TAdapterCommandColumn generates a column of action controls in an adapter grid.

Class Hierarchy

Pascal

```
TAdapterCommandColumn = class(TCustomAdapterCommandColumn);
```

C++

```
class TAdapterCommandColumn : public TCustomAdapterCommandColumn;
```

File

WebForm

Description

Add TAdapterCommandColumn as a child Web item to an adapter grid (TAdapterGrid (see page 6419)). TAdapterCommandColumn adds a column to the grid that contains controls that execute adapter actions. Specify the controls in the cells of this column by adding adapter action buttons (TAdapterActionButton (see page 6316) objects) as child Web items of the TAdapterCommandColumn object. Each cell in the column contains all the adapter action buttons you add as child Web items. For each row in the grid, the column contains duplicates of the same set of adapter action buttons.

Use the TAdapterCommandColumn properties to specify which adapter action buttons appear in the column and to customize their layout and appearance. These properties include:

The AddDefaultCommands (see page 6334), WebFieldControls, and VisibleCommands (see page 6453) properties, which specify which adapter action buttons appear in the column.

The Caption (see page 6334) and CaptionAttributes (see page 6335) properties, which determine the appearance of the label at the top of the column.

The Align (see page 6334), VAlign (see page 6337), and DisplayColumns (see page 6335) properties, which determine the layout of controls inside each cell.

The Style (see page 6336) and StyleRule (see page 6336) properties, which let you apply a style from a stylesheet to the column.

See Also

TAdapterGrid (see page 6419)

TAdapterEditColumn (see page 6387)

TAdapterDisplayColumn (see page 6364)

TAdapterActionButton (see page 6316)

62.1.5.1 TAdapterCommandColumn Members

The following tables list the members exposed by TAdapterCommandColumn.

Protected Methods

	Name	Description
	FormatColumnData (see page 6445)	Generates the HTML for the cells in the column that contain controls to execute actions.
	FormatColumnHeading (see page 6446)	Generates the HTML for the table header cell for this column.
	GetAdapterDisplayCharacteristics (see page 6446)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterCommandColumn.
V	GetLayoutAttributes (see page 6446)	Returns an object that specifies how the generated group of controls should look.
V	ImplCanAddClass (see page 6447)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 6447)	Provides the underlying implementation for the Content method.
	NotifyAdapterChange (see page 6448)	Responds to changes that affect the associated adapter.

Protected Properties

	Name	Description
R	AdapterActionsListHelper (see page 6449)	Identifies the helper object that enables this component to work with the editor at design time.

Public Methods

	Name	Description
	Create (see page 6444)	Creates and initializes an instance of TCustomAdapterCommandColumn (see page 6442).
	Destroy (see page 6445)	Frees an instance of TCustomAdapterCommandColumn (see page 6442).
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterDisplayCharacteristics (see page 1019)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAddAllFieldsItem (see page 6080)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 6080)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 6080)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetNewFieldPrefix (see page 6081)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	NotifyAdapterChange (see page 1058)	Responds when the adapter changes.

Public Properties

	Name	Description
	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
	VisibleCommands (see page 6453)	Lists the child Web items that generate controls that appear in cells of the column.

Published Properties

	Name	Description
	AddDefaultCommands (see page 6334)	Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.
	Align (see page 6334)	Specifies the horizontal alignment of the action control buttons within the column.
	Caption (see page 6334)	Specifies the text label that appears at the top of the column.
	CaptionAttributes (see page 6335)	Specifies the attributes of the Caption property.
	Custom (see page 6335)	Represents a tag option and its value.
	DisplayColumns (see page 6335)	Specifies the number of adapter action buttons that can appear in a single row.
	Style (see page 6336)	Adds style attributes to the generated caption.
	StyleRule (see page 6336)	Applies a style in the page producer's style sheet to the generated column.
	VAlign (see page 6337)	Specifies the vertical alignment of the action control buttons within the column.

62.1.5.2 TAdapterCommandColumn Properties

The properties of the TAdapterCommandColumn class are listed here.

Published Properties

	Name	Description
	AddDefaultCommands (see page 6334)	Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.
	Align (see page 6334)	Specifies the horizontal alignment of the action control buttons within the column.
	Caption (see page 6334)	Specifies the text label that appears at the top of the column.
	CaptionAttributes (see page 6335)	Specifies the attributes of the Caption property.
	Custom (see page 6335)	Represents a tag option and its value.
	DisplayColumns (see page 6335)	Specifies the number of adapter action buttons that can appear in a single row.
	Style (see page 6336)	Adds style attributes to the generated caption.
	StyleRule (see page 6336)	Applies a style in the page producer's style sheet to the generated column.
	VAlign (see page 6337)	Specifies the vertical alignment of the action control buttons within the column.

62.1.5.2.1 TAdapterCommandColumn.AddDefaultCommands Property

Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.

Pascal

```
property AddDefaultCommands: Boolean;
```

C++

```
__property Boolean AddDefaultCommands;
```

Description

Set AddDefaultCommands property to specify what should appear in the generated column when you do not explicitly add any adapter action buttons to the WebFieldControls property. When AddDefaultCommands is true (the default), the adapter command column automatically adds controls for every default action of the associated adapter if you do not explicitly set the WebFieldControls property. When AddDefaultCommands is false, the adapter command column only generates controls if you explicitly add them to the WebFieldControls property. AddDefaultCommands must be false to allow an empty column.

See Also

WebFieldControls

DefaultWebComponents (see page 5237)

VisibleCommands (see page 6453)

62.1.5.2.2 TAdapterCommandColumn.Align Property

Specifies the horizontal alignment of the action control buttons within the column.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align controls where the child HTML control are positioned horizontally within this column. Align indicates the desired value of the Align option of the HTML tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the control wherever it wishes.

See Also

VAlign (see page 6453)

DisplayColumns (see page 6451)

62.1.5.2.3 TAdapterCommandColumn.Caption Property

Specifies the text label that appears at the top of the column.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to get or set the caption for the column in the adapter grid. The caption is the text label that appears at the top of the column.

To change the appearance or layout of the caption, use the CaptionAttribute property.

See Also

CaptionAttributes (see page 6451)

62.1.5.2.4 TAdapterCommandColumn.CaptionAttributes Property

Specifies the attributes of the Caption property.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the column caption.

See Also

Caption (see page 6450)

62.1.5.2.5 TAdapterCommandColumn.Custom Property

Represents a tag option and its value.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to add one or more options to the tag that surrounds the column. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces.

TCustomAdapterCommandColumn inserts the Custom string into the HTML tag when it generates its content.

See Also

Style (see page 6452)

StyleRule (see page 6452)

62.1.5.2.6 TAdapterCommandColumn.DisplayColumns Property

Specifies the number of adapter action buttons that can appear in a single row.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Set DisplayColumns to organize the layout of adapter action buttons when the WebFieldControls property lists more than one adapter action button. TCustomAdapterCommandColumn places the adapter action buttons by rows in the cells of the adapter grid column. DisplayColumns limits the number of controls that can appear in a single row within each column cell. If the WebFieldControls property lists more adapter action buttons than DisplayColumns, then the cell contains multiple rows of controls.

See Also

WebFieldControls

62.1.5.2.7 TAdapterCommandColumn.Style Property

Adds style attributes to the generated caption.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated column. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the HTML tag that generates the column as the value of a STYLE option.

Note: Style affects the contents of the column cells. To specify display characteristics of the column's caption, use the CaptionAttributes property instead.

See Also

Custom (see page 6451)

StyleRule (see page 6452)

CaptionAttributes (see page 6451)

62.1.5.2.8 TAdapterCommandColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated column.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated column. The value

of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

See Also

Custom (see page 6451)

Style (see page 6452)

Styles (see page 1157)

StylesFile (see page 1158)

62.1.5.2.9 TAdapterCommandColumn.VAlign Property

Specifies the vertical alignment of the action control buttons within the column.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign controls where the child HTML control are positioned vertically within the cells of this column. VAlign indicates the desired value of the VAlign option of the HTML tag.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document vertically positions the control wherever it wishes.

See Also

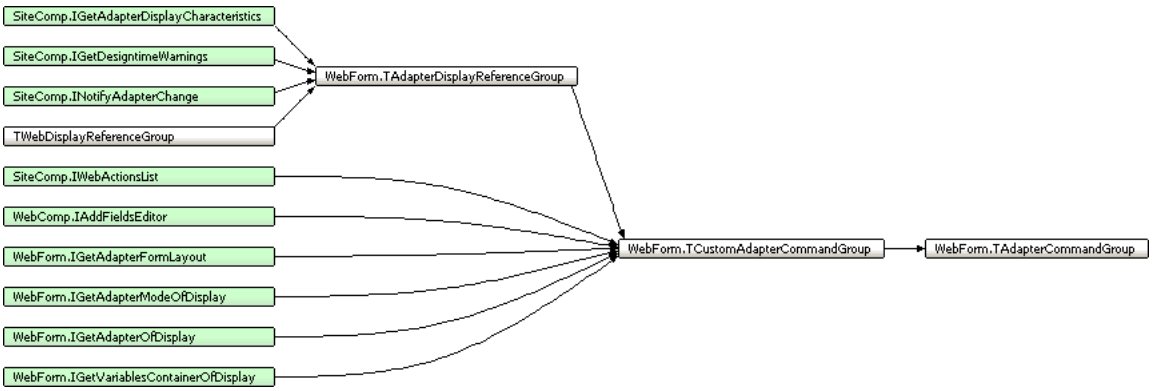
Align (see page 6450)

DisplayColumns (see page 6451)

62.1.6 TAdapterCommandGroup Class

TAdapterCommandGroup generates a group of buttons or other HTML elements that executes adapter actions.

Class Hierarchy



Pascal

```
TAdapterCommandGroup = class(TCustomAdapterCommandGroup);
```

C++

```
class TAdapterCommandGroup : public TCustomAdapterCommandGroup;
```

File

WebForm

Description

TAdapterCommandGroup is added to a TAdapterPageProducer to cause the page producer to generate a group of HTML elements that executes adapter actions. First add a TAdapterForm (see page 6404) to the TAdapterPageProducer and then add TAdapterCommandGroup as a child of TAdapterForm (see page 6404). TAdapterCommandGroup does not reference an adapter directly. Instead, it references a component that references an adapter. Typically, TAdapterCommandGroup references either TAdapterGrid (see page 6419) or TAdapterFieldGroup (see page 6399). TAdapterCommandGroup contains child components, such as TAdapterActionButton (see page 6316), that are responsible for rendering individual HTML elements, such as buttons. By default, TAdapterCommandGroup will automatically add one child component for each action in the adapter.

See Also

TAdapterDisplayReferenceGroup (see page 6381)

TCustomAdapterCommandGroup (see page 6454)

TAdapterForm (see page 6404)

TAdapterFieldGroup (see page 6399)

TAdapterGrid (see page 6419)

TAdapterActionButton (see page 6316)

62.1.6.1 TAdapterCommandGroup Members

The following tables list the members exposed by TAdapterCommandGroup.

Protected Methods

	Name	Description
	AdapterChange (see page 6383)	Responds to changes in the adapter on which the controls in this group operate.
	DisplayComponentChange (see page 6384)	Responds when the DisplayComponent (see page 6386) property changes.
	GetAdapter (see page 6457)	This is GetAdapter, a member of class TCustomAdapterCommandGroup.
	GetAdapterDisplayCharacteristics (see page 6384)	Indicates the display characteristics of the HTML this component generates.
	GetAdapterFormLayout (see page 6457)	This is GetAdapterFormLayout, a member of class TCustomAdapterCommandGroup.
	GetAdapterModeOfAdapter (see page 6457)	Returns the adapter mode defined by the adapter component.
	GetAdapterModeOfDisplay (see page 6457)	Returns the adapter mode defined by the TAdapterPageProducer components.
	GetDesigntimeWarnings (see page 6384)	Populates a design-time warnings object with any warnings that the reference group needs to emit.
	ImplCanAddClass (see page 6458)	Checks the inheritance of the given component.
	ImplContent (see page 6458)	Lays out the buttons for the command group using the TAdapterFormLayout (see page 6408) component.
	NotifyAdapterChange (see page 6385)	Responds when other components notify this one of changes to the adapter.
	OnDisplayComponentChange (see page 6385)	Responds when the associated display component changes.
	SetWebDisplayComponent (see page 6386)	Sets the value of the DisplayComponent (see page 6386) property.

Protected Properties

	Name	Description
	Adapter (see page 6459)	Provides read-only access to the Adapter that this command group uses.
	AdapterActionsListHelper (see page 6459)	Provides read-only access to a helper object that implements design-time editing functions on behalf of this component.

Public Methods

	Name	Description
	Create (see page 6382)	Creates and initializes an instance of TAdapterDisplayReferenceGroup (see page 6381).
	Create (see page 6456)	Creator for TCustomAdapterCommandGroup (see page 6454).
	Destroy (see page 6382)	Frees an instance of TAdapterDisplayReferenceGroup (see page 6381).
	Destroy (see page 6456)	Calls the base class version, and then frees the memory used by the TAdapterActionsListHelper (see page 6324) component.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapter (see page 6513)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterDisplayCharacteristics (see page 1019)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAdapterFormLayout (see page 6511)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.
	GetAdapterModeOfAdapter (see page 6512)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 6512)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAddAllFieldsItem (see page 6080)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 6080)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 6080)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetNewFieldPrefix (see page 6081)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	NotifyAdapterChange (see page 1058)	Responds when the adapter changes.

Public Properties

	Name	Description
	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
	VisibleCommands (see page 6460)	Provides read-only access to the TWebComponentList (see page 6025) that stores the list of visible components.

Published Properties

	Name	Description
	AddDefaultCommands (see page 6340)	Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.
	Custom (see page 6340)	Provides read and write access to the custom HTML element attributes, such as VAlign="top."
	DisplayComponent (see page 6340)	Associates the group with a component that generates the display controls.
	Style (see page 6341)	Provides read and write access to the internal string that stores the CSS style, such as making the background color red.
	StyleRule (see page 6341)	Provides read and write access to the internal string that stores the CSS style rule for the control group.

62.1.6.2 TAdapterCommandGroup Properties

The properties of the TAdapterCommandGroup class are listed here.

Published Properties

	Name	Description
	AddDefaultCommands (see page 6340)	Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.
	Custom (see page 6340)	Provides read and write access to the custom HTML element attributes, such as VAlign="top."
	DisplayComponent (see page 6340)	Associates the group with a component that generates the display controls.
	Style (see page 6341)	Provides read and write access to the internal string that stores the CSS style, such as making the background color red.
	StyleRule (see page 6341)	Provides read and write access to the internal string that stores the CSS style rule for the control group.

62.1.6.2.1 TAdapterCommandGroup.AddDefaultCommands Property

Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.

Pascal

```
property AddDefaultCommands: Boolean;
```

C++

```
__property Boolean AddDefaultCommands;
```

Description

The AddDefaultCommands property provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.

62.1.6.2.2 TAdapterCommandGroup.Custom Property

Provides read and write access to the custom HTML element attributes, such as VAlign="top."

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

The Custom property provides read and write access to the custom HTML element attributes, such as VAlign="top." The content of this string will be written as it is when generating HTML.

62.1.6.2.3 TAdapterCommandGroup.DisplayComponent Property

Associates the group with a component that generates the display controls.

Pascal

```
property DisplayComponent: TComponent;
```

C++

```
__property TComponent * DisplayComponent;
```

Description

Use DisplayComponent to associate the group of controls with a Web item that generates the display elements those controls influence. Typical values of DisplayComponent are TAdapterGrid or TAdapterFieldGroup.

TAdapterDisplayReferenceGroup descendants use the value of DisplayComponent to access the display controls to influence, and to access the adapter, whose information is displayed or manipulated.

See Also

TAdapterGrid (see page 6419)

TAdapterFieldGroup (see page 6399)

62.1.6.2.4 TAdapterCommandGroup.Style Property

Provides read and write access to the internal string that stores the CSS style, such as making the background color red.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

The Style property provides read and write access to the internal string that stores the CSS style, such as making the background color red.

62.1.6.2.5 TAdapterCommandGroup.StyleRule Property

Provides read and write access to the internal string that stores the CSS style rule for the control group.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

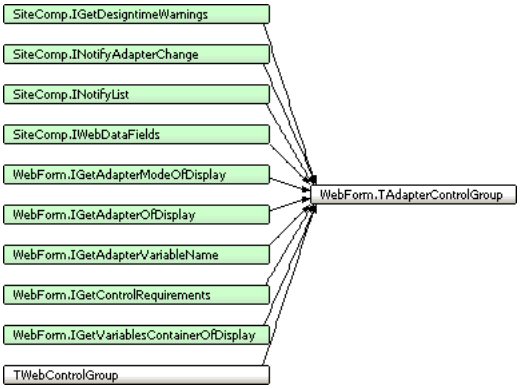
Description

The StyleRule property provides read and write access to the internal string that stores the CSS style rule for the control group. This property is used to reference a CSS style defined in TAdapterPageProducer. ::Styles.

62.1.7 TAdapterControlGroup Class

TAdapterControlGroup is a container for adapter display field components such as TAdapterDisplayField (see page 6371) or TAdapterDisplayColumn (see page 6364).

Class Hierarchy



Pascal

```
TAdapterControlGroup = class(TWebControlGroup, IWebDataFields, INotifyAdapterChange,
IGetAdapterVariableName, IGetAdapterOfDisplay, INotifyList, IGetVariablesContainerOfDisplay,
IGetDesigntimeWarnings, IGetAdapterModeOfDisplay, IGetControlRequirements);
```

C++

```
class TAdapterControlGroup : public TWebControlGroup, public IWebDataFields, public
INotifyAdapterChange, public IGetAdapterVariableName, public IGetAdapterOfDisplay, public
INotifyList, public IGetVariablesContainerOfDisplay, public IGetDesigntimeWarnings, public
IGetAdapterModeOfDisplay, public IGetControlRequirements;
```

File

WebForm

Description

Do not create instances of TAdapterControlGroup. Instead, use a descendant of TAdapterControlGroup that manages particular types of display field components. These descendants include TAdapterFieldGroup (see page 6399) and TAdapterGrid (see page 6419).

Descendants of TAdapterControlGroup are children of TAdapterPageProducer form components. Use the Web page editor to add TAdapterControlGroup descendants to an adapter form when building an HTML form.

See Also

TAdapterFieldGroup (see page 6399)

TAdapterGrid (see page 6419)

TAdapterPageProducer (see page 1136)

TAdapterForm (see page 6404)

TAdapter (see page 5190)

62.1.7.1 TAdapterControlGroup Members

The following tables list the members exposed by TAdapterControlGroup.

Protected Methods

	Name	Description
	AdapterChange (see page 6345)	Responds when the adapter associated with this control group changes.

	AddNotify (see page 6345)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
	CreateDefaultFields (see page 6346)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
	FindField (see page 6346)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 6346)	Returns the value of the Adapter (see page 6352) property.
	GetAdapterModeOfAdapter (see page 6347)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 6347)	Returns the value of the AdapterMode (see page 6353) property.
	GetAdapterVariableName (see page 6348)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetControlRequirements (see page 6348)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
	GetDesigntimeWarnings (see page 6348)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 6349)	Fills a string list with the names of all of the associated adapter's fields.
	GetVisibleFields (see page 6349)	Returns the value of the VisibleFields (see page 6354) property.
V	ImplGetControlRequirements (see page 6350)	Provides the underlying implementation for the GetControlRequirements (see page 6348) method.
	IsFieldInUse (see page 6350)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
V	Notification (see page 6350)	Updates the TAdapterControlGroup (see page 6341) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 6351)	Responds when the control group's adapter notifies it of a change.
	RemoveNotify (see page 6351)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 6352)	Sets the value of the Adapter (see page 6352) property.

Public Methods

	Name	Description
V	Create (see page 6343)	Creates and initializes an instance of TAdapterControlGroup (see page 6341).
V	Destroy (see page 6344)	Frees an instance of TAdapterControlGroup (see page 6341).
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.

Public Properties

	Name	Description
	Adapter (see page 6352)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 6353)	Specifies the mode of the adapter that the controls in the group support.
R	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	AddDefaultFields (see page 6353)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
R	VisibleFields (see page 6354)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.

62.1.7.2 TAdapterControlGroup.Create Constructor

Creates and initializes an instance of TAdapterControlGroup (see page 6341).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterControlGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TAdapterControlGroup (see page 6341) at runtime. TAdapterControlGroup (see page 6341) objects added at design time are instantiated automatically.

See Also

Owner

62.1.7.3 TAdapterControlGroup.Destroy Destructor

Frees an instance of TAdapterControlGroup (see page 6341).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterControlGroup();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for that the object is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

62.1.7.4 TAdapterControlGroup Methods

The methods of the TAdapterControlGroup class are listed here.

Protected Methods

	Name	Description
	AdapterChange (see page 6345)	Responds when the adapter associated with this control group changes.
	AddNotify (see page 6345)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
	CreateDefaultFields (see page 6346)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
	FindField (see page 6346)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 6346)	Returns the value of the Adapter (see page 6352) property.
	GetAdapterModeOfAdapter (see page 6347)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 6347)	Returns the value of the AdapterMode (see page 6353) property.
	GetAdapterVariableName (see page 6348)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetControlRequirements (see page 6348)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
	GetDesigntimeWarnings (see page 6348)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 6349)	Fills a string list with the names of all of the associated adapter's fields.
	GetVisibleFields (see page 6349)	Returns the value of the VisibleFields (see page 6354) property.
	ImplGetControlRequirements (see page 6350)	Provides the underlying implementation for the GetControlRequirements (see page 6348) method.
	IsFieldInUse (see page 6350)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
	Notification (see page 6350)	Updates the TAdapterControlGroup (see page 6341) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 6351)	Responds when the control group's adapter notifies it of a change.
	RemoveNotify (see page 6351)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 6352)	Sets the value of the Adapter (see page 6352) property.

62.1.7.4.1 TAdapterControlGroup.AdapterChange Method

Responds when the adapter associated with this control group changes.

Pascal

```
procedure AdapterChange; virtual;
```

C++

```
virtual __fastcall AdapterChange();
```

Description

AdapterChange is called automatically when the value of the Adapter (see page 6352) property changes, or when the application makes changes to the adapter that is the value of the Adapter (see page 6352) property.

AdapterChange performs the following tasks to respond to the change:

Updates the list of default adapter display field components that is the value of VisibleFields (see page 6354) when you have not explicitly assigned child Web items.

Notifies all of the child Web items listed in the WebFieldControls property that the adapter has changed.

Notifies any objects that registered interest by calling the AddNotify (see page 6345) method that the adapter has changed.

See Also

Adapter (see page 6352)

AddNotify (see page 6345)

WebFieldControls

VisibleFields (see page 6354)

62.1.7.4.2 TAdapterControlGroup.AddNotify Method

Registers interest so that the adapter control group notifies an object of changes to its adapter.

Pascal

```
procedure AddNotify(ANotify: TObject);
```

C++

```
__fastcall AddNotify(TObject * ANotify);
```

Description

Other Web items in the adapter form call AddNotify to register an interest in when the control group's adapter changes. AddNotify adds the specified object to an internal list of interested objects. When the Adapter (see page 6352) property changes, it calls every object in this internal list to notify it of the change.

There is no need for the child Web items listed in the WebFieldControls property to call AddNotify. These objects are notified automatically.

ANotify is the object that registers an interest in change notifications.

See Also

AdapterChange (see page 6345)

RemoveNotify (see page 6351)

Adapter (see page 6352)

62.1.7.4.3 TAdapterControlGroup.CreateDefaultFields Method

Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.

Pascal

```
procedure CreateDefaultFields;
```

C++

```
__fastcall CreateDefaultFields();
```

Description

TAdapterControlGroup (see page 6341) calls CreateDefaultFields internally when it needs to generate child Web items for the fields of the adapter that the Adapter (see page 6352) property specifies. The resulting list becomes the value of the VisibleFields (see page 6354) property if you have not explicitly added any child Web items to the WebFieldControls property and AddDefaultFields (see page 6353) is true.

See Also

VisibleFields (see page 6354)

Adapter (see page 6352)

AddDefaultFields (see page 6353)

WebFieldControls

62.1.7.4.4 TAdapterControlGroup.FindField Method

Returns the child Web item that represents the value of a specified adapter field.

Pascal

```
function FindField(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindField(const UnicodeString AName);
```

Description

FindField searches the list of child Web items for one that represents the specified adapter field. If it finds a Web item that represents the specified field, it returns that adapter display field component. Otherwise, FindField returns nil (Delphi) or NULL (C++).

AName is the name of a field that the adapter control group's adapter contains.

See Also

VisibleFields (see page 6354)

GetFieldsList (see page 6349)

Adapter (see page 6352)

62.1.7.4.5 TAdapterControlGroup.GetAdapter Method

Returns the value of the Adapter (see page 6352) property.

Pascal

```
function GetAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetAdapter();
```

Description

GetAdapter is the protected read implementation of the Adapter (see page 6352) property.

See Also

Adapter (see page 6352)

62.1.7.4.6 TAdapterControlGroup.GetAdapterModeOfAdapter Method

Returns the current mode of the control group's adapter.

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall UnicodeString GetAdapterModeOfAdapter();
```

Description

GetAdapterModeOfAdapter returns the current mode of the adapter that the Adapter (see page 6352) property specifies. If the adapter's mode is not currently set, GetAdapterModeOfAdapter returns the value of the AdapterMode (see page 6353) property.

See Also

AdapterMode (see page 6353)

Adapter (see page 6352)

GetAdapterModeOfDisplay (see page 6347)

62.1.7.4.7 TAdapterControlGroup.GetAdapterModeOfDisplay Method

Returns the value of the AdapterMode (see page 6353) property.

Pascal

```
function GetAdapterModeOfDisplay: string;
```

C++

```
__fastcall UnicodeString GetAdapterModeOfDisplay();
```

Description

GetAdapterModeOfDisplay returns the value of the AdapterMode (see page 6353) property. This is the value that influences the type and behavior of the HTML controls that child Web items generate. It may differ from the current mode of the control group's adapter, which the GetAdapterModeOfAdapter (see page 6347) method returns.

See Also

AdapterMode (see page 6353)

GetAdapterModeOfAdapter (see page 6347)

62.1.7.4.8 TAdapterControlGroup.GetAdapterVariableName Method

Returns the variable name that refers to the control group's adapter in server-side script.

Pascal

```
function GetAdapterVariableName: string;
```

C++

```
__fastcall UnicodeString GetAdapterVariableName();
```

Description

TAdapterControlGroup (see page 6341) uses GetAdapterVariableName internally when generating server-side script that refers to its adapter.

See Also

Adapter (see page 6352)

62.1.7.4.9 TAdapterControlGroup.GetControlRequirements Method

Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.

Pascal

```
procedure GetControlRequirements(ARequirements: TAbstractControlRequirements);
```

C++

```
__fastcall GetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

The adapter form object that includes this control group as a child Web item calls GetControlRequirements to obtain declarations for the variables and functions that the control group uses to assemble HTML controls for its adapter's fields.

ARequirements is the control requirements object that collects a list of required variables and functions.

GetControlRequirements simply calls the ImplGetControlRequirements (see page 6350) method, which adds a variable that represents the control group's adapter to ARequirements if it is not already there.

See Also

ImplGetControlRequirements (see page 6350)

TAdapterForm (see page 6404)

GetAdapterVariableName (see page 6348)

62.1.7.4.10 TAdapterControlGroup.GetDesigntimeWarnings Method

Populates a design-time warnings object with any warnings that the adapter control group needs to emit.

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

GetDesigntimeWarnings is called automatically at design time when the adapter page producer is assembling the current version of its HTML form. This gives the adapter control group an opportunity to add messages to the version of the HTML form that appears at design time, describing problems that you can rectify.

If the Adapter (see page 6352) property has not been set, GetDesigntimeWarnings adds a message that indicates this omission. Otherwise, GetDesigntimeWarnings adds a reference to Adapter (see page 6352) to the design-time warnings object so that it can obtain any warning messages that the adapter wants to add.

AWarnings is the design-time warnings object that assembles design-time warning messages that appear in the HTML form.

See Also

Adapter (see page 6352)

TAdapterPageProducer (see page 1136)

62.1.7.4.11 TAdapterControlGroup.GetFieldsList Method

Fills a string list with the names of all of the associated adapter's fields.

Pascal

```
procedure GetFieldsList(List: TStrings);
```

C++

```
__fastcall GetFieldsList(TStrings List);
```

Description

The CreateDefaultFields (see page 6346) method calls GetFieldsList to obtain a list of adapter fields for which it needs to create default child Web items. GetFieldsList obtains a list of the names of its fields from the adapter, and adds them to the specified string list. For any field that is a "default" field (as defined by the adapter), the string in the list is associated with the class of the child Web item that generates a control to represent that field.

List is a string list to fill with the names of (and Web item classes for) the adapter's default fields.

See Also

CreateDefaultFields (see page 6346)

Adapter (see page 6352)

62.1.7.4.12 TAdapterControlGroup.GetVisibleFields Method

Returns the value of the VisibleFields (see page 6354) property.

Pascal

```
function GetVisibleFields: TWebComponentList;
```

C++

```
__fastcall TWebComponentList GetVisibleFields();
```

Description

GetVisibleFields is the protected implementation of the VisibleFields (see page 6354) property.

See Also

VisibleFields (see page 6354)

62.1.7.4.13 TAdapterControlGroup.ImplGetControlRequirements Method

Provides the underlying implementation for the GetControlRequirements (see page 6348) method.

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); virtual;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

The GetControlRequirements (see page 6348) method calls ImplGetControlRequirements to add the variables and functions the control group needs to have declared to the control requirements object. This method adds the requirement of a variable with the name that the GetAdapterVariableName (see page 6348) method returns to represent the adapter whose fields the control group displays.

ARequirements is the control requirements object that collects a list of required variables and functions.

See Also

GetControlRequirements (see page 6348)

GetAdapterVariableName (see page 6348)

62.1.7.4.14 TAdapterControlGroup.IsFieldInUse Method

Indicates whether one of the adapter control group's child Web items represents a specified adapter field.

Pascal

```
function IsFieldInUse(const AName: string): Boolean;
```

C++

```
__fastcall Boolean IsFieldInUse(const UnicodeString AName);
```

Description

IsFieldInUse returns true if one of its child Web items represents the adapter field with the specified name, false otherwise.

AName is the name of a field that the adapter control group's adapter contains.

See Also

FindField (see page 6346)

VisibleFields (see page 6354)

Adapter (see page 6352)

62.1.7.4.15 TAdapterControlGroup.Notification Method

Updates the TAdapterControlGroup (see page 6341) object when components are added to or removed from the application.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation.

In TAdapterControlGroup (see page 6341), Notification checks whether AComponent is the value of the Adapter (see page 6352) property. If so, and Operation is opRemove, Notification sets the Adapter (see page 6352) property to nil (Delphi) or NULL (C++).

See Also

Adapter (see page 6352)

62.1.7.4.16 TAdapterControlGroup.NotifyAdapterChange Method

Responds when the control group's adapter notifies it of a change.

Pascal

```
procedure NotifyAdapterChange(Sender: TComponent);
```

C++

```
__fastcall NotifyAdapterChange(TComponent * Sender);
```

Description

NotifyAdapterChange is called automatically when the application makes changes to the adapter that is the value of the Adapter (see page 6352) property. This method calls the AdapterChange (see page 6345) method, which updates the list of default fields to be represented, and forwards the notification on to other Web items that may need to adjust themselves.

