typically, the end user adapter that implements this interface implements HasModifyRights by checking the AccessRightsStrings property of the entry for this end user in a TWebUserList component. Note that in this case, the end user must be logged in before HasModifyRights can determine the user's access rights.

See Also

LoggedIn (see page 5994)

HasViewRights (see page 5992)

HasExecuteRights (see page 5991)

ViewAccess

ViewAccess (see page 5574)

TWebUserList (see page 6796)

AccessRightsStrings (see page 6791)

57.2.1.2.8 IWebEndUser.HasViewRights Method

Indicates whether the current user has access rights to view Web pages or adapters associated with a specified access string.

Pascal

```
function HasViewRights(ARights: string): Boolean;
```

C++

```
__fastcall Boolean HasViewRights(UnicodeString ARights);
```

Description

Call HasViewRights to determine whether the current end user is authorized to view Web pages or adapters whose ViewRights property is the value specified by ARights.

Typically, the end user adapter that implements this interface implements HasViewRights by checking the AccessRightsStrings property of the entry for this end user in a TWebUserList component. Note that in this case, the end user must be logged in before HasViewRights can determine the user's access rights.

See Also

LoggedIn (see page 5994)

HasExecuteRights (see page 5991)

HasModifyRights (see page 5992)

ViewAccess

ViewAccess (see page 5574)

TWebUserList (see page 6796)

AccessRightsStrings (see page 6791)

57.2.1.2.9 IWebEndUser.LogIn Method

Logs in a specified user.

Pascal

```
procedure LogIn(UserID: Variant);
```

C++

```
__fastcall LogIn(Variant UserID);
```

Description

Call LogIn to record a user as logged in. Typically, LogIn is called in response to a message from the login page that ProduceLoginPage (see page 5993) generates.

UserID is the identifier of the user that logged in. It is the value of the UserID property of the entry for the user in a WebUserList component, or, in applications that implement their own login scheme, any other Variant (see page 3421) that identifies an end user.

See Also

LoggedIn (see page 5994)

ProduceLoginPage (see page 5993)

TWebUserList (see page 6796)

UserID (see page 6791)

TLoginFormAdapter (see page 5824)

57.2.1.2.10 IWebEndUser.ProduceLoginPage Method

Generates the Web page for logging in users.

Pascal

```
function ProduceLoginPage: Boolean;
```

C++

```
__fastcall Boolean ProduceLoginPage();
```

Description

Call ProduceLoginPage to generate a Web page for logging in users.

ProduceLoginPage returns true if it generates a login form page and updates the current response message so that it will be displayed to the user. ProduceLoginPage returns false if the end user adapter is unable to generate a login page.

See Also

LoggedIn (see page 5994)

LogIn (see page 5993)

LoginFormAction (see page 5995)

57.2.1.3 IWebEndUser Properties

The properties of the IWebEndUser class are listed here.

Public Properties

	Name	Description
	DisplayName (see page 5994)	Indicates the name of the end user as it should be used for display in Web pages.
	EndUserAdapter (see page 5994)	Provides access to the end user adapter that implements this interface.
	LoggedIn (see page 5994)	Indicates whether the current user is logged in.
	LoginFormAction (see page 5995)	Indicates the action component for the login form.
	LogoutAction (see page 5996)	Indicates the action component for logging a user out.

57.2.1.3.1 IWebEndUser.DisplayName Property

Indicates the name of the end user as it should be used for display in Web pages.

Pascal

```
property DisplayName: string;
```

C++

```
__property UnicodeString DisplayName;
```

Description

Read (see page 3634) DisplayName to obtain a string that can be added to Web pages to refer to the current user.

See Also

UserName (see page 6791)

57.2.1.3.2 IWebEndUser.EndUserAdapter Property

Provides access to the end user adapter that implements this interface.

Pascal

```
property EndUserAdapter: TComponent;
```

C++

```
__property TComponent * EndUserAdapter;
```

Description

Read (see page 3634) EndUserAdapter to obtain access to the end user adapter. This is the component that implements this interface. Typically, it is a TEndUserAdapter or TEndUserSessionAdapter instance.

See Also

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

57.2.1.3.3 IWebEndUser.LoggedIn Property

Indicates whether the current user is logged in.

Pascal

```
property LoggedIn: Boolean;
```

C++

```
__property Boolean LoggedIn;
```

Description

Read (see page 3634) LoggedIn to determine whether the current user has logged in to the WebSnap application. By logging in, a caller can be identified as one of the users that a TWebUserList component lists.

Once the user has logged in, the HasViewRights (see page 5992), HasExecuteRights (see page 5991), and HasModifyRights (see page 5992) methods can be used to determine whether the user is authorized to view, execute actions, and modify data on restricted Web pages.

To log in a user that is not logged in, call the ProduceLoginPage (see page 5993) method to display a login Web page. That page should allow the user to provide some sort of UserID, which can then be used to log the user in by a call to the LogIn (see page 5993) method.

See Also

LogIn (see page 5993)

ProduceLoginPage (see page 5993)

TWebUserList (see page 6796)

HasExecuteRights (see page 5991)

HasModifyRights (see page 5992)

HasViewRights (see page 5992)

57.2.1.3.4 IWebEndUser.LoginFormAction Property

Indicates the action component for the login form.

Pascal

```
property LoginFormAction: TComponent;
```

C++

```
__property TComponent * LoginFormAction;
```

Description

Read (see page 3634) LoginFormAction to access the login form action component. The login form action component can be called from server-side scripts to display a login form Web page.

Note: To display the login form Web page using the IWebEndUser (see page 5988) interface (rather than from a server-side script), call the ProduceLoginPage (see page 5993) method.

See Also

ProduceLoginPage (see page 5993)

TEndUserAdapterLoginFormAction (see page 5776)

LogoutAction (see page 5996)

57.2.1.3.5 IWebEndUser.LogoutAction Property

Indicates the action component for logging a user out.

Pascal

```
property LogoutAction: TComponent;
```

C++

```
__property TComponent * LogoutAction;
```

Description

Read (see page 3634) LogoutAction to access the logout action component. The logout action component can be called from server-side scripts to perform any necessary tasks when the user logs out.

See Also

LoginFormAction (see page 5995)

TEndUserAdapterLogoutAction (see page 5784)

57.2.2 IWebPageInfo Interface

IWebPageInfo describes a Web page in a WebSnap application.

Class Hierarchy

Pascal

```
IWebPageInfo = interface;
```

C++

```
__interface IWebPageInfo;
```

File

WebCntxt

Description

Use IWebPageInfo to obtain information about a Web page, including its page name, page title, descriptive text, publish status, and access rights. This information is taken from a TWebPageInfo object that is stored with the Web page module factory.

Note: VCL Method declarations that use IWebPageInfo use the _di_IWebPageInfo type instead. This type is a DelphiInterface (see page 3256) wrapper around the IWebPageInfo interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IWebPageInfo >  _di_IWebPageInfo;
```

See Also

TWebPageInfo (see page 6301)

TAbstractWebContext (see page 5960)

57.2.2.1 IWebPageInfo Members

The following tables list the members exposed by IWebPageInfo.

Public Methods

	Name	Description
	GetHasViewAccess (see page 5997)	Returns the value of the HasViewAccess (see page 6000) property.
	GetLoginRequired (see page 5998)	Returns the value of the LoginRequired (see page 6000) property.
	GetPageDescription (see page 5998)	Returns the value of the PageDescription (see page 6000) property.
	GetPageHREF (see page 5998)	Returns the value of the PageHREF (see page 6001) property.
	GetPageIsPublished (see page 5999)	Returns the value of the PageIsPublished (see page 6001) property.
	GetPageName (see page 5999)	Returns the value of the PageName (see page 6002) property.
	GetPageTitle (see page 5999)	Returns the value of the PageTitle (see page 6002) property.

Public Properties

	Name	Description
R	HasViewAccess (see page 6000)	Indicates whether the current user has access rights to view the Web page.
R	LoginRequired (see page 6000)	Indicates whether callers must log in before accessing this Web page.
R	PageDescription (see page 6000)	Describes the Web page.
R	PageHREF (see page 6001)	Identifies the HREF to use for references to the associated Web page.
R	PageIsPublished (see page 6001)	Indicates whether the WebSnap application automatically displays the Web page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 6002).
R	PageName (see page 6002)	Denotes the logical name for the Web page.
R	PageTitle (see page 6002)	Indicates the title that appears on the Web page.

57.2.2.2 IWebPageInfo Methods

The methods of the IWebPageInfo class are listed here.

Public Methods

	Name	Description
	GetHasViewAccess (see page 5997)	Returns the value of the HasViewAccess (see page 6000) property.
	GetLoginRequired (see page 5998)	Returns the value of the LoginRequired (see page 6000) property.
	GetPageDescription (see page 5998)	Returns the value of the PageDescription (see page 6000) property.
	GetPageHREF (see page 5998)	Returns the value of the PageHREF (see page 6001) property.
	GetPageIsPublished (see page 5999)	Returns the value of the PageIsPublished (see page 6001) property.
	GetPageName (see page 5999)	Returns the value of the PageName (see page 6002) property.
	GetPageTitle (see page 5999)	Returns the value of the PageTitle (see page 6002) property.

57.2.2.2.1 IWebPageInfo.GetHasViewAccess Method

Returns the value of the HasViewAccess (see page 6000) property.

Pascal

```
function GetHasViewAccess: Boolean;
```

C++

```
__fastcall Boolean GetHasViewAccess();
```

Description

GetHasViewAccess is the read implementation of the HasViewAccess (see page 6000) property.

See Also

HasViewAccess (see page 6000)

57.2.2.2.2 IWebPageInfo.GetLoginRequired Method

Returns the value of the LoginRequired (see page 6000) property.

Pascal

```
function GetLoginRequired: Boolean;
```

C++

```
__fastcall Boolean GetLoginRequired();
```

Description

GetLoginRequired is the read implementation of the LoginRequired (see page 6000) property.

See Also

LoginRequired (see page 6000)

57.2.2.2.3 IWebPageInfo.GetPageDescription Method

Returns the value of the PageDescription (see page 6000) property.

Pascal

```
function GetPageDescription: string;
```

C++

```
__fastcall UnicodeString GetPageDescription();
```

Description

GetPageDescription is the read implementation of the PageDescription (see page 6000) property.

See Also

PageDescription (see page 6000)

57.2.2.2.4 IWebPageInfo.GetPageHREF Method

Returns the value of the PageHREF (see page 6001) property.

Pascal

```
function GetPageHREF: string;
```

C++

```
__fastcall UnicodeString GetPageHREF();
```

Description

GetPageHREF is the read implementation of the PageHREF (see page 6001) property.

See Also

PageHREF (see page 6001)

57.2.2.2.5 IWebPageInfo.GetPageIsPublished Method

Returns the value of the PageIsPublished (see page 6001) property.

Pascal

```
function GetPageIsPublished: Boolean;
```

C++

```
__fastcall Boolean GetPageIsPublished();
```

Description

GetPageIsPublished is the read implementation of the PageIsPublished (see page 6001) property.

See Also

PageIsPublished (see page 6001)

57.2.2.2.6 IWebPageInfo.GetPageName Method

Returns the value of the PageName (see page 6002) property.

Pascal

```
function GetPageName: string;
```

C++

```
__fastcall UnicodeString GetPageName();
```

Description

GetPageName is the read implementation of the PageName (see page 6002) property.

See Also

PageName (see page 6002)

57.2.2.2.7 IWebPageInfo.GetPageTitle Method

Returns the value of the PageTitle (see page 6002) property.

Pascal

```
function GetPageTitle: string;
```

C++

```
__fastcall UnicodeString GetPageTitle();
```

Description

GetPageTitle is the read implementation of the PageTitle (see page 6002) property.

See Also

PageTitle (see page 6002)

57.2.2.3 IWebPageInfo Properties

The properties of the IWebPageInfo class are listed here.

Public Properties

	Name	Description
	HasViewAccess (see page 6000)	Indicates whether the current user has access rights to view the Web page.
	LoginRequired (see page 6000)	Indicates whether callers must log in before accessing this Web page.
	PageDescription (see page 6000)	Describes the Web page.
	PageHREF (see page 6001)	Identifies the HREF to use for references to the associated Web page.
	PageIsPublished (see page 6001)	Indicates whether the WebSnap application automatically displays the Web page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 6002).
	PageName (see page 6002)	Denotes the logical name for the Web page.
	PageTitle (see page 6002)	Indicates the title that appears on the Web page.

57.2.2.3.1 IWebPageInfo.HasViewAccess Property

Indicates whether the current user has access rights to view the Web page.

Pascal

```
property HasViewAccess: Boolean;
```

C++

```
__property Boolean HasViewAccess;
```

Description

HasViewAccess is true if the current end user has view rights for the associated Web page, false otherwise.

See Also

HasViewRights (see page 5992)

57.2.2.3.2 IWebPageInfo.LoginRequired Property

Indicates whether callers must log in before accessing this Web page.

Pascal

```
property LoginRequired: Boolean;
```

C++

```
__property Boolean LoginRequired;
```

Description

Read (see page 3634) LoginRequired to determine whether users must log in before they can access this Web page. The application can overrule the LoginRequired property by supplying an OnIsLoginRequired event handler to the page dispatcher.

See Also

OnIsLoginRequired (see page 6199)

TPageDispatcher (see page 6236)

57.2.2.3.3 IWebPageInfo.PageDescription Property

Describes the Web page.

Pascal

```
property PageDescription: string;
```

C++

```
__property UnicodeString PageDescription;
```

Description

Read (see page 3634) PageDescription to obtain a brief description of the Web page.

See Also

PageName (see page 6002)

PageTitle (see page 6002)

57.2.2.3.4 IWebPageInfo.PageHREF Property

Identifies the HREF to use for references to the associated Web page.

Pascal

```
property PageHREF: string;
```

C++

```
__property UnicodeString PageHREF;
```

Description

Read (see page 3634) PageHREF to obtain the HTTP path string that should be inserted in HTML code to create a hypertext link to the associated Web page.

See Also

PageName (see page 6002)

57.2.2.3.5 IWebPageInfo.PageIsPublished Property

Indicates whether the WebSnap application automatically displays the Web page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 6002).

Pascal

```
property PageIsPublished: Boolean;
```

C++

```
__property Boolean PageIsPublished;
```

Description

Read (see page 3634) PageIsPublished to determine whether the page dispatcher (TPageDispatcher) automatically calls on the associated Web page module when it receives HTTP request messages that address this Web page by name. HTTP request messages address a Web page when the pathinfo portion of their target URL matches the value of the PageName (see page 6002) property.

When IsPublished is false, the WebSnap application must explicitly retrieve the content for the Web page and add it to a response message.

See Also

PageName (see page 6002)

TPageDispatcher (see page 6236)

57.2.2.3.6 IWebPageInfo.PageName Property

Denotes the logical name for the Web page.

Pascal

```
property PageName: string;
```

C++

```
__property UnicodeString PageName;
```

Description

Read (see page 3634) PageName to determine the name of the Web page. This name is used to identify the page in server-side scripts, and as the pathinfo portion of the URL for the page when the PageIsPublished (see page 6001) property is true.

See Also

PageTitle (see page 6002)

PageHREF (see page 6001)

PageIsPublished (see page 6001)

57.2.2.3.7 IWebPageInfo.PageTitle Property

Indicates the title that appears on the Web page.

Pascal

```
property PageTitle: string;
```

C++

```
__property UnicodeString PageTitle;
```

Description

Read (see page 3634) PageTitle to determine the title that appears on the Web page when viewed from a user's browser.

See Also

PageName (see page 6002)

57.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	WebContext (see page 6003)	Returns the current Web context

57.3.1 WebCntxt.WebContext Function

Returns the current Web context

Pascal

```
function WebContext: TAbstractWebContext;
```

C++

```
TAbstractWebContext WebContext();
```

File

WebCntxt

Description

Use the WebContext function to obtain a reference to the global Web context. This object stores information about the components that are available in the Web application as well as about the current request that is being processed.

57.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TFindPageOption (see page 6004)	TFindPageOptions (see page 6005) indicates the attributes that must be present on a Web page module that is the target of a search.

57.4.1 WebCntxt.TFindPageOption Enumeration

TFindPageOptions (see page 6005) indicates the attributes that must be present on a Web page module that is the target of a search.

Pascal

```
TFindPageOption = (
  fpPublished,
  fpLoginRequired
);
```

C++

```
enum TFindPageOption {
  fpPublished,
  fpLoginRequired
};
```

File

WebCntxt

Description

When searching for Web modules using a given Web context, TFindPageOption values represent attributes of a Web module that must be present before a given Web module is considered. When a TFindPageOption is included in the set of options, only those Web modules that have the corresponding attribute are considered. Note that if an option is not included, Web modules that have the corresponding attribute are still considered in the search operation.

Option	Meaning
fpPublished	Only published Web page modules are considered.
fpLoginRequired	Only Web page modules that require the user to log in before they can be accessed are considered.

Note: These options are added to a Web page module using properties of the Web page information object with which the module is registered. The Web page information object is supplied as a parameter to the corresponding factory object's constructor in code that the Web page module wizard generates.

See Also

TAbstractWebContext (see page 5960)

TWebPageInfo (see page 6301)

57.5 Types

The following table lists types in this documentation.

Types

Name	Description
TFindPageOptions (see page 6005)	This is type WebCntxt.TFindPageOptions.
TGetWebContextProc (see page 6005)	This is type WebCntxt.TGetWebContextProc.
TGetWebEndUserProc (see page 6006)	This is type WebCntxt.TGetWebEndUserProc.
TSetWebContextProc (see page 6006)	This is type WebCntxt.TSetWebContextProc.

57.5.1 WebCntxt.TFindPageOptions Type

Pascal

```
TFindPageOptions = set of TFindPageOption;
```

C++

```
TFindPageOption TFindPageOptions;
```

File

WebCntxt

Description

This is type WebCntxt.TFindPageOptions.

57.5.2 WebCntxt.TGetWebContextProc Type

Pascal

```
TGetWebContextProc = function : TAbstractWebContext;
```

C++

```
: TAbstractWebContext ( TGetWebContextProc)();
```

File

WebCntxt

Description

This is type WebCntxt.TGetWebContextProc.

57.5.3 WebCntxt.TGetWebEndUserProc Type

Pascal

```
TGetWebEndUserProc = function : IWebEndUser;
```

C++

```
: IWebEndUser ( TGetWebEndUserProc)();
```

File

WebCntxt

Description

This is type WebCntxt.TGetWebEndUserProc.

57.5.4 WebCntxt.TSetWebContextProc Type

Pascal

```
TSetWebContextProc = procedure (AWebContext: TAbstractWebContext);
```

C++

```
(AWebContext: TAbstractWebContext) ( TSetWebContextProc)();
```

File

WebCntxt

Description

This is type WebCntxt.TSetWebContextProc.

57.6 Variables

The following table lists variables in this documentation.

Variables

Name	Description
GetModuleFileNameProc (see page 6007)	This is variable WebCntxt.GetModuleFileNameProc.
GetWebContextProc (see page 6007)	This is variable WebCntxt.GetWebContextProc.
GetWebEndUserProc (see page 6008)	This is variable WebCntxt.GetWebEndUserProc.
SetWebContextProc (see page 6008)	This is variable WebCntxt.SetWebContextProc.

57.6.1 WebCntxt.GetModuleFileNameProc Variable

Pascal

```
GetModuleFileNameProc: function: string = nil;
```

C++

```
function: string GetModuleFileNameProc = nil;
```

File

WebCntxt

Description

This is variable WebCntxt.GetModuleFileNameProc.

57.6.2 WebCntxt.GetWebContextProc Variable

Pascal

```
GetWebContextProc: TGetWebContextProc;
```

C++

```
TGetWebContextProc GetWebContextProc;
```

File

WebCntxt

Description

This is variable WebCntxt.GetWebContextProc.

57.6.3 WebCntxt.GetWebEndUserProc Variable

Pascal

```
GetWebEndUserProc: TGetWebEndUserProc;
```

C++

```
TGetWebEndUserProc GetWebEndUserProc;
```

File

WebCntxt

Description

This is variable WebCntxt.GetWebEndUserProc.

57.6.4 WebCntxt.SetWebContextProc Variable

Pascal

```
SetWebContextProc: TSetWebContextProc;
```

C++

```
TSetWebContextProc SetWebContextProc;
```

File

WebCntxt

Description

This is variable WebCntxt.SetWebContextProc.

58 WebComp Namespace

This is namespace WebComp.

Topics

Name	Description
Classes (see page 6011)	The following table lists classes in this documentation.
Interfaces (see page 6079)	The following table lists interfaces in this documentation.
Functions (see page 6106)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 6109)	The following table lists structs, records, enums in this documentation.
Types (see page 6111)	The following table lists types in this documentation.
Constants (see page 6114)	The following table lists constants in this documentation.

Classes

	Name	Description
	TLayoutAttributes (see page 6011)	TLayoutAttributes describes how an HTML control should be laid out.
	TLayoutWebContent (see page 6014)	TLayoutWebContent lets child Web items adhere to layout rules imposed by their parent.
	TWebComponentClassDescription (see page 6023)	This is class WebComp.TWebComponentClassDescription.
	TWebComponentList (see page 6025)	TWebComponentList maintains a list of Web item components.
	TWebComponentsEditorHelper (see page 6035)	This is class WebComp.TWebComponentsEditorHelper.
	TWebContainedComponent (see page 6038)	TWebContainedComponent is the base class for Web items that generate HTML on behalf of another component.
	TWebContainedComponentHelper (see page 6045)	TWebContainedComponentHelper implements the common behavior of components that generate HTML on behalf of another component.
	TWebContainedContainerComponent (see page 6052)	TWebContainedContainerComponent is the base class for Web items that generate HTML on behalf of another component and also use Web items to generate HTML.
	TWebContainerComponent (see page 6063)	TWebContainerComponent is the base class for components that use Web items to generate HTML.
	TWebContainerComponentHelper (see page 6068)	TWebContainerComponentHelper implements the common behavior of components that maintain a list of Web items to generate HTML.
	TWebContentOptions (see page 6076)	TWebContentOptions controls what a Web item can include in its generated HTML.

Constants

Name	Description
EnumRegisteredWebComponentsProc (see page 6114)	This is constant WebComp.EnumRegisteredWebComponentsProc.
FindWebComponentEditorHelperProc (see page 6114)	This is constant WebComp.FindWebComponentEditorHelperProc.

RegisterWebComponentsProc (see page 6115)	This is constant WebComp.RegisterWebComponentsProc.
UnRegisterWebComponentsProc (see page 6115)	This is constant WebComp.UnRegisterWebComponentsProc.

Functions

	Name	Description
	DesigningComponent (see page 6106)	This is function WebComp.DesigningComponent.
	EnumRegisteredWebComponents (see page 6106)	This is function WebComp.EnumRegisteredWebComponents.
	FindWebComponentEditorHelper (see page 6107)	This is function WebComp.FindWebComponentEditorHelper.
	QualifyFileName (see page 6107)	This is function WebComp.QualifyFileName.
	RegisterWebComponents (see page 6107)	This is function WebComp.RegisterWebComponents.
	UnRegisterWebComponents (see page 6108)	This is function WebComp.UnRegisterWebComponents.
	ValidateWebParent (see page 6108)	This is function WebComp.ValidateWebParent.

Interfaces

	Name	Description
	IAddFieldsEditor (see page 6079)	This is class WebComp.IAddFieldsEditor.
	IGetWebComponentList (see page 6081)	This is class WebComp.IGetWebComponentList.
	IGetWebComponentNodeName (see page 6082)	This is class WebComp.IGetWebComponentNodeName.
	IGetXMLStream (see page 6083)	This is class WebComp.IGetXMLStream.
	ILayoutWebContent (see page 6084)	ILayoutWebContent lets child Web items adhere to layout rules imposed by their parent.
	INotifyActivateModule (see page 6087)	This is class WebComp.INotifyActivateModule.
	INotifyWebActivate (see page 6088)	This is class WebComp.INotifyWebActivate.
	IProducerEditorViewSupport (see page 6089)	This is class WebComp.IProducerEditorViewSupport.
	ISetWebContentOptions (see page 6091)	This is class WebComp.ISetWebContentOptions.
	ITopLevelWebComponent (see page 6092)	This is class WebComp.ITopLevelWebComponent.
	IWebComponent (see page 6093)	IWebComponent is the interface supported by components that TWebComponentList (see page 6025) manages.
	IWebComponentCommands (see page 6097)	This is class WebComp.IWebComponentCommands.
	IWebComponentContainer (see page 6098)	This is class WebComp.IWebComponentContainer.
	IWebComponentEditor (see page 6100)	IWebComponentEditor enables a Web item to be assigned children in the IDE.
	IWebComponentEditorHelper (see page 6102)	This is class WebComp.IWebComponentEditorHelper.
	IWebContent (see page 6103)	IWebContent is an interface that allows components page producers and Web items to access the HTML generated by other components.
	IWebVariablesContainerName (see page 6104)	This is class WebComp.IWebVariablesContainerName.

Structs, Records, Enums

	Name	Description
	TLabelPosition (see page 6109)	This is record WebComp.TLabelPosition.
	TWebContentFlag (see page 6109)	TWebContentFlags (see page 6113) indicates the type of HTML a Web item can produce.

Types

Name	Description
TEnumWebComponentsProc (see page 6111)	This is type WebComp.TEnumWebComponentsProc.
TGetComponentListEvent (see page 6111)	TGetComponentListEvent is the type for event handlers that supply a list of child Web items.
TLayout (see page 6112)	TLayout is the type for helper objects that generate layout code for a Web item.
TSetComponentListEvent (see page 6112)	This is type WebComp.TSetComponentListEvent.
TWebComponentContainer (see page 6113)	TWebComponentContainer is the type for components that maintain a list of Web items.
TWebContentFlags (see page 6113)	This is type WebComp.TWebContentFlags.

58.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TLayoutAttributes (see page 6011)	TLayoutAttributes describes how an HTML control should be laid out.
	TLayoutWebContent (see page 6014)	TLayoutWebContent lets child Web items adhere to layout rules imposed by their parent.
	TWebComponentClassDescription (see page 6023)	This is class WebComp.TWebComponentClassDescription.
	TWebComponentList (see page 6025)	TWebComponentList maintains a list of Web item components.
	TWebComponentsEditorHelper (see page 6035)	This is class WebComp.TWebComponentsEditorHelper.
	TWebContainedComponent (see page 6038)	TWebContainedComponent is the base class for Web items that generate HTML on behalf of another component.
	TWebContainedComponentHelper (see page 6045)	TWebContainedComponentHelper implements the common behavior of components that generate HTML on behalf of another component.
	TWebContainedContainerComponent (see page 6052)	TWebContainedContainerComponent is the base class for Web items that generate HTML on behalf of another component and also use Web items to generate HTML.
	TWebContainerComponent (see page 6063)	TWebContainerComponent is the base class for components that use Web items to generate HTML.
	TWebContainerComponentHelper (see page 6068)	TWebContainerComponentHelper implements the common behavior of components that maintain a list of Web items to generate HTML.
	TWebContentOptions (see page 6076)	TWebContentOptions controls what a Web item can include in its generated HTML.

58.1.1 TLayoutAttributes Class

TLayoutAttributes describes how an HTML control should be laid out.

Class Hierarchy

Pascal

```
TLayoutAttributes = class(TObject);
```

C++

```
class TLayoutAttributes : public TObject;
```

File

WebComp

Description

TLayoutAttributes embodies a set of flags that describe how an HTML control should be laid out. These flags form the value of several public fields of the object, including

LabelAttributes (see page 6013): a string that describes style attributes that apply to the control's label (if any).

LabelPosition (see page 6014): an enumerated value describing the the position of the label (if any) relative to the control. Possible values are lposLeft (to the left of the control), lposRight (to the right of the control), lposAbove (above the control) and lposBelow (below the control).

ControlAttributes (see page 6013): a string that describes style attributes that apply to the control.

See Also

IWebContent (see page 6103)

58.1.1.1 TLayoutAttributes Members

The following tables list the members exposed by TLayoutAttributes.

Public Fields

	Name	Description
	ControlAttributes (see page 6013)	This is ControlAttributes, a member of class TLayoutAttributes.
	LabelAttributes (see page 6013)	This is LabelAttributes, a member of class TLayoutAttributes.
	LabelPosition (see page 6014)	This is LabelPosition, a member of class TLayoutAttributes.

Public Methods

	Name	Description
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6013)	Creates a new TLayoutAttributes (see page 6011) object.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

58.1.1.2 TLayoutAttributes.Create Constructor

Creates a new TLayoutAttributes (see page 6011) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TLayoutAttributes();
```

Description

Typically, applications do not instantiate TLayoutAttributes (see page 6011). Instead, each Web item that generates HTML for an InternetExpress application instantiates an internal TLayoutAttributes (see page 6011) object and uses it to encode property values that affect the layout of its generated HTML.

58.1.1.3 TLayoutAttributes Fields

The fields of the TLayoutAttributes class are listed here.

Public Fields

	Name	Description
	ControlAttributes (see page 6013)	This is ControlAttributes, a member of class TLayoutAttributes.
	LabelAttributes (see page 6013)	This is LabelAttributes, a member of class TLayoutAttributes.
	LabelPosition (see page 6014)	This is LabelPosition, a member of class TLayoutAttributes.

58.1.1.3.1 TLayoutAttributes.ControlAttributes Field

Pascal

```
ControlAttributes: string;
```

C++

```
UnicodeString ControlAttributes;
```

Description

This is ControlAttributes, a member of class TLayoutAttributes.

58.1.1.3.2 TLayoutAttributes.LabelAttributes Field

Pascal

```
LabelAttributes: string;
```

C++

```
UnicodeString LabelAttributes;
```

Description

This is LabelAttributes, a member of class TLayoutAttributes.

58.1.1.3.3 TLayoutAttributes.LabelPosition Field

Pascal

```
LabelPosition: TLabelPosition;
```

C++

```
TLabelPosition LabelPosition;
```

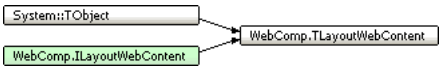
Description

This is LabelPosition, a member of class TLayoutAttributes.

58.1.2 TLayoutWebContent Class

TLayoutWebContent lets child Web items adhere to layout rules imposed by their parent.

Class Hierarchy



Pascal

```
TLayoutWebContent = class(TObject, ILayoutWebContent);
```

C++

```
class TLayoutWebContent : public TObject, public ILayoutWebContent;
```

File

WebComp

Description

TLayoutWebContent is the base class for objects that implement the ILayoutWebContent (see page 6084) interface. Parent components pass a TLayoutWebContent descendant to child Web items as the ParentLayout (see page 6022) parameter of their Content method. This object provides helper functions that the child items use to fit their generated content into the parent object's HTML structure (typically a <TABLE> tag). For example, the TLayoutWebContent methods may add <TD> tags around generated HTML that fills the cells of a parent's HTML table.

Do not create instances of TLayoutWebContent. This implementation of the ILayoutWebContent (see page 6084) methods consists of abstract or, in C++ terminology, pure virtual methods. Instead, use a TLayoutWebContent descendant such as TFormLayout or TAdapterFormLayout, which supplies an implementation for those methods.

See Also

TLayout (see page 6112)

IWebContent (see page 6103)

ILayoutWebContent (see page 6084)

TFormLayout

TAdapterFormLayout (see page 6408)

58.1.2.1 TLayoutWebContent Members

The following tables list the members exposed by TLayoutWebContent.

Protected Methods

	Name	Description
	_AddRef (see page 6017)	Responds when the caller acquires a reference to this object's interface.
	_Release (see page 6017)	Responds when the caller releases a reference to this object's interface.
A	ImplLayoutButton (see page 6017)	Provides the underlying implementation for the LayoutButton (see page 6020) method.
A	ImplLayoutField (see page 6018)	Provides the underlying implementation for the LayoutField (see page 6020) method.
A	ImplLayoutLabelAndField (see page 6018)	Provides the underlying implementation for the LayoutLabelAndField (see page 6020) method.
A	ImplLayoutTable (see page 6019)	Provides the underlying implementation for the LayoutTable (see page 6021) method.
	LayoutButton (see page 6020)	Converts the HTML declaring a button into a form the associated Web item can use.
	LayoutField (see page 6020)	Converts the HTML declaring a field into a form the associated Web item can use.
	LayoutLabelAndField (see page 6020)	Converts the HTML declaring a labeled field into a form the associated Web item can use.
	LayoutTable (see page 6021)	Converts the HTML declaring a table into a form the associated Web item can use.
V	QueryInterface (see page 6021)	Returns a reference to a specified interface if the object supports that interface.

Public Methods

	Name	Description
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6016)	Creates a new TLayoutWebContent (see page 6014) object.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.

	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	ParentLayout (see page 6022)	Provides access to the layout object of the Web item that is the parent of the Web item to which this object belongs.

58.1.2.2 TLayoutWebContent.Create Constructor

Creates a new TLayoutWebContent (see page 6014) object.

Pascal

```
constructor Create(AParentLayout: TLayout);
```

C++

```
__fastcall TLayoutWebContent(TLayout AParentLayout);
```

Description

Call Create to instantiate a TLayoutWebContent (see page 6014) descendant to use when fetching the content produced by child Web items.

AParentLayout is the layout object of the parent Web item (the grandparent of the child Web items that call this object's methods). AParentLayout becomes the value of the ParentLayout (see page 6022) property.

See Also

ParentLayout (see page 6022)

58.1.2.3 TLayoutWebContent Methods

The methods of the TLayoutWebContent class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 6017)	Responds when the caller acquires a reference to this object's interface.
	_Release (see page 6017)	Responds when the caller releases a reference to this object's interface.
A	ImplLayoutButton (see page 6017)	Provides the underlying implementation for the LayoutButton (see page 6020) method.
A	ImplLayoutField (see page 6018)	Provides the underlying implementation for the LayoutField (see page 6020) method.
A	ImplLayoutLabelAndField (see page 6018)	Provides the underlying implementation for the LayoutLabelAndField (see page 6020) method.
A	ImplLayoutTable (see page 6019)	Provides the underlying implementation for the LayoutTable (see page 6021) method.
	LayoutButton (see page 6020)	Converts the HTML declaring a button into a form the associated Web item can use.
	LayoutField (see page 6020)	Converts the HTML declaring a field into a form the associated Web item can use.
	LayoutLabelAndField (see page 6020)	Converts the HTML declaring a labeled field into a form the associated Web item can use.
	LayoutTable (see page 6021)	Converts the HTML declaring a table into a form the associated Web item can use.

	QueryInterface (see page 6021)	Returns a reference to a specified interface if the object supports that interface.

58.1.2.3.1 TLayoutWebContent._AddRef Method

Responds when the caller acquires a reference to this object's interface.

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

In Delphi, when an application uses an interface that is implemented by TLayoutWebContent (see page 6014) or one of its descendants, it automatically calls __AddRef. Typically, interfaced objects use the __AddRef method to increment a reference count, which is then decremented when the application releases the interface. In this typical scenario, when the reference count drops to zero, the object frees itself.

TLayoutWebContent (see page 6014) implements its own version of the interface methods __AddRef and _Release (see page 6017) that avoid this typical behavior. This prevents the object from being freed when its reference count drops to zero. In TLayoutWebContent (see page 6014), __AddRef always returns –1.

See Also

_Release (see page 6017)

_AddRef (see page 3503)

58.1.2.3.2 TLayoutWebContent._Release Method

Responds when the caller releases a reference to this object's interface.

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

In Delphi, when an application releases an interface that is implemented by TLayoutWebContent (see page 6014) or one of its descendants, it automatically calls __Release. Typically, interfaced objects use the __Release method to decrement a reference count. When the reference count drops to zero, the object is automatically freed.

TLayoutWebContent (see page 6014) implements its own version of the interface methods _AddRef (see page 6017) and __Release that avoid this typical behavior. This prevents the object from being freed when its reference count drops to zero. In TLayoutWebContent (see page 6014), __Release always returns –1.

See Also

_AddRef (see page 6017)

_Release (see page 3503)

58.1.2.3.3 TLayoutWebContent.ImplLayoutButton Method

Provides the underlying implementation for the LayoutButton (see page 6020) method.

Pascal

```
function ImplLayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutButton(const UnicodeString HTMLButton,
TLayoutAttributes Attributes) = 0;
```

Description

The LayoutButton (see page 6020) method calls ImplLayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form that the associated Web item requires.

HTMLButton is the HTML that declares a button. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton (see page 6020) returns the HTML for the button in a form that the associated Web item can use.

In TLayoutWebContent (see page 6014), ImplLayoutButton is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutButton (see page 6020) method.

See Also

LayoutButton (see page 6020)

58.1.2.3.4 TLayoutWebContent.ImplLayoutField Method

Provides the underlying implementation for the LayoutField (see page 6020) method.

Pascal

```
function ImplLayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutField(const UnicodeString HTMLField,
TLayoutAttributes Attributes) = 0;
```

Description

The LayoutField (see page 6020) method calls ImplLayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form that the associated Web item requires.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField (see page 6020) returns the HTML for the field in a form that the associated Web item can use.

In TLayoutWebContent (see page 6014), ImplLayoutField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutField (see page 6020) method.

See Also

LayoutField (see page 6020)

58.1.2.3.5 TLayoutWebContent.ImplLayoutLabelAndField Method

Provides the underlying implementation for the LayoutLabelAndField (see page 6020) method.

Pascal

```
function ImplLayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutLabelAndField(const UnicodeString HTMLLabel, const
UnicodeString HTMLField, TLayoutAttributes Attributes) = 0;
```

Description

The LayoutLabelAndField (see page 6020) method calls ImplLayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form that the associated Web item requires.

HTMLLabel is the HTML that declares the label. This is produced by the child Web item.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField (see page 6020) returns the HTML for the field and label in a form that the associated Web item can use.

In TLayoutWebContent (see page 6014), ImplLayoutLabelAndField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutLabelAndField (see page 6020) method.

See Also

LayoutLabelAndField (see page 6020)

58.1.2.3.6 TLayoutWebContent.ImplLayoutTable Method

Provides the underlying implementation for the LayoutTable (see page 6021) method.

Pascal

```
function ImplLayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutTable(const UnicodeString HTMLTable,
TLayoutAttributes Attributes) = 0;
```

Description

The LayoutTable (see page 6021) method calls ImplLayoutTable to convert the HTML that declares a table (typically a structure used to layout the content produced by the child Web item's children) into the form that the associated Web item requires.

HTMLTable is the HTML that declares the table. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the table.

LayoutTable (see page 6021) returns the HTML for the table in a form that the associated Web item can use.

In TLayoutWebContent (see page 6014), ImplLayoutTable is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutTable (see page 6021) method.

See Also

LayoutTable (see page 6021)

58.1.2.3.7 TLayoutWebContent.LayoutButton Method

Converts the HTML declaring a button into a form the associated Web item can use.

Pascal

```
function LayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall UnicodeString LayoutButton(const UnicodeString HTMLButton, TLayoutAttributes
Attributes);
```

Description

Call LayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form that the associated Web item requires.

HTMLButton is the HTML that declares a button. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton returns the HTML for the button in a form that the associated Web item can use.

LayoutButton delegates the task of converting the HTML for the button to the ImplLayoutButton (see page 6017) method.

See Also

ImplLayoutButton (see page 6017)

58.1.2.3.8 TLayoutWebContent.LayoutField Method

Converts the HTML declaring a field into a form the associated Web item can use.

Pascal

```
function LayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall UnicodeString LayoutField(const UnicodeString HTMLField, TLayoutAttributes
Attributes);
```

Description

Call LayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form that the associated Web item requires.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField returns the HTML for the field in a form that the associated Web item can use.

LayoutField delegates the task of converting the HTML for the field to the ImplLayoutField (see page 6018) method.

See Also

ImplLayoutField (see page 6018)

58.1.2.3.9 TLayoutWebContent.LayoutLabelAndField Method

Converts the HTML declaring a labeled field into a form the associated Web item can use.

Pascal

```
function LayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string;
```

C++

```
__fastcall UnicodeString LayoutLabelAndField(const UnicodeString HTMLLabel, const
UnicodeString HTMLField, TLayoutAttributes Attributes);
```

Description

Call LayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form that the associated Web item requires.

HTMLLabel is the HTML that declares the label. This is produced by the child Web item.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField returns the HTML for the field and label in a form that the associated Web item can use.

LayoutLabelAndField delegates the task of converting the HTML for the label and field to the ImplLayoutLabelAndField (see page 6018) method.

See Also

ImplLayoutLabelAndField (see page 6018)

58.1.2.3.10 TLayoutWebContent.LayoutTable Method

Converts the HTML declaring a table into a form the associated Web item can use.

Pascal

```
function LayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall UnicodeString LayoutTable(const UnicodeString HTMLTable, TLayoutAttributes
Attributes);
```

Description

Call LayoutTable to convert the HTML that declares a table (typically a structure used to layout the content produced by the child Web item's children) into the form that the associated Web item requires.

HTMLTable is the HTML that declares the table. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the table.

LayoutTable returns the HTML for the table in a form that the associated Web item can use.

LayoutTable delegates the task of converting the HTML for the table to the ImplLayoutTable (see page 6019) method.

See Also

ImplLayoutTable (see page 6019)

58.1.2.3.11 TLayoutWebContent.QueryInterface Method

Returns a reference to a specified interface if the object supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the TLayoutWebContent (see page 6014) object supports the interface specified by IID. If so, QueryInterface sets the Obj parameter so that it points to an instance of the specified interface and returns 0 to indicate success.

If the layout object does not support the interface, QueryInterface returns a nonzero error code such as E_NoInterface.

IID is the desired interface.

Obj returns a reference to the interface if the TLayoutWebContent (see page 6014) object supports it.

See Also

_AddRef (see page 6017)

_Release (see page 6017)

58.1.2.4 TLayoutWebContent Properties

The properties of the TLayoutWebContent class are listed here.

Public Properties

	Name	Description
	ParentLayout (see page 6022)	Provides access to the layout object of the Web item that is the parent of the Web item to which this object belongs.

58.1.2.4.1 TLayoutWebContent.ParentLayout Property

Provides access to the layout object of the Web item that is the parent of the Web item to which this object belongs.

Pascal

```
property ParentLayout: TLayout;
```

C++

```
__property TLayout ParentLayout;
```

Description

Web items form a hierarchy, where each child Web item generates its content on behalf of a parent object. This TLayoutWebContent (see page 6014) object is associated with a Web item, and supplies methods to help lay out the content of its child Web items. The associated Web item, in turn, may be the child Web item of another Web item. ParentLayout is the layout object of the associated Web item's parent item.

The TLayoutWebContent (see page 6014) object uses ParentLayout in the implementation of its methods so that they reflect the needs of the parent item as well as the needs of the associated Web item.

ParentLayout supports the ILayoutWebContent (see page 6084) interface. Typically, it is another TLayoutWebContent (see page 6014) descendant.

Create (see page 6016)

ILayoutWebContent (see page 6084)

58.1.3 TWebComponentClassDescription Class

Class Hierarchy

Pascal

```
TWebComponentClassDescription = class(TObject);
```

C++

```
class TWebComponentClassDescription : public TObject;
```

File

WebComp

Description

This is class WebComp.TWebComponentClassDescription.

58.1.3.1 TWebComponentClassDescription Members

The following tables list the members exposed by TWebComponentClassDescription.

Public Fields

	Name	Description
	ComponentClass (see page 6024)	This is ComponentClass, a member of class TWebComponentClassDescription.
	ComponentClassName (see page 6024)	This is ComponentClassName, a member of class TWebComponentClassDescription.
	Editor (see page 6025)	This is Editor, a member of class TWebComponentClassDescription.
	FrameClass (see page 6025)	This is FrameClass, a member of class TWebComponentClassDescription.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.

	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

58.1.3.2 TWebComponentClassDescription Fields

The fields of the TWebComponentClassDescription class are listed here.

Public Fields

	Name	Description
	ComponentClass (see page 6024)	This is ComponentClass, a member of class TWebComponentClassDescription.
	ComponentClassName (see page 6024)	This is ComponentClassName, a member of class TWebComponentClassDescription.
	Editor (see page 6025)	This is Editor, a member of class TWebComponentClassDescription.
	FrameClass (see page 6025)	This is FrameClass, a member of class TWebComponentClassDescription.

58.1.3.2.1 TWebComponentClassDescription.ComponentClass Field

Pascal

```
ComponentClass: TComponentClass;
```

C++

```
TComponentClass ComponentClass;
```

Description

This is ComponentClass, a member of class TWebComponentClassDescription.

58.1.3.2.2 TWebComponentClassDescription.ComponentClassName Field

Pascal

```
ComponentClassName: string;
```

C++

```
UnicodeString ComponentClassName;
```

Description

This is ComponentClassName, a member of class TWebComponentClassDescription.

58.1.3.2.3 TWebComponentClassDescription.Editor Field

Pascal

```
Editor: TObject;
```

C++

```
TObject * Editor;
```

Description

This is Editor, a member of class TWebComponentClassDescription.

58.1.3.2.4 TWebComponentClassDescription.FrameClass Field

Pascal

```
FrameClass: Boolean;
```

C++

```
Boolean FrameClass;
```

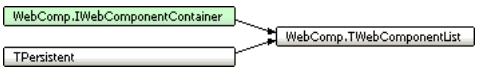
Description

This is FrameClass, a member of class TWebComponentClassDescription.

58.1.4 TWebComponentList Class

TWebComponentList maintains a list of Web item components.

Class Hierarchy



Pascal

```
TWebComponentList = class(TPersistent, IWebComponentContainer);
```

C++

```
class TWebComponentList : public TPersistent, public IWebComponentContainer;
```

File

WebComp

Description

TWebComponentList provides the structure for the hierarchy of Web items that generate HTML documents in a WebSnap or InternetExpress application. At the top of the hierarchy is a page producer (TINetXPageProducer or TAdapterPageProducer) or an adapter. The page producer assembles an HTML document, or the adapter provides information and performs tasks on behalf of an adapter page producer or server-side script. To perform their tasks, the root objects use a set of helper components. Each of these components, in turn, uses one or more helper components, and so on. Each component that uses helper components maintains a list of its helper components. That list is a TWebComponentList object.

Each component in the list must support the IWebComponent (see page 6093) interface. TWebComponentList uses this interface to coordinate the objects it manages. In addition, children of a page producer should support the IWebContent (see page 6103) interface. IWebContent (see page 6103) allows the parent component to extract HTML generated by its children.

Use the properties and methods of TWebComponentList to

Add (see page 6029) or delete the components in the list.

Locate and access components in the list.

Rearrange components in the list.

Access the parent component that uses the list.

IWebContent (see page 6103)

TBasePageItemsProducer

TWebControlGroup

TWebForm

TInetXPageProducer

IWebComponent (see page 6093)

TAdapterPageProducer (see page 1136)

58.1.4.1 TWebComponentList Members

The following tables list the members exposed by TWebComponentList.

Protected Methods

	Name	Description
	_AddRef (see page 6028)	This is _AddRef, a member of class TWebComponentList.
	_Release (see page 6028)	This is _Release, a member of class TWebComponentList.
	Changed (see page 6029)	This is Changed, a member of class TWebComponentList.
	GetComponent (see page 6030)	This is GetComponent, a member of class TWebComponentList.
	GetCount (see page 6030)	This is GetCount, a member of class TWebComponentList.
V	GetOwner (see page 6030)	Returns the owner of an object.
V	NewComponent (see page 6031)	This is NewComponent, a member of class TWebComponentList.
V	QueryInterface (see page 6032)	This is QueryInterface, a member of class TWebComponentList.
	WebComponentContainer_GetComponent (see page 6033)	This is WebComponentContainer_GetComponent, a member of class TWebComponentList.
	WebComponentContainer_GetComponentCount (see page 6033)	This is WebComponentContainer_GetComponentCount, a member of class TWebComponentList.

Public Events

	Name	Description
	OnChange (see page 6035)	Occurs when a change occurs in the web component list.

Public Methods

	Name	Description
	Add (see page 6029)	Inserts a new component at the end of the list.
	Clear (see page 6029)	Deletes all components from the list.
	Create (see page 6027)	Creates and initializes new TWebComponentList (see page 6025) object.
V	Destroy (see page 6027)	Frees an instance of TWebComponentList (see page 6025).
	GetComponentCount (see page 6099)	This is GetComponentCount, a member of class IWebComponentContainer.
	IndexOf (see page 6030)	Returns the index of a specified component in the WebComponents (see page 6034) array.
	LockNotify (see page 6031)	This is LockNotify, a member of class TWebComponentList.

	NotifyLocked (see page 6031)	This is NotifyLocked, a member of class TWebComponentList.
	Remove (see page 6032)	Removes a component from the WebComponents (see page 6034) array.
	SetComponentIndex (see page 6032)	Moves a component to a new position in the WebComponents (see page 6034) array.
	UnlockNotify (see page 6033)	This is UnlockNotify, a member of class TWebComponentList.

Public Properties

	Name	Description
R	ComponentCount (see page 6100)	This is ComponentCount, a member of class IWebComponentContainer.
R	Components (see page 6100)	This is Components, a member of class IWebComponentContainer.
R	Count (see page 6033)	Indicates the number of components in the list.
R	ParentComponent (see page 6034)	Identifies the component that uses this Web component list to maintain its Web Items.
R	WebComponents (see page 6034)	Lists the Web items in the list.

58.1.4.2 TWebComponentList.Create Constructor

Creates and initializes new TWebComponentList (see page 6025) object.

Pascal

```
constructor Create(AParentComponent: TComponent);
```

C++

```
__fastcall TWebComponentList(TComponent * AParentComponent);
```

Description

Call Create to instantiate TWebComponentList (see page 6025) at runtime. Most applications do not need to instantiate TWebComponentList (see page 6025). Instead, the Web items that use TWebComponentList (see page 6025) to manage their own Web items instantiate a TWebComponentList (see page 6025) from their constructors.

58.1.4.3 TWebComponentList.Destroy Destructor

Frees an instance of TWebComponentList (see page 6025).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebComponentList();
```

Description

Do not call Destroy directly. Instead, call Free. Free verifies that the TWebComponentList (see page 6025) reference is not nil, and only then calls Destroy.

Destroy frees the memory used to store the list of WebComponents (see page 6034).

Note: Destroy does not free the components in the list.

See Also

System::TObject::Free (see page 3372)

58.1.4.4 TWebComponentList Methods

The methods of the TWebComponentList class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 6028)	This is _AddRef, a member of class TWebComponentList.
	_Release (see page 6028)	This is _Release, a member of class TWebComponentList.
	Changed (see page 6029)	This is Changed, a member of class TWebComponentList.
	GetComponent (see page 6030)	This is GetComponent, a member of class TWebComponentList.
	GetCount (see page 6030)	This is GetCount, a member of class TWebComponentList.
V	GetOwner (see page 6030)	Returns the owner of an object.
V	NewComponent (see page 6031)	This is NewComponent, a member of class TWebComponentList.
V	QueryInterface (see page 6032)	This is QueryInterface, a member of class TWebComponentList.
	WebComponentContainer_GetComponent (see page 6033)	This is WebComponentContainer_GetComponent, a member of class TWebComponentList.
	WebComponentContainer_GetComponentCount (see page 6033)	This is WebComponentContainer_GetComponentCount, a member of class TWebComponentList.

Public Methods

	Name	Description
	Add (see page 6029)	Inserts a new component at the end of the list.
	Clear (see page 6029)	Deletes all components from the list.
	IndexOf (see page 6030)	Returns the index of a specified component in the WebComponents (see page 6034) array.
	LockNotify (see page 6031)	This is LockNotify, a member of class TWebComponentList.
	NotifyLocked (see page 6031)	This is NotifyLocked, a member of class TWebComponentList.
	Remove (see page 6032)	Removes a component from the WebComponents (see page 6034) array.
	SetComponentIndex (see page 6032)	Moves a component to a new position in the WebComponents (see page 6034) array.
	UnlockNotify (see page 6033)	This is UnlockNotify, a member of class TWebComponentList.

58.1.4.4.1 TWebComponentList._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TWebComponentList.

58.1.4.4.2 TWebComponentList._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TWebComponentList.

58.1.4.4.3 TWebComponentList.Add Method

Inserts a new component at the end of the list.

Pascal

```
procedure Add(Component: TComponent);
```

C++

```
__fastcall Add(TComponent * Component);
```

Description

Call Add to insert a component at the end of the WebComponents (see page 6034) array.

Add increments the Count (see page 6033) property. After calling Add, the value of Count (see page 6033) is one greater than the index of the inserted component in the WebComponents (see page 6034) array. To move this component to another position, use the SetComponentIndex (see page 6032) method.

See Also

WebComponents (see page 6034)

Count (see page 6033)

SetComponentIndex (see page 6032)

Remove (see page 6032)

58.1.4.4.4 TWebComponentList.Changed Method

Pascal

```
procedure Changed;
```

C++

```
__fastcall Changed();
```

Description

This is Changed, a member of class TWebComponentList.

58.1.4.4.5 TWebComponentList.Clear Method

Deletes all components from the list.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the WebComponents (see page 6034) array and set Count (see page 6033) to 0.

See Also

Count (see page 6033)

Remove (see page 6032)

WebComponents (see page 6034)

58.1.4.4.6 TWebComponentList.GetComponent Method

Pascal

```
function GetComponent(Index: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetComponent(int Index);
```

Description

This is GetComponent, a member of class TWebComponentList.

58.1.4.4.7 TWebComponentList.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TWebComponentList.

58.1.4.4.8 TWebComponentList.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath

TCollection

TComponent

Owner

58.1.4.4.9 TWebComponentList.IndexOf Method

Returns the index of a specified component in the WebComponents (see page 6034) array.

Pascal

```
function IndexOf(Component: TComponent): Integer;
```

C++

```
__fastcall int IndexOf(TComponent * Component);
```

Description

Call IndexOf to get the index for a component in the WebComponents (see page 6034) array. Specify the desired component as the Component parameter.

The first component in the array has index 0, the second component has index 1, and so on. If a component is not in the list, IndexOf returns -1. If a component appears more than once in the array, IndexOf returns the index of the first appearance.

See Also

WebComponents (see page 6034)

58.1.4.4.10 TWebComponentList.LockNotify Method

Pascal

```
procedure LockNotify;
```

C++

```
__fastcall LockNotify();
```

Description

This is LockNotify, a member of class TWebComponentList.

58.1.4.4.11 TWebComponentList.NewComponent Method

Pascal

```
function NewComponent(AOwner: TComponent): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * NewComponent(TComponent * AOwner);
```

Description

This is NewComponent, a member of class TWebComponentList.

58.1.4.4.12 TWebComponentList.NotifyLocked Method

Pascal

```
function NotifyLocked: Boolean;
```

C++

```
__fastcall Boolean NotifyLocked();
```

Description

This is NotifyLocked, a member of class TWebComponentList.

58.1.4.4.13 TWebComponentList.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TWebComponentList.

58.1.4.4.14 TWebComponentList.Remove Method

Removes a component from the WebComponents (see page 6034) array.

Pascal

```
procedure Remove(Component: TComponent);
```

C++

```
__fastcall Remove(TComponent * Component);
```

Description

Call Remove to remove a specific component from the WebComponents (see page 6034) array. After a component is removed, all the WebComponents (see page 6034) that follow it are moved up in index position and Count (see page 6033) is reduced by one.

See Also

Add (see page 6029)

Count (see page 6033)

Clear (see page 6029)

WebComponents (see page 6034)

58.1.4.4.15 TWebComponentList.SetComponentIndex Method

Moves a component to a new position in the WebComponents (see page 6034) array.

Pascal

```
procedure SetComponentIndex(Component: TComponent; Value: Integer);
```

C++

```
__fastcall SetComponentIndex(TComponent * Component, int Value);
```

Description

Call SetComponentIndex to move a component to a new position in the list. Component specifies the component to move. Value specifies the index it should have after it is moved. If Value is less than 0, the component is moved to the first position. If Value is greater than or equal to count, the component is moved to the last position.

See Also

WebComponents (see page 6034)

58.1.4.4.16 TWebComponentList.UnlockNotify Method

Pascal

```
procedure UnlockNotify;
```

C++

```
__fastcall UnlockNotify();
```

Description

This is UnlockNotify, a member of class TWebComponentList.

58.1.4.4.17 TWebComponentList.WebComponentContainer_GetComponent Method

Pascal

```
function WebComponentContainer_GetComponent(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * WebComponentContainer_GetComponent(int I);
```

Description

This is WebComponentContainer_GetComponent, a member of class TWebComponentList.

58.1.4.4.18 TWebComponentList.WebComponentContainer_GetComponentCount Method

Pascal

```
function WebComponentContainer_GetComponentCount: Integer;
```

C++

```
__fastcall int WebComponentContainer_GetComponentCount();
```

Description

This is WebComponentContainer_GetComponentCount, a member of class TWebComponentList.

58.1.4.5 TWebComponentList Properties

The properties of the TWebComponentList class are listed here.

Public Properties

	Name	Description
R	Count (see page 6033)	Indicates the number of components in the list.
R	ParentComponent (see page 6034)	Identifies the component that uses this Web component list to maintain its Web Items.
R	WebComponents (see page 6034)	Lists the Web items in the list.

58.1.4.5.1 TWebComponentList.Count Property

Indicates the number of components in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read (see page 3634) Count to determine the number of components in the WebComponents (see page 6034) array. Count is a read-only property. To change the size of the WebComponents (see page 6034) array, add or remove components using the Add (see page 6029) and Remove (see page 6032) methods.

See Also

WebComponents (see page 6034)

Add (see page 6029)

Remove (see page 6032)

58.1.4.5.2 TWebComponentList.ParentComponent Property

Identifies the component that uses this Web component list to maintain its Web Items.

Pascal

```
property ParentComponent: TComponent;
```

C++

```
__property TComponent * ParentComponent;
```

Description

Read (see page 3634) ParentComponent to access the parent of the Web Items in the list. The value of ParentComponent is assigned in the constructor when the parent first instantiates the Web component list.

See Also

Create (see page 6027)

58.1.4.5.3 TWebComponentList.WebComponents Property

Lists the Web items in the list.

Pascal

```
property WebComponents [Index: Integer]: TComponent;
```

C++

```
__property TComponent * WebComponents[int Index];
```

Description

Use WebComponents to access the Web components listed by TWebComponentList (see page 6025). Use WebComponents with the Count (see page 6033) property to iterate through all of the components in the list. Use the Add (see page 6029) or Remove (see page 6032) method to add or remove components from the list.

WebComponents is the default property for TWebComponentList (see page 6025). This means that the property name can be omitted when accessing a component in the list. Thus, the line

```
WebItem := InetXPageProducer1.WebPageItems.WebComponents[0];
WebItem = InetXPageProducer1->WebPageItems->WebComponents[0];
```

can be written

```
WebItem := InetXPageProducer1.WebPageItems[0];
WebItem = (*(InetXPageProducer1->WebPageItems))[0];
```

See Also

Count (see page 6033)

Add (see page 6029)

Remove (see page 6032)

58.1.4.6 TWebComponentList Events

The events of the TWebComponentList class are listed here.

Public Events

	Name	Description
	OnChange (see page 6035)	Occurs when a change occurs in the web component list.

58.1.4.6.1 TWebComponentList.OnChange Event

Occurs when a change occurs in the web component list.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

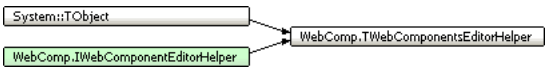
```
__property TNotifyEvent OnChange;
```

Description

Use OnChange to write an event handler to process an action when a change occurs in the web component list, such as when a new component is added.

58.1.5 TWebComponentsEditorHelper Class

Class Hierarchy



Pascal

```
TWebComponentsEditorHelper = class(TObject, IWebComponentEditorHelper);
```

C++

```
class TWebComponentsEditorHelper : public TObject, public IWebComponentEditorHelper;
```

File

WebComp

Description

This is class WebComp.TWebComponentsEditorHelper.

58.1.5.1 TWebComponentsEditorHelper Members

The following tables list the members exposed by TWebComponentsEditorHelper.

Protected Methods

	Name	Description
	_AddRef (see page 6037)	This is _AddRef, a member of class TWebComponentsEditorHelper.
	_Release (see page 6037)	This is _Release, a member of class TWebComponentsEditorHelper.
	CanAddClassHelper (see page 6037)	This is CanAddClassHelper, a member of class TWebComponentsEditorHelper.
	ImplCanAddClassHelper (see page 6037)	This is ImplCanAddClassHelper, a member of class TWebComponentsEditorHelper.
	QueryInterface (see page 6038)	This is QueryInterface, a member of class TWebComponentsEditorHelper.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

58.1.5.2 TWebComponentsEditorHelper Methods

The methods of the TWebComponentsEditorHelper class are listed here.

Protected Methods

	Name	Description
	_AddRef (see page 6037)	This is _AddRef, a member of class TWebComponentsEditorHelper.
	_Release (see page 6037)	This is _Release, a member of class TWebComponentsEditorHelper.
	CanAddClassHelper (see page 6037)	This is CanAddClassHelper, a member of class TWebComponentsEditorHelper.
	ImplCanAddClassHelper (see page 6037)	This is ImplCanAddClassHelper, a member of class TWebComponentsEditorHelper.
	QueryInterface (see page 6038)	This is QueryInterface, a member of class TWebComponentsEditorHelper.

58.1.5.2.1 TWebComponentsEditorHelper._AddRef Method

Pascal

```
function _AddRef: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _AddRef();
```

Description

This is _AddRef, a member of class TWebComponentsEditorHelper.

58.1.5.2.2 TWebComponentsEditorHelper._Release Method

Pascal

```
function _Release: Integer; stdcall;
```

C++

```
__fastcall __stdcall int _Release();
```

Description

This is _Release, a member of class TWebComponentsEditorHelper.

58.1.5.2.3 TWebComponentsEditorHelper.CanAddClassHelper Method

Pascal

```
function CanAddClassHelper(AEditor: TComponent; AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClassHelper(TComponent * AEditor, TComponent * AParent, TClass
AClass);
```

Description

This is CanAddClassHelper, a member of class TWebComponentsEditorHelper.

58.1.5.2.4 TWebComponentsEditorHelper.ImplCanAddClassHelper Method

Pascal

```
function ImplCanAddClassHelper(AEditor: TComponent; AParent: TComponent; AClass: TClass):
```

```
Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClassHelper(TComponent * AEditor, TComponent * AParent,
TClass AClass);
```

Description

This is ImplCanAddClassHelper, a member of class TWebComponentsEditorHelper.

58.1.5.2.5 TWebComponentsEditorHelper.QueryInterface Method

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; virtual; stdcall;
```

C++

```
virtual __fastcall __stdcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

This is QueryInterface, a member of class TWebComponentsEditorHelper.

58.1.6 TWebContainedComponent Class

TWebContainedComponent is the base class for Web items that generate HTML on behalf of another component.

Class Hierarchy

Pascal

```
TWebContainedComponent = class(TComponent, IWebComponent);
```

C++

```
class TWebContainedComponent : public TComponent, public IWebComponent;
```

File

WebComp

Description

Use TWebContainedComponent as a base class for Web items. Web items are items that generate HTML statements on behalf of another component. The component that uses the generated HTML has a property whose type is a TWebComponentList (see page 6025) object that lists a set of its Web items.

TWebContainedComponent implements the logic that fits a component into the hierarchy of Web items. TWebContainedComponent descendants act as leaf nodes in this hierarchy. That is, they do not have their own Web items that they use to generate HTML.

In order to allow TWebComponentList (see page 6025) to manage the Web item, TWebContainedComponent implements the IWebComponent (see page 6093) interface.

Do not create instances of TWebContainedComponent. TWebContainedComponent does not produce any HTML, but merely handles the relationship to a managing TWebComponentList (see page 6025) object.

See Also

TWebComponentList (see page 6025)

IWebComponent (see page 6093)

58.1.6.1 TWebContainedComponent Members

The following tables list the members exposed by TWebContainedComponent.

Protected Methods

	Name	Description
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
V	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
V	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
R	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Methods

	Name	Description
V	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
V	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.

58.1.6.2 TWebContainedComponent.Create Constructor

Creates and initializes an instance of TWebContainedComponent (see page 6038).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebContainedComponent(TComponent * AOwner);
```

Description

Call Create to instantiate a contained component at runtime. Web items added at design time are instantiated automatically.