Sender is the component that sent the notification.

See Also

Adapter (see page 6352)

AdapterChange (see page 6345)

62.1.7.4.17 TAdapterControlGroup.RemoveNotify Method

Unregisters interest in changes to the control group's adapter.

Pascal

```
procedure RemoveNotify(ANotify: TObject);
```

C++

```
__fastcall RemoveNotify(TObject * ANotify);
```

Description

Other Web items in the adapter form call RemoveNotify to unregister an interest in when the control group's adapter changes. The object must have previously registered interest by a call to the AddNotify (see page 6345) method. RemoveNotify removes the specified object from the internal list of interested objects.

ANotify is the object that had previously registered an interest in change notifications.

See Also

AdapterChange (see page 6345)

AddNotify (see page 6345)

62.1.7.4.18 TAdapterControlGroup.SetAdapter Method

Sets the value of the Adapter (see page 6352) property.

Pascal

```
procedure SetAdapter(const Value: TComponent);
```

C++

```
__fastcall SetAdapter(const TComponent * Value);
```

Description

SetAdapter is the protected write implementaiton of the Adapter (see page 6352) property.

See Also

Adapter (see page 6352)

62.1.7.5 TAdapterControlGroup Properties

The properties of the TAdapterControlGroup class are listed here.

Public Properties

	Name	Description
	Adapter (see page 6352)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 6353)	Specifies the mode of the adapter that the controls in the group support.
	AddDefaultFields (see page 6353)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
R	VisibleFields (see page 6354)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.

62.1.7.5.1 TAdapterControlGroup.Adapter Property

Specifies the adapter that supplies values to or receives values from the controls in the group.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Set Adapter to link this adapter control group and all its Web items to an adapter component. Each component that the WebFieldControls property lists generates an HTML control that represents the value of one of the adapter's fields.

See Also

GetFieldsList (see page 5549)

GetFieldsList (see page 6349)

AdapterMode (see page 6353)

WebFieldControls

62.1.7.5.2 TAdapterControlGroup.AdapterMode Property

Specifies the mode of the adapter that the controls in the group support.

Pascal

```
property AdapterMode: string;
```

C++

```
__property UnicodeString AdapterMode;
```

Description

Some adapter components support different modes, or states. For example, dataset adapters can be in Edit, Insert (see page 3601), Browse, or Query mode. The mode of the adapter has an effect on the types of controls that the control group's Web items generate, and how those controls behave.

If the adapter that is assigned to the Adapter (see page 6352) property supports different modes, you can set AdapterMode to force the controls in the group to represent the adapter fields in the specified mode. When AdapterMode is blank, the adapter control group uses the current mode of the adapter at the time when it generates its controls in the HTML form.

The possible values of AdapterMode depend on the modes that the adapter supports. If the adapter supports different modes, you can select a value for AdapterMode from a drop-down list in the Object Inspector that lists all the possible mode strings. If the adapter does not support different modes, the Object Inspector does not display a list, and the value of AdapterMode should be blank.

See Also

Mode

Adapter (see page 6352)

WebFieldControls

62.1.7.5.3 TAdapterControlGroup.AddDefaultFields Property

Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.

Pascal

```
property AddDefaultFields: Boolean;
```

C++

```
__property Boolean AddDefaultFields;
```

Description

Set AddDefaultFields to indicate how you want the adapter control group to respond when you do not explicitly add child Web items. You can add child Web items at design time using Adapter (see page 6352) page editor, or by right-clicking the control group and selecting Add Fields or Add Component. You can add child Web items at runtime using the Add method of the WebFieldControls property.

When AddDefaultFields is true, if you do not add child Web items to the adapter control group, it generates a default set of child Web items to display the fields of the adapter component that the Adapter (see page 6352) property specifies.

When AddDefaultFields is false, if you do not add child Web items to the adapter control group, it remains empty, displaying no field values.

See Also

VisibleFields (see page 6354)

WebFieldControls

Adapter (see page 6352)

62.1.7.5.4 TAdapterControlGroup.VisibleFields Property

Lists the child Web items that generate the visible HTML controls this adapter control group arranges.

Pascal

```
property VisibleFields: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleFields;
```

Description

Read (see page 3634) VisibleFields to determine the adapter display field components that generate HTML controls for this adapter control group. If you have explicitly added child Web items to the control group, or if the AddDefaultFields (see page 6353) property is false, VisibleFields is the same as the value of the WebFieldControls property. If you have not added any child Web items and AddDefaultFields (see page 6353) is true, VisibleFields is a list of adapter display field components that generate controls for the default fields of the control group's adapter.

See Also

WebFieldControls

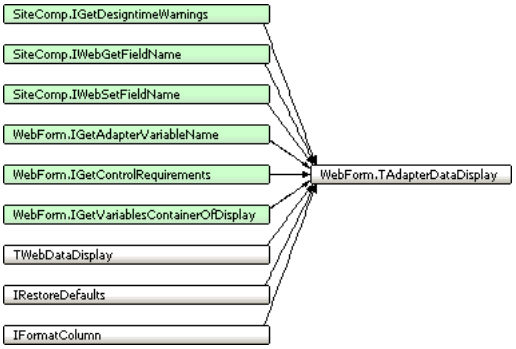
AddDefaultFields (see page 6353)

Adapter (see page 6352)

62.1.8 TAdapterDataDisplay Class

TAdapterDataDisplay is the base class for components that display adapter fields as form fields.

Class Hierarchy



Pascal

```
TAdapterDataDisplay = class(TWebDataDisplay, IWebGetFieldName, IWebSetFieldName,
IGetAdapterVariableName, IRestoreDefaults, IGetControlRequirements,
IGetVariablesContainerOfDisplay, IGetDesigntimeWarnings, IFormatColumn);
```

C++

```
class TAdapterDataDisplay : public TWebDataDisplay, public IWebGetFieldName, public
IWebSetFieldName, public IGetAdapterVariableName, public IRestoreDefaults, public
IGetControlRequirements, public IGetVariablesContainerOfDisplay, public
IGetDesigntimeWarnings, public IFormatColumn;
```

File

WebForm

Description

TAdapterDataDisplay is the base class for components that display adapter fields as HTML form fields. Its descendants include the following classes:

TAdapterDisplayField (see page 6371), which supports free-form display and editing of adapter field data.

TAdapterDisplayColumn (see page 6364), which supports grid display of adapter field data.

TAdapterEditColumn (see page 6387), which supports grid editing of adapter field data.

See Also

TAdapterDisplayField (see page 6371)

TAdapterDisplayColumn (see page 6364)

TAdapterEditColumn (see page 6387)

62.1.8.1 TAdapterDataDisplay Members

The following tables list the members exposed by TAdapterDataDisplay.

Protected Methods

	Name	Description
	FieldConditions (see page 6357)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 6357)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
	FormatCaption (see page 6357)	Returns the HTML for the display control's caption.
	FormatColumnData (see page 6358)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 6358)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 6358)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 6358)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
	GetCaption (see page 6358)	Returns the value of the Caption property.
	GetControlRequirements (see page 6359)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 6359)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 6359)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetVariablesContainer (see page 6360)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	ImplContent (see page 6360)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 6360)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 6361)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 6361)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
	ImplRestoreDefaults (see page 6361)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
	RestoreDefaults (see page 6361)	Returns the Web item to a default state.
	SetCaption (see page 6362)	Sets the value of the Caption property.
	SetFieldName (see page 6362)	This is SetFieldName, a member of class TAdapterDataDisplay.

Public Methods

	Name	Description
	Create (see page 6356)	Creates an instance of TAdapterDataDisplay (see page 6354)

Public Properties

	Name	Description
	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 6362)	Specifies the horizontal alignment of the component relative to its containing cell.
	FieldName (see page 6363)	Specifies the name of the associated dataset field.
	HideOptions (see page 6363)	When field should be hidden.
	VAlign (see page 6363)	Specifies the vertical alignment of the generated display control.

62.1.8.2 TAdapterDataDisplay.Create Constructor

Creates an instance of TAdapterDataDisplay (see page 6354)

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterDataDisplay(TComponent * AOwner);
```

Description

TAdapterDataDisplay (see page 6354) overrides Create in order to initialize the HideOptions (see page 6363) property to [hoHideOnFieldNotVisible].

62.1.8.3 TAdapterDataDisplay Methods

The methods of the TAdapterDataDisplay class are listed here.

Protected Methods

	Name	Description
	FieldConditions (see page 6357)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 6357)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
	FormatCaption (see page 6357)	Returns the HTML for the display control's caption.
	FormatColumnData (see page 6358)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 6358)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 6358)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 6358)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
	GetCaption (see page 6358)	Returns the value of the Caption property.
	GetControlRequirements (see page 6359)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 6359)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 6359)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetVariablesContainer (see page 6360)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	ImplContent (see page 6360)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 6360)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 6361)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 6361)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
	ImplRestoreDefaults (see page 6361)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
	RestoreDefaults (see page 6361)	Returns the Web item to a default state.
	SetCaption (see page 6362)	Sets the value of the Caption property.

	SetFieldName (see page 6362)	This is SetFieldName, a member of class TAdapterDataDisplay.

62.1.8.3.1 TAdapterDataDisplay.FieldConditions Method

Pascal

```
function FieldConditions(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString FieldConditions(TWebContentOptions Options);
```

Description

This is FieldConditions, a member of class TAdapterDataDisplay.

62.1.8.3.2 TAdapterDataDisplay.FindAssociatedField Method

Pascal

```
function FindAssociatedField: TComponent;
```

C++

```
__fastcall TComponent * FindAssociatedField();
```

Description

This is FindAssociatedField, a member of class TAdapterDataDisplay.

62.1.8.3.3 TAdapterDataDisplay.FormatCaption Method

Returns the HTML for the display control's caption.

Pascal

```
function FormatCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString FormatCaption();
```

Description

FormatCaption generates the HTML for the display control's caption, using the attributes specified by the CaptionAttributes property. FormatCaption returns the resulting string of HTML.

In addition, FormatCaption encodes the layout properties of the caption and the value of the CaptionPosition property into the LayoutAttributes property. The TWebDataDisplay component uses this value later to lay out the control and its caption appropriately.

See Also

Caption

CaptionAttributes

CaptionPosition

LayoutAttributes

62.1.8.3.4 TAdapterDataDisplay.FormatColumnData Method

Pascal

```
function FormatColumnData(const Content: string; Options: TWebContentOptions): string;
```

C++

```
__fastcall UnicodeString FormatColumnData(const UnicodeString Content, TWebContentOptions
Options);
```

Description

This is FormatColumnData, a member of class TAdapterDataDisplay.

62.1.8.3.5 TAdapterDataDisplay.FormatColumnHeading Method

Pascal

```
function FormatColumnHeading(Options: TWebContentOptions): string;
```

C++

```
__fastcall UnicodeString FormatColumnHeading(TWebContentOptions Options);
```

Description

This is FormatColumnHeading, a member of class TAdapterDataDisplay.

62.1.8.3.6 TAdapterDataDisplay.GetAdapterModeOfAdapter Method

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall UnicodeString GetAdapterModeOfAdapter();
```

Description

This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.

62.1.8.3.7 TAdapterDataDisplay.GetAdapterVariableName Method

Pascal

```
function GetAdapterVariableName: string;
```

C++

```
__fastcall UnicodeString GetAdapterVariableName();
```

Description

This is GetAdapterVariableName, a member of class TAdapterDataDisplay.

62.1.8.3.8 TAdapterDataDisplay.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

Caption

62.1.8.3.9 TAdapterDataDisplay.GetControlRequirements Method

Pascal

```
procedure GetControlRequirements(ARequirements: TAbstractControlRequirements);
```

C++

```
__fastcall GetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is GetControlRequirements, a member of class TAdapterDataDisplay.

62.1.8.3.10 TAdapterDataDisplay.GetDesigntimeWarnings Method

Populates a design-time warnings object with any warnings that the dataset values list needs to emit.

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

GetDesigntimeWarnings is called automatically at design time when the adapter page producer is assembling the current version of its HTML form. This gives the dataset values list an opportunity to add messages to the version of the HTML form that appears at design time, describing problems that you can rectify.

AWarnings is the design-time warnings object that assembles design-time warning messages that appear in the HTML form.

If the DataSet property has not been set, GetDesigntimeWarnings adds a message that indicates this omission. If DataSet is set, but the dataset is not active, GetDesigntimeWarnings adds a message that indicates this problem. Finally, if the ValueField property is not set, GetDesigntimeWarnings adds a message indicating this omission.

62.1.8.3.11 TAdapterDataDisplay.GetFieldName Method

Pascal

```
function GetFieldName: string;
```

C++

```
__fastcall UnicodeString GetFieldName();
```

Description

This is GetFieldName, a member of class TAdapterDataDisplay.

62.1.8.3.12 TAdapterDataDisplay.GetVariablesContainer Method

Pascal

```
function GetVariablesContainer: TComponent;
```

C++

```
__fastcall TComponent * GetVariablesContainer();
```

Description

This is GetVariablesContainer, a member of class TAdapterDataDisplay.

62.1.8.3.13 TAdapterDataDisplay.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the display control and its label. ImplContent formats the caption and combines this HTML with the results of the ControlContent method. ControlContent is an abstract (pure virtual) method in TWebDataDisplay. TWebDataDisplay descendants override it to generate the definition of their particular display control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebDataDisplay should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the display control.

Caption

ILayoutWebContent (see page 6084)

62.1.8.3.14 TAdapterDataDisplay.ImplFormatColumnData Method

Pascal

```
function ImplFormatColumnData(const Content: string; Options: TWebContentOptions): string;
virtual;
```

C++

```
virtual __fastcall UnicodeString ImplFormatColumnData(const UnicodeString Content,
TWebContentOptions Options);
```

Description

This is ImplFormatColumnData, a member of class TAdapterDataDisplay.

62.1.8.3.15 TAdapterDataDisplay.ImplFormatColumnHeading Method

Pascal

```
function ImplFormatColumnHeading(Options: TWebContentOptions): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplFormatColumnHeading(TWebContentOptions Options);
```

Description

This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.

62.1.8.3.16 TAdapterDataDisplay.ImplGetControlRequirements Method

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); virtual;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.

62.1.8.3.17 TAdapterDataDisplay.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; virtual;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.

62.1.8.3.18 TAdapterDataDisplay.RestoreDefaults Method

Returns the Web item to a default state.

Pascal

```
procedure RestoreDefaults;
```

C++

```
__fastcall RestoreDefaults();
```

Description

The Web page editor calls RestoreDefaults when the user chooses the Restore Defaults command. Web items implement this

method to return property values to a default state.

62.1.8.3.19 TAdapterDataDisplay.SetCaption Method

Sets the value of the Caption property.

Pascal

```
procedure SetCaption(Value: string); override;
```

C++

```
virtual __fastcall SetCaption(UnicodeString Value);
```

Description

SetCaption is the protected write implementation for the Caption property.

62.1.8.3.20 TAdapterDataDisplay.SetFieldName Method

Pascal

```
procedure SetFieldName(const Value: string);
```

C++

```
__fastcall SetFieldName(const UnicodeString Value);
```

Description

This is SetFieldName, a member of class TAdapterDataDisplay.

62.1.8.4 TAdapterDataDisplay Properties

The properties of the TAdapterDataDisplay class are listed here.

Public Properties

	Name	Description
	Align (see page 6362)	Specifies the horizontal alignment of the component relative to its containing cell.
	FieldName (see page 6363)	Specifies the name of the associated dataset field.
	HideOptions (see page 6363)	When field should be hidden.
	VAlign (see page 6363)	Specifies the vertical alignment of the generated display control.

62.1.8.4.1 TAdapterDataDisplay.Align Property

Specifies the horizontal alignment of the component relative to its containing cell.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align specifies the component's horizontal alignment relative to the containing HTML table cell.

See Also

VAlign (see page 6363)

62.1.8.4.2 TAdapterDataDisplay.FieldName Property

Specifies the name of the associated dataset field.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;
```

Description

FieldName specifies the name of the dataset field that the adapter field represents.

See Also

DataSet

62.1.8.4.3 TAdapterDataDisplay.HideOptions Property

When field should be hidden.

Pascal

```
property HideOptions: TDisplayFieldHideOptions;
```

C++

```
__property TDisplayFieldHideOptions HideOptions;
```

Description

Set HideOptions to indicate when the field should be hidden from view.

62.1.8.4.4 TAdapterDataDisplay.VAlign Property

Specifies the vertical alignment of the generated display control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign specifies the control's vertical alignment relative to the containing HTML table cell.

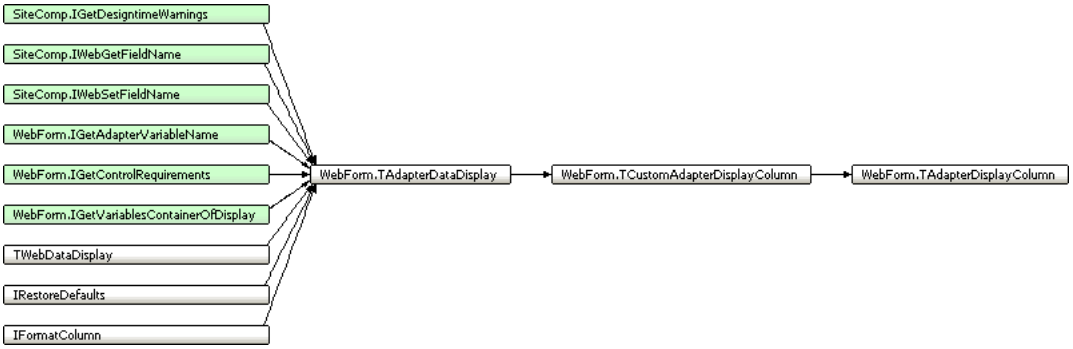
See Also

Align (see page 6362)

62.1.9 TAdapterDisplayColumn Class

TAdapterDisplayColumn displays an Adapter field in a grid.

Class Hierarchy



Pascal

```
TAdapterDisplayColumn = class(TCustomAdapterDisplayColumn);
```

C++

```
class TAdapterDisplayColumn : public TCustomAdapterDisplayColumn;
```

File

WebForm

Description

Add TAdapterDisplayColumn as a child of a TAdapterGrid (see page 6419) to display an Adapter field. The TAdapterGrid (see page 6419) specifies the Adapter used by TAdapterDisplayColumn.

Use the properties and methods of TAdapterDisplayColumn to:

Specify the Adapter field whose value the component displays.

Specify a caption for the column.

Specify when the column should be hidden.

Customize the appearance of the column.

TAdapterDisplayColumn supports multiple display presentation: text, list, and image. The display type can be set explicitly or TAdapterDisplayColumn will automatically choose a display type that is appropriate for the Adapter field.

TAdapterDisplayColumn is a minimal implementation of TCustomAdapterDisplayColumn (see page 6461). To extend this component, create your own concrete descendant of TCustomAdapterDisplayColumn (see page 6461).

See Also

TCustomAdapterDisplayColumn (see page 6461)

62.1.9.1 TAdapterDisplayColumn Members

The following tables list the members exposed by TAdapterDisplayColumn.

Protected Methods

	Name	Description
	CanAddClass (see page 6463)	This is CanAddClass, a member of class TCustomAdapterDisplayColumn.
V	ControlContent (see page 6463)	Returns the HTML that defines the display control (without its caption).
V	FieldConditions (see page 6357)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 6357)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
V	FormatCaption (see page 6357)	Returns the HTML for the display control's caption.
	FormatColumnData (see page 6358)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 6358)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	FormatImage (see page 6464)	This is FormatImage, a member of class TCustomAdapterDisplayColumn.
	FormatListDisplay (see page 6464)	This is FormatListDisplay, a member of class TCustomAdapterDisplayColumn.
	FormatTextDisplay (see page 6464)	This is FormatTextDisplay, a member of class TCustomAdapterDisplayColumn.
	GetAdapterModeOfAdapter (see page 6358)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 6358)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
V	GetCaption (see page 6358)	Returns the value of the Caption property.
	GetControlRequirements (see page 6359)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 6359)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 6359)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetVariablesContainer (see page 6360)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
V	ImplCanAddClass (see page 6465)	This is ImplCanAddClass, a member of class TCustomAdapterDisplayColumn.
V	ImplContent (see page 6360)	Provides the underlying implementation for the Content method.
V	ImplFormatColumnData (see page 6360)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
V	ImplFormatColumnHeading (see page 6361)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
V	ImplFormatColumnHeading (see page 6465)	This is ImplFormatColumnHeading, a member of class TCustomAdapterDisplayColumn.
V	ImplGetControlRequirements (see page 6361)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
V	ImplGetControlRequirements (see page 6465)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayColumn.
V	ImplRestoreDefaults (see page 6361)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
V	ImplRestoreDefaults (see page 6465)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayColumn.
	RestoreDefaults (see page 6361)	Returns the Web item to a default state.
V	SetCaption (see page 6362)	Sets the value of the Caption property.
	SetFieldName (see page 6362)	This is SetFieldName, a member of class TAdapterDataDisplay.

Public Methods

	Name	Description
V	Create (see page 6356)	Creates an instance of TAdapterDataDisplay (see page 6354)
V	Create (see page 6463)	Creates and initializes an instance of TCustomAdapterDisplayColumn (see page 6461).
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
V	IsColumn (see page 6466)	Indicates whether the component generates the controls that appear in the column of a data grid.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.

Public Properties

	Name	Description
R	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.

Published Properties

	Name	Description
	Align (see page 6366)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 6367)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 6367)	Customizes the appearance of the generated control's label.
	Custom (see page 6367)	Represents a tag option and its value in the tag for the display control.
	DisplayType (see page 6368)	Sets the display type for the column.
	FieldName (see page 6368)	Specifies the name of the associated dataset field.
	HideOptions (see page 6368)	When field should be hidden.
	ImageHeight (see page 6369)	Specifies the height of the image in the column.
	ImageWidth (see page 6369)	Specifies the width of the image in the column.
	Style (see page 6369)	Adds style attributes to the generated display control.
	StyleRule (see page 6370)	Applies a style in the page producer's style sheet to the generated display control.
	VAlign (see page 6370)	Specifies the vertical alignment of the generated display control.

62.1.9.2 TAdapterDisplayColumn Properties

The properties of the TAdapterDisplayColumn class are listed here.

Published Properties

	Name	Description
	Align (see page 6366)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 6367)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 6367)	Customizes the appearance of the generated control's label.
	Custom (see page 6367)	Represents a tag option and its value in the tag for the display control.
	DisplayType (see page 6368)	Sets the display type for the column.
	FieldName (see page 6368)	Specifies the name of the associated dataset field.
	HideOptions (see page 6368)	When field should be hidden.
	ImageHeight (see page 6369)	Specifies the height of the image in the column.
	ImageWidth (see page 6369)	Specifies the width of the image in the column.
	Style (see page 6369)	Adds style attributes to the generated display control.
	StyleRule (see page 6370)	Applies a style in the page producer's style sheet to the generated display control.
	VAlign (see page 6370)	Specifies the vertical alignment of the generated display control.

62.1.9.2.1 TAdapterDisplayColumn.Align Property

Specifies the horizontal alignment of the component relative to its containing cell.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align specifies the component's horizontal alignment relative to the containing HTML table cell.

See Also

VAlign (see page 6363)

62.1.9.2.2 TAdapterDisplayColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes

CaptionPosition

62.1.9.2.3 TAdapterDisplayColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes;
```

C++

```
__property CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption

CaptionPosition

HeadingAttributes

62.1.9.2.4 TAdapterDisplayColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom;
```

C++

```
__property Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator

key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style

StyleRule

CaptionAttributes

62.1.9.2.5 TAdapterDisplayColumn.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TColumnHTMLElementType;
```

C++

```
__property TColumnHTMLElementType DisplayType;
```

Description

Set DisplayType to set the display type for the column to text or image.

See Also

ImageHeight (see page 6466)

ImageWidth (see page 6467)

62.1.9.2.6 TAdapterDisplayColumn.FieldName Property

Specifies the name of the associated dataset field.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

FieldName specifies the name of the dataset field that the adapter field represents.

See Also

DataSet

62.1.9.2.7 TAdapterDisplayColumn.HideOptions Property

When field should be hidden.

Pascal

```
property HideOptions: TDisplayFieldHideOptions;
```

C++

```
__property TDisplayFieldHideOptions HideOptions;
```

Description

Set HideOptions to indicate when the field should be hidden from view.

62.1.9.2.8 TAdapterDisplayColumn.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in pixels.

See Also

ImageWidth (see page 6467)

62.1.9.2.9 TAdapterDisplayColumn.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight to indicate the width of the image in pixels.

See Also

ImageHeight (see page 6466)

62.1.9.2.10 TAdapterDisplayColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style;
```

C++

```
__property Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom

StyleRule

CaptionAttributes

Setting Web Item Properties

62.1.9.2.11 TAdapterDisplayColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule;
```

C++

```
__property StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style

Styles

Styles (see page 1157)

StylesFile (see page 1158)

CaptionAttributes

62.1.9.2.12 TAdapterDisplayColumn.VAlign Property

Specifies the vertical alignment of the generated display control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign specifies the control's vertical alignment relative to the containing HTML table cell.

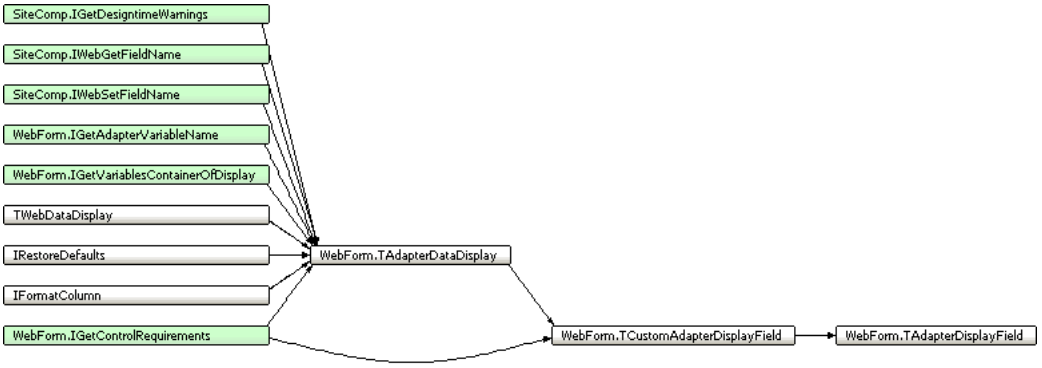
See Also

Align (see page 6362)

62.1.10 TAdapterDisplayField Class

TAdapterDisplayField displays an Adapter field as a form field.

Class Hierarchy



Pascal

```
TAdapterDisplayField = class(TCustomAdapterDisplayField);
```

C++

```
class TAdapterDisplayField : public TCustomAdapterDisplayField;
```

File

WebForm

Description

Add TAdapterDisplayField as a child of a TAdapterFieldGroup (see page 6399) to display an Adapter field. The TAdapterFieldGroup (see page 6399) specifies the Adapter used by TAdapterDisplayField.

Use the properties and methods of TAdapterDisplayField to:

Specify the Adapter field whose value the component displays.

Specify a caption for the field.

Specify when the field should be hidden.

Customize the appearance of the column.

Specify whether the field is used for input or display only.

TAdapterDisplayField supports multiple display type: text, list, and image. The display type can be set explicitly or TAdapterDisplayField will automatically choose a display type that is appropriate for the Adapter field.

TAdapterDisplayField supports multiple input types: Text, Password, Select, MultipleSelect, Radio, CheckBox, TextArea, and File. The input type can be set explicitly or TAdapterDisplayField will automatically choose an input type that is appropriate for the Adapter field.

TAdapterDisplayField instances are not used in grids. TAdapterEditColumn (see page 6387) provides equivalent functionality in a grid context.

TAdapterDisplayField is a minimal implementation of TCustomAdapterDisplayField (see page 6467). To extend the features of this component, define your own descendant of TCustomAdapterDisplayField (see page 6467).

See Also

TAdapterEditColumn (see page 6387)

62.1.10.1 TAdapterDisplayField Members

The following tables list the members exposed by TAdapterDisplayField.

Protected Methods

	Name	Description
	AddAttributes (see page 6470)	This is AddAttributes, a member of class TCustomAdapterDisplayField.
	ControlContent (see page 6470)	Returns the HTML that defines the display control (without its caption).
	FieldConditions (see page 6357)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 6357)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
	FormatCaption (see page 6357)	Returns the HTML for the display control's caption.
	FormatColumnData (see page 6358)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 6358)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 6358)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 6358)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
	GetCaption (see page 6358)	Returns the value of the Caption property.
	GetControlRequirements (see page 6359)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 6359)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 6359)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetLayoutAttributes (see page 6470)	Returns the value of the LayoutAttributes property.
	GetVariablesContainer (see page 6360)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	ImplContent (see page 6360)	Provides the underlying implementation for the Content method.
	ImplContent (see page 6471)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 6360)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 6361)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 6361)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 6471)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
	ImplRestoreDefaults (see page 6361)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
	ImplRestoreDefaults (see page 6471)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.
	RestoreDefaults (see page 6361)	Returns the Web item to a default state.
	SetCaption (see page 6362)	Sets the value of the Caption property.
	SetFieldName (see page 6362)	This is SetFieldName, a member of class TAdapterDataDisplay.

Public Methods

	Name	Description
	Create (see page 6356)	Creates an instance of TAdapterDataDisplay (see page 6354)
	Create (see page 6469)	Creates and initializes an instance of TCustomAdapterDisplayField (see page 6467).
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.

Public Properties

	Name	Description
R	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.

Published Properties

	Name	Description
	Align (see page 6374)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 6374)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 6374)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 6375)	Specifies where the label appears relative to the generated display control.
	Custom (see page 6375)	Represents a tag option and its value in the tag for the display control.
	DisplayColumns (see page 6376)	Specifies the number of columns in a display field.
	DisplayRows (see page 6376)	Specifies the number of rows in a display field.
	DisplayType (see page 6376)	Sets the display type for the column.
	DisplayWidth (see page 6377)	Specifies the width, in characters, of the generated HTML field.
	FieldName (see page 6377)	Specifies the name of the associated dataset field.
	HideOptions (see page 6377)	When field should be hidden.
	ImageHeight (see page 6377)	Specifies the height of the image in the column.
	ImageWidth (see page 6378)	Specifies the width of the image in the column.
	InputType (see page 6378)	Specifies the input type for the display field.
	MaxLength (see page 6378)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 6379)	Indicates the number of rows that can be selected.
	Style (see page 6379)	Adds style attributes to the generated display control.
	StyleRule (see page 6379)	Applies a style in the page producer's style sheet to the generated display control.
	TextAreaWrap (see page 6380)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 6380)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 6381)	Indicates the viewing state of the adapter field.

62.1.10.2 TAdapterDisplayField Properties

The properties of the TAdapterDisplayField class are listed here.

Published Properties

	Name	Description
	Align (see page 6374)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 6374)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 6374)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 6375)	Specifies where the label appears relative to the generated display control.
	Custom (see page 6375)	Represents a tag option and its value in the tag for the display control.
	DisplayColumns (see page 6376)	Specifies the number of columns in a display field.
	DisplayRows (see page 6376)	Specifies the number of rows in a display field.
	DisplayType (see page 6376)	Sets the display type for the column.
	DisplayWidth (see page 6377)	Specifies the width, in characters, of the generated HTML field.
	FieldName (see page 6377)	Specifies the name of the associated dataset field.
	HideOptions (see page 6377)	When field should be hidden.
	ImageHeight (see page 6377)	Specifies the height of the image in the column.
	ImageWidth (see page 6378)	Specifies the width of the image in the column.
	InputType (see page 6378)	Specifies the input type for the display field.
	MaxLength (see page 6378)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 6379)	Indicates the number of rows that can be selected.

	Style (see page 6379)	Adds style attributes to the generated display control.
	StyleRule (see page 6379)	Applies a style in the page producer's style sheet to the generated display control.
	TextAreaWrap (see page 6380)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 6380)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 6381)	Indicates the viewing state of the adapter field.

62.1.10.2.1 TAdapterDisplayField.Align Property

Specifies the horizontal alignment of the component relative to its containing cell.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align specifies the component's horizontal alignment relative to the containing HTML table cell.

See Also

VAlign (see page 6363)

62.1.10.2.2 TAdapterDisplayField.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes

CaptionPosition

62.1.10.2.3 TAdapterDisplayField.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes;
```

C++

```
__property CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption

CaptionPosition

HeadingAttributes

62.1.10.2.4 TAdapterDisplayField.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition;
```

C++

```
__property CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes

Caption

62.1.10.2.5 TAdapterDisplayField.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom;
```

C++

```
__property Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style

StyleRule

CaptionAttributes

62.1.10.2.6 TAdapterDisplayField.DisplayColumns Property

Specifies the number of columns in a display field.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to control the number of columns being displayed.

See Also

DisplayRows (see page 6472)

62.1.10.2.7 TAdapterDisplayField.DisplayRows Property

Specifies the number of rows in a display field.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayColumns to control the number of rows being displayed.

See Also

DisplayColumns (see page 6472)

62.1.10.2.8 TAdapterDisplayField.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TDisplayFieldHTMLElementType;
```

C++

```
__property TDisplayFieldHTMLElementType DisplayType;
```

Description

Set DisplayType to indicate the type of HTML control that should be used to display this field's value when it is read-only.