AOwner is the component, typically a Web module, that becomes the value of the Owner property. The Owner is responsible for initiating the loading and saving of this component, and for freeing the TWebContainedComponent (see page 6038) instance.

See Also

Owner

58.1.6.3 TWebContainedComponent.Destroy Destructor

Frees an instance of TWebContainedComponent (see page 6038).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainedComponent();
```

Description

Destroy removes this component from its parent's list of components that generate HTML before freeing the memory used by TWebContainedComponent (see page 6038).

58.1.6.4 TWebContainedComponent Methods

The methods of the TWebContainedComponent class are listed here.

Protected Methods

	Name	Description
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
V	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
V	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.

Public Methods

	Name	Description
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.

58.1.6.4.1 TWebContainedComponent.GetContainerList Method

Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.

Pascal

```
function GetContainerList: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetContainerList();
```

Description

Applications can't access the protected GetContainerList method. It is used internally to access the object manages this item along with the other Web items of the Web parent.

See Also

IsDefaultField (see page 6042)

WebParent (see page 6044)

58.1.6.4.2 TWebContainedComponent.GetParentComponent Method

Returns the object that uses this component to generate HTML.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

TWebContainedComponent (see page 6038) overrides the GetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It returns the value of the WebParent (see page 6044) property (the object that uses the HTML generated by this component when assembling its own portion of an HTML document.)

See Also

GetParentComponent

HasParent (see page 6041)

WebParent (see page 6044)

58.1.6.4.3 TWebContainedComponent.HasParent Method

Indicates whether this component appears in another component's list of Web items.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TWebContainedComponent (see page 6038) overrides the HasParent method that is introduced in TComponent for the streaming system that loads and saves components. It returns true if the WebParent (see page 6044) property is not nil

(Delphi) or NULL (C++).

If the contained component has a parent, that parent component is responsible for writing this component to a stream.

See Also

HasParent

GetParentComponent (see page 6041)

WebParent (see page 6044)

58.1.6.4.4 TWebContainedComponent.IsDefaultField Method

Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

Pascal

```
function IsDefaultField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsDefaultField();
```

Description

TWebContainedComponent (see page 6038) uses IsDefaultField internally to locate the property on the Web parent that lists this item along with other Web items.

IsDefaultField returns true if the TWebComponentList (see page 6025) that contains this item represents a set of Web items that are used when the application does not explicitly assign Web items to the Web parent. IsDefaultField returns false if this component does not belong to such a default list.

See Also

GetContainerList (see page 6041)

WebParent (see page 6044)

TWebComponentList (see page 6025)

58.1.6.4.5 TWebContainedComponent.ParentChanged Method

Responds when the WebParent (see page 6044) property changes.

Pascal

```
procedure ParentChanged; virtual;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

The protected ParentChanged method is called automatically when the WebParent (see page 6044) property changes. As implemented in TWebContainedComponent (see page 6038), ParentChanged does nothing. Descendant classes can override this method to perform any necessary updates in response to the change in Web parent.

See Also

WebParent (see page 6044)

58.1.6.4.6 TWebContainedComponent.ReadState Method

Reads the component's published properties, stored data, and owned components from a reader object.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

ReadState is part of a sequence of calls used by the streaming system that loads and saves components. It reads the values of all the component's published properties, stored data, and owned components from the reader object passed in Reader. Do not call ReadState directly.

TWebContainedComponent (see page 6038) overrides ReadState to obtain the parent component from the reader, which it assigns as the value of the WebParent (see page 6044) property.

Note: Any descendant classes overriding ReadState should end with a call to the inherited ReadState method.

See Also

GetParentComponent (see page 6041)

WebParent (see page 6044)

58.1.6.4.7 TWebContainedComponent.SetParentComponent Method

Sets the WebParent (see page 6044) property to be the same as this component's parent.

Pascal

```
procedure SetParentComponent(AParent: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * AParent);
```

Description

TWebContainedComponent (see page 6038) overrides the SetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It sets the WebParent (see page 6044) property to AParent, so that it is the same as the parent that loads and saves this component.

See Also

SetParentComponent

HasParent (see page 6041)

WebParent (see page 6044)

58.1.6.4.8 TWebContainedComponent.SetWebParent Method

Sets the value of the WebParent (see page 6044) property.

Pascal

```
procedure SetWebParent(Value: TComponent);
```

C++

```
__fastcall SetWebParent(TComponent * Value);
```

Description

SetWebParent is used internally to set the read-only WebParent (see page 6044) property. To assign a Web parent in an application, add this component to the TWebComponentList (see page 6025) object that implements a property on the new Web parent.

See Also

WebParent (see page 6044)

Add (see page 6029)

58.1.6.5 TWebContainedComponent Properties

The properties of the TWebContainedComponent class are listed here.

Protected Properties

	Name	Description
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

58.1.6.5.1 TWebContainedComponent.WebContainedComponentHelper Property

Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.

Pascal

```
property WebContainedComponentHelper: TWebContainedComponentHelper;
```

C++

```
__property TWebContainedComponentHelper WebContainedComponentHelper;
```

Description

TWebContainedComponent (see page 6038) uses WebContainedComponentHelper internally to access the separate helper object that implements the IWebComponent (see page 6093) interface. In addition to providing the implementation for the IWebComponent (see page 6093) interface, WebContainedComponentHelper provides the underlying implementation for most of the other properties and methods that are common to components that appear in a list of Web items.

See Also

IWebComponent (see page 6093)

58.1.6.5.2 TWebContainedComponent.WebParent Property

Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Pascal

```
property WebParent: TComponent;
```

C++

```
__property TComponent * WebParent;
```

Description

TWebContainedComponent (see page 6038) uses WebParent to access the component on whose behalf it generates HTML. WebParent uses a TWebComponentList (see page 6025) object that includes this TWebContainedComponent (see page 6038) object to represent its Web items.

See Also

TWebComponentList (see page 6025)

58.1.7 TWebContainedComponentHelper Class

TWebContainedComponentHelper implements the common behavior of components that generate HTML on behalf of another component.

Class Hierarchy

Pascal

```
TWebContainedComponentHelper = class(TObject);
```

C++

```
class TWebContainedComponentHelper : public TObject;
```

File

WebComp

Description

Components that generate HTML for another component use TWebContainedComponentHelper to provide the underlying implementation of many of their properties and methods. TWebContainedComponentHelper implements the IWebComponent (see page 6093) interface, which allows a TWebComponentList (see page 6025) object manage a list of child components. In addition, it implements a number of properties and methods that allow a child Web item to interact with its parent item.

See Also

IWebComponent (see page 6093)

TWebContainedComponent (see page 6038)

TWebContainedContainerComponent (see page 6052)

58.1.7.1 TWebContainedComponentHelper Members

The following tables list the members exposed by TWebContainedComponentHelper.

Protected Events

	Name	Description
	OnParentChanged (see page 6052)	Occurs when the WebParent (see page 6051) property changes.

Protected Methods

	Name	Description
	GetContainer (see page 6048)	Returns the value of the WebParent (see page 6051) property.
	GetIndex (see page 6048)	Returns the position of the associated Web item in the parent item's array of Web items.
V	ParentChanged (see page 6049)	Generates an OnParentChanged (see page 6052) event.
	SetComponentList (see page 6049)	Sets the value of the ContainerList (see page 6051) property.
	SetContainer (see page 6050)	Sets the value of the WebParent (see page 6051) property.
	SetIndex (see page 6050)	Sets the position of the associated component in the list specified by ContainerList (see page 6051).
	SetWebParent (see page 6050)	Sets the value of the WebParent (see page 6051) property.

Public Methods

	Name	Description
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6047)	Creates an instance of TWebContainedComponentHelper (see page 6045).
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6047)	Destroys an instance of TWebContainedComponentHelper (see page 6045).
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	IsDefaultField (see page 6048)	Indicates whether the associated component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	ContainerList (see page 6051)	Indicates the list that contains the associated component.

	WebParent (see page 6051)	Indicates the component that uses the list of Web items that includes the associated component.

58.1.7.2 TWebContainedComponentHelper.Create Constructor

Creates an instance of TWebContainedComponentHelper (see page 6045).

Pascal

```
constructor Create(AComponent: TComponent; AOnParentChanged: TNotifyEvent);
```

C++

```
__fastcall TWebContainedComponentHelper(TComponent * AComponent, TNotifyEvent
AOnParentChanged);
```

Description

Applications do not create instances of TWebContainedComponentHelper (see page 6045). The component that uses TWebContainedComponentHelper (see page 6045) so that it can appear as a child item in a TWebComponentList (see page 6025) object instantiates TWebContainedComponentHelper (see page 6045).

AComponent is the component that uses TWebContainedComponentHelper (see page 6045) to implement those properties and methods that allow it to appear in a TWebComponentList (see page 6025) object.

AOnParentChanged is an event handler that AComponent supplies so that it can update itself when it is moved to the list of a different parent component. This becomes the event handler for the OnParentChanged (see page 6052) event.

See Also

OnParentChanged (see page 6052)

58.1.7.3 TWebContainedComponentHelper.Destroy Destructor

Destroys an instance of TWebContainedComponentHelper (see page 6045).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainedComponentHelper();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWebContainedComponentHelper (see page 6045) object is not nil and only then calls Destroy.

See Also

System::TObject::Free (see page 3372)

58.1.7.4 TWebContainedComponentHelper Methods

The methods of the TWebContainedComponentHelper class are listed here.

Protected Methods

	Name	Description
	GetContainer (see page 6048)	Returns the value of the WebParent (see page 6051) property.

	GetIndex (see page 6048)	Returns the position of the associated Web item in the parent item's array of Web items.
V	ParentChanged (see page 6049)	Generates an OnParentChanged (see page 6052) event.
	SetComponentList (see page 6049)	Sets the value of the ContainerList (see page 6051) property.
	SetContainer (see page 6050)	Sets the value of the WebParent (see page 6051) property.
	SetIndex (see page 6050)	Sets the position of the associated component in the list specified by ContainerList (see page 6051).
	SetWebParent (see page 6050)	Sets the value of the WebParent (see page 6051) property.

Public Methods

	Name	Description
	IsDefaultField (see page 6048)	Indicates whether the associated component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

58.1.7.4.1 TWebContainedComponentHelper.GetContainer Method

Returns the value of the WebParent (see page 6051) property.

Pascal

```
function GetContainer: TWebComponentContainer;
```

C++

```
__fastcall TWebComponentContainer GetContainer();
```

Description

Use GetContainer to access the component that uses this helper object's associated component to assemble its HTML output. The component that this method returns uses the list specified by ContainerList (see page 6051) to manage its list of Web items.

See Also

WebParent (see page 6051)

ContainerList (see page 6051)

58.1.7.4.2 TWebContainedComponentHelper.GetIndex Method

Returns the position of the associated Web item in the parent item's array of Web items.

Pascal

```
function GetIndex: Integer;
```

C++

```
__fastcall int GetIndex();
```

Description

GetIndex returns the index of the associated component in the list that is the value of the ContainerList (see page 6051) property. The index of the first item is 0, the index of the second item is 1, and so on.

See Also

ContainerList (see page 6051)

58.1.7.4.3 TWebContainedComponentHelper.IsDefaultField Method

Indicates whether the associated component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

Pascal

```
function IsDefaultField: Boolean;
```

C++

```
__fastcall Boolean IsDefaultField();
```

Description

TWebContainedComponentHelper (see page 6045) uses IsDefaultField internally to locate the property on the Web parent that lists the associated item along with other Web items.

IsDefaultField returns true if the TWebComponentList (see page 6025) that contains the associated item represents a set of Web items that are used when the application does not explicitly assign Web items to the Web parent. IsDefaultField returns false if the associated component does not belong to such a default list.

See Also

ContainerList (see page 6051)

WebParent (see page 6051)

TWebComponentList (see page 6025)

58.1.7.4.4 TWebContainedComponentHelper.ParentChanged Method

Generates an OnParentChanged (see page 6052) event.

Pascal

```
procedure ParentChanged; virtual;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

ParentChanged is called automatically when the WebParent (see page 6051) property changes. It generates an OnParentChanged (see page 6052) event, which is handled by the event handler that the associated component passes to the TWebContainedComponentHelper (see page 6045) constructor.

See Also

OnParentChanged (see page 6052)

Create (see page 6047)

58.1.7.4.5 TWebContainedComponentHelper.SetComponentList Method

Sets the value of the ContainerList (see page 6051) property.

Pascal

```
procedure SetComponentList(List: TObject);
```

C++

```
__fastcall SetComponentList(TObject * List);
```

Description

SetComponentList assigns the object specified by List as the value of the ContainerList (see page 6051) property. Note that List must be an instance of TWebComponentList (see page 6025) (or nil (Delphi) or NULL (C++)).

See Also

ContainerList (see page 6051)

58.1.7.4.6 TWebContainedComponentHelper.SetContainer Method

Sets the value of the WebParent (see page 6051) property.

Pascal

```
procedure SetContainer(Container: TWebComponentContainer);
```

C++

```
__fastcall SetContainer(TWebComponentContainer Container);
```

Description

SetContainer assigns a new value to the WebParent (see page 6051) property.

Container is the new Web parent.

See Also

WebParent (see page 6051)

58.1.7.4.7 TWebContainedComponentHelper.SetIndex Method

Sets the position of the associated component in the list specified by ContainerList (see page 6051).

Pascal

```
procedure SetIndex(Value: Integer);
```

C++

```
__fastcall SetIndex(int Value);
```

Description

SetIndex moves the associated component to a specified position in the list of Web items that contains it.

Value is the new index of the associated component, where 0 specifies the first position, 1 specifies the second position, and so on.

See Also

ContainerList (see page 6051)

58.1.7.4.8 TWebContainedComponentHelper.SetWebParent Method

Sets the value of the WebParent (see page 6051) property.

Pascal

```
procedure SetWebParent(Value: TComponent);
```

C++

```
__fastcall SetWebParent(TComponent * Value);
```

Description

SetWebParent moves the associated component to the component list of a new parent. To do so, it removes the associated component from the current parent's list of Web items, adds it to the new Web parent's list of Web items, and then generates an OnParentChanged (see page 6052) event.

Value is the new index of the associated component, where 0 specifies the first position, 1 specifies the second position, and so on.

Value is the new Web parent.

See Also

WebParent (see page 6051)

OnParentChanged (see page 6052)

ContainerList (see page 6051)

58.1.7.5 TWebContainedComponentHelper Properties

The properties of the TWebContainedComponentHelper class are listed here.

Public Properties

	Name	Description
	ContainerList (see page 6051)	Indicates the list that contains the associated component.
	WebParent (see page 6051)	Indicates the component that uses the list of Web items that includes the associated component.

58.1.7.5.1 TWebContainedComponentHelper.ContainerList Property

Indicates the list that contains the associated component.

Pascal

```
property ContainerList: TWebComponentList;
```

C++

```
__property TWebComponentList ContainerList;
```

Description

Use ContainerList to access the list in which the associated component appears. The parent item uses the components in the list to generate HTML, which it then assembles into its own HTML output.

See Also

WebParent (see page 6051)

58.1.7.5.2 TWebContainedComponentHelper.WebParent Property

Indicates the component that uses the list of Web items that includes the associated component.

Pascal

```
property WebParent: TComponent;
```

C++

```
__property TComponent * WebParent;
```

Description

WebParent specifies the component on whose behalf the associated component generates HTML. WebParent is the component that uses the list that is the value of the ContainerList (see page 6051) property.

See Also

ContainerList (see page 6051)

58.1.7.6 TWebContainedComponentHelper Events

The events of the TWebContainedComponentHelper class are listed here.

Protected Events

	Name	Description
	OnParentChanged (see page 6052)	Occurs when the WebParent (see page 6051) property changes.

58.1.7.6.1 TWebContainedComponentHelper.OnParentChanged Event

Occurs when the WebParent (see page 6051) property changes.

Pascal

```
property OnParentChanged: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnParentChanged;
```

Description

Components that use TWebContainedComponentHelper (see page 6045) so that they can act as a child Web item in a hierarchy of Web items assign an event handler to OnParentChanged.

The associated component uses TWebContainedComponentHelper (see page 6045) to implement the IWebComponent (see page 6093) interface. This interface can be used to change the value of WebParent (see page 6051). By assigning an OnParentChanged event handler, the associated component can update itself when it moves from one parent item to another.

See Also

WebParent (see page 6051)

IWebComponent (see page 6093)

58.1.8 TWebContainedContainerComponent Class

TWebContainedContainerComponent is the base class for Web items that generate HTML on behalf of another component and also use Web items to generate HTML.

Class Hierarchy

Pascal

```
TWebContainedContainerComponent = class(TComponent, IGetWebComponentList, IWebComponent);
```

C++

```
class TWebContainedContainerComponent : public TComponent, public IGetWebComponentList, public
IWebComponent;
```

File

WebComp

Description

Use TWebContainedContainerComponent as a base class for Web items that have their own subitems. Web items are items that generate HTML statements on behalf of another component. The component that uses the generated HTML has a property whose type is a TWebComponentList (see page 6025) object that lists a set of its Web items. In addition, the TWebContainedContainerComponent descendant uses a TWebComponentList (see page 6025) object to store a set of Web items that it uses.

TWebContainedContainerComponent implements the logic that fits a component into the hierarchy of Web items. TWebContainedContainerComponent descendants act as internal nodes in this hierarchy. That is, they have both a Web parent and a set of child Web items.

In order to allow the parent's TWebComponentList (see page 6025) object to manage this Web item, TWebContainedContainerComponent implements the IWebComponent (see page 6093) interface.

Do not create instances of TWebContainedContainerComponent. TWebContainedContainerComponent does not produce any HTML, but merely handles the relationships to parent and child TWebComponentList (see page 6025) objects.

See Also

TWebComponentList (see page 6025)

IWebComponent (see page 6093)

58.1.8.1 TWebContainedContainerComponent Members

The following tables list the members exposed by TWebContainedContainerComponent.

Protected Methods

	Name	Description
	GetChildren (see page 6055)	Executes a callback for each child Web item.
	GetContainerList (see page 6056)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetDefaultWebComponents (see page 6056)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetWebComponents (see page 6057)	Returns the list of Web items that this item uses to generate its HTML.
	ImplGetDefaultComponentList (see page 6058)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	IsDefaultField (see page 6058)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 6058)	Responds when the WebParent (see page 6062) property changes.
	ReadState (see page 6059)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetChildOrder (see page 6059)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 6060)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetParentComponent (see page 6060)	Sets the WebParent (see page 6062) property to be the same as this component's parent.
	SetWebParent (see page 6061)	Sets the value of the WebParent (see page 6062) property.

Protected Properties

	Name	Description
	WebContainedComponentHelper (see page 6061)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.

	WebContainerComponentHelper (see page 6062)	Provides access to the helper object that allows this object to manage sub Web items.
	WebParent (see page 6062)	Indicates the component that uses this TWebContainedContainerComponent (see page 6052) as one of its Web items.

Public Methods

	Name	Description
	Create (see page 6054)	Creates and initializes an instance of TWebContainedContainerComponent (see page 6052).
	Destroy (see page 6054)	Frees an instance of TWebContainedContainerComponent (see page 6052).
	GetComponentList (see page 6082)	This is GetComponentList, a member of class IGetWebComponentList.
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDefaultComponentList (see page 6082)	This is GetDefaultComponentList, a member of class IGetWebComponentList.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetParentComponent (see page 6056)	Returns the object that uses this component to generate HTML.
	HasParent (see page 6057)	Indicates whether this component appears in another component's list of Web items.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.

58.1.8.2 TWebContainedContainerComponent.Create Constructor

Creates and initializes an instance of TWebContainedContainerComponent (see page 6052).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebContainedContainerComponent(TComponent * AOwner);
```

Description

Call Create to instantiate a contained component at runtime. Web items added at design time using the Web Page editor are instantiated automatically.

AOwner is the component, typically a Web module, that becomes the value of the Owner property. The Owner is responsible for initiating the loading and saving of this component, and for freeing the TWebContainedContainerComponent (see page 6052) instance.

See Also

Owner

58.1.8.3 TWebContainedContainerComponent.Destroy Destructor

Frees an instance of TWebContainedContainerComponent (see page 6052).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainedContainerComponent();
```

Description

Destroy removes this component from its parent's list of components that generate HTML before freeing the memory used by TWebContainedContainerComponent (see page 6052).

58.1.8.4 TWebContainedContainerComponent Methods

The methods of the TWebContainedContainerComponent class are listed here.

Protected Methods

	Name	Description
	GetChildren (see page 6055)	Executes a callback for each child Web item.
	GetContainerList (see page 6056)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetDefaultWebComponents (see page 6056)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetWebComponents (see page 6057)	Returns the list of Web items that this item uses to generate its HTML.
	ImplGetDefaultComponentList (see page 6058)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	IsDefaultField (see page 6058)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	ParentChanged (see page 6058)	Responds when the WebParent (see page 6062) property changes.
	ReadState (see page 6059)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetChildOrder (see page 6059)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 6060)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetParentComponent (see page 6060)	Sets the WebParent (see page 6062) property to be the same as this component's parent.
	SetWebParent (see page 6061)	Sets the value of the WebParent (see page 6062) property.

Public Methods

	Name	Description
	GetParentComponent (see page 6056)	Returns the object that uses this component to generate HTML.
	HasParent (see page 6057)	Indicates whether this component appears in another component's list of Web items.

58.1.8.4.1 TWebContainedContainerComponent.GetChildren Method

Executes a callback for each child Web item.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

TWebContainedContainerComponent (see page 6052) overrides the GetChildren method that is introduced in TComponent for the streaming system that loads and saves components. It executes the Proc procedure for each child that in the list that

GetWebComponents (see page 6057) returns, as long as that component has Root for an Owner. This allows the sub Web items to be loaded and saved with the TWebContainedContainerComponent (see page 6052) object.

See Also

GetWebComponents (see page 6057)

SetChildOrder (see page 6059)

58.1.8.4.2 TWebContainedContainerComponent.GetContainerList Method

Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.

Pascal

```
function GetContainerList: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetContainerList();
```

Description

Applications can't access the protected GetContainerList method. It is used internally to access the object manages this item along with the other Web items of the Web parent.

See Also

IsDefaultField (see page 6058)

WebParent (see page 6062)

58.1.8.4.3 TWebContainedContainerComponent.GetDefaultWebComponents Method

Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this Web item. As implemented in TWebContainedContainerComponent (see page 6052), GetDefaultWebComponents always returns nil (Delphi) or NULL (C++). Descendant classes override this method to supply a set of default items.

See Also

GetWebComponents (see page 6057)

IsDefaultField (see page 6058)

58.1.8.4.4 TWebContainedContainerComponent.GetParentComponent Method

Returns the object that uses this component to generate HTML.

Pascal

```
function GetParentComponent: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetParentComponent();
```

Description

TWebContainedContainerComponent (see page 6052) overrides the GetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It returns the value of the WebParent (see page 6062) property (the object that uses the HTML generated by this component when assembling its own portion of an HTML document.)

See Also

GetParentComponent

HasParent (see page 6057)

WebParent (see page 6062)

58.1.8.4.5 TWebContainedContainerComponent.GetWebComponents Method

Returns the list of Web items that this item uses to generate its HTML.

Pascal

```
function GetWebComponents: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetWebComponents();
```

Description

GetWebComponents returns the TWebComponentList (see page 6025) object that manages all of the child items of this component.

See Also

GetDefaultWebComponents (see page 6056)

58.1.8.4.6 TWebContainedContainerComponent.HasParent Method

Indicates whether this component appears in another component's list of Web items.

Pascal

```
function HasParent: Boolean; override;
```

C++

```
virtual __fastcall Boolean HasParent();
```

Description

TWebContainedContainerComponent (see page 6052) overrides the HasParent method that is introduced in TComponent for the streaming system that loads and saves components. It returns true if the WebParent (see page 6062) property is not nil (Delphi) or NULL (C++).

If the contained component has a parent, that parent component is responsible for writing this component to a stream.

See Also

HasParent

GetParentComponent (see page 6056)

WebParent (see page 6062)

58.1.8.4.7 TWebContainedContainerComponent.ImplGetDefaultComponentList Method

Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function ImplGetDefaultComponentList: TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetDefaultComponentList();
```

Description

ImplGetDefaultComponentList supplies the default set of child items for this Web item. ImplGetDefaultComponentList calls the virtual GetDefaultWebComponents (see page 6056) method, which descendant classes override to return this list.

See Also

GetDefaultWebComponents (see page 6056)

IsDefaultField (see page 6058)

58.1.8.4.8 TWebContainedContainerComponent.IsDefaultField Method

Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.

Pascal

```
function IsDefaultField: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean IsDefaultField();
```

Description

TWebContainedComponent (see page 6038) uses IsDefaultField internally to locate the property on the Web parent that lists this item along with other Web items.

IsDefaultField returns true if the TWebComponentList (see page 6025) that contains this item represents a set of Web items that are used when the application does not explicitly assign Web items to the Web parent. IsDefaultField returns false if this component does not belong to such a default list.

See Also

GetContainerList (see page 6056)

WebParent (see page 6062)

TWebComponentList (see page 6025)

GetDefaultWebComponents (see page 6056)

GetWebComponents (see page 6057)

58.1.8.4.9 TWebContainedContainerComponent.ParentChanged Method

Responds when the WebParent (see page 6062) property changes.

Pascal

```
procedure ParentChanged; virtual;
```

C++

```
virtual __fastcall ParentChanged();
```

Description

The protected ParentChanged method is called automatically when the WebParent (see page 6062) property changes. As implemented in TWebContainedContainerComponent (see page 6052), ParentChanged does nothing. Descendant classes can override this method to perform any necessary updates in response to the change in Web parent.

See Also

WebParent (see page 6062)

58.1.8.4.10 TWebContainedContainerComponent.ReadState Method

Reads the component's published properties, stored data, and owned components from a reader object.

Pascal

```
procedure ReadState(Reader: TReader); override;
```

C++

```
virtual __fastcall ReadState(TReader Reader);
```

Description

ReadState is part of a sequence of calls used by the streaming system that loads and saves components. It reads the values of all the component's published properties, stored data, and owned components from the reader object passed in Reader. Do not call ReadState directly.

TWebContainedContainerComponent (see page 6052) overrides ReadState to obtain the parent component from the reader, which it assigns as the value of the WebParent (see page 6062) property.

Note: Any descendant classes overriding ReadState should end with a call to the inherited ReadState method.

See Also

GetParentComponent (see page 6056)

WebParent (see page 6062)

58.1.8.4.11 TWebContainedContainerComponent.SetChildOrder Method

Positions a child component in the list of child Web items.

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

SetChildOrder is part of the streaming system that loads and saves components. It positions a newly loaded child component in the list that GetWebComponents (see page 6057) returns.

Child is the newly loaded child component.

Order indicates its position in the list of child Web items, where 0 is the first position, 1 is the second position, and so on.

See Also

GetWebComponents (see page 6057)

SetChildOrder

58.1.8.4.12 TWebContainedContainerComponent.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); virtual;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

SetDefaultWebComponents assigns the default set of child items for this Web item. This default list can be retrieved by calling the GetDefaultWebComponents (see page 6056) method.

As implemented in TWebContainedContainerComponent (see page 6052), SetDefaultWebComponents does nothing. Descendant classes override this method to store the list of default items in a class-specific manner.

See Also

GetDefaultWebComponents (see page 6056)

IsDefaultField (see page 6058)

58.1.8.4.13 TWebContainedContainerComponent.SetParentComponent Method

Sets the WebParent (see page 6062) property to be the same as this component's parent.

Pascal

```
procedure SetParentComponent(AParent: TComponent); override;
```

C++

```
virtual __fastcall SetParentComponent(TComponent * AParent);
```

Description

TWebContainedContainerComponent (see page 6052) overrides the SetParentComponent method that is introduced in TComponent for the streaming system that loads and saves components. It sets the WebParent (see page 6062) property to AParent, so that it is the same as the parent that loads and saves this component.

See Also

SetParentComponent

HasParent (see page 6057)

WebParent (see page 6062)

58.1.8.4.14 TWebContainedContainerComponent.SetWebParent Method

Sets the value of the WebParent (see page 6062) property.

Pascal

```
procedure SetWebParent(Value: TComponent);
```

C++

```
__fastcall SetWebParent(TComponent * Value);
```

Description

SetWebParent is used internally to set the read-only WebParent (see page 6062) property. To assign a Web parent in an application, add this component to the TWebComponentList (see page 6025) object that implements a property on the new Web parent.

See Also

WebParent (see page 6062)

Add (see page 6029)

58.1.8.5 TWebContainedContainerComponent Properties

The properties of the TWebContainedContainerComponent class are listed here.

Protected Properties

	Name	Description
	WebContainedComponentHelper (see page 6061)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebContainerComponentHelper (see page 6062)	Provides access to the helper object that allows this object to manage sub Web items.
	WebParent (see page 6062)	Indicates the component that uses this TWebContainedContainerComponent (see page 6052) as one of its Web items.

58.1.8.5.1 TWebContainedContainerComponent.WebContainedComponentHelper Property

Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.

Pascal

```
property WebContainedComponentHelper: TWebContainedComponentHelper;
```

C++

```
__property TWebContainedComponentHelper WebContainedComponentHelper;
```

Description

TWebContainedContainerComponent (see page 6052) uses WebContainedComponentHelper internally to access the separate helper object that implements the IWebComponent (see page 6093) interface. In addition to providing the implementation for the IWebComponent (see page 6093) interface, WebContainedComponentHelper provides the underlying implementation for other properties and methods that are common to components that appear in a list of Web items.

See Also

IWebComponent (see page 6093)

58.1.8.5.2 TWebContainedContainerComponent.WebContainerComponentHelper Property

Provides access to the helper object that allows this object to manage sub Web items.

Pascal

```
property WebContainerComponentHelper: TWebContainerComponentHelper;
```

C++

```
__property TWebContainerComponentHelper WebContainerComponentHelper;
```

Description

TWebContainedContainerComponent (see page 6052) uses WebContainerComponentHelper internally to handle two lists of child Web items:

One list contains the default Web items that this component uses if the application does not explicitly assign sub Web items. The GetDefaultWebComponents (see page 6056) method returns this list.

The other list contains explicitly assigned Web items that this component uses. The GetWebComponents (see page 6057) method returns this list.

See Also

GetDefaultWebComponents (see page 6056)

GetWebComponents (see page 6057)

58.1.8.5.3 TWebContainedContainerComponent.WebParent Property

Indicates the component that uses this TWebContainedContainerComponent (see page 6052) as one of its Web items.

Pascal

```
property WebParent: TComponent;
```

C++

```
__property TComponent * WebParent;
```

Description

TWebContainedContainerComponent (see page 6052) uses WebParent to access the component on whose behalf it generates HTML. WebParent uses a TWebComponentList (see page 6025) object that includes this TWebContainedContainerComponent (see page 6052) object to represent its child Web items.

See Also

TWebComponentList (see page 6025)

58.1.9 TWebContainerComponent Class

TWebContainerComponent is the base class for components that use Web items to generate HTML.

Class Hierarchy

Pascal

```
TWebContainerComponent = class(TComponent, IGetWebComponentList);
```

C++

```
class TWebContainerComponent : public TComponent, public IGetWebComponentList;
```

File

WebComp

Description

Use TWebContainerComponent as a base class for objects that maintain a collection of Web items but that do not have a parent Web item. TWebContainerComponent uses a TWebComponentList (see page 6025) object to store the set of child items that it manages.

Do not create instances of TWebContainerComponent, it is intended only as a base class. It only provides support for storing and retrieving child Web items.

See Also

TWebComponentList (see page 6025)

IWebComponent (see page 6093)

TWebContainedContainerComponent (see page 6052)

58.1.9.1 TWebContainerComponent Members

The following tables list the members exposed by TWebContainerComponent.

Protected Methods

	Name	Description
	GetChildren (see page 6065)	Executes a callback for each child Web item.
	GetDefaultWebComponents (see page 6065)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetWebComponents (see page 6065)	Returns the list of Web items that this item manages.
	ImplGetDefaultComponentList (see page 6066)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	SetChildOrder (see page 6066)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 6067)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Protected Properties

	Name	Description
	WebContainerComponentHelper (see page 6067)	Provides access to the helper object that allows this object to manage its Web items.

Public Methods

	Name	Description
	Create (see page 6064)	Creates and initializes an instance of TWebContainerComponent (see page 6063).
	Destroy (see page 6064)	Frees an instance of TWebContainerComponent (see page 6063).
	GetComponentList (see page 6082)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 6082)	This is GetDefaultComponentList, a member of class IGetWebComponentList.

58.1.9.2 TWebContainerComponent.Create Constructor

Creates and initializes an instance of TWebContainerComponent (see page 6063).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebContainerComponent(TComponent * AOwner);
```

Description

Call Create to instantiate a contained component at runtime.

AOwner is the component, typically a Web module, that becomes the value of the Owner property. The Owner is responsible for initiating the loading and saving of this component, and for freeing the TWebContainerComponent (see page 6063) instance.

See Also

Owner

58.1.9.3 TWebContainerComponent.Destroy Destructor

Frees an instance of TWebContainerComponent (see page 6063).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainerComponent();
```

Description

Destroy frees the memory used by TWebContainerComponent (see page 6063).

58.1.9.4 TWebContainerComponent Methods

The methods of the TWebContainerComponent class are listed here.

Protected Methods

	Name	Description
	GetChildren (see page 6065)	Executes a callback for each child Web item.
	GetDefaultWebComponents (see page 6065)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.
	GetWebComponents (see page 6065)	Returns the list of Web items that this item manages.
	ImplGetDefaultComponentList (see page 6066)	Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

	SetChildOrder (see page 6066)	Positions a child component in the list of child Web items.
	SetDefaultWebComponents (see page 6067)	Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

58.1.9.4.1 TWebContainerComponent.GetChildren Method

Executes a callback for each child Web item.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent); override;
```

C++

```
virtual __fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

TWebContainerComponent (see page 6063) overrides the GetChildren method that is introduced in TComponent for the streaming system that loads and saves components. It executes the Proc procedure for each child that in the list that GetWebComponents (see page 6065) returns, as long as that component has Root for an Owner. This allows the child Web items to be loaded and saved with the TWebContainerComponent (see page 6063) object.

See Also

GetWebComponents (see page 6065)

GetParentComponent

SetChildOrder (see page 6066)

58.1.9.4.2 TWebContainerComponent.GetDefaultWebComponents Method

Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function GetDefaultWebComponents: TWebComponentList; virtual;
```

C++

```
virtual __fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents supplies the default set of child items for this component. As implemented in TWebContainerComponent (see page 6063), GetDefaultWebComponents always returns nil (Delphi) or NULL (C++). Descendant classes override this method to supply a set of default items.

See Also

GetWebComponents (see page 6065)

IsDefaultField (see page 6042)

58.1.9.4.3 TWebContainerComponent.GetWebComponents Method

Returns the list of Web items that this item manages.

Pascal

```
function GetWebComponents: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetWebComponents();
```

Description

GetWebComponents returns the TWebComponentList (see page 6025) object that manages all of the child items of this component.

See Also

GetDefaultWebComponents (see page 6065)

58.1.9.4.4 TWebContainerComponent.ImplGetDefaultComponentList Method

Returns a list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
function ImplGetDefaultComponentList: TObject; virtual;
```

C++

```
virtual __fastcall TObject * ImplGetDefaultComponentList();
```

Description

ImplGetDefaultComponentList supplies the default set of child items for this Web item. ImplGetDefaultComponentList calls the virtual GetDefaultWebComponents (see page 6065) method, which descendant classes override to return this list.

See Also

GetDefaultWebComponents (see page 6065)

IsDefaultField (see page 6042)

58.1.9.4.5 TWebContainerComponent.SetChildOrder Method

Positions a child component in the list of child Web items.

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer); override;
```

C++

```
virtual __fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

SetChildOrder is part of the streaming system that loads and saves components. It positions a newly loaded child component in the list that GetWebComponents (see page 6065) returns.

Child is the newly loaded child component.

Order indicates its position in the list of child Web items, where 0 is the first position, 1 is the second position, and so on.

See Also

GetWebComponents (see page 6065)

SetChildOrder

58.1.9.4.6 TWebContainerComponent.SetDefaultWebComponents Method

Sets the list of Web items that are used by default if an application does not explicitly assign child items to this object.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList); virtual;
```

C++

```
virtual __fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

SetDefaultWebComponents assigns the default set of child items for this Web item. This default list can be retrieved by calling the GetDefaultWebComponents (see page 6065) method.

As implemented in TWebContainerComponent (see page 6063), SetDefaultWebComponents does nothing. Descendant classes override this method to store the list of default items in a class-specific manner.

See Also

GetDefaultWebComponents (see page 6065)

IsDefaultField (see page 6042)

58.1.9.5 TWebContainerComponent Properties

The properties of the TWebContainerComponent class are listed here.

Protected Properties

	Name	Description
	WebContainerComponentHelper (see page 6067)	Provides access to the helper object that allows this object to manage its Web items.

58.1.9.5.1 TWebContainerComponent.WebContainerComponentHelper Property

Provides access to the helper object that allows this object to manage its Web items.

Pascal

```
property WebContainerComponentHelper: TWebContainerComponentHelper;
```

C++

```
__property TWebContainerComponentHelper WebContainerComponentHelper;
```

Description

TWebContainerComponent (see page 6063) uses WebContainerComponentHelper internally to handle two lists of child Web items:

One list contains the default Web items that this component uses if the application does not explicitly assign child Web items. The GetDefaultWebComponents (see page 6065) method returns this list.

The other list contains explicitly assigned Web items that this component uses. The GetWebComponents (see page 6065) method returns this list.

See Also

GetDefaultWebComponents (see page 6065)

GetWebComponents (see page 6065)

58.1.10 TWebContainerComponentHelper Class

TWebContainerComponentHelper implements the common behavior of components that maintain a list of Web items to generate HTML.

Class Hierarchy

Pascal

```
TWebContainerComponentHelper = class(TObject);
```

C++

```
class TWebContainerComponentHelper : public TObject;
```

File

WebComp

Description

Components that maintain a list of Web items to help them generate HTML use TWebContainerComponentHelper to provide the common implementation of properties and methods for managing the list of sub components. This includes

The logic for handling two lists of Web items: one that represents the Web items that the application assigns, and one that represents a set of default items that can be used when the application does not explicitly assign Web items.

The logic for interacting with the component streaming system, so that child Web items are correctly loaded and saved with the component that uses TWebContainerComponentHelper.

See Also

TWebContainedContainerComponent (see page 6052)

TWebContainerComponent (see page 6063)

TWebComponentList (see page 6025)

58.1.10.1 TWebContainerComponentHelper Members

The following tables list the members exposed by TWebContainerComponentHelper.

Protected Events

	Name	Description
	OnGetDefaultComponentList (see page 6075)	Occurs when TWebContainerComponentHelper (see page 6068) needs to access the value of DefaultWebComponents (see page 6074).
	OnSetDefaultComponentList (see page 6075)	Occurs when TWebContainerComponentHelper (see page 6068) needs to assign the value of DefaultWebComponents (see page 6074).

Protected Methods

	Name	Description
	GetComponentList (see page 6071)	Returns the value of the Webcomponents (see page 6074) property.
	GetDefaultComponentList (see page 6072)	Returns the list of Web items that is used if an application does not explicitly assign any Web items to the associated component.
	GetDefaultWebComponents (see page 6072)	Generates an OnGetDefaultComponentList (see page 6075) event.

	SetDefaultWebComponents (see page 6073)	Generates an OnSetDefaultComponentList (see page 6075) event.

Public Methods

	Name	Description
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6069)	Creates an instance of TWebContainerComponentHelper (see page 6068).
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6070)	Destroys an instance of TWebContainerComponentHelper (see page 6068).
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetChildren (see page 6071)	Executes a callback for each child Web item.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetChildOrder (see page 6072)	Positions a child component in the list of child Web items.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	DefaultWebComponents (see page 6074)	Lists the Web items that the associated component uses by default if the application does not explicitly assign any Web items.
R	Webcomponents (see page 6074)	Lists the Web items of the associated component.

58.1.10.2 TWebContainerComponentHelper.Create Constructor

Creates an instance of TWebContainerComponentHelper (see page 6068).

Pascal

```
constructor Create(AComponent: TComponent; AOnGetDefaultComponentList: TGetComponentListEvent;
AOnSetDefaultComponentList: TSetComponentListEvent);
```

C++

```
__fastcall TWebContainerComponentHelper(TComponent * AComponent, TGetComponentListEvent
AOnGetDefaultComponentList, TSetComponentListEvent AOnSetDefaultComponentList);
```

Description

Applications do not create instances of TWebContainerComponentHelper (see page 6068). The component that uses TWebContainerComponentHelper (see page 6068) so that it can manage a set of Web items instantiates TWebContainerComponentHelper (see page 6068).

AComponent is the component that uses TWebContainerComponentHelper (see page 6068) to manage its list of Web items and to interact with the component streaming system.

AOnGetDefaultComponentList is an event handler that AComponent supplies to provide the read implementation of the DefaultWebComponents (see page 6074) property. It is assigned as the event handler for OnGetDefaultComponentList (see page 6075).

AOnSetDefaultComponentList is an event handler that AComponent supplies to provide the write implementation of the DefaultWebComponents (see page 6074) property. It is assigned as the event handler for OnSetDefaultComponentList (see page 6075).

See Also

OnGetDefaultComponentList (see page 6075)

OnSetDefaultComponentList (see page 6075)

DefaultWebComponents (see page 6074)

58.1.10.3 TWebContainerComponentHelper.Destroy Destructor

Destroys an instance of TWebContainerComponentHelper (see page 6068).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebContainerComponentHelper();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWebContainerComponentHelper (see page 6068) object is not nil and only then calls Destroy.

See Also

System::TObject::Free (see page 3372)

58.1.10.4 TWebContainerComponentHelper Methods

The methods of the TWebContainerComponentHelper class are listed here.

Protected Methods

	Name	Description
	GetComponentList (see page 6071)	Returns the value of the Webcomponents (see page 6074) property.
	GetDefaultComponentList (see page 6072)	Returns the list of Web items that is used if an application does not explicitly assign any Web items to the associated component.

	GetDefaultWebComponents (see page 6072)	Generates an OnGetDefaultComponentList (see page 6075) event.
	SetDefaultWebComponents (see page 6073)	Generates an OnSetDefaultComponentList (see page 6075) event.

Public Methods

	Name	Description
	GetChildren (see page 6071)	Executes a callback for each child Web item.
	SetChildOrder (see page 6072)	Positions a child component in the list of child Web items.

58.1.10.4.1 TWebContainerComponentHelper.GetChildren Method

Executes a callback for each child Web item.

Pascal

```
procedure GetChildren(Proc: TGetChildProc; Root: TComponent);
```

C++

```
__fastcall GetChildren(TGetChildProc Proc, TComponent * Root);
```

Description

GetChildren provides the underlying implementation of the associated component's GetChildren method. GetChildren is introduced in TComponent for the streaming system that loads and saves components.

GetChildren executes the Proc procedure for each child that in the list specified by the Webcomponents (see page 6074) property, as long as that component has Root for an Owner. This allows the sub Web items to be loaded and saved with the component that uses TWebContainerComponentHelper (see page 6068).

See Also

Webcomponents (see page 6074)

SetChildOrder (see page 6072)

GetChildren

58.1.10.4.2 TWebContainerComponentHelper.GetComponentList Method

Returns the value of the Webcomponents (see page 6074) property.

Pascal

```
function GetComponentList: TObject;
```

C++

```
__fastcall TObject * GetComponentList();
```

Description

GetComponentList returns the list of Web items that have been assigned to the associated component. The return value is an instance of TWebComponentList (see page 6025).

See Also

Webcomponents (see page 6074)

GetDefaultComponentList (see page 6072)

TWebComponentList (see page 6025)

58.1.10.4.3 TWebContainerComponentHelper.GetDefaultComponentList Method

Returns the list of Web items that is used if an application does not explicitly assign any Web items to the associated component.

Pascal

```
function GetDefaultComponentList: TObject;
```

C++

```
__fastcall TObject * GetDefaultComponentList();
```

Description

GetComponentList (see page 6071) returns the value of the DefaultWebComponents (see page 6074) property. The return value is an instance of TWebComponentList (see page 6025).

See Also

DefaultWebComponents (see page 6074)

Webcomponents (see page 6074)

TWebComponentList (see page 6025)

58.1.10.4.4 TWebContainerComponentHelper.GetDefaultWebComponents Method

Generates an OnGetDefaultComponentList (see page 6075) event.

Pascal

```
function GetDefaultWebComponents: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetDefaultWebComponents();
```

Description

GetDefaultWebComponents is the read implementation of the DefaultWebComponents (see page 6074) property. It generates an OnGetDefaultComponentList (see page 6075) event, so that the associated component can supply this list of default items. If there is no OnGetDefaultComponentList (see page 6075) event handler, GetDefaultWebComponents returns nil (Delphi) or NULL (C++).

See Also

OnGetDefaultComponentList (see page 6075)

DefaultWebComponents (see page 6074)

58.1.10.4.5 TWebContainerComponentHelper.SetChildOrder Method

Positions a child component in the list of child Web items.

Pascal

```
procedure SetChildOrder(Component: TComponent; Order: Integer);
```

C++

```
__fastcall SetChildOrder(TComponent * Component, int Order);
```

Description

SetChildOrder provides the underlying implementation of the associated component's SetChildOrder method. SetChildOrder is introduced in TComponent for the streaming system that loads and saves components. It positions a newly loaded child component in the list specified by Webcomponents (see page 6074).

Child is the newly loaded child component.

Order indicates its position in Webcomponents (see page 6074), where 0 is the first position, 1 is the second position, and so on.

See Also

Webcomponents (see page 6074)

SetChildOrder

GetChildren (see page 6071)

58.1.10.4.6 TWebContainerComponentHelper.SetDefaultWebComponents Method

Generates an OnSetDefaultComponentList (see page 6075) event.

Pascal

```
procedure SetDefaultWebComponents(AList: TWebComponentList);
```

C++

```
__fastcall SetDefaultWebComponents(TWebComponentList AList);
```

Description

GetDefaultWebComponents (see page 6072) is the write implementation of the DefaultWebComponents (see page 6074) property. It generates an OnSetDefaultComponentList (see page 6075) event, so that the associated component can assign the new list of default items.

See Also

Create (see page 6069)

OnSetDefaultComponentList (see page 6075)

DefaultWebComponents (see page 6074)

58.1.10.5 TWebContainerComponentHelper Properties

The properties of the TWebContainerComponentHelper class are listed here.

Public Properties

	Name	Description
	DefaultWebComponents (see page 6074)	Lists the Web items that the associated component uses by default if the application does not explicitly assign any Web items.
R	Webcomponents (see page 6074)	Lists the Web items of the associated component.

58.1.10.5.1 TWebContainerComponentHelper.DefaultWebComponents Property

Lists the Web items that the associated component uses by default if the application does not explicitly assign any Web items.

Pascal

```
property DefaultWebComponents: TWebComponentList;
```

C++

```
__property TWebComponentList DefaultWebComponents;
```

Description

Use DefaultWebComponents to access the list of default Web items that can be used when no items have been explicitly assigned.

TWebContainerComponentHelper (see page 6068) does not actually store this list. It leaves that task to the component that uses TWebContainerComponentHelper (see page 6068). Instead, TWebContainerComponentHelper (see page 6068) uses two events, OnGetDefaultComponentList (see page 6075) and OnSetDefaultComponentList (see page 6075) for reading and writing this list. The associated component that uses TWebContainerComponentHelper (see page 6068) assigns event handlers to these two events, thereby providing the implementation for this property.

See Also

Webcomponents (see page 6074)

OnGetDefaultComponentList (see page 6075)

58.1.10.5.2 TWebContainerComponentHelper.Webcomponents Property

Lists the Web items of the associated component.

Pascal

```
property Webcomponents: TWebComponentList;
```

C++

```
__property TWebComponentList Webcomponents;
```

Description

Webcomponents is the list of Web items that the associated component uses to generate HTML. TWebContainerComponentHelper (see page 6068) stores this list on behalf of the object that uses it.

See Also

DefaultWebComponents (see page 6074)

58.1.10.6 TWebContainerComponentHelper Events

The events of the TWebContainerComponentHelper class are listed here.

Protected Events

	Name	Description
	OnGetDefaultComponentList (see page 6075)	Occurs when TWebContainerComponentHelper (see page 6068) needs to access the value of DefaultWebComponents (see page 6074).
	OnSetDefaultComponentList (see page 6075)	Occurs when TWebContainerComponentHelper (see page 6068) needs to assign the value of DefaultWebComponents (see page 6074).

58.1.10.6.1 TWebContainerComponentHelper.OnGetDefaultComponentList Event

Occurs when TWebContainerComponentHelper (see page 6068) needs to access the value of DefaultWebComponents (see page 6074).

Pascal

```
property OnGetDefaultComponentList: TGetComponentListEvent;
```

C++

```
__property TGetComponentListEvent OnGetDefaultComponentList;
```

Description

The component that uses TWebContainerComponentHelper (see page 6068) assigns an event handler for OnGetDefaultComponentList when it creates the TWebContainerComponentHelper (see page 6068) instance. This event handler provides the underlying read implementation of the DefaultWebComponents (see page 6074) property.

If the component that uses TWebContainerComponentHelper (see page 6068) does not provide an OnGetDefaultComponentList event handler, then the value of the DefaultWebComponents (see page 6074) property is nil (Delphi) or NULL (C++).

See Also

OnSetDefaultComponentList (see page 6075)

DefaultWebComponents (see page 6074)

Create (see page 6069)

58.1.10.6.2 TWebContainerComponentHelper.OnSetDefaultComponentList Event

Occurs when TWebContainerComponentHelper (see page 6068) needs to assign the value of DefaultWebComponents (see page 6074).

Pascal

```
property OnSetDefaultComponentList: TSetComponentListEvent;
```

C++

```
__property TSetComponentListEvent OnSetDefaultComponentList;
```

Description

The component that uses TWebContainerComponentHelper (see page 6068) assigns an event handler for OnSetDefaultComponentList when it creates the TWebContainerComponentHelper (see page 6068) instance. This event handler provides the underlying write implementation of the DefaultWebComponents (see page 6074) property.

If the component that uses TWebContainerComponentHelper (see page 6068) does not provide an OnSetDefaultComponentList event handler, then the value of the DefaultWebComponents (see page 6074) can't be changed.

See Also

OnGetDefaultComponentList (see page 6075)

DefaultWebComponents (see page 6074)

Create (see page 6069)

58.1.11 TWebContentOptions Class

TWebContentOptions controls what a Web item can include in its generated HTML.

Class Hierarchy

Pascal

```
TWebContentOptions = class(TObject);
```

C++

```
class TWebContentOptions : public TObject;
```

File

WebComp

Description

Use TWebContentOptions to influence the HTML generated by a component that supports the IWebContent (see page 6103) interface. Each TWebContentOptions represents a set of flags that are passed to the constructor.

See Also

IWebContent (see page 6103)

58.1.11.1 TWebContentOptions Members

The following tables list the members exposed by TWebContentOptions.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6077)	Creates a new TWebContentOptions (see page 6076) object.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.

	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Flags (see page 6077)	Lists the flags that indicate what type of generated HTML is permitted.

58.1.11.2 TWebContentOptions.Create Constructor

Creates a new TWebContentOptions (see page 6076) object.

Pascal

```
constructor Create(AFlags: TWebContentFlags);
```

C++

```
__fastcall TWebContentOptions(TWebContentFlags AFlags);
```

Description

Call Create to create a TWebContentOptions (see page 6076) instance at runtime. Pass the flags that the object should represent as the value of the AFlags parameter. This value initializes the Flags (see page 6077) property.

See Also

Flags (see page 6077)

58.1.11.3 TWebContentOptions Properties

The properties of the TWebContentOptions class are listed here.

Public Properties

	Name	Description
R	Flags (see page 6077)	Lists the flags that indicate what type of generated HTML is permitted.

58.1.11.3.1 TWebContentOptions.Flags Property

Lists the flags that indicate what type of generated HTML is permitted.

Pascal

```
property Flags: TWebContentFlags;
```

C++

```
__property TWebContentFlags Flags;
```

Description

Read (see page 3634) Flags to determine what types of HTML a Web item can generate.

See Also

Create (see page 6077)

58.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAddFieldsEditor (see page 6079)	This is class WebComp.IAddFieldsEditor.
	IGetWebComponentList (see page 6081)	This is class WebComp.IGetWebComponentList.
	IGetWebComponentNodeName (see page 6082)	This is class WebComp.IGetWebComponentNodeName.
	IGetXMLStream (see page 6083)	This is class WebComp.IGetXMLStream.
	ILayoutWebContent (see page 6084)	ILayoutWebContent lets child Web items adhere to layout rules imposed by their parent.
	INotifyActivateModule (see page 6087)	This is class WebComp.INotifyActivateModule.
	INotifyWebActivate (see page 6088)	This is class WebComp.INotifyWebActivate.
	IProducerEditorViewSupport (see page 6089)	This is class WebComp.IProducerEditorViewSupport.
	ISetWebContentOptions (see page 6091)	This is class WebComp.ISetWebContentOptions.
	ITopLevelWebComponent (see page 6092)	This is class WebComp.ITopLevelWebComponent.
	IWebComponent (see page 6093)	IWebComponent is the interface supported by components that TWebComponentList (see page 6025) manages.
	IWebComponentCommands (see page 6097)	This is class WebComp.IWebComponentCommands.
	IWebComponentContainer (see page 6098)	This is class WebComp.IWebComponentContainer.
	IWebComponentEditor (see page 6100)	IWebComponentEditor enables a Web item to be assigned children in the IDE.
	IWebComponentEditorHelper (see page 6102)	This is class WebComp.IWebComponentEditorHelper.
	IWebContent (see page 6103)	IWebContent is an interface that allows components page producers and Web items to access the HTML generated by other components.
	IWebVariablesContainerName (see page 6104)	This is class WebComp.IWebVariablesContainerName.

58.2.1 IAddFieldsEditor Interface

Class Hierarchy

Pascal

```
IAddFieldsEditor = interface;
```

C++

```
__interface IAddFieldsEditor;
```

File

WebComp

Description

This is class WebComp.IAddFieldsEditor.

58.2.1.1 IAddFieldsEditor Members

The following tables list the members exposed by IAddFieldsEditor.

Public Methods

	Name	Description
	GetAddAllFieldsItem (see page 6080)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 6080)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 6080)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetNewFieldPrefix (see page 6081)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.

58.2.1.2 IAddFieldsEditor Methods

The methods of the IAddFieldsEditor class are listed here.

Public Methods

	Name	Description
	GetAddAllFieldsItem (see page 6080)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 6080)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 6080)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetNewFieldPrefix (see page 6081)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.

58.2.1.2.1 IAddFieldsEditor.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.

58.2.1.2.2 IAddFieldsEditor.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.

58.2.1.2.3 IAddFieldsEditor.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class IAddFieldsEditor.

58.2.1.2.4 IAddFieldsEditor.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall UnicodeString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class IAddFieldsEditor.

58.2.2 IGetWebComponentList Interface

Class Hierarchy

Pascal

```
IGetWebComponentList = interface;
```

C++

```
__interface IGetWebComponentList;
```

File

WebComp

Description

This is class WebComp.IGetWebComponentList.

58.2.2.1 IGetWebComponentList Members

The following tables list the members exposed by IGetWebComponentList.

Public Methods

	Name	Description
	GetComponentList (see page 6082)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 6082)	This is GetDefaultComponentList, a member of class IGetWebComponentList.

58.2.2.2 IGetWebComponentList Methods

The methods of the IGetWebComponentList class are listed here.

Public Methods

	Name	Description
	GetComponentList (see page 6082)	This is GetComponentList, a member of class IGetWebComponentList.
	GetDefaultComponentList (see page 6082)	This is GetDefaultComponentList, a member of class IGetWebComponentList.

58.2.2.2.1 IGetWebComponentList.GetComponentList Method

Pascal

```
function GetComponentList: TObject;
```

C++

```
__fastcall TObject * GetComponentList();
```

Description

This is GetComponentList, a member of class IGetWebComponentList.

58.2.2.2.2 IGetWebComponentList.GetDefaultComponentList Method

Pascal

```
function GetDefaultComponentList: TObject;
```

C++

```
__fastcall TObject * GetDefaultComponentList();
```

Description

This is GetDefaultComponentList, a member of class IGetWebComponentList.

58.2.3 IGetWebComponentNodeName Interface

Class Hierarchy

Pascal

```
IGetWebComponentNodeName = interface;
```

C++

```
__interface IGetWebComponentNodeName;
```

File

WebComp

Description

This is class WebComp.IGetWebComponentNodeName.

58.2.3.1 IGetWebComponentNodeName Members

The following tables list the members exposed by IGetWebComponentNodeName.

Public Methods

	Name	Description
	GetWebComponentNodeName (see page 6083)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.

58.2.3.2 IGetWebComponentNodeName Methods

The methods of the IGetWebComponentNodeName class are listed here.

Public Methods

	Name	Description
	GetWebComponentNodeName (see page 6083)	This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.

58.2.3.2.1 IGetWebComponentNodeName.GetWebComponentNodeName Method

Pascal

```
function GetWebComponentNodeName: string;
```

C++

```
__fastcall UnicodeString GetWebComponentNodeName();
```

Description

This is GetWebComponentNodeName, a member of class IGetWebComponentNodeName.

58.2.4 IGetXMLStream Interface

Class Hierarchy

WebComp.IGetXMLStream

Pascal

```
IGetXMLStream = interface;
```

C++

```
__interface IGetXMLStream;
```

File

WebComp

Description

This is class WebComp.IGetXMLStream.

58.2.4.1 IGetXMLStream Members

The following tables list the members exposed by IGetXMLStream.

Public Methods

	Name	Description
	GetXMLStream (see page 6084)	This is GetXMLStream, a member of class IGetXMLStream.

58.2.4.2 IGetXMLStream Methods

The methods of the IGetXMLStream class are listed here.

Public Methods

	Name	Description
	GetXMLStream (see page 6084)	This is GetXMLStream, a member of class IGetXMLStream.

58.2.4.2.1 IGetXMLStream.GetXMLStream Method

Pascal

```
function GetXMLStream(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLStream(Boolean Owned);
```

Description

This is GetXMLStream, a member of class IGetXMLStream.

58.2.5 ILayoutWebContent Interface

ILayoutWebContent lets child Web items adhere to layout rules imposed by their parent.

Class Hierarchy

Pascal

```
ILayoutWebContent = interface;
```

C++

```
__interface ILayoutWebContent;
```

File

WebComp

Description

The Content method, implemented by all Web items to return the generated HTML, takes as a parameter an object of type TLayout (see page 6112). TLayout (see page 6112) is any object that implements the ILayoutWebContent interface. Typically, this is a descendant of TLayoutWebContent (see page 6014).

Parent components pass the TLayout (see page 6112) object to child Web items to provide helper functions that the child items use to fit their generated content into the parent object's HTML structure (typically a <TABLE> tag). For example, the ILayoutWebContent methods may add <TD> tags around generated HTML that fills the cells of a parent's HTML table.

See Also

TLayout (see page 6112)

IWebContent (see page 6103)

TLayoutWebContent (see page 6014)

58.2.5.1 ILayoutWebContent Members

The following tables list the members exposed by ILayoutWebContent.

Public Methods

	Name	Description
	LayoutButton (see page 6085)	Converts the HTML declaring a button into a form the Web item's parent can use.
	LayoutField (see page 6085)	Converts the HTML declaring a field into a form the Web item's parent can use.
	LayoutLabelAndField (see page 6086)	Converts the HTML declaring a labeled field into a form the Web item's parent can use.
	LayoutTable (see page 6086)	Converts the HTML declaring a table into a form the Web item's parent can use.

58.2.5.2 ILayoutWebContent Methods

The methods of the ILayoutWebContent class are listed here.

Public Methods

	Name	Description
	LayoutButton (see page 6085)	Converts the HTML declaring a button into a form the Web item's parent can use.
	LayoutField (see page 6085)	Converts the HTML declaring a field into a form the Web item's parent can use.
	LayoutLabelAndField (see page 6086)	Converts the HTML declaring a labeled field into a form the Web item's parent can use.
	LayoutTable (see page 6086)	Converts the HTML declaring a table into a form the Web item's parent can use.

58.2.5.2.1 ILayoutWebContent.LayoutButton Method

Converts the HTML declaring a button into a form the Web item's parent can use.

Pascal

```
function LayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall UnicodeString LayoutButton(const UnicodeString HTMLButton, TLayoutAttributes
Attributes);
```

Description

Call LayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form required by the Web item's parent.

HTMLButton is the HTML that declares a button. This is produced by the Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton returns the HTML for the button in a form that can be used by the Web item's parent.

58.2.5.2.2 ILayoutWebContent.LayoutField Method

Converts the HTML declaring a field into a form the Web item's parent can use.

Pascal

```
function LayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall UnicodeString LayoutField(const UnicodeString HTMLField, TLayoutAttributes
Attributes);
```

Description

Call LayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form required by the Web item's parent.

HTMLField is the HTML that declares the field. This is produced by the Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField returns the HTML for the field in a form that can be used by the Web item's parent.

58.2.5.2.3 ILayoutWebContent.LayoutLabelAndField Method

Converts the HTML declaring a labeled field into a form the Web item's parent can use.

Pascal

```
function LayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string;
```

C++

```
__fastcall UnicodeString LayoutLabelAndField(const UnicodeString HTMLLabel, const
UnicodeString HTMLField, TLayoutAttributes Attributes);
```

Description

Call LayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form required by the Web item's parent.

HTMLLabel is the HTML that declares the label. This is produced by the Web item.

HTMLField is the HTML that declares the field. This is produced by the Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField returns the HTML for the field and label in a form that can be used by the Web item's parent.

58.2.5.2.4 ILayoutWebContent.LayoutTable Method

Converts the HTML declaring a table into a form the Web item's parent can use.

Pascal

```
function LayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
```

C++

```
__fastcall UnicodeString LayoutTable(const UnicodeString HTMLTable, TLayoutAttributes
Attributes);
```

Description

Call LayoutTable to convert the HTML that declares a table (typically a structure used to layout the content produced by the Web item's children) into the form required by the Web item's parent.

HTMLTable is the HTML that declares the table. This is produced by the Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the table.

LayoutTable returns the HTML for the table in a form that can be used by the Web item's parent.

58.2.6 INotifyActivateModule Interface

Class Hierarchy

Pascal

```
INotifyActivateModule = interface;
```

C++

```
__interface INotifyActivateModule;
```

File

WebComp

Description

This is class WebComp.INotifyActivateModule.

58.2.6.1 INotifyActivateModule Members

The following tables list the members exposed by INotifyActivateModule.

Public Methods

	Name	Description
	NotifyActivateModule (see page 6087)	This is NotifyActivateModule, a member of class INotifyActivateModule.
	NotifyDeactivateModule (see page 6088)	This is NotifyDeactivateModule, a member of class INotifyActivateModule.

58.2.6.2 INotifyActivateModule Methods

The methods of the INotifyActivateModule class are listed here.

Public Methods

	Name	Description
	NotifyActivateModule (see page 6087)	This is NotifyActivateModule, a member of class INotifyActivateModule.
	NotifyDeactivateModule (see page 6088)	This is NotifyDeactivateModule, a member of class INotifyActivateModule.

58.2.6.2.1 INotifyActivateModule.NotifyActivateModule Method

Pascal

```
procedure NotifyActivateModule(AWebModule: TComponent);
```

C++

```
__fastcall NotifyActivateModule(TComponent * AWebModule);
```

Description

This is NotifyActivateModule, a member of class INotifyActivateModule.

58.2.6.2.2 INotifyActivateModule.NotifyDeactivateModule Method

Pascal

```
procedure NotifyDeactivateModule(AWebModule: TComponent);
```

C++

```
__fastcall NotifyDeactivateModule(TComponent * AWebModule);
```

Description

This is NotifyDeactivateModule, a member of class INotifyActivateModule.

58.2.7 INotifyWebActivate Interface

Class Hierarchy

Pascal

```
INotifyWebActivate = interface;
```

C++

```
__interface INotifyWebActivate;
```

File

WebComp

Description

This is class WebComp.INotifyWebActivate.

58.2.7.1 INotifyWebActivate Members

The following tables list the members exposed by INotifyWebActivate.

Public Methods

	Name	Description
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.

58.2.7.2 INotifyWebActivate Methods

The methods of the INotifyWebActivate class are listed here.

Public Methods

	Name	Description
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.

58.2.7.2.1 INotifyWebActivate.NotifyActivate Method

Pascal

```
procedure NotifyActivate;
```

C++

```
__fastcall NotifyActivate();
```

Description

This is NotifyActivate, a member of class INotifyWebActivate.

58.2.7.2.2 INotifyWebActivate.NotifyDeactivate Method

Pascal

```
procedure NotifyDeactivate;
```

C++

```
__fastcall NotifyDeactivate();
```

Description

This is NotifyDeactivate, a member of class INotifyWebActivate.

58.2.8 IProducerEditorViewSupport Interface

Class Hierarchy

Pascal

```
IProducerEditorViewSupport = interface;
```

C++

```
__interface IProducerEditorViewSupport;
```

File

WebComp

Description

This is class WebComp.IProducerEditorViewSupport.

58.2.8.1 IProducerEditorViewSupport Members

The following tables list the members exposed by IProducerEditorViewSupport.

Public Methods

	Name	Description
	GetTemplateFileType (see page 6090)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 6090)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 6090)	This is GetXSLData, a member of class IProducerEditorViewSupport.

	HasHTMLBrowserView (see page 6091)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 6091)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 6091)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 6091)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.

58.2.8.2 IProducerEditorViewSupport Methods

The methods of the IProducerEditorViewSupport class are listed here.

Public Methods

	Name	Description
	GetTemplateFileType (see page 6090)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 6090)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 6090)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 6091)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 6091)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 6091)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 6091)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.

58.2.8.2.1 IProducerEditorViewSupport.GetTemplateFileType Method

Pascal

```
function GetTemplateFileType: string;
```

C++

```
__fastcall UnicodeString GetTemplateFileType();
```

Description

This is GetTemplateFileType, a member of class IProducerEditorViewSupport.

58.2.8.2.2 IProducerEditorViewSupport.GetXMLData Method

Pascal

```
function GetXMLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLData(Boolean Owned);
```

Description

This is GetXMLData, a member of class IProducerEditorViewSupport.

58.2.8.2.3 IProducerEditorViewSupport.GetXSLData Method

Pascal

```
function GetXSLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXSLData(Boolean Owned);
```

Description

This is GetXSLData, a member of class IProducerEditorViewSupport.

58.2.8.2.4 IProducerEditorViewSupport.HasHTMLBrowserView Method

Pascal

```
function HasHTMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasHTMLBrowserView();
```

Description

This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.

58.2.8.2.5 IProducerEditorViewSupport.HasScriptView Method

Pascal

```
function HasScriptView: Boolean;
```

C++

```
__fastcall Boolean HasScriptView();
```

Description

This is HasScriptView, a member of class IProducerEditorViewSupport.

58.2.8.2.6 IProducerEditorViewSupport.HasXMLBrowserView Method

Pascal

```
function HasXMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXMLBrowserView();
```

Description

This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.

58.2.8.2.7 IProducerEditorViewSupport.HasXSLBrowserView Method

Pascal

```
function HasXSLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXSLBrowserView();
```

Description

This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.

58.2.9 ISetWebContentOptions Interface

Class Hierarchy

Pascal

```
ISetWebContentOptions = interface;
```

C++

```
__interface ISetWebContentOptions;
```

File

WebComp

Description

This is class WebComp.ISetWebContentOptions.

58.2.9.1 ISetWebContentOptions Members

The following tables list the members exposed by ISetWebContentOptions.

Public Methods

	Name	Description
	SetWebContentOptions (see page 6092)	This is SetWebContentOptions, a member of class ISetWebContentOptions.

58.2.9.2 ISetWebContentOptions Methods

The methods of the ISetWebContentOptions class are listed here.

Public Methods

	Name	Description
	SetWebContentOptions (see page 6092)	This is SetWebContentOptions, a member of class ISetWebContentOptions.

58.2.9.2.1 ISetWebContentOptions.SetWebContentOptions Method

Pascal

```
procedure SetWebContentOptions(AOptions: TWebContentOptions);
```

C++

```
__fastcall SetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is SetWebContentOptions, a member of class ISetWebContentOptions.

58.2.10 ITopLevelWebComponent Interface

Class Hierarchy

Pascal

```
ITopLevelWebComponent = interface;
```

C++

```
__interface ITopLevelWebComponent;
```

File

WebComp

Description

This is class WebComp.ITopLevelWebComponent.

58.2.11 IWebComponent Interface

IWebComponent is the interface supported by components that TWebComponentList (see page 6025) manages.

Class Hierarchy

Pascal

```
IWebComponent = interface;
```

C++

```
__interface IWebComponent;
```

File

WebComp

Description

TWebComponentList (see page 6025) uses IWebComponent to ensure that all components in its list have access to information about how they fit in the hierarchy of Web items.

Note: VCL methods that work with the IWebComponent interface wrap it using the DelphiInterface (see page 3256) class:

Note: typedef System::DelphiInterface (see page 3256)< IWebComponent > _di_IWebComponent;

See Also

TWebComponentList (see page 6025)

58.2.11.1 IWebComponent Members

The following tables list the members exposed by IWebComponent.

Public Methods

	Name	Description
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.

58.2.11.2 IWebComponent Methods

The methods of the IWebComponent class are listed here.

Public Methods

	Name	Description
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

58.2.11.2.1 IWebComponent.GetContainer Method

Returns the value of the Container (see page 6096) property.

Pascal

```
function GetContainer: TWebComponentContainer;
```

C++

```
__fastcall TWebComponentContainer GetContainer();
```

Description

GetContainer is the read method for the Container (see page 6096) property.

See Also

Container (see page 6096)

58.2.11.2.2 IWebComponent.GetIndex Method

Returns the value of the Index (see page 6097) property.

Pascal

```
function GetIndex: Integer;
```

C++

```
__fastcall int GetIndex();
```

Description

GetIndex is the read method for the Index (see page 6097) property.

See Also

Index (see page 6097)

58.2.11.2.3 IWebComponent.SetComponentList Method

Sets the value of the ComponentList (see page 6096) property.

Pascal

```
procedure SetComponentList(List: TObject);
```

C++

```
__fastcall SetComponentList(TObject * List);
```

Description

SetComponentList is the write method for the ComponentList (see page 6096) property. The List parameter specifies the value to assign to ComponentList (see page 6096).

See Also

ComponentList (see page 6096)

58.2.11.2.4 IWebComponent.SetContainer Method

Sets the value of the Container (see page 6096) property.

Pascal

```
procedure SetContainer(Container: TWebComponentContainer);
```

C++

```
__fastcall SetContainer(TWebComponentContainer Container);
```

Description

SetContainer is the write method for the Container (see page 6096) property. The Container (see page 6096) parameter specifies the value to assign to Container (see page 6096).

See Also

Container (see page 6096)

58.2.11.2.5 IWebComponent.SetIndex Method

Sets the value of the Index (see page 6097) property.

Pascal

```
procedure SetIndex(Value: Integer);
```

C++

```
__fastcall SetIndex(int Value);
```

Description

SetIndex is the write method for the Index (see page 6097) property. The Value parameter specifies the value to assign to Index (see page 6097).

See Also

Index (see page 6097)

58.2.11.3 IWebComponent Properties

The properties of the IWebComponent class are listed here.

Public Properties

	Name	Description
	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.

58.2.11.3.1 IWebComponent.ComponentList Property

Indicates the component list that contains the Web item.

Pascal

```
property ComponentList: TObject;
```

C++

```
__property TObject * ComponentList;
```

Description

The Web component list assigns a value to ComponentList when the component is added to it. The component can use this value to access the list and obtain information about the other components in the list.

Note that the IWebComponent (see page 6093) interface does not include any methods for reading the value of ComponentList.

See Also

Container (see page 6096)

Index (see page 6097)

TWebComponentList (see page 6025)

58.2.11.3.2 IWebComponent.Container Property

Specifies the component that uses content generated by this Web item.

Pascal

```
property Container: TWebComponentContainer;
```

C++

```
__property TWebComponentContainer Container;
```

Description

Web items are arranged in a hierarchy, where each item generates its content using content produced by its children. Container specifies the parent that uses the content of this Web item. Container maintains a list of all its children using a TWebComponentList (see page 6025) object.

See Also

ComponentList (see page 6096)

ParentComponent (see page 6034)

58.2.11.3.3 IWebComponent.Index Property

Indicates where the Web item appears in the Web component list's array of Web items.

Pascal

```
property Index: Integer;
```

C++

```
__property int Index;
```

Description

The Web component list sets Index to indicate where the component sits in its WebComponents property array.

See Also

WebComponents (see page 6034)

58.2.12 IWebComponentCommands Interface

Class Hierarchy

Pascal

```
IWebComponentCommands = interface;
```

C++

```
__interface IWebComponentCommands;
```

File

WebComp

Description

This is class WebComp.IWebComponentCommands.

58.2.12.1 IWebComponentCommands Members

The following tables list the members exposed by IWebComponentCommands.

Public Methods

	Name	Description
	ExecuteVerb (see page 6098)	This is ExecuteVerb, a member of class IWebComponentCommands.
	GetVerb (see page 6098)	This is GetVerb, a member of class IWebComponentCommands.
	GetVerbCount (see page 6098)	This is GetVerbCount, a member of class IWebComponentCommands.

58.2.12.2 IWebComponentCommands Methods

The methods of the IWebComponentCommands class are listed here.

Public Methods

	Name	Description
	ExecuteVerb (see page 6098)	This is ExecuteVerb, a member of class IWebComponentCommands.
	GetVerb (see page 6098)	This is GetVerb, a member of class IWebComponentCommands.
	GetVerbCount (see page 6098)	This is GetVerbCount, a member of class IWebComponentCommands.

58.2.12.2.1 IWebComponentCommands.ExecuteVerb Method

Pascal

```
procedure ExecuteVerb(AComponent: TComponent; Index: Integer);
```

C++

```
__fastcall ExecuteVerb(TComponent * AComponent, int Index);
```

Description

This is ExecuteVerb, a member of class IWebComponentCommands.

58.2.12.2.2 IWebComponentCommands.GetVerb Method

Pascal

```
function GetVerb(AComponent: TComponent; Index: Integer): string;
```

C++

```
__fastcall UnicodeString GetVerb(TComponent * AComponent, int Index);
```

Description

This is GetVerb, a member of class IWebComponentCommands.

58.2.12.2.3 IWebComponentCommands.GetVerbCount Method

Pascal

```
function GetVerbCount(AComponent: TComponent): Integer;
```

C++

```
__fastcall int GetVerbCount(TComponent * AComponent);
```

Description

This is GetVerbCount, a member of class IWebComponentCommands.

58.2.13 IWebComponentContainer Interface

Class Hierarchy

Pascal

```
IWebComponentContainer = interface;
```

C++

```
__interface IWebComponentContainer;
```

File

WebComp

Description

This is class WebComp.IWebComponentContainer.

58.2.13.1 IWebComponentContainer Members

The following tables list the members exposed by IWebComponentContainer.

Public Methods

	Name	Description
	GetComponent (see page 6099)	This is GetComponent, a member of class IWebComponentContainer.
	GetComponentCount (see page 6099)	This is GetComponentCount, a member of class IWebComponentContainer.

Public Properties

	Name	Description
R	ComponentCount (see page 6100)	This is ComponentCount, a member of class IWebComponentContainer.
R	Components (see page 6100)	This is Components, a member of class IWebComponentContainer.

58.2.13.2 IWebComponentContainer Methods

The methods of the IWebComponentContainer class are listed here.

Public Methods

	Name	Description
	GetComponent (see page 6099)	This is GetComponent, a member of class IWebComponentContainer.
	GetComponentCount (see page 6099)	This is GetComponentCount, a member of class IWebComponentContainer.

58.2.13.2.1 IWebComponentContainer.GetComponent Method

Pascal

```
function GetComponent(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetComponent(int I);
```

Description

This is GetComponent, a member of class IWebComponentContainer.

58.2.13.2.2 IWebComponentContainer.GetComponentCount Method

Pascal

```
function GetComponentCount: Integer;
```

C++

```
__fastcall int GetComponentCount();
```

Description

This is GetComponentCount, a member of class IWebComponentContainer.

58.2.13.3 IWebComponentContainer Properties

The properties of the IWebComponentContainer class are listed here.

Public Properties

	Name	Description
	ComponentCount (see page 6100)	This is ComponentCount, a member of class IWebComponentContainer.
	Components (see page 6100)	This is Components, a member of class IWebComponentContainer.

58.2.13.3.1 IWebComponentContainer.ComponentCount Property

Pascal

```
property ComponentCount: Integer;
```

C++

```
__property int ComponentCount;
```

Description

This is ComponentCount, a member of class IWebComponentContainer.

58.2.13.3.2 IWebComponentContainer.Components Property

Pascal

```
property Components [I: Integer]: TComponent;
```

C++

```
__property TComponent * Components[int I];
```

Description

This is Components, a member of class IWebComponentContainer.

58.2.14 IWebComponentEditor Interface

IWebComponentEditor enables a Web item to be assigned children in the IDE.

Class Hierarchy

WebComp.IWebComponentEditor

Pascal

```
IWebComponentEditor = interface;
```

C++

```
__interface IWebComponentEditor;
```

File

WebComp

Description

When the Web Page editor builds the list of new items that can be added as the child of a Web item, it calls the

IWebComponentEditor interface. Components that contain child items for generating portions of their HTML content must implement this interface so that the Web Page editor can display the appropriate list of components to add.

IWebComponentEditor defines a single method, CanAddClass (see page 6101), which indicates whether a specified class can be used for a child Web item by the Web item that implements the interface.

See Also

IRestoreDefaults

TAdapterPageProducer (see page 1136)

TInetXPageProducer

TWebForm

TWebControlGroup

TAdapterSubComponent (see page 5406)

58.2.14.1 IWebComponentEditor Members

The following tables list the members exposed by IWebComponentEditor.

Public Methods

	Name	Description
	CanAddClass (see page 6101)	Indicates whether a specified class can be used as a child Web item.

58.2.14.2 IWebComponentEditor Methods

The methods of the IWebComponentEditor class are listed here.

Public Methods

	Name	Description
	CanAddClass (see page 6101)	Indicates whether a specified class can be used as a child Web item.

58.2.14.2.1 IWebComponentEditor.CanAddClass Method

Indicates whether a specified class can be used as a child Web item.

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

The Web page editor calls CanAddClass to determine what Web items can be added to supply content for the Web item that implements this interface.

AParent is the Web item that will act as a parent to the added Web item.

AClass is the class of the proposed child Web item.

CanAddClass returns true if the Web item can use content generated by a component of type AClass, false otherwise.

58.2.15 IWebComponentEditorHelper Interface

Class Hierarchy

Pascal

```
IWebComponentEditorHelper = interface;
```

C++

```
__interface IWebComponentEditorHelper;
```

File

WebComp

Description

This is class WebComp.IWebComponentEditorHelper.

58.2.15.1 IWebComponentEditorHelper Members

The following tables list the members exposed by IWebComponentEditorHelper.

Public Methods

	Name	Description
	CanAddClassHelper (see page 6102)	This is CanAddClassHelper, a member of class IWebComponentEditorHelper.

58.2.15.2 IWebComponentEditorHelper Methods

The methods of the IWebComponentEditorHelper class are listed here.

Public Methods

	Name	Description
	CanAddClassHelper (see page 6102)	This is CanAddClassHelper, a member of class IWebComponentEditorHelper.

58.2.15.2.1 IWebComponentEditorHelper.CanAddClassHelper Method

Pascal

```
function CanAddClassHelper(AEditor: TComponent; AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClassHelper(TComponent * AEditor, TComponent * AParent, TClass
AClass);
```

Description

This is CanAddClassHelper, a member of class IWebComponentEditorHelper.

58.2.16 IWebContent Interface

IWebContent is an interface that allows components page producers and Web items to access the HTML generated by other components.

Class Hierarchy

Pascal

```
IWebContent = interface;
```

C++

```
__interface IWebContent;
```

File

WebComp

Description

TInetXPageProducer, TAdapterPageProducer, and TComponentsPageProducer create HTML documents that include content generated by other components, called Web items. Similarly, the Web items that generate content can make use of other Web items when producing their content.

For a component to act as a Web item, it must support the IWebContent interface. This interface defines one new method, Content (see page 6104), which returns the HTML generated by the Web item.

Note: The only other required interface for Web items is IWebComponent (see page 6093).

See Also

TAdapterPageProducer (see page 1136)

TInetXPageProducer

TBasePageItemsProducer

TWebComponentList (see page 6025)

Customizing the InternetExpress Page Producer Template

58.2.16.1 IWebContent Members

The following tables list the members exposed by IWebContent.

Public Methods

	Name	Description
	Content (see page 6104)	Returns the HTML that the Web item generates.

58.2.16.2 IWebContent Methods

The methods of the IWebContent class are listed here.

Public Methods

	Name	Description
	Content (see page 6104)	Returns the HTML that the Web item generates.

58.2.16.2.1 IWebContent.Content Method

Returns the HTML that the Web item generates.

Pascal

```
function Content(Options: TWebContentOptions; ParentLayout: TLayout): string;
```

C++

```
__fastcall UnicodeString Content(TWebContentOptions Options, TLayout ParentLayout);
```

Description

Call Content to access the HTML produced by the Web item.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web item should lay out its constituent parts. This object supports the ILayoutWebContent (see page 6084) interface, which the Web item uses to fit its own content into the parent's HTML structures.

Content returns a string of HTML produced by the Web item.

See Also

ILayoutWebContent (see page 6084)

58.2.17 IWebVariablesContainerName Interface

Class Hierarchy

Pascal

```
IWebVariablesContainerName = interface;
```

C++

```
__interface IWebVariablesContainerName;
```

File

WebComp

Description

This is class WebComp.IWebVariablesContainerName.

58.2.17.1 IWebVariablesContainerName Members

The following tables list the members exposed by IWebVariablesContainerName.

Public Methods

	Name	Description
	GetContainerName (see page 6105)	This is GetContainerName, a member of class IWebVariablesContainerName.

Public Properties

	Name	Description
R	ContainerName (see page 6105)	This is ContainerName, a member of class IWebVariablesContainerName.

58.2.17.2 IWebVariablesContainerName Methods

The methods of the IWebVariablesContainerName class are listed here.

Public Methods

	Name	Description
	GetContainerName (see page 6105)	This is GetContainerName, a member of class IWebVariablesContainerName.

58.2.17.2.1 IWebVariablesContainerName.GetContainerName Method

Pascal

```
function GetContainerName: string;
```

C++

```
__fastcall UnicodeString GetContainerName();
```

Description

This is GetContainerName, a member of class IWebVariablesContainerName.

58.2.17.3 IWebVariablesContainerName Properties

The properties of the IWebVariablesContainerName class are listed here.

Public Properties

	Name	Description
R	ContainerName (see page 6105)	This is ContainerName, a member of class IWebVariablesContainerName.

58.2.17.3.1 IWebVariablesContainerName.ContainerName Property

Pascal

```
property ContainerName: string;
```

C++

```
__property UnicodeString ContainerName;
```

Description

This is ContainerName, a member of class IWebVariablesContainerName.

58.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	DesigningComponent (see page 6106)	This is function WebComp.DesigningComponent.
	EnumRegisteredWebComponents (see page 6106)	This is function WebComp.EnumRegisteredWebComponents.
	FindWebComponentEditorHelper (see page 6107)	This is function WebComp.FindWebComponentEditorHelper.
	QualifyFileName (see page 6107)	This is function WebComp.QualifyFileName.
	RegisterWebComponents (see page 6107)	This is function WebComp.RegisterWebComponents.
	UnRegisterWebComponents (see page 6108)	This is function WebComp.UnRegisterWebComponents.
	ValidateWebParent (see page 6108)	This is function WebComp.ValidateWebParent.

58.3.1 WebComp.DesigningComponent Function

Pascal

```
function DesigningComponent(AComponent: TComponent): Boolean;
```

C++

```
Boolean DesigningComponent(TComponent * AComponent);
```

File

WebComp

Description

This is function WebComp.DesigningComponent.

58.3.2 WebComp.EnumRegisteredWebComponents Function

Pascal

```
procedure EnumRegisteredWebComponents(Proc: TEnumWebComponentsProc; Info: Pointer);
```

C++

```
EnumRegisteredWebComponents(TEnumWebComponentsProc Proc, void * Info);
```

File

WebComp

Description

This is function WebComp.EnumRegisteredWebComponents.

58.3.3 WebComp.FindWebComponentEditorHelper Function

Pascal

```
function FindWebComponentEditorHelper(AClass: TClass): TObject;
```

C++

```
TObject * FindWebComponentEditorHelper(TClass AClass);
```

File

WebComp

Description

This is function WebComp.FindWebComponentEditorHelper.

58.3.4 WebComp.QualifyFileName Function

Pascal

```
function QualifyFileName(const AFileName: string): string;
```

C++

```
UnicodeString QualifyFileName(const UnicodeString AFileName);
```

File

WebComp

Description

This is function WebComp.QualifyFileName.

58.3.5 WebComp.RegisterWebComponents Function

Pascal

```
procedure RegisterWebComponents(const AClasses: array of TComponentClass; Editor: TObject =
nil);
```

C++

```
RegisterWebComponents(const array of TComponentClass AClasses, TObject * Editor = nil);
```

File

WebComp

Description

This is function WebComp.RegisterWebComponents.

58.3.6 WebComp.UnRegisterWebComponents Function

Pascal

```
procedure UnRegisterWebComponents(const AClasses: array of TComponentClass);
```

C++

```
UnRegisterWebComponents(const array of TComponentClass AClasses);
```

File

WebComp

Description

This is function WebComp.UnRegisterWebComponents.

58.3.7 WebComp.ValidateWebParent Function

Pascal

```
procedure ValidateWebParent(AComponent: TComponent; AParent: TComponent);
```

C++

```
ValidateWebParent(TComponent * AComponent, TComponent * AParent);
```

File

WebComp

Description

This is function WebComp.ValidateWebParent.

58.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TLabelPosition (see page 6109)	This is record WebComp.TLabelPosition.
	TWebContentFlag (see page 6109)	TWebContentFlags (see page 6113) indicates the type of HTML a Web item can produce.

58.4.1 WebComp.TLabelPosition Enumeration

Pascal

```
TLabelPosition = (
  lposLeft,
  lposRight,
  lposAbove,
  lposBelow
);
```

C++

```
enum TLabelPosition {
  lposLeft,
  lposRight,
  lposAbove,
  lposBelow
};
```

File

WebComp

Description

This is record WebComp.TLabelPosition.

58.4.2 WebComp.TWebContentFlag Enumeration

TWebContentFlags (see page 6113) indicates the type of HTML a Web item can produce.

Pascal

```
TWebContentFlag = (
  coNoScript,
  coLocalPaths,
  coNoExecuteScript
);
```

C++

```
enum TWebContentFlag {
  coNoScript,
  coLocalPaths,
```

```
  coNoExecuteScript
};
```

File

WebComp

Description

TWebContentFlags (see page 6113) is a set of TWebContentFlag values. It can include zero or more of the following values:

Value	Meaning
coNoScript	The generated HTML can't contain any client-side script such as javascript.
coLocalPaths	The generated HTML can use local paths to included resources rather than requiring URLs. This option is for HTML documents that are only viewed on the same machine as the included resources.
coNoExecuteScript	The item generates its HTML in a class-specific manner, ignoring any server-side script that may be included in the application.

58.5 Types

The following table lists types in this documentation.

Types

Name	Description
TEnumWebComponentsProc (see page 6111)	This is type WebComp.TEnumWebComponentsProc.
TGetComponentListEvent (see page 6111)	TGetComponentListEvent is the type for event handlers that supply a list of child Web items.
TLayout (see page 6112)	TLayout is the type for helper objects that generate layout code for a Web item.
TSetComponentListEvent (see page 6112)	This is type WebComp.TSetComponentListEvent.
TWebComponentContainer (see page 6113)	TWebComponentContainer is the type for components that maintain a list of Web items.
TWebContentFlags (see page 6113)	This is type WebComp.TWebContentFlags.

58.5.1 WebComp.TEnumWebComponentsProc Type

Pascal

```
TEnumWebComponentsProc = procedure (WebComponentClass: TWebComponentClassDescription; Info:
Pointer) of object;
```

C++

```
(WebComponentClass: TWebComponentClassDescription; Info: Pointer) ( TEnumWebComponentsProc)();
```

File

WebComp

Description

This is type WebComp.TEnumWebComponentsProc.

58.5.2 WebComp.TGetComponentListEvent Type

TGetComponentListEvent is the type for event handlers that supply a list of child Web items.

Pascal

```
TGetComponentListEvent = procedure (Sender: TObject; var AList: TWebComponentList) of object;
```

C++

```
(Sender: TObject; var AList: TWebComponentList) ( TGetComponentListEvent)();
```

File

WebComp

Description

TGetComponentListEvent is the type for event handlers of helper objects that manage the lists of child Web items for a component in a WebSnap application.

Sender is the helper object that needs to access the list of child Web items.

AList returns the list of child Web items.

See Also

Procedural types

Creating events

58.5.3 WebComp.TLayout Type

TLayout is the type for helper objects that generate layout code for a Web item.

Pascal

```
TLayout = TObject;
```

C++

```
TObject * TLayout;
```

File

WebComp

Description

TLayout is the type for objects that Web items use to transmit common functions that control the layout of HTML controls. When a Web item generates content that includes HTML produced by child components, it passes a TLayout object to those children. The TLayout object implements an interface (ILayoutWebContent (see page 6084)) that generates HTML to lay out the controls which the child components generate.

Note: Typically, TLayout objects are descendants of TLayoutWebContent (see page 6014).

See Also

IWebContent (see page 6103)

ILayoutWebContent (see page 6084)

TLayoutWebContent (see page 6014)

58.5.4 WebComp.TSetComponentListEvent Type

Pascal

```
TSetComponentListEvent = procedure (Sender: TObject; AList: TWebComponentList) of object;
```

C++

```
(Sender: TObject; AList: TWebComponentList) ( TSetComponentListEvent)();
```

File

WebComp

Description

This is type WebComp.TSetComponentListEvent.

58.5.5 WebComp.TWebComponentContainer Type

TWebComponentContainer is the type for components that maintain a list of Web items.

Pascal

```
TWebComponentContainer = TObject;
```

C++

```
TObject * TWebComponentContainer;
```

File

WebComp

Description

TWebComponentContainer is the type for objects that make use of Web items (components that generate HTML and support the IWebContent (see page 6103) interface). Each TWebComponentContainer has a property of type TWebComponentList (see page 6025) that lists its Web items. The TWebComponentContainer uses these Web items to generate constituent parts of the HTML that it generates.

See Also

TWebComponentList (see page 6025)

IWebContent (see page 6103)

58.5.6 WebComp.TWebContentFlags Type

Pascal

```
TWebContentFlags = set of TWebContentFlag;
```

C++

```
TWebContentFlag TWebContentFlags;
```

File

WebComp

Description

This is type WebComp.TWebContentFlags.

58.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
EnumRegisteredWebComponentsProc (see page 6114)	This is constant WebComp.EnumRegisteredWebComponentsProc.
FindWebComponentEditorHelperProc (see page 6114)	This is constant WebComp.FindWebComponentEditorHelperProc.
RegisterWebComponentsProc (see page 6115)	This is constant WebComp.RegisterWebComponentsProc.
UnRegisterWebComponentsProc (see page 6115)	This is constant WebComp.UnRegisterWebComponentsProc.

58.6.1 WebComp.EnumRegisteredWebComponentsProc Constant

Pascal

```
EnumRegisteredWebComponentsProc: procedure (Proc: TEnumWebComponentsProc; Info: Pointer) = nil;
```

C++

```
procedure (Proc: TEnumWebComponentsProc; Info: Pointer) EnumRegisteredWebComponentsProc = nil;
```

File

WebComp

Description

This is constant WebComp.EnumRegisteredWebComponentsProc.

58.6.2 WebComp.FindWebComponentEditorHelperProc Constant

Pascal

```
FindWebComponentEditorHelperProc: function (AClass: TClass): TObject = nil;
```

C++

```
function (AClass: TClass): TObject FindWebComponentEditorHelperProc = nil;
```

File

WebComp

Description

This is constant WebComp.FindWebComponentEditorHelperProc.

58.6.3 WebComp.RegisterWebComponentsProc Constant

Pascal

```
RegisterWebComponentsProc: procedure ( const AClasses: array of TComponentClass; Editor:
TObject) = nil;
```

C++

```
procedure ( const AClasses: array of TComponentClass; Editor: TObject)
RegisterWebComponentsProc = nil;
```

File

WebComp

Description

This is constant WebComp.RegisterWebComponentsProc.

58.6.4 WebComp.UnRegisterWebComponentsProc Constant

Pascal

```
UnRegisterWebComponentsProc: procedure (const AClasses: array of TComponentClass) = nil;
```

C++

```
procedure (const AClasses: array of TComponentClass) UnRegisterWebComponentsProc = nil;
```

File

WebComp

Description

This is constant WebComp.UnRegisterWebComponentsProc.

59 WebContnrs Namespace

This is namespace WebContnrs.

Topics

Name	Description
Classes (see page 6118)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 6140)	The following table lists structs, records, enums in this documentation.
Types (see page 6141)	The following table lists types in this documentation.

Classes

	Name	Description
	ENamedVariantsError (see page 6118)	ENamedVariantsError is the exception for errors encountered by a TNamedVariantsList (see page 6134) object.
	TAbstractNamedVariants (see page 6118)	TAbstractNamedVariants is the base class for persistent lists of Variant (see page 3421) values.
	TNamedVariantsList (see page 6134)	TNamedVariantsList is a persistent list of name/Variant (see page 3421) pairs.

Structs, Records, Enums

	Name	Description
	TNamedVariantItem (see page 6140)	This is record WebContnrs.TNamedVariantItem.

Types

Name	Description
PNamedVariantItem (see page 6141)	This is type WebContnrs.PNamedVariantItem.
PNamedVariantList (see page 6141)	This is type WebContnrs.PNamedVariantList.
TNamedVariantList (see page 6141)	This is type WebContnrs.TNamedVariantList.

59.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ENamedVariantsError (see page 6118)	ENamedVariantsError is the exception for errors encountered by a TNamedVariantsList (see page 6134) object.
	TAbstractNamedVariants (see page 6118)	TAbstractNamedVariants is the base class for persistent lists of Variant (see page 3421) values.
	TNamedVariantsList (see page 6134)	TNamedVariantsList is a persistent list of name/Variant (see page 3421) pairs.

59.1.1 ENamedVariantsError Class

ENamedVariantsError is the exception for errors encountered by a TNamedVariantsList (see page 6134) object.

Class Hierarchy

Pascal

```
ENamedVariantsError = class(Exception);
```

C++

```
class ENamedVariantsError : public Exception;
```

File

WebContnrs

Description

ENamedVariantsError is raised when an error occurs in TNamedVariantsList (see page 6134). For example, when an application supplies an invalid index to one of the TNamedVariantsList (see page 6134) methods, it raises an ENamedVariantsError exception.

See Also

TNamedVariantsList (see page 6134)

59.1.2 TAbstractNamedVariants Class

TAbstractNamedVariants is the base class for persistent lists of Variant (see page 3421) values.

Class Hierarchy

Pascal

```
TAbstractNamedVariants = class(TPersistent);
```

C++

```
class TAbstractNamedVariants : public TPersistent;
```

File

WebContnrs

Description

Use TAbstractNamedVariants as a base class for objects that represents a set of name/value pairs where the values are all Variants (see page 6133). TAbstractNamedVariants is a descendant of TPersistent, which means that if it is the type of a published property on a component, the named variants list is saved with the component.

Do not create instances of TAbstractNamedVariants: This class contains abstract or, in C++ terminology, pure virtual methods. Instead, use a descendant of TAbstractNamedVariants such as TNamedVariantsList (see page 6134). TNamedVariantsList (see page 6134) provides an implementation for the abstract or pure virtual methods introduced in TAbstractNamedVariants.

See Also

TStrings

TCollection

TList

TNamedVariantsList (see page 6134)

59.1.2.1 TAbstractNamedVariants Members

The following tables list the members exposed by TAbstractNamedVariants.

Protected Methods

	Name	Description
	CompareStrings (see page 6123)	Compares two strings.
	DefineProperties (see page 6124)	Allows the list of names and their corresponding Variant (see page 3421) values to be saved with the named Variants (see page 6133) list.
	Error (see page 6126)	Raises an ENamedVariantsError (see page 6118) exception.
	Get (see page 6126)	Retrieves the name and Variant (see page 3421) stored at a specified position in the list.
	GetCapacity (see page 6127)	Returns the value of the Capacity (see page 6131) property.
	GetCount (see page 6127)	Returns the value of the Count (see page 6131) property.
	Put (see page 6129)	Stores a name/Variant (see page 3421) pair at a specified position in the list.
	SetCapacity (see page 6130)	Sets the value of the Capacity (see page 6131) property.
	SetUpdateState (see page 6130)	Responds when an update operation begins or ends.

Protected Properties

	Name	Description
	UpdateCount (see page 6132)	Indicates the number of calls to BeginUpdate (see page 6122) that have not been matched by a corresponding call to EndUpdate (see page 6125).

Public Methods

	Name	Description
	Add (see page 6121)	Adds a named Variant (see page 3421) to the end of the list.
	Append (see page 6122)	Adds a named Variant (see page 3421) to the end of the list.
	Assign (see page 6122)	Copies the list of named Variants (see page 6133) from another object.
	BeginUpdate (see page 6122)	Signals the start of an update operation.
	Clear (see page 6123)	Empties the list of all its name/Variant (see page 3421) pairs.
	Delete (see page 6124)	Deletes an entry from the list.

	Destroy (see page 6120)	Disposes of an object instance.
	EndUpdate (see page 6125)	Signals the end of an update operation.
	Equals (see page 6125)	Compares this named Variants (see page 6133) list with another one.
	Exchange (see page 6126)	Swaps the positions of two items in the list.
	IndexOfName (see page 6128)	Returns the index of the first item in the list with a specified name.
	Insert (see page 6128)	Inserts a name/Variant (see page 3421) pair at a specified position.
	Move (see page 6129)	Moves a name/Variant (see page 3421) pair to a new position in the list.

Public Properties

	Name	Description
	Capacity (see page 6131)	Specifies the allocated size of the named variants list.
	Count (see page 6131)	Indicates the number of name/value pairs in the list.
	Names (see page 6132)	Lists the names of all the Variants (see page 6133) in the list.
	Values (see page 6133)	Lists the Variants (see page 6133) in the list by name.
	Variants (see page 6133)	Lists the Variants in the list by position.

59.1.2.2 TAbstractNamedVariants.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAbstractNamedVariants();
```

Description

Do not call ~Destroy directly. Instead, use the delete keyword when destroying VCL objects.

~Destroy deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

Warning: Never destroy a component from one of its own event handlers or from the event handler of a component it owns or contains. For example, don't destroy a button, or the form that owns the button, in the button's OnClick event handler.

To destroy a form, call its Release (see page 3641) method, which destroys the form and releases the memory allocated for it after all its event handlers and those of the components it contains have executed.

See Also

delete

59.1.2.3 TAbstractNamedVariants Methods

The methods of the TAbstractNamedVariants class are listed here.

Protected Methods

	Name	Description
	CompareStrings (see page 6123)	Compares two strings.

	DefineProperties (see page 6124)	Allows the list of names and their corresponding Variant (see page 3421) values to be saved with the named Variants (see page 6133) list.
	Error (see page 6126)	Raises an ENamedVariantsError (see page 6118) exception.
	Get (see page 6126)	Retrieves the name and Variant (see page 3421) stored at a specified position in the list.
	GetCapacity (see page 6127)	Returns the value of the Capacity (see page 6131) property.
	GetCount (see page 6127)	Returns the value of the Count (see page 6131) property.
	Put (see page 6129)	Stores a name/Variant (see page 3421) pair at a specified position in the list.
	SetCapacity (see page 6130)	Sets the value of the Capacity (see page 6131) property.
	SetUpdateState (see page 6130)	Responds when an update operation begins or ends.

Public Methods

	Name	Description
	Add (see page 6121)	Adds a named Variant (see page 3421) to the end of the list.
	Append (see page 6122)	Adds a named Variant (see page 3421) to the end of the list.
	Assign (see page 6122)	Copies the list of named Variants (see page 6133) from another object.
	BeginUpdate (see page 6122)	Signals the start of an update operation.
	Clear (see page 6123)	Empties the list of all its name/Variant (see page 3421) pairs.
	Delete (see page 6124)	Deletes an entry from the list.
	EndUpdate (see page 6125)	Signals the end of an update operation.
	Equals (see page 6125)	Compares this named Variants (see page 6133) list with another one.
	Exchange (see page 6126)	Swaps the positions of two items in the list.
	IndexOfName (see page 6128)	Returns the index of the first item in the list with a specified name.
	Insert (see page 6128)	Inserts a name/Variant (see page 3421) pair at a specified position.
	Move (see page 6129)	Moves a name/Variant (see page 3421) pair to a new position in the list.

59.1.2.3.1 TAbstractNamedVariants.Add Method

Adds a named Variant (see page 3421) to the end of the list.

Pascal

```
function Add(const S: string; const AValue: Variant): Integer; virtual;
```

C++

```
virtual __fastcall int Add(const UnicodeString S, const Variant AValue);
```

Description

Call Add to add a name/Variant (see page 3421) pair to the end of the list. Add adds a new name/Variant (see page 3421) pair to the list with a position index equal to the value of the Count (see page 6131) property.

S is the name of the Variant (see page 3421) value. This can be used to look up the value using the Values (see page 6133) property.

AValue is the Variant (see page 3421) value to associate with S.

Note: Unlike setting the Values (see page 6133) property, calling Add adds a duplicate name/Variant (see page 3421) pair to the list if S matches the name of a Variant (see page 3421) that is already in the list.

See Also

Values (see page 6133)

Append (see page 6122)

Insert (see page 6128)

Delete (see page 6124)

Count (see page 6131)

59.1.2.3.2 TAbstractNamedVariants.Append Method

Adds a named Variant (see page 3421) to the end of the list.

Pascal

```
procedure Append(const S: string; const AValue: Variant);
```

C++

```
__fastcall Append(const UnicodeString S, const Variant AValue);
```

Description

Call Append to add a name/Variant (see page 3421) pair to the end of the list. Append simply calls the Add (see page 6121) method to add the specified name and its associated Variant (see page 3421) value.

S is the name of the Variant (see page 3421) value. This can be used to look up the value using the Values (see page 6133) property.

AValue is the Variant (see page 3421) value to associate with S.

See Also

Values (see page 6133)

Add (see page 6121)

Insert (see page 6128)

Delete (see page 6124)

59.1.2.3.3 TAbstractNamedVariants.Assign Method

Copies the list of named Variants (see page 6133) from another object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Call Assign to copy another list to this named Variants (see page 6133) list. If the source object is another named Variants (see page 6133) list, Assign discards any name/Variant (see page 3421) pairs currently in the list and replaces them with the name/Variant (see page 3421) pairs in the source list. If the source is any other type of object, Assign calls the inherited method, which copies the list from any object that implements the AssignTo method so that it copies its items to a named Variants (see page 6133) list.

Source is the object from which to copy the list.

See Also

Values (see page 6133)

AssignTo

59.1.2.3.4 TAbstractNamedVariants.BeginUpdate Method

Signals the start of an update operation.

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

Call BeginUpdate before starting an operation that makes multiple changes to the named Variants (see page 6133) list. After completing all of the changes, call the EndUpdate (see page 6125) method to signal the end of the operation.

Every call to BeginUpdate must be matched by a corresponding call to the EndUpdate (see page 6125) method.

Note: TAbstractNamedVariants (see page 6118) calls BeginUpdate and EndUpdate (see page 6125) internally when performing operations that affect multiple entries in the list.

See Also

EndUpdate (see page 6125)

59.1.2.3.5 TAbstractNamedVariants.Clear Method

Empties the list of all its name/Variant (see page 3421) pairs.

Pascal

```
procedure Clear; virtual; abstract;
```

C++

```
virtual __fastcall Clear() = 0;
```

Description

Call Clear to empty the named Variants (see page 6133) list. After a call to Clear, the value of the Count (see page 6131) property is zero.

TAbstractNamedVariants (see page 6118) declares Clear as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Count (see page 6131)

Delete (see page 6124)

59.1.2.3.6 TAbstractNamedVariants.CompareStrings Method

Compares two strings.

Pascal

```
function CompareStrings(const S1: string; const S2: string): Integer; virtual;
```

C++

```
virtual __fastcall int CompareStrings(const UnicodeString S1, const UnicodeString S2);
```

Description

TAbstractNamedVariants (see page 6118) calls CompareStrings internally to locate names in the list (for example, in the implementation of the Values (see page 6133) property). Descendant classes can use this method to sort the list entries by name.

S1 and S2 are the strings to compare.

CompareStrings returns a value less than 0 if S1 < S2, 0 if S1 = S2, and a value greater than 0 if S1 > S2.

In TAbstractNamedVariants (see page 6118), CompareStrings calls the AnsiCompareText (see page 4051) function. This performs a locale-based case-insensitive comparison. Override this method in a descendant class to change the way the named Variants (see page 6133) list compares names. For example, by changing CompareStrings to a case sensitive function, the Values (see page 6133) property would distinguish two names that differed only in case.

See Also

AnsiCompareText (see page 4051)

Values (see page 6133)

Equals (see page 6125)

59.1.2.3.7 TAbstractNamedVariants.DefineProperties Method

Allows the list of names and their corresponding Variant (see page 3421) values to be saved with the named Variants (see page 6133) list.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

The component streaming system calls DefineProperties when it loads or saves the named Variants (see page 6133) list. TAbstractNamedVariants (see page 6118) overrides the inherited method to specify how to load and save the list of names and Variant (see page 3421) values.

Filer is the current TReader or TWriter object that is loading or saving the named Variants (see page 6133) list.

See Also

Values (see page 6133)

DefineProperties

TReader

TWriter

59.1.2.3.8 TAbstractNamedVariants.Delete Method

Deletes an entry from the list.

Pascal

```
procedure Delete(Index: Integer); virtual; abstract;
```

C++

```
virtual __fastcall Delete(int Index) = 0;
```

Description

Call Delete to remove a specified name/Variant (see page 3421) pair from the list. After a call to Delete, any name/Variant (see page 3421) pairs that appeared after the deleted item in the list move up by one (getting a new index).

Index is the position of the item to delete.

TAbstractNamedVariants (see page 6118) declares Delete as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 6132)

Variants (see page 6133)

Clear (see page 6123)

59.1.2.3.9 TAbstractNamedVariants.EndUpdate Method

Signals the end of an update operation.

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

Call EndUpdate after completing an operation that was preceded by a call to the BeginUpdate (see page 6122) method. Every call to BeginUpdate (see page 6122) must be matched by a corresponding call to the EndUpdate method. Calls to BeginUpdate (see page 6122) and EndUpdate can be nested.

Note: TAbstractNamedVariants (see page 6118) calls BeginUpdate (see page 6122) and EndUpdate internally when performing operations that affect multiple entries in the list.

See Also

BeginUpdate (see page 6122)

59.1.2.3.10 TAbstractNamedVariants.Equals Method

Compares this named Variants (see page 6133) list with another one.

Pascal

```
function Equals(ANamedVariants: TAbstractNamedVariants): Boolean; reintroduce;
```

C++

```
__fastcall Boolean Equals(TAbstractNamedVariants ANamedVariants);
```

Description

Call Equals to determine whether another named Variants (see page 6133) list contains the same name/Variant (see page 3421) pairs as this one.

ANamedVariants is the named Variants (see page 6133) list to compare to this one.

Equals returns true if every entry in ANamedVariants has the same name and Variant (see page 3421) value as the corresponding entry in this list. Equals returns false if ANamedVariants has a different number of entries, if its entries appear in a different order, or if it contains different entries.

Equals considers two name to be the same if they differ only by case.

59.1.2.3.11 TAbstractNamedVariants.Error Method

Raises an ENamedVariantsError (see page 6118) exception.

Pascal

```
procedure Error(const Msg: string; Data: Integer); overload;
```

C++

```
__fastcall Error(const UnicodeString Msg, int Data);
```

Description

TAbstractNamedVariants (see page 6118) calls Error internally when it encounters an invalid index. For example, if an application tries to delete or change a name/Variant (see page 3421) pair and supplies an index that is greater than Count (see page 6131), TAbstractNamedVariants (see page 6118) calls Error to generate the exception about the out-of-bounds index.

Msg is the error message for the exception. This message contains a format specifier for the integer that represents the index that caused the problem.

Data is the index that caused the problem.

See Also

ENamedVariantsError (see page 6118)

Count (see page 6131)

59.1.2.3.12 TAbstractNamedVariants.Exchange Method

Swaps the positions of two items in the list.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); virtual;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

Call Exchange to interchange the positions of two name/Variant (see page 3421) pairs.

Index1 and Index2 are the indexes of the two entries to swap. Exchange copies the name and Variant (see page 3421) stored at Index1 to the position specified by Index2, and the name and Variant (see page 3421) from Index2 to the position specified by Index1.

See Also

Move (see page 6129)

59.1.2.3.13 TAbstractNamedVariants.Get Method

Retrieves the name and Variant (see page 3421) stored at a specified position in the list.

Pascal

```
function Get(Index: Integer; out AName: string; out AValue: Variant): Boolean; virtual;
abstract;
```

C++

```
virtual __fastcall Boolean Get(int Index, UnicodeString AName, Variant AValue) = 0;
```

Description

Get provides the underlying implementation of all methods that extract information from the named Variants (see page 6133) list based on item position. For example, the property read methods for the Names (see page 6132) and Variants (see page 6133) properties both call Get to extract the relevant information from the list.

Index is the index of the name and Variant (see page 3421) to read.

AName returns the name stored at the specified position.

AValue returns the Variant (see page 3421) value stored at the specified position.

Get returns true if Index is the index of an item in the list, false if there is no name/Variant (see page 3421) pair at the specified position.

TAbstractNamedVariants (see page 6118) declares Get as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 6132)

Variants (see page 6133)

Put (see page 6129)

59.1.2.3.14 TAbstractNamedVariants.GetCapacity Method

Returns the value of the Capacity (see page 6131) property.

Pascal

```
function GetCapacity: Integer; virtual;
```

C++

```
virtual __fastcall int GetCapacity();
```

Description

GetCapacity is the protected read implementation of the Capacity (see page 6131) property.

In TAbstractNamedVariants (see page 6118), GetCapacity always returns the value of the Count (see page 6131) property, because TAbstractNamedVariants (see page 6118) does not implement support for preallocating memory to hold name/Variant (see page 3421) pairs that have not been added to the list. Descendant classes that provide support for allocating memory before adding items to the list override GetCapacity to reflect the capacity of the list.

See Also

Capacity (see page 6131)

Count (see page 6131)

59.1.2.3.15 TAbstractNamedVariants.GetCount Method

Returns the value of the Count (see page 6131) property.

Pascal

```
function GetCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCount() = 0;
```

Description

GetCapacity (see page 6127) is the protected read implementation of the Count (see page 6131) property.

TAbstractNamedVariants (see page 6118) declares GetCount as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation for the Count (see page 6131) property.

See Also

Count (see page 6131)

59.1.2.3.16 TAbstractNamedVariants.IndexOfName Method

Returns the index of the first item in the list with a specified name.

Pascal

```
function IndexOfName(const Name: string): Integer; virtual;
```

C++

```
virtual __fastcall int IndexOfName(const UnicodeString Name);
```

Description

Call IndexOfName to determine where a name appears in the list, if it appears at all.

Name is the name to locate in the list.

If Name appears as the name part of a name/Variant (see page 3421) pair in the list, IndexOfName returns the index of the first item with that name. If there are no items with the specified name, IndexOfName returns –1.

Note: In TAbstractNamedVariants (see page 6118), IndexOfName uses a case-insensitive comparison to locate the name. In descendant classes that treat strings case sensitively, IndexOfName makes a case sensitive comparison.

See Also

Names (see page 6132)

59.1.2.3.17 TAbstractNamedVariants.Insert Method

Inserts a name/Variant (see page 3421) pair at a specified position.

Pascal

```
procedure Insert(Index: Integer; const S: string; const AValue: Variant); virtual; abstract;
```

C++

```
virtual __fastcall Insert(int Index, const UnicodeString S, const Variant AValue) = 0;
```

Description

Call Insert to add a name/Variant (see page 3421) pair to the list at a specified position. After a call to Insert, any name/Variant (see page 3421) pairs that appeared at or after the specified position move down by one (getting a new index).

Index is the position where the new name and Variant (see page 3421) should be added.

S is the name of the new entry.

AValue is the Variant (see page 3421) value of the new entry.

TAbstractNamedVariants (see page 6118) declares Insert as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Values (see page 6133)

Append (see page 6122)

Add (see page 6121)

Delete (see page 6124)

Count (see page 6131)

59.1.2.3.18 TAbstractNamedVariants.Move Method

Moves a name/Variant (see page 3421) pair to a new position in the list.

Pascal

```
procedure Move(CurIndex: Integer; NewIndex: Integer); virtual;
```

C++

```
virtual __fastcall Move(int CurIndex, int NewIndex);
```

Description

Call move to reposition an item in the list. Move removes the item from its current position and inserts it in the new position, readjusting the positions (indexes) of other items as necessary.

CurIndex is the current position of the item to move.

NewIndex is the position to which the item is moved.

See Also

Exchange (see page 6126)

59.1.2.3.19 TAbstractNamedVariants.Put Method

Stores a name/Variant (see page 3421) pair at a specified position in the list.

Pascal

```
procedure Put(Index: Integer; const AName: string; const AValue: Variant); virtual; abstract;
```

C++

```
virtual __fastcall Put(int Index, const UnicodeString AName, const Variant AValue) = 0;
```

Description

Put provides the underlying implementation of all methods that change the information stored in the named Variants (see page 6133) list based on item position. For example, the property write methods for the Names (see page 6132) and Variants (see page 6133) properties both call Put to assign new values to items in the list.

Index is the index of the name and Variant (see page 3421) to write.

AName is the name to store at the specified position.

AValue is the Variant (see page 3421) value to store at the specified position.

TAbstractNamedVariants (see page 6118) declares Put as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 6132)

Variants (see page 6133)

Get (see page 6126)

59.1.2.3.20 TAbstractNamedVariants.SetCapacity Method

Sets the value of the Capacity (see page 6131) property.

Pascal

```
procedure SetCapacity(NewCapacity: Integer); virtual;
```

C++

```
virtual __fastcall SetCapacity(int NewCapacity);
```

Description

SetCapacity is the protected write implementation of the Capacity (see page 6131) property.

In TAbstractNamedVariants (see page 6118), SetCapacity does nothing, because TAbstractNamedVariants (see page 6118) does not implement support for preallocating memory to hold name/Variant (see page 3421) pairs that have not been added to the list. Descendant classes that provide support for allocating memory before adding items to the list override SetCapacity to reallocate the memory used to hold list items.

See Also

Capacity (see page 6131)

GetCapacity (see page 6127)

59.1.2.3.21 TAbstractNamedVariants.SetUpdateState Method

Responds when an update operation begins or ends.

Pascal

```
procedure SetUpdateState(Updating: Boolean); virtual;
```

C++

```
virtual __fastcall SetUpdateState(Boolean Updating);
```

Description

The BeginUpdate (see page 6122) and EndUpdate (see page 6125) methods call SetUpdate state when an update operation first starts or finally stops. If the calls to BeginUpdate (see page 6122) and EndUpdate (see page 6125) are nested, SetUpdate is only called by the first BeginUpdate (see page 6122) call and the last EndUpdate (see page 6125) call.

In TAbstractNamedVariants (see page 6118), SetUpdateState does nothing. Descendant classes can override this method to respond in some way (such as enabling or suppressing repaints of a control that displays the values in the list) when an update operation begins or ends.

See Also

BeginUpdate (see page 6122)

EndUpdate (see page 6125)

59.1.2.4 TAbstractNamedVariants Properties

The properties of the TAbstractNamedVariants class are listed here.

Protected Properties

	Name	Description
	UpdateCount (see page 6132)	Indicates the number of calls to BeginUpdate (see page 6122) that have not been matched by a corresponding call to EndUpdate (see page 6125).

Public Properties

	Name	Description
	Capacity (see page 6131)	Specifies the allocated size of the named variants list.
	Count (see page 6131)	Indicates the number of name/value pairs in the list.
	Names (see page 6132)	Lists the names of all the Variants (see page 6133) in the list.
	Values (see page 6133)	Lists the Variants (see page 6133) in the list by name.
	Variants (see page 6133)	Lists the Variants in the list by position.

59.1.2.4.1 TAbstractNamedVariants.Capacity Property

Specifies the allocated size of the named variants list.

Pascal

```
property Capacity: Integer;
```

C++

```
__property int Capacity;
```

Description

Set Capacity to the number of named Variants (see page 6133) the list will need to contain. When a value is added to a list that is already filled to capacity, the Capacity property is automatically increased. Setting Capacity before adding values can reduce the number of memory reallocations and thereby improve performance. In addition, in descendants that allocate memory in chunks, setting Capacity can ensure that you do not allocate more memory for the list than your application needs.

Read (see page 3634) Capacity to learn number of values the list can hold without reallocating memory. Do not confuse Capacity with the Count (see page 6131) property, which is the number of entries in the list that are in use. The value of Capacity is always greater than or equal to the value of Count (see page 6131). When Capacity is greater than Count (see page 6131), the unused memory can be reclaimed by setting Capacity to Count (see page 6131).

See Also

Count (see page 6131)

Insert (see page 6128)

59.1.2.4.2 TAbstractNamedVariants.Count Property

Indicates the number of name/value pairs in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Read (see page 3634) Count to determine the number of values the list contains. Count acts as an upper bound to the index that you can use for the Names (see page 6132) and Variants (see page 6133) properties.

See Also

Capacity (see page 6131)

Names (see page 6132)

Variants (see page 6133)

59.1.2.4.3 TAbstractNamedVariants.Names Property

Lists the names of all the Variants (see page 6133) in the list.

Pascal

```
property Names [Index: Integer]: string;
```

C++

```
__property UnicodeString Names[int Index];
```

Description

Read (see page 3634) Names to obtain the name of a Variant (see page 3421) in the list.

Index is the position of the name (and its corresponding Variant (see page 3421)) in the named Variants (see page 6133) list. The value of Index falls in the range from 0 to Count (see page 6131) – 1.

See Also

Count (see page 6131)

Values (see page 6133)

Variants (see page 6133)

59.1.2.4.4 TAbstractNamedVariants.UpdateCount Property

Indicates the number of calls to BeginUpdate (see page 6122) that have not been matched by a corresponding call to EndUpdate (see page 6125).

Pascal

```
property UpdateCount: Integer;
```

C++

```
__property int UpdateCount;
```

Description

UpdateCount keeps track of whether the named Variants (see page 6133) list is in the middle of an update operation (an operation that makes several changes to the list). Every time the application calls BeginUpdate (see page 6122), the value of UpdateCount is incremented. Every call to EndUpdate (see page 6125) decrements the value of UpdateCount.

When UpdateCount changes from 0 to 1, and when it changes from 1 to 0, TAbstractNamedVariants (see page 6118) calls the SetUpdateState (see page 6130) method. This allows TAbstractNamedVariants (see page 6118) descendants to respond in some way (such as enabling or suppressing repaints of a control that displays the values in the list) when an update operation begins or ends.

See Also

BeginUpdate (see page 6122)

EndUpdate (see page 6125)

SetUpdateState (see page 6130)

59.1.2.4.5 TAbstractNamedVariants.Values Property

Lists the Variants (see page 6133) in the list by name.

Pascal

```
property Values [const Name: string]: Variant;
```

C++

```
__property Variant Values[UnicodeString const Name];
```

Description

Read (see page 3634) Values to look up the Variant (see page 3421) that is stored under a particular name. Set Values to change the Variant (see page 3421) associated with a name, or to add a new name and Variant (see page 3421) to the list.

Name is the name of the Variant (see page 3421). If there is no Variant (see page 3421) in the list with the specified name, reading Values gives an unassigned Variant (see page 3421), and setting Values adds a new name and Variant (see page 3421) to the list.

See Also

Count (see page 6131)

Variants (see page 6133)

59.1.2.4.6 TAbstractNamedVariants.Variants Property

Lists the Variants in the list by position.

Pascal

```
property Variants [Index: Integer]: Variant;
```

C++

```
__property Variant Variants[int Index];
```

Description

Read (see page 3634) Variants to look up the Variant (see page 3421) that is stored at a particular position. Set Variants to change the Variant (see page 3421) stored in a particular position.

Index is the position of the Variant (see page 3421) in the named Variants list. The value of Index falls in the range from 0 to Count (see page 6131) – 1. If you specify a value of Index that is out of range, TAbstractNamedVariants (see page 6118) raises an ENamedVariantsError (see page 6118) exception.

See Also

Count (see page 6131)

Values (see page 6133)

Names (see page 6132)

ENamedVariantsError (see page 6118)

59.1.3 TNamedVariantsList Class

TNamedVariantsList is a persistent list of name/Variant (see page 3421) pairs.

Class Hierarchy

Pascal

```
TNamedVariantsList = class(TAbstractNamedVariants);
```

C++

```
class TNamedVariantsList : public TAbstractNamedVariants;
```

File

WebContnrs

Description

Use TNamedVariantsList to represent a set of name/value pairs where the values are all Variants (see page 4973). Because TNamedVariantsList is a descendant of TPersistent, it can be used as the type of a published property on a component.

TNamedVariantsList has properties and methods that let you:

Look up Variant (see page 3421) values by name or by index.

Locate a name in the list.

Add (see page 6121) or delete name/Variant (see page 3421) pairs.

Rearrange the items in the list.

Compare this list to another named variants list.

Note: TNamedVariantsList treats the names it stores in a case-insensitive manner. When locating a name in the list or assigning a Variant (see page 3421) value to an existing name, TNamedVariantsList treats names that differ only by case as the same.

TInterfaceList

59.1.3.1 TNamedVariantsList Members

The following tables list the members exposed by TNamedVariantsList.

Protected Methods

	Name	Description
	CompareStrings (see page 6123)	Compares two strings.

	DefineProperties (see page 6124)	Allows the list of names and their corresponding Variant (see page 3421) values to be saved with the named Variants (see page 6133) list.
	Error (see page 6126)	Raises an ENamedVariantsError (see page 6118) exception.
	Get (see page 6137)	Retrieves the name and Variant stored at a specified position in the list.
	GetCapacity (see page 6137)	Returns the value of the Capacity property.
	GetCount (see page 6138)	Returns the value of the Count property.
	Put (see page 6139)	Stores a name/Variant pair at a specified position in the list.
	SetCapacity (see page 6139)	Sets the value of the Capacity property.
	SetUpdateState (see page 6130)	Responds when an update operation begins or ends.

Protected Properties

	Name	Description
	UpdateCount (see page 6132)	Indicates the number of calls to BeginUpdate (see page 6122) that have not been matched by a corresponding call to EndUpdate (see page 6125).

Public Methods

	Name	Description
	Add (see page 6121)	Adds a named Variant (see page 3421) to the end of the list.
	Append (see page 6122)	Adds a named Variant (see page 3421) to the end of the list.
	Assign (see page 6122)	Copies the list of named Variants (see page 6133) from another object.
	BeginUpdate (see page 6122)	Signals the start of an update operation.
	Clear (see page 6136)	Deletes all the name/Variant (see page 3421) pairs from the list.
	Delete (see page 6136)	Removes a specified Variant (see page 3421) specified by the Index parameter.
	Destroy (see page 6135)	Frees an instance of TNamedVariantsList (see page 6134).
	EndUpdate (see page 6125)	Signals the end of an update operation.
	Equals (see page 6125)	Compares this named Variants (see page 6133) list with another one.
	Exchange (see page 6126)	Swaps the positions of two items in the list.
	IndexOfName (see page 6128)	Returns the index of the first item in the list with a specified name.
	Insert (see page 6138)	Inserts a name/Variant (see page 3421) pair at a specified position.
	Move (see page 6129)	Moves a name/Variant (see page 3421) pair to a new position in the list.

Public Properties

	Name	Description
	Capacity (see page 6131)	Specifies the allocated size of the named variants list.
	Count (see page 6131)	Indicates the number of name/value pairs in the list.
	Names (see page 6132)	Lists the names of all the Variants (see page 6133) in the list.
	Values (see page 6133)	Lists the Variants (see page 6133) in the list by name.
	Variants (see page 6133)	Lists the Variants in the list by position.

59.1.3.2 TNamedVariantsList.Destroy Destructor

Frees an instance of TNamedVariantsList (see page 6134).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TNamedVariantsList();
```

Description

Do not call the TNamedVariantsList (see page 6134) destructor directly. Instead, use the Free method, which first checks whether the reference to the object is nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

59.1.3.3 TNamedVariantsList Methods

The methods of the TNamedVariantsList class are listed here.

Protected Methods

	Name	Description
	Get (see page 6137)	Retrieves the name and Variant stored at a specified position in the list.
	GetCapacity (see page 6137)	Returns the value of the Capacity property.
	GetCount (see page 6138)	Returns the value of the Count property.
	Put (see page 6139)	Stores a name/Variant pair at a specified position in the list.
	SetCapacity (see page 6139)	Sets the value of the Capacity property.

Public Methods

	Name	Description
	Clear (see page 6136)	Deletes all the name/Variant (see page 3421) pairs from the list.
	Delete (see page 6136)	Removes a specified Variant (see page 3421) specified by the Index parameter.
	Insert (see page 6138)	Inserts a name/Variant (see page 3421) pair at a specified position.

59.1.3.3.1 TNamedVariantsList.Clear Method

Deletes all the name/Variant (see page 3421) pairs from the list.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Call Clear to empty the list. Clear frees the memory that the Variants (see page 4973) in the list use to store their values as well as the memory used to store the list itself.