See Also

ImageHeight (see page 6473)

ImageWidth (see page 6474)

InputType (see page 6474)

62.1.10.2.9 TAdapterDisplayField.DisplayWidth Property

Specifies the width, in characters, of the generated HTML field.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to control the width of the HTML field that displays record status information. By default, DisplayWidth is 1 because the TCustomAdapterDisplayField control values are one character (M for modified or I for inserted).

62.1.10.2.10 TAdapterDisplayField.FieldName Property

Specifies the name of the associated dataset field.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

FieldName specifies the name of the dataset field that the adapter field represents.

See Also

DataSet

62.1.10.2.11 TAdapterDisplayField.HideOptions Property

When field should be hidden.

Pascal

```
property HideOptions: TDisplayFieldHideOptions;
```

C++

```
__property TDisplayFieldHideOptions HideOptions;
```

Description

Set HideOptions to indicate when the field should be hidden from view.

62.1.10.2.12 TAdapterDisplayField.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in the column.

See Also

DisplayWidth (see page 6473)

ImageWidth (see page 6474)

62.1.10.2.13 TAdapterDisplayField.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight to indicate the width of the image in the column.

See Also

ImageHeight (see page 6473)

62.1.10.2.14 TAdapterDisplayField.InputType Property

Specifies the input type for the display field.

Pascal

```
property InputType: TInputFieldHTMLElementType;
```

C++

```
__property TInputFieldHTMLElementType InputType;
```

Description

Set InputType to indicate the type of control that should be generated to let users assign values to the adapter field.

See Also

ImageHeight (see page 6473)

ImageWidth (see page 6474)

DisplayType (see page 6473)

62.1.10.2.15 TAdapterDisplayField.MaxLength Property

Specifies the maximum number of characters the user can enter into the display field.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the display field. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

62.1.10.2.16 TAdapterDisplayField.SelectRows Property

Indicates the number of rows that can be selected.

Pascal

```
property SelectRows: Integer;
```

C++

```
__property int SelectRows;
```

Description

Use SelectRows to indicate the number of rows that can be selected.

62.1.10.2.17 TAdapterDisplayField.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style;
```

C++

```
__property Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom

StyleRule

CaptionAttributes

Setting Web Item Properties

62.1.10.2.18 TAdapterDisplayField.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule;
```

C++

```
__property StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style

Styles

Styles (see page 1157)

StylesFile

StylesFile (see page 1158)

CaptionAttributes

62.1.10.2.19 TAdapterDisplayField.TextAreaWrap Property

Specifies how the display field treats lines that are longer than the display width.

Pascal

```
property TextAreaWrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap TextAreaWrap;
```

Description

Use TextAreaWrap to specify how the generated display field formats lines that are longer than the number of characters specified by DisplayWidth.

See Also

DisplayWidth (see page 6473)

62.1.10.2.20 TAdapterDisplayField.VAlign Property

Specifies the vertical alignment of the generated display control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign specifies the control's vertical alignment relative to the containing HTML table cell.

See Also

Align (see page 6362)

62.1.10.2.21 TAdapterDisplayField.ViewMode Property

Indicates the viewing state of the adapter field.

Pascal

```
property ViewMode: TDisplayFieldViewMode;
```

C++

```
__property TDisplayFieldViewMode ViewMode;
```

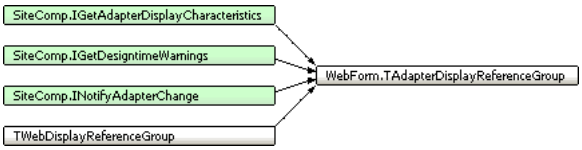
Description

Use ViewMode to specify the viewing state of the field.

62.1.11 TAdapterDisplayReferenceGroup Class

TAdapterDisplayReferenceGroup is the base class for components that generate HTML controls that refer to a control which displays data from an adapter.

Class Hierarchy



Pascal

```
TAdapterDisplayReferenceGroup = class(TWebDisplayReferenceGroup, IGetDesigntimeWarnings,
INotifyAdapterChange, IGetAdapterDisplayCharacteristics);
```

C++

```
class TAdapterDisplayReferenceGroup : public TWebDisplayReferenceGroup, public
IGetDesigntimeWarnings, public INotifyAdapterChange, public IGetAdapterDisplayCharacteristics;
```

File

WebForm

Description

Use TAdapterDisplayReferenceGroup as a base class for Web items that generate the HTML to arrange a collection of controls. The TAdapterDisplayReferenceGroup is associated with another component that generates HTML elements to display the data from an adapter. This component is the value of the DisplayComponent (see page 6386) property. The child Web items of TAdapterDisplayReferenceGroup generate the individual controls in the collection this class arranges. Each of those controls operates on the display element produced by the component that is the value of the DisplayComponent (see page 6386) property.

Do not create instances of TAdapterDisplayReferenceGroup. TAdapterDisplayReferenceGroup only manages the Web items that generate controls, the association to a display generator, and the logic for working with the WebSnap editors in the IDE. It does not include any special logic for working with the display generator's adapter. To add a component that organizes controls in an adapter form, use a descendant of TAdapterDisplayReferenceGroup such as TAdapterCommandGroup (see page 6337).

See Also

TAdapterCommandGroup (see page 6337)

62.1.11.1 TAdapterDisplayReferenceGroup Members

The following tables list the members exposed by TAdapterDisplayReferenceGroup.

Protected Methods

	Name	Description
	AdapterChange (see page 6383)	Responds to changes in the adapter on which the controls in this group operate.
	DisplayComponentChange (see page 6384)	Responds when the DisplayComponent (see page 6386) property changes.
	GetAdapterDisplayCharacteristics (see page 6384)	Indicates the display characteristics of the HTML this component generates.
	GetDesigntimeWarnings (see page 6384)	Populates a design-time warnings object with any warnings that the reference group needs to emit.
	NotifyAdapterChange (see page 6385)	Responds when other components notify this one of changes to the adapter.
	OnDisplayComponentChange (see page 6385)	Responds when the associated display component changes.
	SetWebDisplayComponent (see page 6386)	Sets the value of the DisplayComponent (see page 6386) property.

Public Methods

	Name	Description
	Create (see page 6382)	Creates and initializes an instance of TAdapterDisplayReferenceGroup (see page 6381).
	Destroy (see page 6382)	Frees an instance of TAdapterDisplayReferenceGroup (see page 6381).

Public Properties

	Name	Description
	DisplayComponent (see page 6386)	Associates the group with a component that generates the display controls.

62.1.11.2 TAdapterDisplayReferenceGroup.Create Constructor

Creates and initializes an instance of TAdapterDisplayReferenceGroup (see page 6381).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TAdapterDisplayReferenceGroup(TComponent * AOwner);
```

Description

Call Create to instantiate an adapter display reference group at runtime. TAdapterDisplayReferenceGroup (see page 6381) descendants added to an adapter form at design time are instantiated automatically.

AOwner is a component, typically a Web page module, that becomes the value of the Owner property. The Owner is responsible for freeing the TAdapterDisplayReferenceGroup (see page 6381) instance.

See Also

Create (see page 6456)

Owner

62.1.11.3 TAdapterDisplayReferenceGroup.Destroy Destructor

Frees an instance of TAdapterDisplayReferenceGroup (see page 6381).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAdapterDisplayReferenceGroup();
```

Description

Do not call Destroy directly. Instead, call the Free method, which checks whether the reference to the producer is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

62.1.11.4 TAdapterDisplayReferenceGroup Methods

The methods of the TAdapterDisplayReferenceGroup class are listed here.

Protected Methods

	Name	Description
	AdapterChange (see page 6383)	Responds to changes in the adapter on which the controls in this group operate.
	DisplayComponentChange (see page 6384)	Responds when the DisplayComponent (see page 6386) property changes.
	GetAdapterDisplayCharacteristics (see page 6384)	Indicates the display characteristics of the HTML this component generates.
	GetDesigntimeWarnings (see page 6384)	Populates a design-time warnings object with any warnings that the reference group needs to emit.
	NotifyAdapterChange (see page 6385)	Responds when other components notify this one of changes to the adapter.
	OnDisplayComponentChange (see page 6385)	Responds when the associated display component changes.
	SetWebDisplayComponent (see page 6386)	Sets the value of the DisplayComponent (see page 6386) property.

62.1.11.4.1 TAdapterDisplayReferenceGroup.AdapterChange Method

Responds to changes in the adapter on which the controls in this group operate.

Pascal

```
procedure AdapterChange; virtual;
```

C++

```
virtual __fastcall AdapterChange();
```

Description

TAdapterDisplayReferenceGroup (see page 6381) calls AdapterChange internally whenever the adapter associated with its display component changes. This happens in response to the following occurrences:

The component specified by DisplayComponent (see page 6386) notifies this one that it has changed.

Another component notifies this one of a change to the adapter by calling the NotifyAdapterChange (see page 6385) method.

AdapterChange responds to the change by regenerating its list of default child Web items and passing the notification on to every child Web item in its WebFieldControls property list.

See Also

NotifyAdapterChange (see page 6385)

DisplayComponent (see page 6386)

DisplayComponentChange (see page 6384)

WebFieldControls

62.1.11.4.2 TAdapterDisplayReferenceGroup.DisplayComponentChange Method

Responds when the DisplayComponent (see page 6386) property changes.

Pascal

```
procedure DisplayComponentChange; virtual;
```

C++

```
virtual __fastcall DisplayComponentChange();
```

Description

The component specified by the DisplayComponent (see page 6386) property calls DisplayComponentChange when its properties change. This allows the TAdapterDisplayReferenceGroup (see page 6381) object to update itself to reflect any changes.

In TAdapterDisplayReferenceGroup (see page 6381), DisplayComponentChange calls the AdapterChange (see page 6383) method, to ensure that its Web items are up-to-date in case the change was to the associated adapter.

See Also

AdapterChange (see page 6383)

DisplayComponent (see page 6386)

62.1.11.4.3 TAdapterDisplayReferenceGroup.GetAdapterDisplayCharacteristics Method

Indicates the display characteristics of the HTML this component generates.

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

Adapter actions call GetAdapterDisplayCharacteristics from their IsDefaultAction methods to determine whether their function should be included in the adapter's default set of actions. If the adapter action is appropriate to operate on an HTML form with the indicated characteristics, the adapter action returns true from its IsDefaultAction method.

In TAdapterDisplayReferenceGroup (see page 6381), GetAdapterDisplayCharacteristics delegates this task by fetching the display characteristics from the associated display component.

See Also

IsDefaultAction (see page 5471)

DisplayComponent (see page 6386)

62.1.11.4.4 TAdapterDisplayReferenceGroup.GetDesigntimeWarnings Method

Populates a design-time warnings object with any warnings that the reference group needs to emit.

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

GetDesigntimeWarnings is called automatically at design time when the adapter page producer is assembling the current version of its HTML form. This gives the display reference group an opportunity to add messages to the version of the HTML form that appears at design time, describing problems that you can rectify.

AWarnings is the design-time warnings object that assembles design-time warning messages that appear in the HTML form.

If the DisplayComponent (see page 6386) property has not been set, GetDesigntimeWarnings adds a message that indicates this omission. Otherwise, GetDesigntimeWarnings adds the display component to the list of objects that can supply design-time warnings.

See Also

DisplayComponent (see page 6386)

TAdapterPageProducer (see page 1136)

62.1.11.4.5 TAdapterDisplayReferenceGroup.NotifyAdapterChange Method

Responds when other components notify this one of changes to the adapter.

Pascal

```
procedure NotifyAdapterChange(Sender: TComponent);
```

C++

```
__fastcall NotifyAdapterChange(TComponent * Sender);
```

Description

Other components in the WebSnap application call NotifyAdapterChange when they detect possible changes to the adapter on which this group's controls operate.

Sender is the component that detected the possible change and sent the notification.

NotifyAdapterChange calls the AdapterChange (see page 6383) method, which responds to the notification.

See Also

AdapterChange (see page 6383)

DisplayComponent (see page 6386)

62.1.11.4.6 TAdapterDisplayReferenceGroup.OnDisplayComponentChange Method

Responds when the associated display component changes.

Pascal

```
procedure OnDisplayComponentChange(ASender: TObject);
```

C++

```
__fastcall OnDisplayComponentChange(TObject * ASender);
```

Description

The component specified by the DisplayComponent (see page 6386) property calls OnDisplayComponentChange to notify this component of changes to its properties or child Web items.

ASender is the display component that calls this method.

OnDisplayComponentChange calls the DisplayComponentChange (see page 6384) method, which responds to the change.

See Also

DisplayComponentChange (see page 6384)

DisplayComponent (see page 6386)

62.1.11.4.7 TAdapterDisplayReferenceGroup.SetWebDisplayComponent Method

Sets the value of the DisplayComponent (see page 6386) property.

Pascal

```
procedure SetWebDisplayComponent(const AComponent: TComponent); override;
```

C++

```
virtual __fastcall SetWebDisplayComponent(const TComponent * AComponent);
```

Description

SetWebDisplayComponent is the protected write implementation of the DisplayComponent (see page 6386) property.

AComponent is the new value of the DisplayComponent (see page 6386) property.

See Also

DisplayComponent (see page 6386)

62.1.11.5 TAdapterDisplayReferenceGroup Properties

The properties of the TAdapterDisplayReferenceGroup class are listed here.

Public Properties

	Name	Description
	DisplayComponent (see page 6386)	Associates the group with a component that generates the display controls.

62.1.11.5.1 TAdapterDisplayReferenceGroup.DisplayComponent Property

Associates the group with a component that generates the display controls.

Pascal

```
property DisplayComponent: TComponent;
```

C++

```
__property TComponent * DisplayComponent;
```

Description

Use DisplayComponent to associate the group of controls with a Web item that generates the display elements those controls influence. Typical values of DisplayComponent are TAdapterGrid (see page 6419) or TAdapterFieldGroup (see page 6399).

TAdapterDisplayReferenceGroup (see page 6381) descendants use the value of DisplayComponent to access the display controls to influence, and to access the adapter, whose information is displayed or manipulated.

See Also

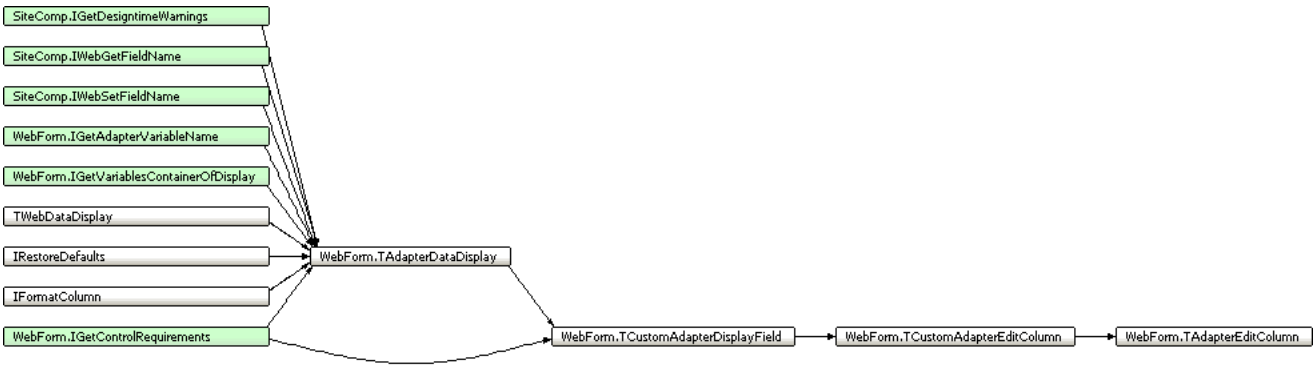
TAdapterGrid (see page 6419)

TAdapterFieldGroup (see page 6399)

62.1.12 TAdapterEditColumn Class

TAdapterEditColumn displays an adapter field as a form field in a grid.

Class Hierarchy



Pascal

```
TAdapterEditColumn = class(TCustomAdapterEditColumn);
```

C++

```
class TAdapterEditColumn : public TCustomAdapterEditColumn;
```

File

WebForm

Description

TAdapterEditColumn has the same functionality as TAdapterDisplayField (see page 6371), but is designed to work with grids. TAdapterEditColumn is a minimal implementation of TCustomAdapterEditColumn (see page 6475).

See Also

TCustomAdapterEditColumn (see page 6475)

TAdapterDisplayField (see page 6371)

62.1.12.1 TAdapterEditColumn Members

The following tables list the members exposed by TAdapterEditColumn.

Protected Methods

	Name	Description
	AddAttributes (see page 6470)	This is AddAttributes, a member of class TCustomAdapterDisplayField.

	ControlContent (see page 6470)	Returns the HTML that defines the display control (without its caption).
	FieldConditions (see page 6357)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 6357)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
	FormatCaption (see page 6357)	Returns the HTML for the display control's caption.
	FormatColumnData (see page 6358)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 6358)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 6358)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 6358)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
	GetCaption (see page 6358)	Returns the value of the Caption property.
	GetControlRequirements (see page 6359)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 6359)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 6359)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetLayoutAttributes (see page 6470)	Returns the value of the LayoutAttributes property.
	GetVariablesContainer (see page 6360)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	ImplContent (see page 6360)	Provides the underlying implementation for the Content method.
	ImplContent (see page 6471)	Provides the underlying implementation for the Content method.
	ImplContent (see page 6478)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 6360)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 6361)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 6361)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 6471)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
	ImplRestoreDefaults (see page 6361)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
	ImplRestoreDefaults (see page 6471)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.
	RestoreDefaults (see page 6361)	Returns the Web item to a default state.
	SetCaption (see page 6362)	Sets the value of the Caption property.
	SetFieldName (see page 6362)	This is SetFieldName, a member of class TAdapterDataDisplay.

Public Methods

	Name	Description
	Create (see page 6356)	Creates an instance of TAdapterDataDisplay (see page 6354)
	Create (see page 6469)	Creates and initializes an instance of TCustomAdapterDisplayField (see page 6467).
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.

Public Properties

	Name	Description
	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.

Published Properties

	Name	Description
	Align (see page 6389)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 6390)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 6390)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 6390)	Specifies where the label appears relative to the generated display control.
	Custom (see page 6391)	Represents a tag option and its value in the tag for the display control.
	DisplayColumns (see page 6391)	Specifies the number of columns in a display field.

	DisplayRows (see page 6392)	Specifies the number of rows in a display field.
	DisplayType (see page 6392)	Sets the display type for the column.
	DisplayWidth (see page 6392)	Specifies the width, in characters, of the generated HTML field.
	FieldName (see page 6393)	Specifies the name of the associated dataset field.
	HideOptions (see page 6393)	When field should be hidden.
	ImageHeight (see page 6393)	Specifies the height of the image in the column.
	ImageWidth (see page 6393)	Specifies the width of the image in the column.
	InputType (see page 6394)	Specifies the input type for the display field.
	MaxLength (see page 6394)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 6394)	Indicates the number of rows that can be selected.
	Style (see page 6395)	Adds style attributes to the generated display control.
	StyleRule (see page 6395)	Applies a style in the page producer's style sheet to the generated display control.
	TextAreaWrap (see page 6396)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 6396)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 6396)	Indicates the viewing state of the adapter field.

62.1.12.2 TAdapterEditColumn Properties

The properties of the TAdapterEditColumn class are listed here.

Published Properties

	Name	Description
	Align (see page 6389)	Specifies the horizontal alignment of the component relative to its containing cell.
	Caption (see page 6390)	Specifies the text of a label that indicates what information the generated control displays.
	CaptionAttributes (see page 6390)	Customizes the appearance of the generated control's label.
	CaptionPosition (see page 6390)	Specifies where the label appears relative to the generated display control.
	Custom (see page 6391)	Represents a tag option and its value in the tag for the display control.
	DisplayColumns (see page 6391)	Specifies the number of columns in a display field.
	DisplayRows (see page 6392)	Specifies the number of rows in a display field.
	DisplayType (see page 6392)	Sets the display type for the column.
	DisplayWidth (see page 6392)	Specifies the width, in characters, of the generated HTML field.
	FieldName (see page 6393)	Specifies the name of the associated dataset field.
	HideOptions (see page 6393)	When field should be hidden.
	ImageHeight (see page 6393)	Specifies the height of the image in the column.
	ImageWidth (see page 6393)	Specifies the width of the image in the column.
	InputType (see page 6394)	Specifies the input type for the display field.
	MaxLength (see page 6394)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 6394)	Indicates the number of rows that can be selected.
	Style (see page 6395)	Adds style attributes to the generated display control.
	StyleRule (see page 6395)	Applies a style in the page producer's style sheet to the generated display control.
	TextAreaWrap (see page 6396)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 6396)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 6396)	Indicates the viewing state of the adapter field.

62.1.12.2.1 TAdapterEditColumn.Align Property

Specifies the horizontal alignment of the component relative to its containing cell.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align specifies the component's horizontal alignment relative to the containing HTML table cell.

See Also

VAlign (see page 6363)

62.1.12.2.2 TAdapterEditColumn.Caption Property

Specifies the text of a label that indicates what information the generated control displays.

Pascal

```
property Caption;
```

C++

```
__property Caption;
```

Description

Use Caption to specify the text of the control's label.

See Also

CaptionAttributes

CaptionPosition

62.1.12.2.3 TAdapterEditColumn.CaptionAttributes Property

Customizes the appearance of the generated control's label.

Pascal

```
property CaptionAttributes;
```

C++

```
__property CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the control's label. CaptionAttributes defines a set of options that are added to an HTML SPAN tag surrounding the value of the Caption property.

See Also

Caption

CaptionPosition

HeadingAttributes

62.1.12.2.4 TAdapterEditColumn.CaptionPosition Property

Specifies where the label appears relative to the generated display control.

Pascal

```
property CaptionPosition;
```

C++

```
__property CaptionPosition;
```

Description

Use CaptionPosition to indicate where the label should appear relative to the control that displays information.

Note: CaptionPosition has no effect on column controls. The position of column labels is always in the table header.

See Also

CaptionAttributes

Caption

62.1.12.2.5 TAdapterEditColumn.Custom Property

Represents a tag option and its value in the tag for the display control.

Pascal

```
property Custom;
```

C++

```
__property Custom;
```

Description

TWebDataDisplay descendants generate different HTML tags to generate the control that displays information. Use Custom to add options that qualify the tag. Each option and its value has the form

OPTIONNAME=Value

The options specified by Custom should be separated by spaces. For example, to provide an INPUT control with an accelerator key and align text to the bottom, you can set Custom to

ACCESSKEY=A ALIGN=BOTTOM

Note: To add custom options to the control's label, use the CaptionAttributes property instead.

See Also

Style

StyleRule

CaptionAttributes

62.1.12.2.6 TAdapterEditColumn.DisplayColumns Property

Specifies the number of columns in a display field.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to control the number of columns being displayed.

See Also

DisplayRows (see page 6472)

62.1.12.2.7 TAdapterEditColumn.DisplayRows Property

Specifies the number of rows in a display field.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayColumns to control the number of rows being displayed.

See Also

DisplayColumns (see page 6472)

62.1.12.2.8 TAdapterEditColumn.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TDisplayFieldHTMLElementType;
```

C++

```
__property TDisplayFieldHTMLElementType DisplayType;
```

Description

Set DisplayType to indicate the type of HTML control that should be used to display this field's value when it is read-only.

See Also

ImageHeight (see page 6473)

ImageWidth (see page 6474)

InputType (see page 6474)

62.1.12.2.9 TAdapterEditColumn.DisplayWidth Property

Specifies the width, in characters, of the generated HTML field.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to control the width of the HTML field that displays record status information. By default, DisplayWidth is 1 because the TCustomAdapterDisplayField control values are one character (M for modified or I for inserted).

62.1.12.2.10 TAdapterEditColumn.FieldName Property

Specifies the name of the associated dataset field.

Pascal

```
property FieldName: string;
```

C++

```
__property UnicodeString FieldName;__property UnicodeString FieldName;
```

Description

FieldName specifies the name of the dataset field that the adapter field represents.

See Also

DataSet

62.1.12.2.11 TAdapterEditColumn.HideOptions Property

When field should be hidden.

Pascal

```
property HideOptions: TDisplayFieldHideOptions;
```

C++

```
__property TDisplayFieldHideOptions HideOptions;
```

Description

Set HideOptions to indicate when the field should be hidden from view.

62.1.12.2.12 TAdapterEditColumn.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in the column.

See Also

DisplayWidth (see page 6473)

ImageWidth (see page 6474)

62.1.12.2.13 TAdapterEditColumn.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight to indicate the width of the image in the column.

See Also

ImageHeight (see page 6473)

62.1.12.2.14 TAdapterEditColumn.InputType Property

Specifies the input type for the display field.

Pascal

```
property InputType: TInputFieldHTMLElementType;
```

C++

```
__property TInputFieldHTMLElementType InputType;
```

Description

Set InputType to indicate the type of control that should be generated to let users assign values to the adapter field.

See Also

ImageHeight (see page 6473)

ImageWidth (see page 6474)

DisplayType (see page 6473)

62.1.12.2.15 TAdapterEditColumn.MaxLength Property

Specifies the maximum number of characters the user can enter into the display field.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the display field. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

62.1.12.2.16 TAdapterEditColumn.SelectRows Property

Indicates the number of rows that can be selected.

Pascal

```
property SelectRows: Integer;
```

C++

```
__property int SelectRows;
```

Description

Use SelectRows to indicate the number of rows that can be selected.

62.1.12.2.17 TAdapterEditColumn.Style Property

Adds style attributes to the generated display control.

Pascal

```
property Style;
```

C++

```
__property Style;
```

Description

Use Style to specify display characteristics that affect the generated control. The Style option consists of one or more attribute descriptions such as

font-family: arial; font-weight: bold; font-size: 10px

These attributes are added to the HTML tag that generates the control as the value of a STYLE option.

Note: To add style attributes to the control's label, use the CaptionAttributes property instead.