After a call to Clear, the value of the Count (see page 6131) property is zero.

See Also

Delete (see page 6136)

Variants (see page 6133)

Count (see page 6131)

59.1.3.3.2 TNamedVariantsList.Delete Method

Removes a specified Variant (see page 3421) specified by the Index parameter.

Pascal

```
procedure Delete(Index: Integer); override;
```

C++

```
virtual __fastcall Delete(int Index);
```

Description

Call Delete to remove a specified name/Variant (see page 3421) pair from the list. Delete frees the Variant (see page 3421) when it removes the item from the list.

After a call to Delete, any name/Variant (see page 3421) pairs that appeared after the deleted item in the list move up by one (getting a new index).

Index is the position of the item to delete.

See Also

Clear (see page 6136)

IndexOfName (see page 6128)

59.1.3.3.3 TNamedVariantsList.Get Method

Retrieves the name and Variant stored at a specified position in the list.

Pascal

```
function Get(Index: Integer; out AName: string; out AValue: Variant): Boolean; override;
```

C++

```
virtual __fastcall Boolean Get(int Index, UnicodeString AName, Variant AValue);
```

Description

Get provides the underlying implementation of all methods that extract information from the named Variants list based on item position. For example, the property read methods for the Names and Variants properties both call Get to extract the relevant information from the list.

Index is the index of the name and Variant to read.

AName returns the name stored at the specified position.

AValue returns the Variant value stored at the specified position.

Get returns true if Index is the index of an item in the list, false if there is no name/Variant pair at the specified position.

TAbstractNamedVariants declares Get as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 6132)

Variants (see page 6133)

Put (see page 6129)

59.1.3.3.4 TNamedVariantsList.GetCapacity Method

Returns the value of the Capacity property.

Pascal

```
function GetCapacity: Integer; override;
```

C++

```
virtual __fastcall int GetCapacity();
```

Description

GetCapacity is the protected read implementation of the Capacity property.

In TAbstractNamedVariants, GetCapacity always returns the value of the Count property, because TAbstractNamedVariants does not implement support for preallocating memory to hold name/Variant pairs that have not been added to the list. Descendant classes that provide support for allocating memory before adding items to the list override GetCapacity to reflect the capacity of the list.

See Also

Capacity (see page 6131)

Count (see page 6131)

59.1.3.3.5 TNamedVariantsList.GetCount Method

Returns the value of the Count property.

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCapacity is the protected read implementation of the Count property.

TAbstractNamedVariants declares GetCount as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation for the Count property.

See Also

Count (see page 6131)

59.1.3.3.6 TNamedVariantsList.Insert Method

Inserts a name/Variant (see page 3421) pair at a specified position.

Pascal

```
procedure Insert(Index: Integer; const S: string; const AValue: Variant); override;
```

C++

```
virtual __fastcall Insert(int Index, const UnicodeString S, const Variant AValue);
```

Description

Call Insert to add a name/Variant (see page 3421) pair to the list at a specified position. After a call to Insert, any name/Variant (see page 3421) pairs that appeared at or after the specified position move down by one (getting a new index).

Index is the position where the new name and Variant (see page 3421) should be added.

S is the name of the new entry.

AValue is the Variant (see page 3421) value of the new entry.

See Also

Values (see page 6133)

Append (see page 6122)

Add (see page 6121)

Delete (see page 6136)

Count (see page 6131)

59.1.3.3.7 TNamedVariantsList.Put Method

Stores a name/Variant pair at a specified position in the list.

Pascal

```
procedure Put(Index: Integer; const AName: string; const AValue: Variant); override;
```

C++

```
virtual __fastcall Put(int Index, const UnicodeString AName, const Variant AValue);
```

Description

Put provides the underlying implementation of all methods that change the information stored in the named Variants list based on item position. For example, the property write methods for the Names and Variants properties both call Put to assign new values to items in the list.

Index is the index of the name and Variant to write.

AName is the name to store at the specified position.

AValue is the Variant value to store at the specified position.

TAbstractNamedVariants declares Put as an abstract or (in C++ terminology) a pure virtual method, meaning that it provides no implementation. Descendant classes must override this method to provide an implementation.

See Also

Names (see page 6132)

Variants (see page 6133)

Get (see page 6126)

59.1.3.3.8 TNamedVariantsList.SetCapacity Method

Sets the value of the Capacity property.

Pascal

```
procedure SetCapacity(NewCapacity: Integer); override;
```

C++

```
virtual __fastcall SetCapacity(int NewCapacity);
```

Description

SetCapacity is the protected write implementation of the Capacity property.

In TAbstractNamedVariants, SetCapacity does nothing, because TAbstractNamedVariants does not implement support for preallocating memory to hold name/Variant pairs that have not been added to the list. Descendant classes that provide support for allocating memory before adding items to the list override SetCapacity to reallocate the memory used to hold list items.

See Also

Capacity (see page 6131)

GetCapacity (see page 6127)

59.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TNamedVariantItem (see page 6140)	This is record WebContnrs.TNamedVariantItem.

59.2.1 WebContnrs.TNamedVariantItem Record

Pascal

```
TNamedVariantItem = record
  FString: string;
  FVariant: Variant;
end;
```

C++

```
struct TNamedVariantItem {
  UnicodeString FString;
  Variant FVariant;
};
```

File

WebContnrs

Description

This is record WebContnrs.TNamedVariantItem.

59.3 Types

The following table lists types in this documentation.

Types

Name	Description
PNamedVariantItem (see page 6141)	This is type WebContnrs.PNamedVariantItem.
PNamedVariantList (see page 6141)	This is type WebContnrs.PNamedVariantList.
TNamedVariantList (see page 6141)	This is type WebContnrs.TNamedVariantList.

59.3.1 WebContnrs.PNamedVariantItem Type

Pascal

```
PNamedVariantItem = ^TNamedVariantItem;
```

C++

```
^TNamedVariantItem PNamedVariantItem;
```

File

WebContnrs

Description

This is type WebContnrs.PNamedVariantItem.

59.3.2 WebContnrs.PNamedVariantList Type

Pascal

```
PNamedVariantList = ^TNamedVariantList;
```

C++

```
^TNamedVariantList PNamedVariantList;
```

File

WebContnrs

Description

This is type WebContnrs.PNamedVariantList.

59.3.3 WebContnrs.TNamedVariantList Type

Pascal

```
TNamedVariantList = array[0..2000000000 div sizeof(TNamedVariantItem)] of TNamedVariantItem;
```

C++

```
array[0..2000000000 div sizeof(TNamedVariantItem)] of TNamedVariantItem TNamedVariantList;
```

File

WebContnrs

Description

This is type WebContnrs.TNamedVariantList.

60 WebDisp Namespace

This is namespace WebDisp.

Topics

Name	Description
Classes (see page 6146)	The following table lists classes in this documentation.
Interfaces (see page 6257)	The following table lists interfaces in this documentation.
Functions (see page 6259)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 6265)	The following table lists structs, records, enums in this documentation.
Types (see page 6266)	The following table lists types in this documentation.
Constants (see page 6277)	The following table lists constants in this documentation.

Classes

	Name	Description
	EAdapterDispatcherException (see page 6146)	EAdapterDispatcherException is the exception class for WebSnap actions and image requests that can't be serviced.
	EPageDispatcherException (see page 6147)	EPageDispatcherException raises an exception when a page dispatcher encounters an error.
	ESessionException (see page 6147)	ESessionException is the exception that is raised when a WebSnap application tries to use an invalid session.
	TAdapterDispatcher (see page 6148)	TAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.
	TAdapterDispatchParams (see page 6153)	TAdapterDispatchParams parses a request to determine the adapter to which it is directed, and, if available, the Web pages that should appear when the request is successfully or unsuccessfully handled.
	TAdapterItemRequestParams (see page 6160)	TAdapterItemRequestParams holds the name/value pairs that must be included in request messages addressed to an adapter or its subcomponents.
	TBaseRequestHandler (see page 6166)	The TBaseRequestHandler component is a base class for WebSnap dispatcher components.
	TCustomAdapterDispatcher (see page 6168)	TCustomAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.
	TCustomLocateFileService (see page 6181)	TCustomLocateFileService uses event handlers to control access to templates and server-side script include files at runtime.
	TCustomPageDispatcher (see page 6188)	Dispatches incoming HTTP request messages in a WebSnap application.
	TCustomWebAppComponents (see page 6201)	TCustomWebAppComponents manages the components that provide a WebSnap application's functionality.
	TInvalidWebSession (see page 6216)	Serves as a placeholder when an HTTP request could not be given a session.
	TLocateFileService (see page 6220)	TLocateFileService controls the access of templates and server-side script include files at runtime.

	TMultiModuleWebAppServices (see page 6223)	TMultiModuleWebAppServices coordinates the response to HTTP request messages by locating the appropriate components to handle various tasks.
	TPageDispatcher (see page 6236)	TPageDispatcher dispatches incoming HTTP request messages in a WebSnap application.
	TWebAppComponents (see page 6243)	TWebAppComponents holds the application components that provide the WebSnap application's functionality.
	TWebSession (see page 6251)	TWebSession stores temporary information associated with the user in a WebSnap application.

Constants

Name	Description
sFailurePageParamName (see page 6277)	This is constant WebDisp.sFailurePageParamName.
sPageParamName (see page 6277)	This is constant WebDisp.sPageParamName.
sRequestIDParamName (see page 6278)	This is constant WebDisp.sRequestIDParamName.
sSessionCookieName (see page 6278)	This is constant WebDisp.sSessionCookieName.
sSuccessPageParamName (see page 6278)	This is constant WebDisp.sSuccessPageParamName.

Functions

	Name	Description
	AdapterRequestParamsAsStrings (see page 6259)	This is function WebDisp.AdapterRequestParamsAsStrings.
	DispatchPageName (see page 6259)	This is function WebDisp.DispatchPageName.
	EncodeParamNameValues (see page 6260)	This is function WebDisp.EncodeParamNameValues.
	EncodeParamsAsHTTPQuery (see page 6260)	This is function WebDisp.EncodeParamsAsHTTPQuery.
	ExpandScriptException (see page 6260)	This is function WebDisp.ExpandScriptException.
	ExtractParamNameValues (see page 6261)	This is function WebDisp.ExtractParamNameValues.
	FindDefaultAppPageName (see page 6261)	This is function WebDisp.FindDefaultAppPageName.
	PageNameOfRequest (see page 6261)	This is function WebDisp.PageNameOfRequest.
	RaiseDispatchBlankPageNameException (see page 6262)	This is function WebDisp.RaiseDispatchBlankPageNameException.
	RaisePageDoesNotProvideContent (see page 6262)	This is function WebDisp.RaisePageDoesNotProvideContent.
	RaisePageNotFound (see page 6262)	This is function WebDisp.RaisePageNotFound.
	RedirectToPageName (see page 6263)	This is function WebDisp.RedirectToPageName.
	RegisterAdapterRequestIdentifier (see page 6263)	This is function WebDisp.RegisterAdapterRequestIdentifier.
	SafeRedirect (see page 6263)	Redirects a browser to another specified page.

Interfaces

	Name	Description
	IWebSessionAccess (see page 6257)	This is class WebDisp.IWebSessionAccess.

Structs, Records, Enums

	Name	Description
	TPageAccessDenied (see page 6265)	TPageAccessDenied indicates why a user was denied access to a requested Web page.

Types

Name	Description
TActivateWebModuleEvent (see page 6266)	This is type WebDisp.TActivateWebModuleEvent.
TCanViewPageEvent (see page 6267)	TCanViewPageEvent is the type for event handlers that indicate whether the current user can view a specified Web page.
TDispatchActionEvent (see page 6267)	TDispatchActionEvent is the type for event handlers that respond when an adapter action executes.
TDispatchActionHandledEvent (see page 6268)	TDispatchActionHandledEvent is the type for event handlers that can handle requests to execute an adapter action.
TDispatchImageEvent (see page 6269)	TDispatchImageEvent is the type for event handlers that respond when an adapter action gets a request for an image field value.
TDispatchImageHandledEvent (see page 6269)	TDispatchImageHandledEvent is the type for event handlers that can handle requests for an image field value.
TDispatchPageEvent (see page 6270)	TDispatchPageEvent is the type for event handlers that are called after a Web page module finishes handling an HTTP request.

TDispatchPageHandledEvent (see page 6270)	TDispatchPageHandledEvent is the type for event handlers that can handle HTTP request messages.
TDispatchPageParamsHandledEvent (see page 6271)	TDispatchPageParamsHandledEvent is the type for event handlers that are called before a WebSnap application assembles a response message redirecting the caller to another Web page.
TGetAdapterRequestParamsEvent (see page 6272)	TGetAdapterRequestParamsEvent is the type for event handlers that retrieve parameters for an adapter dispatcher.
TLocateFileServiceFindFileEvent (see page 6273)	TLocateFileServiceFindFileEvent is the type for event handlers that locates a file on disk in a WebSnap application.
TLocateFileServiceFindStreamEvent (see page 6273)	TLocateFileServiceFindStreamEvent is the type for event handlers that provide access to a requested file.
TLoginPagedHandledEvent (see page 6274)	This is type WebDisp.TLoginPagedHandledEvent.
TLoginRequiredEvent (see page 6274)	TLoginRequiredEvent is the type for event handlers that indicate whether the current user must log in before accessing a specified Web page.
TPageAccessDeniedEvent (see page 6275)	TPageAccessDeniedEvent is the type for event handlers that respond when a page dispatcher determines that the current user can't access the current page.
TWebRequest (see page 6276)	This is type WebDisp.TWebRequest.
TWebResponse (see page 6276)	This is type WebDisp.TWebResponse.

60.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EAdapterDispatcherException (see page 6146)	EAdapterDispatcherException is the exception class for WebSnap actions and image requests that can't be serviced.
	EPageDispatcherException (see page 6147)	EPageDispatcherException raises an exception when a page dispatcher encounters an error.
	ESessionException (see page 6147)	ESessionException is the exception that is raised when a WebSnap application tries to use an invalid session.
	TAdapterDispatcher (see page 6148)	TAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.
	TAdapterDispatchParams (see page 6153)	TAdapterDispatchParams parses a request to determine the adapter to which it is directed, and, if available, the Web pages that should appear when the request is successfully or unsuccessfully handled.
	TAdapterItemRequestParams (see page 6160)	TAdapterItemRequestParams holds the name/value pairs that must be included in request messages addressed to an adapter or its subcomponents.
	TBaseRequestHandler (see page 6166)	The TBaseRequestHandler component is a base class for WebSnap dispatcher components.
	TCustomAdapterDispatcher (see page 6168)	TCustomAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.
	TCustomLocateFileService (see page 6181)	TCustomLocateFileService uses event handlers to control access to templates and server-side script include files at runtime.
	TCustomPageDispatcher (see page 6188)	Dispatches incoming HTTP request messages in a WebSnap application.
	TCustomWebAppComponents (see page 6201)	TCustomWebAppComponents manages the components that provide a WebSnap application's functionality.
	TInvalidWebSession (see page 6216)	Serves as a placeholder when an HTTP request could not be given a session.
	TLocateFileService (see page 6220)	TLocateFileService controls the access of templates and server-side script include files at runtime.
	TMultiModuleWebAppServices (see page 6223)	TMultiModuleWebAppServices coordinates the response to HTTP request messages by locating the appropriate components to handle various tasks.
	TPageDispatcher (see page 6236)	TPageDispatcher dispatches incoming HTTP request messages in a WebSnap application.
	TWebAppComponents (see page 6243)	TWebAppComponents holds the application components that provide the WebSnap application's functionality.
	TWebSession (see page 6251)	TWebSession stores temporary information associated with the user in a WebSnap application.

60.1.1 EAdapterDispatcherException Class

EAdapterDispatcherException is the exception class for WebSnap actions and image requests that can't be serviced.

Class Hierarchy

Pascal

```
EAdapterDispatcherException = class(EWebBrokerException);
```

C++

```
class EAdapterDispatcherException : public EWebBrokerException;
```

File

WebDisp

Description

When the TAdapterDispatcher (see page 6148) component can't successfully dispatch an action or obtain a dynamic image in response to a request, it generates an OnActionRequestNotHandled or an OnImageRequestNotHandled event. If there is no event handler for that event, or if the event handler does not handle the situation, TAdapterDispatcher (see page 6148) raises an EAdapterDispatcherException exception.

See Also

TCustomAdapterDispatcher (see page 6168)

60.1.2 EPageDispatcherException Class

EPageDispatcherException raises an exception when a page dispatcher encounters an error.

Class Hierarchy

Pascal

```
EPageDispatcherException = class(EWebBrokerException);
```

C++

```
class EPageDispatcherException : public EWebBrokerException;
```

File

WebDisp

Description

EPageDispatcherException represents exceptions that occur when a page dispatcher tries to obtain the content of a Web page in response to an incoming HTTP request. These exceptions include

The incoming request does not request a specific Web page and the application does not provide a default Web page to handle this situation.

The current user does not have access rights for the requested page.

The page dispatcher could not locate a Web page module to provide the requested page.

The Web module with the same name as the requested page can't produce a Web page.

The application is attempting to send a response that redirects the user to a page that the dispatcher can't locate.

See Also

TPageDispatcher (see page 6236)

60.1.3 ESessionException Class

ESessionException is the exception that is raised when a WebSnap application tries to use an invalid session.

Class Hierarchy

Pascal

```
ESessionException = class(EWebBrokerException);
```

C++

```
class ESessionException : public EWebBrokerException;
```

File

WebDisp

Description

The TInvalidWebSession (see page 6216) class raises ESessionException when the application tries to use the current session and that session could not be created. This includes attempts to change the properties of the current session (such as setting the time-out period), attempts to get or set values, or attempts to terminate the current session.

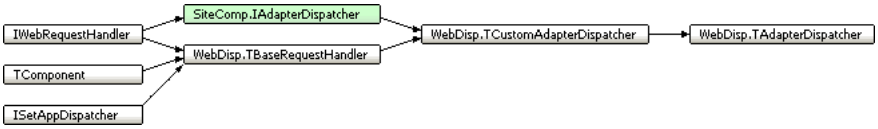
See Also

TInvalidWebSession (see page 6216)

60.1.4 TAdapterDispatcher Class

TAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.

Class Hierarchy



Pascal

```
TAdapterDispatcher = class(TCustomAdapterDispatcher);
```

C++

```
class TAdapterDispatcher : public TCustomAdapterDispatcher;
```

File

WebDisp

Description

TAdapterDispatcher is one of the default application components that is added when creating a WebSnap application. Events are triggered before and after dispatching an action or image, when adapter parameters are requested, and in cases when the action or image request was not handled.

Note: Your web application will be unable to execute adapter actions or obtain images from adapter fields unless it includes a TAdapterDispatcher component.

See Also

TAdapter (see page 5190)

TCustomWebAppComponents (see page 6201)

60.1.4.1 TAdapterDispatcher Members

The following tables list the members exposed by TAdapterDispatcher.

Protected Methods

	Name	Description
	AddSpecialParams (see page 6170)	Adds parameters for the success and failure Web pages to the list of adapter parameters.
	DoAdapterRequestNotHandled (see page 6171)	Generates an OnActionRequestNotHandled (see page 6177) and an OnImageRequestNotHandled (see page 6180) event.
	DoAfterDispatchAdapterRequest (see page 6172)	Generates an OnAfterDispatchAction (see page 6178) and an OnAfterDispatchImage (see page 6178) event.
	DoBeforeDispatchAdapterRequest (see page 6172)	Generates an OnBeforeDispatchAction (see page 6179) and an OnBeforeDispatchImage (see page 6179) event.
	EncodeAdapterItemRequestAsFieldValue (see page 6173)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 6173)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 6174)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.
	GetDispatchParams (see page 6174)	Parses a request to determine the adapter to which it is directed.
	HandleRequest (see page 6167)	Handles an HTTP request.
	ImplEncodeAdapterItemRequestAsFieldValue (see page 6175)	Provides the underlying implementation for the EncodeAdapterItemRequestAsFieldValue (see page 6173) method.
	ImplEncodeAdapterItemRequestAsHREF (see page 6175)	Provides the underlying implementation for the EncodeAdapterItemRequestAsHREF (see page 6173) method.
	ImplGetAdapterItemRequestParams (see page 6176)	Provides the underlying implementation for the GetAdapterItemRequestParams (see page 6174) method.
	ImplHandleRequest (see page 6167)	Handles application-specific processing of an HTTP request.
	ImplHandleRequest (see page 6176)	Provides the underlying implementation for the HandleRequest (see page 6167) method.
	SetAppDispatcher (see page 6167)	Sets the AppDispatcher (see page 6168) property.

Protected Properties

	Name	Description
	AppDispatcher (see page 6168)	Provides read-only access to the application dispatcher component.

Public Methods

	Name	Description
	EncodeAdapterItemRequestAsFieldValue (see page 986)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 986)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 987)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.

Published Events

	Name	Description
	OnActionRequestNotHandled (see page 6150)	Occurs when the WebSnap application could not execute a requested action.
	OnAfterDispatchAction (see page 6151)	Occurs after the target adapter has finished executing an action.
	OnAfterDispatchImage (see page 6151)	Occurs after the target adapter has finished handling an image request.
	OnBeforeDispatchAction (see page 6151)	Occurs before the dispatcher forwards an action to an adapter for execution.
	OnBeforeDispatchImage (see page 6152)	Occurs before the dispatcher forwards an image request to an adapter for handling.
	OnGetAdapterRequestParams (see page 6152)	Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.

	OnImageRequestNotHandled (see page 6153)	Occurs when the WebSnap application could not provide a requested image.

60.1.4.2 TAdapterDispatcher Events

The events of the TAdapterDispatcher class are listed here.

Published Events

	Name	Description
	OnActionRequestNotHandled (see page 6150)	Occurs when the WebSnap application could not execute a requested action.
	OnAfterDispatchAction (see page 6151)	Occurs after the target adapter has finished executing an action.
	OnAfterDispatchImage (see page 6151)	Occurs after the target adapter has finished handling an image request.
	OnBeforeDispatchAction (see page 6151)	Occurs before the dispatcher forwards an action to an adapter for execution.
	OnBeforeDispatchImage (see page 6152)	Occurs before the dispatcher forwards an image request to an adapter for handling.
	OnGetAdapterRequestParams (see page 6152)	Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.
	OnImageRequestNotHandled (see page 6153)	Occurs when the WebSnap application could not provide a requested image.

60.1.4.2.1 TAdapterDispatcher.OnActionRequestNotHandled Event

Occurs when the WebSnap application could not execute a requested action.

Pascal

```
property OnActionRequestNotHandled: TDispatchActionHandledEvent;
```

C++

```
__property TDispatchActionHandledEvent OnActionRequestNotHandled;
```

Description

Write an OnActionRequestNotHandled event handler to provide a response to actions that the adapter components in the application can't execute. This may occur because the adapter dispatcher could not find an adapter to handle the action, or it may occur because the identified adapter was unable to execute the action.

If the OnActionRequestNotHandled event handler does not set its Handled parameter to true, the adapter dispatcher generates an OnImageRequestNotHandled. If the OnImageRequestNotHandled event handler also does not handle the event, the dispatcher raises an EAdapterDispatcherException exception.

Tip: Use the Response property of the current Web context to access the response message from the OnActionRequestNotHandled event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnAfterDispatchAction (see page 6178)

OnBeforeDispatchAction (see page 6179)

EAdapterDispatcherException (see page 6146)

WebContext (see page 6003)

Response (see page 5975)

OnImageRequestNotHandled (see page 6180)

60.1.4.2.2 TAdapterDispatcher.OnAfterDispatchAction Event

Occurs after the target adapter has finished executing an action.

Pascal

```
property OnAfterDispatchAction: TDispatchActionEvent;
```

C++

```
__property TDispatchActionEvent OnAfterDispatchAction;
```

Description

Write an OnAfterDispatchAction event handler to take specific action after an adapter has executed an action. Note that this event can occur even if the request does not request the execution of an action or if the adapter was not successful in its attempt to execute the action.

See Also

OnActionRequestNotHandled (see page 6177)

OnBeforeDispatchAction (see page 6179)

60.1.4.2.3 TAdapterDispatcher.OnAfterDispatchImage Event

Occurs after the target adapter has finished handling an image request.

Pascal

```
property OnAfterDispatchImage: TDispatchImageEvent;
```

C++

```
__property TDispatchImageEvent OnAfterDispatchImage;
```

Description

Write an OnAfterDispatchImage event handler to take specific action after an adapter has responded to an image request. Note that this event can occur even if the request does not request the value of an image field or if the adapter was not successful in its attempt to honor that request.

See Also

OnImageRequestNotHandled (see page 6180)

OnBeforeDispatchImage (see page 6179)

60.1.4.2.4 TAdapterDispatcher.OnBeforeDispatchAction Event

Occurs before the dispatcher forwards an action to an adapter for execution.

Pascal

```
property OnBeforeDispatchAction: TDispatchActionHandledEvent;
```

C++

```
__property TDispatchActionHandledEvent OnBeforeDispatchAction;
```

Description

Write an OnBeforeDispatchAction event handler to respond to action requests before they are forwarded to the associated adapter for execution. Note that if the request does not request the execution of an action, the Params parameter of the event handler is nil (Delphi) or NULL (C++).

If the OnBeforeDispatchAction event handler does not set its Handled parameter to true, the adapter dispatcher forwards the request to the identified adapter that is the value of the Action parameter. If the event handler sets Handled to false, the dispatcher does not forward the request to the adapter for execution, and does not generate an OnAfterDispatchAction event.

Tip: Use the Response property of the current Web context to access the response message from the OnBeforeDispatchAction event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnActionRequestNotHandled (see page 6177)

OnAfterDispatchAction (see page 6178)

WebContext (see page 6003)

Response (see page 5975)

60.1.4.2.5 TAdapterDispatcher.OnBeforeDispatchImage Event

Occurs before the dispatcher forwards an image request to an adapter for handling.

Pascal

```
property OnBeforeDispatchImage: TDispatchImageHandledEvent;
```

C++

```
__property TDispatchImageHandledEvent OnBeforeDispatchImage;
```

Description

Write an OnBeforeDispatchImage event handler to respond to image requests before they are forwarded to the associated adapter for handling. Note that if the request does not ask for the value of an image field, the Params parameter of the event handler is nil (Delphi) or NULL (C++).

If the OnBeforeDispatchImage event handler does not set its Handled parameter to true, the adapter dispatcher forwards the request to the identified adapter that is the value of the Image parameter. If the event handler sets Handled to false, the dispatcher does not forward the request to the adapter for handling, and does not generate an OnAfterDispatchImage event.

Tip: Use the Response property of the current Web context to access the response message from the OnBeforeDispatchImage event handler. You can obtain a reference to the Web context by calling the global WebContext function.

See Also

OnImageRequestNotHandled (see page 6180)

OnAfterDispatchImage (see page 6178)

WebContext (see page 6003)

Response (see page 5975)

60.1.4.2.6 TAdapterDispatcher.OnGetAdapterRequestParams Event

Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.

Pascal

```
property OnGetAdapterRequestParams: TGetAdapterRequestParamsEvent;
```

C++

```
__property TGetAdapterRequestParamsEvent OnGetAdapterRequestParams;
```

Description

Write an OnGetAdapterRequestParams event handler to modify the list of parameters for an action or image request before they are used. The OnGetAdapterRequestParams event handler can modify the current parameters or add its own parameters to the list. This event occurs both when the dispatcher formats parameters that are added to HTML forms and when it is dispatching a request message that contains an action or image request.

See Also

GetAdapterItemRequestParams (see page 6174)

EncodeAdapterItemRequestAsFieldValue (see page 6173)

EncodeAdapterItemRequestAsHREF (see page 6173)

AddSpecialParams (see page 6170)

60.1.4.2.7 TAdapterDispatcher.OnImageRequestNotHandled Event

Occurs when the WebSnap application could not provide a requested image.

Pascal

```
property OnImageRequestNotHandled: TDispatchImageHandledEvent;
```

C++

```
__property TDispatchImageHandledEvent OnImageRequestNotHandled;
```

Description

Write an OnImageRequestNotHandled event handler to provide a response to image requests that the adapter components in the application can't honor. This may occur because the adapter dispatcher could not find an adapter to handle the request, or it may occur because the identified adapter was unable to provide the requested image.

If the OnImageRequestNotHandled event handler exits with its Handled parameter set to false, the dispatcher raises an EAdapterDispatcherException exception.

Tip: Use the Response property of the current Web context to access the response message from the OnImageRequestNotHandled event handler. You can obtain a reference to the Web context by calling the global WebContext function.

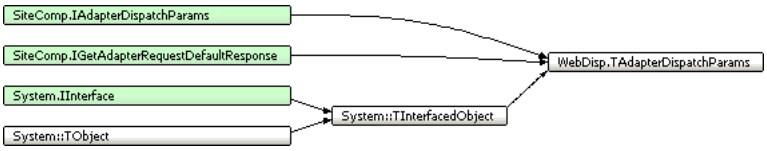
60.1.5 TAdapterDispatchParams Class

TAdapterDispatchParams parses a request to determine the adapter to which it is directed, and, if available, the Web pages that should appear when the request is successfully or unsuccessfully handled.

Class Hierarchy



Pascal

```
TAdapterDispatchParams = class(TInterfacedObject, IAdapterDispatchParams,
IGetAdapterRequestDefaultResponse);
```

C++

```
class TAdapterDispatchParams : public TInterfacedObject, public IAdapterDispatchParams, public
IGetAdapterRequestDefaultResponse;
```

File

WebDisp

Description

TAdapterDispatcher (see page 6148) uses TAdapterDispatchParams as a helper object for locating the adapter that can handle a request message. The TAdapterDispatchParams constructor takes a request message as an argument, and parses the request to determine the adapter, if any, that should handle it and the parameters that the adapter needs to handle the request.

The TAdapterDispatchParms properties identify the adapter that can process the request, the name of the action or field that the adapter uses to process the request, and the type of request (an action to execute or a field value to retrieve).

See Also

TAdapterDispatcher (see page 6148)

IAdapterDispatchParams (see page 987)

60.1.5.1 TAdapterDispatchParams Members

The following tables list the members exposed by TAdapterDispatchParams.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	GetFailurePage (see page 6157)	This is GetFailurePage, a member of class TAdapterDispatchParams.
	GetHandler (see page 6157)	Returns the value of the Handler property.
	GetObjectIdentifier (see page 6157)	Returns the value of the ObjectIdentifier property.
	GetParams (see page 6158)	Returns the value of the Params property.
	GetRequestIdentifier (see page 6158)	Returns the value of the RequestIdentifier property.
	GetSuccessPage (see page 6158)	This is GetSuccessPage, a member of class TAdapterDispatchParams.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6156)	Creates and initializes a TAdapterDispatchParams (see page 6153) object based on the information in an HTTP request.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6156)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	FailurePage (see page 1026)	This is FailurePage, a member of class IGetAdapterRequestDefaultResponse.
R	Handler (see page 6159)	Indicates the adapter object that can handle the current request.
R	ObjectIdentifier (see page 6159)	Specifies the name of the action to execute or the field to retrieve.
R	Params (see page 991)	Indicates the parameter values to use when executing the action or looking up the image.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
R	RequestIdentifier (see page 6160)	Identifies the type of the request identified by the ObjectIdentifier (see page 6159) property.

	SuccessPage (see page 1026)	This is SuccessPage, a member of class IGetAdapterRequestDefaultResponse.

60.1.5.2 TAdapterDispatchParams.Create Constructor

Creates and initializes a TAdapterDispatchParams (see page 6153) object based on the information in an HTTP request.

Pascal

```
constructor Create(ARequest: TWebRequest);
```

C++

```
__fastcall TAdapterDispatchParams(TWebRequest ARequest);
```

Description

Call Create to create a new TAdapterDispatchParams (see page 6153) object and use it to obtain information encoded in an HTTP request message.

The TAdapterDispatchParams (see page 6153) constructor parses the request message that is supplied as ARequest, locating the values that identify the adapter that must be used to handle the request, and the name and type of the information that that adapter supplies. Create uses this information to initialize the Handler (see page 6159), ObjectIdentifier (see page 6159), and RequestIdentifier (see page 6160) properties.

See Also

Handler (see page 6159)

ObjectIdentifier (see page 6159)

RequestIdentifier (see page 6160)

60.1.5.3 TAdapterDispatchParams.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterDispatchParams();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a

safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

60.1.5.4 TAdapterDispatchParams Methods

The methods of the TAdapterDispatchParams class are listed here.

Protected Methods

	Name	Description
	GetFailurePage (see page 6157)	This is GetFailurePage, a member of class TAdapterDispatchParams.
	GetHandler (see page 6157)	Returns the value of the Handler property.
	GetObjectIdentifier (see page 6157)	Returns the value of the ObjectIdentifier property.
	GetParams (see page 6158)	Returns the value of the Params property.
	GetRequestIdentifier (see page 6158)	Returns the value of the RequestIdentifier property.
	GetSuccessPage (see page 6158)	This is GetSuccessPage, a member of class TAdapterDispatchParams.

60.1.5.4.1 TAdapterDispatchParams.GetFailurePage Method

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall UnicodeString GetFailurePage();
```

Description

This is GetFailurePage, a member of class TAdapterDispatchParams.

60.1.5.4.2 TAdapterDispatchParams.GetHandler Method

Returns the value of the Handler property.

Pascal

```
function GetHandler: TObject;
```

C++

```
__fastcall TObject * GetHandler();
```

Description

GetHandler is the read implementation of the Handler property.

See Also

Handler (see page 990)

60.1.5.4.3 TAdapterDispatchParams.GetObjectIdentifier Method

Returns the value of the ObjectIdentifier property.

Pascal

```
function GetObjectIdentifier: string;
```

C++

```
__fastcall UnicodeString GetObjectIdentifier();
```

Description

GetObjectIdentifier is the read implementation of the ObjectIdentifier property.

See Also

ObjectIdentifier (see page 990)

60.1.5.4.4 TAdapterDispatchParams.GetParams Method

Returns the value of the Params property.

Pascal

```
function GetParams: TStrings;
```

C++

```
__fastcall TStrings GetParams();
```

Description

GetParams is the read implementation of the Params property.

See Also

Params (see page 991)

60.1.5.4.5 TAdapterDispatchParams.GetRequestIdentifier Method

Returns the value of the RequestIdentifier property.

Pascal

```
function GetRequestIdentifier: string;
```

C++

```
__fastcall UnicodeString GetRequestIdentifier();
```

Description

GetRequestIdentifier is the read implementation of the RequestIdentifier property.

See Also

RequestIdentifier (see page 991)

60.1.5.4.6 TAdapterDispatchParams.GetSuccessPage Method

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall UnicodeString GetSuccessPage();
```

Description

This is GetSuccessPage, a member of class TAdapterDispatchParams.

60.1.5.5 TAdapterDispatchParams Properties

The properties of the TAdapterDispatchParams class are listed here.

Public Properties

	Name	Description
	Handler (see page 6159)	Indicates the adapter object that can handle the current request.
	ObjectIdentifier (see page 6159)	Specifies the name of the action to execute or the field to retrieve.
	RequestIdentifier (see page 6160)	Identifies the type of the request identified by the ObjectIdentifier (see page 6159) property.

60.1.5.5.1 TAdapterDispatchParams.Handler Property

Indicates the adapter object that can handle the current request.

Pascal

```
property Handler: TObject;
```

C++

```
__property TObject * Handler;
```

Description

Read (see page 3634) Handler to access the adapter that can execute the action or supply the image that is requested. The TAdapterDispatchParams (see page 6153) constructor initializes this property based on the information it parses from the current request message.

See Also

Create (see page 6156)

ObjectIdentifier (see page 6159)

RequestIdentifier (see page 6160)

60.1.5.5.2 TAdapterDispatchParams.ObjectIdentifier Property

Specifies the name of the action to execute or the field to retrieve.

Pascal

```
property ObjectIdentifier: string;
```

C++

```
__property UnicodeString ObjectIdentifier;
```

Description

Read (see page 3634) ObjectIdentifier to determine the name of the requested action or field. The TAdapterDispatchParams (see page 6153) constructor initializes this property based on the information it parses from the current request message.

The interpretation of this value is the responsibility of the object specified by the Handler (see page 6159) parameter.

See Also

Create (see page 6156)

Handler (see page 6159)

RequestIdentifier (see page 6160)

60.1.5.5.3 TAdapterDispatchParams.RequestIdentifier Property

Identifies the type of the request identified by the ObjectIdentifier (see page 6159) property.

Pascal

```
property RequestIdentifier: string;
```

C++

```
__property UnicodeString RequestIdentifier;
```

Description

Read (see page 3634) RequestIdentifier to determine the type of processing the current request requires. For example, the RequestIdentifier may identify the request as a request for the value of an image field or a request to execute an action. The TAdapterDispatchParams (see page 6153) constructor initializes this property based on the information it parses from the current request message.

The interpretation of this value is the responsibility of the object specified by the Handler (see page 6159) parameter.

See Also

Create (see page 6156)

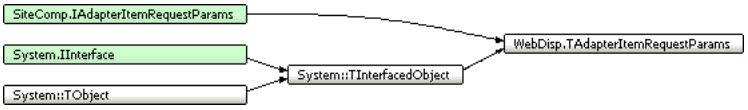
Handler (see page 6159)

ObjectIdentifier (see page 6159)

60.1.6 TAdapterItemRequestParams Class

TAdapterItemRequestParams holds the name/value pairs that must be included in request messages addressed to an adapter or its subcomponents.

Class Hierarchy



Pascal

```
TAdapterItemRequestParams = class(TInterfacedObject, IAdapterItemRequestParams);
```

C++

```
class TAdapterItemRequestParams : public TInterfacedObject, public IAdapterItemRequestParams;
```

File

WebDisp

Description

TAdapterItemRequestParams is the default implementation of the IAdapterItemRequestParams (see page 1005) interface. It holds the name/value pairs that should be included as request parameters to an adapter or one of its subcomponents.

The parameters, which can be accessed through the ParamValues (see page 6165) property, are a set of 'Name=Value' strings. In addition to holding these parameters, TAdapterItemRequestParams has two properties, SuccessPage (see page 6165) and FailurePage (see page 6165), which identify the Web pages that should be returned to the caller when the request succeeds or fails.

See Also

TAdapterDispatcher (see page 6148)

IAdapterItemRequestParams (see page 1005)

GetAdapterItemRequestParams (see page 5629)

60.1.6.1 TAdapterItemRequestParams Members

The following tables list the members exposed by TAdapterItemRequestParams.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	GetFailurePage (see page 6163)	Returns the value of the FailurePage property.
	GetParamValues (see page 6163)	Returns the value of the ParamValues property.
	GetSuccessPage (see page 6164)	Returns the value of the SuccessPage property.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	SetFailurePage (see page 6164)	Sets the value of the FailurePage property.
	SetSuccessPage (see page 6164)	Sets the value of the SuccessPage property.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6162)	Creates and initializes a TAdapterItemRequestParams (see page 6160) object.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6162)	Frees an instance of TAdapterItemRequestParams (see page 6160).
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.

	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	FailurePage (see page 6165)	Indicates the Web page that the application should return if the current request fails.
	ParamValues (see page 6165)	Lists the parameter values that are included in requests to the adapter action or field.
	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	SuccessPage (see page 6165)	Indicates the Web page that the application should return if the request succeeds.

60.1.6.2 TAdapterItemRequestParams.Create Constructor

Creates and initializes a TAdapterItemRequestParams (see page 6160) object.

Pascal

```
constructor Create;
```

C++

```
__fastcall TAdapterItemRequestParams();
```

Description

Typically, applications have no need to create TAdapterItemRequestParams (see page 6160) instances. The adapter dispatcher creates these objects to hold the parameters for a request.

See Also

TAdapterDispatcher (see page 6148)

60.1.6.3 TAdapterItemRequestParams.Destroy Destructor

Frees an instance of TAdapterItemRequestParams (see page 6160).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterItemRequestParams();
```

Description

Most applications have no need to create or free TAdapterItemRequestParams (see page 6160) instances. These objects are managed by the adapter dispatcher.

See Also

TAdapterDispatcher (see page 6148)

60.1.6.4 TAdapterItemRequestParams Methods

The methods of the TAdapterItemRequestParams class are listed here.

Protected Methods

	Name	Description
	GetFailurePage (see page 6163)	Returns the value of the FailurePage property.
	GetParamValues (see page 6163)	Returns the value of the ParamValues property.
	GetSuccessPage (see page 6164)	Returns the value of the SuccessPage property.
	SetFailurePage (see page 6164)	Sets the value of the FailurePage property.
	SetSuccessPage (see page 6164)	Sets the value of the SuccessPage property.

60.1.6.4.1 TAdapterItemRequestParams.GetFailurePage Method

Returns the value of the FailurePage property.

Pascal

```
function GetFailurePage: string;
```

C++

```
__fastcall UnicodeString GetFailurePage();
```

Description

GetFailurePage is the read implementation of the FailurePage property.

See Also

FailurePage (see page 1008)

60.1.6.4.2 TAdapterItemRequestParams.GetParamValues Method

Returns the value of the ParamValues property.

Pascal

```
function GetParamValues: TStrings;
```

C++

```
__fastcall TStrings GetParamValues();
```

Description

GetParamValues is the read implementation of the ParamValues property.

See Also

ParamValues (see page 1009)

60.1.6.4.3 TAdapterItemRequestParams.GetSuccessPage Method

Returns the value of the SuccessPage property.

Pascal

```
function GetSuccessPage: string;
```

C++

```
__fastcall UnicodeString GetSuccessPage();
```

Description

GetSuccessPage is the read implementation of the SuccessPage property.

See Also

SuccessPage (see page 1009)

60.1.6.4.4 TAdapterItemRequestParams.SetFailurePage Method

Sets the value of the FailurePage property.

Pascal

```
procedure SetFailurePage(const AValue: string);
```

C++

```
__fastcall SetFailurePage(const UnicodeString AValue);
```

Description

SetFailurePage is the write implementation of the FailurePage property.

AValue is the name of the Web page that should be returned if the adapter request fails.

See Also

FailurePage (see page 1008)

60.1.6.4.5 TAdapterItemRequestParams.SetSuccessPage Method

Sets the value of the SuccessPage property.

Pascal

```
procedure SetSuccessPage(const AValue: string);
```

C++

```
__fastcall SetSuccessPage(const UnicodeString AValue);
```

Description

SetSuccessPage is the write implementation of the SuccessPage property.

AValue is the name of the Web page that should be returned when the adapter request succeeds.

See Also

SuccessPage (see page 1009)

60.1.6.5 TAdapterItemRequestParams Properties

The properties of the TAdapterItemRequestParams class are listed here.

Public Properties

	Name	Description
	FailurePage (see page 6165)	Indicates the Web page that the application should return if the current request fails.
R	ParamValues (see page 6165)	Lists the parameter values that are included in requests to the adapter action or field.
	SuccessPage (see page 6165)	Indicates the Web page that the application should return if the request succeeds.

60.1.6.5.1 TAdapterItemRequestParams.FailurePage Property

Indicates the Web page that the application should return if the current request fails.

Pascal

```
property FailurePage: string;
```

C++

```
__property UnicodeString FailurePage;
```

Description

FailurePage is the name of the registered Web page module that should generate the content of the response message if the request to the adapter fails.

See Also

SuccessPage (see page 6165)

60.1.6.5.2 TAdapterItemRequestParams.ParamValues Property

Lists the parameter values that are included in requests to the adapter action or field.

Pascal

```
property ParamValues: TStrings;
```

C++

```
__property TStrings ParamValues;
```

Description

Use ParamValues to access the list of parameter values. Use the Names property of ParamValues to obtain the names of the parameters and the Values property to access the corresponding values.

See Also

Names

Values

60.1.6.5.3 TAdapterItemRequestParams.SuccessPage Property

Indicates the Web page that the application should return if the request succeeds.

Pascal

```
property SuccessPage: string;
```

C++

```
__property UnicodeString SuccessPage;
```

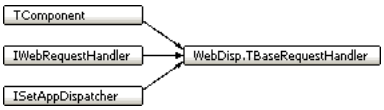
Description

SuccessPage is the name of the registered Web page module that should generate the content of the response message when the request to the adapter succeeds.

60.1.7 TBaseRequestHandler Class

The TBaseRequestHandler component is a base class for WebSnap dispatcher components.

Class Hierarchy



Pascal

```
TBaseRequestHandler = class(TComponent, IWebRequestHandler, ISetAppDispatcher);
```

C++

```
class TBaseRequestHandler : public TComponent, public IWebRequestHandler, public
ISetAppDispatcher;
```

File

WebDisp

Description

The TCustomAdapterDispatcher (see page 6168) and TCustomPageDispatcher (see page 6188) components are derived from TBaseRequestHandler.

60.1.7.1 TBaseRequestHandler Members

The following tables list the members exposed by TBaseRequestHandler.

Protected Methods

	Name	Description
	HandleRequest (see page 6167)	Handles an HTTP request.
V	ImplHandleRequest (see page 6167)	Handles application-specific processing of an HTTP request.
	SetAppDispatcher (see page 6167)	Sets the AppDispatcher (see page 6168) property.

Protected Properties

	Name	Description
R	AppDispatcher (see page 6168)	Provides read-only access to the application dispatcher component.

60.1.7.2 TBaseRequestHandler Methods

The methods of the TBaseRequestHandler class are listed here.

Protected Methods

	Name	Description
	HandleRequest (see page 6167)	Handles an HTTP request.
	ImplHandleRequest (see page 6167)	Handles application-specific processing of an HTTP request.
	SetAppDispatcher (see page 6167)	Sets the AppDispatcher (see page 6168) property.

60.1.7.2.1 TBaseRequestHandler.HandleRequest Method

Handles an HTTP request.

Pascal

```
function HandleRequest(ARequest: TWebRequest; AResponse: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(TWebRequest ARequest, TWebResponse AResponse);
```

Description

HandleRequest returns true if it handles the request specified by ARequest. This function calls the ImplHandleRequest (see page 6167) to process the request. A customized overridden function should be written for ImplHandleRequest (see page 6167) to do the necessary processing specific to the application.

See Also

ImplHandleRequest (see page 6167)

60.1.7.2.2 TBaseRequestHandler.ImplHandleRequest Method

Handles application-specific processing of an HTTP request.

Pascal

```
function ImplHandleRequest(ARequest: TWebRequest; AResponse: TWebResponse): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(TWebRequest ARequest, TWebResponse AResponse);
```

Description

The ImplHandleRequest function is called from HandleRequest (see page 6167) to handle the application-specific processing of the HTTP request.

This base version of the function generates an assertion failure as a reminder that a customized overridden version of this function needs to be defined in order to handle the request processing specific to the application.

See Also

HandleRequest (see page 6167)

60.1.7.2.3 TBaseRequestHandler.SetAppDispatcher Method

Sets the AppDispatcher (see page 6168) property.

Pascal

```
procedure SetAppDispatcher(const AWebAppDispatcher: TComponent);
```

C++

```
__fastcall SetAppDispatcher(const TComponent * AWebAppDispatcher);
```

Description

SetAppDispatcher provides a way to set the AppDispatcher (see page 6168) property.

See Also

AppDispatcher (see page 6168)

60.1.7.3 TBaseRequestHandler Properties

The properties of the TBaseRequestHandler class are listed here.

Protected Properties

	Name	Description
	AppDispatcher (see page 6168)	Provides read-only access to the application dispatcher component.

60.1.7.3.1 TBaseRequestHandler.AppDispatcher Property

Provides read-only access to the application dispatcher component.

Pascal

```
property AppDispatcher: TComponent;
```

C++

```
__property TComponent * AppDispatcher;
```

Description

The application dispatcher component is typically TWebAppComponents (see page 6243). The application dispatcher component is used to access application objects such as TWebRequest (see page 6276) and application components such as TEndUserAdapter.

See Also

TCustomAdapterDispatcher (see page 6168)

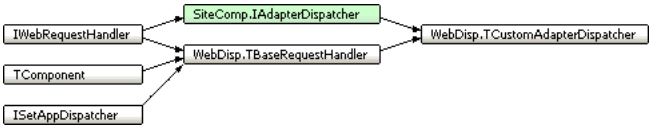
TCustomPageDispatcher (see page 6188)

TWebAppComponents (see page 6243)

60.1.8 TCustomAdapterDispatcher Class

TCustomAdapterDispatcher automatically handles HTML form submissions and requests for dynamic images by calling adapter action and field components.

Class Hierarchy



Pascal

```
TCustomAdapterDispatcher = class(TBaseRequestHandler, IAdapterDispatcher);
```

C++

```
class TCustomAdapterDispatcher : public TBaseRequestHandler, public IAdapterDispatcher;
```

File

WebDisp

Description

TCustomAdapterDispatcher is the base class for the adapter dispatcher. The adapter dispatcher is responsible for dispatching adapter actions and references to image fields. It also handles the encoding of parameters that must be included in HTML form submissions that invoke those adapter actions or field references. If a WebSnap application does not include an AdapterDispatcher component, then it can't execute adapter actions or obtain images from adapter fields.

See Also

TAdapter (see page 5190)

TAdapterDispatcher (see page 6148)

TCustomWebAppComponents (see page 6201)

60.1.8.1 TCustomAdapterDispatcher Members

The following tables list the members exposed by TCustomAdapterDispatcher.

Protected Methods

	Name	Description
	AddSpecialParams (see page 6170)	Adds parameters for the success and failure Web pages to the list of adapter parameters.
	DoAdapterRequestNotHandled (see page 6171)	Generates an OnActionRequestNotHandled (see page 6177) and an OnImageRequestNotHandled (see page 6180) event.
	DoAfterDispatchAdapterRequest (see page 6172)	Generates an OnAfterDispatchAction (see page 6178) and an OnAfterDispatchImage (see page 6178) event.
	DoBeforeDispatchAdapterRequest (see page 6172)	Generates an OnBeforeDispatchAction (see page 6179) and an OnBeforeDispatchImage (see page 6179) event.
	EncodeAdapterItemRequestAsFieldValue (see page 6173)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 6173)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 6174)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.
	GetDispatchParams (see page 6174)	Parses a request to determine the adapter to which it is directed.
	HandleRequest (see page 6167)	Handles an HTTP request.
	ImplEncodeAdapterItemRequestAsFieldValue (see page 6175)	Provides the underlying implementation for the EncodeAdapterItemRequestAsFieldValue (see page 6173) method.
	ImplEncodeAdapterItemRequestAsHREF (see page 6175)	Provides the underlying implementation for the EncodeAdapterItemRequestAsHREF (see page 6173) method.

	ImplGetAdapterItemRequestParams (see page 6176)	Provides the underlying implementation for the GetAdapterItemRequestParams (see page 6174) method.
	ImplHandleRequest (see page 6176)	Provides the underlying implementation for the HandleRequest (see page 6167) method.
	SetAppDispatcher (see page 6167)	Sets the AppDispatcher (see page 6168) property.

Protected Properties

	Name	Description
	AppDispatcher (see page 6168)	Provides read-only access to the application dispatcher component.

Public Events

	Name	Description
	OnActionRequestNotHandled (see page 6177)	Occurs when the WebSnap application could not execute a requested action.
	OnAfterDispatchAction (see page 6178)	Occurs after the target adapter has finished executing an action.
	OnAfterDispatchImage (see page 6178)	Occurs after the target adapter has finished handling an image request.
	OnBeforeDispatchAction (see page 6179)	Occurs before the dispatcher forwards an action to an adapter for execution.
	OnBeforeDispatchImage (see page 6179)	Occurs before the dispatcher forwards an image request to an adapter for handling.
	OnGetAdapterRequestParams (see page 6180)	Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.
	OnImageRequestNotHandled (see page 6180)	Occurs when the WebSnap application could not provide a requested image.

60.1.8.2 TCustomAdapterDispatcher Methods

The methods of the TCustomAdapterDispatcher class are listed here.

Protected Methods

	Name	Description
	AddSpecialParams (see page 6170)	Adds parameters for the success and failure Web pages to the list of adapter parameters.
	DoAdapterRequestNotHandled (see page 6171)	Generates an OnActionRequestNotHandled (see page 6177) and an OnImageRequestNotHandled (see page 6180) event.
	DoAfterDispatchAdapterRequest (see page 6172)	Generates an OnAfterDispatchAction (see page 6178) and an OnAfterDispatchImage (see page 6178) event.
	DoBeforeDispatchAdapterRequest (see page 6172)	Generates an OnBeforeDispatchAction (see page 6179) and an OnBeforeDispatchImage (see page 6179) event.
	EncodeAdapterItemRequestAsFieldValue (see page 6173)	Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.
	EncodeAdapterItemRequestAsHREF (see page 6173)	Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.
	GetAdapterItemRequestParams (see page 6174)	Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.
	GetDispatchParams (see page 6174)	Parses a request to determine the adapter to which it is directed.
	ImplEncodeAdapterItemRequestAsFieldValue (see page 6175)	Provides the underlying implementation for the EncodeAdapterItemRequestAsFieldValue (see page 6173) method.
	ImplEncodeAdapterItemRequestAsHREF (see page 6175)	Provides the underlying implementation for the EncodeAdapterItemRequestAsHREF (see page 6173) method.
	ImplGetAdapterItemRequestParams (see page 6176)	Provides the underlying implementation for the GetAdapterItemRequestParams (see page 6174) method.
	ImplHandleRequest (see page 6176)	Provides the underlying implementation for the HandleRequest (see page 6167) method.

60.1.8.2.1 TCustomAdapterDispatcher.AddSpecialParams Method

Adds parameters for the success and failure Web pages to the list of adapter parameters.

Pascal

```
procedure AddSpecialParams(AHandler: IUnknown; Params: IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall AddSpecialParams(IUnknown AHandler, IAdapterItemRequestParams Params);
```

Description

The adapter dispatcher calls AddSpecialParams internally after retrieving a set of parameters from an adapter (handler) and before generating an OnGetAdapterRequestParams (see page 6180) event. This method adds parameters to the list that are not required by the adapter for handling the request.

AddSpecialParams retrieves the Web pages that should be displayed when the adapter succeeds or fails in processing the request with which the handler is associated. If the handler has any special pages to display, AddSpecialParams adds the names of these pages to the parameters, using the parameter names of '__sp' and '__fp' (for success page and failure page), or '__p' (if the same page should be used for both success and failure).

AHandler is the interface for the adapter associated with the action or image.

Params is an interface that provides access to the current list of parameters.

See Also

GetAdapterItemRequestParams (see page 6174)

OnGetAdapterRequestParams (see page 6180)

FailurePage (see page 1008)

SuccessPage (see page 1009)

60.1.8.2.2 TCustomAdapterDispatcher.DoAdapterRequestNotHandled Method

Generates an OnActionRequestNotHandled (see page 6177) and an OnImageRequestNotHandled (see page 6180) event.

Pascal

```
procedure DoAdapterRequestNotHandled(AObject: TObject; var AHandled: Boolean);
```

C++

```
__fastcall DoAdapterRequestNotHandled(TObject * AObject, Boolean AHandled);
```

Description

TCustomAdapterDispatcher (see page 6168) calls DoAdapterRequestNotHandled internally when an adapter request remains unhandled. The request may be unhandled because the adapter could not execute the requested action or obtain the requested image, or it may be unhandled because the dispatcher could not locate an adapter to handle the request.

DoAdapterRequestNotHandled assembles the parameters for an action request and generates an OnActionRequestNotHandled (see page 6177) event. It then assembles the parameters for an image request and generates an OnImageRequestNotHandled (see page 6180) event.

AObject is the adapter that failed to handle the request (or nil (Delphi) or NULL (C++) if the dispatcher could not locate an adapter for the request).

AHandled returns true if an event handler handled the request.

See Also

OnActionRequestNotHandled (see page 6177)

OnImageRequestNotHandled (see page 6180)

60.1.8.2.3 TCustomAdapterDispatcher.DoAfterDispatchAdapterRequest Method

Generates an OnAfterDispatchAction (see page 6178) and an OnAfterDispatchImage (see page 6178) event.

Pascal

```
procedure DoAfterDispatchAdapterRequest(AObject: TObject);
```

C++

```
__fastcall DoAfterDispatchAdapterRequest(TObject * AObject);
```

Description

TCustomAdapterDispatcher (see page 6168) calls DoAfterDispatchAdapterRequest internally after calling on an adapter to handle a request. It calls this method both when the adapter indicates success and when it indicates failure in handling the request.

DoAfterDispatchAdapterRequest assembles the parameters for an action request and generates an OnAfterDispatchAction (see page 6178) event. It then assembles the parameters for an image request and generates an OnAfterDispatchImage (see page 6178) event.

AObject is the adapter that just handled the current request.

See Also

OnAfterDispatchAction (see page 6178)

OnAfterDispatchImage (see page 6178)

60.1.8.2.4 TCustomAdapterDispatcher.DoBeforeDispatchAdapterRequest Method

Generates an OnBeforeDispatchAction (see page 6179) and an OnBeforeDispatchImage (see page 6179) event.

Pascal

```
procedure DoBeforeDispatchAdapterRequest(AObject: TObject; var AHandled: Boolean);
```

C++

```
__fastcall DoBeforeDispatchAdapterRequest(TObject * AObject, Boolean AHandled);
```

Description

TCustomAdapterDispatcher (see page 6168) calls DoBeforeDispatchAdapterRequest internally before calling on an adapter to handle a request. It calls this method only after it has identified the appropriate handler for responding to the current request.

DoBeforeDispatchAdapterRequest assembles the parameters for an action request and generates an OnBeforeDispatchAction (see page 6179) event. It then assembles the parameters for an image request and generates an OnBeforeDispatchImage (see page 6179) event.

AObject is the adapter for handling the current request.

AHandled returns true if an event handler handled the request.

See Also

OnBeforeDispatchAction (see page 6179)

OnBeforeDispatchImage (see page 6179)

60.1.8.2.5 TCustomAdapterDispatcher.EncodeAdapterItemRequestAsFieldValue Method

Returns the hidden fields that can be added to an HTML form to represent the parameters of a request to an adapter action or image field.

Pascal

```
function EncodeAdapterItemRequestAsFieldValue(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string;
```

C++

```
__fastcall UnicodeString EncodeAdapterItemRequestAsFieldValue(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

Adapter components call EncodeAdapterItemRequestAsFieldValue to encode the action or field parameters as they should appear as field values in form submissions. The resulting parameter string has a form such as '?param1=value1&param2=value2'.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItmRequestAsFieldValue returns the parameter string.

See Also

GetAdapterItemRequestParams (see page 6174)

EncodeAdapterItemRequestAsHREF (see page 6173)

60.1.8.2.6 TCustomAdapterDispatcher.EncodeAdapterItemRequestAsHREF Method

Returns the HREF parameters that can be added to an anchor tag on an HTML form to represent the parameters of a request to an adapter.

Pascal

```
function EncodeAdapterItemRequestAsHREF(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string;
```

C++

```
__fastcall UnicodeString EncodeAdapterItemRequestAsHREF(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

Adapter components call EncodeAdapterItemRequestAsHREF to encode the action or image field parameters as they should appear as parameters to an anchor tag in an HTML form.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItemRequestAsHREF returns the parameter string.

See Also

GetAdapterItemRequestParams (see page 6174)

EncodeAdapterItemRequestAsFieldValue (see page 6173)

60.1.8.2.7 TCustomAdapterDispatcher.GetAdapterItemRequestParams Method

Retrieves an interface for reading and writing the parameters of a request to an adapter action or image field.

Pascal

```
procedure GetAdapterItemRequestParams(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions; Params: IAdapterItemRequestParams);
```

C++

```
__fastcall GetAdapterItemRequestParams(IUnknown AHandler, TAdapterItemRequestParamOptions
AOptions, IAdapterItemRequestParams Params);
```

Description

GetAdapterItemRequestParams retrieves the parameters for a call to execute an adapter action or to fetch the value of an image field.

AHandler is the interface of the adapter that requires the parameters to execute the action or produce the image field value.

AOptions is a set of flags that indicate what types of parameters should be included.

AParams is an interface for reading and writing parameter values. GetAdapterItemRequestParams uses this interface to write the parameter values.

GetAdapterItemRequestParams simply calls the ImplGetAdapterItemRequestParams (see page 6176) method, which fetches the parameter values and writes them to AParams.

See Also

EncodeAdapterItemRequestAsHREF (see page 6173)

EncodeAdapterItemRequestAsFieldValue (see page 6173)

ImplGetAdapterItemRequestParams (see page 6176)

60.1.8.2.8 TCustomAdapterDispatcher.GetDispatchParams Method

Parses a request to determine the adapter to which it is directed.

Pascal

```
function GetDispatchParams(Request: TWebRequest): TAdapterDispatchParams; virtual;
```

C++

```
virtual __fastcall TAdapterDispatchParams GetDispatchParams(TWebRequest Request);
```

Description

TCustomAdapterDispatcher (see page 6168) calls GetDispatchParams internally to obtain information about the adapter to which a request is directed. GetDispatchParams creates a new TAdapterDispatchParams (see page 6153) object, which parses the current request to determine the adapter to which it is directed.

Request is the current http request object.

GetDispatchParams returns the new TAdapterDispatchParams (see page 6153) object, whose properties have been filled out to reflect the information in the current request. It is the caller's responsibility to free this object.

60.1.8.2.9
TCustomAdapterDispatcher.ImplEncodeAdapterItemRequestAsFieldValue Method

Provides the underlying implementation for the EncodeAdapterItemRequestAsFieldValue (see page 6173) method.

Pascal

```
function ImplEncodeAdapterItemRequestAsFieldValue(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplEncodeAdapterItemRequestAsFieldValue(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

The EncodeAdapterItemRequestAsFieldValue (see page 6173) method calls ImplEncodeAdapterItemRequestAsFieldValue to retrieve a set of parameters formatted as a set of field values for an HTTP request. ImplEncodeAdapterItemRequestAsFieldValue calls GetAdapterItemRequestParams (see page 6174) to fetch the parameter values, and then formats them as a set of field values.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItmRequestAsFieldValue returns the parameter string.

See Also

EncodeAdapterItemRequestAsFieldValue (see page 6173)

GetAdapterItemRequestParams (see page 6174)

60.1.8.2.10
TCustomAdapterDispatcher.ImplEncodeAdapterItemRequestAsHREF Method

Provides the underlying implementation for the EncodeAdapterItemRequestAsHREF (see page 6173) method.

Pascal

```
function ImplEncodeAdapterItemRequestAsHREF(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplEncodeAdapterItemRequestAsHREF(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions);
```

Description

The EncodeAdapterItemRequestAsHREF (see page 6173) method calls ImplEncodeAdapterItemRequestAsFieldValue (see page 6175) to retrieve a set of parameters formatted as the parameters to an anchor tag in an HTML form. ImplEncodeAdapterItemRequestAsHREF calls GetAdapterItemRequestParams (see page 6174) to fetch the parameter values, and then formats them.

AHandler is the interface of the adapter whose action or image field requires the parameters.

AOptions is a set of flags that indicate what types of parameters to include.

EncodeAdapterItemRequestAsHREF (see page 6173) returns the parameter string.

See Also

EncodeAdapterItemRequestAsHREF (see page 6173)

GetAdapterItemRequestParams (see page 6174)

60.1.8.2.11 TCustomAdapterDispatcher.ImplGetAdapterItemRequestParams Method

Provides the underlying implementation for the GetAdapterItemRequestParams (see page 6174) method.

Pascal

```
procedure ImplGetAdapterItemRequestParams(AHandler: IUnknown; AOptions:
TAdapterItemRequestParamOptions; Params: IAdapterItemRequestParams); virtual;
```

C++

```
virtual __fastcall ImplGetAdapterItemRequestParams(IUnknown AHandler,
TAdapterItemRequestParamOptions AOptions, IAdapterItemRequestParams Params);
```

Description

GetAdapterItemRequestParams (see page 6174) calls ImplGetAdapterItemRequestParams to retrieve the parameters for a call to execute an adapter action or to fetch the value of an image field. This method fetches the requested parameters from the adapter interface, calls the AddSpecialParams (see page 6170) method to add additional parameters for the return Web page, and then generates an OnGetAdapterRequestParams (see page 6180) event so that you can make your own final adjustments to the parameter list.

AHandler is the interface of the adapter that requires the parameters to execute the action or produce the image field value.

AOptions is a set of flags that indicate what types of parameters should be included.

AParams is an interface for reading and writing parameter values. ImplGetAdapterItemRequestParams uses this interface to write the parameter values.

See Also

GetAdapterItemRequestParams (see page 6174)

AddSpecialParams (see page 6170)

OnGetAdapterRequestParams (see page 6180)

60.1.8.2.12 TCustomAdapterDispatcher.ImplHandleRequest Method

Provides the underlying implementation for the HandleRequest (see page 6167) method.

Pascal

```
function ImplHandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

The HandleRequest (see page 6167) method calls ImplHandleRequest to process an http request message and obtain the response that should be sent back to the caller. (The HandleRequest (see page 6167) method is called using the IWebRequestHandler interface.)

ImplHandleRequest

1. Calls GetDispatchParams (see page 6174) to parse the request and identify the adapter that should handle it.
2. If it finds an adapter, calls DoBeforeDispatchAdapterRequest (see page 6172) to generate the OnBeforeDispatchAction (see page 6179) and OnBeforeDispatchImage (see page 6179) events.
3. If the event handlers do not handle the event, forwards the request to the adapter for processing.
4. Calls DoAfterDispatchAdapterRequest (see page 6172) to generate the OnAfterDispatchAction (see page 6178) and OnAfterDispatchImage (see page 6178) events.
5. Calls DoAdapterRequestNotHandled (see page 6171) to generate the OnActionRequestNotHandled (see page 6177) and OnImageRequestNotHandled (see page 6180) events if the request has not yet been handled.

See Also

IWebRequestHandler

HandleRequest (see page 6167)

GetDispatchParams (see page 6174)

DoBeforeDispatchAdapterRequest (see page 6172)

DoAfterDispatchAdapterRequest (see page 6172)

DoAdapterRequestNotHandled (see page 6171)

60.1.8.3 TCustomAdapterDispatcher Events

The events of the TCustomAdapterDispatcher class are listed here.

Public Events

	Name	Description
	OnActionRequestNotHandled (see page 6177)	Occurs when the WebSnap application could not execute a requested action.
	OnAfterDispatchAction (see page 6178)	Occurs after the target adapter has finished executing an action.
	OnAfterDispatchImage (see page 6178)	Occurs after the target adapter has finished handling an image request.
	OnBeforeDispatchAction (see page 6179)	Occurs before the dispatcher forwards an action to an adapter for execution.
	OnBeforeDispatchImage (see page 6179)	Occurs before the dispatcher forwards an image request to an adapter for handling.
	OnGetAdapterRequestParams (see page 6180)	Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.
	OnImageRequestNotHandled (see page 6180)	Occurs when the WebSnap application could not provide a requested image.

60.1.8.3.1 TCustomAdapterDispatcher.OnActionRequestNotHandled Event

Occurs when the WebSnap application could not execute a requested action.

Pascal

```
property OnActionRequestNotHandled: TDispatchActionHandledEvent;
```

C++

```
__property TDispatchActionHandledEvent OnActionRequestNotHandled;
```

Description

Write (see page 3707) an OnActionRequestNotHandled event handler to provide a response to actions that the adapter components in the application can't execute. This may occur because the adapter dispatcher could not find an adapter to handle the action, or it may occur because the identified adapter was unable to execute the action.

If the OnActionRequestNotHandled event handler does not set its Handled parameter to true, the adapter dispatcher generates

an OnImageRequestNotHandled (see page 6180). If the OnImageRequestNotHandled (see page 6180) event handler also does not handle the event, the dispatcher raises an EAdapterDispatcherException (see page 6146) exception.

Tip: Use the Response property of the current Web context to access the response message from the OnActionRequestNotHandled event handler. You can obtain a reference to the Web context by calling the global WebContext (see page 6003) function.

See Also

OnAfterDispatchAction (see page 6178)

OnBeforeDispatchAction (see page 6179)

EAdapterDispatcherException (see page 6146)

WebContext (see page 6003)

Response (see page 5975)

OnImageRequestNotHandled (see page 6180)

60.1.8.3.2 TCustomAdapterDispatcher.OnAfterDispatchAction Event

Occurs after the target adapter has finished executing an action.

Pascal

```
property OnAfterDispatchAction: TDispatchActionEvent;
```

C++

```
__property TDispatchActionEvent OnAfterDispatchAction;
```

Description

Write (see page 3707) an OnAfterDispatchAction event handler to take specific action after an adapter has executed an action. Note that this event can occur even if the request does not request the execution of an action or if the adapter was not successful in its attempt to execute the action.

See Also

OnActionRequestNotHandled (see page 6177)

OnBeforeDispatchAction (see page 6179)

60.1.8.3.3 TCustomAdapterDispatcher.OnAfterDispatchImage Event

Occurs after the target adapter has finished handling an image request.

Pascal

```
property OnAfterDispatchImage: TDispatchImageEvent;
```

C++

```
__property TDispatchImageEvent OnAfterDispatchImage;
```

Description

Write (see page 3707) an OnAfterDispatchImage event handler to take specific action after an adapter has responded to an image request. Note that this event can occur even if the request does not request the value of an image field or if the adapter was not successful in its attempt to honor that request.

See Also

OnImageRequestNotHandled (see page 6180)

OnBeforeDispatchImage (see page 6179)

60.1.8.3.4 TCustomAdapterDispatcher.OnBeforeDispatchAction Event

Occurs before the dispatcher forwards an action to an adapter for execution.

Pascal

```
property OnBeforeDispatchAction: TDispatchActionHandledEvent;
```

C++

```
__property TDispatchActionHandledEvent OnBeforeDispatchAction;
```

Description

Write (see page 3707) an OnBeforeDispatchAction event handler to respond to action requests before they are forwarded to the associated adapter for execution. Note that if the request does not request the execution of an action, the Params parameter of the event handler is nil (Delphi) or NULL (C++).

If the OnBeforeDispatchAction event handler does not set its Handled parameter to true, the adapter dispatcher forwards the request to the identified adapter that is the value of the Action parameter. If the event handler sets Handled to false, the dispatcher does not forward the request to the adapter for execution, and does not generate an OnAfterDispatchAction (see page 6178) event.

Tip: Use the Response property of the current Web context to access the response message from the OnBeforeDispatchAction event handler. You can obtain a reference to the Web context by calling the global WebContext (see page 6003) function.

See Also

OnActionRequestNotHandled (see page 6177)

OnAfterDispatchAction (see page 6178)

WebContext (see page 6003)

Response (see page 5975)

60.1.8.3.5 TCustomAdapterDispatcher.OnBeforeDispatchImage Event

Occurs before the dispatcher forwards an image request to an adapter for handling.

Pascal

```
property OnBeforeDispatchImage: TDispatchImageHandledEvent;
```

C++

```
__property TDispatchImageHandledEvent OnBeforeDispatchImage;
```

Description

Write (see page 3707) an OnBeforeDispatchImage event handler to respond to image requests before they are forwarded to the associated adapter for handling. Note that if the request does not ask for the value of an image field, the Params parameter of the event handler is nil (Delphi) or NULL (C++).

If the OnBeforeDispatchImage event handler does not set its Handled parameter to true, the adapter dispatcher forwards the request to the identified adapter that is the value of the Image parameter. If the event handler sets Handled to false, the dispatcher does not forward the request to the adapter for handling, and does not generate an OnAfterDispatchImage (see page 6178) event.

Tip: Use the Response property of the current Web context to access the response message from the OnBeforeDispatchImage event handler. You can obtain a reference to the Web context by calling the global WebContext (see page 6003) function.

See Also

OnImageRequestNotHandled (see page 6180)

OnAfterDispatchImage (see page 6178)

WebContext (see page 6003)

Response (see page 5975)

60.1.8.3.6 TCustomAdapterDispatcher.OnGetAdapterRequestParams Event

Occurs when the adapter dispatcher needs to obtain the parameters for executing an action or retrieving an image.

Pascal

```
property OnGetAdapterRequestParams: TGetAdapterRequestParamsEvent;
```

C++

```
__property TGetAdapterRequestParamsEvent OnGetAdapterRequestParams;
```

Description

Write (see page 3707) an OnGetAdapterRequestParams event handler to modify the list of parameters for an action or image request before they are used. The OnGetAdapterRequestParams event handler can modify the current parameters or add its own parameters to the list. This event occurs both when the dispatcher formats parameters that are added to HTML forms and when it is dispatching a request message that contains an action or image request.

See Also

GetAdapterItemRequestParams (see page 6174)

EncodeAdapterItemRequestAsFieldValue (see page 6173)

EncodeAdapterItemRequestAsHREF (see page 6173)

AddSpecialParams (see page 6170)

60.1.8.3.7 TCustomAdapterDispatcher.OnImageRequestNotHandled Event

Occurs when the WebSnap application could not provide a requested image.

Pascal

```
property OnImageRequestNotHandled: TDispatchImageHandledEvent;
```

C++

```
__property TDispatchImageHandledEvent OnImageRequestNotHandled;
```

Description

Write (see page 3707) an OnImageRequestNotHandled event handler to provide a response to image requests that the adapter components in the application can't honor. This may occur because the adapter dispatcher could not find an adapter to handle the request, or it may occur because the identified adapter was unable to provide the requested image.

If the OnImageRequestNotHandled event handler exits with its Handled parameter set to false, the dispatcher raises an EAdapterDispatcherException (see page 6146) exception.

Tip: Use the Response property of the current Web context to access the response message from the OnImageRequestNotHandled event handler. You can obtain a reference to the Web context by calling the global WebContext (see page 6003) function.

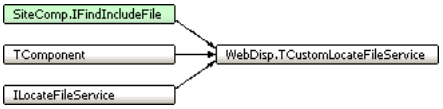
OnActionRequestNotHandled (see page 6177)

60.1.9 TCustomLocateFileService Class

TCustomLocateFileService uses event handlers to control access to templates and server-side script include files at runtime.

Class Hierarchy



Pascal

```
TCustomLocateFileService = class(TComponent, ILocateFileService, IFindIncludeFile);
```

C++

```
class TCustomLocateFileService : public TComponent, public ILocateFileService, public
IFindIncludeFile;
```

File

WebDisp

Description

TCustomLocateFileService is the base class for components that control access to files in a WebSnap application. TCustomLocateFileService defines events that indicate where to locate a requested file or that supply a stream object from which to read the contents of a file. By using a TCustomLocateFileService descendant, a WebSnap application can adjust to differences in the way files are deployed or even to use different files, depending on the current Web context.

Do not create instances of TCustomLocateFileService. All of the events it introduces are protected, and so unavailable to your application. Instead, use a TCustomLocateFileService descendant, such as TLocateFileService (see page 6220), which publishes those events.

See Also

TLocateFileService (see page 6220)

TStream

60.1.9.1 TCustomLocateFileService Members

The following tables list the members exposed by TCustomLocateFileService.

Protected Events

	Name	Description
	OnFindIncludeFile (see page 6186)	Occurs when the WebSnap application tries to locate an include file for a server-side script.
	OnFindStream (see page 6187)	Occurs when the WebSnap application tries to locate a file.
	OnFindTemplateFile (see page 6187)	Occurs when the WebSnap application tries to locate the template file for a content producer.

Protected Methods

	Name	Description
	FindIncludeFile (see page 6182)	Returns the fully-qualified path name for an include file for a server-side script.
V	FindStream (see page 6183)	Generates an OnFindStream (see page 6187) event.
	FindTemplateFile (see page 6183)	Generates an OnFindTemplateFile (see page 6187) event.
V	GetFileStream (see page 6184)	Returns a stream object from which to read a specified file.
	GetTemplateStream (see page 6184)	Returns a stream from which to read a template file.
V	ImplFindIncludeFile (see page 6185)	Provides the underlying implementation for the FindIncludeFile (see page 6182) method.
V	ImplGetTemplateStream (see page 6185)	Provides the underlying implementation for the GetTemplateStream (see page 6184) method.

60.1.9.2 TCustomLocateFileService Methods

The methods of the TCustomLocateFileService class are listed here.

Protected Methods

	Name	Description
	FindIncludeFile (see page 6182)	Returns the fully-qualified path name for an include file for a server-side script.
V	FindStream (see page 6183)	Generates an OnFindStream (see page 6187) event.
	FindTemplateFile (see page 6183)	Generates an OnFindTemplateFile (see page 6187) event.
V	GetFileStream (see page 6184)	Returns a stream object from which to read a specified file.
	GetTemplateStream (see page 6184)	Returns a stream from which to read a template file.
V	ImplFindIncludeFile (see page 6185)	Provides the underlying implementation for the FindIncludeFile (see page 6182) method.
V	ImplGetTemplateStream (see page 6185)	Provides the underlying implementation for the GetTemplateStream (see page 6184) method.

60.1.9.2.1 TCustomLocateFileService.FindIncludeFile Method

Returns the fully-qualified path name for an include file for a server-side script.

Pascal

```
function FindIncludeFile(AComponent: TComponent; const AFileName: string; var AResult:
string): Boolean;
```

C++

```
__fastcall Boolean FindIncludeFile(TComponent * AComponent, const UnicodeString AFileName,
UnicodeString AResult);
```

Description

WebSnap applications call FindIncludeFile when they encounter a reference to an include file in server-side script. This method returns the fully-qualified path name for the include file.

FindIncludeFile calls the virtual ImplFindIncludeFile (see page 6185) method to obtain the path and name of the include file. In TCustomLocateFileService (see page 6181), ImplFindIncludeFile (see page 6185) fetches the include file name by generating an OnFindIncludeFile (see page 6186) event. Component writers that which to locate include files in some other

way should override the ImplFindIncludeFile (see page 6185) method.

AComponent is the Web module context object that stores the reference to the include file.

AFileName is the name of the include file to locate.

AResult returns the fully-qualified path name where the WebSnap application can find the requested file.

FindIncludeFile returns true if it locates the requested file and returns its fully-qualified name as AResult.

See Also

OnFindIncludeFile (see page 6186)

ImplFindIncludeFile (see page 6185)

WebModuleContext

60.1.9.2.2 TCustomLocateFileService.FindStream Method

Generates an OnFindStream (see page 6187) event.

Pascal

```
function FindStream(AComponent: TComponent; const AFileName: string; out AResult: TStream; out AOwned: Boolean): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean FindStream(TComponent * AComponent, const UnicodeString AFileName, TStream AResult, Boolean AOwned);
```

Description

TCustomLocateFileService (see page 6181) calls FindStream internally to generate an OnFindStream (see page 6187) event.

AComponent is the object that uses or is associated with the requested file. Typically, this is a content producer.

AFileName is the name of the file to locate. This can be a "logical" file that does not exist on disk.

AResult returns a stream from which the caller can read the contents of the requested file.

AOwned indicates whether the caller should free AResult after reading the file contents. When AOwned returns true, the caller should free the stream object. When AOwned returns false, the caller should not free the stream object.

FindStream returns true if it supplies a stream as the value of the AResult parameter. It returns false if there is no OnFindStream (see page 6187) event handler or if the event handler does not return a value for AResult.

See Also

OnFindStream (see page 6187)

60.1.9.2.3 TCustomLocateFileService.FindTemplateFile Method

Generates an OnFindTemplateFile (see page 6187) event.

Pascal

```
function FindTemplateFile(AComponent: TComponent; const AFileName: string; var AResult: string): Boolean;
```

C++

```
__fastcall Boolean FindTemplateFile(TComponent * AComponent, const UnicodeString AFileName, UnicodeString AResult);
```

Description

TCustomLocateFileService (see page 6181) calls FindTemplateFile internally to generate an OnFindTemplateFile (see page 6187) event.

AComponent is the object that uses or is associated with the requested template. Typically, this is a content producer.

AFileName is the name of the file to locate.

AResult returns the fully-qualified path name for the requested file.

FindTemplateFile returns true if it supplies a file name as the value of the AResult parameter. It returns false if there is no OnFindTemplateFile (see page 6187) event handler or if the event handler does not return a value for AResult.

See Also

OnFindTemplateFile (see page 6187)

60.1.9.2.4 TCustomLocateFileService.GetFileStream Method

Returns a stream object from which to read a specified file.

Pascal

```
function GetFileStream(const AFileName: string; out AOwned: Boolean): TStream; virtual;
```

C++

```
virtual __fastcall TStream GetFileStream(const UnicodeString AFileName, Boolean AOwned);
```

Description

The GetTemplateStream (see page 6184) method calls GetFileStream internally to obtain the stream it returns when the requested file maps to a fully-qualified path name.

AFileName is the fully-qualified name of a file whose contents can be read from the returned stream.

AOwned indicates whether the caller should free the stream after reading the file contents. When AOwned returns true, the caller should free the stream object. When AOwned returns false, the caller should not free the stream object.

GetFileStream returns a stream object from which to read the contents of AFileName.

See Also

GetTemplateStream (see page 6184)

60.1.9.2.5 TCustomLocateFileService.GetTemplateStream Method

Returns a stream from which to read a template file.

Pascal

```
function GetTemplateStream(AComponent: TComponent; AFileName: string; out AOwned: Boolean):
TStream;
```

C++

```
__fastcall TStream GetTemplateStream(TComponent * AComponent, UnicodeString AFileName, Boolean
AOwned);
```

Description

Producer components call GetTemplateStream to read the contents of the template files they use to generate their content. GetTemplateStream locates the specified template file (which can be a logical rather than a physical file name), and returns a stream from which the caller can read the file contents.

GetTemplateStream calls the ImplGetTemplateStream (see page 6185) method, which generates first an OnFindStream (see page 6187) event, and, if OnFindStream (see page 6187) is unsuccessful, an OnFindTemplateFile (see page 6187) event.

AComponent is the object that uses or is associated with the requested template. Typically, this is a content producer.

AFileName is the logical name of the file to locate.

AOwned indicates whether the caller should free the stream after reading the file contents. When AOwned returns true, the caller should free the stream object. When AOwned returns false, the caller should not free the stream object.

GetTemplateStream returns a stream from which to read the requested file, or, if it could not locate the file, nil (Delphi) or NULL (C++).

See Also

ImplGetTemplateStream (see page 6185)

OnFindStream (see page 6187)

OnFindTemplateFile (see page 6187)

60.1.9.2.6 TCustomLocateFileService.ImplFindIncludeFile Method

Provides the underlying implementation for the FindIncludeFile (see page 6182) method.

Pascal

```
function ImplFindIncludeFile(AComponent: TComponent; const AFileName: string; var AResult:
string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplFindIncludeFile(TComponent * AComponent, const UnicodeString
AFileName, UnicodeString AResult);
```

Description

The FindIncludeFile (see page 6182) method calls ImplFindIncludeFile to locate the fully-qualified path name for an include file to a server-side script. ImplFindIncludeFile generates an OnFindIncludeFile (see page 6186) event to obtain the fully-qualified path name.

AComponent is the Web module context object that stores the reference to the include file.

AFileName is the name of the include file to locate.

AResult returns the fully-qualified path name where the WebSnap application can find the requested file.

FindIncludeFile (see page 6182) returns true if it locates the requested file and returns its fully-qualified name as AResult. It returns false if there is no OnFindIncludeFile (see page 6186) event handler or if the event handler does not return a value for AResult.

See Also

OnFindIncludeFile (see page 6186)

FindIncludeFile (see page 6182)

WebModuleContext

60.1.9.2.7 TCustomLocateFileService.ImplGetTemplateStream Method

Provides the underlying implementation for the GetTemplateStream (see page 6184) method.

Pascal

```
function ImplGetTemplateStream(AComponent: TComponent; AFileName: string; out AOwned:
Boolean): TStream; virtual;
```

C++

```
virtual __fastcall TStream ImplGetTemplateStream(TComponent * AComponent, UnicodeString
AFileName, Boolean AOwned);
```

Description

The GetTemplateStream (see page 6184) method calls ImplGetTemplateStream to obtain a stream from which to read a specified template. ImplGetTemplateStream generates an OnFindStream (see page 6187) event, and, if OnFindStream (see page 6187) is unsuccessful, an OnFindTemplateFile (see page 6187) event. If it gets a file name from the OnFindTemplateFile (see page 6187) event handler, ImplGetTemplateStream calls the GetFileStream (see page 6184) method to obtain a stream object from which to read the file.

AComponent is the object that uses or is associated with the requested template. Typically, this is a content producer.

AFileName is the logical name of the file to locate.

AOwned indicates whether the caller should free the stream after reading the file contents. When AOwned returns true, the caller should free the stream object. When AOwned returns false, the caller should not free the stream object.

GetTemplateStream (see page 6184) returns a stream from which to read the requested file, or, if it could not locate the file, nil (Delphi) or NULL (C++).

GetTemplateStream (see page 6184)

OnFindStream (see page 6187)

OnFindTemplateFile (see page 6187)

GetFileStream (see page 6184)

60.1.9.3 TCustomLocateFileService Events

The events of the TCustomLocateFileService class are listed here.

Protected Events

	Name	Description
	OnFindIncludeFile (see page 6186)	Occurs when the WebSnap application tries to locate an include file for a server-side script.
	OnFindStream (see page 6187)	Occurs when the WebSnap application tries to locate a file.
	OnFindTemplateFile (see page 6187)	Occurs when the WebSnap application tries to locate the template file for a content producer.

60.1.9.3.1 TCustomLocateFileService.OnFindIncludeFile Event

Occurs when the WebSnap application tries to locate an include file for a server-side script.

Pascal

```
property OnFindIncludeFile: TLocateFileServiceFindFileEvent;
```

C++

```
__property TLocateFileServiceFindFileEvent OnFindIncludeFile;
```

Description

Write (see page 3707) an OnFindIncludeFile event handler to indicate the location on disk of include files for server-side scripts. In WebSnap applications that include a locate file service component, you must supply either an OnFindIncludeFile or an OnFindStream (see page 6187) event handler (or both) if the server-side scripts have include files. Otherwise the application can't locate these include files at all.

See Also

OnFindStream (see page 6187)

OnFindTemplateFile (see page 6187)

60.1.9.3.2 TCustomLocateFileService.OnFindStream Event

Occurs when the WebSnap application tries to locate a file.

Pascal

```
property OnFindStream: TLocateFileServiceFindStreamEvent;
```

C++

```
__property TLocateFileServiceFindStreamEvent OnFindStream;
```

Description

Write (see page 3707) an OnFindStream event handler to supply the WebSnap application with the contents of a file given its name. This event is particularly useful for applications that use "logical" files that do not exist physically on disk. When the WebSnap application tries to locate a file, the locate file service generates this event, along with an OnFindTemplateFile (see page 6187). One of these event handlers must be provided in order for the application to use the requested file.

See Also

OnFindIncludeFile (see page 6186)

OnFindTemplateFile (see page 6187)

60.1.9.3.3 TCustomLocateFileService.OnFindTemplateFile Event

Occurs when the WebSnap application tries to locate the template file for a content producer.

Pascal

```
property OnFindTemplateFile: TLocateFileServiceFindFileEvent;
```

C++

```
__property TLocateFileServiceFindFileEvent OnFindTemplateFile;
```

Description

Write (see page 3707) an OnFindIncludeFile (see page 6186) event handler to indicate the location on disk of templates that a content producer component uses to generate its content. In WebSnap applications that include a locate file service component, you must supply either an OnFindTemplateFile or an OnFindStream (see page 6187) event handler (or both) if the application has content producers that use template files. Otherwise content producers can't locate their templates.

See Also

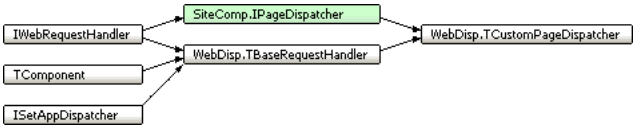
OnFindStream (see page 6187)

OnFindIncludeFile (see page 6186)

60.1.10 TCustomPageDispatcher Class

Dispatches incoming HTTP request messages in a WebSnap application.

Class Hierarchy



Pascal

```
TCustomPageDispatcher = class(TBaseRequestHandler, IPageDispatcher);
```

C++

```
class TCustomPageDispatcher : public TBaseRequestHandler, public IPageDispatcher;
```

File

WebDisp

Description

TCustomPageDispatcher is the base class for components that locate the appropriate page module for handling an incoming HTTP message and retrieve the content that the identified page module creates for the corresponding response message. Typically, the WebSnap application wizard adds a TCustomPageDispatcher descendant to the Web application module that it creates.

A WebSnap application only requires a single page dispatcher. The dispatcher examines all incoming HTTP request messages, checking the pathInfo portion of the URL to which a request is addressed for the name of a registered Web page module. It then forwards the request to the matching Web page module so that the page module can handle the request and produce the content of a response. If the request is not addressed to an URL with a pathinfo portion, the page dispatcher forwards the request to the Web page module identified by its DefaultPage (see page 6195) property.

See Also

TPageDispatcher (see page 6236)

60.1.10.1 TCustomPageDispatcher Members

The following tables list the members exposed by TCustomPageDispatcher.

Protected Methods

	Name	Description
	DispatchPageName (see page 6190)	Checks whether a specified user has a given access rights string.
	EndUser (see page 6190)	This is EndUser, a member of class TCustomPageDispatcher.
	GetCanView (see page 6191)	Indicates whether the current user is permitted to view a specified Web page.
	GetDefaultPageName (see page 6191)	Returns the value of the DefaultPageName property.
	GetLoginRequired (see page 6191)	Indicates whether a user must log in before accessing a specified Web page.
	GetRequestedPage (see page 6192)	This is GetRequestedPage, a member of class TCustomPageDispatcher.
	HandleRequest (see page 6167)	Handles an HTTP request.
	ImplDispatchPageName (see page 6192)	This is ImplDispatchPageName, a member of class TCustomPageDispatcher.
V	ImplGetCanView (see page 6192)	This is ImplGetCanView, a member of class TCustomPageDispatcher.
V	ImplGetDefaultPageName (see page 6192)	This is ImplGetDefaultPageName, a member of class TCustomPageDispatcher.

	ImplGetLoginRequired (see page 6193)	This is ImplGetLoginRequired, a member of class TCustomPageDispatcher.
	ImplHandleRequest (see page 6193)	Handles application-specific processing of an HTTP request.
	ImplPageNameOfRequest (see page 6193)	This is ImplPageNameOfRequest, a member of class TCustomPageDispatcher.
	ImplRedirectToPageName (see page 6193)	This is ImplRedirectToPageName, a member of class TCustomPageDispatcher.
	IsLoggedIn (see page 6194)	This is IsLoggedIn, a member of class TCustomPageDispatcher.
	PageNameOfRequest (see page 6194)	Returns the name of the Web page to which an HTTP request is addressed.
	ProduceLoginPage (see page 6194)	This is ProduceLoginPage, a member of class TCustomPageDispatcher.
	RedirectToPageName (see page 6194)	Fills out a response message so that it redirects the caller to another page in the application.
	SetAppDispatcher (see page 6167)	Sets the AppDispatcher (see page 6168) property.
	ValidatePage (see page 6195)	This is ValidatePage, a member of class TCustomPageDispatcher.

Protected Properties

	Name	Description
	AppDispatcher (see page 6168)	Provides read-only access to the application dispatcher component.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 6196)	Occurs after the page dispatcher successfully dispatches an HTTP request message.
	OnAfterRedirectToPage (see page 6197)	Occurs after the page dispatcher successfully dispatches an HTTP request message in response to an internal redirection request.
	OnBeforeDispatchPage (see page 6197)	Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.
	OnBeforeRedirectToPage (see page 6198)	Occurs before the page dispatcher dispatches an HTTP request message in response to an internal redirection request.
	OnCanViewPage (see page 6198)	Occurs just before the dispatcher passes a request message to a Web page module.
	OnIsLoginRequired (see page 6199)	Occurs when a request arrives from a caller that has not yet logged in.
	OnPageAccessDenied (see page 6200)	Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.
	OnPageNotFound (see page 6200)	Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

Public Properties

	Name	Description
	DefaultPage (see page 6195)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.
	DefaultPageName (see page 1064)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

60.1.10.2 TCustomPageDispatcher Methods

The methods of the TCustomPageDispatcher class are listed here.

Protected Methods

	Name	Description
	DispatchPageName (see page 6190)	Checks whether a specified user has a given access rights string.
	EndUser (see page 6190)	This is EndUser, a member of class TCustomPageDispatcher.
	GetCanView (see page 6191)	Indicates whether the current user is permitted to view a specified Web page.
	GetDefaultPageName (see page 6191)	Returns the value of the DefaultPageName property.
	GetLoginRequired (see page 6191)	Indicates whether a user must log in before accessing a specified Web page.
	GetRequestedPage (see page 6192)	This is GetRequestedPage, a member of class TCustomPageDispatcher.
	ImplDispatchPageName (see page 6192)	This is ImplDispatchPageName, a member of class TCustomPageDispatcher.
	ImplGetCanView (see page 6192)	This is ImplGetCanView, a member of class TCustomPageDispatcher.
	ImplGetDefaultPageName (see page 6192)	This is ImplGetDefaultPageName, a member of class TCustomPageDispatcher.

	ImplGetLoginRequired (see page 6193)	This is ImplGetLoginRequired, a member of class TCustomPageDispatcher.
	ImplHandleRequest (see page 6193)	Handles application-specific processing of an HTTP request.
	ImplPageNameOfRequest (see page 6193)	This is ImplPageNameOfRequest, a member of class TCustomPageDispatcher.
	ImplRedirectToPageName (see page 6193)	This is ImplRedirectToPageName, a member of class TCustomPageDispatcher.
	IsLoggedIn (see page 6194)	This is IsLoggedIn, a member of class TCustomPageDispatcher.
	PageNameOfRequest (see page 6194)	Returns the name of the Web page to which an HTTP request is addressed.
	ProduceLoginPage (see page 6194)	This is ProduceLoginPage, a member of class TCustomPageDispatcher.
	RedirectToPageName (see page 6194)	Fills out a response message so that it redirects the caller to another page in the application.
	ValidatePage (see page 6195)	This is ValidatePage, a member of class TCustomPageDispatcher.

60.1.10.2.1 TCustomPageDispatcher.DispatchPageName Method

Checks whether a specified user has a given access rights string.

Pascal

```
function DispatchPageName(const APageName: string; AResponse: TWebResponse; AFlags:
TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean DispatchPageName(const UnicodeString APageName, TWebResponse AResponse,
TDispatchPageFlags AFlags);
```

Description

Call DispatchPageName to fill out a response message with the Web page that a specified Web page module provides. DispatchPageName locates the Web page module that produces the requested Web page and uses it to fill out the content of a response object.

APageName is the name of the Web page to fetch. If APageName is an empty string, DispatchPageName uses the first Web page module that is registered with the current Web context.

AResponse is the response object whose Content property receives the requested Web page.

AFlags indicates the attributes that must be present on the Web page module. For example, if AFlags includes dpPublished, APageName must specify a published Web page module or the page dispatcher won't fetch the Web page.

DispatchPageName returns true if it successfully fetches the requested page, false if it fails to obtain the requested page.

See Also

RedirectToPageName (see page 1063)

HandleRequest

Content

WebContext (see page 6003)

60.1.10.2.2 TCustomPageDispatcher.EndUser Method

Pascal

```
function EndUser: IWebEndUser;
```

C++

```
__fastcall IWebEndUser EndUser();
```

Description

This is EndUser, a member of class TCustomPageDispatcher.

60.1.10.2.3 TCustomPageDispatcher.GetCanView Method

Indicates whether the current user is permitted to view a specified Web page.

Pascal

```
function GetCanView(const APageName: string): Boolean;
```

C++

```
__fastcall Boolean GetCanView(const UnicodeString APageName);
```

Description

Call GetCanView to check whether the current user should be allowed to view a specified Web page. Typically, this method is called after the user logs in.

APageName is the name of the Web page the user wants to view.

See Also

GetLoginRequired (see page 1062)

HasViewRights (see page 5992)

OnCanViewPage (see page 6198)

60.1.10.2.4 TCustomPageDispatcher.GetDefaultPageName Method

Returns the value of the DefaultPageName property.

Pascal

```
function GetDefaultPageName: string;
```

C++

```
__fastcall UnicodeString GetDefaultPageName();
```

Description

GetDefaultPageName is the read implementation of the DefaultPageName property.

See Also

DefaultPageName (see page 1064)

60.1.10.2.5 TCustomPageDispatcher.GetLoginRequired Method

Indicates whether a user must log in before accessing a specified Web page.

Pascal

```
function GetLoginRequired(const APageName: string): Boolean;
```

C++

```
__fastcall Boolean GetLoginRequired(const UnicodeString APageName);
```

Description

Call GetLoginRequired to check whether users must log in before accessing a specified Web page. GetLoginRequired can check the Web page information object for the target Web page, but can also use other means (such as an event handler) to obtain this information.

APageName is the name of the Web page to check whether it requires users to first log in.

See Also

GetCanView (see page 1062)

IsLoginRequired

OnIsLoginRequired (see page 6199)

60.1.10.2.6 TCustomPageDispatcher.GetRequestedPage Method

Pascal

```
function GetRequestedPage(const APageName: string; AFlags: TDispatchPageFlags): TObject;
```

C++

```
__fastcall TObject * GetRequestedPage(const UnicodeString APageName, TDispatchPageFlags
AFlags);
```

Description

This is GetRequestedPage, a member of class TCustomPageDispatcher.

60.1.10.2.7 TCustomPageDispatcher.ImplDispatchPageName Method

Pascal

```
function ImplDispatchPageName(const APageName: string; AResponse: TWebResponse; AFlags:
TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean ImplDispatchPageName(const UnicodeString APageName, TWebResponse AResponse,
TDispatchPageFlags AFlags);
```

Description

This is ImplDispatchPageName, a member of class TCustomPageDispatcher.

60.1.10.2.8 TCustomPageDispatcher.ImplGetCanView Method

Pascal

```
function ImplGetCanView(const APageName: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetCanView(const UnicodeString APageName);
```

Description

This is ImplGetCanView, a member of class TCustomPageDispatcher.

60.1.10.2.9 TCustomPageDispatcher.ImplGetDefaultPageName Method

Pascal

```
function ImplGetDefaultPageName: string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplGetDefaultPageName();
```

Description

This is ImplGetDefaultPageName, a member of class TCustomPageDispatcher.

60.1.10.2.10 TCustomPageDispatcher.ImplGetLoginRequired Method

Pascal

```
function ImplGetLoginRequired(const APageName: string): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplGetLoginRequired(const UnicodeString APageName);
```

Description

This is ImplGetLoginRequired, a member of class TCustomPageDispatcher.

60.1.10.2.11 TCustomPageDispatcher.ImplHandleRequest Method

Handles application-specific processing of an HTTP request.

Pascal

```
function ImplHandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

The ImplHandleRequest function is called from HandleRequest to handle the application-specific processing of the HTTP request.

This base version of the function generates an assertion failure as a reminder that a customized overridden version of this function needs to be defined in order to handle the request processing specific to the application.

See Also

HandleRequest (see page 6167)

60.1.10.2.12 TCustomPageDispatcher.ImplPageNameOfRequest Method

Pascal

```
function ImplPageNameOfRequest(Request: TWebRequest): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplPageNameOfRequest(TWebRequest Request);
```

Description

This is ImplPageNameOfRequest, a member of class TCustomPageDispatcher.

60.1.10.2.13 TCustomPageDispatcher.ImplRedirectToPageName Method

Pascal

```
function ImplRedirectToPageName(const APageName: string; AParams: TStrings; AResponse:
TWebResponse; AFlags: TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean ImplRedirectToPageName(const UnicodeString APageName, TStrings AParams,
TWebResponse AResponse, TDispatchPageFlags AFlags);
```

Description

This is ImplRedirectToPageName, a member of class TCustomPageDispatcher.

60.1.10.2.14 TCustomPageDispatcher.IsLoggedIn Method

Pascal

```
function IsLoggedIn: Boolean;
```

C++

```
__fastcall Boolean IsLoggedIn();
```

Description

This is IsLoggedIn, a member of class TCustomPageDispatcher.

60.1.10.2.15 TCustomPageDispatcher.PageNameOfRequest Method

Returns the name of the Web page to which an HTTP request is addressed.

Pascal

```
function PageNameOfRequest(Request: TWebRequest): string;
```

C++

```
__fastcall UnicodeString PageNameOfRequest(TWebRequest Request);
```

Description

Call PageNameOfRequest to obtain the name of the Web page that a request message is trying to fetch.

ARequest is the request object that describes the HTTP request message.

PageNameOfRequest returns the last string in the path info portion of the request message's target URL.

See Also

DefaultPageName (see page 1064)

60.1.10.2.16 TCustomPageDispatcher.ProduceLoginPage Method

Pascal

```
function ProduceLoginPage: Boolean;
```

C++

```
__fastcall Boolean ProduceLoginPage();
```

Description

This is ProduceLoginPage, a member of class TCustomPageDispatcher.

60.1.10.2.17 TCustomPageDispatcher.RedirectToPageName Method

Fills out a response message so that it redirects the caller to another page in the application.

Pascal

```
function RedirectToPageName(const APageName: string; AParams: TStrings; AResponse:
TWebResponse; AFlags: TDispatchPageFlags): Boolean;
```

C++

```
__fastcall Boolean RedirectToPageName(const UnicodeString APageName, TStrings AParams,
TWebResponse AResponse, TDispatchPageFlags AFlags);
```

Description

Call RedirectToPageName to generate a response that redirects the caller to another Web page in the WebSnap application.

APageName is the name of the Web page to which the request should be redirected. If APageName is an empty string, RedirectToPageName uses the first Web page module that is registered with the current Web context.

AParams is a string list containing application-defined name-value pairs. These name-value pairs supply the query fields of the redirected request message, and are added to the URL that is the target of the SendRedirect call.

AResponse is the response object that the WebSnap uses to make the SendRedirect call.

AFlags indicates the attributes that must be present on the Web page module to which the current request is redirected. For example, if AFlags includes dpPublished, APageName must specify a published Web page module.

RedirectToPageName returns true if it successfully redirects to the specified page.

See Also

DispatchPageName (see page 1061)

HandleRequest

Content

WebContext (see page 6003)

60.1.10.2.18 TCustomPageDispatcher.ValidatePage Method

Pascal

```
function ValidatePage(const APage: string; var AHandled: Boolean): Boolean;
```

C++

```
__fastcall Boolean ValidatePage(const UnicodeString APage, Boolean AHandled);
```

Description

This is ValidatePage, a member of class TCustomPageDispatcher.

60.1.10.3 TCustomPageDispatcher Properties

The properties of the TCustomPageDispatcher class are listed here.

Public Properties

	Name	Description
	DefaultPage (see page 6195)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

60.1.10.3.1 TCustomPageDispatcher.DefaultPage Property

Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

Pascal

```
property DefaultPage: string;
```

C++

```
__property UnicodeString DefaultPage;
```

Description

DefaultPage is the name of the registered Web page module that should handle incoming request messages that do not have a pathinfo portion on their target URL. This is the name that is supplied to the Web page module wizard when you created the default Web page module. It forms the basis of that Web page module's class name. For example, if the default Web page module has the name MyDefaultPage, the Web page module class is of type TMyDefaultPage.

If DefaultPage is an empty string, the page dispatcher uses the Web application module as a default Web page module, as long as it is a Web Page module.

60.1.10.4 TCustomPageDispatcher Events

The events of the TCustomPageDispatcher class are listed here.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 6196)	Occurs after the page dispatcher successfully dispatches an HTTP request message.
	OnAfterRedirectToPage (see page 6197)	Occurs after the page dispatcher successfully dispatches an HTTP request message in response to an internal redirection request.
	OnBeforeDispatchPage (see page 6197)	Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.
	OnBeforeRedirectToPage (see page 6198)	Occurs before the page dispatcher dispatches an HTTP request message in response to an internal redirection request.
	OnCanViewPage (see page 6198)	Occurs just before the dispatcher passes a request message to a Web page module.
	OnIsLoginRequired (see page 6199)	Occurs when a request arrives from a caller that has not yet logged in.
	OnPageAccessDenied (see page 6200)	Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.
	OnPageNotFound (see page 6200)	Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

60.1.10.4.1 TCustomPageDispatcher.OnAfterDispatchPage Event

Occurs after the page dispatcher successfully dispatches an HTTP request message.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write (see page 3707) an OnAfterDispatchPage event handler to take specific action after an HTTP request has been successfully handled by a Web page module. For example, an OnAfterDispatchPage event handler can maintain a log of all Web traffic handled by the WebSnap application.

OnAfterDispatchPage occurs only if the target Web page module succeeds in handling the request. If the target Web page module could not be validated, an OnPageAccessDenied (see page 6200) event occurs instead. If the page could not be located, an OnPageNotFound (see page 6200) event occurs instead.

See Also

OnBeforeDispatchPage (see page 6197)

OnPageNotFound (see page 6200)

OnCanViewPage (see page 6198)

OnIsLoginRequired (see page 6199)

OnPageAccessDenied (see page 6200)

60.1.10.4.2 TCustomPageDispatcher.OnAfterRedirectToPage Event

Occurs after the page dispatcher successfully dispatches an HTTP request message in response to an internal redirection request.

Pascal

```
property OnAfterRedirectToPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterRedirectToPage;
```

Description

Write (see page 3707) an OnAfterRedirectToPage event handler to take specific action after an HTTP request has been successfully redirected to a Web page module. This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost), and the new target Web page module succeeds in handling the request.

See Also

OnBeforeRedirectToPage (see page 6198)

OnAfterDispatchPage (see page 6196)

RedirectOptions (see page 5476)

60.1.10.4.3 TCustomPageDispatcher.OnBeforeDispatchPage Event

Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write (see page 3707) an OnBeforeDispatchPage event handler to process an HTTP request message before the dispatcher forwards it to the target Web page module for processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the page dispatcher from locating the target Web page module, verifying that it can handle the request, and forwarding the request to that Web page module.

If the event handler does not handle the request (for example, if it is merely maintaining a log of incoming requests), it can leave the Handled parameter as false and the dispatcher will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, call the global WebContext (see page 6003) function to access the Web context and read its Request and Response properties.

See Also

OnAfterDispatchPage (see page 6196)

OnPageNotFound (see page 6200)

OnCanViewPage (see page 6198)

OnIsLoginRequired (see page 6199)

OnPageAccessDenied (see page 6200)

WebContext (see page 6003)

Request (see page 5974)

Response (see page 5975)

60.1.10.4.4 TCustomPageDispatcher.OnBeforeRedirectToPage Event

Occurs before the page dispatcher dispatches an HTTP request message in response to an internal redirection request.

Pascal

```
property OnBeforeRedirectToPage: TDispatchPageParamsHandledEvent;
```

C++

```
__property TDispatchPageParamsHandledEvent OnBeforeRedirectToPage;
```

Description

Write (see page 3707) an OnBeforeRedirectToPage event handler to take specific action before an HTTP request is redirected to a Web page module. This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost).

If the event handler sets Handled to true, the dispatcher assumes it has handled the request and performs no further processing. Otherwise, after the event handler exits, the page dispatcher calls on the Web Module to set up the response message and call SendRedirect.

Tip: To access the Web request and response objects from within an OnBeforeRedirectToPage event handler, call the global WebContext (see page 6003) function to access the Web context and read its Request and Response properties.

See Also

OnAfterRedirectToPage (see page 6197)

OnBeforeDispatchPage (see page 6197)

WebContext (see page 6003)

Request (see page 5974)

Response (see page 5975)

SendRedirect

60.1.10.4.5 TCustomPageDispatcher.OnCanViewPage Event

Occurs just before the dispatcher passes a request message to a Web page module.

Pascal

```
property OnCanViewPage: TCanViewPageEvent;
```

C++

```
__property TCanViewPageEvent OnCanViewPage;
```

Description

Write (see page 3707) an OnCanViewPage event handler to customize the way the WebSnap application determines whether a given request can be passed to a Web page module for processing. This event is part of the mechanism by which the dispatcher validates a Web page for viewing. The validation process, which occurs after the OnBeforeDispatchPage (see page 6197) event, occurs as follows:

1. If the caller has not already logged in, the dispatcher generates an OnIsLoginRequired (see page 6199) event to check whether the specified Web page requires the caller to log in.
2. If a login is required, the dispatcher does not validate the page (and so does not forward the request to the specified Web page module). Rather, it initiates the process of creating a response to allow the user to log in.

a. First, the dispatcher generates an OnPageAccessDenied (see page 6200) event, where the application can handle the login process.

b. If the OnPageAccessDenied (see page 6200) event handler does not handle the login process, the dispatcher forwards the request to the login page specified by the end user adapter's LoginPage property.

3. If a login is not required (either because the caller already logged in or because there is no need to log in), the dispatcher generates an OnCanViewPage event. This event can validate a caller that has logged in, or provide any other type of validation that governs access to the requested page.
4. If there is no OnCanViewPage event handler, or if the OnCanViewPage event handler does not handle the validation, the dispatcher calls on a TEndUserAdapter component to check the user's access rights.

   Tip: To access the Web request and response objects from within an OnCanViewPage event handler, call the global WebContext (see page 6003) function to access the Web context and read its Request and Response properties. To access information about the access rights that the target page requires, call the Web context's FindPageInfo method to obtain a Web page info object for the target page and check its ViewAccess property.

Request (see page 5974)

Response (see page 5975)

ViewAccess

FindPageInfo (see page 5966)

60.1.10.4.6 TCustomPageDispatcher.OnIsLoginRequired Event

Occurs when a request arrives from a caller that has not yet logged in.

Pascal

```
property OnIsLoginRequired: TLoginRequiredEvent;
```

C++

```
__property TLoginRequiredEvent OnIsLoginRequired;
```

Description

Write (see page 3707) an OnIsLoginRequired event handler to customize the way the WebSnap application determines whether a caller must log in before obtaining access to a requested page. This event occurs after the OnBeforeDispatchPage (see page 6197) event if the caller has not already logged in to the WebSnap application.

If there is no OnPageAccessDenied (see page 6200) event handler, or if the OnPageAccessDenied (see page 6200) event handler does not handle the login process, the dispatcher obtains a response message from the login page specified by the end user adapter.

See Also

OnCanViewPage (see page 6198)

OnBeforeDispatchPage (see page 6197)

OnPageAccessDenied (see page 6200)

LoginPage (see page 5516)

60.1.10.4.7 TCustomPageDispatcher.OnPageAccessDenied Event

Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.

Pascal

```
property OnPageAccessDenied: TPageAccessDeniedEvent;
```

C++

```
__property TPageAccessDeniedEvent OnPageAccessDenied;
```

Description

Write (see page 3707) an OnPageAccessDenied event handler to customize the response when a request for a specific Web page fails to be validated.

Tip: To access the Web request and response objects from within an OnPageAccessDenied event handler, call the global WebContext (see page 6003) function to access the Web context and read its Request and Response properties.

See Also

OnIsLoginRequired (see page 6199)

OnCanViewPage (see page 6198)

WebContext (see page 6003)

Request (see page 5974)

Response (see page 5975)

LoginPage (see page 5516)

60.1.10.4.8 TCustomPageDispatcher.OnPageNotFound Event

Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

Pascal

```
property OnPageNotFound: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnPageNotFound;
```

Description

Write (see page 3707) an OnPageNotFound event handler to generate a response when the dispatcher can't locate the Web page module to which an HTTP request message is addressed. For example, an OnPageNotFound event handler can provide the response object with content that indicates that the requested page does not exist or that represents simple content for a page that does not have an associated Web page module.

If the OnPageNotFound event handler sets its Handled parameter to true, the page dispatcher assumes it has updated the response message and returns it. If the OnPageNotFound leaves the Handled parameter set to false, the dispatcher raises an EPageDispatcherException (see page 6147) exception after the event handler exits.

Tip: To access the Web request and response objects from within an OnPageNotFound event handler, call the global WebContext (see page 6003) function to access the Web context and read its Request and Response properties.

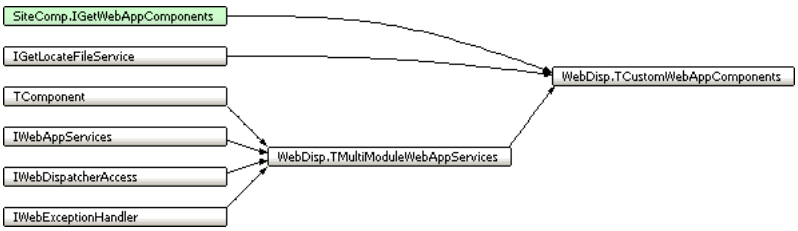
Response (see page 5975)

60.1.11 TCustomWebAppComponents Class

TCustomWebAppComponents manages the components that provide a WebSnap application's functionality.

Class Hierarchy



Pascal

```
TCustomWebAppComponents = class(TMultiModuleWebAppServices, IGetWebAppComponents,
IGetLocateFileService);
```

C++

```
class TCustomWebAppComponents : public TMultiModuleWebAppServices, public
IGetWebAppComponents, public IGetLocateFileService;
```

File

WebDisp

Description

Use TCustomWebAppComponents as a base class for the component that centralizes access to the main WebSnap components. It keeps track of the current request and response objects, maintains a list of the available Web modules, and locates the appropriate components to handle incoming request messages. TCustomWebAppComponents introduces properties that provide access to the components that perform many common tasks in a WebSnap application. These properties include:

PageDispatcher (see page 6214), which locates the Web page modules to process incoming request messages.

AdapterDispatcher (see page 6211), which encodes calls to adapter actions and fields, and which handles HTML form submissions and requests for dynamic images by calling adapter actions and fields.

Sessions (see page 6214), which manages the sessions for each caller.

ApplicationAdapter (see page 6212), which implements the fields and actions of the Application variable in server-side scripts.

EndUserAdapter (see page 6213), which implements the fields and actions of the EndUser variable in server-side scripts.

UserListService (see page 6215), which maintains a list of end users and their passwords and access privileges.

LocateFileService (see page 6213), which controls access to the templates and server-side script include files that are used while processing requests.

DispatchActions (see page 6212), which maintains a list of action items that can respond to request messages.

The components these properties reference are optional. The WebSnap Application wizard automatically creates components and fill in these properties for any components that you select.

See Also

TApplicationAdapter (see page 5439)

TEndUserAdapter (see page 5764)

TPageDispatcher (see page 6236)

TAdapterDispatcher (see page 6148)

TLocateFileService (see page 6220)

TSessionsService (see page 6756)

TWebUserList (see page 6796)

WebContext (see page 6003)

60.1.11.1 TCustomWebAppComponents Members

The following tables list the members exposed by TCustomWebAppComponents.

Protected Events

	Name	Description
	OnAfterDispatch (see page 6235)	Occurs after the WebSnap application generates the content of a response message.
	OnBeforeDispatch (see page 6235)	Occurs before TMultiModuleWebAppServices (see page 6223) passes an HTTP request onto the other components in the application for processing.

Protected Methods

	Name	Description
	Access_Request (see page 6225)	Returns the value of the Access_Request property.
	Access_Response (see page 6225)	Returns the value of the Access_Response property.
V	CreateContext (see page 6204)	Creates the Web context for the current request message.
	DoAfterDispatch (see page 6226)	Generates an OnAfterDispatch (see page 6235) event.
	DoBeforeDispatch (see page 6226)	Generates an OnBeforeDispatch (see page 6235) event.
V	DoneModule (see page 6227)	Performs any final tasks before deactivating a Web module.
	FinishContext (see page 6227)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetAdapterDispatcher (see page 6205)	Returns the value of the AdapterDispatcher (see page 6211) property.
	GetExceptionHandler (see page 6228)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetLocateFileService (see page 6205)	Returns the value of the LocateFileService (see page 6213) property.
	GetPageDispatcher (see page 6205)	Returns the value of the PageDispatcher (see page 6214) property.
	GetWebApplicationInfo (see page 6206)	Returns the value of the ApplicationAdapter (see page 6212) property.
	GetWebEndUser (see page 6206)	Returns the value of the EndUserAdapter (see page 6213) property.
	GetWebUserList (see page 6206)	Returns the value of the UserListService (see page 6215) property.
	HandleException (see page 6228)	Responds to any exceptions not caught by the WebSnap application.
	HandleRequest (see page 6229)	Directs the processing of the current request message.
V	ImplFinishContext (see page 6207)	Provides the underlying implementation of the FinishContext (see page 6227) method.
V	ImplHandleException (see page 6207)	Provides the underlying implementation of the HandleException (see page 6228) method.
V	ImplHandleRequest (see page 6208)	Provides the underlying implementation for the HandleRequest (see page 6229) method.
V	ImplInitContext (see page 6208)	Provides the underlying implementation for the InitContext (see page 6231) method.
	InitContext (see page 6231)	Creates and initializes the Web context for the current Web request.
V	InitModule (see page 6209)	Initializes a Web module before the WebSnap application uses it to handle the current request.
V	InitModules (see page 6210)	Initializes all the currently active Web modules.
V	ListRequestHandlers (see page 6210)	Fills an interface list with the interfaces of all dispatcher components in the WebSnap application.
	ModuleAdded (see page 6233)	Initializes a Web module when it is activated while processing the current request.
V	Notification (see page 6211)	Updates the TCustomWebAppComponents (see page 6201) properties when components are added to or removed from the application.

Protected Properties

	Name	Description
R	Request (see page 6234)	Provides access to the current request object.
R	Response (see page 6234)	Provides access to the current response object.
R	WebModules (see page 6234)	Lists the Web modules available in the WebSnap application.

Public Events

	Name	Description
	OnException (see page 6215)	Occurs when an exception escapes all try blocks in the WebSnap application.

Public Properties

	Name	Description
	AdapterDispatcher (see page 6211)	Provides access to the current adapter dispatcher object.
	ApplicationAdapter (see page 6212)	Provides access to the application adapter.
	DispatchActions (see page 6212)	Provides access to an action-based Web dispatcher.
	EndUserAdapter (see page 6213)	Provides access to an end-user adapter.
	LocateFileService (see page 6213)	Provides access to the file location service.
	PageDispatcher (see page 6214)	Provides access to the current page dispatcher object.
	Sessions (see page 6214)	Provides access to the sessions service.

	UserListService (see page 6215)	Provides access to the file location service.
R	WebApplicationInfo (see page 1039)	This is WebApplicationInfo, a member of class IGetWebAppComponents.
R	WebEndUser (see page 1040)	This is WebEndUser, a member of class IGetWebAppComponents.

60.1.11.2 TCustomWebAppComponents Methods

The methods of the TCustomWebAppComponents class are listed here.

Protected Methods

	Name	Description
V	CreateContext (see page 6204)	Creates the Web context for the current request message.
	GetAdapterDispatcher (see page 6205)	Returns the value of the AdapterDispatcher (see page 6211) property.
	GetLocateFileService (see page 6205)	Returns the value of the LocateFileService (see page 6213) property.
	GetPageDispatcher (see page 6205)	Returns the value of the PageDispatcher (see page 6214) property.
	GetWebApplicationInfo (see page 6206)	Returns the value of the ApplicationAdapter (see page 6212) property.
	GetWebEndUser (see page 6206)	Returns the value of the EndUserAdapter (see page 6213) property.
	GetWebUserList (see page 6206)	Returns the value of the UserListService (see page 6215) property.
V	ImplFinishContext (see page 6207)	Provides the underlying implementation of the FinishContext (see page 6227) method.
V	ImplHandleException (see page 6207)	Provides the underlying implementation of the HandleException (see page 6228) method.
V	ImplHandleRequest (see page 6208)	Provides the underlying implementation for the HandleRequest (see page 6229) method.
V	ImplInitContext (see page 6208)	Provides the underlying implementation for the InitContext (see page 6231) method.
V	InitModule (see page 6209)	Initializes a Web module before the WebSnap application uses it to handle the current request.
V	InitModules (see page 6210)	Initializes all the currently active Web modules.
V	ListRequestHandlers (see page 6210)	Fills an interface list with the interfaces of all dispatcher components in the WebSnap application.
V	Notification (see page 6211)	Updates the TCustomWebAppComponents (see page 6201) properties when components are added to or removed from the application.

60.1.11.2.1 TCustomWebAppComponents.CreateContext Method

Creates the Web context for the current request message.

Pascal

```
function CreateContext: TAbstractWebContext; override;
```

C++

```
virtual __fastcall TAbstractWebContext CreateContext();
```

Description

The ImplInitContext (see page 6208) method calls CreateContext to instantiate the Web context object for the current request. This context can then be accessed by the WebSnap application using the global WebContext (see page 6003) function.

In TCustomWebAppComponents (see page 6201), CreateContext creates a TWebContext (see page 5976) object, creating a new session object for the current request and passing the session object along with the values of the protected Request (see page 6234), Response (see page 6234), and WebModules (see page 6234) properties to the TWebContext (see page 5976) constructor.

See Also

WebContext (see page 6003)

ImplInitContext (see page 6208)

Create (see page 5978)

Request (see page 6234)

Response (see page 6234)

WebModules (see page 6234)

60.1.11.2.2 TCustomWebAppComponents.GetAdapterDispatcher Method

Returns the value of the AdapterDispatcher (see page 6211) property.

Pascal

```
function GetAdapterDispatcher: IAdapterDispatcher;
```

C++

```
__fastcall IAdapterDispatcher GetAdapterDispatcher();
```

Description

The protected GetAdapterDispatcher method is used internally to fetch the value of the AdapterDispatcher (see page 6211) property.

See Also

AdapterDispatcher (see page 6211)

60.1.11.2.3 TCustomWebAppComponents.GetLocateFileService Method

Returns the value of the LocateFileService (see page 6213) property.

Pascal

```
function GetLocateFileService: ILocateFileService;
```

C++

```
__fastcall ILocateFileService GetLocateFileService();
```

Description

The protected GetLocateFileService method is used internally to fetch the value of the LocateFileService (see page 6213) property.

See Also

LocateFileService (see page 6213)

60.1.11.2.4 TCustomWebAppComponents.GetPageDispatcher Method

Returns the value of the PageDispatcher (see page 6214) property.

Pascal

```
function GetPageDispatcher: IPageDispatcher;
```

C++

```
__fastcall IPageDispatcher GetPageDispatcher();
```

Description

The protected GetPageDispatcher method is used internally to fetch the value of the PageDispatcher (see page 6214) property.

See Also

PageDispatcher (see page 6214)

60.1.11.2.5 TCustomWebAppComponents.GetWebApplicationInfo Method

Returns the value of the ApplicationAdapter (see page 6212) property.

Pascal

```
function GetWebApplicationInfo: IWebApplicationInfo;
```

C++

```
__fastcall IWebApplicationInfo GetWebApplicationInfo();
```

Description

The protected GetWebApplicationInfo method is used internally to fetch the value of the ApplicationAdapter (see page 6212) property.

See Also

ApplicationAdapter (see page 6212)

60.1.11.2.6 TCustomWebAppComponents.GetWebEndUser Method

Returns the value of the EndUserAdapter (see page 6213) property.

Pascal

```
function GetWebEndUser: IWebEndUser;
```

C++

```
__fastcall IWebEndUser GetWebEndUser();
```

Description

The protected GetWebEndUser method is used internally to fetch the value of the EndUserAdapter (see page 6213) property.

See Also

EndUserAdapter (see page 6213)

60.1.11.2.7 TCustomWebAppComponents.GetWebUserList Method

Returns the value of the UserListService (see page 6215) property.

Pascal

```
function GetWebUserList: IWebUserList;
```

C++

```
__fastcall IWebUserList GetWebUserList();
```

Description

The protected GetWebUserList method is used internally to fetch the value of the UserListService (see page 6215) property.

See Also

UserListService (see page 6215)

60.1.11.2.8 TCustomWebAppComponents.ImplFinishContext Method

Provides the underlying implementation of the FinishContext (see page 6227) method.

Pascal

```
procedure ImplFinishContext; override;
```

C++

```
virtual __fastcall ImplFinishContext();
```

Description

ImplFinishContext performs any final tasks and cleanup after the WebSnap application has finished processing a request message.

ImplFinishContext

1. Instructs the Web dispatcher that implements the DispatchActions (see page 6212) property to perform any final tasks.
2. Calls the DoneModule (see page 6227) method for every active Web module so that it can be freed or deactivated.
3. Frees the Web context for the current request.
4. Adds the session ID of the current session to the response message so that subsequent requests from the same caller can use the same session.

See Also

FinishContext (see page 6227)

DoneModule (see page 6227)

WebContext (see page 6003)

DispatchActions (see page 6212)

Sessions (see page 6214)

60.1.11.2.9 TCustomWebAppComponents.ImplHandleException Method

Provides the underlying implementation of the HandleException (see page 6228) method.

Pascal

```
procedure ImplHandleException(E: Exception; var Handled: Boolean); override;
```

C++

```
virtual __fastcall ImplHandleException(Exception E, Boolean Handled);
```

Description

The HandleException (see page 6228) method calls ImplHandleException to handle any exception that passes through all the try blocks in the application code.

ImplHandleException generates an OnException (see page 6215) event, so that an event handler can take care of the exception. If the OnException (see page 6215) event handler does not handle the exception, ImplHandleException checks whether the response message has not yet been sent. If not, it adds the exception error message to the response.

E is the exception object for the exception that occurred.

Handled returns true if the OnException (see page 6215) event handler handled the exception or if ImplHandleException added the error message to the response object. If Handled returns false, the WebSnap application displays a dialog box that

indicates an error occurred.

See Also

HandleException (see page 6228)

OnException (see page 6215)

60.1.11.2.10 TCustomWebAppComponents.ImplHandleRequest Method

Provides the underlying implementation for the HandleRequest (see page 6229) method.

Pascal

```
function ImplHandleRequest: Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest();
```

Description

The HandleRequest (see page 6229) method calls ImplHandleRequest to handle the current HTTP request message.

ImpleHandleRequest

1.Generates an OnBeforeDispatch (see page 6235) event.

2.If the OnBeforeDispatch (see page 6235) event handler does not handle the request, checks the PageDispatcher (see page 6214), AdapterDispatcher (see page 6211), and DispatchActions (see page 6212) properties to find a dispatcher that can handle the request. If it finds one, the dispatcher forwards the request to the appropriate components for handling.

3.If the request was handled by the OnBeforeDispatch (see page 6235) event or by one of the dispatchers, and if the response was not already sent to the caller, generates an OnAfterDispatch (see page 6235) event.

ImplHandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

HandleRequest (see page 6229)

OnBeforeDispatch (see page 6235)

OnAfterDispatch (see page 6235)

PageDispatcher (see page 6214)

AdapterDispatcher (see page 6211)

DispatchActions (see page 6212)

60.1.11.2.11 TCustomWebAppComponents.ImplInitContext Method

Provides the underlying implementation for the InitContext (see page 6231) method.

Pascal

```
procedure ImplInitContext(AWebModuleList: TAbstractWebModuleList; ARequest: TWebRequest;
AResponse: TWebResponse); override;
```

C++

```
virtual __fastcall ImplInitContext(TAbstractWebModuleList AWebModuleList, TWebRequest
ARequest, TWebResponse AResponse);
```

Description

The InitContext (see page 6231) method, which is called when the WebSnap application first receives a request, calls ImplInitContext to perform any initializations and to create the Web context for the new request message.