See Also

Custom

StyleRule

CaptionAttributes

Setting Web Item Properties

62.1.12.2.18 TAdapterEditColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated display control.

Pascal

```
property StyleRule;
```

C++

```
__property StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated display control. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style property instead.

Note: To apply a style to the control's label, use the CaptionAttributes property instead.

See Also

Style

Styles

Styles (see page 1157)

StylesFile

StylesFile (see page 1158)

CaptionAttributes

62.1.12.2.19 TAdapterEditColumn.TextAreaWrap Property

Specifies how the display field treats lines that are longer than the display width.

Pascal

```
property TextAreaWrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap TextAreaWrap;
```

Description

Use TextAreaWrap to specify how the generated display field formats lines that are longer than the number of characters specified by DisplayWidth.

See Also

DisplayWidth (see page 6473)

62.1.12.2.20 TAdapterEditColumn.VAlign Property

Specifies the vertical alignment of the generated display control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign specifies the control's vertical alignment relative to the containing HTML table cell.

See Also

Align (see page 6362)

62.1.12.2.21 TAdapterEditColumn.ViewMode Property

Indicates the viewing state of the adapter field.

Pascal

```
property ViewMode: TDisplayFieldViewMode;
```

C++

```
__property TDisplayFieldViewMode ViewMode;
```

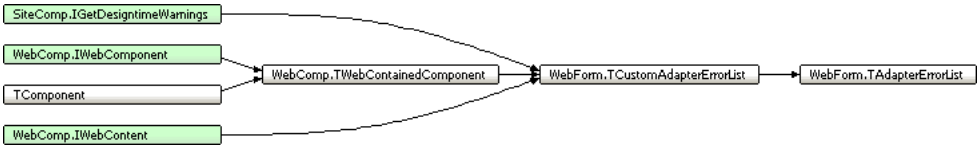
Description

Use ViewMode to specify the viewing state of the field.

62.1.13 TAdapterErrorList Class

TAdapterErrorList is the error list display component.

Class Hierarchy



Pascal

```
TAdapterErrorList = class(TCustomAdapterErrorList);
```

C++

```
class TAdapterErrorList : public TCustomAdapterErrorList;
```

File

WebForm

Description

Use TAdapterErrorList to display errors relating to a specific adapter component.

TAdapterErrorList is a minimal implementation of TCustomAdapterErrorList (see page 6478). To extend its features, create your own concrete descendant of TCustomAdapterErrorList (see page 6478).

Note: Do not confuse TAdapterErrorList with TAdapterErrorsList.

See Also

TAdapterErrorsList (see page 5259)

62.1.13.1 TAdapterErrorList Members

The following tables list the members exposed by TAdapterErrorList.

Protected Methods

	Name	Description
	Content (see page 6480)	Returns the HTML that the Web item generates.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetDesigntimeWarnings (see page 6481)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	ImplContent (see page 6481)	This is ImplContent, a member of class TCustomAdapterErrorList.
	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
	Notification (see page 6482)	Forwards notification messages to all owned components.
	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.

Protected Properties

	Name	Description
	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Methods

	Name	Description
	Content (see page 6104)	Returns the HTML that the Web item generates.
	Create (see page 6039)	Creates and initializes an instance of TWebContainedComponent (see page 6038).
	Create (see page 6480)	Creates an instance of TCustomAdapterErrorList (see page 6478).
	Destroy (see page 6040)	Frees an instance of TWebContainedComponent (see page 6038).
	Destroy (see page 6480)	Frees the memory associated with an instance of TCustomAdapterErrorList (see page 6478).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.
	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.

Published Properties

	Name	Description
	Adapter (see page 6398)	Specifies a related adapter.

62.1.13.2 TAdapterErrorList Properties

The properties of the TAdapterErrorList class are listed here.

Published Properties

	Name	Description
	Adapter (see page 6398)	Specifies a related adapter.

62.1.13.2.1 TAdapterErrorList.Adapter Property

Specifies a related adapter.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

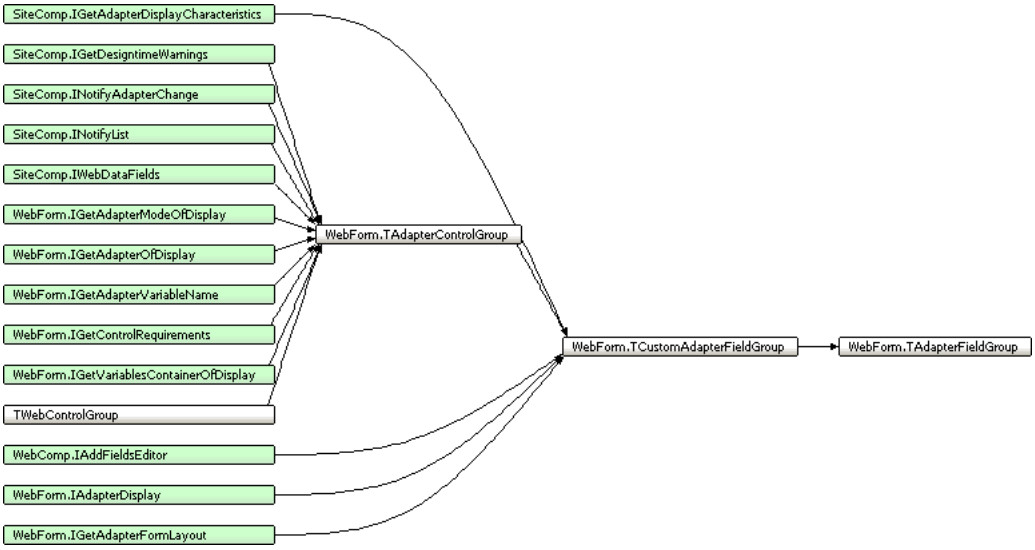
Description

Adapter specifies the adapter component for which this component reports errors.

62.1.14 TAdapterFieldGroup Class

TAdapterFieldGroup is a container for Adapter (see page 6402) display field components such as TAdapterDisplayField (see page 6371). TAdapterFieldGroup labels and fields in an HTML form.

Class Hierarchy



Pascal

```
TAdapterFieldGroup = class(TCustomAdapterFieldGroup);
```

C++

```
class TAdapterFieldGroup : public TCustomAdapterFieldGroup;
```

File

WebForm

Description

Add TAdapterFieldGroup as a child of TAdapterForm (see page 6404).

TAdapterFieldGroup is associated with an Adapter (see page 6402). All of its child display field components will use the same Adapter (see page 6402).

If no display fields have been explicitly added to the TAdapterFieldGroup, display fields associated with all of the Adapter (see page 6402) fields will be added by default. The properties of default display fields cannot be modified.

Modifying the AdapterMode (see page 6402) property of TAdapterFieldGroup may change the default display type or input type of Adapter (see page 6402) fields. This may cause the display field children of TAdapterFieldGroup to change appearance.

Use the properties and methods of TAdapterFieldGroup to:

Specify the associated Adapter (see page 6402).

Specify when the Adapter (see page 6402) Mode.

Specify whether default fields should be added.

See Also

TAdapterDisplayField (see page 6371)

TAdapterForm (see page 6404)

62.1.14.1 TAdapterFieldGroup Members

The following tables list the members exposed by TAdapterFieldGroup.

Protected Methods

	Name	Description
	AdapterChange (see page 6345)	Responds when the adapter associated with this control group changes.
	AddNotify (see page 6345)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
	CreateDefaultFields (see page 6346)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
	FindField (see page 6346)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 6346)	Returns the value of the Adapter (see page 6352) property.
	GetAdapterDisplayCharacteristics (see page 6486)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterFieldGroup.
	GetAdapterFormLayout (see page 6486)	This is GetAdapterFormLayout, a member of class TCustomAdapterFieldGroup.
	GetAdapterModeOfAdapter (see page 6347)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 6347)	Returns the value of the AdapterMode (see page 6353) property.
	GetAdapterVariableName (see page 6348)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetAddAllFieldsItem (see page 6486)	This is GetAddAllFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsDlgCaption (see page 6487)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsItem (see page 6487)	This is GetAddFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetControlRequirements (see page 6348)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
	GetDesigntimeWarnings (see page 6348)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 6349)	Fills a string list with the names of all of the associated adapter's fields.
	GetLayoutAttributes (see page 6487)	Returns an object that specifies how the generated group of controls should look.
	GetNewFieldPrefix (see page 6487)	This is GetNewFieldPrefix, a member of class TCustomAdapterFieldGroup.
	GetVisibleFields (see page 6349)	Returns the value of the VisibleFields (see page 6354) property.
	ImplCanAddClass (see page 6488)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 6488)	Provides the underlying implementation for the Content method.
	ImplGetControlRequirements (see page 6350)	Provides the underlying implementation for the GetControlRequirements (see page 6348) method.
	IsFieldInUse (see page 6350)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
	Notification (see page 6350)	Updates the TAdapterControlGroup (see page 6341) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 6351)	Responds when the control group's adapter notifies it of a change.
	RemoveNotify (see page 6351)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 6352)	Sets the value of the Adapter (see page 6352) property.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	Create (see page 6343)	Creates and initializes an instance of TAdapterControlGroup (see page 6341).

	Create (see page 6485)	Creates and initializes an instance of TCustomAdapterFieldGroup (see page 6483).
	Destroy (see page 6344)	Frees an instance of TAdapterControlGroup (see page 6341).
	Destroy (see page 6485)	Frees an instance of TCustomAdapterFieldGroup (see page 6483).
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetAdapter (see page 6513)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterDisplayCharacteristics (see page 1019)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAdapterFormLayout (see page 6511)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.
	GetAdapterModeOfAdapter (see page 6512)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 6512)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetAddAllFieldsItem (see page 6080)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 6080)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 6080)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetNewFieldPrefix (see page 6081)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NotifyAdapterChange (see page 1058)	Responds when the adapter changes.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.

Public Properties

	Name	Description
	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.
	VisibleFields (see page 6354)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.

Published Properties

	Name	Description
	Adapter (see page 6402)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 6402)	Specifies the mode of the adapter that the controls in the group support.
	AddDefaultFields (see page 6403)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	Custom (see page 6403)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 6404)	Adds style attributes to the generated button group.
	StyleRule (see page 6404)	Applies a style in the page producer's style sheet to the button group.

62.1.14.2 TAdapterFieldGroup Properties

The properties of the TAdapterFieldGroup class are listed here.

Published Properties

	Name	Description
	Adapter (see page 6402)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 6402)	Specifies the mode of the adapter that the controls in the group support.

	AddDefaultFields (see page 6403)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	Custom (see page 6403)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 6404)	Adds style attributes to the generated button group.
	StyleRule (see page 6404)	Applies a style in the page producer's style sheet to the button group.

62.1.14.2.1 TAdapterFieldGroup.Adapter Property

Specifies the adapter that supplies values to or receives values from the controls in the group.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Set Adapter to link this adapter control group and all its Web items to an adapter component. Each component that the WebFieldControls property lists generates an HTML control that represents the value of one of the adapter's fields.

See Also

GetFieldsList (see page 5549)

GetFieldsList (see page 6349)

AdapterMode (see page 6353)

WebFieldControls

62.1.14.2.2 TAdapterFieldGroup.AdapterMode Property

Specifies the mode of the adapter that the controls in the group support.

Pascal

```
property AdapterMode: string;
```

C++

```
__property UnicodeString AdapterMode;
```

Description

Some adapter components support different modes, or states. For example, dataset adapters can be in Edit, Insert, Browse, or Query mode. The mode of the adapter has an effect on the types of controls that the control group's Web items generate, and how those controls behave.

If the adapter that is assigned to the Adapter property supports different modes, you can set AdapterMode to force the controls in the group to represent the adapter fields in the specified mode. When AdapterMode is blank, the adapter control group uses the current mode of the adapter at the time when it generates its controls in the HTML form.

The possible values of AdapterMode depend on the modes that the adapter supports. If the adapter supports different modes, you can select a value for AdapterMode from a drop-down list in the Object Inspector that lists all the possible mode strings. If the adapter does not support different modes, the Object Inspector does not display a list, and the value of AdapterMode should be blank.

Mode

Adapter (see page 6352)

WebFieldControls

62.1.14.2.3 TAdapterFieldGroup.AddDefaultFields Property

Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.

Pascal

```
property AddDefaultFields: Boolean;
```

C++

```
__property Boolean AddDefaultFields;
```

Description

Set AddDefaultFields to indicate how you want the adapter control group to respond when you do not explicitly add child Web items. You can add child Web items at design time using Adapter page editor, or by right-clicking the control group and selecting Add Fields or Add Component. You can add child Web items at runtime using the Add method of the WebFieldControls property.

When AddDefaultFields is true, if you do not add child Web items to the adapter control group, it generates a default set of child Web items to display the fields of the adapter component that the Adapter property specifies.

When AddDefaultFields is false, if you do not add child Web items to the adapter control group, it remains empty, displaying no field values.

VisibleFields (see page 6354)

WebFieldControls

Adapter (see page 6352)

62.1.14.2.4 TAdapterFieldGroup.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button group. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Style (see page 6489)

62.1.14.2.5 TAdapterFieldGroup.Style Property

Adds style attributes to the generated button group.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button group. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 6489)

StyleRule (see page 6489)

62.1.14.2.6 TAdapterFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the button group.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button group. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style property.

Style (see page 6489)

Styles (see page 1157)

StylesFile (see page 1158)

62.1.15 TAdapterForm Class

TAdapterForm generates an HTML form displaying Adapter fields.

Class Hierarchy

Pascal

```
TAdapterForm = class(TCustomAdapterForm);
```

C++

```
class TAdapterForm : public TCustomAdapterForm;
```

File

WebForm

Description

TAdapter form is a basic implementation of TCustomAdapterForm (see page 6490). Add TAdapterForm to a TAdapterPageProducer to display Adapter fields users can view and/or edit, and Adapter actions that users can execute.

Add child components to TAdapterForm to display Adapter fields and Adapter actions. Child components include TAdapterGrid (see page 6419), TAdapterFieldGroup (see page 6399), and TAdapterCommandGroup (see page 6337). Add TAdapterErrors to TAdapterForm to display errors that are generated by an Adapter.

Use the properties and methods of TAdapterForm to:

Customize the appearance of the HTML form.

Indicate the HTTP method used to submit the HTML form.

See Also

TAdapterPageProducer (see page 1136)

TAdapterGrid (see page 6419)

TAdapterFieldGroup (see page 6399)

TAdapterCommandGroup (see page 6337)

TAdapterErrorList (see page 6397)

62.1.15.1 TAdapterForm Members

The following tables list the members exposed by TAdapterForm.

Protected Methods

	Name	Description
	GetAdapterFormLayout (see page 6492)	This is GetAdapterFormLayout, a member of class TCustomAdapterForm.
	GetFormRequirements (see page 6492)	This is GetFormRequirements, a member of class TCustomAdapterForm.
	GetHTMLFormName (see page 6492)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 6493)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 6493)	Returns an object that specifies how the generated group of controls should look.
V	ImplCanAddClass (see page 6493)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 6494)	Provides the underlying implementation for the Content method.

Public Methods

	Name	Description
	Create (see page 6491)	Creates and initializes an instance of TCustomAdapterForm (see page 6490).
	Destroy (see page 6491)	Frees an instance of TCustomAdapterForm (see page 6490).
	GetAdapterFormLayout (see page 6511)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.
	GetFormRequirements (see page 6517)	This is GetFormRequirements, a member of class IGetFormRequirements.

Published Properties

	Name	Description
	Custom (see page 6406)	Represents a tag option and its value in the generated INPUT tag.
	FormMethod (see page 6406)	Specifies the method that the adapter form adds to its generated <form> tag.
	Style (see page 6407)	Adds style attributes to the generated form.
	StyleRule (see page 6407)	Applies a style in the page producer's style sheet to the form.

62.1.15.2 TAdapterForm Properties

The properties of the TAdapterForm class are listed here.

Published Properties

	Name	Description
	Custom (see page 6406)	Represents a tag option and its value in the generated INPUT tag.
	FormMethod (see page 6406)	Specifies the method that the adapter form adds to its generated <form> tag.
	Style (see page 6407)	Adds style attributes to the generated form.
	StyleRule (see page 6407)	Applies a style in the page producer's style sheet to the form.

62.1.15.2.1 TAdapterForm.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the <table> tag that the adapter form generates to manage the layout of its Web items. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

ALIGN=TOP TABINDEX=2

See Also

Style (see page 6495)

62.1.15.2.2 TAdapterForm.FormMethod Property

Specifies the method that the adapter form adds to its generated <form> tag.

Pascal

```
property FormMethod: TFormMethod;
```

C++

```
__property TFormMethod FormMethod;
```

Description

Set FormMethod to specify the METHOD header for HTTP messages that the form submits. This value gives rise to the MethodType property of the HTTP request message.

See Also

MethodType

62.1.15.2.3 TAdapterForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the <table> tag that the adapter form generates to manage the layout of its Web items. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated <table> tag as the value of a STYLE option.

See Also

Custom (see page 6495)

StyleRule (see page 6496)

62.1.15.2.4 TAdapterForm.StyleRule Property

Applies a style in the page producer's style sheet to the form.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the adapter page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the form's Style property.

See Also

Style (see page 6495)

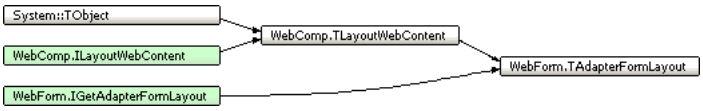
Styles (see page 1157)

StylesFile (see page 1158)

62.1.16 TAdapterFormLayout Class

TAdapterFormLayout lets child Web items adhere to layout rules imposed by their parent.

Class Hierarchy



Pascal

```
TAdapterFormLayout = class(TLayoutWebContent, IGetAdapterFormLayout);
```

C++

```
class TAdapterFormLayout : public TLayoutWebContent, public IGetAdapterFormLayout;
```

File

WebForm

Description

TAdapterFormLayout is the default implementation of the ILayoutWebContent (see page 6084) interface for WebSnap applications. The Web items that belong to an adapter page producer (TAdapterPageProducer) pass a TAdapterFormLayout instance to their child Web items as the ParentLayout parameter of their Content method. This object provides helper functions that the child items use to fit their generated content into the parent object's HTML structure.

Use the TAdapterFormLayout properties to configure how the ILayoutWebContent (see page 6084) methods convert HTML that child Web items generate into a final form.

See Also

TLayout (see page 6112)

IWebContent (see page 6103)

ILayoutWebContent (see page 6084)

TAdapterPageProducer (see page 1136)

62.1.16.1 TAdapterFormLayout Members

The following tables list the members exposed by TAdapterFormLayout.

Protected Methods

	Name	Description
	_AddRef (see page 6017)	Responds when the caller acquires a reference to this object's interface.
	_Release (see page 6017)	Responds when the caller releases a reference to this object's interface.
	EndButtons (see page 6411)	This is EndButtons, a member of class TAdapterFormLayout.
	EndField (see page 6411)	This is EndField, a member of class TAdapterFormLayout.
	EndFields (see page 6411)	This is EndFields, a member of class TAdapterFormLayout.
	EndRow (see page 6412)	This is EndRow, a member of class TAdapterFormLayout.
	EndTable (see page 6412)	This is EndTable, a member of class TAdapterFormLayout.

	GetAdapterFormLayout (see page 6412)	This is GetAdapterFormLayout, a member of class TAdapterFormLayout.
	GetChildTableIndent (see page 6413)	This is GetChildTableIndent, a member of class TAdapterFormLayout.
	GetFieldIndent (see page 6413)	This is GetFieldIndent, a member of class TAdapterFormLayout.
	GetTableIndent (see page 6413)	This is GetTableIndent, a member of class TAdapterFormLayout.
V	ImplLayoutButton (see page 6413)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 6414)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 6414)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 6415)	Provides the underlying implementation for the LayoutTable method.
	LayoutButton (see page 6020)	Converts the HTML declaring a button into a form the associated Web item can use.
	LayoutField (see page 6020)	Converts the HTML declaring a field into a form the associated Web item can use.
	LayoutLabelAndField (see page 6020)	Converts the HTML declaring a labeled field into a form the associated Web item can use.
	LayoutTable (see page 6021)	Converts the HTML declaring a table into a form the associated Web item can use.
	NextColumn (see page 6415)	This is NextColumn, a member of class TAdapterFormLayout.
V	QueryInterface (see page 6021)	Returns a reference to a specified interface if the object supports that interface.
	StartButtons (see page 6415)	This is StartButtons, a member of class TAdapterFormLayout.
	StartFields (see page 6416)	This is StartFields, a member of class TAdapterFormLayout.
	StartRow (see page 6416)	This is StartRow, a member of class TAdapterFormLayout.
	StartTable (see page 6416)	This is StartTable, a member of class TAdapterFormLayout.

Public Methods

	Name	Description
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6410)	Creates a new TLayoutWebContent object.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	EndLayout (see page 6412)	Returns the string of HTML to insert after laying out all child items.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	LayoutButton (see page 6085)	Converts the HTML declaring a button into a form the Web item's parent can use.
	LayoutField (see page 6085)	Converts the HTML declaring a field into a form the Web item's parent can use.

	LayoutLabelAndField (see page 6086)	Converts the HTML declaring a labeled field into a form the Web item's parent can use.
	LayoutTable (see page 6086)	Converts the HTML declaring a table into a form the Web item's parent can use.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	BreakButtons (see page 6417)	Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.
R	ChildTableIndent (see page 6417)	Specifies a string that appears before the <table> tags that child Web items generate.
	ColumnCount (see page 6417)	Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.
R	FieldIndent (see page 6418)	Specifies a string that appears before the HTML tags (other than <table> tags) that child Web items generate.
R	ParentLayout (see page 6022)	Provides access to the layout object of the Web item that is the parent of the Web item to which this object belongs.
	TableHeader (see page 6418)	Specifies the HTML to generate at the beginning of a table that lays out child elements.
R	TableIndent (see page 6419)	Specifies a string that appears before the <table> tags of the HTML table that contains child Web items.

62.1.16.2 TAdapterFormLayout.Create Constructor

Creates a new TLayoutWebContent object.

Pascal

```
constructor Create(AParentLayout: TLayout);
```

C++

```
__fastcall TAdapterFormLayout(TLayout AParentLayout);
```

Description

Call Create to instantiate a TLayoutWebContent descendant to use when fetching the content produced by child Web items.

AParentLayout is the layout object of the parent Web item (the grandparent of the child Web items that call this object's methods). AParentLayout becomes the value of the ParentLayout property.

See Also

ParentLayout (see page 6022)

62.1.16.3 TAdapterFormLayout Methods

The methods of the TAdapterFormLayout class are listed here.

Protected Methods

	Name	Description
	EndButtons (see page 6411)	This is EndButtons, a member of class TAdapterFormLayout.
	EndField (see page 6411)	This is EndField, a member of class TAdapterFormLayout.

	EndFields (see page 6411)	This is EndFields, a member of class TAdapterFormLayout.
	EndRow (see page 6412)	This is EndRow, a member of class TAdapterFormLayout.
	EndTable (see page 6412)	This is EndTable, a member of class TAdapterFormLayout.
	GetAdapterFormLayout (see page 6412)	This is GetAdapterFormLayout, a member of class TAdapterFormLayout.
	GetChildTableIndent (see page 6413)	This is GetChildTableIndent, a member of class TAdapterFormLayout.
	GetFieldIndent (see page 6413)	This is GetFieldIndent, a member of class TAdapterFormLayout.
	GetTableIndent (see page 6413)	This is GetTableIndent, a member of class TAdapterFormLayout.
V	ImplLayoutButton (see page 6413)	Provides the underlying implementation for the LayoutButton method.
V	ImplLayoutField (see page 6414)	Provides the underlying implementation for the LayoutField method.
V	ImplLayoutLabelAndField (see page 6414)	Provides the underlying implementation for the LayoutLabelAndField method.
V	ImplLayoutTable (see page 6415)	Provides the underlying implementation for the LayoutTable method.
	NextColumn (see page 6415)	This is NextColumn, a member of class TAdapterFormLayout.
	StartButtons (see page 6415)	This is StartButtons, a member of class TAdapterFormLayout.
	StartFields (see page 6416)	This is StartFields, a member of class TAdapterFormLayout.
	StartRow (see page 6416)	This is StartRow, a member of class TAdapterFormLayout.
	StartTable (see page 6416)	This is StartTable, a member of class TAdapterFormLayout.

Public Methods

	Name	Description
	EndLayout (see page 6412)	Returns the string of HTML to insert after laying out all child items.

62.1.16.3.1 TAdapterFormLayout.EndButtons Method

Pascal

```
function EndButtons: string;
```

C++

```
__fastcall UnicodeString EndButtons();
```

Description

This is EndButtons, a member of class TAdapterFormLayout.

62.1.16.3.2 TAdapterFormLayout.EndField Method

Pascal

```
function EndField: string;
```

C++

```
__fastcall UnicodeString EndField();
```

Description

This is EndField, a member of class TAdapterFormLayout.

62.1.16.3.3 TAdapterFormLayout.EndFields Method

Pascal

```
function EndFields: string;
```

C++

```
__fastcall UnicodeString EndFields();
```

Description

This is EndFields, a member of class TAdapterFormLayout.

62.1.16.3.4 TAdapterFormLayout.EndLayout Method

Returns the string of HTML to insert after laying out all child items.

Pascal

```
function EndLayout: string;
```

C++

```
__fastcall UnicodeString EndLayout();
```

Description

EndLayout generates the tags that must be inserted after all the content that child Web items generate. TAdapterFormLayout (see page 6408) keeps track of the ILayoutWebContent (see page 6084) method calls that are made so that it can know what tags need to be closed.

See Also

ILayoutWebContent (see page 6084)

62.1.16.3.5 TAdapterFormLayout.EndRow Method

Pascal

```
function EndRow: string;
```

C++

```
__fastcall UnicodeString EndRow();
```

Description

This is EndRow, a member of class TAdapterFormLayout.

62.1.16.3.6 TAdapterFormLayout.EndTable Method

Pascal

```
function EndTable: string;
```

C++

```
__fastcall UnicodeString EndTable();
```

Description

This is EndTable, a member of class TAdapterFormLayout.

62.1.16.3.7 TAdapterFormLayout.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TAdapterFormLayout.

62.1.16.3.8 TAdapterFormLayout.GetChildTableIndent Method

Pascal

```
function GetChildTableIndent: string;
```

C++

```
__fastcall UnicodeString GetChildTableIndent();
```

Description

This is GetChildTableIndent, a member of class TAdapterFormLayout.

62.1.16.3.9 TAdapterFormLayout.GetFieldIndent Method

Pascal

```
function GetFieldIndent: string;
```

C++

```
__fastcall UnicodeString GetFieldIndent();
```

Description

This is GetFieldIndent, a member of class TAdapterFormLayout.

62.1.16.3.10 TAdapterFormLayout.GetTableIndent Method

Pascal

```
function GetTableIndent: string;
```

C++

```
__fastcall UnicodeString GetTableIndent();
```

Description

This is GetTableIndent, a member of class TAdapterFormLayout.

62.1.16.3.11 TAdapterFormLayout.ImplLayoutButton Method

Provides the underlying implementation for the LayoutButton method.

Pascal

```
function ImplLayoutButton(const HTMLButton: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutButton(const UnicodeString HTMLButton,
TLayoutAttributes Attributes);
```

Description

The LayoutButton method calls ImplLayoutButton to convert the HTML that declares a button (typically an <INPUT> tag) into the form that the associated Web item requires.

HTMLButton is the HTML that declares a button. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the button.

LayoutButton returns the HTML for the button in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutButton is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutButton method.

See Also

LayoutButton (see page 6020)

62.1.16.3.12 TAdapterFormLayout.ImplLayoutField Method

Provides the underlying implementation for the LayoutField method.

Pascal

```
function ImplLayoutField(const HTMLField: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutField(const UnicodeString HTMLField,
TLayoutAttributes Attributes);
```

Description

The LayoutField method calls ImplLayoutField to convert the HTML that declares a field (an input control that represents a data field or a named value) into the form that the associated Web item requires.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field.

LayoutField returns the HTML for the field in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutField method.

See Also

LayoutField (see page 6020)

62.1.16.3.13 TAdapterFormLayout.ImplLayoutLabelAndField Method

Provides the underlying implementation for the LayoutLabelAndField method.

Pascal

```
function ImplLayoutLabelAndField(const HTMLLabel: string; const HTMLField: string; Attributes:
TLayoutAttributes): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutLabelAndField(const UnicodeString HTMLLabel, const
UnicodeString HTMLField, TLayoutAttributes Attributes);
```

Description

The LayoutLabelAndField method calls ImplLayoutLabelAndField to convert the HTML that declares a labeled field (an input control that represents a data field or a named value along with its label) into the form that the associated Web item requires.

HTMLLabel is the HTML that declares the label. This is produced by the child Web item.

HTMLField is the HTML that declares the field. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the field and its label.

LayoutLabelAndField returns the HTML for the field and label in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutLabelAndField is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutLabelAndField method.

See Also

LayoutLabelAndField (see page 6020)

62.1.16.3.14 TAdapterFormLayout.ImplLayoutTable Method

Provides the underlying implementation for the LayoutTable method.

Pascal

```
function ImplLayoutTable(const HTMLTable: string; Attributes: TLayoutAttributes): string;
override;
```

C++

```
virtual __fastcall UnicodeString ImplLayoutTable(const UnicodeString HTMLTable,
TLayoutAttributes Attributes);
```

Description

The LayoutTable method calls ImplLayoutTable to convert the HTML that declares a table (typically a structure used to layout the content produced by the child Web item's children) into the form that the associated Web item requires.

HTMLTable is the HTML that declares the table. This is produced by the child Web item.

Attributes describes any style attributes or layout considerations that should be applied to the final HTML for the table.

LayoutTable returns the HTML for the table in a form that the associated Web item can use.

In TLayoutWebContent, ImplLayoutTable is abstract or, in C++ terminology, pure virtual. Descendant classes override this method to provide an implementation for the LayoutTable method.

See Also

LayoutTable (see page 6021)

62.1.16.3.15 TAdapterFormLayout.NextColumn Method

Pascal

```
function NextColumn(SubItemCount: Integer): string;
```

C++

```
__fastcall UnicodeString NextColumn(int SubItemCount);
```

Description

This is NextColumn, a member of class TAdapterFormLayout.

62.1.16.3.16 TAdapterFormLayout.StartButtons Method

Pascal

```
function StartButtons: string;
```

C++

```
__fastcall UnicodeString StartButtons();
```

Description

This is StartButtons, a member of class TAdapterFormLayout.

62.1.16.3.17 TAdapterFormLayout.StartFields Method

Pascal

```
function StartFields(ColCount: Integer): string;
```

C++

```
__fastcall UnicodeString StartFields(int ColCount);
```

Description

This is StartFields, a member of class TAdapterFormLayout.

62.1.16.3.18 TAdapterFormLayout.StartRow Method

Pascal

```
function StartRow: string;
```

C++

```
__fastcall UnicodeString StartRow();
```

Description

This is StartRow, a member of class TAdapterFormLayout.

62.1.16.3.19 TAdapterFormLayout.StartTable Method

Pascal

```
function StartTable: string;
```

C++

```
__fastcall UnicodeString StartTable();
```

Description

This is StartTable, a member of class TAdapterFormLayout.

62.1.16.4 TAdapterFormLayout Properties

The properties of the TAdapterFormLayout class are listed here.

Public Properties

	Name	Description
	BreakButtons (see page 6417)	Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.
R	ChildTableIndent (see page 6417)	Specifies a string that appears before the <table> tags that child Web items generate.
	ColumnCount (see page 6417)	Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.
R	FieldIndent (see page 6418)	Specifies a string that appears before the HTML tags (other than <table> tags) that child Web items generate.
	TableHeader (see page 6418)	Specifies the HTML to generate at the beginning of a table that lays out child elements.
R	TableIndent (see page 6419)	Specifies a string that appears before the <table> tags of the HTML table that contains child Web items.

62.1.16.4.1 TAdapterFormLayout.BreakButtons Property

Indicates whether the associated Web item uses a grid to lay out buttons that child Web items generate.

Pascal

```
property BreakButtons: Boolean;
```

C++

```
__property Boolean BreakButtons;
```

Description

Set BreakButtons to true if the Web item that supplies this object to its child Web items uses an HTML table to position HTML buttons that those child Web items generate. Set BreakButtons to false if the Web item does not use an HTML table to position child buttons.

BreakButtons affects the whether the LayoutButton method on this object's ILayoutWebContent (see page 6084) interface adds <TD> tags to the HTML that child Web items generate for HTML buttons.

See Also

LayoutButton (see page 6085)

62.1.16.4.2 TAdapterFormLayout.ChildTableIndent Property

Specifies a string that appears before the <table> tags that child Web items generate.

Pascal

```
property ChildTableIndent: string;
```

C++

```
__property UnicodeString ChildTableIndent;
```

Description

Child Web items read ChildTableIndent from the implementation of their Content method to create the proper indentation of the HTML for a table. ChildTableIndent is a string of spaces that reflects the nesting of HTML tags for an HTML table tag that the child Web item generates.

Note: Do not confuse ChildTableIndent with the TableIndent (see page 6419) property. ChildTableIndent gives the indentation of a table that the child Web item generates. TableIndent (see page 6419) gives the indentation of a table that the associated Web item generates. (The associated Web item is the one that passes this object to the Content method of its child Web items.)

See Also

FieldIndent (see page 6418)

Content (see page 6104)

TableIndent (see page 6419)

62.1.16.4.3 TAdapterFormLayout.ColumnCount Property

Indicates the number of child elements appear in a single row when the associated Web item uses a grid to lay them out.

Pascal

```
property ColumnCount: Integer;
```

C++

```
__property int ColumnCount;
```

Description

Set ColumnCount to the number of child elements that appear in a single row when laying out child controls by rows.

ColumnCount affects where the LayoutFields or LayoutButtons method on this object's ILayoutWebContent (see page 6084) interface adds <TR> and </TR> tags to the HTML that child Web items generate.

Note: ColumnCount only affects the LayoutButtons method if the value of the BreakButtons (see page 6417) property is true.

See Also

LayoutButton (see page 6085)

LayoutField (see page 6085)

BreakButtons (see page 6417)

62.1.16.4.4 TAdapterFormLayout.FieldIndent Property

Specifies a string that appears before the HTML tags (other than <table> tags) that child Web items generate.

Pascal

```
property FieldIndent: string;
```

C++

```
__property UnicodeString FieldIndent;
```

Description

Child Web items read FieldIndent from the implementation of their Content method to create the proper indentation of the HTML for individual fields or controls. FieldIndent is a string of spaces that reflects the nesting of HTML tags for the tag that the child Web item generates.

See Also

ChildTableIndent (see page 6417)

Content (see page 6104)

TableIndent (see page 6419)

62.1.16.4.5 TAdapterFormLayout.TableHeader Property

Specifies the HTML to generate at the beginning of a table that lays out child elements.

Pascal

```
property TableHeader: string;
```

C++

```
__property UnicodeString TableHeader;
```

Description

Set TableHeader to the HTML tag that appears at the beginning of the HTML table used to control the layout of child elements. TableHeader is a string that includes the <table> tag, along with any attributes (such as alignment) that affect the layout of child items.

See Also

LayoutButton (see page 6085)

LayoutField (see page 6085)

BreakButtons (see page 6417)

62.1.16.4.6 TAdapterFormLayout.TableIndent Property

Specifies a string that appears before the <table> tags of the HTML table that contains child Web items.

Pascal

```
property TableIndent: string;
```

C++

```
__property UnicodeString TableIndent;
```

Description

TAdapterFormLayout (see page 6408) uses TableIndent internally to create the proper indentation of the HTML table tags for the table used to lay out child Web items. For example, the EndLayout (see page 6412) method uses TableIndent to properly format its </table> tag.

TableIndent is a string of spaces that reflects the nesting of HTML tags for the HTML table tag that the associated Web item generates.

Note: Do not confuse TableIndent with the ChildTableIndent (see page 6417) property. TableIndent gives the indentation of a table that the associated Web item generates. (The associated Web item is the one that passes this object to the Content method of its child Web items.) ChildTableIndent (see page 6417) gives the indentation of a table that the child Web item generates.

See Also

FieldIndent (see page 6418)

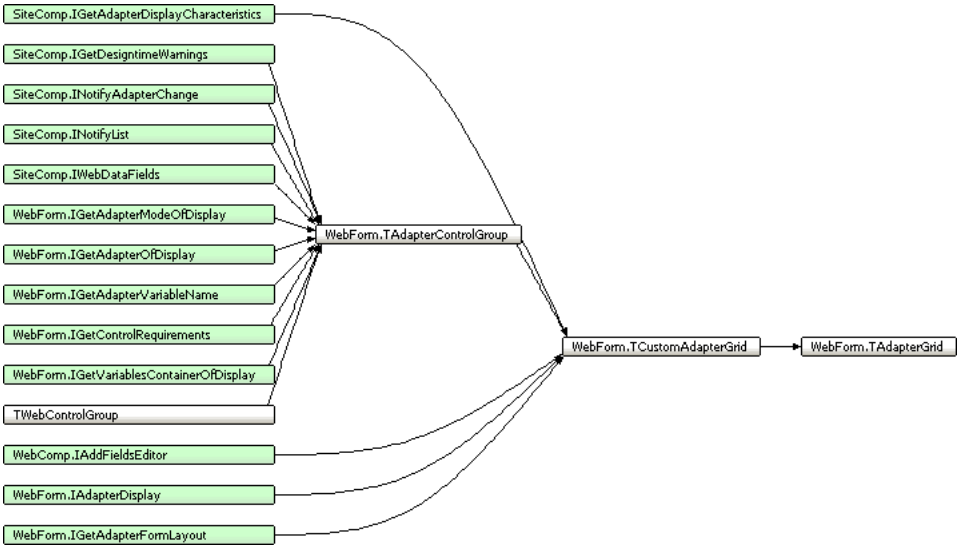
EndLayout (see page 6412)

ChildTableIndent (see page 6417)

62.1.17 TAdapterGrid Class

TAdapterGrid is a container for Adapter (see page 6422) display field components such as TAdapterDisplayColumn (see page 6364). TAdapterGrid generates an HTML table.

Class Hierarchy



Pascal

```
TAdapterGrid = class(TCustomAdapterGrid);
```

C++

```
class TAdapterGrid : public TCustomAdapterGrid;
```

File

WebForm

Description

Add TAdapterGrid as a child of TAdapterForm (see page 6404). TAdapterGrid is associated with an Adapter (see page 6422). All of it's child display field components will use the same Adapter (see page 6422).

If no display fields have been explicitly added to the TAdapterGrid, display fields associated with all of the Adapter (see page 6422) fields will be added by default. The properties of default display fields cannot be modified.

Modifying the AdapterMode (see page 6423) property of TAdapterGrid may change the default display type or input type of Adapter (see page 6422) fields. This may cause the display field children of TAdapterGrid to change appearance.

Use the properties and methods of TAdapterGrid to:

Specify the associated Adapter (see page 6422).

Specify when the Adapter (see page 6422) Mode.

Specify whether default fields should be added.

Customize the appearance of the HTML table.

See Also

TAdapterDisplayColumn (see page 6364)

TAdapterForm (see page 6404)

62.1.17.1 TAdapterGrid Members

The following tables list the members exposed by TAdapterGrid.

Protected Methods

	Name	Description
	AdapterChange (see page 6345)	Responds when the adapter associated with this control group changes.
	AddNotify (see page 6345)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
	CreateDefaultFields (see page 6346)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
	FindField (see page 6346)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 6346)	Returns the value of the Adapter (see page 6352) property.
	GetAdapterDisplayCharacteristics (see page 6500)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterGrid.
	GetAdapterFormLayout (see page 6500)	This is GetAdapterFormLayout, a member of class TCustomAdapterGrid.
	GetAdapterModeOfAdapter (see page 6347)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 6347)	Returns the value of the AdapterMode (see page 6353) property.
	GetAdapterVariableName (see page 6348)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetAddAllFieldsItem (see page 6500)	This is GetAddAllFieldsItem, a member of class TCustomAdapterGrid.
	GetAddFieldsDlgCaption (see page 6501)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterGrid.
	GetAddFieldsItem (see page 6501)	This is GetAddFieldsItem, a member of class TCustomAdapterGrid.
	GetControlRequirements (see page 6348)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
	GetDesigntimeWarnings (see page 6348)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 6349)	Fills a string list with the names of all of the associated adapter's fields.
	GetNewFieldPrefix (see page 6501)	This is GetNewFieldPrefix, a member of class TCustomAdapterGrid.
	GetVisibleFields (see page 6349)	Returns the value of the VisibleFields (see page 6354) property.
	ImplCanAddClass (see page 6501)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 6502)	Provides the underlying implementation for the Content method.
	ImplGetControlRequirements (see page 6350)	Provides the underlying implementation for the GetControlRequirements (see page 6348) method.
	IsFieldInUse (see page 6350)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
	Notification (see page 6350)	Updates the TAdapterControlGroup (see page 6341) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 6351)	Responds when the control group's adapter notifies it of a change.
	RemoveNotify (see page 6351)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 6352)	Sets the value of the Adapter (see page 6352) property.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	Create (see page 6343)	Creates and initializes an instance of TAdapterControlGroup (see page 6341).
	Create (see page 6499)	Creates and initializes an instance of TCustomAdapterGrid (see page 6496).
	Destroy (see page 6344)	Frees an instance of TAdapterControlGroup (see page 6341).
	Destroy (see page 6499)	Frees an instance of TCustomAdapterGrid (see page 6496).
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetAdapter (see page 6513)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterDisplayCharacteristics (see page 1019)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAdapterFormLayout (see page 6511)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.
	GetAdapterModeOfAdapter (see page 6512)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.

	GetAdapterModeOfDisplay (see page 6512)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetAddAllFieldsItem (see page 6080)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 6080)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 6080)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetNewFieldPrefix (see page 6081)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NotifyAdapterChange (see page 1058)	Responds when the adapter changes.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.

Public Properties

	Name	Description
R	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.
R	VisibleFields (see page 6354)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.

Published Properties

	Name	Description
	Adapter (see page 6422)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 6423)	Specifies the mode of the adapter that the controls in the group support.
	AddDefaultFields (see page 6423)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	HeadingAttributes (see page 6424)	Determines the display characteristics of the table's header.
	RowAttributes (see page 6424)	Determines the display characteristics of the table's body.
	TableAttributes (see page 6425)	Determines the basic display characteristics of the table.

62.1.17.2 TAdapterGrid Properties

The properties of the TAdapterGrid class are listed here.

Published Properties

	Name	Description
	Adapter (see page 6422)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 6423)	Specifies the mode of the adapter that the controls in the group support.
	AddDefaultFields (see page 6423)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	HeadingAttributes (see page 6424)	Determines the display characteristics of the table's header.
	RowAttributes (see page 6424)	Determines the display characteristics of the table's body.
	TableAttributes (see page 6425)	Determines the basic display characteristics of the table.

62.1.17.2.1 TAdapterGrid.Adapter Property

Specifies the adapter that supplies values to or receives values from the controls in the group.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Set Adapter to link this adapter control group and all its Web items to an adapter component. Each component that the WebFieldControls property lists generates an HTML control that represents the value of one of the adapter's fields.

See Also

GetFieldsList (see page 5549)

GetFieldsList (see page 6349)

AdapterMode (see page 6353)

WebFieldControls

62.1.17.2.2 TAdapterGrid.AdapterMode Property

Specifies the mode of the adapter that the controls in the group support.

Pascal

```
property AdapterMode: string;
```

C++

```
__property UnicodeString AdapterMode;
```

Description

Some adapter components support different modes, or states. For example, dataset adapters can be in Edit, Insert, Browse, or Query mode. The mode of the adapter has an effect on the types of controls that the control group's Web items generate, and how those controls behave.

If the adapter that is assigned to the Adapter property supports different modes, you can set AdapterMode to force the controls in the group to represent the adapter fields in the specified mode. When AdapterMode is blank, the adapter control group uses the current mode of the adapter at the time when it generates its controls in the HTML form.

The possible values of AdapterMode depend on the modes that the adapter supports. If the adapter supports different modes, you can select a value for AdapterMode from a drop-down list in the Object Inspector that lists all the possible mode strings. If the adapter does not support different modes, the Object Inspector does not display a list, and the value of AdapterMode should be blank.

See Also

Mode

Adapter (see page 6352)

WebFieldControls

62.1.17.2.3 TAdapterGrid.AddDefaultFields Property

Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.

Pascal

```
property AddDefaultFields: Boolean;
```

C++

```
__property Boolean AddDefaultFields;
```

Description

Set AddDefaultFields to indicate how you want the adapter control group to respond when you do not explicitly add child Web items. You can add child Web items at design time using Adapter page editor, or by right-clicking the control group and selecting Add Fields or Add Component. You can add child Web items at runtime using the Add method of the WebFieldControls property.

When AddDefaultFields is true, if you do not add child Web items to the adapter control group, it generates a default set of child Web items to display the fields of the adapter component that the Adapter property specifies.

When AddDefaultFields is false, if you do not add child Web items to the adapter control group, it remains empty, displaying no field values.

See Also

VisibleFields (see page 6354)

WebFieldControls

Adapter (see page 6352)

62.1.17.2.4 TAdapterGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table. HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes or RowAttributes property instead.

See Also

TableAttributes (see page 6503)

RowAttributes (see page 6503)

62.1.17.2.5 TAdapterGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes or HeadingAttributes property instead.

See Also

TableAttributes (see page 6503)

HeadingAttributes (see page 6502)

62.1.17.2.6 TAdapterGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes property instead.

See Also

RowAttributes (see page 6503)

HeadingAttributes (see page 6502)

62.1.18 TControlRequirements Class

TControlRequirements lists the variables and functions that the controls in an adapter form require to generate their HTML.

Class Hierarchy

Pascal

```
TControlRequirements = class(TAbstractControlRequirements);
```

C++

```
class TControlRequirements : public TAbstractControlRequirements;
```

File

WebForm

Description

Adapter forms create instances of TControlRequirements to store information about variables and functions that are needed for generating an HTML form to display the controls they contain. Components that generate HTML controls to represent the fields of an adapter (TAdapterControlGroup (see page 6341) and TAdapterDataDisplay (see page 6354) descendants) use the TControlRequirements instance that the form provides to store these variable and function declarations.

Typically, applications do not need to create or use TControlRequirements instances. Component writers that create Web items for an adapter form (that is, components that generate HTML controls to reflect the fields of an adapter) use the methods of TControlRequirements when implementing the GetControlRequirements method.

See Also

TAdapterControlGroup (see page 6341)

TAdapterDataDisplay (see page 6354)

TAdapterForm (see page 6404)

62.1.18.1 TControlRequirements Members

The following tables list the members exposed by TControlRequirements.

Public Methods

	Name	Description
	Create (see page 6426)	Creates and initializes an instance of TControlRequirements (see page 6425).
V	DefineFunction (see page 6427)	Adds the declaration of a function to those that this control requirements object stores.
V	DefineVariable (see page 6428)	Adds the declaration of a variable to those that this control requirements object stores.
V	Destroy (see page 6427)	Frees an instance of TControlRequirements (see page 6425).
V	IsFunctionDefined (see page 6428)	Indicates whether a function with the specified name has already been added to the list of control requirements.
V	IsVariableDefined (see page 6429)	Indicates whether a variable with the specified name has already been added to the list of control requirements.
V	RequiresMultipartForm (see page 6429)	Stores the fact that the generated HTML form should be multipart.

Public Properties

	Name	Description
R	NeedMultipartForm (see page 6429)	Indicates whether the form that the adapter form generates must be multipart.

62.1.18.2 TControlRequirements.Create Constructor

Creates and initializes an instance of TControlRequirements (see page 6425).

Pascal

```
constructor Create;
```

C++

```
__fastcall TControlRequirements();
```

Description

Applications should have no need to instantiate TControlRequirements (see page 6425). The adapter form creates instances of this object to assemble and store information from their Web items.

See Also

TAdapterForm (see page 6404)

62.1.18.3 TControlRequirements.Destroy Destructor

Frees an instance of TControlRequirements (see page 6425).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TControlRequirements();
```

Description

Applications should have no need to create or destroy TControlRequirements (see page 6425) instances. These objects are created and freed by the adapter form.

See Also

TAdapterForm (see page 6404)

62.1.18.4 TControlRequirements Methods

The methods of the TControlRequirements class are listed here.

Public Methods

	Name	Description
	DefineFunction (see page 6427)	Adds the declaration of a function to those that this control requirements object stores.
	DefineVariable (see page 6428)	Adds the declaration of a variable to those that this control requirements object stores.
	IsFunctionDefined (see page 6428)	Indicates whether a function with the specified name has already been added to the list of control requirements.
	IsVariableDefined (see page 6429)	Indicates whether a variable with the specified name has already been added to the list of control requirements.
	RequiresMultipartForm (see page 6429)	Stores the fact that the generated HTML form should be multipart.

62.1.18.4.1 TControlRequirements.DefineFunction Method

Adds the declaration of a function to those that this control requirements object stores.

Pascal

```
procedure DefineFunction(const AName: string; const ABody: string); override;
```

C++

```
virtual __fastcall DefineFunction(const UnicodeString AName, const UnicodeString ABody);
```

Description

DefineFunction stores the declaration of a function that has the name AName, where ABody is the text of the function body.

AName is the name of the function. This name is one of a standard set that the adapter form knows to call under specific circumstances. For example, the name can be the standard name of the function to generate an HTML button.

ABody is the body of the specified function. This value is typically customized to reflect the properties of a specific control in the

form.

See Also

IsFunctionDefined (see page 6428)

DefineVariable (see page 6428)

62.1.18.4.2 TControlRequirements.DefineVariable Method

Adds the declaration of a variable to those that this control requirements object stores.

Pascal

```
procedure DefineVariable(const AName: string; const AValue: string; AAdapter: Boolean);
override;
```

C++

```
virtual __fastcall DefineVariable(const UnicodeString AName, const UnicodeString AValue,
Boolean AAdapter);
```

Description

DefineVariable stores the name and value of a variable declaration.

AName is the name of the variable.

AValue is the value to assign to the variable.

AAdapter indicates whether this variable is the one that declares the adapter object whose field a control represents or whose set of fields a control group represents.

See Also

IsVariableDefined (see page 6429)

DefineFunction (see page 6427)

62.1.18.4.3 TControlRequirements.IsFunctionDefined Method

Indicates whether a function with the specified name has already been added to the list of control requirements.

Pascal

```
function IsFunctionDefined(const AName: string): Boolean; override;
```

C++

```
virtual __fastcall Boolean IsFunctionDefined(const UnicodeString AName);
```

Description

IsFunctionDefined returns true if the control requirements object already lists a function with the specified name. That is, IsFunctionDefined returns true if the DefineFunction (see page 6427) method has been called to define the specified function, and false otherwise.

AName is the name of the function.

See Also

DefineFunction (see page 6427)

IsVariableDefined (see page 6429)

62.1.18.4.4 TControlRequirements.IsVariableDefined Method

Indicates whether a variable with the specified name has already been added to the list of control requirements.

Pascal

```
function IsVariableDefined(const AName: string): Boolean; override;
```

C++

```
virtual __fastcall Boolean IsVariableDefined(const UnicodeString AName);
```

Description

IsVariableDefined returns true if the control requirements object already lists a variable with the specified name. That is, IsVariableDefined returns true if the DefineVariable (see page 6428) method has been called to define a value for the specified variable, and false otherwise.

AName is the name of the variable.

See Also

DefineVariable (see page 6428)

IsFunctionDefined (see page 6428)

62.1.18.4.5 TControlRequirements.RequiresMultipartForm Method

Stores the fact that the generated HTML form should be multipart.

Pascal

```
procedure RequiresMultipartForm; override;
```

C++

```
virtual __fastcall RequiresMultipartForm();
```

Description

Web items call this method if they need to be contained in a multipart form (for example, when a field in the form is represented by a reference to another file). A multipart form's HTML declaration includes the attribute 'enctype=multipart/form-data'.

See Also

NeedMultipartForm (see page 6429)

62.1.18.5 TControlRequirements Properties

The properties of the TControlRequirements class are listed here.

Public Properties

	Name	Description
	NeedMultipartForm (see page 6429)	Indicates whether the form that the adapter form generates must be multipart.

62.1.18.5.1 TControlRequirements.NeedMultipartForm Property

Indicates whether the form that the adapter form generates must be multipart.

Pascal

```
property NeedMultipartForm: Boolean;
```

C++

```
__property Boolean NeedMultipartForm;
```

Description

NeedMultipartForm indicates whether any control has called the RequiresMultipartForm (see page 6429) method to indicate that the form that contains it must be multipart. A multipart form's HTML declaration includes the attribute 'enctype=multipart/form-data'.

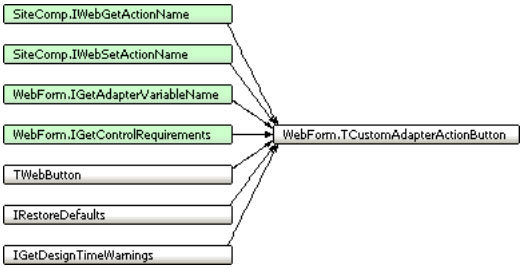
See Also

RequiresMultipartForm (see page 6429)

62.1.19 TCustomAdapterActionButton Class

TCustomAdapterActionButton is the base class for Web items that generate HTML controls for executing adapter actions.

Class Hierarchy



Pascal

```
TCustomAdapterActionButton = class(TWebButton, IWebGetActionName, IWebSetActionName,
IRestoreDefaults, IGetControlRequirements, IGetAdapterVariableName, IGetDesignTimeWarnings);
```

C++

```
class TCustomAdapterActionButton : public TWebButton, public IWebGetActionName, public
IWebSetActionName, public IRestoreDefaults, public IGetControlRequirements, public
IGetAdapterVariableName, public IGetDesignTimeWarnings;
```

File

WebForm

Description

Use TCustomAdapterActionButton as a base class when defining Web items that generate HTML controls for adapter actions. TCustomAdapterActionButton descendants are added to Web items that appear in the hierarchy of a TAdapterForm (see page 6404) object. The adapter action button generates an HTML control that appears in the HTML form. When the end user clicks that control, it sends a request message that executes the adapter action.

TCustomAdapterActionButton introduces properties to link this component to the adapter action it executes, and for defining the type and appearance of the generated control in the HTML form.

TAdapterActionButton (see page 6316)

TCustomAdapterAction (see page 5579)

TAdapterForm (see page 6404)

62.1.19.1 TCustomAdapterActionButton Members

The following tables list the members exposed by TCustomAdapterActionButton.

Protected Methods

	Name	Description
	FindAssociatedAction (see page 6433)	This is FindAssociatedAction, a member of class TCustomAdapterActionButton.
	GetActionName (see page 6433)	This is GetActionName, a member of class TCustomAdapterActionButton.
	GetAdapterModeOfAdapter (see page 6433)	This is GetAdapterModeOfAdapter, a member of class TCustomAdapterActionButton.
	GetAdapterVariableName (see page 6433)	This is GetAdapterVariableName, a member of class TCustomAdapterActionButton.
V	GetCaption (see page 6434)	Returns the value of the Caption property.
	GetControlRequirements (see page 6434)	This is GetControlRequirements, a member of class TCustomAdapterActionButton.
	GetDesigntimeWarnings (see page 6434)	This is GetDesigntimeWarnings, a member of class TCustomAdapterActionButton.
	GetHTMLFormVarName (see page 6434)	This is GetHTMLFormVarName, a member of class TCustomAdapterActionButton.
V	GetLayoutAttributes (see page 6435)	Returns the layout object that specifies how the generated control should look.
V	ImplContent (see page 6435)	Provides the underlying implementation for the Content method.
V	ImplGetControlRequirements (see page 6435)	This is ImplGetControlRequirements, a member of class TCustomAdapterActionButton.
V	ImplRestoreDefaults (see page 6436)	This is ImplRestoreDefaults, a member of class TCustomAdapterActionButton.
V	Notification (see page 6436)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 6436)	Returns the Web item to a default state.
	SetActionName (see page 6437)	This is SetActionName, a member of class TCustomAdapterActionButton.
V	SetCaption (see page 6437)	Sets the value of the Caption property.

Public Methods

	Name	Description
V	Create (see page 6431)	Creates and initializes an instance of TCustomAdapterActionButton (see page 6430).
V	Destroy (see page 6432)	Frees an instance of TCustomAdapterActionButton (see page 6430).

Public Properties

	Name	Description
	ActionName (see page 6438)	Specifies the name of the action taken by the Web button.
R	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 6438)	Specifies the horizontal alignment of the generated HTML control.
	DisplayColumns (see page 6438)	Indicates the number of columns to use when laying out the generated HTML control.
	DisplayType (see page 6439)	Specifies the DisplayType of the generated HTML control.
	ErrorPageName (see page 6439)	Specifies the name of the page to display when an error occurs executing the action.
	HideOptions (see page 6440)	Controls when the generated HTML element appears in HTML forms.
	ImageHeight (see page 6440)	Specifies the height of the generated element if it is a clickable image.
	ImageProducer (see page 6441)	Specifies the interface that this adapter action button uses to generate images.
	ImageWidth (see page 6441)	Specifies the width of the generated element if it is a clickable image.
	PageName (see page 6441)	Specifies the name of the page to display after successfully executing the action.
	VAlign (see page 6442)	Specifies the vertical alignment of the generated HTML control.

62.1.19.2 TCustomAdapterActionButton.Create Constructor

Creates and initializes an instance of TCustomAdapterActionButton (see page 6430).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterActionButton(TComponent * AOwner);
```

Description

Call Create to instantiate an adapter action button at runtime. Adapter action buttons added to an adapter form at design time are created automatically.

AOwner is the component, typically a Web module, that is responsible for freeing the TCustomAdapterActionButton (see page 6430) instance. This becomes the value of the Owner property.

See Also

Owner

62.1.19.3 TCustomAdapterActionButton.Destroy Destructor

Frees an instance of TCustomAdapterActionButton (see page 6430).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterActionButton();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks that the TCustomAdapterActionButton (see page 6430) is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

62.1.19.4 TCustomAdapterActionButton Methods

The methods of the TCustomAdapterActionButton class are listed here.

Protected Methods

	Name	Description
	FindAssociatedAction (see page 6433)	This is FindAssociatedAction, a member of class TCustomAdapterActionButton.
	GetActionName (see page 6433)	This is GetActionName, a member of class TCustomAdapterActionButton.
	GetAdapterModeOfAdapter (see page 6433)	This is GetAdapterModeOfAdapter, a member of class TCustomAdapterActionButton.
	GetAdapterVariableName (see page 6433)	This is GetAdapterVariableName, a member of class TCustomAdapterActionButton.
	GetCaption (see page 6434)	Returns the value of the Caption property.
	GetControlRequirements (see page 6434)	This is GetControlRequirements, a member of class TCustomAdapterActionButton.
	GetDesigntimeWarnings (see page 6434)	This is GetDesigntimeWarnings, a member of class TCustomAdapterActionButton.
	GetHTMLFormVarName (see page 6434)	This is GetHTMLFormVarName, a member of class TCustomAdapterActionButton.
	GetLayoutAttributes (see page 6435)	Returns the layout object that specifies how the generated control should look.

	ImplContent (see page 6435)	Provides the underlying implementation for the Content method.
	ImplGetControlRequirements (see page 6435)	This is ImplGetControlRequirements, a member of class TCustomAdapterActionButton.
	ImplRestoreDefaults (see page 6436)	This is ImplRestoreDefaults, a member of class TCustomAdapterActionButton.
	Notification (see page 6436)	Forwards notification messages to all owned components.
	RestoreDefaults (see page 6436)	Returns the Web item to a default state.
	SetActionName (see page 6437)	This is SetActionName, a member of class TCustomAdapterActionButton.
	SetCaption (see page 6437)	Sets the value of the Caption property.

62.1.19.4.1 TCustomAdapterActionButton.FindAssociatedAction Method

Pascal

```
function FindAssociatedAction: TComponent;
```

C++

```
__fastcall TComponent * FindAssociatedAction();
```

Description

This is FindAssociatedAction, a member of class TCustomAdapterActionButton.

62.1.19.4.2 TCustomAdapterActionButton.GetActionName Method

Pascal

```
function GetActionName: string;
```

C++

```
__fastcall UnicodeString GetActionName();
```

Description

This is GetActionName, a member of class TCustomAdapterActionButton.

62.1.19.4.3 TCustomAdapterActionButton.GetAdapterModeOfAdapter Method

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall UnicodeString GetAdapterModeOfAdapter();
```

Description

This is GetAdapterModeOfAdapter, a member of class TCustomAdapterActionButton.

62.1.19.4.4 TCustomAdapterActionButton.GetAdapterVariableName Method

Pascal

```
function GetAdapterVariableName: string;
```

C++

```
__fastcall UnicodeString GetAdapterVariableName();
```

Description

This is GetAdapterVariableName, a member of class TCustomAdapterActionButton.

62.1.19.4.5 TCustomAdapterActionButton.GetCaption Method

Returns the value of the Caption property.

Pascal

```
function GetCaption: string; override;
```

C++

```
virtual __fastcall UnicodeString GetCaption();
```

Description

GetCaption is the protected read implementation for the Caption property.

See Also

Caption

SetCaption

62.1.19.4.6 TCustomAdapterActionButton.GetControlRequirements Method

Pascal

```
procedure GetControlRequirements(ARequirements: TAbstractControlRequirements);
```

C++

```
__fastcall GetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is GetControlRequirements, a member of class TCustomAdapterActionButton.

62.1.19.4.7 TCustomAdapterActionButton.GetDesigntimeWarnings Method

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

This is GetDesigntimeWarnings, a member of class TCustomAdapterActionButton.

62.1.19.4.8 TCustomAdapterActionButton.GetHTMLFormVarName Method

Pascal

```
function GetHTMLFormVarName: string;
```

C++

```
__fastcall UnicodeString GetHTMLFormVarName();
```

Description

This is GetHTMLFormVarName, a member of class TCustomAdapterActionButton.

62.1.19.4.9 TCustomAdapterActionButton.GetLayoutAttributes Method

Returns the layout object that specifies how the generated control should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebButton, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because the layout of buttons does not make use of layout attributes.

See Also

Content

62.1.19.4.10 TCustomAdapterActionButton.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the button control. TWebButton introduces ImplContent as an abstract or, in C++ terminology, pure virtual method. TWebButton descendants must override ImplContent to generate the definition of their particular button control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web button should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the button control.

See Also

Content

ILayoutWebContent (see page 6084)

62.1.19.4.11 TCustomAdapterActionButton.ImplGetControlRequirements Method

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); virtual;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is ImplGetControlRequirements, a member of class TCustomAdapterActionButton.

62.1.19.4.12 TCustomAdapterActionButton.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; virtual;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TCustomAdapterActionButton.

62.1.19.4.13 TCustomAdapterActionButton.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

FreeNotification

InsertComponent

RemoveComponent

Owner

62.1.19.4.14 TCustomAdapterActionButton.RestoreDefaults Method

Returns the Web item to a default state.

Pascal

```
procedure RestoreDefaults;
```

C++

```
__fastcall RestoreDefaults();
```

Description

The Web page editor calls RestoreDefaults when the user chooses the Restore Defaults command. Web items implement this method to return property values to a default state.

62.1.19.4.15 TCustomAdapterActionButton.SetActionName Method

Pascal

```
procedure SetActionName(const AValue: string);
```

C++

```
__fastcall SetActionName(const UnicodeString AValue);
```

Description

This is SetActionName, a member of class TCustomAdapterActionButton.

62.1.19.4.16 TCustomAdapterActionButton.SetCaption Method

Sets the value of the Caption property.

Pascal

```
procedure SetCaption(const Value: string); override;
```

C++

```
virtual __fastcall SetCaption(const UnicodeString Value);
```

Description

SetCaption is the protected write implementation for the Caption property.

GetCaption

62.1.19.5 TCustomAdapterActionButton Properties

The properties of the TCustomAdapterActionButton class are listed here.

Public Properties

	Name	Description
	ActionName (see page 6438)	Specifies the name of the action taken by the Web button.
	Align (see page 6438)	Specifies the horizontal alignment of the generated HTML control.
	DisplayColumns (see page 6438)	Indicates the number of columns to use when laying out the generated HTML control.
	DisplayType (see page 6439)	Specifies the DisplayType of the generated HTML control.
	ErrorPageName (see page 6439)	Specifies the name of the page to display when an error occurs executing the action.
	HideOptions (see page 6440)	Controls when the generated HTML element appears in HTML forms.
	ImageHeight (see page 6440)	Specifies the height of the generated element if it is a clickable image.
	ImageProducer (see page 6441)	Specifies the interface that this adapter action button uses to generate images.
	ImageWidth (see page 6441)	Specifies the width of the generated element if it is a clickable image.

	PageName (see page 6441)	Specifies the name of the page to display after successfully executing the action.
	VAlign (see page 6442)	Specifies the vertical alignment of the generated HTML control.

62.1.19.5.1 TCustomAdapterActionButton.ActionName Property

Specifies the name of the action taken by the Web button.

Pascal

```
property ActionName: string;
```

C++

```
__property UnicodeString ActionName;
```

Description

Use ActionName to get or set the name of the adapter action that executes in response to requests sent when the user clicks this object's generated control. ActionName is the same as the ActionName property of the adapter action object that this control executes.

See Also

Caption

ActionName (see page 5586)

62.1.19.5.2 TCustomAdapterActionButton.Align Property

Specifies the horizontal alignment of the generated HTML control.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align controls where the generated HTML control is positioned horizontally within its parent HTML element. If the adapter action button is included in the column of an adapter grid, this property has no effect unless the associated action has multiple items. It affects the position of the HTML controls for each individual of the items within the grid generated to position them into rows.

Align indicates the desired value of the Align option of the HTML tag for the generated control.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the control wherever it wishes.

See Also

VAlign (see page 6442)

DisplayColumns (see page 6438)

ItemCount (see page 5475)

62.1.19.5.3 TCustomAdapterActionButton.DisplayColumns Property

Indicates the number of columns to use when laying out the generated HTML control.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

An adapter action may represent multiple commands. When the TCustomAdapterActionButton (see page 6430) object generates controls for such an action, it must handle the layout of individual items for each of the action's commands. DisplayColumns controls how many items (controls) appear in a row before TCustomAdapterActionButton (see page 6430) starts a new row of controls.

If the corresponding adapter action does not represent multiple commands (that is, if its ItemCount property is not greater than 1), the value of DisplayColumns has no effect.

If DisplayColumns is –1, the Web browser controls the layout of the adapter action's items.

See Also

ItemCount (see page 5475)

DisplayType (see page 6439)

62.1.19.5.4 TCustomAdapterActionButton.DisplayType Property

Specifies the DisplayType of the generated HTML control.

Pascal