ImplInitContext performs the following tasks:

1. If the DispatchActions (see page 6212) property is set, instructs the Web dispatcher to initialize itself.
2. Calls the CreateContext (see page 6204) method to create a Web context for the current request, supplying it with the values of the AWebModuleList, ARequest, and AResponse parameters. This Web context can then be accessed using the global WebContext (see page 6003) function.
3. Calls the InitModules (see page 6210) method to initialize all the Web modules that the AWebModuleList parameter indicates are currently instantiated. (These are the Web modules that are created for every request message)
4. Hooks up the InitModule (see page 6209) method so that it can initialize any Web modules that are instantiated in the course of processing the current request.

See Also

InitContext (see page 6231)

CreateContext (see page 6204)

WebContext (see page 6003)

Request (see page 5974)

Response (see page 5975)

WebModules (see page 5975)

InitModules (see page 6210)

DispatchActions (see page 6212)

InitModule (see page 6209)

60.1.11.2.12 TCustomWebAppComponents.InitModule Method

Initializes a Web module before the WebSnap application uses it to handle the current request.

Pascal

```
procedure InitModule(AModule: TComponent); override;
```

C++

```
virtual __fastcall InitModule(TComponent * AModule);
```

Description

InitModule is called whenever the WebSnap application instantiates a Web module to handle the current request. InitModule handles any initializations, including assigning itself as the Web dispatcher to any content producers in the Web module, generating an OnActivate event on the Web module, and allowing the Web dispatcher that is the value of the DispatchActions (see page 6212) property to perform its own initializations.

AWebModule is the Web module component to initialize.

See Also

InitModules (see page 6210)

Dispatcher

DispatchActions (see page 6212)

OnActivate (see page 6556)

60.1.11.2.13 TCustomWebAppComponents.InitModules Method

Initializes all the currently active Web modules.

Pascal

```
procedure InitModules; override;
```

C++

```
virtual __fastcall InitModules();
```

Description

InitModules is called to initialize the currently active Web modules when the WebSnap application first sets up the Web context for a new request. It iterates over all the active Web modules that the WebModules (see page 6234) property lists, calling the InitModule (see page 6209) method to initialize each one. It then checks whether the session for the request is new (rather than a continuation of the session from a previous request), and if so, generates an OnStartSession event on the sessions service.

See Also

InitModule (see page 6209)

WebModules (see page 6234)

InitContext (see page 6231)

OnStartSession (see page 6755)

60.1.11.2.14 TCustomWebAppComponents.ListRequestHandlers Method

Fills an interface list with the interfaces of all dispatcher components in the WebSnap application.

Pascal

```
procedure ListRequestHandlers(L: IInterfaceList); virtual;
```

C++

```
virtual __fastcall ListRequestHandlers(IInterfaceList L);
```

Description

The ImplHandleRequest (see page 6208) method calls ListRequestHandlers to obtain a list of all interfaces it can call to dispatch the request. ListRequestHandlers adds the interfaces that are the values of the PageDispatcher (see page 6214), AdapterDispatcher (see page 6211), and DispatchActions (see page 6212) properties to the list.

L is the interface list to which the dispatcher interfaces should be added.

See Also

ImplHandleRequest (see page 6208)

PageDispatcher (see page 6214)

AdapterDispatcher (see page 6211)

DispatchActions (see page 6212)

60.1.11.2.15 TCustomWebAppComponents.Notification Method

Updates the TCustomWebAppComponents (see page 6201) properties when components are added to or removed from the application.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. It checks whether AComponent supports one of the interfaces that is the type of a TCustomWebAppComponents (see page 6201) property, and if so, sets that property to nil (Delphi) or NULL (C++) if the object is about to be removed, or sets the property to the AComponent interface if the object was just added.

See Also

Notification

AdapterDispatcher (see page 6211)

ApplicationAdapter (see page 6212)

DispatchActions (see page 6212)

EndUserAdapter (see page 6213)

LocateFileService (see page 6213)

Sessions (see page 6214)

PageDispatcher (see page 6214)

UserListService (see page 6215)

60.1.11.3 TCustomWebAppComponents Properties

The properties of the TCustomWebAppComponents class are listed here.

Public Properties

	Name	Description
	AdapterDispatcher (see page 6211)	Provides access to the current adapter dispatcher object.
	ApplicationAdapter (see page 6212)	Provides access to the application adapter.
	DispatchActions (see page 6212)	Provides access to an action-based Web dispatcher.
	EndUserAdapter (see page 6213)	Provides access to an end-user adapter.
	LocateFileService (see page 6213)	Provides access to the file location service.
	PageDispatcher (see page 6214)	Provides access to the current page dispatcher object.
	Sessions (see page 6214)	Provides access to the sessions service.
	UserListService (see page 6215)	Provides access to the file location service.

60.1.11.3.1 TCustomWebAppComponents.AdapterDispatcher Property

Provides access to the current adapter dispatcher object.

Pascal

```
property AdapterDispatcher: IAdapterDispatcher;
```

C++

```
__property IAdapterDispatcher AdapterDispatcher;
```

Description

Use AdapterDispatcher to get or set the interface of the adapter dispatcher. The adapter dispatcher is responsible for encoding the hidden fields and HREF values that represent calls to adapter fields and actions, and for interpreting the fields in incoming requests by calling adapters to execute their actions or to fetch image field values.

Typically, AdapterDispatcher is the interface of a TAdapterDispatcher (see page 6148) object. If the WebSnap application does not include a TAdapterDispatcher (see page 6148) component, or some other component that implements the IAdapterDispatcher (see page 985) interface, the value of this property is nil (Delphi) or NULL (C++). When AdapterDispatcher is nil (Delphi) or NULL (C++), the WebSnap application can't execute adapter actions or fetch image fields from adapters.

See Also

TAdapterDispatcher (see page 6148)

DispatchActions (see page 6212)

60.1.11.3.2 TCustomWebAppComponents.ApplicationAdapter Property

Provides access to the application adapter.

Pascal

```
property ApplicationAdapter: IWebApplicationInfo;
```

C++

```
__property IWebApplicationInfo ApplicationAdapter;
```

Description

Use ApplicationAdapter to get or set the interface of the application adapter. The application adapter implements the fields and actions of the Application variable in server-side scripts.

Typically, ApplicationAdapter is the interface of a TApplicationAdapter object. If the WebSnap application does not include a TApplicationAdapter component, or some other component that implements the IWebApplicationInfo (see page 1078) interface, the value of this property is nil (Delphi) or NULL (C++). When ApplicationAdapter is nil (Delphi) or NULL (C++), the WebSnap application can't use the Application variable in server-side scripts.

See Also

TApplicationAdapter (see page 5439)

60.1.11.3.3 TCustomWebAppComponents.DispatchActions Property

Provides access to an action-based Web dispatcher.

Pascal

```
property DispatchActions: IWebDispatchActions;
```

C++

```
__property IWebDispatchActions DispatchActions;
```

Description

Read (see page 3634) DispatchActions to determine whether the WebSnap application contains a Web dispatcher. A Web dispatcher maintains a list of action items that respond to incoming request messages. Web dispatchers can appear in both WebSnap and Web broker applications.

The IWebDispatchActions interface that is the value of DispatchActions does nothing special other than identify its component as a Web dispatcher. You can, however, use this interface to obtain other interfaces that belong to the Web dispatcher.

Typically, DispatchActions is the interface of a TWebDispatcher object. If the WebSnap application does not include a TWebDispatcher component, or some other component that implements the IWebDispatchActions interface, the value of this property is nil (Delphi) or NULL (C++).

See Also

TWebModule

TWebDispatcher

60.1.11.3.4 TCustomWebAppComponents.EndUserAdapter Property

Provides access to an end-user adapter.

Pascal

```
property EndUserAdapter: IWebEndUser;
```

C++

```
__property IWebEndUser EndUserAdapter;
```

Description

Use EndUserAdapter to get or set the interface of the end user adapter. An end user adapter maintains information about the current end user, and supports the actions for logging users in and out. End user adapters implement the fields and actions of the EndUser variable in server-side scripts.

Typically, EndUserAdapter is the interface of a TEndUserAdapter or TEndUserSessionAdapter object. If the WebSnap application does not include a component that implements the IWebEndUser (see page 5988) interface, the value of this property is nil (Delphi) or NULL (C++). When EndUserAdapter is nil (Delphi) or NULL (C++), the WebSnap application can't use the EndUser variable in server-side scripts or take advantage of the login support that end user adapters provide.

See Also

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

60.1.11.3.5 TCustomWebAppComponents.LocateFileService Property

Provides access to the file location service.

Pascal

```
property LocateFileService: ILocateFileService;
```

C++

```
__property ILocateFileService LocateFileService;
```

Description

Use LocateFileService to get or set the interface of the file location service. The file location service controls access to the

templates and server-side script include files that are used while processing requests.

Typically, LocateFileService is the interface of a TLocateFileService (see page 6220) object. If the WebSnap application does not include a component that implements the ILocateFileService interface, the value of this property is nil (Delphi) or NULL (C++). When LocateFileService is nil (Delphi) or NULL (C++), the WebSnap application can still use template files and include files, but you have less control over how the application locates these files (that is, they must reside in the current directory or references to them must be qualified).

See Also

TLocateFileService (see page 6220)

60.1.11.3.6 TCustomWebAppComponents.PageDispatcher Property

Provides access to the current page dispatcher object.

Pascal

```
property PageDispatcher: IPageDispatcher;
```

C++

```
__property IPageDispatcher PageDispatcher;
```

Description

Use PageDispatcher to get or set the interface of the page dispatcher. The page dispatcher is responsible for interpreting requests for specific Web pages, checking the access rights for requested Web pages, and dispatching Web page requests to the appropriate Web page module.

Typically, PageDispatcher is the interface of a TPageDispatcher (see page 6236) object. If the WebSnap application does not include a TPageDispatcher (see page 6236) component, or some other component that implements the IPageDispatcher (see page 1060) interface, the value of this property is nil (Delphi) or NULL (C++). When PageDispatcher is nil (Delphi) or NULL (C++), the WebSnap application does not automatically generate Web page content in response to requests that give the Web page name in their target URL.

See Also

TPageDispatcher (see page 6236)

AdapterDispatcher (see page 6211)

60.1.11.3.7 TCustomWebAppComponents.Sessions Property

Provides access to the sessions service.

Pascal

```
property Sessions: ISessionsService;
```

C++

```
__property ISessionsService Sessions;
```

Description

Use Sessions to get or set the interface of the sessions service. The sessions service maintains Web sessions so that the WebSnap application can store temporary information about an end user.

Typically, Sessions is the interface of a TSessionsService object. If the WebSnap application does not include a component that implements the ISessionsService (see page 1066) interface, the value of this property is nil (Delphi) or NULL (C++). When Sessions is nil (Delphi) or NULL (C++), the WebSnap application can't use Web sessions to store named information about the current end user.

See Also

TSessionsService (see page 6756)

60.1.11.3.8 TCustomWebAppComponents.UserListService Property

Provides access to the file location service.

Pascal

```
property UserListService: IWebUserList;
```

C++

```
__property IWebUserList UserListService;
```

Description

Use UserListService to get or set the interface of the user list service. The user list service maintains a list of user names, passwords, and access rights. Using this information, it can validate logins and check a user's access rights.

Typically, UserListService is the interface of a TWebUserList object. If the WebSnap application does not include a component that implements the IWebUserList (see page 1116) interface, the value of this property is nil (Delphi) or NULL (C++). When UserListService is nil (Delphi) or NULL (C++), the WebSnap application can still allow users to log in and check access rights, but the support for this must be coded using event handlers on the page dispatcher.

See Also

TWebUserList (see page 6796)

TPageDispatcher (see page 6236)

60.1.11.4 TCustomWebAppComponents Events

The events of the TCustomWebAppComponents class are listed here.

Public Events

	Name	Description
	OnException (see page 6215)	Occurs when an exception escapes all try blocks in the WebSnap application.

60.1.11.4.1 TCustomWebAppComponents.OnException Event

Occurs when an exception escapes all try blocks in the WebSnap application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Write (see page 3707) an OnException event handler respond to exceptions that arise while processing a request message. OnException occurs when an exception is not caught by the components that process the request message. If the OnException event handler does not handle the exception, TCustomWebAppComponents (see page 6201) updates the response message so that it describes the exception to the caller.

See Also

OnAfterDispatch (see page 6235)

60.1.12 TInvalidWebSession Class

Serves as a placeholder when an HTTP request could not be given a session.

Class Hierarchy

Pascal

```
TInvalidWebSession = class(TAbstractWebSession);
```

C++

```
class TInvalidWebSession : public TAbstractWebSession;
```

File

WebDisp

Description

TInvalidWebSession implements the Session property on the Web context when the WebSnap application fails to create an active session (TWebSession (see page 6251)) for the current request. The failure to create an active session can arise from various reasons, including the situation where the WebSnap application does not have a TSessionsService component or the situation where an incoming request message tries to reactivate a session that was terminated.

TInvalidWebSession acts as a placeholder, so that the WebSnap application does not need to raise an exception when the attempt to create an active session fails. Any attempt to use TInvalidWebSession, however, leads to an ESessionException (see page 6147) exception.

See Also

TSessionsService (see page 6756)

TAbstractWebContext (see page 5960)

TWebSession (see page 6251)

ESessionException (see page 6147)

60.1.12.1 TInvalidWebSession Members

The following tables list the members exposed by TInvalidWebSession.

Protected Methods

	Name	Description
	GetSessionID (see page 6217)	Returns the value of the SessionID property.
	GetTimeoutMinutes (see page 6218)	Returns the value of the TimeoutMinutes property.
	GetValue (see page 6218)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 6219)	Sets the value of the TimoutMinutes property.
	SetValue (see page 6219)	Assigns a value to a specified name.

Public Methods

	Name	Description
	Create (see page 6217)	Creates and initializes an instance of TInvalidWebSession (see page 6216).
	Terminate (see page 6219)	Raises an ESessionException (see page 6147) exception.
	UpdateResponse (see page 6220)	Does nothing.

60.1.12.2 TInvalidWebSession.Create Constructor

Creates and initializes an instance of TInvalidWebSession (see page 6216).

Pascal

```
constructor Create(const AMsg: string);
```

C++

```
__fastcall TInvalidWebSession(const UnicodeString AMsg);
```

Description

Do not create instances of TInvalidWebSession (see page 6216). WebSnap applications automatically create TInvalidWebSession (see page 6216) objects when a call to the TWebSession (see page 6251) constructor fails.

AMsg is the error message from the exception that was raised within a call to the TWebSession (see page 6251) constructor. This error message is used for any ESessionException (see page 6147) exception that the TInvalidWebSession (see page 6216) object raises.

See Also

ESessionException (see page 6147)

Create (see page 6252)

60.1.12.3 TInvalidWebSession Methods

The methods of the TInvalidWebSession class are listed here.

Protected Methods

	Name	Description
	GetSessionID (see page 6217)	Returns the value of the SessionID property.
	GetTimeoutMinutes (see page 6218)	Returns the value of the TimeoutMinutes property.
	GetValue (see page 6218)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 6219)	Sets the value of the TimoutMinutes property.
	SetValue (see page 6219)	Assigns a value to a specified name.

Public Methods

	Name	Description
	Terminate (see page 6219)	Raises an ESessionException (see page 6147) exception.
	UpdateResponse (see page 6220)	Does nothing.

60.1.12.3.1 TInvalidWebSession.GetSessionID Method

Returns the value of the SessionID property.

Pascal

```
function GetSessionID: string; override;
```

C++

```
virtual __fastcall UnicodeString GetSessionID();
```

Description

GetSessionID is the protected read implementation of the SessionID property.

In TAbstractWebSession, GetSessionID is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the SessionID property.

See Also

SessionID

60.1.12.3.2 TInvalidWebSession.GetTimeoutMinutes Method

Returns the value of the TimeoutMinutes property.

Pascal

```
function GetTimeoutMinutes: Integer; override;
```

C++

```
virtual __fastcall int GetTimeoutMinutes();
```

Description

GetTimeoutMinutes is the protected read implementation of the TimeoutMinutes property.

In TAbstractWebSession, GetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes property.

See Also

TimeoutMinutes

SetTimeoutMinutes

60.1.12.3.3 TInvalidWebSession.GetValue Method

Returns the value associated with a specified name.

Pascal

```
function GetValue(const AName: string): Variant; override;
```

C++

```
virtual __fastcall Variant GetValue(const UnicodeString AName);
```

Description

GetValue is the protected read implementation of the Values property.

AName is the name of the value to return.

In TAbstractWebSession, GetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values property.

See Also

Values

SetValue

60.1.12.3.4 TInvalidWebSession.SetTimeoutMinutes Method

Sets the value of the TimoutMinutes property.

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer); override;
```

C++

```
virtual __fastcall SetTimeoutMinutes(int AValue);
```

Description

SetTimeoutMinutes is the protected write implementation of the TimeoutMinutes property.

AValue is the number of minutes that can elapse before the session terminates itself.

In TAbstractWebSession, SetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes property.

See Also

GetTimeoutMinutes

TimeoutMinutes

60.1.12.3.5 TInvalidWebSession.SetValue Method

Assigns a value to a specified name.

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant); override;
```

C++

```
virtual __fastcall SetValue(const UnicodeString AName, const Variant AValue);
```

Description

SetValue is the protected write implementation of the Value property.

AName is the name of the value to store.

AValue is the value to store under the specified name.

In TAbstractWebSession, SetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values property.

See Also

GetValue

Values

60.1.12.3.6 TInvalidWebSession.Terminate Method

Raises an ESessionException (see page 6147) exception.

Pascal

```
procedure Terminate; override;
```

C++

```
virtual __fastcall Terminate();
```

Description

Do not call the Terminate method. TInvalidWebSession (see page 6216) does not represent an active Web session, so there is no Web session to terminate.

If the application calls the Terminate method, TInvalidWebSession (see page 6216) raises an ESessionException (see page 6147) object.

See Also

ESessionException (see page 6147)

60.1.12.3.7 TInvalidWebSession.UpdateResponse Method

Does nothing.

Pascal

```
procedure UpdateResponse(AResponse: TWebResponse); override;
```

C++

```
virtual __fastcall UpdateResponse(TWebResponse AResponse);
```

Description

UpdateResponse is called automatically to allow the WebSnap application to add the session ID to the response message before it is sent to the user. In TInvalidWebSession (see page 6216), UpdateResponse does nothing, because invalid Web sessions do not have session ID's.

See Also

SessionID

60.1.13 TLocateFileService Class

TLocateFileService controls the access of templates and server-side script include files at runtime.

Class Hierarchy

Pascal

```
TLocateFileService = class(TCustomLocateFileService);
```

C++

```
class TLocateFileService : public TCustomLocateFileService;
```

File

WebDisp

Description

Add a TLocateFileService component to your WebSnap application when you want greater control over how template and

server-side script include files are accessed at runtime. Define event handlers that will be called when the application requires one of these files. Event handlers can specify a different directory location for a file or return a TStream containing the file.

See Also

TStream

60.1.13.1 TLocateFileService Members

The following tables list the members exposed by TLocateFileService.

Protected Methods

	Name	Description
	FindIncludeFile (see page 6182)	Returns the fully-qualified path name for an include file for a server-side script.
V	FindStream (see page 6183)	Generates an OnFindStream (see page 6187) event.
	FindTemplateFile (see page 6183)	Generates an OnFindTemplateFile (see page 6187) event.
V	GetFileStream (see page 6184)	Returns a stream object from which to read a specified file.
	GetTemplateStream (see page 6184)	Returns a stream from which to read a template file.
V	ImplFindIncludeFile (see page 6185)	Provides the underlying implementation for the FindIncludeFile (see page 6182) method.
V	ImplGetTemplateStream (see page 6185)	Provides the underlying implementation for the GetTemplateStream (see page 6184) method.

Public Methods

	Name	Description
	FindIncludeFile (see page 1017)	This is FindIncludeFile, a member of class IFindIncludeFile.

Published Events

	Name	Description
	OnFindIncludeFile (see page 6221)	Occurs when the WebSnap application tries to locate an include file for a server-side script.
	OnFindStream (see page 6222)	Occurs when the WebSnap application tries to locate a file.
	OnFindTemplateFile (see page 6222)	Occurs when the WebSnap application tries to locate the template file for a content producer.

60.1.13.2 TLocateFileService Events

The events of the TLocateFileService class are listed here.

Published Events

	Name	Description
	OnFindIncludeFile (see page 6221)	Occurs when the WebSnap application tries to locate an include file for a server-side script.
	OnFindStream (see page 6222)	Occurs when the WebSnap application tries to locate a file.
	OnFindTemplateFile (see page 6222)	Occurs when the WebSnap application tries to locate the template file for a content producer.

60.1.13.2.1 TLocateFileService.OnFindIncludeFile Event

Occurs when the WebSnap application tries to locate an include file for a server-side script.

Pascal

```
property OnFindIncludeFile: TLocateFileServiceFindFileEvent;
```

C++

```
__property TLocateFileServiceFindFileEvent OnFindIncludeFile;
```

Description

Write an OnFindIncludeFile event handler to indicate the location on disk of include files for server-side scripts. In WebSnap applications that include a locate file service component, you must supply either an OnFindIncludeFile or an OnFindStream event handler (or both) if the server-side scripts have include files. Otherwise the application can't locate these include files at all.

See Also

OnFindStream (see page 6187)

OnFindTemplateFile (see page 6187)

60.1.13.2.2 TLocateFileService.OnFindStream Event

Occurs when the WebSnap application tries to locate a file.

Pascal

```
property OnFindStream: TLocateFileServiceFindStreamEvent;
```

C++

```
__property TLocateFileServiceFindStreamEvent OnFindStream;
```

Description

Write an OnFindStream event handler to supply the WebSnap application with the contents of a file given its name. This event is particularly useful for applications that use "logical" files that do not exist physically on disk. When the WebSnap application tries to locate a file, the locate file service generates this event, along with an OnFindTemplateFile. One of these event handlers must be provided in order for the application to use the requested file.

See Also

OnFindIncludeFile (see page 6186)

OnFindTemplateFile (see page 6187)

60.1.13.2.3 TLocateFileService.OnFindTemplateFile Event

Occurs when the WebSnap application tries to locate the template file for a content producer.

Pascal

```
property OnFindTemplateFile: TLocateFileServiceFindFileEvent;
```

C++

```
__property TLocateFileServiceFindFileEvent OnFindTemplateFile;
```

Description

Write an OnFindIncludeFile event handler to indicate the location on disk of templates that a content producer component uses to generate its content. In WebSnap applications that include a locate file service component, you must supply either an OnFindTemplateFile or an OnFindStream event handler (or both) if the application has content producers that use template files. Otherwise content producers can't locate their templates.

See Also

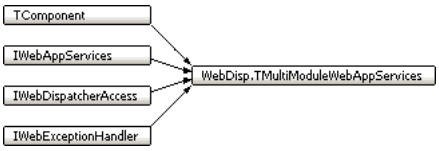
OnFindStream (see page 6187)

OnFindIncludeFile (see page 6186)

60.1.14 TMultiModuleWebAppServices Class

TMultiModuleWebAppServices coordinates the response to HTTP request messages by locating the appropriate components to handle various tasks.

Class Hierarchy



Pascal

```
TMultiModuleWebAppServices = class(TComponent, IWebAppServices, IWebDispatcherAccess,
IWebExceptionHandler);
```

C++

```
class TMultiModuleWebAppServices : public TComponent, public IWebAppServices, public
IWebDispatcherAccess, public IWebExceptionHandler;
```

File

WebDisp

Description

TMultiModuleWebAppServices is the base class for components that provide access to the services available in a WebSnap application. It keeps track of the current request and response objects, maintains a list of the available Web modules, and introduces methods for locating the appropriate components to handle incoming request messages.

Do not use TMultiModuleWebAppServices directly. The methods that process request messages and any exceptions that arise during that processing are simple stubs that should be overridden by a descendant class. Rather, use a TMultiModuleWebAppServices descendant such as TWebAppComponents (see page 6243), to provide access to the central components of the WebSnap application.

See Also

TWebRequest

TWebResponse

TWebRequestHandler (see page 6633)

TWebAppComponents (see page 6243)

IWebAppServices

60.1.14.1 TMultiModuleWebAppServices Members

The following tables list the members exposed by TMultiModuleWebAppServices.

Protected Events

	Name	Description
	OnAfterDispatch (see page 6235)	Occurs after the WebSnap application generates the content of a response message.

	OnBeforeDispatch (see page 6235)	Occurs before TMultiModuleWebAppServices (see page 6223) passes an HTTP request onto the other components in the application for processing.

Protected Methods

	Name	Description
	Access_Request (see page 6225)	Returns the value of the Access_Request property.
	Access_Response (see page 6225)	Returns the value of the Access_Response property.
V	CreateContext (see page 6225)	Creates the Web context for the current request message.
	DoAfterDispatch (see page 6226)	Generates an OnAfterDispatch (see page 6235) event.
	DoBeforeDispatch (see page 6226)	Generates an OnBeforeDispatch (see page 6235) event.
V	DoneModule (see page 6227)	Performs any final tasks before deactivating a Web module.
	FinishContext (see page 6227)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 6228)	Returns the object that handles exceptions that arise in the WebSnap application.
	HandleException (see page 6228)	Responds to any exceptions not caught by the WebSnap application.
	HandleRequest (see page 6229)	Directs the processing of the current request message.
V	ImplFinishContext (see page 6229)	Provides the underlying implementation of the FinishContext (see page 6227) method.
V	ImplHandleException (see page 6230)	Provides the underlying implementation of the HandleException (see page 6228) method.
V	ImplHandleRequest (see page 6230)	Provides the underlying implementation for the HandleRequest (see page 6229) method.
V	ImplInitContext (see page 6231)	Provides the underlying implementation for the InitContext (see page 6231) method.
	InitContext (see page 6231)	Creates and initializes the Web context for the current Web request.
V	InitModule (see page 6232)	Initializes a Web module before the WebSnap application uses it to handle the current request.
V	InitModules (see page 6233)	Initializes all the currently active Web modules.
	ModuleAdded (see page 6233)	Initializes a Web module when it is activated while processing the current request.

Protected Properties

	Name	Description
R	Request (see page 6234)	Provides access to the current request object.
R	Response (see page 6234)	Provides access to the current response object.
R	WebModules (see page 6234)	Lists the Web modules available in the WebSnap application.

60.1.14.2 TMultiModuleWebAppServices Methods

The methods of the TMultiModuleWebAppServices class are listed here.

Protected Methods

	Name	Description
	Access_Request (see page 6225)	Returns the value of the Access_Request property.
	Access_Response (see page 6225)	Returns the value of the Access_Response property.
V	CreateContext (see page 6225)	Creates the Web context for the current request message.
	DoAfterDispatch (see page 6226)	Generates an OnAfterDispatch (see page 6235) event.
	DoBeforeDispatch (see page 6226)	Generates an OnBeforeDispatch (see page 6235) event.
V	DoneModule (see page 6227)	Performs any final tasks before deactivating a Web module.
	FinishContext (see page 6227)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetExceptionHandler (see page 6228)	Returns the object that handles exceptions that arise in the WebSnap application.
	HandleException (see page 6228)	Responds to any exceptions not caught by the WebSnap application.
	HandleRequest (see page 6229)	Directs the processing of the current request message.
V	ImplFinishContext (see page 6229)	Provides the underlying implementation of the FinishContext (see page 6227) method.

	ImplHandleException (see page 6230)	Provides the underlying implementation of the HandleException (see page 6228) method.
	ImplHandleRequest (see page 6230)	Provides the underlying implementation for the HandleRequest (see page 6229) method.
	ImplInitContext (see page 6231)	Provides the underlying implementation for the InitContext (see page 6231) method.
	InitContext (see page 6231)	Creates and initializes the Web context for the current Web request.
	InitModule (see page 6232)	Initializes a Web module before the WebSnap application uses it to handle the current request.
	InitModules (see page 6233)	Initializes all the currently active Web modules.
	ModuleAdded (see page 6233)	Initializes a Web module when it is activated while processing the current request.

60.1.14.2.1 TMultiModuleWebAppServices.Access_Request Method

Returns the value of the Access_Request property.

Pascal

```
function Access_Request: TWebRequest;
```

C++

```
__fastcall TWebRequest Access_Request();
```

Description

Access_Access_Request provides the TMultiModuleWebAppServices (see page 6223) object's implementation of the Access_Request method of its IWebDispatcherAccess interface. This allows content producer components in the application to access the current request message.

See Also

Request

Dispatcher

60.1.14.2.2 TMultiModuleWebAppServices.Access_Response Method

Returns the value of the Access_Response property.

Pascal

```
function Access_Response: TWebResponse;
```

C++

```
__fastcall TWebResponse Access_Response();
```

Description

Access_Access_Response provides the TMultiModuleWebAppServices (see page 6223) object's implementation of the Access_Response method of its IWebDispatcherAccess interface. This allows content producer components in the application to access the current Access_Response message.

See Also

Response

Dispatcher

60.1.14.2.3 TMultiModuleWebAppServices.CreateContext Method

Creates the Web context for the current request message.

Pascal

```
function CreateContext: TAbstractWebContext; virtual;
```

C++

```
virtual __fastcall TAbstractWebContext CreateContext();
```

Description

The InitContext (see page 6231) method calls CreateContext to instantiate the Web context object for the current request. This context can then be accessed by the WebSnap application using the global WebContext (see page 6003) function.

In TMultiModuleWebAppServices (see page 6223), CreateContext creates a TWebContext (see page 5976) object, passing the values of the Request (see page 6234), Response (see page 6234), and WebModules (see page 6234) properties to the constructor. The Web context is created without a session.

See Also

WebContext (see page 6003)

InitContext (see page 6231)

Create (see page 5978)

Request (see page 6234)

Response (see page 6234)

WebModules (see page 6234)

60.1.14.2.4 TMultiModuleWebAppServices.DoAfterDispatch Method

Generates an OnAfterDispatch (see page 6235) event.

Pascal

```
function DoAfterDispatch(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DoAfterDispatch(TWebRequest Request, TWebResponse Response);
```

Description

TMultiModuleWebAppServices (see page 6223) descendants call DoAfterDispatch to generate an OnAfterDispatch (see page 6235) event after dispatching a request message to the other components in the WebSnap application.

Request (see page 6234) is the current request message that was just handled.

Response (see page 6234) is the response message that was filled in by the rest of the WebSnap application.

DoAfterDispatch returns true if the WebSnap application should send the response message back to the caller.

See Also

OnAfterDispatch (see page 6235)

60.1.14.2.5 TMultiModuleWebAppServices.DoBeforeDispatch Method

Generates an OnBeforeDispatch (see page 6235) event.

Pascal

```
function DoBeforeDispatch(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DoBeforeDispatch(TWebRequest Request, TWebResponse Response);
```

Description

TMultiModuleWebAppServices (see page 6223) descendants call DoBeforeDispatch to generate an OnBeforeDispatch (see page 6235) event before dispatching a request message to the other components in the WebSnap application.

Request (see page 6234) is the current request message that needs to be handled.

Response (see page 6234) is the response message that needs to be filled out.

DoBeforeDispatch returns true if the OnBeforeDispatch (see page 6235) event handler has handled the event. When DoBeforeDispatch returns true, the WebSnap application does not need to continue processing the request.

See Also

OnBeforeDispatch (see page 6235)

60.1.14.2.6 TMultiModuleWebAppServices.DoneModule Method

Performs any final tasks before deactivating a Web module.

Pascal

```
procedure DoneModule(AWebModule: TComponent); virtual;
```

C++

```
virtual __fastcall DoneModule(TComponent * AWebModule);
```

Description

The FinishContext (see page 6227) method calls DoneModule for every active Web module as part of the final cleanup before freeing the Web modules and Web context when the WebSnap application is finished handling an HTTP request. DoneModule notifies the Web module that it is about to be deactivated, so that it can perform any final tasks before it is freed or deactivated.

AWebModule is the Web module instance that is about to be deactivated.

See Also

WebModules (see page 6234)

InitModule (see page 6232)

FinishContext (see page 6227)

60.1.14.2.7 TMultiModuleWebAppServices.FinishContext Method

Performs any final tasks after the WebSnap application has finished processing a request.

Pascal

```
procedure FinishContext;
```

C++

```
__fastcall FinishContext();
```

Description

FinishContext is called as the last step before a WebSnap application sends a response message back to the caller. FinishContext performs any final tasks, and frees all the objects and components that were created to handle the request message.

FinishContext is not a virtual method. Descendant classes can't override this method to add additional final tasks. Instead, FinishContext calls the virtual ImplFinishContext (see page 6229) method, which descendant classes override to add their own final tasks.

See Also

InitContext (see page 6231)

ImplFinishContext (see page 6229)

60.1.14.2.8 TMultiModuleWebAppServices.GetExceptionHandler Method

Returns the object that handles exceptions that arise in the WebSnap application.

Pascal

```
function GetExceptionHandler: TObject;
```

C++

```
__fastcall TObject * GetExceptionHandler();
```

Description

GetExceptionHandler returns the object that the WebSnap application should call when an exception is raised while trying to process a request message. The request handler must implement the IWebExceptionHandler interface, which includes only a single method: HandleException (see page 6228).

In TMultiModuleWebAppServices (see page 6223), GetExceptionHandler returns self this, because TMultiModuleWebAppServices (see page 6223) implements the IWebExceptionHandler interface.

See Also

HandleException (see page 6228)

60.1.14.2.9 TMultiModuleWebAppServices.HandleException Method

Responds to any exceptions not caught by the WebSnap application.

Pascal

```
procedure HandleException(E: Exception; var Handled: Boolean);
```

C++

```
__fastcall HandleException(Exception E, Boolean Handled);
```

Description

HandleException provides the last opportunity for a WebSnap application to handle an exception that passes through all the try blocks in the application code. If the HandleException method does not handle the exception, the WebSnap application displays a dialog box that indicates an error occurred.

HandleException calls the ImplHandleException (see page 6230) method to handle the exception. In TMultiModuleWebAppServices (see page 6223), ImplHandleException (see page 6230) does nothing. However, descendant classes override ImplHandleException (see page 6230) to provide more meaningful responses, such as generating an OnException event or creating a response message that describes the exception to the caller.

E is the exception object for the exception that occurred.

Handled returns true if HandleException handled the exception. If Handled returns false, the WebSnap application displays a dialog box that indicates an error occurred.

See Also

ImplHandleException (see page 6230)

60.1.14.2.10 TMultiModuleWebAppServices.HandleRequest Method

Directs the processing of the current request message.

Pascal

```
function HandleRequest: Boolean;
```

C++

```
__fastcall Boolean HandleRequest();
```

Description

When the WebSnap application receives a request message, it makes the following calls:

1. The InitContext (see page 6231) method is called to generate a Web context for the request.
2. HandleRequest is called to generate a response to the request.
3. FinishContext (see page 6227) is called to perform any final cleanup.

HandleRequest simply calls the ImplHandleRequest (see page 6230) method, which directs the processing of the request. In TMultiModuleWebAppServices (see page 6223), ImplHandleRequest (see page 6230) simply declares the request as handled while doing no processing. Descendant classes override ImplHandleRequest (see page 6230) to locate the components that should handle the request and forwarding the request to those components for processing.

HandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

ImplHandleRequest (see page 6230)

Request (see page 6234)

InitContext (see page 6231)

FinishContext (see page 6227)

60.1.14.2.11 TMultiModuleWebAppServices.ImplFinishContext Method

Provides the underlying implementation of the FinishContext (see page 6227) method.

Pascal

```
procedure ImplFinishContext; virtual;
```

C++

```
virtual __fastcall ImplFinishContext();
```

Description

ImplFinishContext performs any final tasks and cleanup after the WebSnap application has finished processing a request message.

In TMultiModuleWebAppServices (see page 6223), ImplFinishContext calls the DoneModule (see page 6227) method for every active Web module so that it can be freed or deactivated, and then frees the Web context for the current request.

Descendant classes override ImplFinishContext to add their own final tasks.

See Also

FinishContext (see page 6227)

DoneModule (see page 6227)

WebContext (see page 6003)

60.1.14.2.12 TMultiModuleWebAppServices.ImplHandleException Method

Provides the underlying implementation of the HandleException (see page 6228) method.

Pascal

```
procedure ImplHandleException(E: Exception; var Handled: Boolean); virtual;
```

C++

```
virtual __fastcall ImplHandleException(Exception E, Boolean Handled);
```

Description

The HandleException (see page 6228) method calls ImplHandleException to handle any exception that passes through all the try blocks in the application code. If ImplHandleException does not handle the exception, the WebSnap application displays a dialog box that indicates an error occurred.

In TMultiModuleWebAppServices (see page 6223), ImplHandleException returns true, ignoring the exception that occurred. Descendant classes override this method to provide more meaningful responses, such as generating an OnException event or creating a response message that describes the exception to the caller.

E is the exception object for the exception that occurred.

Handled returns true if ImplHandleException handled the exception. If Handled returns false, the WebSnap application displays a dialog box that indicates an error occurred.

See Also

HandleException (see page 6228)

60.1.14.2.13 TMultiModuleWebAppServices.ImplHandleRequest Method

Provides the underlying implementation for the HandleRequest (see page 6229) method.

Pascal

```
function ImplHandleRequest: Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplHandleRequest();
```

Description

The HandleRequest (see page 6229) method calls ImplHandleRequest to handle the current HTTP request message. In TMultiModuleWebAppServices (see page 6223), ImplHandleRequest returns true, indicating that the request is handled, but does nothing to fill out the response object. Descendant classes override this method to locate components in the WebSnap application that can process the request and forward the request to them for handling.

ImplHandleRequest returns true if the request is handled and the response should be sent back to the caller (if it was not already sent). It returns false if the WebSnap application could not handle the request.

See Also

HandleRequest (see page 6229)

Request (see page 6234)

Response (see page 6234)

60.1.14.2.14 TMultiModuleWebAppServices.ImplInitContext Method

Provides the underlying implementation for the InitContext (see page 6231) method.

Pascal

```
procedure ImplInitContext(AWebModuleList: TAbstractWebModuleList; ARequest: TWebRequest;
AResponse: TWebResponse); virtual;
```

C++

```
virtual __fastcall ImplInitContext(TAbstractWebModuleList AWebModuleList, TWebRequest
ARequest, TWebResponse AResponse);
```

Description

The InitContext (see page 6231) method, which is called when the WebSnap application first receives a request, calls ImplInitContext to perform any initializations and to create the Web context for the new request message.

ImplInitContext performs the following tasks:

1. Sets the WebModules (see page 6234), Request (see page 6234), and Response (see page 6234) properties to the values of the AWebModuleList, ARequest, and AResponse parameters, respectively.
2. Calls the CreateContext (see page 6225) method to create a Web context for the current request. This Web context can then be accessed using the global WebContext (see page 6003) function.
3. Calls the InitModules (see page 6233) method to initialize all the Web modules that the AWebModuleList parameter indicates are currently instantiated. (These are the Web modules that are created for every request message.)
4. Hooks up the ModuleAdded (see page 6233) method so that it can initialize any Web modules that are instantiated in the course of processing the current request.

See Also

InitContext (see page 6231)

CreateContext (see page 6225)

WebContext (see page 6003)

Request (see page 6234)

Response (see page 6234)

WebModules (see page 6234)

InitModules (see page 6233)

60.1.14.2.15 TMultiModuleWebAppServices.InitContext Method

Creates and initializes the Web context for the current Web request.

Pascal

```
procedure InitContext(WebModuleList: TAbstractWebModuleList; Request: TWebRequest; Response:
```

```
TWebResponse);
```

C++

```
__fastcall InitContext(TAbstractWebModuleList WebModuleList, TWebRequest Request, TWebResponse
Response);
```

Description

InitContext is called when the WebSnap application first receives a request message to set up the Web context before the application attempts to handle the request. It creates and sets up the global Web context, which can be accessed by calling the global WebContext (see page 6003) function. It also performs any other initializations that ready the application for handling a new request message.

WebModuleList lists the currently active Web modules in the WebSnap application and provides access to all Web module factories so that the application can create any new modules it needs for processing the request message. This becomes the value of the WebModules (see page 6234) property.

Request (see page 6234) describes the new request message. This becomes the value of the Request (see page 6234) property.

Response (see page 6234) is the response object that the WebSnap application should fill out when handling the current request. This becomes the value of the Response (see page 6234) property.

InitContext is not a virtual method. Descendant classes can't override this method to add additional initializations. Instead, InitContext calls the virtual ImplInitContext (see page 6231) method, which descendant classes override to add their own initial tasks.

See Also

ImplInitContext (see page 6231)

WebContext (see page 6003)

Request (see page 6234)

Response (see page 6234)

WebModules (see page 6234)

60.1.14.2.16 TMultiModuleWebAppServices.InitModule Method

Initializes a Web module before the WebSnap application uses it to handle the current request.

Pascal

```
procedure InitModule(AWebModule: TComponent); virtual;
```

C++

```
virtual __fastcall InitModule(TComponent * AWebModule);
```

Description

Both the ModuleAdded (see page 6233) and the InitModules (see page 6233) methods call InitModule to initialize a Web module after it is first created. InitModule assigns itself as the Web dispatcher to any content producers in the Web module, and notifies the Web module that it has been activated.

AWebModule is the Web module component to initialize.

See Also

InitModules (see page 6233)

ModuleAdded (see page 6233)

WebModules (see page 6234)

Dispatcher

60.1.14.2.17 TMultiModuleWebAppServices.InitModules Method

Initializes all the currently active Web modules.

Pascal

```
procedure InitModules; virtual;
```

C++

```
virtual __fastcall InitModules();
```

Description

InitModules is called to initialize the currently active Web modules when the WebSnap application first sets up the Web context for a new request. It iterates over all the active Web modules that the WebModules (see page 6234) property lists, calling the InitModule (see page 6232) method to initialize each one.

See Also

InitModule (see page 6232)

WebModules (see page 6234)

InitContext (see page 6231)

60.1.14.2.18 TMultiModuleWebAppServices.ModuleAdded Method

Initializes a Web module when it is activated while processing the current request.

Pascal

```
procedure ModuleAdded(AWebModule: TComponent);
```

C++

```
__fastcall ModuleAdded(TComponent * AWebModule);
```

Description

TMultiModuleWebAppServices (see page 6223) assigns ModuleAdded as the OnModuleAdded event handler on the TWebModuleList that is the value of the WebModules (see page 6234) property. As a result, this method is called every time the WebSnap application activates a new Web module while processing the current request.

ModuleAdded calls the InitModule (see page 6232) method to initialize the new Web module before it is used.

AWebModule is the newly activated Web module.

See Also

InitModule (see page 6232)

OnModuleAdded

WebModules (see page 6234)

60.1.14.3 TMultiModuleWebAppServices Properties

The properties of the TMultiModuleWebAppServices class are listed here.

Protected Properties

	Name	Description
	Request (see page 6234)	Provides access to the current request object.
	Response (see page 6234)	Provides access to the current response object.
	WebModules (see page 6234)	Lists the Web modules available in the WebSnap application.

60.1.14.3.1 TMultiModuleWebAppServices.Request Property

Provides access to the current request object.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Read (see page 3634) Request to obtain information about the current HTTP request message. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 6234)

60.1.14.3.2 TMultiModuleWebAppServices.Response Property

Provides access to the current response object.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Read (see page 3634) Response to obtain information about or add to the response message that the application builds as a reply to the message that the Request (see page 6234) property specifies. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 6234)

60.1.14.3.3 TMultiModuleWebAppServices.WebModules Property

Lists the Web modules available in the WebSnap application.

Pascal

```
property WebModules: TAbstractWebModuleList;
```

C++

```
__property TAbstractWebModuleList WebModules;
```

Description

Use WebModules to access one of the Web modules that make up the WebSnap application. WebModules lists all of the

currently instantiated Web modules. It also provides access to the factory objects for all Web modules in the application, including those that are not yet instantiated.

When the application first receives a Web request message, the Web request handler initializes WebModules to include all Web modules that have the crAlways flag set in their factory's CreateMode property.

See Also

CreateMode

60.1.14.4 TMultiModuleWebAppServices Events

The events of the TMultiModuleWebAppServices class are listed here.

Protected Events

	Name	Description
	OnAfterDispatch (see page 6235)	Occurs after the WebSnap application generates the content of a response message.
	OnBeforeDispatch (see page 6235)	Occurs before TMultiModuleWebAppServices (see page 6223) passes an HTTP request onto the other components in the application for processing.

60.1.14.4.1 TMultiModuleWebAppServices.OnAfterDispatch Event

Occurs after the WebSnap application generates the content of a response message.

Pascal

```
property OnAfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnAfterDispatch;
```

Description

Write (see page 3707) an AfterDispatch event handler to perform any final actions before sending a response back to the Web browser that sent the WebSnap application a request. OnAfterDispatch occurs after the other components in the WebSnap application have attempted to generate a response for the current request. It does not occur if the response message has already been sent back to the caller.

If the AfterDispatch event handler sets the Handled parameter to true, the WebSnap application sends the response back to the caller after the event handler exits. If it sets the Handled parameter to false, the WebSnap application does not send the response message.

Note: Although TMultiModuleWebAppServices (see page 6223) introduces the OnAfterDispatch event, it never calls the event handler. Descendant classes add the code to generate this event after dispatching a request message.

See Also

OnBeforeDispatch (see page 6235)

60.1.14.4.2 TMultiModuleWebAppServices.OnBeforeDispatch Event

Occurs before TMultiModuleWebAppServices (see page 6223) passes an HTTP request onto the other components in the application for processing.

Pascal

```
property OnBeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnBeforeDispatch;
```

Description

Write (see page 3707) an OnBeforeDispatch event handler to initialize the response to an HTTP request or to handle any messages that the other components in the WebSnap application can't handle. If the event handler completely handles the request, filling out the response object so that it is ready to send, it should set the Handled parameter to true, thereby preventing this component from trying to locate a component in the WebSnap application that can handle the message.

Note: Although TMultiModuleWebAppServices (see page 6223) introduces the OnBeforeDispatch event, it never calls the event handler. Descendant classes add the code to generate this event before dispatching a request message.

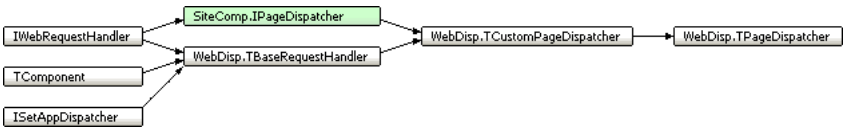
See Also

OnAfterDispatch (see page 6235)

60.1.15 TPageDispatcher Class

TPageDispatcher dispatches incoming HTTP request messages in a WebSnap application.

Class Hierarchy



Pascal

```
TPageDispatcher = class(TCustomPageDispatcher);
```

C++

```
class TPageDispatcher : public TCustomPageDispatcher;
```

File

WebDisp

Description

Add a single TPageDispatcher object to the Web application module of a WebSnap application. Typically, the WebSnap application wizard adds a page dispatcher to the Web application module that it creates.

A WebSnap application only requires a single page dispatcher. The page dispatcher examines all incoming HTTP request messages, checking the pathInfo portion of the URL to which a request is addressed for the name of a registered Web page module. It then forwards the request to the matching Web page module so that the page module can handle the request and produce the content of a response. If the request is not addressed to a URL with a pathinfo portion, the page dispatcher forwards the request to the Web page module identified by its DefaultPage (see page 6238) property.

60.1.15.1 TPageDispatcher Members

The following tables list the members exposed by TPageDispatcher.

Protected Methods

	Name	Description
	DispatchPageName (see page 6190)	Checks whether a specified user has a given access rights string.
	EndUser (see page 6190)	This is EndUser, a member of class TCustomPageDispatcher.
	GetCanView (see page 6191)	Indicates whether the current user is permitted to view a specified Web page.
	GetDefaultPageName (see page 6191)	Returns the value of the DefaultPageName property.
	GetLoginRequired (see page 6191)	Indicates whether a user must log in before accessing a specified Web page.
	GetRequestedPage (see page 6192)	This is GetRequestedPage, a member of class TCustomPageDispatcher.
	HandleRequest (see page 6167)	Handles an HTTP request.
	ImplDispatchPageName (see page 6192)	This is ImplDispatchPageName, a member of class TCustomPageDispatcher.
V	ImplGetCanView (see page 6192)	This is ImplGetCanView, a member of class TCustomPageDispatcher.
V	ImplGetDefaultPageName (see page 6192)	This is ImplGetDefaultPageName, a member of class TCustomPageDispatcher.
V	ImplGetLoginRequired (see page 6193)	This is ImplGetLoginRequired, a member of class TCustomPageDispatcher.
V	ImplHandleRequest (see page 6167)	Handles application-specific processing of an HTTP request.
V	ImplHandleRequest (see page 6193)	Handles application-specific processing of an HTTP request.
V	ImplPageNameOfRequest (see page 6193)	This is ImplPageNameOfRequest, a member of class TCustomPageDispatcher.
	ImplRedirectToPageName (see page 6193)	This is ImplRedirectToPageName, a member of class TCustomPageDispatcher.
	IsLoggedIn (see page 6194)	This is IsLoggedIn, a member of class TCustomPageDispatcher.
	PageNameOfRequest (see page 6194)	Returns the name of the Web page to which an HTTP request is addressed.
	ProduceLoginPage (see page 6194)	This is ProduceLoginPage, a member of class TCustomPageDispatcher.
	RedirectToPageName (see page 6194)	Fills out a response message so that it redirects the caller to another page in the application.
	SetAppDispatcher (see page 6167)	Sets the AppDispatcher (see page 6168) property.
	ValidatePage (see page 6195)	This is ValidatePage, a member of class TCustomPageDispatcher.

Protected Properties

	Name	Description
R	AppDispatcher (see page 6168)	Provides read-only access to the application dispatcher component.

Public Events

	Name	Description
	OnAfterRedirectToPage (see page 6197)	Occurs after the page dispatcher successfully dispatches an HTTP request message in response to an internal redirection request.
	OnBeforeRedirectToPage (see page 6198)	Occurs before the page dispatcher dispatches an HTTP request message in response to an internal redirection request.

Public Methods

	Name	Description
	DispatchPageName (see page 1061)	Checks whether a specified user has a given access rights string.
	GetCanView (see page 1062)	Indicates whether the current user is permitted to view a specified Web page.
	GetDefaultPageName (see page 1062)	Returns the value of the DefaultPageName (see page 1064) property.
	GetLoginRequired (see page 1062)	Indicates whether a user must log in before accessing a specified Web page.
	PageNameOfRequest (see page 1063)	Returns the name of the Web page to which an HTTP request is addressed.
	RedirectToPageName (see page 1063)	Fills out a response message so that it redirects the caller to another page in the application.

Public Properties

	Name	Description
R	DefaultPageName (see page 1064)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

Published Events

	Name	Description
	OnAfterDispatchPage (see page 6239)	Occurs after the page dispatcher successfully dispatches an HTTP request message.

	OnBeforeDispatchPage (see page 6239)	Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.
	OnCanViewPage (see page 6240)	Occurs just before the dispatcher passes a request message to a Web page module.
	OnIsLoginRequired (see page 6241)	Occurs when a request arrives from a caller that has not yet logged in.
	OnPageAccessDenied (see page 6241)	Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.
	OnPageNotFound (see page 6242)	Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

Published Properties

	Name	Description
	DefaultPage (see page 6238)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

60.1.15.2 TPageDispatcher Properties

The properties of the TPageDispatcher class are listed here.

Published Properties

	Name	Description
	DefaultPage (see page 6238)	Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

60.1.15.2.1 TPageDispatcher.DefaultPage Property

Indicates the Web page module that should handle requests that do not include a Web page module name in the pathinfo portion of their target URL.

Pascal

```
property DefaultPage: string;
```

C++

```
__property UnicodeString DefaultPage;
```

Description

DefaultPage is the name of the registered Web page module that should handle incoming request messages that do not have a pathinfo portion on their target URL. This is the name that is supplied to the Web page module wizard when you created the default Web page module. It forms the basis of that Web page module's class name. For example, if the default Web page module has the name MyDefaultPage, the Web page module class is of type TMyDefaultPage.

If DefaultPage is an empty string, the page dispatcher uses the Web application module as a default Web page module, as long as it is a Web Page module.

60.1.15.3 TPageDispatcher Events

The events of the TPageDispatcher class are listed here.

Published Events

	Name	Description
	OnAfterDispatchPage (see page 6239)	Occurs after the page dispatcher successfully dispatches an HTTP request message.
	OnBeforeDispatchPage (see page 6239)	Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.

	OnCanViewPage (see page 6240)	Occurs just before the dispatcher passes a request message to a Web page module.
	OnIsLoginRequired (see page 6241)	Occurs when a request arrives from a caller that has not yet logged in.
	OnPageAccessDenied (see page 6241)	Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.
	OnPageNotFound (see page 6242)	Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

60.1.15.3.1 TPageDispatcher.OnAfterDispatchPage Event

Occurs after the page dispatcher successfully dispatches an HTTP request message.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take specific action after an HTTP request has been successfully handled by a Web page module. For example, an OnAfterDispatchPage event handler can maintain a log of all Web traffic handled by the WebSnap application.

OnAfterDispatchPage occurs only if the target Web page module succeeds in handling the request. If the target Web page module could not be validated, an OnPageAccessDenied event occurs instead. If the page could not be located, an OnPageNotFound event occurs instead.

See Also

OnBeforeDispatchPage (see page 6197)

OnPageNotFound (see page 6200)

OnCanViewPage (see page 6198)

OnIsLoginRequired (see page 6199)

OnPageAccessDenied (see page 6200)

60.1.15.3.2 TPageDispatcher.OnBeforeDispatchPage Event

Occurs before the page dispatcher passes an HTTP request to a Web page module for processing.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the dispatcher forwards it to the target Web page module for processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the page dispatcher from locating the target Web page module, verifying that it can handle the request, and forwarding the request to that Web page module.

If the event handler does not handle the request (for example, if it is merely maintaining a log of incoming requests), it can leave

the Handled parameter as false and the dispatcher will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

See Also

OnAfterDispatchPage (see page 6196)

OnPageNotFound (see page 6200)

OnCanViewPage (see page 6198)

OnIsLoginRequired (see page 6199)

OnPageAccessDenied (see page 6200)

WebContext (see page 6003)

Request (see page 5974)

Response (see page 5975)

60.1.15.3.3 TPageDispatcher.OnCanViewPage Event

Occurs just before the dispatcher passes a request message to a Web page module.

Pascal

```
property OnCanViewPage: TCanViewPageEvent;
```

C++

```
__property TCanViewPageEvent OnCanViewPage;
```

Description

Write an OnCanViewPage event handler to customize the way the WebSnap application determines whether a given request can be passed to a Web page module for processing. This event is part of the mechanism by which the dispatcher validates a Web page for viewing. The validation process, which occurs after the OnBeforeDispatchPage event, occurs as follows:

1. If the caller has not already logged in, the dispatcher generates an OnIsLoginRequired event to check whether the specified Web page requires the caller to log in.
2. If a login is required, the dispatcher does not validate the page (and so does not forward the request to the specified Web page module). Rather, it initiates the process of creating a response to allow the user to log in.

a. First, the dispatcher generates an OnPageAccessDenied event, where the application can handle the login process.

b. If the OnPageAccessDenied event handler does not handle the login process, the dispatcher forwards the request to the login page specified by the end user adapter's LoginPage property.

3. If a login is not required (either because the caller already logged in or because there is no need to log in), the dispatcher generates an OnCanViewPage event. This event can validate a caller that has logged in, or provide any other type of validation that governs access to the requested page.
4. If there is no OnCanViewPage event handler, or if the OnCanViewPage event handler does not handle the validation, the dispatcher calls on a TEndUserAdapter component to check the user's access rights.

   Tip: To access the Web request and response objects from within an OnCanViewPage event handler, call the global WebContext function to access the Web context and read its Request and Response properties. To access information about the access rights that the target page requires, call the Web context's FindPageInfo method to obtain a Web page info object for the target page and check its ViewAccess property.

Request (see page 5974)

Response (see page 5975)

ViewAccess

FindPageInfo (see page 5966)

60.1.15.3.4 TPageDispatcher.OnIsLoginRequired Event

Occurs when a request arrives from a caller that has not yet logged in.

Pascal

```
property OnIsLoginRequired: TLoginRequiredEvent;
```

C++

```
__property TLoginRequiredEvent OnIsLoginRequired;
```

Description

Write an OnIsLoginRequired event handler to customize the way the WebSnap application determines whether a caller must log in before obtaining access to a requested page. This event occurs after the OnBeforeDispatchPage event if the caller has not already logged in to the WebSnap application.

If there is no OnPageAccessDenied event handler, or if the OnPageAccessDenied event handler does not handle the login process, the dispatcher obtains a response message from the login page specified by the end user adapter.

See Also

OnCanViewPage (see page 6198)

OnBeforeDispatchPage (see page 6197)

OnPageAccessDenied (see page 6200)

LoginPage (see page 5516)

60.1.15.3.5 TPageDispatcher.OnPageAccessDenied Event

Occurs when the page dispatcher fails to validate the caller's right to access a requested Web page.

Pascal

```
property OnPageAccessDenied: TPageAccessDeniedEvent;
```

C++

```
__property TPageAccessDeniedEvent OnPageAccessDenied;
```

Description

Write an OnPageAccessDenied event handler to customize the response when a request for a specific Web page fails to be validated.

Tip: To access the Web request and response objects from within an OnPageAccessDenied event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

See Also

OnIsLoginRequired (see page 6199)

OnCanViewPage (see page 6198)

WebContext (see page 6003)

Request (see page 5974)

Response (see page 5975)

LoginPage (see page 5516)

60.1.15.3.6 TPageDispatcher.OnPageNotFound Event

Occurs when the dispatcher can't locate a registered Web page module with the name specified in an HTTP request message.

Pascal

```
property OnPageNotFound: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnPageNotFound;
```

Description

Write an OnPageNotFound event handler to generate a response when the dispatcher can't locate the Web page module to which an HTTP request message is addressed. For example, an OnPageNotFound event handler can provide the response object with content that indicates that the requested page does not exist or that represents simple content for a page that does not have an associated Web page module.

If the OnPageNotFound event handler sets its Handled parameter to true, the page dispatcher assumes it has updated the response message and returns it. If the OnPageNotFound leaves the Handled parameter set to false, the dispatcher raises an EPageDispatcherException exception after the event handler exits.

Tip: To access the Web request and response objects from within an OnPageNotFound event handler, call the global WebContext function to access the Web context and read its Request and Response properties.

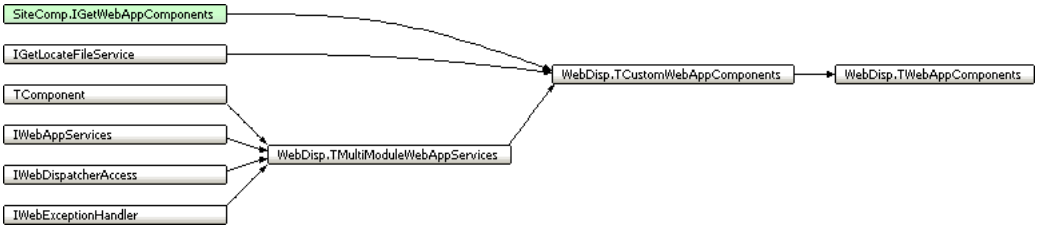
60.1.16 TWebAppComponents Class

TWebAppComponents holds the application components that provide the WebSnap application's functionality.

Class Hierarchy



Pascal

```
TWebAppComponents = class(TCustomWebAppComponents);
```

C++

```
class TWebAppComponents : public TCustomWebAppComponents;
```

File

WebDisp

Description

Use TWebAppComponents to centralize access to the main WebSnap components. It initializes the Web context for new request messages and locates the appropriate components to handle the request message. TWebAppComponents publishes properties that provide access to the components that perform many common tasks in a WebSnap application. These properties include

PageDispatcher (see page 6248), which locates the Web page modules to process incoming request messages.

AdapterDispatcher (see page 6245), which encodes calls to adapter actions and fields, and which handles HTML form submissions and requests for dynamic images by calling adapter actions and fields.

Sessions (see page 6248), which manages the sessions for each caller.

ApplicationAdapter (see page 6246), which implements the fields and actions of the Application variable in server-side scripts.

EndUserAdapter (see page 6247), which implements the fields and actions of the EndUser variable in server-side scripts.

UserListService (see page 6249), which maintains a list of end users and their passwords and access privileges.

LocateFileService (see page 6247), which controls access to the templates and server-side script include files that are used while processing requests.

DispatchActions (see page 6246), which maintains a list of action items that can respond to request messages.

The components these properties reference are optional. The WebSnap Application wizard automatically creates components and fills in these properties for any components that you select.

Add TWebAppComponents to the application module of the WebSnap application to provide centralized access to the other components that govern the behavior of the WebSnap application.

60.1.16.1 TWebAppComponents Members

The following tables list the members exposed by TWebAppComponents.

Protected Methods

	Name	Description
	Access_Request (see page 6225)	Returns the value of the Access_Request property.
	Access_Response (see page 6225)	Returns the value of the Access_Response property.
V	CreateContext (see page 6204)	Creates the Web context for the current request message.
V	CreateContext (see page 6225)	Creates the Web context for the current request message.
	DoAfterDispatch (see page 6226)	Generates an OnAfterDispatch (see page 6235) event.
	DoBeforeDispatch (see page 6226)	Generates an OnBeforeDispatch (see page 6235) event.
V	DoneModule (see page 6227)	Performs any final tasks before deactivating a Web module.
	FinishContext (see page 6227)	Performs any final tasks after the WebSnap application has finished processing a request.
	GetAdapterDispatcher (see page 6205)	Returns the value of the AdapterDispatcher (see page 6211) property.
	GetExceptionHandler (see page 6228)	Returns the object that handles exceptions that arise in the WebSnap application.
	GetLocateFileService (see page 6205)	Returns the value of the LocateFileService (see page 6213) property.
	GetPageDispatcher (see page 6205)	Returns the value of the PageDispatcher (see page 6214) property.
	GetWebApplicationInfo (see page 6206)	Returns the value of the ApplicationAdapter (see page 6212) property.
	GetWebEndUser (see page 6206)	Returns the value of the EndUserAdapter (see page 6213) property.
	GetWebUserList (see page 6206)	Returns the value of the UserListService (see page 6215) property.
	HandleException (see page 6228)	Responds to any exceptions not caught by the WebSnap application.
	HandleRequest (see page 6229)	Directs the processing of the current request message.
V	ImplFinishContext (see page 6207)	Provides the underlying implementation of the FinishContext (see page 6227) method.
V	ImplFinishContext (see page 6229)	Provides the underlying implementation of the FinishContext (see page 6227) method.
V	ImplHandleException (see page 6207)	Provides the underlying implementation of the HandleException (see page 6228) method.
V	ImplHandleException (see page 6230)	Provides the underlying implementation of the HandleException (see page 6228) method.
V	ImplHandleRequest (see page 6208)	Provides the underlying implementation for the HandleRequest (see page 6229) method.
V	ImplHandleRequest (see page 6230)	Provides the underlying implementation for the HandleRequest (see page 6229) method.
V	ImplInitContext (see page 6208)	Provides the underlying implementation for the InitContext (see page 6231) method.
V	ImplInitContext (see page 6231)	Provides the underlying implementation for the InitContext (see page 6231) method.
	InitContext (see page 6231)	Creates and initializes the Web context for the current Web request.
V	InitModule (see page 6209)	Initializes a Web module before the WebSnap application uses it to handle the current request.
V	InitModule (see page 6232)	Initializes a Web module before the WebSnap application uses it to handle the current request.
V	InitModules (see page 6210)	Initializes all the currently active Web modules.
V	InitModules (see page 6233)	Initializes all the currently active Web modules.
V	ListRequestHandlers (see page 6210)	Fills an interface list with the interfaces of all dispatcher components in the WebSnap application.
	ModuleAdded (see page 6233)	Initializes a Web module when it is activated while processing the current request.
V	Notification (see page 6211)	Updates the TCustomWebAppComponents (see page 6201) properties when components are added to or removed from the application.

Protected Properties

	Name	Description
R	Request (see page 6234)	Provides access to the current request object.
R	Response (see page 6234)	Provides access to the current response object.

	WebModules (see page 6234)	Lists the Web modules available in the WebSnap application.

Public Methods

	Name	Description
	GetAdapterDispatcher (see page 1038)	This is GetAdapterDispatcher, a member of class IGetWebAppComponents.
	GetLocateFileService (see page 1038)	This is GetLocateFileService, a member of class IGetWebAppComponents.
	GetPageDispatcher (see page 1038)	This is GetPageDispatcher, a member of class IGetWebAppComponents.
	GetWebApplicationInfo (see page 1038)	This is GetWebApplicationInfo, a member of class IGetWebAppComponents.
	GetWebEndUser (see page 1039)	This is GetWebEndUser, a member of class IGetWebAppComponents.
	GetWebUserList (see page 1039)	This is GetWebUserList, a member of class IGetWebAppComponents.

Public Properties

	Name	Description
	WebApplicationInfo (see page 1039)	This is WebApplicationInfo, a member of class IGetWebAppComponents.
	WebEndUser (see page 1040)	This is WebEndUser, a member of class IGetWebAppComponents.

Published Events

	Name	Description
	OnAfterDispatch (see page 6249)	Occurs after the WebSnap application generates the content of a response message.
	OnBeforeDispatch (see page 6250)	Occurs before TMultiModuleWebAppServices passes an HTTP request onto the other components in the application for processing.
	OnException (see page 6250)	Occurs when an exception escapes all try blocks in the WebSnap application.

Published Properties

	Name	Description
	AdapterDispatcher (see page 6245)	Provides access to the current adapter dispatcher object.
	ApplicationAdapter (see page 6246)	Provides access to the application adapter.
	DispatchActions (see page 6246)	Provides access to an action-based Web dispatcher.
	EndUserAdapter (see page 6247)	Provides access to an end-user adapter.
	LocateFileService (see page 6247)	Provides access to the file location service.
	PageDispatcher (see page 6248)	Provides access to the current page dispatcher object.
	Sessions (see page 6248)	Provides access to the sessions service.
	UserListService (see page 6249)	Provides access to the file location service.

60.1.16.2 TWebAppComponents Properties

The properties of the TWebAppComponents class are listed here.

Published Properties

	Name	Description
	AdapterDispatcher (see page 6245)	Provides access to the current adapter dispatcher object.
	ApplicationAdapter (see page 6246)	Provides access to the application adapter.
	DispatchActions (see page 6246)	Provides access to an action-based Web dispatcher.
	EndUserAdapter (see page 6247)	Provides access to an end-user adapter.
	LocateFileService (see page 6247)	Provides access to the file location service.
	PageDispatcher (see page 6248)	Provides access to the current page dispatcher object.
	Sessions (see page 6248)	Provides access to the sessions service.
	UserListService (see page 6249)	Provides access to the file location service.

60.1.16.2.1 TWebAppComponents.AdapterDispatcher Property

Provides access to the current adapter dispatcher object.

Pascal

```
property AdapterDispatcher: IAdapterDispatcher;
```

C++

```
__property IAdapterDispatcher AdapterDispatcher;
```

Description

Use AdapterDispatcher to get or set the interface of the adapter dispatcher. The adapter dispatcher is responsible for encoding the hidden fields and HREF values that represent calls to adapter fields and actions, and for interpreting the fields in incoming requests by calling adapters to execute their actions or to fetch image field values.

Typically, AdapterDispatcher is the interface of a TAdapterDispatcher object. If the WebSnap application does not include a TAdapterDispatcher component, or some other component that implements the IAdapterDispatcher interface, the value of this property is nil (Delphi) or NULL (C++). When AdapterDispatcher is nil (Delphi) or NULL (C++), the WebSnap application can't execute adapter actions or fetch image fields from adapters.

See Also

TAdapterDispatcher (see page 6148)

DispatchActions (see page 6212)

60.1.16.2.2 TWebAppComponents.ApplicationAdapter Property

Provides access to the application adapter.

Pascal

```
property ApplicationAdapter: IWebApplicationInfo;
```

C++

```
__property IWebApplicationInfo ApplicationAdapter;
```

Description

Use ApplicationAdapter to get or set the interface of the application adapter. The application adapter implements the fields and actions of the Application variable in server-side scripts.

Typically, ApplicationAdapter is the interface of a TApplicationAdapter object. If the WebSnap application does not include a TApplicationAdapter component, or some other component that implements the IWebApplicationInfo interface, the value of this property is nil (Delphi) or NULL (C++). When ApplicationAdapter is nil (Delphi) or NULL (C++), the WebSnap application can't use the Application variable in server-side scripts.

See Also

TApplicationAdapter (see page 5439)

60.1.16.2.3 TWebAppComponents.DispatchActions Property

Provides access to an action-based Web dispatcher.

Pascal

```
property DispatchActions: IWebDispatchActions;
```

C++

```
__property IWebDispatchActions DispatchActions;
```

Description

Read DispatchActions to determine whether the WebSnap application contains a Web dispatcher. A Web dispatcher maintains a list of action items that respond to incoming request messages. Web dispatchers can appear in both WebSnap and Web broker applications.

The IWebDispatchActions interface that is the value of DispatchActions does nothing special other than identify its component as a Web dispatcher. You can, however, use this interface to obtain other interfaces that belong to the Web dispatcher.

Typically, DispatchActions is the interface of a TWebDispatcher object. If the WebSnap application does not include a TWebDispatcher component, or some other component that implements the IWebDispatchActions interface, the value of this property is nil (Delphi) or NULL (C++).

See Also

TWebModule

TWebDispatcher

60.1.16.2.4 TWebAppComponents.EndUserAdapter Property

Provides access to an end-user adapter.

Pascal

```
property EndUserAdapter: IWebEndUser;
```

C++

```
__property IWebEndUser EndUserAdapter;
```

Description

Use EndUserAdapter to get or set the interface of the end user adapter. An end user adapter maintains information about the current end user, and supports the actions for logging users in and out. End user adapters implement the fields and actions of the EndUser variable in server-side scripts.

Typically, EndUserAdapter is the interface of a TEndUserAdapter or TEndUserSessionAdapter object. If the WebSnap application does not include a component that implements the IWebEndUser interface, the value of this property is nil (Delphi) or NULL (C++). When EndUserAdapter is nil (Delphi) or NULL (C++), the WebSnap application can't use the EndUser variable in server-side scripts or take advantage of the login support that end user adapters provide.

See Also

TEndUserAdapter (see page 5764)

TEndUserSessionAdapter (see page 5792)

60.1.16.2.5 TWebAppComponents.LocateFileService Property

Provides access to the file location service.

Pascal

```
property LocateFileService: ILocateFileService;
```

C++

```
__property ILocateFileService LocateFileService;
```

Description

Use LocateFileService to get or set the interface of the file location service. The file location service controls access to the

templates and server-side script include files that are used while processing requests.

Typically, LocateFileService is the interface of a TLocateFileService object. If the WebSnap application does not include a component that implements the ILocateFileService interface, the value of this property is nil (Delphi) or NULL (C++). When LocateFileService is nil (Delphi) or NULL (C++), the WebSnap application can still use template files and include files, but you have less control over how the application locates these files (that is, they must reside in the current directory or references to them must be qualified).

See Also

TLocateFileService (see page 6220)

60.1.16.2.6 TWebAppComponents.PageDispatcher Property

Provides access to the current page dispatcher object.

Pascal

```
property PageDispatcher: IPageDispatcher;
```

C++

```
__property IPageDispatcher PageDispatcher;
```

Description

Use PageDispatcher to get or set the interface of the page dispatcher. The page dispatcher is responsible for interpreting requests for specific Web pages, checking the access rights for requested Web pages, and dispatching Web page requests to the appropriate Web page module.

Typically, PageDispatcher is the interface of a TPageDispatcher object. If the WebSnap application does not include a TPageDispatcher component, or some other component that implements the IPageDispatcher interface, the value of this property is nil (Delphi) or NULL (C++). When PageDispatcher is nil (Delphi) or NULL (C++), the WebSnap application does not automatically generate Web page content in response to requests that give the Web page name in their target URL.

See Also

TPageDispatcher (see page 6236)

AdapterDispatcher (see page 6211)

60.1.16.2.7 TWebAppComponents.Sessions Property

Provides access to the sessions service.

Pascal

```
property Sessions: ISessionsService;
```

C++

```
__property ISessionsService Sessions;
```

Description

Use Sessions to get or set the interface of the sessions service. The sessions service maintains Web sessions so that the WebSnap application can store temporary information about an end user.

Typically, Sessions is the interface of a TSessionsService object. If the WebSnap application does not include a component that implements the ISessionsService interface, the value of this property is nil (Delphi) or NULL (C++). When Sessions is nil (Delphi) or NULL (C++), the WebSnap application can't use Web sessions to store named information about the current end user.

See Also

TSessionsService (see page 6756)

60.1.16.2.8 TWebAppComponents.UserListService Property

Provides access to the file location service.

Pascal

```
property UserListService: IWebUserList;
```

C++

```
__property IWebUserList UserListService;
```

Description

Use UserListService to get or set the interface of the user list service. The user list service maintains a list of user names, passwords, and access rights. Using this information, it can validate logins and check a user's access rights.

Typically, UserListService is the interface of a TWebUserList object. If the WebSnap application does not include a component that implements the IWebUserList interface, the value of this property is nil (Delphi) or NULL (C++). When UserListService is nil (Delphi) or NULL (C++), the WebSnap application can still allow users to log in and check access rights, but the support for this must be coded using event handlers on the page dispatcher.

See Also

TWebUserList (see page 6796)

TPageDispatcher (see page 6236)

60.1.16.3 TWebAppComponents Events

The events of the TWebAppComponents class are listed here.

Published Events

	Name	Description
	OnAfterDispatch (see page 6249)	Occurs after the WebSnap application generates the content of a response message.
	OnBeforeDispatch (see page 6250)	Occurs before TMultiModuleWebAppServices passes an HTTP request onto the other components in the application for processing.
	OnException (see page 6250)	Occurs when an exception escapes all try blocks in the WebSnap application.

60.1.16.3.1 TWebAppComponents.OnAfterDispatch Event

Occurs after the WebSnap application generates the content of a response message.

Pascal

```
property OnAfterDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnAfterDispatch;
```

Description

Write an AfterDispatch event handler to perform any final actions before sending a response back to the Web browser that sent the WebSnap application a request. OnAfterDispatch occurs after the other components in the WebSnap application have attempted to generate a response for the current request. It does not occur if the response message has already been sent back

to the caller.

If the AfterDispatch event handler sets the Handled parameter to true, the WebSnap application sends the response back to the caller after the event handler exits. If it sets the Handled parameter to false, the WebSnap application does not send the response message.

Note: Although TMultiModuleWebAppServices introduces the OnAfterDispatch event, it never calls the event handler. Descendant classes add the code to generate this event after dispatching a request message.

See Also

OnBeforeDispatch (see page 6235)

60.1.16.3.2 TWebAppComponents.OnBeforeDispatch Event

Occurs before TMultiModuleWebAppServices passes an HTTP request onto the other components in the application for processing.

Pascal

```
property OnBeforeDispatch: THTTPMethodEvent;
```

C++

```
__property THTTPMethodEvent OnBeforeDispatch;
```

Description

Write an OnBeforeDispatch event handler to initialize the response to an HTTP request or to handle any messages that the other components in the WebSnap application can't handle. If the event handler completely handles the request, filling out the response object so that it is ready to send, it should set the Handled parameter to true, thereby preventing this component from trying to locate a component in the WebSnap application that can handle the message.

Note: Although TMultiModuleWebAppServices introduces the OnBeforeDispatch event, it never calls the event handler. Descendant classes add the code to generate this event before dispatching a request message.

See Also

OnAfterDispatch (see page 6235)

60.1.16.3.3 TWebAppComponents.OnException Event

Occurs when an exception escapes all try blocks in the WebSnap application.

Pascal

```
property OnException: TWebExceptionEvent;
```

C++

```
__property TWebExceptionEvent OnException;
```

Description

Write an OnException event handler respond to exceptions that arise while processing a request message. OnException occurs when an exception is not caught by the components that process the request message. If the OnException event handler does not handle the exception, TCustomWebAppComponents updates the response message so that it describes the exception to the caller.

See Also

OnAfterDispatch (see page 6235)

60.1.17 TWebSession Class

TWebSession stores temporary information associated with the user in a WebSnap application.

Class Hierarchy

Pascal

```
TWebSession = class(TAbstractWebSession, IWebSessionAccess);
```

C++

```
class TWebSession : public TAbstractWebSession, public IWebSessionAccess;
```

File

WebDisp

Description

TWebSession represents an active Web session. Use its Values property to get or set application-specific information about the current user. If your application uses sessions to store user information, you need to include a TSessionsService component in the Web application module.

A Web session stores information that persists over multiple calls from the same user. This information is stored as a set of Variant (see page 3421) values that are indexed by name. You can use these named Variants (see page 4973) to store application-defined information that is associated with a single user.

There is no need to instantiate session objects. A Session is created automatically when the WebSnap application receives an HTTP request message. The new session is given a unique identifier, which is added (in a cookie) to response messages, so that the same session can be used for subsequent requests from the same caller. The session persists until either the user logs out, a specified time elapses with no request messages from the caller, or the application explicitly calls the session's Terminate (see page 6255) method.

See Also

TSessionsService (see page 6756)

TAbstractWebContext (see page 5960)

TInvalidWebSession (see page 6216)

60.1.17.1 TWebSession Members

The following tables list the members exposed by TWebSession.

Protected Methods

	Name	Description
	GetSessionID (see page 6253)	Returns the value of the SessionID property.
	GetTimeoutMinutes (see page 6253)	Returns the value of the TimeoutMinutes property.
	GetValue (see page 6254)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 6254)	Sets the value of the TimoutMinutes property.
	SetValue (see page 6254)	Assigns a value to a specified name.

Public Methods

	Name	Description
	Create (see page 6252)	This is the overview for the Create constructor overload.
	GetSessionsService (see page 6258)	This is GetSessionsService, a member of class IWebSessionAccess.
	GetWebSession (see page 6258)	This is GetWebSession, a member of class IWebSessionAccess.
V	Terminate (see page 6255)	Terminates the session.
V	UpdateResponse (see page 6255)	Adds the session ID to a cookie in a response message.

60.1.17.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TWebSession.Create (ISessionsService, TSessionID) (see page 6252)	This is Create, a member of class TWebSession.
	TWebSession.Create (ISessionsService, TWebRequest, TWebResponse) (see page 6252)	This is Create, a member of class TWebSession.

60.1.17.2.1 TWebSession.Create Constructor (ISessionsService, TSessionID)

Pascal

```
constructor Create(ASessions: ISessionsService; AID: TSessionID); overload;
```

C++

```
__fastcall TWebSession(ISessionsService ASessions, TSessionID AID);
```

Description

This is Create, a member of class TWebSession.

60.1.17.2.2 TWebSession.Create Constructor (ISessionsService, TWebRequest, TWebResponse)

Pascal

```
constructor Create(ASessions: ISessionsService; ARequest: TWebRequest; AResponse:
TWebResponse); overload;
```

C++

```
__fastcall TWebSession(ISessionsService ASessions, TWebRequest ARequest, TWebResponse
AResponse);
```

Description

This is Create, a member of class TWebSession.

60.1.17.3 TWebSession Methods

The methods of the TWebSession class are listed here.

Protected Methods

	Name	Description
	GetSessionID (see page 6253)	Returns the value of the SessionID property.
	GetTimeoutMinutes (see page 6253)	Returns the value of the TimeoutMinutes property.
	GetValue (see page 6254)	Returns the value associated with a specified name.
	SetTimeoutMinutes (see page 6254)	Sets the value of the TimoutMinutes property.
	SetValue (see page 6254)	Assigns a value to a specified name.

Public Methods

	Name	Description
	Terminate (see page 6255)	Terminates the session.
	UpdateResponse (see page 6255)	Adds the session ID to a cookie in a response message.

60.1.17.3.1 TWebSession.GetSessionID Method

Returns the value of the SessionID property.

Pascal

```
function GetSessionID: string; override;
```

C++

```
virtual __fastcall UnicodeString GetSessionID();
```

Description

GetSessionID is the protected read implementation of the SessionID property.

In TAbstractWebSession, GetSessionID is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the SessionID property.

See Also

SessionID

60.1.17.3.2 TWebSession.GetTimeoutMinutes Method

Returns the value of the TimeoutMinutes property.

Pascal

```
function GetTimeoutMinutes: Integer; override;
```

C++

```
virtual __fastcall int GetTimeoutMinutes();
```

Description

GetTimeoutMinutes is the protected read implementation of the TimeoutMinutes property.

In TAbstractWebSession, GetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes property.

See Also

TimeoutMinutes

SetTimeoutMinutes

60.1.17.3.3 TWebSession.GetValue Method

Returns the value associated with a specified name.

Pascal

```
function GetValue(const AName: string): Variant; override;
```

C++

```
virtual __fastcall Variant GetValue(const UnicodeString AName);
```

Description

GetValue is the protected read implementation of the Values property.

AName is the name of the value to return.

In TAbstractWebSession, GetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values property.

See Also

Values

SetValue

60.1.17.3.4 TWebSession.SetTimeoutMinutes Method

Sets the value of the TimoutMinutes property.

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer); override;
```

C++

```
virtual __fastcall SetTimeoutMinutes(int AValue);
```

Description

SetTimeoutMinutes is the protected write implementation of the TimeoutMinutes property.

AValue is the number of minutes that can elapse before the session terminates itself.

In TAbstractWebSession, SetTimeoutMinutes is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the TimeoutMinutes property.

See Also

GetTimeoutMinutes

TimeoutMinutes

60.1.17.3.5 TWebSession.SetValue Method

Assigns a value to a specified name.

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant); override;
```

C++

```
virtual __fastcall SetValue(const UnicodeString AName, const Variant AValue);
```

Description

SetValue is the protected write implementation of the Value property.

AName is the name of the value to store.

AValue is the value to store under the specified name.

In TAbstractWebSession, SetValue is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to provide an implementation for the Values property.

See Also

GetValue

Values

60.1.17.3.6 TWebSession.Terminate Method

Terminates the session.

Pascal

```
procedure Terminate; override;
```

C++

```
virtual __fastcall Terminate();
```

Description

Call Terminate to explicitly terminate a session. Once a session has been terminated, the application can no longer access its Values.

Sessions are terminated automatically when the application does not receive any requests for the session for TimoutMinutes minutes.

See Also

TimeoutMinutes

Values

60.1.17.3.7 TWebSession.UpdateResponse Method

Adds the session ID to a cookie in a response message.

Pascal

```
procedure UpdateResponse(AResponse: TWebResponse); override;
```

C++

```
virtual __fastcall UpdateResponse(TWebResponse AResponse);
```

Description

Call UpdateResponse to add the value of the SessionID property to one of the response message's cookies. This allows the user's next request message to use the Values stored in this session.

AResponse is the Web response message to which a cookie with the session ID should be added.

See Also

SessionID

Values

60.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebSessionAccess (see page 6257)	This is class WebDisp.IWebSessionAccess.

60.2.1 IWebSessionAccess Interface

Class Hierarchy

WebDisp.IWebSessionAccess

Pascal

```
IWebSessionAccess = interface;
```

C++

```
__interface IWebSessionAccess;
```

File

WebDisp

Description

This is class WebDisp.IWebSessionAccess.

60.2.1.1 IWebSessionAccess Members

The following tables list the members exposed by IWebSessionAccess.

Public Methods

	Name	Description
	GetSessionsService (see page 6258)	This is GetSessionsService, a member of class IWebSessionAccess.
	GetWebSession (see page 6258)	This is GetWebSession, a member of class IWebSessionAccess.

60.2.1.2 IWebSessionAccess Methods

The methods of the IWebSessionAccess class are listed here.

Public Methods

	Name	Description
	GetSessionsService (see page 6258)	This is GetSessionsService, a member of class IWebSessionAccess.
	GetWebSession (see page 6258)	This is GetWebSession, a member of class IWebSessionAccess.

60.2.1.2.1 IWebSessionAccess.GetSessionsService Method

Pascal

```
function GetSessionsService: ISessionsService;
```

C++

```
__fastcall ISessionsService GetSessionsService();
```

Description

This is GetSessionsService, a member of class IWebSessionAccess.

60.2.1.2.2 IWebSessionAccess.GetWebSession Method

Pascal

```
function GetWebSession: IWebSession;
```

C++

```
__fastcall IWebSession GetWebSession();
```

Description

This is GetWebSession, a member of class IWebSessionAccess.

60.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AdapterRequestParamsAsStrings (see page 6259)	This is function WebDisp.AdapterRequestParamsAsStrings.
	DispatchPageName (see page 6259)	This is function WebDisp.DispatchPageName.
	EncodeParamNameValues (see page 6260)	This is function WebDisp.EncodeParamNameValues.
	EncodeParamsAsHTTPQuery (see page 6260)	This is function WebDisp.EncodeParamsAsHTTPQuery.
	ExpandScriptException (see page 6260)	This is function WebDisp.ExpandScriptException.
	ExtractParamNameValues (see page 6261)	This is function WebDisp.ExtractParamNameValues.
	FindDefaultAppPageName (see page 6261)	This is function WebDisp.FindDefaultAppPageName.
	PageNameOfRequest (see page 6261)	This is function WebDisp.PageNameOfRequest.
	RaiseDispatchBlankPageNameException (see page 6262)	This is function WebDisp.RaiseDispatchBlankPageNameException.
	RaisePageDoesNotProvideContent (see page 6262)	This is function WebDisp.RaisePageDoesNotProvideContent.
	RaisePageNotFound (see page 6262)	This is function WebDisp.RaisePageNotFound.
	RedirectToPageName (see page 6263)	This is function WebDisp.RedirectToPageName.
	RegisterAdapterRequestIdentifier (see page 6263)	This is function WebDisp.RegisterAdapterRequestIdentifier.
	SafeRedirect (see page 6263)	Redirects a browser to another specified page.

60.3.1 WebDisp.AdapterRequestParamsAsStrings Function

Pascal

```
function AdapterRequestParamsAsStrings(AAdapterRequest: IUnknown): TStrings;
```

C++

```
TStrings AdapterRequestParamsAsStrings(IUnknown AAdapterRequest);
```

File

WebDisp

Description

This is function WebDisp.AdapterRequestParamsAsStrings.

60.3.2 WebDisp.DispatchPageName Function

Pascal

```
function DispatchPageName(const APageName: string; AResponse: TWebResponse; AFlags:
TDispatchPageFlags): Boolean;
```

C++

```
Boolean DispatchPageName(const UnicodeString APageName, TWebResponse AResponse,
TDispatchPageFlags AFlags);
```

File

WebDisp

Description

This is function WebDisp.DispatchPageName.

60.3.3 WebDisp.EncodeParamNameValues Function

Pascal

```
function EncodeParamNameValues(ParamValues: TStrings): string;
```

C++

```
UnicodeString EncodeParamNameValues(TStrings ParamValues);
```

File

WebDisp

Description

This is function WebDisp.EncodeParamNameValues.

60.3.4 WebDisp.EncodeParamsAsHTTPQuery Function

Pascal

```
function EncodeParamsAsHTTPQuery(AParams: TStrings): string;
```

C++

```
UnicodeString EncodeParamsAsHTTPQuery(TStrings AParams);
```

File

WebDisp

Description

This is function WebDisp.EncodeParamsAsHTTPQuery.

60.3.5 WebDisp.ExpandScriptException Function

Pascal

```
function ExpandScriptException(E: EScriptError): string;
```

C++

```
UnicodeString ExpandScriptException(EScriptError E);
```

File

WebDisp

Description

This is function WebDisp.ExpandScriptException.

60.3.6 WebDisp.ExtractParamNameValues Function

Pascal

```
procedure ExtractParamNameValues(const AParam: string; AList: TStrings);
```

C++

```
ExtractParamNameValues(const UnicodeString AParam, TStrings AList);
```

File

WebDisp

Description

This is function WebDisp.ExtractParamNameValues.

60.3.7 WebDisp.FindDefaultAppPageName Function

Pascal

```
function FindDefaultAppPageName: string;
```

C++

```
UnicodeString FindDefaultAppPageName();
```

File

WebDisp

Description

This is function WebDisp.FindDefaultAppPageName.

60.3.8 WebDisp.PageNameOfRequest Function

Pascal

```
function PageNameOfRequest(ARequest: TWebRequest): string;
```

C++

```
UnicodeString PageNameOfRequest(TWebRequest ARequest);
```

File

WebDisp

Description

This is function WebDisp.PageNameOfRequest.

60.3.9 WebDisp.RaiseDispatchBlankPageNameException Function

Pascal

```
procedure RaiseDispatchBlankPageNameException;
```

C++

```
RaiseDispatchBlankPageNameException();
```

File

WebDisp

Description

This is function WebDisp.RaiseDispatchBlankPageNameException.

60.3.10 WebDisp.RaisePageDoesNotProvideContent Function

Pascal

```
procedure RaisePageDoesNotProvideContent(const APageName: string);
```

C++

```
RaisePageDoesNotProvideContent(const UnicodeString APageName);
```

File

WebDisp

Description

This is function WebDisp.RaisePageDoesNotProvideContent.

60.3.11 WebDisp.RaisePageNotFound Function

Pascal

```
procedure RaisePageNotFound(const APageName: string);
```

C++

```
RaisePageNotFound(const UnicodeString APageName);
```

File

WebDisp

Description

This is function WebDisp.RaisePageNotFound.

60.3.12 WebDisp.RedirectToPageName Function

Pascal

```
function RedirectToPageName(const APageName: string; AParams: TStrings; AResponse:
TWebResponse; AFlags: TDispatchPageFlags): Boolean;
```

C++

```
Boolean RedirectToPageName(const UnicodeString APageName, TStrings AParams, TWebResponse
AResponse, TDispatchPageFlags AFlags);
```

File

WebDisp

Description

This is function WebDisp.RedirectToPageName.

60.3.13 WebDisp.RegisterAdapterRequestIdentifier Function

Pascal

```
procedure RegisterAdapterRequestIdentifier(const AIdentifier: string);
```

C++

```
RegisterAdapterRequestIdentifier(const UnicodeString AIdentifier);
```

File

WebDisp

Description

This is function WebDisp.RegisterAdapterRequestIdentifier.

60.3.14 WebDisp.SafeRedirect Function

Redirects a browser to another specified page.

Pascal

```
procedure SafeRedirect(AResponse: TWebResponse; const AURL: string);
```

C++

```
SafeRedirect(TWebResponse AResponse, const UnicodeString AURL);
```

File

WebDisp

Description

Use the SafeRedirect function to send a response which redirects a Web browser to another page. AResponse is the response object which will send the redirect. AURL is the URL for the page that the browser is being redirected to.

SafeRedirect differs from other redirect methods (such as an override of TWebResponse (see page 6276)'s SendRedirect method) in that it allows browsers to accept cookies. Other redirect methods don't allow cookies to be set during a redirect.

60.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TPageAccessDenied (see page 6265)	TPageAccessDenied indicates why a user was denied access to a requested Web page.

60.4.1 WebDisp.TPageAccessDenied Enumeration

TPageAccessDenied indicates why a user was denied access to a requested Web page.

Pascal

```
TPageAccessDenied = (
  adLoginRequired,
  adCantView
);
```

C++

```
enum TPageAccessDenied {
  adLoginRequired,
  adCantView
};
```

File

WebDisp

Description

The following table describes the possible values:

Value	Meaning
adLoginRequired	The caller has not logged in and the page specified by PageName requires a login. If the OnPageAccessDenied event handler does not set Handled to true, the dispatcher obtains a response message from the page specified by the end user adapter's LoginPage property. If the application does not include an end user adapter, or if that adapter does not specify a login page, the dispatcher raises an EPageDispatcherException (see page 6147) exception.
adCantView	The caller was denied access to the page by an OnCanViewPage event or because the caller's access rights do not match those required by the target Web page module. If the OnPageAccessDenied event handler does not set Handled to true, the dispatcher raises an EPageDispatcherException (see page 6147) exception.

60.5 Types

The following table lists types in this documentation.

Types

Name	Description
TActivateWebModuleEvent (see page 6266)	This is type WebDisp.TActivateWebModuleEvent.
TCanViewPageEvent (see page 6267)	TCanViewPageEvent is the type for event handlers that indicate whether the current user can view a specified Web page.
TDispatchActionEvent (see page 6267)	TDispatchActionEvent is the type for event handlers that respond when an adapter action executes.
TDispatchActionHandledEvent (see page 6268)	TDispatchActionHandledEvent is the type for event handlers that can handle requests to execute an adapter action.
TDispatchImageEvent (see page 6269)	TDispatchImageEvent is the type for event handlers that respond when an adapter action gets a request for an image field value.
TDispatchImageHandledEvent (see page 6269)	TDispatchImageHandledEvent is the type for event handlers that can handle requests for an image field value.
TDispatchPageEvent (see page 6270)	TDispatchPageEvent is the type for event handlers that are called after a Web page module finishes handling an HTTP request.
TDispatchPageHandledEvent (see page 6270)	TDispatchPageHandledEvent is the type for event handlers that can handle HTTP request messages.
TDispatchPageParamsHandledEvent (see page 6271)	TDispatchPageParamsHandledEvent is the type for event handlers that are called before a WebSnap application assembles a response message redirecting the caller to another Web page.
TGetAdapterRequestParamsEvent (see page 6272)	TGetAdapterRequestParamsEvent is the type for event handlers that retrieve parameters for an adapter dispatcher.
TLocateFileServiceFindFileEvent (see page 6273)	TLocateFileServiceFindFileEvent is the type for event handlers that locates a file on disk in a WebSnap application.
TLocateFileServiceFindStreamEvent (see page 6273)	TLocateFileServiceFindStreamEvent is the type for event handlers that provide access to a requested file.
TLoginPagedHandledEvent (see page 6274)	This is type WebDisp.TLoginPagedHandledEvent.
TLoginRequiredEvent (see page 6274)	TLoginRequiredEvent is the type for event handlers that indicate whether the current user must log in before accessing a specified Web page.
TPageAccessDeniedEvent (see page 6275)	TPageAccessDeniedEvent is the type for event handlers that respond when a page dispatcher determines that the current user can't access the current page.
TWebRequest (see page 6276)	This is type WebDisp.TWebRequest.
TWebResponse (see page 6276)	This is type WebDisp.TWebResponse.

60.5.1 WebDisp.TActivateWebModuleEvent Type

Pascal

```
TActivateWebModuleEvent = procedure (Sender: TObject; WebModule: TComponent) of object;
```

C++

```
(Sender: TObject; WebModule: TComponent) ( TActivateWebModuleEvent)();
```

File

WebDisp

Description

This is type WebDisp.TActivateWebModuleEvent.

60.5.2 WebDisp.TCanViewPageEvent Type

TCanViewPageEvent is the type for event handlers that indicate whether the current user can view a specified Web page.

Pascal

```
TCanViewPageEvent = procedure (Sender: TObject; const PageName: string; var CanView: Boolean;
var AHandled: Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; var CanView: Boolean; var AHandled: Boolean) (
TCanViewPageEvent)();
```

File

WebDisp

Description

TCanViewPageEvent is the type for event handlers of a page dispatcher that indicate whether a request can be forwarded to a Web page module.

Sender is the page dispatcher that is validating a request for the Web page module.

PageName is the name of the Web page module to which the request is redirected.

CanView returns an indication of whether the caller can access the specified page. For example, an OnCanViewPage event handler can set CanView to true when PageName specifies a page that does not require access rights.

Handled returns an indication of whether the CanView parameter accurately indicates whether the caller can access the requested page. If Handled returns false (the default), the dispatcher checks the callers access rights after the event handler exits.

60.5.3 WebDisp.TDispatchActionEvent Type

TDispatchActionEvent is the type for event handlers that respond when an adapter action executes.

Pascal

```
TDispatchActionEvent = procedure (Sender: TObject; Action: TObject; Params: TStrings) of
object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings) ( TDispatchActionEvent)();
```

File

WebDisp

Description

TDispatchActionEvent is the type for event handlers of an adapter dispatcher that respond when the adapter action executes a request.

Sender is the adapter dispatcher component that received the HTTP request message.

Action is the object that executes the action. If the dispatcher could not find an object to execute the action, this parameter is nil (Delphi) or NULL (C++).

Params lists the parameters for the action, in 'Name=Value' format. The '__id' parameter gives the name of the action to execute. If the current request is not a request to execute an action, Params is nil (Delphi) or NULL (C++).

60.5.4 WebDisp.TDispatchActionHandledEvent Type

TDispatchActionHandledEvent is the type for event handlers that can handle requests to execute an adapter action.

Pascal

```
TDispatchActionHandledEvent = procedure (Sender: TObject; Action: TObject; Params: TStrings;
var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Action: TObject; Params: TStrings; var Handled: Boolean) (
TDispatchActionHandledEvent)();
```

File

WebDisp

Description

TDispatchActionHandledEvent is the type for event handlers of an adapter dispatcher that can handle requests to execute an adapter action. If the event handler executes the requested action, it can then prevent the default handling that would otherwise occur.

Sender is the adapter dispatcher component that received the HTTP request message.

Action is the object that would ordinarily execute the action. If the dispatcher could not find an object to execute the action, this parameter is nil (Delphi) or NULL (C++).

Params lists the parameters for the action, in 'Name=Value' format. The '__id' parameter gives the name of the action to execute. If the current request is not a request to execute an action, Params is nil (Delphi) or NULL (C++).

Handled returns an indication of how the adapter dispatcher should proceed after the event handler exits. If the event handler sets Handled to true, the dispatcher assumes that the event handler has taken care of the request. If the event handler leaves Handled set to false, the dispatcher continues with its normal processing of the request message.

60.5.5 WebDisp.TDispatchImageEvent Type

TDispatchImageEvent is the type for event handlers that respond when an adapter action gets a request for an image field value.

Pascal

```
TDispatchImageEvent = procedure (Sender: TObject; Image: TObject; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Image: TObject; Params: TStrings) ( TDispatchImageEvent)();
```

File

WebDisp

Description

TDispatchImageEvent is the type for event handlers of an adapter dispatcher that respond to requests for the image from an image field.

Sender is the adapter dispatcher component that received the HTTP request message.

Image is the object that provides the image. If the dispatcher could not find an object to provide the image, this parameter is nil (Delphi) or NULL (C++).

Params lists the parameters for the image, in 'Name=Value' format. The '__id' parameter gives the name of the requested image. If the current request is not a request to retrieve an image, Params is nil (Delphi) or NULL (C++).

60.5.6 WebDisp.TDispatchImageHandledEvent Type

TDispatchImageHandledEvent is the type for event handlers that can handle requests for an image field value.

Pascal

```
TDispatchImageHandledEvent = procedure (Sender: TObject; Image: TObject; Params: TStrings; var
Handled: Boolean) of object;
```

C++

```
(Sender: TObject; Image: TObject; Params: TStrings; var Handled: Boolean) (
TDispatchImageHandledEvent)();
```

File

WebDisp

Description

TDispatchImageHandledEvent is the type for event handlers of an adapter dispatcher that can handle requests for the image from an image field. If the event handler adds the requested image (or a substitute) to the current response message, it can then prevent the default handling that would otherwise occur.

Sender is the adapter dispatcher component that received the HTTP request message.

Image is the object that would ordinarily provide the image. If the dispatcher could not find an object to provide the image, this parameter is nil (Delphi) or NULL (C++).

Params lists the parameters for the image, in 'Name=Value' format. The '__id' parameter gives the name of the requested image. If the current request is not a request to retrieve an image, Params is nil (Delphi) or NULL (C++).

Handled returns an indication of how the adapter dispatcher should proceed after the event handler exits. If the event handler sets Handled to true, the dispatcher assumes that the event handler has taken care of the request. If the event handler leaves Handled set to false, the dispatcher continues with its normal processing of the request message.

60.5.7 WebDisp.TDispatchPageEvent Type

TDispatchPageEvent is the type for event handlers that are called after a Web page module finishes handling an HTTP request.

Pascal

```
TDispatchPageEvent = procedure (Sender: TObject; const PageName: string) of object;
```

C++

```
(Sender: TObject; const PageName: string) ( TDispatchPageEvent)();
```

File

WebDisp

Description

TDispatchPageEvent is the type for event handlers that are called after dispatching an HTTP request message to a Web page module.

Sender is the page dispatcher or Web page module that received the event.

PageName is the name of the Web page module that handled the request.

Procedural types

Creating events

60.5.8 WebDisp.TDispatchPageHandledEvent Type

TDispatchPageHandledEvent is the type for event handlers that can handle HTTP request messages.

Pascal

```
TDispatchPageHandledEvent = procedure (Sender: TObject; const PageName: string; var Handled:
```

```
Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; var Handled: Boolean) ( TDispatchPageHandledEvent)();
```

File

WebDisp

Description

TDispatchPageHandledEvent is the type for event handlers that are called before a Web page module handles an HTTP request message. The event handler allows the application handle the message in any way, and then prevent the default handling that would otherwise occur.

Sender is the page dispatcher or Web page module that receives the event.

PageName is the name of the Web page module to which the request was addressed.

Handled returns an indication of how the application should proceed after the event handler exits. If the event handler sets Handled to true, the application assumes that the event handler has taken care of the request and filled out the content of the response message. If the event handler leaves Handled set to false, the application continues with its normal processing of the request message.

Procedural types

Creating events

60.5.9 WebDisp.TDispatchPageParamsHandledEvent Type

TDispatchPageParamsHandledEvent is the type for event handlers that are called before a WebSnap application assembles a response message redirecting the caller to another Web page.

Pascal

```
TDispatchPageParamsHandledEvent = procedure (Sender: TObject; const PageName: string; Params:
TStrings; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; Params: TStrings; var Handled: Boolean) (
TDispatchPageParamsHandledEvent)();
```

File

WebDisp

Description

TDispatchPageParamsHandledEvent is the type for event handlers that are called when an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost).

Sender is the page dispatcher or Web page module that receives the event.

PageName is the name of the Web page to which the request should be redirected.

Params is a set of name/value pairs that should be added to the redirect message for use by the Web page module when it

receives the redirected request.

Handled returns an indication of how the application should proceed after the event handler exits. If the event handler sets Handled to true, the application assumes that the event handler has taken care of setting up the response message to indicate the redirection. If the event handler leaves Handled set to false, the application continues with its normal processing of the redirection.

60.5.10 WebDisp.TGetAdapterRequestParamsEvent Type

TGetAdapterRequestParamsEvent is the type for event handlers that retrieve parameters for an adapter dispatcher.

Pascal

```
TGetAdapterRequestParamsEvent = procedure (Sender: TObject; Handler: IUnknown; var Identifer:
string; Params: TStrings) of object;
```

C++

```
(Sender: TObject; Handler: IUnknown; var Identifer: string; Params: TStrings) (
TGetAdapterRequestParamsEvent)();
```

File

WebDisp

Description

TGetAdapterRequestParamsEvent is the type for event handlers of an adapter dispatcher that fetch the parameters needed to execute an action or retrieve an image.

Sender is the adapter dispatcher component.

Handler is the interface of the adapter that has set up the Params parameter to reflect the current values.

Identifier is the name of the action to execute or the image to retrieve.

Params lists the parameters for the request. It lists the parameters in "Name=Value" strings. When the dispatcher is formatting parameters that are added to an HTML form, these values come from the adapter. When the dispatcher is handling an incoming request, these parameters come from the current request message. The event handler can change these parameters before they are added to the HTML form or passed to the adapter.

60.5.11 WebDisp.TLocateFileServiceFindFileEvent Type

TLocateFileServiceFindFileEvent is the type for event handlers that locates a file on disk in a WebSnap application.

Pascal

```
TLocateFileServiceFindFileEvent = procedure (ASender: TObject; AComponent: TComponent; const
AFileName: string; var AFoundFile: string; var AHandled: Boolean) of object;
```

C++

```
(ASender: TObject; AComponent: TComponent; const AFileName: string; var AFoundFile: string;
var AHandled: Boolean) ( TLocateFileServiceFindFileEvent)();
```

File

WebDisp

Description

TLocateFileServiceFindFileEvent is the type for event handlers of a TLocateFileService (see page 6220) component that return a fully-qualified file name to indicate where a specified file can be found.

ASender is the TLocateFileService (see page 6220) component that is asked to locate a file.

AComponent is the component that uses or is otherwise associated with the file. For example, this can be a content producer component that uses a template file.

AFileName is the name of the file to locate. This is the name that the WebSnap application uses to refer to the desired file. Typically, it is the name of the Web page that the file is used to produce.

AFoundFile returns the fully-qualified file name where the requested file can be found.

AHandled returns true if the event handler supplies a file name as the value of AFoundFile.

60.5.12 WebDisp.TLocateFileServiceFindStreamEvent Type

TLocateFileServiceFindStreamEvent is the type for event handlers that provide access to a requested file.

Pascal

```
TLocateFileServiceFindStreamEvent = procedure (ASender: TObject; AComponent: TComponent; const
AFileName: string; var AFoundStream: TStream; var AOwned: Boolean; var AHandled: Boolean) of
object;
```

C++

```
(ASender: TObject; AComponent: TComponent; const AFileName: string; var AFoundStream: TStream;
var AOwned: Boolean; var AHandled: Boolean) ( TLocateFileServiceFindStreamEvent)();
```

File

WebDisp

Description

ASender is the TCustomLocateFileService (see page 6181) descendant that is asked to locate a file.

AComponent is the component that uses or is otherwise associated with the file. For example, this can be a content producer component that uses a template file.

AFileName is the name of the file to locate. This is the name that the WebSnap application uses to refer to the desired file. Typically, it is the name of a Web page.

AFoundStream returns a stream object from which the WebSnap application can read the contents of the requested file.

AOwned indicates whether the caller should free AFoundStream after reading the file contents. When AOwned returns true, the caller should free the stream object. When AOwned returns false, the caller should not free the stream object.

AHandled returns true if the event handler supplies a stream as the value of AFoundStream.

60.5.13 WebDisp.TLoginPagedHandledEvent Type

Pascal

```
TLoginPagedHandledEvent = procedure (Sender: TObject; const PageName: string; var Handled:
Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; var Handled: Boolean) ( TLoginPagedHandledEvent)();
```

File

WebDisp

Description

This is type WebDisp.TLoginPagedHandledEvent.

60.5.14 WebDisp.TLoginRequiredEvent Type

TLoginRequiredEvent is the type for event handlers that indicate whether the current user must log in before accessing a specified Web page.

Pascal

```
TLoginRequiredEvent = procedure (Sender: TObject; const PageName: string; var Required:
Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; var Required: Boolean) ( TLoginRequiredEvent)();
```

File

WebDisp

Description

TLoginRequiredEvent is the type for event handlers of a page dispatcher that indicate whether a specified Web page requires that the user be logged in.

Sender is the page dispatcher that is about to dispatch the HTTP request.

PageName is the name of the Web page module to which the request is redirected.

Required returns an indication of whether the caller must log in before accessing the specified page. On entry, this is set to the default associated with the specified Web page module. If the event handler returns with Required set to true, the dispatcher does not forward the request to the specified Web module. Rather, it generates an OnPageAccessDenied event, where the application can handle the login process.

Procedural types

Creating events

60.5.15 WebDisp.TPageAccessDeniedEvent Type

TPageAccessDeniedEvent is the type for event handlers that respond when a page dispatcher determines that the current user can't access the current page.

Pascal

```
TPageAccessDeniedEvent = procedure (Sender: TObject; const PageName: string; Reason:
TPageAccessDenied; var Handled: Boolean) of object;
```

C++

```
(Sender: TObject; const PageName: string; Reason: TPageAccessDenied; var Handled: Boolean) (
TPageAccessDeniedEvent)();
```

File

WebDisp

Description

TPageAccessDeniedEvent is the type for event handlers of a page dispatcher that respond when the current user can't be validated for accessing the requested page.

Sender is the page dispatcher that checked the caller's rights to access the requested page and found them insufficient.

PageName is the name of the Web page module to which the request was directed.

Reason indicates why the caller was not validated.

Handled returns an indication of whether the event handler has handled the situation (typically, by generating an appropriate response message). This value determines what the page dispatcher does next after the event handler exits, as indicated in the previous table.

	Name	Description
	TBaseWebModuleFactory (see page 6280)	TBaseWebModuleFactory is the base class for Web module factory objects whose generated Web modules do not create Web pages.
	TBaseWebPageInfo (see page 6285)	TBaseWebPageInfo stores information about a page registered with a Web page module factory.
	TBaseWebPageModuleFactory (see page 6290)	TBaseWebPageModuleFactory is the base class for Web module factory objects whose generated Web modules create Web pages.
	TWebAppDataModuleFactory (see page 6295)	TWebAppDataModule is the factory object for WebSnap application data modules.
	TWebAppPageModuleFactory (see page 6297)	TWebAppPageModuleFactory is the factory object for application Web page modules in a WebSnap application.
	TWebDataModuleFactory (see page 6299)	TWebDataModuleFactory is the factory class for WebSnap data modules.
	TWebPageInfo (see page 6301)	TWebPageInfo describes a WebSnap page.
	TWebPageModuleFactory (see page 6303)	TWebPageModuleFactory is the factory object for Web page modules in a WebSnap application.

Structs, Records, Enums

	Name	Description
	TWebPageAccessFlags (see page 6305)	TWebPageAccessFlags and TWebPageAccess (see page 6306) determine what conditions must be met for a user to access the page that a Web Page module produces.

Types

Name	Description
TWebPageAccess (see page 6306)	This is type WebFact.TWebPageAccess.

61.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TBaseWebModuleFactory (see page 6280)	TBaseWebModuleFactory is the base class for Web module factory objects whose generated Web modules do not create Web pages.
	TBaseWebPageInfo (see page 6285)	TBaseWebPageInfo stores information about a page registered with a Web page module factory.
	TBaseWebPageModuleFactory (see page 6290)	TBaseWebPageModuleFactory is the base class for Web module factory objects whose generated Web modules create Web pages.
	TWebAppDataModuleFactory (see page 6295)	TWebAppDataModule is the factory object for WebSnap application data modules.
	TWebAppPageModuleFactory (see page 6297)	TWebAppPageModuleFactory is the factory object for application Web page modules in a WebSnap application.
	TWebDataModuleFactory (see page 6299)	TWebDataModuleFactory is the factory class for WebSnap data modules.
	TWebPageInfo (see page 6301)	TWebPageInfo describes a WebSnap page.
	TWebPageModuleFactory (see page 6303)	TWebPageModuleFactory is the factory object for Web page modules in a WebSnap application.

61.1.1 TBaseWebModuleFactory Class

TBaseWebModuleFactory is the base class for Web module factory objects whose generated Web modules do not create Web pages.

Class Hierarchy

Pascal

```
TBaseWebModuleFactory = class(TAbstractWebModuleFactory);
```

C++

```
class TBaseWebModuleFactory : public TAbstractWebModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory object is responsible for creating Web module instance. Applications can set flags for each factory object to indicate when it should create instances of its Web module and whether it can cache Web module instance for reuse with subsequent request messages.

TBaseWebModuleFactory descendants generate Web modules that do generate Web pages. These Web modules can contain components, such as adapters, that perform tasks for the WebSnap application.

Do not create instances of TBaseWebModuleFactory. Although TBaseWebModuleFactory provides an implementation for the abstract or, in C++ terminology, pure virtual methods introduced by its ancestors, it is intended only as a base class. Instead, create instances of a TBaseWebModuleFactory descendant such as TWebDataModuleFactory (see page 6299) or TWebAppDataModuleFactory (see page 6295).

See Also

TWebAppDataModuleFactory (see page 6295)

TWebDataModuleFactory (see page 6299)

TWebRequestHandler (see page 6633)

61.1.1.1 TBaseWebModuleFactory Members

The following tables list the members exposed by TBaseWebModuleFactory.

Protected Methods

	Name	Description
	Create (see page 6281)	Creates and initializes an instance of TBaseWebModuleFactory (see page 6280).
	GetCacheMode (see page 6282)	Returns the value of the CacheMode property.
	GetComponentClass (see page 6282)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 6283)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 6283)	Returns the value of the IsAppModule property.
	GetModuleName (see page 6284)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	GetModule (see page 6283)	Creates an instance of the associated Web module.
	PreventDestruction (see page 6284)	Prevents the WebSnap application from freeing the Web module instance.

61.1.1.2 TBaseWebModuleFactory.Create Constructor

Creates and initializes an instance of TBaseWebModuleFactory (see page 6280).

Pascal

```
constructor Create(AComponentClass: TComponentClass; ACreateMode: TWebModuleCreateMode;
ACacheMode: TWebModuleCacheMode);
```

C++

```
__fastcall TBaseWebModuleFactory(TComponentClass AComponentClass, TWebModuleCreateMode
ACreateMode, TWebModuleCacheMode ACacheMode);
```

Description

Call Create to instantiate a Web module factory. Typically, Web module factory objects are created in the initialization section of the unit for the Web module. The call to the constructor is added by the Web module wizard or WebSnap application wizard when it generates the unit for the Web module.

AComponentClass is the class of the Web module that this factory object creates. It becomes the value of the ComponentClass property.

ACreateMode describes whether the factory should create instances of the Web module for every request message, or only when the application explicitly requests the Web module. This becomes the value of the CreateMode property.

ACacheMode indicates whether the application can cache Web module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

ComponentClass

CreateMode

CacheMode

61.1.1.3 TBaseWebModuleFactory Methods

The methods of the TBaseWebModuleFactory class are listed here.

Protected Methods

	Name	Description
	GetCacheMode (see page 6282)	Returns the value of the CacheMode property.
	GetComponentClass (see page 6282)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 6283)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 6283)	Returns the value of the IsAppModule property.
	GetModuleName (see page 6284)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	GetModule (see page 6283)	Creates an instance of the associated Web module.
	PreventDestruction (see page 6284)	Prevents the WebSnap application from freeing the Web module instance.

61.1.1.3.1 TBaseWebModuleFactory.GetCacheMode Method

Returns the value of the CacheMode property.

Pascal

```
function GetCacheMode: TWebModuleCacheMode; override;
```

C++

```
virtual __fastcall TWebModuleCacheMode GetCacheMode();
```

Description

GetCacheMode is the protected read implementation of the CacheMode property. It returns the cache mode flag that was supplied to the constructor.

See Also

CacheMode

Create (see page 6281)

61.1.1.3.2 TBaseWebModuleFactory.GetComponentClass Method

Returns the value of the ComponentClass property.

Pascal

```
function GetComponentClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetComponentClass();
```

Description

GetComponentClass is the protected read implementation of the ComponentClass property. It returns the class of the Web page module this factory creates, as supplied to the Web page module factory constructor.

See Also

ComponentClass

Create (see page 6281)

61.1.1.3.3 TBaseWebModuleFactory.GetCreateMode Method

Returns the value of the CreateMode property.

Pascal

```
function GetCreateMode: TWebModuleCreateMode; override;
```

C++

```
virtual __fastcall TWebModuleCreateMode GetCreateMode();
```

Description

GetCreateMode is the protected read implementation of the CreateMode property. It returns the create mode flag that was supplied to the constructor.

See Also

CreateMode

Create (see page 6281)

61.1.1.3.4 TBaseWebModuleFactory.GetIsAppModule Method

Returns the value of the IsAppModule property.

Pascal

```
function GetIsAppModule: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsAppModule();
```

Description

GetIsAppModule is the protected read implementation of the IsAppModule property.

In TBaseWebModuleFactory (see page 6280), GetIsAppModule returns false. Descendant classes that generate Web application modules (such as TWebAppDataModuleFactory (see page 6295)) override this method to return true.

See Also

IsAppModule

TWebAppPageModuleFactory (see page 6297)

61.1.1.3.5 TBaseWebModuleFactory.GetModule Method

Creates an instance of the associated Web module.

Pascal

```
function GetModule: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetModule();
```

Description

Call GetModule to obtain a new instance of the Web module that the factory creates. GetModule creates an instance of the class that the ComponentClass property specifies and returns it.

See Also

ComponentClass

CreateMode

CacheMode

61.1.1.3.6 TBaseWebModuleFactory.GetModuleName Method

Returns the value of the ModuleName property.

Pascal

```
function GetModuleName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetModuleName();
```

Description

GetModuleName is the protected read implementation of the ModuleName property. It returns the name of the class that the ComponentClass property specifies.

See Also

ModuleName

ComponentClass

61.1.1.3.7 TBaseWebModuleFactory.PreventDestruction Method

Prevents the WebSnap application from freeing the Web module instance.

Pascal

```
procedure PreventDestruction; override;
```

C++

```
virtual __fastcall PreventDestruction();
```

Description

Call PreventDestruction if the WebSnap application should not free the Web module instance when the current HTTP request message has been fully processed. For example, if another Web module contains a reference to the Web module that this factory creates, you may not want to allow the WebSnap application to free the Web module that this factory creates while the other module exists.

In TBaseWebModuleFactory (see page 6280), PreventDestruction changes the CacheMode property to caCache.

See Also

CacheMode

61.1.2 TBaseWebPageInfo Class

TBaseWebPageInfo stores information about a page registered with a Web page module factory.

Class Hierarchy

Pascal

```
TBaseWebPageInfo = class(TAbstractWebPageInfo);
```

C++

```
class TBaseWebPageInfo : public TAbstractWebPageInfo;
```

File

WebFact

Description

The TBaseWebPageInfo component stores basic information about an HTML page such as the filename, page name, page title, descriptive text, publish status, and access rights. This information is stored with the Web page module factory.

An instance of a TBaseWebPageInfo descendant, such as TWebPageInfo (see page 6301), is supplied to the constructor of the factory object that creates instances of a Web page module. Typically, the code to create this object and supply it to the Web page factory's constructor is generated by a Web page module wizard. You can change this generated code, which appears in the generated unit for the Web page module, to alter the properties of the Web page information object. For example, you may want to add a ViewAccess string to allow your application to limit access to the Web page.

In a WebSnap application, you can access the Web page information object of any Web page module by calling the FindPageInfo method of the application's global Web context.

See Also

TWebPageInfo (see page 6301)

TAbstractWebContext (see page 5960)

TWebAppPageModuleFactory (see page 6297)

TWebPageModuleFactory (see page 6303)

WebContext (see page 6003)

61.1.2.1 TBaseWebPageInfo Members

The following tables list the members exposed by TBaseWebPageInfo.

Protected Methods

	Name	Description
	Create (see page 6286)	Creates and initializes a TBaseWebPageInfo (see page 6285) object.
	GetIsLoginRequired (see page 6287)	Returns the value of the IsLoginRequired property.
	GetIsPublished (see page 6287)	Returns the value of the IsPublished property.
	GetPageDescription (see page 6287)	Returns the value of the PageDescription property.
	GetPageFile (see page 6288)	Returns the value of the PageFile property.
	GetPageHREF (see page 6288)	Returns the value of the PageHREF property.

	GetPageName (see page 6288)	Returns the value of the PageName property.
	GetPageTitle (see page 6289)	Returns the value of the PageTitle property.
	GetViewAccess (see page 6289)	Returns the value of the ViewAccess property.
	SetFactory (see page 6290)	Connects a specified Web page module factory with the Web page information object.

61.1.2.2 TBaseWebPageInfo.Create Constructor

Creates and initializes a TBaseWebPageInfo (see page 6285) object.

Pascal

```
constructor Create(AAccess: TWebPageAccess; const AFile: string; const AName: string; const
ATitle: string; const ADescription: string; const AViewAccess: string);
```

C++

```
__fastcall TBaseWebPageInfo(TWebPageAccess AAccess, const UnicodeString AFile, const
UnicodeString AName, const UnicodeString ATitle, const UnicodeString ADescription, const
UnicodeString AViewAccess);
```

Description

Typically, you do not need to create a call to the Web page information object constructor. The Web page module wizard generates code to make this call and pass the resulting object instance to the constructor of a Web page module factory. You may, however, want to edit the generated call to the constructor, changing some of the parameter values that the wizard supplies.

AAccess specifies access information for the associated Web page.

AFile specifies the name (or extension) of the file that the associated Web page module uses to generate its content. It becomes the value of the PageFile property.

AName is the logical name of the associated Web page. It becomes the value of the PageName property.

ATitle is the title that appears on the associated Web page. It becomes the value of the PageTitle property.

ADescription is a brief description of the associated Web page. It becomes the value of the PageDescription property.

AViewAccess is the view access string that represents a set of access rights needed to work with the associated Web page. It becomes the value of the ViewAccess property.

IsLoginRequired

61.1.2.3 TBaseWebPageInfo Methods

The methods of the TBaseWebPageInfo class are listed here.

Protected Methods

	Name	Description
	GetIsLoginRequired (see page 6287)	Returns the value of the IsLoginRequired property.
	GetIsPublished (see page 6287)	Returns the value of the IsPublished property.
	GetPageDescription (see page 6287)	Returns the value of the PageDescription property.
	GetPageFile (see page 6288)	Returns the value of the PageFile property.
	GetPageHREF (see page 6288)	Returns the value of the PageHREF property.
	GetPageName (see page 6288)	Returns the value of the PageName property.
	GetPageTitle (see page 6289)	Returns the value of the PageTitle property.
	GetViewAccess (see page 6289)	Returns the value of the ViewAccess property.
	SetFactory (see page 6290)	Connects a specified Web page module factory with the Web page information object.

61.1.2.3.1 TBaseWebPageInfo.GetIsLoginRequired Method

Returns the value of the IsLoginRequired property.

Pascal

```
function GetIsLoginRequired: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsLoginRequired();
```

Description

GetIsLoginRequired is the protected read implementation of the IsLoginRequired property. It returns true if wpLoginRequired is included in the access flags passed to the constructor.

See Also

IsLoginRequired

Create (see page 6286)

61.1.2.3.2 TBaseWebPageInfo.GetIsPublished Method

Returns the value of the IsPublished property.

Pascal

```
function GetIsPublished: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsPublished();
```

Description

GetIsPublished is the protected read implementation of the IsPublished property. It returns true if wpPublished is included in the access flags passed to the constructor.

See Also

IsPublished

Create (see page 6286)

61.1.2.3.3 TBaseWebPageInfo.GetPageDescription Method

Returns the value of the PageDescription property.

Pascal

```
function GetPageDescription: string; override;
```

C++

```
virtual __fastcall UnicodeString GetPageDescription();
```

Description

GetPageDescription is the protected read implementation of the PageDescription property. It returns the description string that is passed to the constructor.

See Also

PageDescription

Create (see page 6286)

61.1.2.3.4 TBaseWebPageInfo.GetPageFile Method

Returns the value of the PageFile property.

Pascal

```
function GetPageFile: string; override;
```

C++

```
virtual __fastcall UnicodeString GetPageFile();
```

Description

GetPageFile is the protected read implementation of the PageFile property.

See Also

PageFile

61.1.2.3.5 TBaseWebPageInfo.GetPageHREF Method

Returns the value of the PageHREF property.

Pascal

```
function GetPageHREF: string; override;
```

C++

```
virtual __fastcall UnicodeString GetPageHREF();
```

Description

GetPageHREF is the protected read implementation of the PageHREF property. It returns the HTTP path string that is passed to the constructor.

See Also

PageHREF

Create (see page 6286)

61.1.2.3.6 TBaseWebPageInfo.GetPageName Method

Returns the value of the PageName property.

Pascal

```
function GetPageName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetPageName();
```

Description

GetPageName is the protected read implementation of the PageName property. It returns the page name that is passed to the constructor.

See Also

PageName

Create (see page 6286)

61.1.2.3.7 TBaseWebPageInfo.GetPageTitle Method

Returns the value of the PageTitle property.

Pascal

```
function GetPageTitle: string; override;
```

C++

```
virtual __fastcall UnicodeString GetPageTitle();
```

Description

GetPageTitle is the protected read implementation of the PageTitle property. It returns the title that is passed to the constructor.

See Also

PageTitle

Create (see page 6286)

61.1.2.3.8 TBaseWebPageInfo.GetViewAccess Method

Returns the value of the ViewAccess property.

Pascal

```
function GetViewAccess: string; override;
```

C++

```
virtual __fastcall UnicodeString GetViewAccess();
```

Description

GetViewAccess is the protected read implementation of the ViewAccess property. It returns the view access string that is passed to the constructor.

See Also

ViewAccess

Create (see page 6286)

61.1.2.3.9 TBaseWebPageInfo.SetFactory Method

Connects a specified Web page module factory with the Web page information object.

Pascal

```
procedure SetFactory(AFactory: TAbstractWebPageModuleFactory); override;
```

C++

```
virtual __fastcall SetFactory(TAbstractWebPageModuleFactory AFactory);
```

Description

SetFactory is the protected write implementation of the Factory property.

AFactory is the Web page module factory object that instantiates the Web page module that this object describes.

See Also

Factory

61.1.3 TBaseWebPageModuleFactory Class

TBaseWebPageModuleFactory is the base class for Web module factory objects whose generated Web modules create Web pages.

Class Hierarchy

Pascal

```
TBaseWebPageModuleFactory = class(TAbstractWebPageModuleFactory);
```

C++

```
class TBaseWebPageModuleFactory : public TAbstractWebPageModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory object is responsible for creating Web module instances. Applications can set flags for each factory object to indicate when it should create instances of its Web module and whether it can cache Web module instances for reuse with subsequent request messages.

TBaseWebPageModuleFactory descendants generate Web page modules. In addition to holding components that perform tasks for the WebSnap application, Web page modules can generate a Web page. The Web page is described by a Web page information object, which the Web page module factory makes available as its WebPageInfo property.

Do not create instances of TBaseWebPageModuleFactory. Although TBaseWebPageModuleFactory provides an implementation for the abstract or, in C++ terminology, pure virtual methods introduced by its ancestors, it is intended only as a base class. Instead, create instances of a TBaseWebPageModuleFactory descendant such as TWebPageModuleFactory (see page 6303) or TWebAppPageModuleFactory (see page 6297).

See Also

TWebAppPageModuleFactory (see page 6297)

TWebPageModuleFactory (see page 6303)

TWebRequestHandler (see page 6633)

TWebPageInfo (see page 6301)

61.1.3.1 TBaseWebPageModuleFactory Members

The following tables list the members exposed by TBaseWebPageModuleFactory.

Protected Methods

	Name	Description
	Create (see page 6291)	Creates and initializes an instance of TBaseWebPageModuleFactory (see page 6290).
	GetCacheMode (see page 6292)	Returns the value of the CacheMode property.
	GetComponentClass (see page 6292)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 6293)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 6293)	Returns the value of the IsAppModule property.
	GetModuleName (see page 6294)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	GetModule (see page 6293)	Creates an instance of the associated Web module.
	PreventDestruction (see page 6294)	Prevents the WebSnap application from freeing the Web module instance.

61.1.3.2 TBaseWebPageModuleFactory.Create Constructor

Creates and initializes an instance of TBaseWebPageModuleFactory (see page 6290).