```
property DisplayType: TCommandHTMLElementType;
```

C++

```
__property TCommandHTMLElementType DisplayType;
```

Description

DisplayType controls the type of HTML element that this Web item generates.

When DisplayType is ctDefault (the default), TCustomAdapterActionButton (see page 6430) uses the element type that the associated adapter action suggests. Change DisplayType to generate a different type of control or set of controls.

When DisplayType is ctImage or ctEventImages, you must set the ImageProducer (see page 6441) property to a component that can provide the image or images.

See Also

ImageProducer (see page 6441)

Caption

GetDisplayStyle (see page 5457)

62.1.19.5.5 TCustomAdapterActionButton.ErrorPageName Property

Specifies the name of the page to display when an error occurs executing the action.

Pascal

```
property ErrorPageName: string;
```

C++

```
__property UnicodeString ErrorPageName;
```

Description

Use ErrorPageName to indicate the Web page that should appear if the WebSnap application encounters an error when executing the adapter action in response to the user clicking the generated control. This is the name used to identify the Web page in server-side scripts, and appears as the pathinfo portion of the URL for that page if it is published.

See Also

PageName (see page 6441)

62.1.19.5.6 TCustomAdapterActionButton.HideOptions Property

Controls when the generated HTML element appears in HTML forms.

Pascal

```
property HideOptions: TActionButtonHideOptions;
```

C++

```
__property TActionButtonHideOptions HideOptions;
```

Description

HideOptions controls when this Web item generates an HTML control for its associated action. This property is a set of flags that control when the adapter page producer suppresses the controls that this object generates. If HideOptions is an empty set, TCustomAdapterActionButton (see page 6430) always generates a control for its associated adapter action.

See Also

GetVisible (see page 5462)

WebEnabled (see page 5473)

HasExecuteAccess (see page 5463)

62.1.19.5.7 TCustomAdapterActionButton.ImageHeight Property

Specifies the height of the generated element if it is a clickable image.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

ImageHeight controls the height of the image that the user can click to execute the associated action. If ImageHeight is –1 (the default), the browser controls the height it uses to display the generated image.

ImageHeight is only used when the value of the DisplayType (see page 6439) property is ctImage or ctEventImages.

See Also

ImageProducer (see page 6441)

ImageWidth (see page 6441)

DisplayType (see page 6439)

62.1.19.5.8 TCustomAdapterActionButton.ImageProducer Property

Specifies the interface that this adapter action button uses to generate images.

Pascal

```
property ImageProducer: IActionImageProducer;
```

C++

```
__property IActionImageProducer ImageProducer;
```

Description

Set ImageProducer when the value of the DisplayType (see page 6439) is ctImage or ctEventImages. ImageProducer is the interface of the component that supplies the image or images that appear in HTML forms as the control that this Web item generates. When the user clicks on the generated image in the HTML form, the associated action executes.

See Also

DisplayType (see page 6439)

ImageHeight (see page 6440)

ImageWidth (see page 6441)

62.1.19.5.9 TCustomAdapterActionButton.ImageWidth Property

Specifies the width of the generated element if it is a clickable image.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

ImageWidth controls the width of the image that the user can click to execute the associated action. If ImageWidth is –1 (the default), the browser controls the width it uses to display the generated image.

ImageWidth is only used when the value of the DisplayType (see page 6439) property is ctImage or ctEventImages.

See Also

ImageProducer (see page 6441)

ImageHeight (see page 6440)

DisplayType (see page 6439)

62.1.19.5.10 TCustomAdapterActionButton.PageName Property

Specifies the name of the page to display after successfully executing the action.

Pascal

```
property PageName: string;
```

C++

```
__property UnicodeString PageName;
```

Description

Use PageName to indicate the Web page that should appear if the WebSnap application successfully executes the adapter action in response to the user clicking the generated control. This is the name used to identify the Web page in server-side scripts, and appears as the pathinfo portion of the URL for that page if it is published.

See Also

ErrorPageName (see page 6439)

62.1.19.5.11 TCustomAdapterActionButton.VAlign Property

Specifies the vertical alignment of the generated HTML control.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign controls where the generated HTML control is positioned vertically within its parent HTML element. VAlign indicates the desired value of the VAlign option of the HTML tag for the generated control. . If the adapter action button is included in the column of an adapter grid, this property has no effect unless the associated action has multiple items. It affects the position of the HTML controls for each of the individual items within the grid generated to position them into rows.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document vertically positions the control wherever it wishes.

See Also

Align (see page 6438)

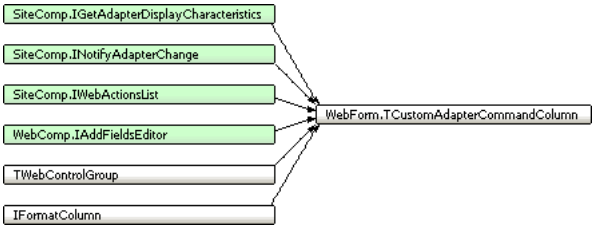
DisplayColumns (see page 6438)

ItemCount (see page 5475)

62.1.20 TCustomAdapterCommandColumn Class

TCustomAdapterCommandColumn is the base class for components that generate a column of action controls in an adapter grid.

Class Hierarchy



Pascal

```
TCustomAdapterCommandColumn = class(TWebControlGroup, IWebActionsList, IAddFieldsEditor,
IFormatColumn, IGetAdapterDisplayCharacteristics, INotifyAdapterChange);
```

C++

```
class TCustomAdapterCommandColumn : public TWebControlGroup, public IWebActionsList, public
IAddFieldsEditor, public IFormatColumn, public IGetAdapterDisplayCharacteristics, public
INotifyAdapterChange;
```

File

WebForm

Description

Use TCustomAdapterCommandColumn as a base class when creating a specialized display control that organizes the output of several adapter action buttons (TAdapterActionButton (see page 6316) objects) into a column of an adapter grid (TAdapterGrid (see page 6419)). TCustomAdapterCommandColumn generates the HTML to lay out a single column of an adapter grid. Each cell in the column can contain one or more adapter action buttons, each of which executes an adapter action. For each row in the grid, the column contains duplicates of the same set of adapter action buttons.

Use the TCustomAdapterCommandColumn properties to specify which adapter action buttons appear in the column and to customize their layout and appearance. These properties include:

The AddDefaultCommands (see page 6449), WebFieldControls, and VisibleCommands (see page 6453) properties, which specify which adapter action buttons appear in the column.

The Caption (see page 6450) and CaptionAttributes (see page 6451) properties, which determine the appearance of the label at the top of the column.

The Align (see page 6450), VAlign (see page 6453), and DisplayColumns (see page 6451) properties, which determine the layout of controls inside each cell.

The Style (see page 6452) and StyleRule (see page 6452) properties, which let you apply a style from a stylesheet to the column.

See Also

TAdapterCommandColumn (see page 6331)

TAdapterGrid (see page 6419)

TAdapterEditColumn (see page 6387)

TAdapterDisplayColumn (see page 6364)

TAdapterActionButton (see page 6316)

62.1.20.1 TCustomAdapterCommandColumn Members

The following tables list the members exposed by TCustomAdapterCommandColumn.

Protected Methods

	Name	Description
	FormatColumnData (see page 6445)	Generates the HTML for the cells in the column that contain controls to execute actions.
	FormatColumnHeading (see page 6446)	Generates the HTML for the table header cell for this column.
	GetAdapterDisplayCharacteristics (see page 6446)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterCommandColumn.
V	GetLayoutAttributes (see page 6446)	Returns an object that specifies how the generated group of controls should look.
V	ImplCanAddClass (see page 6447)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 6447)	Provides the underlying implementation for the Content method.
	NotifyAdapterChange (see page 6448)	Responds to changes that affect the associated adapter.

Protected Properties

	Name	Description
R	AdapterActionsListHelper (see page 6449)	Identifies the helper object that enables this component to work with the editor at design time.

Public Methods

	Name	Description
V	Create (see page 6444)	Creates and initializes an instance of TCustomAdapterCommandColumn (see page 6442).
V	Destroy (see page 6445)	Frees an instance of TCustomAdapterCommandColumn (see page 6442).
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAddAllFieldsItem (see page 6080)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 6080)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 6080)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetNewFieldPrefix (see page 6081)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.

Public Properties

	Name	Description
	AddDefaultCommands (see page 6449)	Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.
	Align (see page 6450)	Specifies the horizontal alignment of the action control buttons within the column.
	Caption (see page 6450)	Specifies the text label that appears at the top of the column.
	CaptionAttributes (see page 6451)	Specifies the attributes of the Caption (see page 6450) property.
	Custom (see page 6451)	Represents a tag option and its value.
	DisplayColumns (see page 6451)	Specifies the number of adapter action buttons that can appear in a single row.
	Style (see page 6452)	Adds style attributes to the generated caption.
	StyleRule (see page 6452)	Applies a style in the page producer's style sheet to the generated column.
	VAlign (see page 6453)	Specifies the vertical alignment of the action control buttons within the column.
R	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
R	VisibleCommands (see page 6453)	Lists the child Web items that generate controls that appear in cells of the column.

62.1.20.2 TCustomAdapterCommandColumn.Create Constructor

Creates and initializes an instance of TCustomAdapterCommandColumn (see page 6442).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterCommandColumn(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterCommandColumn (see page 6442) at runtime. TCustomAdapterCommandColumn (see page 6442) descendants added at design time are instantiated automatically.

AOwner is the component that becomes the value of the Owner property. Typically, this is the Web module.

See Also

Owner

62.1.20.3 TCustomAdapterCommandColumn.Destroy Destructor

Frees an instance of TCustomAdapterCommandColumn (see page 6442).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterCommandColumn();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks that the TCustomAdapterCommandColumn (see page 6442) reference is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

62.1.20.4 TCustomAdapterCommandColumn Methods

The methods of the TCustomAdapterCommandColumn class are listed here.

Protected Methods

	Name	Description
	FormatColumnData (see page 6445)	Generates the HTML for the cells in the column that contain controls to execute actions.
	FormatColumnHeading (see page 6446)	Generates the HTML for the table header cell for this column.
	GetAdapterDisplayCharacteristics (see page 6446)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterCommandColumn.
V	GetLayoutAttributes (see page 6446)	Returns an object that specifies how the generated group of controls should look.
V	ImplCanAddClass (see page 6447)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 6447)	Provides the underlying implementation for the Content method.
	NotifyAdapterChange (see page 6448)	Responds to changes that affect the associated adapter.

62.1.20.4.1 TCustomAdapterCommandColumn.FormatColumnData Method

Generates the HTML for the cells in the column that contain controls to execute actions.

Pascal

```
function FormatColumnData(const Content: string; Options: TWebContentOptions): string;
```

C++

```
__fastcall UnicodeString FormatColumnData(const UnicodeString Content, TWebContentOptions
Options);
```

Description

The adapter grid calls FormatColumnData to update the HTML for the contents of a cell to include any column attributes that affect the layout of that content. This method adds attributes to the HTML that reflect the Align (see page 6450) and VAlign (see page 6453) properties.

Content is the HTML that represents the content of the cell. It is the value that the Content method returns.

Options contains a set of flags that limit what can be included in the generated HTML.

FormatColumnData returns the resulting HTML.

See Also

Content

TAdapterGrid (see page 6419)

Align (see page 6450)

VAlign (see page 6453)

62.1.20.4.2 TCustomAdapterCommandColumn.FormatColumnHeading Method

Generates the HTML for the table header cell for this column.

Pascal

```
function FormatColumnHeading(Options: TWebContentOptions): string;
```

C++

```
__fastcall UnicodeString FormatColumnHeading(TWebContentOptions Options);
```

Description

The adapter grid calls FormatColumnHeading to generate the HTML for the top cell of the column (the one that contains the caption). This method generates the HTML to reflect the Caption (see page 6450) and CaptionAttributes (see page 6451) properties.

Options contains a set of flags that limit what can be included in the generated HTML.

FormatColumnHeading returns the resulting HTML.

See Also

Caption (see page 6450)

TAdapterGrid (see page 6419)

CaptionAttributes (see page 6451)

62.1.20.4.3 TCustomAdapterCommandColumn.GetAdapterDisplayCharacteristics Method

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterCommandColumn.

62.1.20.4.4 TCustomAdapterCommandColumn.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

GetLayoutAttributes adds returns a TLayoutAttributes (see page 6011) object that encodes the values of the Style (see page 6452), StyleRule (see page 6452), and Custom (see page 6451) properties.

See Also

Content

Style (see page 6452)

StyleRule (see page 6452)

Custom (see page 6451)

62.1.20.4.5 TCustomAdapterCommandColumn.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TCustomAdapterCommandColumn (see page 6442) descendant can add a component of type AClass to its WebFieldControls property list.

AParent is the TCustomAdapterCommandColumn (see page 6442) instance to which the component will be added.

AClass is the class of the component to be added.

In TCustomAdapterCommandColumn (see page 6442), ImplCanAddClass returns true if AClass is a descendant of TCustomAdapterActionButton (see page 6430) or TCustomLayoutGroup.

See Also

CanAddClass

WebFieldControls

TCustomAdapterActionButton (see page 6430)

TCustomLayoutGroup

62.1.20.4.6 TCustomAdapterCommandColumn.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML for the controls in one cell of the column. ImplContent generates the HTML to display the controls that the VisibleCommands (see page 6453) property lists, reflecting the values of the DisplayColumns (see page 6451), .Style (see page 6452), StyleRule (see page 6452), and Custom (see page 6451) properties.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TCustomAdapterCommandColumn (see page 6442) should format the HTML controls it generates. It implements the ILayoutWebContent (see page 6084) interface.

ImplContent returns the generated HTML.

Note: ImplContent does not include attributes for the alignment of controls inside the cell. The FormatColumnData (see page 6445) method adds this information to the HTML that ImplContent generates.

See Also

Content

FormatColumnData (see page 6445)

ILayoutWebContent (see page 6084)

VisibleCommands (see page 6453)

DisplayColumns (see page 6451)

Style (see page 6452)

StyleRule (see page 6452)

Custom (see page 6451)

62.1.20.4.7 TCustomAdapterCommandColumn.NotifyAdapterChange Method

Responds to changes that affect the associated adapter.

Pascal

```
procedure NotifyAdapterChange(Sender: TComponent);
```

C++

```
__fastcall NotifyAdapterChange(TComponent * Sender);
```

Description

NotifyAdapterChange is called automatically when the associated adapter changes. This method updates the set of default actions for that adapter to reflect the current change, and passes on the change notification to the actions that the WebFieldControls property lists.

See Also

GetDefaultWebComponents

WebFieldControls

62.1.20.5 TCustomAdapterCommandColumn Properties

The properties of the TCustomAdapterCommandColumn class are listed here.

Protected Properties

	Name	Description
	AdapterActionsListHelper (see page 6449)	Identifies the helper object that enables this component to work with the editor at design time.

Public Properties

	Name	Description
	AddDefaultCommands (see page 6449)	Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.
	Align (see page 6450)	Specifies the horizontal alignment of the action control buttons within the column.
	Caption (see page 6450)	Specifies the text label that appears at the top of the column.
	CaptionAttributes (see page 6451)	Specifies the attributes of the Caption (see page 6450) property.
	Custom (see page 6451)	Represents a tag option and its value.
	DisplayColumns (see page 6451)	Specifies the number of adapter action buttons that can appear in a single row.
	Style (see page 6452)	Adds style attributes to the generated caption.
	StyleRule (see page 6452)	Applies a style in the page producer's style sheet to the generated column.
	VAlign (see page 6453)	Specifies the vertical alignment of the action control buttons within the column.
	VisibleCommands (see page 6453)	Lists the child Web items that generate controls that appear in cells of the column.

62.1.20.5.1 TCustomAdapterCommandColumn.AdapterActionsListHelper Property

Identifies the helper object that enables this component to work with the editor at design time.

Pascal

```
property AdapterActionsListHelper: TAdapterActionsListHelper;
```

C++

```
__property TAdapterActionsListHelper AdapterActionsListHelper;
```

Description

AdapterActionsListHelper provides read-only access to a helper object that implements design-time editing functions on behalf of this component. This helper object implements methods for locating child Web items for specified actions, for listing the child Web items of this component, and for specifying the text of menu commands that operate on this component's list of adapter action buttons.

See Also

WebFieldControls

62.1.20.5.2 TCustomAdapterCommandColumn.AddDefaultCommands Property

Indicates whether cells in the column contain controls for all of the adapter's default actions if you do not explicitly add items to the WebFieldControls property.

Pascal

```
property AddDefaultCommands: Boolean;
```

C++

```
__property Boolean AddDefaultCommands;
```

Description

Set AddDefaultCommands property to specify what should appear in the generated column when you do not explicitly add any adapter action buttons to the WebFieldControls property. When AddDefaultCommands is true (the default), the adapter command column automatically adds controls for every default action of the associated adapter if you do not explicitly set the WebFieldControls property. When AddDefaultCommands is false, the adapter command column only generates controls if you explicitly add them to the WebFieldControls property. AddDefaultCommands must be false to allow an empty column.

See Also

WebFieldControls

DefaultWebComponents (see page 5237)

VisibleCommands (see page 6453)

62.1.20.5.3 TCustomAdapterCommandColumn.Align Property

Specifies the horizontal alignment of the action control buttons within the column.

Pascal

```
property Align: THTMLAlign;
```

C++

```
__property THTMLAlign Align;
```

Description

Align controls where the child HTML control are positioned horizontally within this column. Align indicates the desired value of the Align option of the HTML tag.

The default value of Align is haDefault, which means the web browser that reads the HTML document horizontally positions the control wherever it wishes.

See Also

VAlign (see page 6453)

DisplayColumns (see page 6451)

62.1.20.5.4 TCustomAdapterCommandColumn.Caption Property

Specifies the text label that appears at the top of the column.

Pascal

```
property Caption: string;
```

C++

```
__property UnicodeString Caption;
```

Description

Use Caption to get or set the caption for the column in the adapter grid. The caption is the text label that appears at the top of the column.

To change the appearance or layout of the caption, use the CaptionAttribute property.

See Also

CaptionAttributes (see page 6451)

62.1.20.5.5 TCustomAdapterCommandColumn.CaptionAttributes Property

Specifies the attributes of the Caption (see page 6450) property.

Pascal

```
property CaptionAttributes: TCaptionAttributes;
```

C++

```
__property TCaptionAttributes CaptionAttributes;
```

Description

Use CaptionAttributes to customize the appearance of the column caption.

See Also

Caption (see page 6450)

62.1.20.5.6 TCustomAdapterCommandColumn.Custom Property

Represents a tag option and its value.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to add one or more options to the tag that surrounds the column. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces.

TCustomAdapterCommandColumn (see page 6442) inserts the Custom string into the HTML tag when it generates its content.

See Also

Style (see page 6452)

StyleRule (see page 6452)

62.1.20.5.7 TCustomAdapterCommandColumn.DisplayColumns Property

Specifies the number of adapter action buttons that can appear in a single row.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Set DisplayColumns to organize the layout of adapter action buttons when the WebFieldControls property lists more than one

adapter action button. TCustomAdapterCommandColumn (see page 6442) places the adapter action buttons by rows in the cells of the adapter grid column. DisplayColumns limits the number of controls that can appear in a single row within each column cell. If the WebFieldControls property lists more adapter action buttons than DisplayColumns, then the cell contains multiple rows of controls.

See Also

WebFieldControls

62.1.20.5.8 TCustomAdapterCommandColumn.Style Property

Adds style attributes to the generated caption.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to specify display characteristics that affect the generated column. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the HTML tag that generates the column as the value of a STYLE option.

Note: Style affects the contents of the column cells. To specify display characteristics of the column's caption, use the CaptionAttributes (see page 6451) property instead.

See Also

Custom (see page 6451)

StyleRule (see page 6452)

CaptionAttributes (see page 6451)

62.1.20.5.9 TCustomAdapterCommandColumn.StyleRule Property

Applies a style in the page producer's style sheet to the generated column.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated column. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

To apply a style definition that is not included in the style sheet, use the Style (see page 6452) property instead.

See Also

Custom (see page 6451)

Style (see page 6452)

Styles (see page 1157)

StylesFile (see page 1158)

62.1.20.5.10 TCustomAdapterCommandColumn.VAlign Property

Specifies the vertical alignment of the action control buttons within the column.

Pascal

```
property VAlign: THTMLVAlign;
```

C++

```
__property THTMLVAlign VAlign;
```

Description

VAlign controls where the child HTML control are positioned vertically within the cells of this column. VAlign indicates the desired value of the VAlign option of the HTML tag.

The default value of VAlign is haVDefault, which means the web browser that reads the HTML document vertically positions the control wherever it wishes.

See Also

Align (see page 6450)

DisplayColumns (see page 6451)

62.1.20.5.11 TCustomAdapterCommandColumn.VisibleCommands Property

Lists the child Web items that generate controls that appear in cells of the column.

Pascal

```
property VisibleCommands: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleCommands;
```

Description

VisibleCommands is the list of child Web items that generate HTML controls for the cells of the adapter command column. Each element in this list is an adapter action button (TAdapterActionButton (see page 6316) object).

If you have explicitly added child Web items to this component, VisibleCommands is the same as the value of the WebFieldControls property. Otherwise, if the AddDefaultCommands (see page 6449) property is true, VisibleCommands lists adapter action buttons for the default actions of the associated adapter. If AddDefaultCommands (see page 6449) is false, VisibleCommands is an empty list.

See Also

WebFieldControls

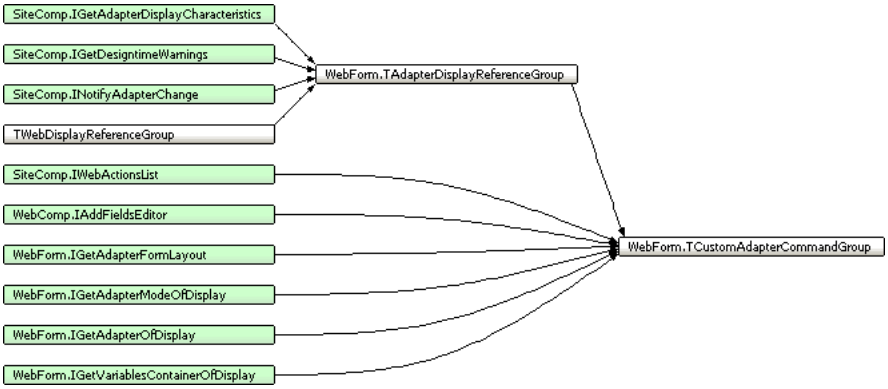
AddDefaultCommands (see page 6449)

TAdapterActionButton (see page 6316)

62.1.21 TCustomAdapterCommandGroup Class

TCustomAdapterCommandGroup is the base class for TAdapterCommandGroup (see page 6337).

Class Hierarchy



Pascal

```
TCustomAdapterCommandGroup = class(TAdapterDisplayReferenceGroup, IWebActionsList,
IGetAdapterOfDisplay, IGetVariablesContainerOfDisplay, IAddFieldsEditor,
IGetAdapterModeOfDisplay, IGetAdapterFormLayout);
```

C++

```
class TCustomAdapterCommandGroup : public TAdapterDisplayReferenceGroup, public
IWebActionsList, public IGetAdapterOfDisplay, public IGetVariablesContainerOfDisplay, public
IAddFieldsEditor, public IGetAdapterModeOfDisplay, public IGetAdapterFormLayout;
```

File

WebForm

Description

Derive from TCustomAdapterCommandGroup to define a component that generates a group of HTML buttons or other HTML elements that execute adapter actions.

See Also

TAdapterDisplayReferenceGroup (see page 6381)

TAdapterCommandGroup (see page 6337)

TAdapterForm (see page 6404)

TAdapterFieldGroup (see page 6399)

TAdapterGrid (see page 6419)

TAdapterActionButton (see page 6316)

62.1.21.1 TCustomAdapterCommandGroup Members

The following tables list the members exposed by TCustomAdapterCommandGroup.

Protected Methods

	Name	Description
	AdapterChange (see page 6383)	Responds to changes in the adapter on which the controls in this group operate.
	DisplayComponentChange (see page 6384)	Responds when the DisplayComponent (see page 6386) property changes.
	GetAdapter (see page 6457)	This is GetAdapter, a member of class TCustomAdapterCommandGroup.
	GetAdapterDisplayCharacteristics (see page 6384)	Indicates the display characteristics of the HTML this component generates.
	GetAdapterFormLayout (see page 6457)	This is GetAdapterFormLayout, a member of class TCustomAdapterCommandGroup.
	GetAdapterModeOfAdapter (see page 6457)	Returns the adapter mode defined by the adapter component.
	GetAdapterModeOfDisplay (see page 6457)	Returns the adapter mode defined by the TAdapterPageProducer components.
	GetDesigntimeWarnings (see page 6384)	Populates a design-time warnings object with any warnings that the reference group needs to emit.
	ImplCanAddClass (see page 6458)	Checks the inheritance of the given component.
	ImplContent (see page 6458)	Lays out the buttons for the command group using the TAdapterFormLayout (see page 6408) component.
	NotifyAdapterChange (see page 6385)	Responds when other components notify this one of changes to the adapter.
	OnDisplayComponentChange (see page 6385)	Responds when the associated display component changes.
	SetWebDisplayComponent (see page 6386)	Sets the value of the DisplayComponent (see page 6386) property.

Protected Properties

	Name	Description
	Adapter (see page 6459)	Provides read-only access to the Adapter that this command group uses.
	AdapterActionsListHelper (see page 6459)	Provides read-only access to a helper object that implements design-time editing functions on behalf of this component.

Public Methods

	Name	Description
	Create (see page 6456)	Creator for TCustomAdapterCommandGroup (see page 6454).
	Destroy (see page 6456)	Calls the base class version, and then frees the memory used by the TAdapterActionsListHelper (see page 6324) component.
	FindAction (see page 1077)	This is FindAction, a member of class IWebActionsList.
	GetActionsList (see page 1077)	This is GetActionsList, a member of class IWebActionsList.
	GetAdapterDisplayCharacteristics (see page 1019)	This is GetAdapterDisplayCharacteristics, a member of class IGetAdapterDisplayCharacteristics.
	GetAddAllFieldsItem (see page 6080)	This is GetAddAllFieldsItem, a member of class IAddFieldsEditor.
	GetAddFieldsDlgCaption (see page 6080)	This is GetAddFieldsDlgCaption, a member of class IAddFieldsEditor.
	GetAddFieldsItem (see page 6080)	This is GetAddFieldsItem, a member of class IAddFieldsEditor.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetNewFieldPrefix (see page 6081)	This is GetNewFieldPrefix, a member of class IAddFieldsEditor.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleActions (see page 1077)	This is GetVisibleActions, a member of class IWebActionsList.
	IsActionInUse (see page 1078)	This is IsActionInUse, a member of class IWebActionsList.
	NotifyAdapterChange (see page 1058)	Responds when the adapter changes.

Public Properties

	Name	Description
	AddDefaultCommands (see page 6459)	Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.
	Custom (see page 6459)	Provides read and write access to the custom HTML element attributes, such as VAlign="top."
	DisplayComponent (see page 6386)	Associates the group with a component that generates the display controls.
	Style (see page 6460)	Provides read and write access to the internal string that stores the CSS style, such as making the background color red.
	StyleRule (see page 6460)	Provides read and write access to the internal string that stores the CSS style rule for the control group.

	VisibleActions (see page 1078)	This is VisibleActions, a member of class IWebActionsList.
	VisibleCommands (see page 6460)	Provides read-only access to the TWebComponentList (see page 6025) that stores the list of visible components.

62.1.21.2 TCustomAdapterCommandGroup.Create Constructor

Creator for TCustomAdapterCommandGroup (see page 6454).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterCommandGroup(TComponent * AOwner);
```

Description

This constructor calls the base class version, and then creates a TAdapterActionsListHelper (see page 6324) component and sets the AddDefaultActions property to true by default.

See Also

Create (see page 6382)

AddDefaultActions (see page 6331)

62.1.21.3 TCustomAdapterCommandGroup.Destroy Destructor

Calls the base class version, and then frees the memory used by the TAdapterActionsListHelper (see page 6324) component.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterCommandGroup();
```

Description

This destructor calls the base class version, and then frees the memory used by the TAdapterActionsListHelper (see page 6324) component. Do not call this destructor directly; instead, use the Free method

See Also

Destroy (see page 6382)

62.1.21.4 TCustomAdapterCommandGroup Methods

The methods of the TCustomAdapterCommandGroup class are listed here.

Protected Methods

	Name	Description
	GetAdapter (see page 6457)	This is GetAdapter, a member of class TCustomAdapterCommandGroup.
	GetAdapterFormLayout (see page 6457)	This is GetAdapterFormLayout, a member of class TCustomAdapterCommandGroup.
	GetAdapterModeOfAdapter (see page 6457)	Returns the adapter mode defined by the adapter component.
	GetAdapterModeOfDisplay (see page 6457)	Returns the adapter mode defined by the TAdapterPageProducer components.
	ImplCanAddClass (see page 6458)	Checks the inheritance of the given component.

	ImplContent (see page 6458)	Lays out the buttons for the command group using the TAdapterFormLayout (see page 6408) component.

62.1.21.4.1 TCustomAdapterCommandGroup.GetAdapter Method

Pascal

```
function GetAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetAdapter();
```

Description

This is GetAdapter, a member of class TCustomAdapterCommandGroup.

62.1.21.4.2 TCustomAdapterCommandGroup.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TCustomAdapterCommandGroup.

62.1.21.4.3 TCustomAdapterCommandGroup.GetAdapterModeOfAdapter Method

Returns the adapter mode defined by the adapter component.

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall UnicodeString GetAdapterModeOfAdapter();
```

Description

The GetAdapterModeOfAdapter function returns the adapter mode defined by the adapter component. Some adapters support a mode. For example, the TDataSetAdapter supports Edit, Insert (see page 3601), and Delete (see page 3552) modes. The mode can be set by TAdapterPageProducer components or during adapter action execution. The mode defined by adapter action takes precedence over the mode defined by TAdapterPageProducer components.

62.1.21.4.4 TCustomAdapterCommandGroup.GetAdapterModeOfDisplay Method

Returns the adapter mode defined by the TAdapterPageProducer components.

Pascal

```
function GetAdapterModeOfDisplay: string;
```

C++

```
__fastcall UnicodeString GetAdapterModeOfDisplay();
```

Description

This function returns the adapter mode defined by the TAdapterPageProducer components. Some adapters support a mode. For example, the TDataSetAdapter supports Edit, Insert (see page 3601), and Delete (see page 3552) modes. The mode can be set by TAdapterPageProducer components or during adapter action execution. The mode defined by adapter action takes precedence over the mode defined by TAdapterPageProducer components.

62.1.21.4.5 TCustomAdapterCommandGroup.ImplCanAddClass Method

Checks the inheritance of the given component.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The ImplCanAddClass checks the inheritance of the given component. If it is derived from either TCustomAdapterActionButton (see page 6430) or TCustomLayoutGroup, it will return True to indicate that the class can be added to this TCustomAdapterCommandGroup (see page 6454).