Pascal

```
constructor Create(AComponentClass: TComponentClass; AWebPageInfo: TAbstractWebPageInfo;
ACreateMode: TWebModuleCreateMode; ACacheMode: TWebModuleCacheMode);
```

C++

```
__fastcall TBaseWebPageModuleFactory(TComponentClass AComponentClass, TAbstractWebPageInfo
AWebPageInfo, TWebModuleCreateMode ACreateMode, TWebModuleCacheMode ACacheMode);
```

Description

Call Create to instantiate a Web page module factory. Typically, Web page module factory objects are created in the initialization section of the unit for the Web page module. The call to the constructor is added by the Web module wizard or WebSnap application wizard when it generates the unit for the Web page module.

AComponentClass is the class of the Web page module that this factory object creates. It becomes the value of the ComponentClass property.

AWebPageInfo is the Web page information object that describes the Web page that this factory's Web page module generates. It becomes the value of the WebPageInfo property.

ACreateMode describes whether the factory should create instances of the Web page module for every request message, or only when the application explicitly requests the Web page module. This becomes the value of the CreateMode property.

ACacheMode indicates whether the application can cache Web page module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

WebPageInfo

ComponentClass

CreateMode

CacheMode

61.1.3.3 TBaseWebPageModuleFactory Methods

The methods of the TBaseWebPageModuleFactory class are listed here.

Protected Methods

	Name	Description
	GetCacheMode (see page 6292)	Returns the value of the CacheMode property.
	GetComponentClass (see page 6292)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 6293)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 6293)	Returns the value of the IsAppModule property.
	GetModuleName (see page 6294)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	GetModule (see page 6293)	Creates an instance of the associated Web module.
	PreventDestruction (see page 6294)	Prevents the WebSnap application from freeing the Web module instance.

61.1.3.3.1 TBaseWebPageModuleFactory.GetCacheMode Method

Returns the value of the CacheMode property.

Pascal

```
function GetCacheMode: TWebModuleCacheMode; override;
```

C++

```
virtual __fastcall TWebModuleCacheMode GetCacheMode();
```

Description

GetCacheMode is the protected read implementation of the CacheMode property. It returns the cache mode flag that was supplied to the constructor.

See Also

CacheMode

Create (see page 6291)

61.1.3.3.2 TBaseWebPageModuleFactory.GetComponentClass Method

Returns the value of the ComponentClass property.

Pascal

```
function GetComponentClass: TComponentClass; override;
```

C++

```
virtual __fastcall TComponentClass GetComponentClass();
```

Description

GetComponentClass is the protected read implementation of the ComponentClass property. It returns the class of the Web page module this factory creates, as supplied to the Web page module factory constructor.

See Also

ComponentClass

Create (see page 6291)

61.1.3.3.3 TBaseWebPageModuleFactory.GetCreateMode Method

Returns the value of the CreateMode property.

Pascal

```
function GetCreateMode: TWebModuleCreateMode; override;
```

C++

```
virtual __fastcall TWebModuleCreateMode GetCreateMode();
```

Description

GetCreateMode is the protected read implementation of the CreateMode property. It returns the create mode flag that was supplied to the constructor.

See Also

CreateMode

Create (see page 6291)

61.1.3.3.4 TBaseWebPageModuleFactory.GetIsAppModule Method

Returns the value of the IsAppModule property.

Pascal

```
function GetIsAppModule: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsAppModule();
```

Description

GetIsAppModule is the protected read implementation of the IsAppModule property.

In TBaseWebPageModuleFactory (see page 6290), GetIsAppModule returns false. Descendant classes that generate Web application modules (such as TWebAppPageModuleFactory (see page 6297)) override this method to return true.

See Also

IsAppModule

TWebAppPageModuleFactory (see page 6297)

61.1.3.3.5 TBaseWebPageModuleFactory.GetModule Method

Creates an instance of the associated Web module.

Pascal

```
function GetModule: TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetModule();
```

Description

Call GetModule to obtain a new instance of the Web module that the factory creates. GetModule creates an instance of the class that the ComponentClass property specifies and returns it.

See Also

ComponentClass

CreateMode

CacheMode

61.1.3.3.6 TBaseWebPageModuleFactory.GetModuleName Method

Returns the value of the ModuleName property.

Pascal

```
function GetModuleName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetModuleName();
```

Description

GetModuleName is the protected read implementation of the ModuleName property. It returns the name of the class that the ComponentClass property specifies.

See Also

ModuleName

ComponentClass

61.1.3.3.7 TBaseWebPageModuleFactory.PreventDestruction Method

Prevents the WebSnap application from freeing the Web module instance.

Pascal

```
procedure PreventDestruction; override;
```

C++

```
virtual __fastcall PreventDestruction();
```

Description

Call PreventDestruction if the WebSnap application should not free the Web module instance when the current HTTP request message has been fully processed. For example, if another Web module contains a reference to the Web module that this factory creates, you may not want to allow the WebSnap application to free the Web module that this factory creates while the other module exists.

In TBaseWebPageModuleFactory (see page 6290), PreventDestruction changes the CacheMode property to caCache.

See Also

CacheMode

61.1.4 TWebAppDataModuleFactory Class

TWebAppDataModule is the factory object for WebSnap application data modules.

Class Hierarchy

Pascal

```
TWebAppDataModuleFactory = class(TBaseWebModuleFactory);
```

C++

```
class TWebAppDataModuleFactory : public TBaseWebModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory is responsible for creating the module and also contains flags that specify how the module should be managed by the WebSnap application. TWebAppDataModuleFactory contains creation flags. Creation flags determine whether the module should be cached for future requests or destroyed after each request and created for each new request.

TWebAppDataModuleFactory identifies the module as an application module. The application module contains the components responsible for dispatching the HTTP request. WebSnap applications register a single application module class.

61.1.4.1 TWebAppDataModuleFactory Members

The following tables list the members exposed by TWebAppDataModuleFactory.

Protected Methods

	Name	Description
	GetCacheMode (see page 6282)	Returns the value of the CacheMode property.
	GetComponentClass (see page 6282)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 6283)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 6296)	Returns the value of the IsAppModule property.
	GetModuleName (see page 6284)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	Create (see page 6296)	Creates and initializes an instance of TWebAppDataModuleFactory (see page 6295).
	GetModule (see page 6283)	Creates an instance of the associated Web module.
	PreventDestruction (see page 6284)	Prevents the WebSnap application from freeing the Web module instance.

61.1.4.2 TWebAppDataModuleFactory.Create Constructor

Creates and initializes an instance of TWebAppDataModuleFactory (see page 6295).

Pascal

```
constructor Create(AComponentClass: TComponentClass; ACacheMode: TWebModuleCacheMode =
caCache);
```

C++

```
__fastcall TWebAppDataModuleFactory(TComponentClass AComponentClass, TWebModuleCacheMode
ACacheMode = caCache);
```

Description

Call Create to instantiate a Web application module factory. Typically, the WebSnap application wizard generates the call to the constructor in the initialization section of the Web application module's unit.

AComponentClass is the class of the Web data module that this factory object creates. It becomes the value of the ComponentClass property.

ACacheMode indicates whether the application can cache Web application module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

See Also

CacheMode

ComponentClass

61.1.4.3 TWebAppDataModuleFactory Methods

The methods of the TWebAppDataModuleFactory class are listed here.

Protected Methods

	Name	Description
	GetIsAppModule (see page 6296)	Returns the value of the IsAppModule property.

61.1.4.3.1 TWebAppDataModuleFactory.GetIsAppModule Method

Returns the value of the IsAppModule property.

Pascal

```
function GetIsAppModule: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsAppModule();
```

Description

GetIsAppModule is the protected read implementation of the IsAppModule property.

In TBaseWebModuleFactory, GetIsAppModule returns false. Descendant classes that generate Web application modules (such as TWebAppDataModuleFactory) override this method to return true.

See Also

IsAppModule

TWebAppPageModuleFactory (see page 6297)

61.1.5 TWebAppPageModuleFactory Class

TWebAppPageModuleFactory is the factory object for application Web page modules in a WebSnap application.

Class Hierarchy

Pascal

```
TWebAppPageModuleFactory = class(TBaseWebPageModuleFactory);
```

C++

```
class TWebAppPageModuleFactory : public TBaseWebPageModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory object is responsible for creating the module and also contains flags that determine whether the module should be cached for future request or destroyed after each request and created for each new request.

Page module factories also contain information about the page such as the page name, description, and access rights. This information is available through the factory so that it can be retrieved without creating the module.

TWebAppPageModuleFactory identifies the module as an application module. The application module contains the components responsible for dispatching the HTTP request. WebSnap applications register a single application module class.

61.1.5.1 TWebAppPageModuleFactory Members

The following tables list the members exposed by TWebAppPageModuleFactory.

Protected Methods

	Name	Description
	GetCacheMode (see page 6292)	Returns the value of the CacheMode property.
	GetComponentClass (see page 6292)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 6293)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 6299)	Returns the value of the IsAppModule property.
	GetModuleName (see page 6294)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	Create (see page 6298)	Creates and initializes an instance of TWebAppPageModuleFactory (see page 6297).
	GetModule (see page 6293)	Creates an instance of the associated Web module.
	PreventDestruction (see page 6294)	Prevents the WebSnap application from freeing the Web module instance.

61.1.5.2 TWebAppPageModuleFactory.Create Constructor

Creates and initializes an instance of TWebAppPageModuleFactory (see page 6297).

Pascal

```
constructor Create(AComponentClass: TComponentClass; AWebPageInfo: TAbstractWebPageInfo;
ACacheMode: TWebModuleCacheMode = caCache);
```

C++

```
__fastcall TWebAppPageModuleFactory(TComponentClass AComponentClass, TAbstractWebPageInfo
AWebPageInfo, TWebModuleCacheMode ACacheMode = caCache);
```

Description

Call Create to instantiate a Web page module factory. Typically, the WebSnap application wizard generates the call to the constructor in the initialization section of the Web application page module's unit.

AComponentClass is the class of the Web application page module that this factory object creates.

AWebPageInfo describes the attributes of the Web application page module, such as the page name, page title, access strings, and so on. This becomes the value of the WebPageInfo property.

ACacheMode indicates whether the factory can cache Web application page module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

61.1.5.3 TWebAppPageModuleFactory Methods

The methods of the TWebAppPageModuleFactory class are listed here.

Protected Methods

	Name	Description
	GetIsAppModule (see page 6299)	Returns the value of the IsAppModule property.

61.1.5.3.1 TWebAppPageModuleFactory.GetIsAppModule Method

Returns the value of the IsAppModule property.

Pascal

```
function GetIsAppModule: Boolean; override;
```

C++

```
virtual __fastcall Boolean GetIsAppModule();
```

Description

GetIsAppModule is the protected read implementation of the IsAppModule property.

In TBaseWebPageModuleFactory, GetIsAppModule returns false. Descendant classes that generate Web application modules (such as TWebAppPageModuleFactory) override this method to return true.

TWebAppPageModuleFactory (see page 6297)

61.1.6 TWebDataModuleFactory Class

TWebDataModuleFactory is the factory class for WebSnap data modules.

Class Hierarchy

Pascal

```
TWebDataModuleFactory = class(TBaseWebModuleFactory);
```

C++

```
class TWebDataModuleFactory : public TBaseWebModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. (In Delphi, the factory object is typically created in the initialization section of the module source file; in C++, it is added in a #pragma startup.)The factory is responsible for creating the module and also contains flags that specify how the module should be managed by the WebSnap application. TWebDataModuleFactory includes caching flags and creation flags. Caching flags determine whether the module should be cached for future request, or destroyed after each request and created for each new request. Creation flags determine whether the module should be automatically created for every request or created on demand.

The WebSnap application may register multiple Web data module classes. Each class is registered with an instance of TWebDataModuleFactory.

61.1.6.1 TWebDataModuleFactory Members

The following tables list the members exposed by TWebDataModuleFactory.

Protected Methods

	Name	Description
	GetCacheMode (see page 6282)	Returns the value of the CacheMode property.
	GetComponentClass (see page 6282)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 6283)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 6283)	Returns the value of the IsAppModule property.
	GetModuleName (see page 6284)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	Create (see page 6300)	Creates and initializes an instance of TWebDataModuleFactory (see page 6299).
	GetModule (see page 6283)	Creates an instance of the associated Web module.
	PreventDestruction (see page 6284)	Prevents the WebSnap application from freeing the Web module instance.

61.1.6.2 TWebDataModuleFactory.Create Constructor

Creates and initializes an instance of TWebDataModuleFactory (see page 6299).

Pascal

```
constructor Create(AComponentClass: TComponentClass; ACreateMode: TWebModuleCreateMode =
crOnDemand; ACacheMode: TWebModuleCacheMode = caCache);
```

C++

```
__fastcall TWebDataModuleFactory(TComponentClass AComponentClass, TWebModuleCreateMode
ACreateMode = crOnDemand, TWebModuleCacheMode ACacheMode = caCache);
```

Description

Call Create to instantiate a Web data module factory. Typically, the Web module wizard generates the call to the constructor in the initialization section of the Web data module's unit.

AComponentClass is the class of the Web data module that this factory object creates.

ACreateMode describes whether the factory should create instances of the Web data module for every request message, or only when the application explicitly requests the Web data module. This becomes the value of the CreateMode property.

ACacheMode indicates whether the application can cache Web data module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

61.1.7 TWebPageInfo Class

TWebPageInfo describes a WebSnap page.

Class Hierarchy

Pascal

```
TWebPageInfo = class(TBaseWebPageInfo);
```

C++

```
class TWebPageInfo : public TBaseWebPageInfo;
```

File

WebFact

Description

The TWebPageInfo module stores information relating to a web page, such as the template filename, page name, title, description, and access rights. This information is part of the web page module factory. This information is stored as part of the factory rather than as part of the module so that it can be accessed without creating the web page module.

An instance of a TWebPageInfo is supplied to the constructor of the factory object that creates instances of the Web page module. Typically, the code to create this object and supply it to the Web page factory's constructor is generated by a Web page module wizard (in Delphi, the generated code appears in the initialization section of the generated unit for the Web page module; in C++, it appears in a #pragma startup). You can change the generated code to alter the properties of the Web page information object. For example, you may want to add a ViewAccess string to allow your application to limit access to the Web page.

In a WebSnap application, you can access the Web page information object of any Web page module by calling the FindPageInfo method of the application's global Web context.

61.1.7.1 TWebPageInfo Members

The following tables list the members exposed by TWebPageInfo.

Protected Methods

	Name	Description
	GetIsLoginRequired (see page 6287)	Returns the value of the IsLoginRequired property.
	GetIsPublished (see page 6287)	Returns the value of the IsPublished property.
	GetPageDescription (see page 6287)	Returns the value of the PageDescription property.
	GetPageFile (see page 6288)	Returns the value of the PageFile property.
	GetPageHREF (see page 6288)	Returns the value of the PageHREF property.
	GetPageName (see page 6288)	Returns the value of the PageName property.
	GetPageTitle (see page 6289)	Returns the value of the PageTitle property.
	GetViewAccess (see page 6289)	Returns the value of the ViewAccess property.
	SetFactory (see page 6290)	Connects a specified Web page module factory with the Web page information object.

Public Methods

	Name	Description
	Create (see page 6302)	Creates and initializes a TWebPageInfo (see page 6301) object.

61.1.7.2 TWebPageInfo.Create Constructor

Creates and initializes a TWebPageInfo (see page 6301) object.

Pascal

```
constructor Create(AAccess: TWebPageAccess = [wpPublished]; const APageFile: string = '.html';
const APageName: string = ''; const ACaption: string = ''; const ADescription: string = '';
const AViewAccess: string = '');
```

C++

```
__fastcall TWebPageInfo(TWebPageAccess AAccess = [wpPublished], const UnicodeString APageFile
= '.html', const UnicodeString APageName = '', const UnicodeString ACaption = '', const
UnicodeString ADescription = '', const UnicodeString AViewAccess = '');
```

Description

Typically, you do not need create a call to the Web page information object constructor. The Web page module wizard generates code to make this call and pass the resulting object instance to the constructor of a Web page module factory. You may, however, want to edit the generated call to the constructor, changing some of the parameter values that the wizard supplies.

AAccess specifies access information for the associated Web page.

APageFile specifies the name (or extension) of the file that the associated Web page module uses to generate its content. It becomes the value of the PageFile property.

APageName is the logical name of the associated Web page. It becomes the value of the PageName property.

ACaption is the title that appears on the associated Web page. It becomes the value of the PageTitle property.

ADescription is a brief description of the associated Web page. It becomes the value of the PageDescription property.

AViewAccess is the view access string that represents a set of access rights needed to work with the associated Web page. It becomes the value of the ViewAccess property.

61.1.8 TWebPageModuleFactory Class

TWebPageModuleFactory is the factory object for Web page modules in a WebSnap application.

Class Hierarchy

Pascal

```
TWebPageModuleFactory = class(TBaseWebPageModuleFactory);
```

C++

```
class TWebPageModuleFactory : public TBaseWebPageModuleFactory;
```

File

WebFact

Description

All WebSnap modules are registered with the WebSnap application using a factory object. The factory object is responsible for creating the module and also contains flags that specify how the WebSnap application should manage the creation, destruction, and use of the Web module. TWebPageModuleFactory also contains flags that determine whether the module should be cached for future request or destroyed after each request and created for each new request.

Note: In the Delphi language, the factory object is created in the initialization section of the module source file.

Page module factories also contain information about the page such as the page name, description, and access rights. This information is available through the factory so that it can be retrieved without creating the module.

WebSnap applications can contain multiple Web page module factories (hence multiple Web page modules), each of which creates the Web page module for a different Web page that the application can create.

61.1.8.1 TWebPageModuleFactory Members

The following tables list the members exposed by TWebPageModuleFactory.

Protected Methods

	Name	Description
	GetCacheMode (see page 6292)	Returns the value of the CacheMode property.
	GetComponentClass (see page 6292)	Returns the value of the ComponentClass property.
	GetCreateMode (see page 6293)	Returns the value of the CreateMode property.
	GetIsAppModule (see page 6293)	Returns the value of the IsAppModule property.
	GetModuleName (see page 6294)	Returns the value of the ModuleName property.

Public Methods

	Name	Description
	Create (see page 6304)	Creates and initializes an instance of TWebPageModuleFactory (see page 6303).
	GetModule (see page 6293)	Creates an instance of the associated Web module.
	PreventDestruction (see page 6294)	Prevents the WebSnap application from freeing the Web module instance.

61.1.8.2 TWebPageModuleFactory.Create Constructor

Creates and initializes an instance of TWebPageModuleFactory (see page 6303).

Pascal

```
constructor Create(AComponentClass: TComponentClass; AWebPageInfo: TAbstractWebPageInfo;
ACreateMode: TWebModuleCreateMode = crOnDemand; ACacheMode: TWebModuleCacheMode = caCache);
```

C++

```
__fastcall TWebPageModuleFactory(TComponentClass AComponentClass, TAbstractWebPageInfo
AWebPageInfo, TWebModuleCreateMode ACreateMode = crOnDemand, TWebModuleCacheMode ACacheMode =
caCache);
```

Description

Call Create to instantiate a Web page module factory. Typically, the Web page module wizard generates the call to the constructor in the Web page module's unit. In Delphi, the constructor call is placed in the initialization section of the unit. In C++, the call is placed in a #pragma startup.

AComponentClass is the class of the Web page module that this factory object creates.

AWebPageInfo describes the attributes of the Web page module, such as the page name, page title, access strings, and so on. This becomes the value of the WebPageInfo property.

ACreateMode describes whether the factory should create instances of the Web page module for every request message, or only when the application explicitly requests the Web page module. This becomes the value of the CreateMode property.

ACacheMode indicates whether the application can cache Web page module instances for reuse with subsequent request messages. This becomes the value of the CacheMode property.

61.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TWebPageAccessFlags (see page 6305)	TWebPageAccessFlags and TWebPageAccess (see page 6306) determine what conditions must be met for a user to access the page that a Web Page module produces.

61.2.1 WebFact.TWebPageAccessFlags Enumeration

TWebPageAccessFlags and TWebPageAccess (see page 6306) determine what conditions must be met for a user to access the page that a Web Page module produces.

Pascal

```
TWebPageAccessFlags = (
  wpPublished,
  wpLoginRequired
);
```

C++

```
enum TWebPageAccessFlags {
  wpPublished,
  wpLoginRequired
};
```

File

WebFact

Description

TWebPageAccessFlags are flags that signal limitations on how users can access a Web page that a Web page module produces. TWebPageAccess (see page 6306) is a set of zero or more TWebPageAccessFlags values. The following table lists the possible flags:

Flag	Meaning
wpPublished	The Web page module is automatically called in response to HTTP request messages that specify the Web page name as the pathinfo portion of their target URL. When included, the value of the IsPublished property is true. When not included, IsPublished is false.
wpLoginRequired	Users must log in before they can access the associated Web page. When included, the value of the IsLoginRequired property is true. When not included, IsLoginRequired is false.

61.3 Types

The following table lists types in this documentation.

Types

Name	Description
TWebPageAccess (see page 6306)	This is type WebFact.TWebPageAccess.

61.3.1 WebFact.TWebPageAccess Type

Pascal

```
TWebPageAccess = set of TWebPageAccessFlags;
```

C++

```
TWebPageAccessFlags TWebPageAccess;
```

File

WebFact

Description

This is type WebFact.TWebPageAccess.

62 WebForm Namespace

This is namespace WebForm.

Classes

	Name	Description
	TAbstractControlRequirements (see page 6311)	TAbstractControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.
	TAbstractFormRequirements (see page 6314)	This is class WebForm.TAbstractFormRequirements.
	TAdapterActionButton (see page 6316)	TAdapterActionButton generates HTML controls for executing adapter actions.
	TAdapterActionsListHelper (see page 6324)	TAdapterActionsListHelper assists a display component that represents a collection of adapter action buttons to work with the design-time editors.
	TAdapterCommandColumn (see page 6331)	TAdapterCommandColumn generates a column of action controls in an adapter grid.
	TAdapterCommandGroup (see page 6337)	TAdapterCommandGroup generates a group of buttons or other HTML elements that executes adapter actions.
	TAdapterControlGroup (see page 6341)	TAdapterControlGroup is a container for adapter display field components such as TAdapterDisplayField (see page 6371) or TAdapterDisplayColumn (see page 6364).
	TAdapterDataDisplay (see page 6354)	TAdapterDataDisplay is the base class for components that display adapter fields as form fields.
	TAdapterDisplayColumn (see page 6364)	TAdapterDisplayColumn displays an Adapter field in a grid.
	TAdapterDisplayField (see page 6371)	TAdapterDisplayField displays an Adapter field as a form field.
	TAdapterDisplayReferenceGroup (see page 6381)	TAdapterDisplayReferenceGroup is the base class for components that generate HTML controls that refer to a control which displays data from an adapter.
	TAdapterEditColumn (see page 6387)	TAdapterEditColumn displays an adapter field as a form field in a grid.
	TAdapterErrorList (see page 6397)	TAdapterErrorList is the error list display component.
	TAdapterFieldGroup (see page 6399)	TAdapterFieldGroup is a container for Adapter (see page 6402) display field components such as TAdapterDisplayField (see page 6371). TAdapterFieldGroup labels and fields in an HTML form.
	TAdapterForm (see page 6404)	TAdapterForm generates an HTML form displaying Adapter fields.

	TAdapterFormLayout (see page 6408)	TAdapterFormLayout lets child Web items adhere to layout rules imposed by their parent.
	TAdapterGrid (see page 6419)	TAdapterGrid is a container for Adapter (see page 6422) display field components such as TAdapterDisplayColumn (see page 6364). TAdapterGrid generates an HTML table.
	TControlRequirements (see page 6425)	TControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.
	TCustomAdapterActionButton (see page 6430)	TCustomAdapterActionButton is the base class for Web items that generate HTML controls for executing adapter actions.
	TCustomAdapterCommandColumn (see page 6442)	TCustomAdapterCommandColumn is the base class for components that generate a column of action controls in an adapter grid.
	TCustomAdapterCommandGroup (see page 6454)	TCustomAdapterCommandGroup is the base class for TAdapterCommandGroup (see page 6337).
	TCustomAdapterDisplayColumn (see page 6461)	TCustomAdapterDisplayColumn is the base class for the grid display of adapter field data.
	TCustomAdapterDisplayField (see page 6467)	TCustomAdapterDisplayField is the base class for the free-form display and editing of adapter field data.
	TCustomAdapterEditColumn (see page 6475)	TCustomAdapterEditColumn is the base class for components that display adapter fields as form fields in grids.
	TCustomAdapterErrorList (see page 6478)	TCustomAdapterErrorList is the base class adapter for components that display error lists.
	TCustomAdapterFieldGroup (see page 6483)	TCustomAdapterFieldGroup manages a collection of Web Items that generate a group of HTML controls.
	TCustomAdapterForm (see page 6490)	TCustomAdapterForm is the base class for components that generate an HTML form for an adapter page producer.
	TCustomAdapterGrid (see page 6496)	TCustomAdapterGrid is the base class for Web items that generate an HTML table to display a datasetin an XML data packet or web application.
	TDesigntimeWarnings (see page 6504)	This is class WebForm.TDesigntimeWarnings.
	TGeneratedFunctions (see page 6506)	This is class WebForm.TGeneratedFunctions.

Constants

Name	Description
sDisplayText (see page 6530)	This is constant WebForm.sDisplayText.
sFieldText (see page 6530)	This is constant WebForm.sFieldText.
sFormGet (see page 6531)	This is constant WebForm.sFormGet.
sFormPost (see page 6531)	This is constant WebForm.sFormPost.
sMultipartForm (see page 6531)	This is constant WebForm.sMultipartForm.

Functions

	Name	Description
	CalcDisplayFieldHTMLElementType (see page 6519)	This is function WebForm.CalcDisplayFieldHTMLElementType.
	CalcDisplayFieldViewMode (see page 6519)	This is function WebForm.CalcDisplayFieldViewMode.
	FindVariablesContainer (see page 6520)	This is function WebForm.FindVariablesContainer.
	FindVariablesContainerInParent (see page 6520)	This is function WebForm.FindVariablesContainerInParent.
	GetAdapterModeOfAdapterInParent (see page 6520)	This is function WebForm.GetAdapterModeOfAdapterInParent.
	MakeAdapterHTMLName (see page 6521)	This is function WebForm.MakeAdapterHTMLName.
	MakeAdapterVariableName (see page 6521)	This is function WebForm.MakeAdapterVariableName.

Interfaces

	Name	Description
	IAdapterDisplay (see page 6510)	This is class WebForm.IAdapterDisplay.
	IGetAdapterFormLayout (see page 6510)	This is class WebForm.IGetAdapterFormLayout.
	IGetAdapterModeOfDisplay (see page 6511)	This is class WebForm.IGetAdapterModeOfDisplay.
	IGetAdapterOfDisplay (see page 6512)	This is class WebForm.IGetAdapterOfDisplay.
	IGetAdapterVariableName (see page 6513)	This is class WebForm.IGetAdapterVariableName.
	IGetControlRequirements (see page 6515)	This is class WebForm.IGetControlRequirements.
	IGetFormRequirements (see page 6516)	This is class WebForm.IGetFormRequirements.
	IGetVariablesContainerOfDisplay (see page 6517)	This is class WebForm.IGetVariablesContainerOfDisplay.

Structs, Records, Enums

	Name	Description
	TActionButtonHideOption (see page 6522)	TActionButtonHideOptions (see page 6528) indicates when a control to represent an adapter action should not be generated.
	TColumnHTMLElementType (see page 6523)	This is record WebForm.TColumnHTMLElementType.
	TCommandHTMLElementType (see page 6523)	TCommandHTMLElementType identifies an HTML control type that can be used execute an adapter action.
	TDisplayFieldHideOption (see page 6524)	TDisplayFieldHideOptions (see page 6528) indicates when a control to represent a dataset field should not be generated.
	TDisplayFieldHTMLElementType (see page 6525)	TDisplayFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.
	TDisplayFieldViewMode (see page 6525)	TDisplayFieldViewMode indicates the mode in which an adapter field's value is displayed.
	TInputFieldHTMLElementType (see page 6526)	TInputFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.
	TLayoutState (see page 6527)	This is record WebForm.TLayoutState.

Types

Name	Description
TActionButtonHideOptions (see page 6528)	This is type WebForm.TActionButtonHideOptions.
TAdapterDataDisplayClass (see page 6528)	This is type WebForm.TAdapterDataDisplayClass.
TDisplayFieldHideOptions (see page 6528)	This is type WebForm.TDisplayFieldHideOptions.

62.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TAbstractControlRequirements (see page 6311)	TAbstractControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.
	TAbstractFormRequirements (see page 6314)	This is class WebForm.TAbstractFormRequirements.
	TAdapterActionButton (see page 6316)	TAdapterActionButton generates HTML controls for executing adapter actions.
	TAdapterActionsListHelper (see page 6324)	TAdapterActionsListHelper assists a display component that represents a collection of adapter action buttons to work with the design-time editors.
	TAdapterCommandColumn (see page 6331)	TAdapterCommandColumn generates a column of action controls in an adapter grid.
	TAdapterCommandGroup (see page 6337)	TAdapterCommandGroup generates a group of buttons or other HTML elements that executes adapter actions.
	TAdapterControlGroup (see page 6341)	TAdapterControlGroup is a container for adapter display field components such as TAdapterDisplayField (see page 6371) or TAdapterDisplayColumn (see page 6364).
	TAdapterDataDisplay (see page 6354)	TAdapterDataDisplay is the base class for components that display adapter fields as form fields.
	TAdapterDisplayColumn (see page 6364)	TAdapterDisplayColumn displays an Adapter field in a grid.
	TAdapterDisplayField (see page 6371)	TAdapterDisplayField displays an Adapter field as a form field.
	TAdapterDisplayReferenceGroup (see page 6381)	TAdapterDisplayReferenceGroup is the base class for components that generate HTML controls that refer to a control which displays data from an adapter.
	TAdapterEditColumn (see page 6387)	TAdapterEditColumn displays an adapter field as a form field in a grid.
	TAdapterErrorList (see page 6397)	TAdapterErrorList is the error list display component.
	TAdapterFieldGroup (see page 6399)	TAdapterFieldGroup is a container for Adapter (see page 6402) display field components such as TAdapterDisplayField (see page 6371). TAdapterFieldGroup labels and fields in an HTML form.
	TAdapterForm (see page 6404)	TAdapterForm generates an HTML form displaying Adapter fields.
	TAdapterFormLayout (see page 6408)	TAdapterFormLayout lets child Web items adhere to layout rules imposed by their parent.
	TAdapterGrid (see page 6419)	TAdapterGrid is a container for Adapter (see page 6422) display field components such as TAdapterDisplayColumn (see page 6364). TAdapterGrid generates an HTML table.
	TControlRequirements (see page 6425)	TControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.
	TCustomAdapterActionButton (see page 6430)	TCustomAdapterActionButton is the base class for Web items that generate HTML controls for executing adapter actions.
	TCustomAdapterCommandColumn (see page 6442)	TCustomAdapterCommandColumn is the base class for components that generate a column of action controls in an adapter grid.
	TCustomAdapterCommandGroup (see page 6454)	TCustomAdapterCommandGroup is the base class for TAdapterCommandGroup (see page 6337).
	TCustomAdapterDisplayColumn (see page 6461)	TCustomAdapterDisplayColumn is the base class for the grid display of adapter field data.
	TCustomAdapterDisplayField (see page 6467)	TCustomAdapterDisplayField is the base class for the free-form display and editing of adapter field data.
	TCustomAdapterEditColumn (see page 6475)	TCustomAdapterEditColumn is the base class for components that display adapter fields as form fields in grids.
	TCustomAdapterErrorList (see page 6478)	TCustomAdapterErrorList is the base class adapter for components that display error lists.
	TCustomAdapterFieldGroup (see page 6483)	TCustomAdapterFieldGroup manages a collection of Web Items that generate a group of HTML controls.
	TCustomAdapterForm (see page 6490)	TCustomAdapterForm is the base class for components that generate an HTML form for an adapter page producer.
	TCustomAdapterGrid (see page 6496)	TCustomAdapterGrid is the base class for Web items that generate an HTML table to display a datasetin an XML data packet or web application.

	TDesigntimeWarnings (see page 6504)	This is class WebForm.TDesigntimeWarnings.
	TGeneratedFunctions (see page 6506)	This is class WebForm.TGeneratedFunctions.

62.1.1 TAbstractControlRequirements Class

TAbstractControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.

Class Hierarchy

Pascal

```
TAbstractControlRequirements = class;
```

C++

```
class TAbstractControlRequirements;
```

File

WebForm

Description

Components that generate HTML controls to represent the fields of an adapter (TAdapterControlGroup (see page 6341) and TAdapterDataDisplay (see page 6354) descendants) use descendants of TAbstractControlRequirements. The descendants of TAbstractControlRequirements store the variable and function declarations the adapter form must include before the control group can assemble HTML controls for the fields of the adapter it represents.

TAbstractControlRequirements introduces methods to

Store a specified function or variable (along with its value).

Query whether the function or variable declaration has already been added to the list of requirements.

Store an indication of whether the control requires that it be contained in a multipart form.

TAbstractControlRequirements is abstract or, in C++ terminology, pure virtual. It does not implement any of the methods it declares. WebSnap applications use TAbstractControlRequirements descendants such as TControlRequirements (see page 6425), which provide implementations for these methods.

See Also

TAdapterControlGroup (see page 6341)

TAdapterDataDisplay (see page 6354)

TAdapterForm (see page 6404)

TControlRequirements (see page 6425)

62.1.1.1 TAbstractControlRequirements Members

The following tables list the members exposed by TAbstractControlRequirements.

Public Methods

	Name	Description
	DefineFunction (see page 6312)	Adds the declaration of a function to those that this control requirements object stores.
	DefineVariable (see page 6312)	Adds the declaration of a variable to those that this control requirements object stores.
	IsFunctionDefined (see page 6313)	Indicates whether a function with the specified name has already been added to the list of control requirements.
	IsVariableDefined (see page 6313)	Indicates whether a variable with the specified name has already been added to the list of control requirements.
	RequiresMultipartForm (see page 6314)	Stores the fact that the generated HTML form should be multipart.

62.1.1.2 TAbstractControlRequirements Methods

The methods of the TAbstractControlRequirements class are listed here.

Public Methods

	Name	Description
	DefineFunction (see page 6312)	Adds the declaration of a function to those that this control requirements object stores.
	DefineVariable (see page 6312)	Adds the declaration of a variable to those that this control requirements object stores.
	IsFunctionDefined (see page 6313)	Indicates whether a function with the specified name has already been added to the list of control requirements.
	IsVariableDefined (see page 6313)	Indicates whether a variable with the specified name has already been added to the list of control requirements.
	RequiresMultipartForm (see page 6314)	Stores the fact that the generated HTML form should be multipart.

62.1.1.2.1 TAbstractControlRequirements.DefineFunction Method

Adds the declaration of a function to those that this control requirements object stores.

Pascal

```
procedure DefineFunction(const AName: string; const ABody: string); virtual; abstract;
```

C++

```
virtual __fastcall DefineFunction(const UnicodeString AName, const UnicodeString ABody) = 0;
```

Description

DefineFunction stores the declaration of a function that has the name AName, where ABody is the text of the function body.

AName is the name of the function. This name is one of a standard set that the adapter form knows to call under specific circumstances. For example, the name can be the standard name of the function to generate an HTML button.

ABody is the body of the specified function. This value is typically customized to reflect the properties of a specific control in the form.

See Also

IsFunctionDefined (see page 6313)

DefineVariable (see page 6312)

62.1.1.2.2 TAbstractControlRequirements.DefineVariable Method

Adds the declaration of a variable to those that this control requirements object stores.

Pascal

```
procedure DefineVariable(const AName: string; const AValue: string; AAdapter: Boolean);
virtual; abstract;
```

C++

```
virtual __fastcall DefineVariable(const UnicodeString AName, const UnicodeString AValue,
Boolean AAdapter) = 0;
```

Description

DefineVariable stores the name and value of a variable declaration.

AName is the name of the variable.

AValue is the value to assign to the variable.

AAdapter indicates whether this variable is the one that declares the adapter object whose field a control represents or whose set of fields a control group represents.

See Also

DefineFunction (see page 6312)

IsVariableDefined (see page 6313)

Adapter (see page 6352)

62.1.1.2.3 TAbstractControlRequirements.IsFunctionDefined Method

Indicates whether a function with the specified name has already been added to the list of control requirements.

Pascal

```
function IsFunctionDefined(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean IsFunctionDefined(const UnicodeString AName) = 0;
```

Description

IsFunctionDefined returns true if the control requirements object already lists a function with the specified name. That is, IsFunctionDefined returns true if the DefineFunction (see page 6312) method has been called to define the specified function, and false otherwise.

AName is the name of the function.

See Also

DefineFunction (see page 6312)

IsVariableDefined (see page 6313)

62.1.1.2.4 TAbstractControlRequirements.IsVariableDefined Method

Indicates whether a variable with the specified name has already been added to the list of control requirements.

Pascal

```
function IsVariableDefined(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean IsVariableDefined(const UnicodeString AName) = 0;
```

Description

IsVariableDefined returns true if the control requirements object already lists a variable with the specified name. That is, IsVariableDefined returns true if the DefineVariable (see page 6312) method has been called to define a value for the specified variable, and false otherwise.

AName is the name of the variable.

See Also

DefineVariable (see page 6312)

IsFunctionDefined (see page 6313)

62.1.1.2.5 TAbstractControlRequirements.RequiresMultipartForm Method

Stores the fact that the generated HTML form should be multipart.

Pascal

```
procedure RequiresMultipartForm; virtual; abstract;
```

C++

```
virtual __fastcall RequiresMultipartForm() = 0;
```

Description

Web items call this method if they need to be contained in a multipart form (for example, when a field in the form is represented by a reference to another file). A multipart form's HTML declaration includes the attribute 'enctype=multipart/form-data'.

62.1.2 TAbstractFormRequirements Class

Class Hierarchy

Pascal

```
TAbstractFormRequirements = class;
```

C++

```
class TAbstractFormRequirements;
```

File

WebForm

Description

This is class WebForm.TAbstractFormRequirements.

62.1.2.1 TAbstractFormRequirements Members

The following tables list the members exposed by TAbstractFormRequirements.

Public Methods

	Name	Description
	DefineFunction (see page 6315)	This is DefineFunction, a member of class TAbstractFormRequirements.
	DefineVariable (see page 6315)	This is DefineVariable, a member of class TAbstractFormRequirements.
	IsFunctionDefined (see page 6315)	This is IsFunctionDefined, a member of class TAbstractFormRequirements.
	IsVariableDefined (see page 6316)	This is IsVariableDefined, a member of class TAbstractFormRequirements.

62.1.2.2 TAbstractFormRequirements Methods

The methods of the TAbstractFormRequirements class are listed here.

Public Methods

	Name	Description
	DefineFunction (see page 6315)	This is DefineFunction, a member of class TAbstractFormRequirements.
	DefineVariable (see page 6315)	This is DefineVariable, a member of class TAbstractFormRequirements.
	IsFunctionDefined (see page 6315)	This is IsFunctionDefined, a member of class TAbstractFormRequirements.
	IsVariableDefined (see page 6316)	This is IsVariableDefined, a member of class TAbstractFormRequirements.

62.1.2.2.1 TAbstractFormRequirements.DefineFunction Method

Pascal

```
procedure DefineFunction(const AName: string; const ABody: string); virtual; abstract;
```

C++

```
virtual __fastcall DefineFunction(const UnicodeString AName, const UnicodeString ABody) = 0;
```

Description

This is DefineFunction, a member of class TAbstractFormRequirements.

62.1.2.2.2 TAbstractFormRequirements.DefineVariable Method

Pascal

```
procedure DefineVariable(const AName: string; const AValue: string); virtual; abstract;
```

C++

```
virtual __fastcall DefineVariable(const UnicodeString AName, const UnicodeString AValue) = 0;
```

Description

This is DefineVariable, a member of class TAbstractFormRequirements.

62.1.2.2.3 TAbstractFormRequirements.IsFunctionDefined Method

Pascal

```
function IsFunctionDefined(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean IsFunctionDefined(const UnicodeString AName) = 0;
```

Description

This is IsFunctionDefined, a member of class TAbstractFormRequirements.

62.1.2.2.4 TAbstractFormRequirements.IsVariableDefined Method

Pascal

```
function IsVariableDefined(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean IsVariableDefined(const UnicodeString AName) = 0;
```

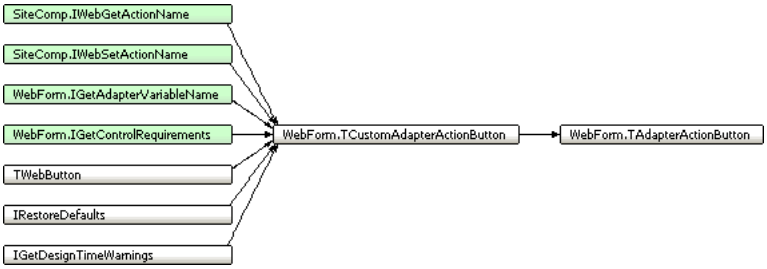
Description

This is IsVariableDefined, a member of class TAbstractFormRequirements.

62.1.3 TAdapterActionButton Class

TAdapterActionButton generates HTML controls for executing adapter actions.

Class Hierarchy



Pascal

```
TAdapterActionButton = class(TCustomAdapterActionButton);
```

C++

```
class TAdapterActionButton : public TCustomAdapterActionButton;
```

File

WebForm

Description

Add TAdapterActionButton to the hierarchy of Web items that an adapter page producer (TAdapterPageProducer) maintains to include a control in the HTML form that executes an adapter action. When the end user clicks the control, it sends a request message that executes the adapter action. Use the ActionName (see page 6318) property to specify the adapter action that the generated control executes.

TAdapterActionButton can generate a variety of controls, including labeled buttons, images that the user can click, and hypertext links. Use the DisplayType (see page 6320) property to specify the type of control you want. Other properties customize the appearance of the control, or indicate when it is included in HTML forms.

See Also

TAdapterPageProducer (see page 1136)

TCustomAdapterAction (see page 5579)

TAdapterForm (see page 6404)

62.1.3.1 TAdapterActionButton Members

The following tables list the members exposed by TAdapterActionButton.

Protected Methods

	Name	Description
	FindAssociatedAction (see page 6433)	This is FindAssociatedAction, a member of class TCustomAdapterActionButton.
	GetActionName (see page 6433)	This is GetActionName, a member of class TCustomAdapterActionButton.
	GetAdapterModeOfAdapter (see page 6433)	This is GetAdapterModeOfAdapter, a member of class TCustomAdapterActionButton.
	GetAdapterVariableName (see page 6433)	This is GetAdapterVariableName, a member of class TCustomAdapterActionButton.
V	GetCaption (see page 6434)	Returns the value of the Caption property.
	GetControlRequirements (see page 6434)	This is GetControlRequirements, a member of class TCustomAdapterActionButton.
	GetDesigntimeWarnings (see page 6434)	This is GetDesigntimeWarnings, a member of class TCustomAdapterActionButton.
	GetHTMLFormVarName (see page 6434)	This is GetHTMLFormVarName, a member of class TCustomAdapterActionButton.
V	GetLayoutAttributes (see page 6435)	Returns the layout object that specifies how the generated control should look.
V	ImplContent (see page 6435)	Provides the underlying implementation for the Content method.
V	ImplGetControlRequirements (see page 6435)	This is ImplGetControlRequirements, a member of class TCustomAdapterActionButton.
V	ImplRestoreDefaults (see page 6436)	This is ImplRestoreDefaults, a member of class TCustomAdapterActionButton.
V	Notification (see page 6436)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 6436)	Returns the Web item to a default state.
	SetActionName (see page 6437)	This is SetActionName, a member of class TCustomAdapterActionButton.
V	SetCaption (see page 6437)	Sets the value of the Caption property.

Public Methods

	Name	Description
V	Create (see page 6431)	Creates and initializes an instance of TCustomAdapterActionButton (see page 6430).
V	Destroy (see page 6432)	Frees an instance of TCustomAdapterActionButton (see page 6430).
	GetActionName (see page 1087)	This is GetActionName, a member of class IWebGetActionName.
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	SetActionName (see page 1115)	This is SetActionName, a member of class IWebSetActionName.

Public Properties

	Name	Description
R	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.

Published Properties

	Name	Description
	ActionName (see page 6318)	Specifies the name of the action taken by the Web button.
	Align (see page 6318)	Specifies the horizontal alignment of the generated HTML control.
	Caption (see page 6319)	Specifies the caption that appears on the button.
	Custom (see page 6319)	Represents a tag option and its value in the generated INPUT tag.
	DisplayColumns (see page 6320)	Indicates the number of columns to use when laying out the generated HTML control.
	DisplayType (see page 6320)	Specifies the DisplayType of the generated HTML control.
	ErrorPageName (see page 6321)	Specifies the name of the page to display when an error occurs executing the action.
	HideOptions (see page 6321)	Controls when the generated HTML element appears in HTML forms.
	ImageHeight (see page 6321)	Specifies the height of the generated element if it is a clickable image.

	ImageProducer (see page 6322)	Specifies the interface that this adapter action button uses to generate images.
	ImageWidth (see page 6322)	Specifies the width of the generated element if it is a clickable image.
	PageName (see page 6323)	Specifies the name of the page to display after successfully executing the action.
	Style (see page 6323)	Adds style attributes to the generated button control.
	StyleRule (see page 6323)	Applies a style in the page producer's style sheet to the button.
	VAlign (see page 6324)	Specifies the vertical alignment of the generated HTML control.

62.1.3.2 TAdapterActionButton Properties

The properties of the TAdapterActionButton class are listed here.

Published Properties

	Name	Description
	ActionName (see page 6318)	Specifies the name of the action taken by the Web button.
	Align (see page 6318)	Specifies the horizontal alignment of the generated HTML control.
	Caption (see page 6319)	Specifies the caption that appears on the button.
	Custom (see page 6319)	Represents a tag option and its value in the generated INPUT tag.
	DisplayColumns (see page 6320)	Indicates the number of columns to use when laying out the generated HTML control.
	DisplayType (see page 6320)	Specifies the DisplayType of the generated HTML control.
	ErrorPageName (see page 6321)	Specifies the name of the page to display when an error occurs executing the action.
	HideOptions (see page 6321)	Controls when the generated HTML element appears in HTML forms.
	ImageHeight (see page 6321)	Specifies the height of the generated element if it is a clickable image.
	ImageProducer (see page 6322)	Specifies the interface that this adapter action button uses to generate images.
	ImageWidth (see page 6322)	Specifies the width of the generated element if it is a clickable image.
	PageName (see page 6323)	Specifies the name of the page to display after successfully executing the action.
	Style (see page 6323)	Adds style attributes to the generated button control.
	StyleRule (see page 6323)	Applies a style in the page producer's style sheet to the button.
	VAlign (see page 6324)	Specifies the vertical alignment of the generated HTML control.

62.1.3.2.1 TAdapterActionButton.ActionName Property

Specifies the name of the action taken by the Web button.

Pascal

```
property ActionName: string;
```

C++

```
__property UnicodeString ActionName;__property UnicodeString ActionName;
```

Description

Use ActionName to get or set the name of the adapter action that executes in response to requests sent when the user clicks this object's generated control. ActionName is the same as the ActionName property of the adapter action object that this control executes.

See Also

Caption

ActionName (see page 5586)

62.1.3.2.2 TAdapterActionButton.Align Property

Specifies the horizontal alignment of the generated HTML control.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align controls where the generated HTML control is positioned horizontally within its parent HTML element. If the adapter action button is included in the column of an adapter grid, this property has no effect unless the associated action has multiple items. It affects the position of the HTML controls for each individual of the items within the grid generated to position them into rows.

Align indicates the desired value of the Align option of the HTML tag for the generated control.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the control wherever it wishes.

See Also

VAlign (see page 6442)

DisplayColumns (see page 6438)

ItemCount (see page 5475)

62.1.3.2.3 TAdapterActionButton.Caption Property

Specifies the caption that appears on the button.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the caption that appears on the generated HTML button. The value of Caption is used as the value of a VALUE parameter on the HTML INPUT tag generated to implement the button.

See Also

Custom

GetCaption

SetCaption

62.1.3.2.4 TAdapterActionButton.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom;
```

C++

```
__property Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button. Each option and its value

has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Caption

Style

62.1.3.2.5 TAdapterActionButton.DisplayColumns Property

Indicates the number of columns to use when laying out the generated HTML control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

An adapter action may represent multiple commands. When the TCustomAdapterActionButton object generates controls for such an action, it must handle the layout of individual items for each of the action's commands. DisplayColumns controls how many items (controls) appear in a row before TCustomAdapterActionButton starts a new row of controls.

If the corresponding adapter action does not represent multiple commands (that is, if its ItemCount property is not greater than 1), the value of DisplayColumns has no effect.

If DisplayColumns is –1, the Web browser controls the layout of the adapter action's items.

See Also

ItemCount (see page 5475)

DisplayType (see page 6439)

62.1.3.2.6 TAdapterActionButton.DisplayType Property

Specifies the DisplayType of the generated HTML control.

Pascal

```
property DisplayType: TCommandHTMLElementType;
```

C++

```
__property TCommandHTMLElementType DisplayType;
```

Description

DisplayType controls the type of HTML element that this Web item generates.

When DisplayType is ctDefault (the default), TCustomAdapterActionButton uses the element type that the associated adapter action suggests. Change DisplayType to generate a different type of control or set of controls.

When DisplayType is ctImage or ctEventImages, you must set the ImageProducer property to a component that can provide the image or images.

See Also

ImageProducer (see page 6441)

Caption

GetDisplayStyle (see page 5457)

62.1.3.2.7 TAdapterActionButton.ErrorPageName Property

Specifies the name of the page to display when an error occurs executing the action.

Pascal

```
property ErrorPageName: string;
```

C++

```
__property UnicodeString ErrorPageName;
```

Description

Use ErrorPageName to indicate the Web page that should appear if the WebSnap application encounters an error when executing the adapter action in response to the user clicking the generated control. This is the name used to identify the Web page in server-side scripts, and appears as the pathinfo portion of the URL for that page if it is published.

See Also

PageName (see page 6441)

62.1.3.2.8 TAdapterActionButton.HideOptions Property

Controls when the generated HTML element appears in HTML forms.

Pascal

```
property HideOptions: TActionButtonHideOptions;
```

C++

```
__property TActionButtonHideOptions HideOptions;
```

Description

HideOptions controls when this Web item generates an HTML control for its associated action. This property is a set of flags that control when the adapter page producer suppresses the controls that this object generates. If HideOptions is an empty set, TCustomAdapterActionButton always generates a control for its associated adapter action.

See Also

GetVisible (see page 5462)

WebEnabled (see page 5473)

HasExecuteAccess (see page 5463)

62.1.3.2.9 TAdapterActionButton.ImageHeight Property

Specifies the height of the generated element if it is a clickable image.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

ImageHeight controls the height of the image that the user can click to execute the associated action. If ImageHeight is –1 (the default), the browser controls the height it uses to display the generated image.

ImageHeight is only used when the value of the DisplayType property is ctImage or ctEventImages.

See Also

ImageProducer (see page 6441)

ImageWidth (see page 6441)

DisplayType (see page 6439)

62.1.3.2.10 TAdapterActionButton.ImageProducer Property

Specifies the interface that this adapter action button uses to generate images.

Pascal

```
property ImageProducer: IActionImageProducer;
```

C++

```
__property IActionImageProducer ImageProducer;
```

Description

Set ImageProducer when the value of the DisplayType is ctImage or ctEventImages. ImageProducer is the interface of the component that supplies the image or images that appear in HTML forms as the control that this Web item generates. When the user clicks on the generated image in the HTML form, the associated action executes.

See Also

DisplayType (see page 6439)

ImageHeight (see page 6440)

ImageWidth (see page 6441)

62.1.3.2.11 TAdapterActionButton.ImageWidth Property

Specifies the width of the generated element if it is a clickable image.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

ImageWidth controls the width of the image that the user can click to execute the associated action. If ImageWidth is –1 (the default), the browser controls the width it uses to display the generated image.

ImageWidth is only used when the value of the DisplayType property is ctImage or ctEventImages.

See Also

ImageProducer (see page 6441)

ImageHeight (see page 6440)

DisplayType (see page 6439)

62.1.3.2.12 TAdapterActionButton.PageName Property

Specifies the name of the page to display after successfully executing the action.

Pascal

```
property PageName: string;
```

C++

```
__property UnicodeString PageName;
```

Description

Use PageName to indicate the Web page that should appear if the WebSnap application successfully executes the adapter action in response to the user clicking the generated control. This is the name used to identify the Web page in server-side scripts, and appears as the pathinfo portion of the URL for that page if it is published.

See Also

ErrorPageName (see page 6439)

62.1.3.2.13 TAdapterActionButton.Style Property

Adds style attributes to the generated button control.

Pascal

```
property Style;
```

C++

```
__property Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom

StyleRule

62.1.3.2.14 TAdapterActionButton.StyleRule Property

Applies a style in the page producer's style sheet to the button.

Pascal

```
property StyleRule;
```

C++

```
__property StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

See Also

Style

Styles

StylesFile

Styles (see page 1157)

StylesFile (see page 1158)

62.1.3.2.15 TAdapterActionButton.VAlign Property

Specifies the vertical alignment of the generated HTML control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign controls where the generated HTML control is positioned vertically within its parent HTML element. VAlign indicates the desired value of the VAlign option of the HTML tag for the generated control. . If the adapter action button is included in the column of an adapter grid, this property has no effect unless the associated action has multiple items. It affects the position of the HTML controls for each of the individual items within the grid generated to position them into rows.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document vertically positions the control wherever it wishes.

See Also

Align (see page 6438)

DisplayColumns (see page 6438)

ItemCount (see page 5475)

62.1.4 TAdapterActionsListHelper Class

TAdapterActionsListHelper assists a display component that represents a collection of adapter action buttons to work with the design-time editors.

Class Hierarchy

Pascal

```
TAdapterActionsListHelper = class(TObject);
```

C++

```
class TAdapterActionsListHelper : public TObject;
```

File

WebForm

Description

AdapterActionsListHelper is a helper object that works with components that generate a collection of controls for executing adapter actions. Such components include TAdapterCommandColumn (see page 6331) and TAdapterCommandGroup (see page 6337). TAdapterActionsListHelper handles common tasks that allow the display component to work with the IDE. These tasks include locating child Web items for specified actions, listing the child Web items (adapter action buttons) of the display component, and specifying the text of menu commands that operate on the set of child Web items.

See Also

TAdapterCommandColumn (see page 6331)

TAdapterCommandGroup (see page 6337)

TAdapterActionButton (see page 6316)

62.1.4.1 TAdapterActionsListHelper Members

The following tables list the members exposed by TAdapterActionsListHelper.

Protected Methods

	Name	Description
	FindAction (see page 6327)	Returns the child Web item that corresponds to the specified adapter action.
	GetActionsList (see page 6327)	Fills a list with the names of all the actions for which there are child Web items.
	GetAddAllFieldsItem (see page 6328)	Returns the string that the IDE uses for the command to add all default actions to the list of child Web items.
	GetAddFieldsDlgCaption (see page 6328)	Returns the string that the IDE uses to label the dialog in which you can select child Web items to add.
	GetAddFieldsItem (see page 6329)	Returns the string that the IDE uses for the command to display the Add Commands dialog.
	GetNewFieldPrefix (see page 6329)	Returns the string that is used to start the names of all automatically-generated Web items.
	GetVisibleActions (see page 6329)	Fills a list with the names of all the actions for which there are child Web items.
	IsActionInUse (see page 6330)	Indicates whether there is a child Web item that corresponds to a specified action.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6326)	Creates and initializes an instance of TAdapterActionsListHelper (see page 6324).
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.

	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	AddDefaultActions (see page 6331)	Indicates whether the display control represents all of the adapter's default actions if you do not explicitly add items to its WebFieldControls property.

62.1.4.2 TAdapterActionsListHelper.Create Constructor

Creates and initializes an instance of TAdapterActionsListHelper (see page 6324).

Pascal

```
constructor Create(AComponent: TComponent; AHelper: TWebContainerComponentHelper);
```

C++

```
__fastcall TAdapterActionsListHelper(TComponent * AComponent, TWebContainerComponentHelper
AHelper);
```

Description

Do not instantiate TAdapterActionsListHelper (see page 6324). It is created by display components that use it to handle their interactions with the IDE.

AComponent is the adapter display component that uses TAdapterActionsListHelper (see page 6324) to interact with the IDE. This component is a Web item, such as TAdapterCommandColumn (see page 6331) or TAdapterCommandGroup (see page 6337), that assembles a set of HTML controls for executing adapter actions.

AHelper is the helper object that ACompnent uses to manage its list of child Web items.

See Also

TAdapterCommandColumn (see page 6331)

TAdapterCommandGroup (see page 6337)

62.1.4.3 TAdapterActionsListHelper Methods

The methods of the TAdapterActionsListHelper class are listed here.

Protected Methods

	Name	Description
	FindAction (see page 6327)	Returns the child Web item that corresponds to the specified adapter action.
	GetActionsList (see page 6327)	Fills a list with the names of all the actions for which there are child Web items.
	GetAddAllFieldsItem (see page 6328)	Returns the string that the IDE uses for the command to add all default actions to the list of child Web items.
	GetAddFieldsDlgCaption (see page 6328)	Returns the string that the IDE uses to label the dialog in which you can select child Web items to add.
	GetAddFieldsItem (see page 6329)	Returns the string that the IDE uses for the command to display the Add Commands dialog.
	GetNewFieldPrefix (see page 6329)	Returns the string that is used to start the names of all automatically-generated Web items.
	GetVisibleActions (see page 6329)	Fills a list with the names of all the actions for which there are child Web items.
	IsActionInUse (see page 6330)	Indicates whether there is a child Web item that corresponds to a specified action.

62.1.4.3.1 TAdapterActionsListHelper.FindAction Method

Returns the child Web item that corresponds to the specified adapter action.

Pascal

```
function FindAction(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindAction(const UnicodeString AName);
```

Description

FindAction searches through the list of child Web items for a component that corresponds to the specified adapter action.

AName is the name of the adapter action to locate.

FindAction returns the child Web item (typically a TAdapterActionButton (see page 6316) instance) that generates a control for the specified action. If there is no child Web item for the specified action, FindAction returns nil (Delphi) or NULL (C++).

See Also

GetActionsList (see page 6327)

GetVisibleActions (see page 6329)

IsActionInUse (see page 6330)

ActionName (see page 6438)

62.1.4.3.2 TAdapterActionsListHelper.GetActionsList Method

Fills a list with the names of all the actions for which there are child Web items.

Pascal

```
procedure GetActionsList(List: TStrings);
```

C++

```
__fastcall GetActionsList(TStrings List);
```

Description

GetActionsList searches through the variables that have been defined for child Web items that represent adapter actions. It adds the names of any actions it finds to the list, along with the class of the Web item that represents each action.

List is the list to fill with the names of adapter actions for which there are child Web items.

62.1.4.3.3 TAdapterActionsListHelper.GetAddAllFieldsItem Method

Returns the string that the IDE uses for the command to add all default actions to the list of child Web items.

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddAllFieldsItem();
```

Description

The IDE calls GetAddAllFieldsItem to customize the label of the command that adds all the default items to the list of child Web items. Because TAdapterActionsListHelper (see page 6324) is specialized for controls that contain adapter action buttons, it returns the string 'Add All Commands'.

GetAddFieldsItem (see page 6329)

GetNewFieldPrefix (see page 6329)

62.1.4.3.4 TAdapterActionsListHelper.GetAddFieldsDlgCaption Method

Returns the string that the IDE uses to label the dialog in which you can select child Web items to add.

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsDlgCaption();
```

Description

The IDE calls GetAddFieldsDlgCaption to label the dialog that lists available child Web items. Because TAdapterActionsListHelper (see page 6324) is specialized for controls that contain adapter action buttons, it returns the string 'Add Commands'.

See Also

GetAddAllFieldsItem (see page 6328)

GetAddFieldsItem (see page 6329)

GetNewFieldPrefix (see page 6329)

62.1.4.3.5 TAdapterActionsListHelper.GetAddFieldsItem Method

Returns the string that the IDE uses for the command to display the Add Commands dialog.

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsItem();
```

Description

The IDE calls GetAddFieldsItem to customize the label of the command that brings up a dialog where you can select child Web items to add. Because TAdapterActionsListHelper (see page 6324) is specialized for controls that contain adapter action buttons, it returns the string 'Add Commands ...'.

See Also

GetAddFieldsDlgCaption (see page 6328)

GetAddAllFieldsItem (see page 6328)

GetNewFieldPrefix (see page 6329)

62.1.4.3.6 TAdapterActionsListHelper.GetNewFieldPrefix Method

Returns the string that is used to start the names of all automatically-generated Web items.

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall UnicodeString GetNewFieldPrefix();
```

Description

When the IDE adds new child Web items, it generates names of the components it adds. Because TAdapterActionsListHelper (see page 6324) is specialized for controls that contain adapter action buttons, the names of those TAdapterActionButton (see page 6316) components are generated by prepending the string that this method returns to the name of the action the button executes.

GetNewFieldPrefix returns the string 'Cmd'.

GetAddAllFieldsItem (see page 6328)

GetAddFieldsItem (see page 6329)

62.1.4.3.7 TAdapterActionsListHelper.GetVisibleActions Method

Fills a list with the names of all the actions for which there are child Web items.

Pascal

```
function GetVisibleActions: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleActions();
```

Description

GetVisibleActions returns the list of child Web items that generate HTML controls for the associated component. Each element in this list is an adapter action button (TAdapterActionButton (see page 6316) object).

If you have explicitly added child Web items, the returned list contains the child Web items you added. Otherwise, if the AddDefaultActions (see page 6331) property is true, the list contains adapter action buttons for the default actions of the adapter. If AddDefaultActions (see page 6331) is false, the list is empty.

IsActionInUse (see page 6330)

TAdapterActionButton (see page 6316)

AddDefaultActions (see page 6331)

62.1.4.3.8 TAdapterActionsListHelper.IsActionInUse Method

Indicates whether there is a child Web item that corresponds to a specified action.

Pascal

```
function IsActionInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsActionInUse(const UnicodeString AName);
```

Description

IsActionInUse indicates whether the associated component already has a child Web item that executes a specified adapter action.

AName is the name of the adapter action.

IsActionInUse returns true if there is a child Web item that executes the specified action, false if there is no child Web item for the action.

62.1.4.4 TAdapterActionsListHelper Properties

The properties of the TAdapterActionsListHelper class are listed here.

Public Properties

	Name	Description
	AddDefaultActions (see page 6331)	Indicates whether the display control represents all of the adapter's default actions if you do not explicitly add items to its WebFieldControls property.

62.1.4.4.1 TAdapterActionsListHelper.AddDefaultActions Property

Indicates whether the display control represents all of the adapter's default actions if you do not explicitly add items to its WebFieldControls property.

Pascal

```
property AddDefaultActions: Boolean;
```

C++

```
__property Boolean AddDefaultActions;
```

Description

AddDefaultCommands determines what controls appear in the generated set of HTML controls if you do not explicitly add any adapter action buttons to the WebFieldControls property of the component that uses this TAdapterActionsListHelper (see page 6324). When AddDefaultCommands is true (the default), the associated component automatically adds controls for every default action of its adapter when you do not explicitly set the WebFieldControls property. When AddDefaultCommands is false, the associated component only generates controls if you explicitly add them to the WebFieldControls property. AddDefaultCommands must be false to allow an empty column.