62.1.21.4.6 TCustomAdapterCommandGroup.ImplContent Method

Lays out the buttons for the command group using the TAdapterFormLayout (see page 6408) component.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The ImplContent function lays out the buttons for the command group using the TAdapterFormLayout (see page 6408) component. It loops through all of the visible child components, calling them to render their HTML content.

62.1.21.5 TCustomAdapterCommandGroup Properties

The properties of the TCustomAdapterCommandGroup class are listed here.

Protected Properties

	Name	Description
	Adapter (see page 6459)	Provides read-only access to the Adapter that this command group uses.
	AdapterActionsListHelper (see page 6459)	Provides read-only access to a helper object that implements design-time editing functions on behalf of this component.

Public Properties

	Name	Description
	AddDefaultCommands (see page 6459)	Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.
	Custom (see page 6459)	Provides read and write access to the custom HTML element attributes, such as VAlign="top."

	Style (see page 6460)	Provides read and write access to the internal string that stores the CSS style, such as making the background color red.
	StyleRule (see page 6460)	Provides read and write access to the internal string that stores the CSS style rule for the control group.
R	VisibleCommands (see page 6460)	Provides read-only access to the TWebComponentList (see page 6025) that stores the list of visible components.

62.1.21.5.1 TCustomAdapterCommandGroup.Adapter Property

Provides read-only access to the Adapter that this command group uses.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

The Adapter property provides read-only access to the Adapter that this command group uses.

62.1.21.5.2 TCustomAdapterCommandGroup.AdapterActionsListHelper Property

Provides read-only access to a helper object that implements design-time editing functions on behalf of this component.

Pascal

```
property AdapterActionsListHelper: TAdapterActionsListHelper;
```

C++

```
__property TAdapterActionsListHelper AdapterActionsListHelper;
```

Description

The AdapterActionsListHelper provides read-only access to a helper object that implements design-time editing functions on behalf of this component.

62.1.21.5.3 TCustomAdapterCommandGroup.AddDefaultCommands Property

Provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.

Pascal

```
property AddDefaultCommands: Boolean;
```

C++

```
__property Boolean AddDefaultCommands;
```

Description

The AddDefaultCommands property provides read and write access to the internal Boolean flag that determines if the default commands should be added automatically.

62.1.21.5.4 TCustomAdapterCommandGroup.Custom Property

Provides read and write access to the custom HTML element attributes, such as VAlign="top."

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

The Custom property provides read and write access to the custom HTML element attributes, such as VAlign="top." The content of this string will be written as it is when generating HTML.

62.1.21.5.5 TCustomAdapterCommandGroup.Style Property

Provides read and write access to the internal string that stores the CSS style, such as making the background color red.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

The Style property provides read and write access to the internal string that stores the CSS style, such as making the background color red.

62.1.21.5.6 TCustomAdapterCommandGroup.StyleRule Property

Provides read and write access to the internal string that stores the CSS style rule for the control group.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

The StyleRule property provides read and write access to the internal string that stores the CSS style rule for the control group. This property is used to reference a CSS style defined in TAdapterPageProducer. ::Styles.

62.1.21.5.7 TCustomAdapterCommandGroup.VisibleCommands Property

Provides read-only access to the TWebComponentList (see page 6025) that stores the list of visible components.

Pascal

```
property VisibleCommands: TWebComponentList;
```

C++

```
__property TWebComponentList VisibleCommands;
```

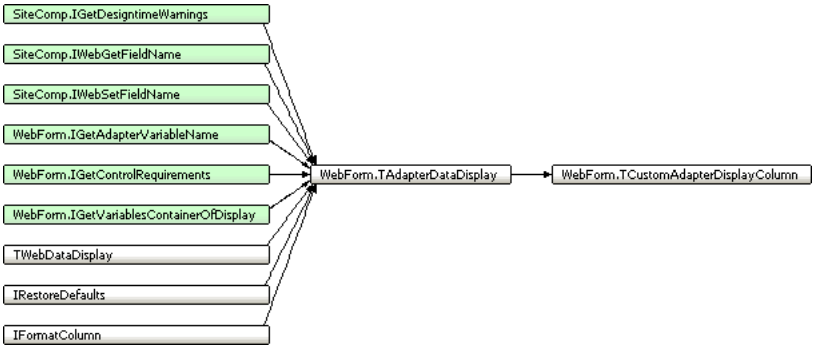
Description

The VisibleCommands property provides read-only access to the TWebComponentList (see page 6025) that stores the list of visible components.

62.1.22 TCustomAdapterDisplayColumn Class

TCustomAdapterDisplayColumn is the base class for the grid display of adapter field data.

Class Hierarchy



Pascal

```
TCustomAdapterDisplayColumn = class(TAdapterDataDisplay);
```

C++

```
class TCustomAdapterDisplayColumn : public TAdapterDataDisplay;
```

File

WebForm

Description

TCustomAdapterDisplayColumn is the base class for grid components that display adapter field data. Do not directly instantiate TCustomAdapterDisplayColumn. Use TAdapterDisplayColumn (see page 6364) or create your own concrete descendants of TCustomAdapterDisplayColumn.

See Also

IWebContent (see page 6103)

TAdapterGrid (see page 6419)

TAdapterFieldGroup (see page 6399)

TAdapterCommandColumn (see page 6331)

TAdapterCommandGroup (see page 6337)

TAdapterDisplayColumn (see page 6364)

62.1.22.1 TCustomAdapterDisplayColumn Members

The following tables list the members exposed by TCustomAdapterDisplayColumn.

Protected Methods

	Name	Description
	CanAddClass (see page 6463)	This is CanAddClass, a member of class TCustomAdapterDisplayColumn.
	ControlContent (see page 6463)	Returns the HTML that defines the display control (without its caption).

	FieldConditions (see page 6357)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 6357)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
	FormatCaption (see page 6357)	Returns the HTML for the display control's caption.
	FormatColumnData (see page 6358)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 6358)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	FormatImage (see page 6464)	This is FormatImage, a member of class TCustomAdapterDisplayColumn.
	FormatListDisplay (see page 6464)	This is FormatListDisplay, a member of class TCustomAdapterDisplayColumn.
	FormatTextDisplay (see page 6464)	This is FormatTextDisplay, a member of class TCustomAdapterDisplayColumn.
	GetAdapterModeOfAdapter (see page 6358)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 6358)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
	GetCaption (see page 6358)	Returns the value of the Caption property.
	GetControlRequirements (see page 6359)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 6359)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 6359)	This is GetFieldName, a member of class TAdapterDataDisplay.
	GetVariablesContainer (see page 6360)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	ImplCanAddClass (see page 6465)	This is ImplCanAddClass, a member of class TCustomAdapterDisplayColumn.
	ImplContent (see page 6360)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 6360)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 6465)	This is ImplFormatColumnHeading, a member of class TCustomAdapterDisplayColumn.
	ImplGetControlRequirements (see page 6465)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayColumn.
	ImplRestoreDefaults (see page 6465)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayColumn.
	RestoreDefaults (see page 6361)	Returns the Web item to a default state.
	SetCaption (see page 6362)	Sets the value of the Caption property.
	SetFieldName (see page 6362)	This is SetFieldName, a member of class TAdapterDataDisplay.

Public Methods

	Name	Description
	Create (see page 6463)	Creates and initializes an instance of TCustomAdapterDisplayColumn (see page 6461).
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	IsColumn (see page 6466)	Indicates whether the component generates the controls that appear in the column of a data grid.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.

Public Properties

	Name	Description
	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 6362)	Specifies the horizontal alignment of the component relative to its containing cell.
	DisplayType (see page 6466)	Sets the display type for the column.
	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 6363)	Specifies the name of the associated dataset field.
	HideOptions (see page 6363)	When field should be hidden.
	ImageHeight (see page 6466)	Specifies the height of the image in the column.
	ImageWidth (see page 6467)	Specifies the width of the image in the column.
	VAlign (see page 6363)	Specifies the vertical alignment of the generated display control.

62.1.22.2 TCustomAdapterDisplayColumn.Create Constructor

Creates and initializes an instance of TCustomAdapterDisplayColumn (see page 6461).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterDisplayColumn(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterDisplayColumn (see page 6461) at runtime. TCustomAdapterDisplayColumn (see page 6461) objects added at design time using the Web Page editor are instantiated automatically.

62.1.22.3 TCustomAdapterDisplayColumn Methods

The methods of the TCustomAdapterDisplayColumn class are listed here.

Protected Methods

	Name	Description
	CanAddClass (see page 6463)	This is CanAddClass, a member of class TCustomAdapterDisplayColumn.
V	ControlContent (see page 6463)	Returns the HTML that defines the display control (without its caption).
	FormatImage (see page 6464)	This is FormatImage, a member of class TCustomAdapterDisplayColumn.
	FormatListDisplay (see page 6464)	This is FormatListDisplay, a member of class TCustomAdapterDisplayColumn.
	FormatTextDisplay (see page 6464)	This is FormatTextDisplay, a member of class TCustomAdapterDisplayColumn.
V	ImplCanAddClass (see page 6465)	This is ImplCanAddClass, a member of class TCustomAdapterDisplayColumn.
V	ImplFormatColumnHeading (see page 6465)	This is ImplFormatColumnHeading, a member of class TCustomAdapterDisplayColumn.
V	ImplGetControlRequirements (see page 6465)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayColumn.
V	ImplRestoreDefaults (see page 6465)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayColumn.

Public Methods

	Name	Description
V	IsColumn (see page 6466)	Indicates whether the component generates the controls that appear in the column of a data grid.

62.1.22.3.1 TCustomAdapterDisplayColumn.CanAddClass Method

Pascal

```
function CanAddClass(AParent: TComponent; AClass: TClass): Boolean;
```

C++

```
__fastcall Boolean CanAddClass(TComponent * AParent, TClass AClass);
```

Description

This is CanAddClass, a member of class TCustomAdapterDisplayColumn.

62.1.22.3.2 TCustomAdapterDisplayColumn.ControlContent Method

Returns the HTML that defines the display control (without its caption).

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options);
```

Description

ControlContent is used internally to generate the HTML for the display control. This method does not generate any HTML for the control's label, which is handled separately by the FormatCaption method.

TWebDataDisplay introduces ControlContent as an abstract (pure virtual) method. Descendant classes override this method to generate the appropriate type of display component.

Options contains a set of flags that limit what can be included in the generated HTML.

ControlContent returns a string of HTML defining the display control.

See Also

ImplContent

EventContent

FormatCaption

62.1.22.3.3 TCustomAdapterDisplayColumn.FormatImage Method

Pascal

```
function FormatImage(const VarName: string; const HTMLName: string; Options:
TWebContentOptions): string;
```

C++

```
__fastcall UnicodeString FormatImage(const UnicodeString VarName, const UnicodeString
HTMLName, TWebContentOptions Options);
```

Description

This is FormatImage, a member of class TCustomAdapterDisplayColumn.

62.1.22.3.4 TCustomAdapterDisplayColumn.FormatListDisplay Method

Pascal

```
function FormatListDisplay(const VarName: string; const HTMLName: string): string;
```

C++

```
__fastcall UnicodeString FormatListDisplay(const UnicodeString VarName, const UnicodeString
HTMLName);
```

Description

This is FormatListDisplay, a member of class TCustomAdapterDisplayColumn.

62.1.22.3.5 TCustomAdapterDisplayColumn.FormatTextDisplay Method

Pascal

```
function FormatTextDisplay(const VarName: string; const HTMLName: string): string;
```

C++

```
__fastcall UnicodeString FormatTextDisplay(const UnicodeString VarName, const UnicodeString HTMLName);
```

Description

This is FormatTextDisplay, a member of class TCustomAdapterDisplayColumn.

62.1.22.3.6 TCustomAdapterDisplayColumn.ImplCanAddClass Method

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

This is ImplCanAddClass, a member of class TCustomAdapterDisplayColumn.

62.1.22.3.7 TCustomAdapterDisplayColumn.ImplFormatColumnHeading Method

Pascal

```
function ImplFormatColumnHeading(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplFormatColumnHeading(TWebContentOptions Options);
```

Description

This is ImplFormatColumnHeading, a member of class TCustomAdapterDisplayColumn.

62.1.22.3.8 TCustomAdapterDisplayColumn.ImplGetControlRequirements Method

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); override;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayColumn.

62.1.22.3.9 TCustomAdapterDisplayColumn.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; override;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayColumn.

62.1.22.3.10 TCustomAdapterDisplayColumn.IsColumn Method

Indicates whether the component generates the controls that appear in the column of a data grid.

Pascal

```
class function IsColumn: Boolean; override;
```

C++

```
virtual __fastcall Boolean IsColumn();
```

Description

Call IsColumn to determine whether a TCustomAdapterDisplayColumn (see page 6461) object generates the controls that appear in a single column of a data grid. As implemented in TCustomAdapterDisplayColumn (see page 6461), IsColumn always returns true.

See Also

IsColumn

62.1.22.4 TCustomAdapterDisplayColumn Properties

The properties of the TCustomAdapterDisplayColumn class are listed here.

Public Properties

	Name	Description
	DisplayType (see page 6466)	Sets the display type for the column.
	ImageHeight (see page 6466)	Specifies the height of the image in the column.
	ImageWidth (see page 6467)	Specifies the width of the image in the column.

62.1.22.4.1 TCustomAdapterDisplayColumn.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TColumnHTMLElementType;
```

C++

```
__property TColumnHTMLElementType DisplayType;
```

Description

Set DisplayType to set the display type for the column to text or image.

See Also

ImageHeight (see page 6466)

ImageWidth (see page 6467)

62.1.22.4.2 TCustomAdapterDisplayColumn.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in pixels.

See Also

ImageWidth (see page 6467)

62.1.22.4.3 TCustomAdapterDisplayColumn.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight (see page 6466) to indicate the width of the image in pixels.

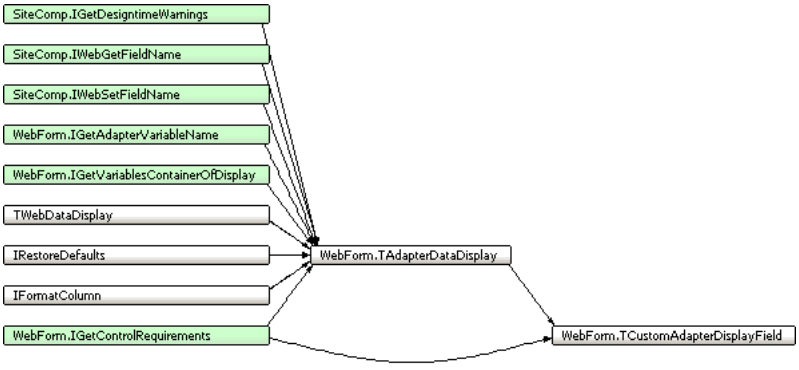
See Also

ImageHeight (see page 6466)

62.1.23 TCustomAdapterDisplayField Class

TCustomAdapterDisplayField is the base class for the free-form display and editing of adapter field data.

Class Hierarchy



Pascal

```
TCustomAdapterDisplayField = class(TAdapterDataDisplay, IGetControlRequirements);
```

C++

```
class TCustomAdapterDisplayField : public TAdapterDataDisplay, public IGetControlRequirements;
```

File

WebForm

Description

TCustomAdapterDisplayField is the base class for free-form components that display and edit adapter field data. Do not directly instantiate TCustomAdapterDisplayField. Use TAdapterDisplayField (see page 6371) or create your own concrete descendants of TCustomAdapterDisplayField.

See Also

TCustomAdapterEditColumn (see page 6475)

TAdapterDisplayField (see page 6371)

IWebContent (see page 6103)

TAdapterGrid (see page 6419)

TAdapterFieldGroup (see page 6399)

62.1.23.1 TCustomAdapterDisplayField Members

The following tables list the members exposed by TCustomAdapterDisplayField.

Protected Methods

	Name	Description
	AddAttributes (see page 6470)	This is AddAttributes, a member of class TCustomAdapterDisplayField.
V	ControlContent (see page 6470)	Returns the HTML that defines the display control (without its caption).
V	FieldConditions (see page 6357)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 6357)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
V	FormatCaption (see page 6357)	Returns the HTML for the display control's caption.
	FormatColumnData (see page 6358)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 6358)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 6358)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 6358)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
V	GetCaption (see page 6358)	Returns the value of the Caption property.
	GetControlRequirements (see page 6359)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 6359)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 6359)	This is GetFieldName, a member of class TAdapterDataDisplay.
V	GetLayoutAttributes (see page 6470)	Returns the value of the LayoutAttributes property.
	GetVariablesContainer (see page 6360)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
V	ImplContent (see page 6471)	Provides the underlying implementation for the Content method.
V	ImplFormatColumnData (see page 6360)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
V	ImplFormatColumnHeading (see page 6361)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
V	ImplGetControlRequirements (see page 6471)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
V	ImplRestoreDefaults (see page 6471)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.
	RestoreDefaults (see page 6361)	Returns the Web item to a default state.
V	SetCaption (see page 6362)	Sets the value of the Caption property.
	SetFieldName (see page 6362)	This is SetFieldName, a member of class TAdapterDataDisplay.

Public Methods

	Name	Description
V	Create (see page 6469)	Creates and initializes an instance of TCustomAdapterDisplayField (see page 6467).

	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.

Public Properties

	Name	Description
R	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 6362)	Specifies the horizontal alignment of the component relative to its containing cell.
	DisplayColumns (see page 6472)	Specifies the number of columns in a display field.
	DisplayRows (see page 6472)	Specifies the number of rows in a display field.
	DisplayType (see page 6473)	Sets the display type for the column.
	DisplayWidth (see page 6473)	Specifies the width, in characters, of the generated HTML field.
R	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 6363)	Specifies the name of the associated dataset field.
	HideOptions (see page 6363)	When field should be hidden.
	ImageHeight (see page 6473)	Specifies the height of the image in the column.
	ImageWidth (see page 6474)	Specifies the width of the image in the column.
	InputType (see page 6474)	Specifies the input type for the display field.
	MaxLength (see page 6474)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 6475)	Indicates the number of rows that can be selected.
	TextAreaWrap (see page 6475)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 6363)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 6475)	Indicates the viewing state of the adapter field.

62.1.23.2 TCustomAdapterDisplayField.Create Constructor

Creates and initializes an instance of TCustomAdapterDisplayField (see page 6467).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterDisplayField(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterDisplayField (see page 6467) at runtime. TCustomAdapterDisplayField (see page 6467) descendants added at design time using the Web Page editor are instantiated automatically.

62.1.23.3 TCustomAdapterDisplayField Methods

The methods of the TCustomAdapterDisplayField class are listed here.

Protected Methods

	Name	Description
	AddAttributes (see page 6470)	This is AddAttributes, a member of class TCustomAdapterDisplayField.
V	ControlContent (see page 6470)	Returns the HTML that defines the display control (without its caption).
V	GetLayoutAttributes (see page 6470)	Returns the value of the LayoutAttributes property.

	ImplContent (see page 6471)	Provides the underlying implementation for the Content method.
	ImplGetControlRequirements (see page 6471)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
	ImplRestoreDefaults (see page 6471)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.

62.1.23.3.1 TCustomAdapterDisplayField.AddAttributes Method

Pascal

```
procedure AddAttributes(var Attrs: string);
```

C++

```
__fastcall AddAttributes(UnicodeString Attrs);
```

Description

This is AddAttributes, a member of class TCustomAdapterDisplayField.

62.1.23.3.2 TCustomAdapterDisplayField.ControlContent Method

Returns the HTML that defines the display control (without its caption).

Pascal

```
function ControlContent(Options: TWebContentOptions): string; override;
```

C++

```
virtual __fastcall UnicodeString ControlContent(TWebContentOptions Options);
```

Description

ControlContent is used internally to generate the HTML for the display control. This method does not generate any HTML for the control's label, which is handled separately by the FormatCaption method.

TWebDataDisplay introduces ControlContent as an abstract (pure virtual) method. Descendant classes override this method to generate the appropriate type of display component.

Options contains a set of flags that limit what can be included in the generated HTML.

ControlContent returns a string of HTML defining the display control.

See Also

ImplContent

EventContent

FormatCaption

62.1.23.3.3 TCustomAdapterDisplayField.GetLayoutAttributes Method

Returns the value of the LayoutAttributes property.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the

Content method) to take into account layout properties of the child component.

GetLayoutAttributes returns the value of the LayoutAttributes property.

See Also

Content

LayoutAttributes

62.1.23.3.4 TCustomAdapterDisplayField.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the display control and its label. ImplContent formats the caption and combines this HTML with the results of the ControlContent method. ControlContent is an abstract (pure virtual) method in TWebDataDisplay. TWebDataDisplay descendants override it to generate the definition of their particular display control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebDataDisplay should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the display control.

62.1.23.3.5 TCustomAdapterDisplayField.ImplGetControlRequirements Method

Pascal

```
procedure ImplGetControlRequirements(ARequirements: TAbstractControlRequirements); override;
```

C++

```
virtual __fastcall ImplGetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.

62.1.23.3.6 TCustomAdapterDisplayField.ImplRestoreDefaults Method

Pascal

```
procedure ImplRestoreDefaults; override;
```

C++

```
virtual __fastcall ImplRestoreDefaults();
```

Description

This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.

62.1.23.4 TCustomAdapterDisplayField Properties

The properties of the TCustomAdapterDisplayField class are listed here.

Public Properties

	Name	Description
	DisplayColumns (see page 6472)	Specifies the number of columns in a display field.
	DisplayRows (see page 6472)	Specifies the number of rows in a display field.
	DisplayType (see page 6473)	Sets the display type for the column.
	DisplayWidth (see page 6473)	Specifies the width, in characters, of the generated HTML field.
	ImageHeight (see page 6473)	Specifies the height of the image in the column.
	ImageWidth (see page 6474)	Specifies the width of the image in the column.
	InputType (see page 6474)	Specifies the input type for the display field.
	MaxLength (see page 6474)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 6475)	Indicates the number of rows that can be selected.
	TextAreaWrap (see page 6475)	Specifies how the display field treats lines that are longer than the display width.
	ViewMode (see page 6475)	Indicates the viewing state of the adapter field.

62.1.23.4.1 TCustomAdapterDisplayField.DisplayColumns Property

Specifies the number of columns in a display field.

Pascal

```
property DisplayColumns: Integer;
```

C++

```
__property int DisplayColumns;
```

Description

Use DisplayColumns to control the number of columns being displayed.

See Also

DisplayRows (see page 6472)

62.1.23.4.2 TCustomAdapterDisplayField.DisplayRows Property

Specifies the number of rows in a display field.

Pascal

```
property DisplayRows: Integer;
```

C++

```
__property int DisplayRows;
```

Description

Use DisplayColumns (see page 6472) to control the number of rows being displayed.

See Also

DisplayColumns (see page 6472)

62.1.23.4.3 TCustomAdapterDisplayField.DisplayType Property

Sets the display type for the column.

Pascal

```
property DisplayType: TDisplayFieldHTMLElementType;
```

C++

```
__property TDisplayFieldHTMLElementType DisplayType;
```

Description

Set DisplayType to indicate the type of HTML control that should be used to display this field's value when it is read-only.

See Also

ImageHeight (see page 6473)

ImageWidth (see page 6474)

InputType (see page 6474)

62.1.23.4.4 TCustomAdapterDisplayField.DisplayWidth Property

Specifies the width, in characters, of the generated HTML field.

Pascal

```
property DisplayWidth: Integer;
```

C++

```
__property int DisplayWidth;
```

Description

Use DisplayWidth to control the width of the HTML field that displays record status information. By default, DisplayWidth is 1 because the TCustomAdapterDisplayField (see page 6467) control values are one character (M for modified or I for inserted).

62.1.23.4.5 TCustomAdapterDisplayField.ImageHeight Property

Specifies the height of the image in the column.

Pascal

```
property ImageHeight: Integer;
```

C++

```
__property int ImageHeight;
```

Description

Set ImageHeight to indicate the height of the image in the column.

See Also

DisplayWidth (see page 6473)

ImageWidth (see page 6474)

62.1.23.4.6 TCustomAdapterDisplayField.ImageWidth Property

Specifies the width of the image in the column.

Pascal

```
property ImageWidth: Integer;
```

C++

```
__property int ImageWidth;
```

Description

Set ImageHeight (see page 6473) to indicate the width of the image in the column.

See Also

ImageHeight (see page 6473)

62.1.23.4.7 TCustomAdapterDisplayField.InputType Property

Specifies the input type for the display field.

Pascal

```
property InputType: TInputFieldHTMLElementType;
```

C++

```
__property TInputFieldHTMLElementType InputType;
```

Description

Set InputType to indicate the type of control that should be generated to let users assign values to the adapter field.

See Also

ImageHeight (see page 6473)

ImageWidth (see page 6474)

DisplayType (see page 6473)

62.1.23.4.8 TCustomAdapterDisplayField.MaxLength Property

Specifies the maximum number of characters the user can enter into the display field.

Pascal

```
property MaxLength: Integer;
```

C++

```
__property int MaxLength;
```

Description

Use MaxLength to limit the number of characters that can be entered into the display field. A value of 0 indicates that there is no application-defined limit on the length.

Note: Setting MaxLength will not truncate the existing text, it merely prevents the user from adding more text after reaching the limit of MaxLength characters.

62.1.23.4.9 TCustomAdapterDisplayField.SelectRows Property

Indicates the number of rows that can be selected.

Pascal

```
property SelectRows: Integer;
```

C++

```
__property int SelectRows;
```

Description

Use SelectRows to indicate the number of rows that can be selected.

62.1.23.4.10 TCustomAdapterDisplayField.TextAreaWrap Property

Specifies how the display field treats lines that are longer than the display width.

Pascal

```
property TextAreaWrap: TTextAreaWrap;
```

C++

```
__property TTextAreaWrap TextAreaWrap;
```

Description

Use TextAreaWrap to specify how the generated display field formats lines that are longer than the number of characters specified by DisplayWidth (see page 6473).

See Also

DisplayWidth (see page 6473)

62.1.23.4.11 TCustomAdapterDisplayField.ViewMode Property

Indicates the viewing state of the adapter field.

Pascal

```
property ViewMode: TDisplayFieldViewMode;
```

C++

```
__property TDisplayFieldViewMode ViewMode;
```

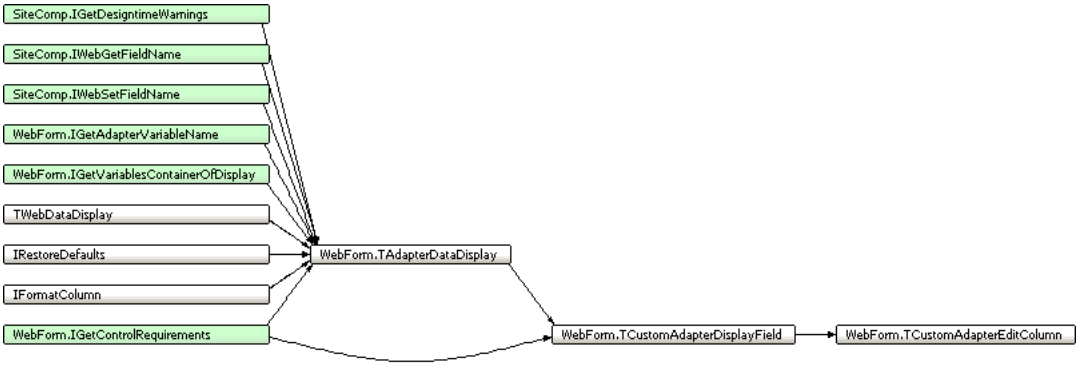
Description

Use ViewMode to specify the viewing state of the field.

62.1.24 TCustomAdapterEditColumn Class

TCustomAdapterEditColumn is the base class for components that display adapter fields as form fields in grids.

Class Hierarchy



Pascal

```
TCustomAdapterEditColumn = class(TCustomAdapterDisplayField);
```

C++

```
class TCustomAdapterEditColumn : public TCustomAdapterDisplayField;
```

File

WebForm

Description

TCustomAdapterEditColumn has the same functionality as TCustomAdapterDisplayField (see page 6467), but is designed to work with grids. Do not directly instantiate TCustomAdapterEditColumn. Use TAdapterEditColumn (see page 6387) or create your own concrete descendants of TCustomAdapterEditColumn.

See Also

TAdapterEditColumn (see page 6387)

62.1.24.1 TCustomAdapterEditColumn Members

The following tables list the members exposed by TCustomAdapterEditColumn.

Protected Methods

	Name	Description
	AddAttributes (see page 6470)	This is AddAttributes, a member of class TCustomAdapterDisplayField.
V	ControlContent (see page 6470)	Returns the HTML that defines the display control (without its caption).
V	FieldConditions (see page 6357)	This is FieldConditions, a member of class TAdapterDataDisplay.
	FindAssociatedField (see page 6357)	This is FindAssociatedField, a member of class TAdapterDataDisplay.
V	FormatCaption (see page 6357)	Returns the HTML for the display control's caption.
	FormatColumnData (see page 6358)	This is FormatColumnData, a member of class TAdapterDataDisplay.
	FormatColumnHeading (see page 6358)	This is FormatColumnHeading, a member of class TAdapterDataDisplay.
	GetAdapterModeOfAdapter (see page 6358)	This is GetAdapterModeOfAdapter, a member of class TAdapterDataDisplay.
	GetAdapterVariableName (see page 6358)	This is GetAdapterVariableName, a member of class TAdapterDataDisplay.
V	GetCaption (see page 6358)	Returns the value of the Caption property.
	GetControlRequirements (see page 6359)	This is GetControlRequirements, a member of class TAdapterDataDisplay.
	GetDesigntimeWarnings (see page 6359)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 6359)	This is GetFieldName, a member of class TAdapterDataDisplay.

	GetLayoutAttributes (see page 6470)	Returns the value of the LayoutAttributes property.
	GetVariablesContainer (see page 6360)	This is GetVariablesContainer, a member of class TAdapterDataDisplay.
	ImplContent (see page 6478)	Provides the underlying implementation for the Content method.
	ImplFormatColumnData (see page 6360)	This is ImplFormatColumnData, a member of class TAdapterDataDisplay.
	ImplFormatColumnHeading (see page 6361)	This is ImplFormatColumnHeading, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 6361)	This is ImplGetControlRequirements, a member of class TAdapterDataDisplay.
	ImplGetControlRequirements (see page 6471)	This is ImplGetControlRequirements, a member of class TCustomAdapterDisplayField.
	ImplRestoreDefaults (see page 6361)	This is ImplRestoreDefaults, a member of class TAdapterDataDisplay.
	ImplRestoreDefaults (see page 6471)	This is ImplRestoreDefaults, a member of class TCustomAdapterDisplayField.
	RestoreDefaults (see page 6361)	Returns the Web item to a default state.
	SetCaption (see page 6362)	Sets the value of the Caption property.
	SetFieldName (see page 6362)	This is SetFieldName, a member of class TAdapterDataDisplay.

Public Methods

	Name	Description
	Create (see page 6356)	Creates an instance of TAdapterDataDisplay (see page 6354)
	Create (see page 6469)	Creates and initializes an instance of TCustomAdapterDisplayField (see page 6467).
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldName (see page 1090)	This is GetFieldName, a member of class IWebGetFieldName.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	SetFieldName (see page 1116)	This is SetFieldName, a member of class IWebSetFieldName.

Public Properties

	Name	Description
	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	Align (see page 6362)	Specifies the horizontal alignment of the component relative to its containing cell.
	DisplayColumns (see page 6472)	Specifies the number of columns in a display field.
	DisplayRows (see page 6472)	Specifies the number of rows in a display field.
	DisplayType (see page 6473)	Sets the display type for the column.
	DisplayWidth (see page 6473)	Specifies the width, in characters, of the generated HTML field.
	FieldName (see page 1091)	This is FieldName, a member of class IWebGetFieldName.
	FieldName (see page 6363)	Specifies the name of the associated dataset field.
	HideOptions (see page 6363)	When field should be hidden.
	ImageHeight (see page 6473)	Specifies the height of the image in the column.
	ImageWidth (see page 6474)	Specifies the width of the image in the column.
	InputType (see page 6474)	Specifies the input type for the display field.
	MaxLength (see page 6474)	Specifies the maximum number of characters the user can enter into the display field.
	SelectRows (see page 6475)	Indicates the number of rows that can be selected.
	TextAreaWrap (see page 6475)	Specifies how the display field treats lines that are longer than the display width.
	VAlign (see page 6363)	Specifies the vertical alignment of the generated display control.
	ViewMode (see page 6475)	Indicates the viewing state of the adapter field.

62.1.24.2 TCustomAdapterEditColumn Methods

The methods of the TCustomAdapterEditColumn class are listed here.

Protected Methods

	Name	Description
	ImplContent (see page 6478)	Provides the underlying implementation for the Content method.

62.1.24.2.1 TCustomAdapterEditColumn.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the HTML that defines the display control and its label. ImplContent formats the caption and combines this HTML with the results of the ControlContent method. ControlContent is an abstract (pure virtual) method in TWebDataDisplay. TWebDataDisplay descendants override it to generate the definition of their particular display control.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebDataDisplay should format the HTML control it generates. It implements the ILayoutWebContent interface.

ImplContent returns a string of HTML defining the display control.

Content

Caption

ILayoutWebContent (see page 6084)

62.1.25 TCustomAdapterErrorList Class

TCustomAdapterErrorList is the base class adapter for components that display error lists.

Class Hierarchy

Pascal

```
TCustomAdapterErrorList = class(TWebContainedComponent, IWebContent, IGetDesigntimeWarnings);
```

C++

```
class TCustomAdapterErrorList : public TWebContainedComponent, public IWebContent, public
IGetDesigntimeWarnings;
```

File

WebForm

Description

TCustomAdapterErrorList is the base class for adapter components that display error lists. Do not instantiate TCustomAdapterErrorList directly. Use TAdapterErrorList (see page 6397), or create your own concrete descendant class.

62.1.25.1 TCustomAdapterErrorList Members

The following tables list the members exposed by TCustomAdapterErrorList.

Protected Methods

	Name	Description
	Content (see page 6480)	Returns the HTML that the Web item generates.
	GetContainerList (see page 6041)	Returns the TWebComponentList (see page 6025) object that the Web parent uses to manage this and its other Web items.
	GetDesigntimeWarnings (see page 6481)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
V	ImplContent (see page 6481)	This is ImplContent, a member of class TCustomAdapterErrorList.
V	IsDefaultField (see page 6042)	Indicates whether this component represents a Web item that is used by default when the parent's set of Web items is not explicitly assigned.
V	Notification (see page 6482)	Forwards notification messages to all owned components.
V	ParentChanged (see page 6042)	Responds when the WebParent (see page 6044) property changes.
V	ReadState (see page 6043)	Reads the component's published properties, stored data, and owned components from a reader object.
V	SetParentComponent (see page 6043)	Sets the WebParent (see page 6044) property to be the same as this component's parent.
	SetWebParent (see page 6043)	Sets the value of the WebParent (see page 6044) property.

Protected Properties

	Name	Description
R	WebContainedComponentHelper (see page 6044)	Provides access to the helper object that implements the IWebComponent (see page 6093) interface for this contained component.
R	WebParent (see page 6044)	Indicates the component that uses this TWebContainedComponent (see page 6038) as one of its Web items.

Public Methods

	Name	Description
V	Create (see page 6480)	Creates an instance of TCustomAdapterErrorList (see page 6478).
V	Destroy (see page 6480)	Frees the memory associated with an instance of TCustomAdapterErrorList (see page 6478).
	GetContainer (see page 6094)	Returns the value of the Container (see page 6096) property.
	GetIndex (see page 6094)	Returns the value of the Index (see page 6097) property.
V	GetParentComponent (see page 6041)	Returns the object that uses this component to generate HTML.
V	HasParent (see page 6041)	Indicates whether this component appears in another component's list of Web items.
	SetComponentList (see page 6095)	Sets the value of the ComponentList (see page 6096) property.
	SetContainer (see page 6095)	Sets the value of the Container (see page 6096) property.
	SetIndex (see page 6095)	Sets the value of the Index (see page 6097) property.

Public Properties

	Name	Description
	Adapter (see page 6482)	Specifies a related adapter.
W	ComponentList (see page 6096)	Indicates the component list that contains the Web item.
	Container (see page 6096)	Specifies the component that uses content generated by this Web item.

	Index (see page 6097)	Indicates where the Web item appears in the Web component list's array of Web items.

62.1.25.2 TCustomAdapterErrorList.Create Constructor

Creates an instance of TCustomAdapterErrorList (see page 6478).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterErrorList(TComponent * AOwner);
```

Description

Call Create to create and initialize an instance of TCustomAdapterErrorList (see page 6478).

See Also

Create

62.1.25.3 TCustomAdapterErrorList.Destroy Destructor

Frees the memory associated with an instance of TCustomAdapterErrorList (see page 6478).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterErrorList();
```

Description

Call Destroy to destroy an instance of TCustomAdapterErrorList (see page 6478) and free the memory associated with it.

62.1.25.4 TCustomAdapterErrorList Methods

The methods of the TCustomAdapterErrorList class are listed here.

Protected Methods

	Name	Description
	Content (see page 6480)	Returns the HTML that the Web item generates.
	GetDesigntimeWarnings (see page 6481)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
V	ImplContent (see page 6481)	This is ImplContent, a member of class TCustomAdapterErrorList.
V	Notification (see page 6482)	Forwards notification messages to all owned components.

62.1.25.4.1 TCustomAdapterErrorList.Content Method

Returns the HTML that the Web item generates.

Pascal

```
function Content(Options: TWebContentOptions; Layout: TLayout): string;
```

C++

```
__fastcall UnicodeString Content(TWebContentOptions Options, TLayout Layout);
```

Description

Call Content to access the HTML produced by the Web item.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the Web item should lay out its constituent parts. This object supports the ILayoutWebContent interface, which the Web item uses to fit its own content into the parent's HTML structures.

Content returns a string of HTML produced by the Web item.

See Also

ILayoutWebContent (see page 6084)

62.1.25.4.2 TCustomAdapterErrorList.GetDesigntimeWarnings Method

Populates a design-time warnings object with any warnings that the dataset values list needs to emit.

Pascal

```
procedure GetDesigntimeWarnings(AWarnings: TAbstractDesigntimeWarnings);
```

C++

```
__fastcall GetDesigntimeWarnings(TAbstractDesigntimeWarnings AWarnings);
```

Description

GetDesigntimeWarnings is called automatically at design time when the adapter page producer is assembling the current version of its HTML form. This gives the dataset values list an opportunity to add messages to the version of the HTML form that appears at design time, describing problems that you can rectify.

AWarnings is the design-time warnings object that assembles design-time warning messages that appear in the HTML form.

If the DataSet property has not been set, GetDesigntimeWarnings adds a message that indicates this omission. If DataSet is set, but the dataset is not active, GetDesigntimeWarnings adds a message that indicates this problem. Finally, if the ValueField property is not set, GetDesigntimeWarnings adds a message indicating this omission.

See Also

DataSet

Active

ValueField

62.1.25.4.3 TCustomAdapterErrorList.ImplContent Method

Pascal

```
function ImplContent(Options: TWebContentOptions; Layout: TLayout): string; virtual;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout Layout);
```

Description

This is ImplContent, a member of class TCustomAdapterErrorList.

62.1.25.4.4 TCustomAdapterErrorList.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

FreeNotification

InsertComponent

RemoveComponent

Owner

62.1.25.5 TCustomAdapterErrorList Properties

The properties of the TCustomAdapterErrorList class are listed here.

Public Properties

	Name	Description
	Adapter (see page 6482)	Specifies a related adapter.

62.1.25.5.1 TCustomAdapterErrorList.Adapter Property

Specifies a related adapter.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

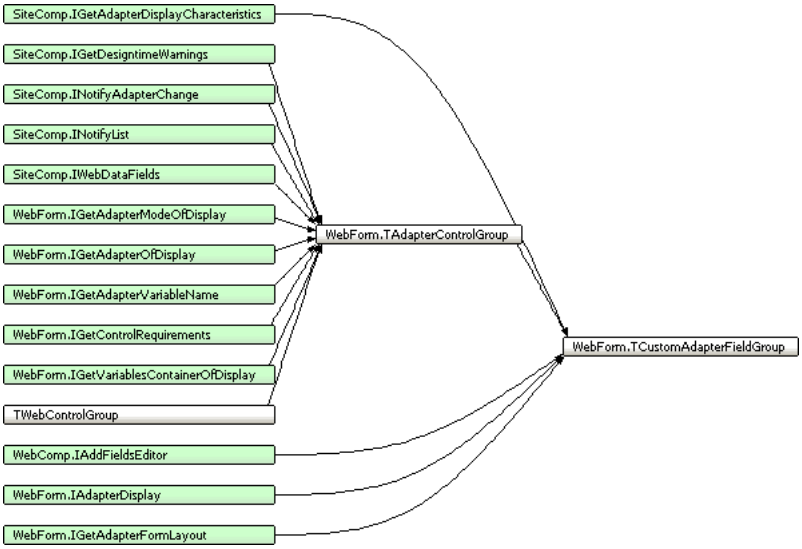
Description

Adapter specifies the adapter component for which this component reports errors.

62.1.26 TCustomAdapterFieldGroup Class

TCustomAdapterFieldGroup manages a collection of Web Items that generate a group of HTML controls.

Class Hierarchy



Pascal

```
TCustomAdapterFieldGroup = class(TAdapterControlGroup, IAdapterDisplay,
IGetAdapterDisplayCharacteristics, IAddFieldsEditor, IGetAdapterFormLayout);
```

C++

```
class TCustomAdapterFieldGroup : public TAdapterControlGroup, public IAdapterDisplay, public
IGetAdapterDisplayCharacteristics, public IAddFieldsEditor, public IGetAdapterFormLayout;
```

File

WebForm

Description

Use TCustomAdapterFieldGroup as a base class for components that generate organized portions of the HTML document containing one or more related HTML controls. TCustomAdapterFieldGroup introduces the properties and methods for managing a collection of Web items that generate the HTML controls that make up the group.

In order to let other Web items use the HTML that defines the organized collection of controls, TCustomAdapterFieldGroup implements the IWebContent (see page 6103) interface.

Do not create instances of TCustomAdapterFieldGroup. TCustomAdapterFieldGroup manages the Web items that generate HTML defining controls, but does not combine the generated content into any content of its own. Instead, use a descendant of TCustomAdapterFieldGroup such as TAdapterFieldGroup (see page 6399).

See Also

TAdapterGrid (see page 6419)

TAdapterActionButton (see page 6316)

IWebContent (see page 6103)

62.1.26.1 TCustomAdapterFieldGroup Members

The following tables list the members exposed by TCustomAdapterFieldGroup.

Protected Methods

	Name	Description
	AdapterChange (see page 6345)	Responds when the adapter associated with this control group changes.
	AddNotify (see page 6345)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
	CreateDefaultFields (see page 6346)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
	FindField (see page 6346)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 6346)	Returns the value of the Adapter (see page 6352) property.
	GetAdapterDisplayCharacteristics (see page 6486)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterFieldGroup.
	GetAdapterFormLayout (see page 6486)	This is GetAdapterFormLayout, a member of class TCustomAdapterFieldGroup.
	GetAdapterModeOfAdapter (see page 6347)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 6347)	Returns the value of the AdapterMode (see page 6353) property.
	GetAdapterVariableName (see page 6348)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetAddAllFieldsItem (see page 6486)	This is GetAddAllFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsDlgCaption (see page 6487)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsItem (see page 6487)	This is GetAddFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetControlRequirements (see page 6348)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
	GetDesigntimeWarnings (see page 6348)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 6349)	Fills a string list with the names of all of the associated adapter's fields.
	GetLayoutAttributes (see page 6487)	Returns an object that specifies how the generated group of controls should look.
	GetNewFieldPrefix (see page 6487)	This is GetNewFieldPrefix, a member of class TCustomAdapterFieldGroup.
	GetVisibleFields (see page 6349)	Returns the value of the VisibleFields (see page 6354) property.
	ImplCanAddClass (see page 6488)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 6488)	Provides the underlying implementation for the Content method.
	ImplGetControlRequirements (see page 6350)	Provides the underlying implementation for the GetControlRequirements (see page 6348) method.
	IsFieldInUse (see page 6350)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
	Notification (see page 6350)	Updates the TAdapterControlGroup (see page 6341) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 6351)	Responds when the control group's adapter notifies it of a change.
	RemoveNotify (see page 6351)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 6352)	Sets the value of the Adapter (see page 6352) property.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	Create (see page 6485)	Creates and initializes an instance of TCustomAdapterFieldGroup (see page 6483).
	Destroy (see page 6485)	Frees an instance of TCustomAdapterFieldGroup (see page 6483).
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetAdapter (see page 6513)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterModeOfAdapter (see page 6512)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 6512)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.

	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NotifyAdapterChange (see page 1058)	Responds when the adapter changes.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.

Public Properties

	Name	Description
	Adapter (see page 6352)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 6353)	Specifies the mode of the adapter that the controls in the group support.
R	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	AddDefaultFields (see page 6353)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	Custom (see page 6489)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 6489)	Adds style attributes to the generated button group.
	StyleRule (see page 6489)	Applies a style in the page producer's style sheet to the button group.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.
R	VisibleFields (see page 6354)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.

62.1.26.2 TCustomAdapterFieldGroup.Create Constructor

Creates and initializes an instance of TCustomAdapterFieldGroup (see page 6483).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterFieldGroup(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterFieldGroup (see page 6483) at runtime. TCustomAdapterFieldGroup (see page 6483) objects added at design time using the Web Page editor are instantiated automatically.

62.1.26.3 TCustomAdapterFieldGroup.Destroy Destructor

Frees an instance of TCustomAdapterFieldGroup (see page 6483).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterFieldGroup();
```

Description

Destroy removes the Web control group from its parent's list of components that generate HTML before freeing its own resources.

62.1.26.4 TCustomAdapterFieldGroup Methods

The methods of the TCustomAdapterFieldGroup class are listed here.

Protected Methods

	Name	Description
	GetAdapterDisplayCharacteristics (see page 6486)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterFieldGroup.
	GetAdapterFormLayout (see page 6486)	This is GetAdapterFormLayout, a member of class TCustomAdapterFieldGroup.
	GetAddAllFieldsItem (see page 6486)	This is GetAddAllFieldsItem, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsDlgCaption (see page 6487)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterFieldGroup.
	GetAddFieldsItem (see page 6487)	This is GetAddFieldsItem, a member of class TCustomAdapterFieldGroup.
V	GetLayoutAttributes (see page 6487)	Returns an object that specifies how the generated group of controls should look.
	GetNewFieldPrefix (see page 6487)	This is GetNewFieldPrefix, a member of class TCustomAdapterFieldGroup.
V	ImplCanAddClass (see page 6488)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 6488)	Provides the underlying implementation for the Content method.

62.1.26.4.1 TCustomAdapterFieldGroup.GetAdapterDisplayCharacteristics Method

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterFieldGroup.

62.1.26.4.2 TCustomAdapterFieldGroup.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TCustomAdapterFieldGroup.

62.1.26.4.3 TCustomAdapterFieldGroup.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class TCustomAdapterFieldGroup.

62.1.26.4.4 TCustomAdapterFieldGroup.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class TCustomAdapterFieldGroup.

62.1.26.4.5 TCustomAdapterFieldGroup.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class TCustomAdapterFieldGroup.

62.1.26.4.6 TCustomAdapterFieldGroup.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content

62.1.26.4.7 TCustomAdapterFieldGroup.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall UnicodeString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class TCustomAdapterFieldGroup.

62.1.26.4.8 TCustomAdapterFieldGroup.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass

WebFieldControls

62.1.26.4.9 TCustomAdapterFieldGroup.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

AddElements

ILayoutWebContent (see page 6084)

62.1.26.5 TCustomAdapterFieldGroup Properties

The properties of the TCustomAdapterFieldGroup class are listed here.

Public Properties

	Name	Description
	Custom (see page 6489)	Represents a tag option and its value in the generated INPUT tag.
	Style (see page 6489)	Adds style attributes to the generated button group.
	StyleRule (see page 6489)	Applies a style in the page producer's style sheet to the button group.

62.1.26.5.1 TCustomAdapterFieldGroup.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the INPUT tag generated by the Web button group. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

```
ALIGN=TOP TABINDEX=2
```

See Also

Style (see page 6489)

62.1.26.5.2 TCustomAdapterFieldGroup.Style Property

Adds style attributes to the generated button group.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the INPUT tag generated by the Web button group. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated INPUT tag as the value of a STYLE option.

See Also

Custom (see page 6489)

StyleRule (see page 6489)

62.1.26.5.3 TCustomAdapterFieldGroup.StyleRule Property

Applies a style in the page producer's style sheet to the button group.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated button group. The value of StyleRule specifies one of the user-defined style names defined in the page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the button's Style (see page 6489) property.

See Also

Style (see page 6489)

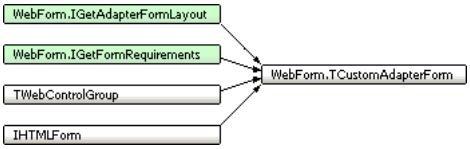
Styles (see page 1157)

StylesFile (see page 1158)

62.1.27 TCustomAdapterForm Class

TCustomAdapterForm is the base class for components that generate an HTML form for an adapter page producer.

Class Hierarchy



Pascal

```
TCustomAdapterForm = class(TWebControlGroup, IHTMLForm, IGetFormRequirements,
IGetAdapterFormLayout);
```

C++

```
class TCustomAdapterForm : public TWebControlGroup, public IHTMLForm, public
IGetFormRequirements, public IGetAdapterFormLayout;
```

File

WebForm

Description

Use TCustomAdapterForm as a base class when defining a form that can contain adapter fields and actions. TCustomAdapterForm is an abstract class, and should not be instantiated directly. Use TAdapterForm (see page 6404), which is a minimal implementation of TCustomAdapterForm, or create your own implementation.

62.1.27.1 TCustomAdapterForm Members

The following tables list the members exposed by TCustomAdapterForm.

Protected Methods

	Name	Description
	GetAdapterFormLayout (see page 6492)	This is GetAdapterFormLayout, a member of class TCustomAdapterForm.
	GetFormRequirements (see page 6492)	This is GetFormRequirements, a member of class TCustomAdapterForm.
	GetHTMLFormName (see page 6492)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 6493)	Returns the name of the javascript variable that refers to the generated form.
	GetLayoutAttributes (see page 6493)	Returns an object that specifies how the generated group of controls should look.
	ImplCanAddClass (see page 6493)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 6494)	Provides the underlying implementation for the Content method.

Public Methods

	Name	Description
	Create (see page 6491)	Creates and initializes an instance of TCustomAdapterForm (see page 6490).
	Destroy (see page 6491)	Frees an instance of TCustomAdapterForm (see page 6490).

Public Properties

	Name	Description
	Custom (see page 6495)	Represents a tag option and its value in the generated INPUT tag.
	FormMethod (see page 6495)	Specifies the method that the adapter form adds to its generated <form> tag.
	Style (see page 6495)	Adds style attributes to the generated form.
	StyleRule (see page 6496)	Applies a style in the page producer's style sheet to the form.

62.1.27.2 TCustomAdapterForm.Create Constructor

Creates and initializes an instance of TCustomAdapterForm (see page 6490).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterForm(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterForm (see page 6490) at runtime. TCustomAdapterForm (see page 6490) objects added at design time using the Web Page editor are instantiated automatically.

62.1.27.3 TCustomAdapterForm.Destroy Destructor

Frees an instance of TCustomAdapterForm (see page 6490).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterForm();
```

Description

Do not call Destroy directly. Instead, use the Free method, which checks for that the object is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

62.1.27.4 TCustomAdapterForm Methods

The methods of the TCustomAdapterForm class are listed here.

Protected Methods

	Name	Description
	GetAdapterFormLayout (see page 6492)	This is GetAdapterFormLayout, a member of class TCustomAdapterForm.
	GetFormRequirements (see page 6492)	This is GetFormRequirements, a member of class TCustomAdapterForm.
	GetHTMLFormName (see page 6492)	Returns the name of the generated HTML form.
	GetHTMLFormVarName (see page 6493)	Returns the name of the javascript variable that refers to the generated form.
V	GetLayoutAttributes (see page 6493)	Returns an object that specifies how the generated group of controls should look.
V	ImplCanAddClass (see page 6493)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 6494)	Provides the underlying implementation for the Content method.

62.1.27.4.1 TCustomAdapterForm.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TCustomAdapterForm.

62.1.27.4.2 TCustomAdapterForm.GetFormRequirements Method

Pascal

```
procedure GetFormRequirements(ARequirements: TAbstractFormRequirements);
```

C++

```
__fastcall GetFormRequirements(TAbstractFormRequirements ARequirements);
```

Description

This is GetFormRequirements, a member of class TCustomAdapterForm.

62.1.27.4.3 TCustomAdapterForm.GetHTMLFormName Method

Returns the name of the generated HTML form.

Pascal

```
function GetHTMLFormName: string;
```

C++

```
__fastcall UnicodeString GetHTMLFormName();
```

Description

GetHTMLFormName is the read access method for the HTMLFormName property.

See Also

HTMLFormName

62.1.27.4.4 TCustomAdapterForm.GetHTMLFormVarName Method

Returns the name of the javascript variable that refers to the generated form.

Pascal

```
function GetHTMLFormVarName: string;
```

C++

```
__fastcall UnicodeString GetHTMLFormVarName();
```

Description

GetHTMLFormVarName is the read access method for the HTMLFormVarName property.

See Also

HTMLFormVarName

62.1.27.4.5 TCustomAdapterForm.GetLayoutAttributes Method

Returns an object that specifies how the generated group of controls should look.

Pascal

```
function GetLayoutAttributes: TLayoutAttributes; override;
```

C++

```
virtual __fastcall TLayoutAttributes GetLayoutAttributes();
```

Description

GetLayoutAttributes is used internally by Web items to allow the layout object supplied by a parent (as a parameter to the Content method) to take into account layout properties of the child component.

As implemented by TWebControlGroup, GetLayoutAttributes returns nil (Delphi) or NULL (C++), because TWebControlGroup descendants not make use of layout attributes.

See Also

Content

62.1.27.4.6 TCustomAdapterForm.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass

WebFieldControls

62.1.27.4.7 TCustomAdapterForm.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

Content

AddElements

ILayoutWebContent (see page 6084)

62.1.27.5 TCustomAdapterForm Properties

The properties of the TCustomAdapterForm class are listed here.

Public Properties

	Name	Description
	Custom (see page 6495)	Represents a tag option and its value in the generated INPUT tag.
	FormMethod (see page 6495)	Specifies the method that the adapter form adds to its generated <form> tag.
	Style (see page 6495)	Adds style attributes to the generated form.
	StyleRule (see page 6496)	Applies a style in the page producer's style sheet to the form.

62.1.27.5.1 TCustomAdapterForm.Custom Property

Represents a tag option and its value in the generated INPUT tag.

Pascal

```
property Custom: string;
```

C++

```
__property UnicodeString Custom;
```

Description

Use Custom to represent one or more options that qualify the <table> tag that the adapter form generates to manage the layout of its Web items. Each option and its value has the form

```
OPTIONNAME=Value
```

The options specified by Custom should be separated by spaces. For example, to add an ALIGN option that aligns the caption and a TABINDEX tag to control tab order, set Custom to

ALIGN=TOP TABINDEX=2

See Also

Style (see page 6495)

62.1.27.5.2 TCustomAdapterForm.FormMethod Property

Specifies the method that the adapter form adds to its generated <form> tag.

Pascal

```
property FormMethod: TFormMethod;
```

C++

```
__property TFormMethod FormMethod;
```

Description

Set FormMethod to specify the METHOD header for HTTP messages that the form submits. This value gives rise to the MethodType property of the HTTP request message.

See Also

MethodType

62.1.27.5.3 TCustomAdapterForm.Style Property

Adds style attributes to the generated form.

Pascal

```
property Style: string;
```

C++

```
__property UnicodeString Style;
```

Description

Use Style to add a STYLE option that qualifies the <table> tag that the adapter form generates to manage the layout of its Web items. The Style option consists of one or more attribute descriptions such as

```
font-family: arial; font-weight: bold; font-size: 10px
```

These attributes are added to the generated <table> tag as the value of a STYLE option.

See Also

Custom (see page 6495)

StyleRule (see page 6496)

62.1.27.5.4 TCustomAdapterForm.StyleRule Property

Applies a style in the page producer's style sheet to the form.

Pascal

```
property StyleRule: string;
```

C++

```
__property UnicodeString StyleRule;
```

Description

Use StyleRule to assign one of the user-defined styles in the HTML document's style sheet to the generated form. The value of StyleRule specifies one of the user-defined style names defined in the adapter page producer's Styles or StylesFile property.

Note: To apply a style definition that is not included in the style sheet, use the form's Style (see page 6495) property.

See Also

Style (see page 6495)

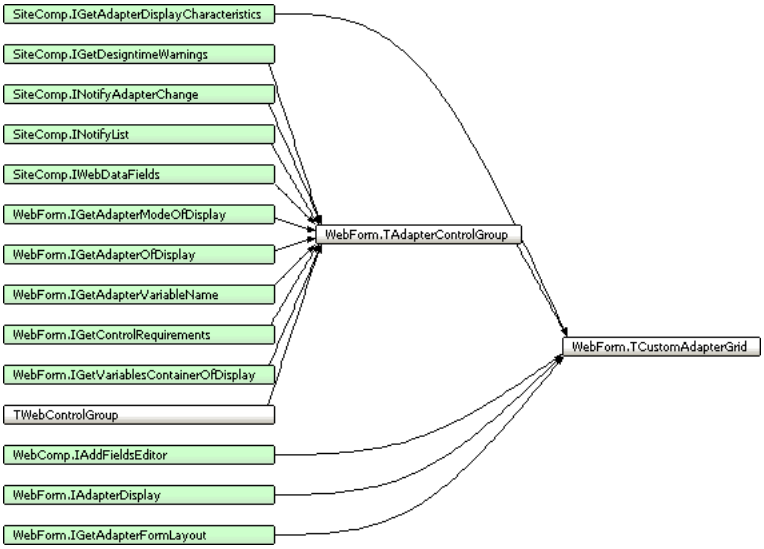
Styles (see page 1157)

StylesFile (see page 1158)

62.1.28 TCustomAdapterGrid Class

TCustomAdapterGrid is the base class for Web items that generate an HTML table to display a datasetin an XML data packet or web application.

Class Hierarchy



Pascal

```
TCustomAdapterGrid = class(TAdapterControlGroup, IAdapterDisplay,
IGetAdapterDisplayCharacteristics, IAddFieldsEditor, IGetAdapterFormLayout);
```

C++

```
class TCustomAdapterGrid : public TAdapterControlGroup, public IAdapterDisplay, public
IGetAdapterDisplayCharacteristics, public IAddFieldsEditor, public IGetAdapterFormLayout;
```

File

WebForm

Description

Use TCustomAdapterGrid as a base class for Web items that generate an HTML table to display multiple records of data supplied by an adapter component. All of the adapter grid's child Web items display field components that use the same adapter, which is specified by a property of the adapter grid.

If no display fields are explicitly added to the adapter grid, it displays all of the adapter's display fields by default. The properties of default display fields cannot be modified.

TCustomAdapterGrid introduces properties to

Specify the associated Adapter (see page 6352)

Specify whether default fields should be added

Customize the appearance of the HTML table.

Do not create instances of TCustomAdapterGrid. Instead, use a descendant of TCustomAdapterGrid such as TAdapterGrid (see page 6419).

See Also

TAdapterCommandColumn (see page 6331)

TAdapterGrid (see page 6419)

TAdapterFieldGroup (see page 6399)

IWebContent (see page 6103)

62.1.28.1 TCustomAdapterGrid Members

The following tables list the members exposed by TCustomAdapterGrid.

Protected Methods

	Name	Description
	AdapterChange (see page 6345)	Responds when the adapter associated with this control group changes.
	AddNotify (see page 6345)	Registers interest so that the adapter control group notifies an object of changes to its adapter.
	CreateDefaultFields (see page 6346)	Generates a list of the default adapter display field components that generate controls for the default fields of the control group's adapter.
	FindField (see page 6346)	Returns the child Web item that represents the value of a specified adapter field.
	GetAdapter (see page 6346)	Returns the value of the Adapter (see page 6352) property.
	GetAdapterDisplayCharacteristics (see page 6500)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterGrid.
	GetAdapterFormLayout (see page 6500)	This is GetAdapterFormLayout, a member of class TCustomAdapterGrid.
	GetAdapterModeOfAdapter (see page 6347)	Returns the current mode of the control group's adapter.
	GetAdapterModeOfDisplay (see page 6347)	Returns the value of the AdapterMode (see page 6353) property.
	GetAdapterVariableName (see page 6348)	Returns the variable name that refers to the control group's adapter in server-side script.
	GetAddAllFieldsItem (see page 6500)	This is GetAddAllFieldsItem, a member of class TCustomAdapterGrid.
	GetAddFieldsDlgCaption (see page 6501)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterGrid.
	GetAddFieldsItem (see page 6501)	This is GetAddFieldsItem, a member of class TCustomAdapterGrid.
	GetControlRequirements (see page 6348)	Populates a control requirements object with declarations of the variables and functions this control group requires for generating its HTML.
	GetDesigntimeWarnings (see page 6348)	Populates a design-time warnings object with any warnings that the adapter control group needs to emit.
	GetFieldsList (see page 6349)	Fills a string list with the names of all of the associated adapter's fields.
	GetNewFieldPrefix (see page 6501)	This is GetNewFieldPrefix, a member of class TCustomAdapterGrid.
	GetVisibleFields (see page 6349)	Returns the value of the VisibleFields (see page 6354) property.
	ImplCanAddClass (see page 6501)	Provides the underlying implementation for the CanAddClass method.
	ImplContent (see page 6502)	Provides the underlying implementation for the Content method.
	ImplGetControlRequirements (see page 6350)	Provides the underlying implementation for the GetControlRequirements (see page 6348) method.
	IsFieldInUse (see page 6350)	Indicates whether one of the adapter control group's child Web items represents a specified adapter field.
	Notification (see page 6350)	Updates the TAdapterControlGroup (see page 6341) object when components are added to or removed from the application.
	NotifyAdapterChange (see page 6351)	Responds when the control group's adapter notifies it of a change.
	RemoveNotify (see page 6351)	Unregisters interest in changes to the control group's adapter.
	SetAdapter (see page 6352)	Sets the value of the Adapter (see page 6352) property.

Public Methods

	Name	Description
	AddNotify (see page 1059)	Registers an interest in change notifications.
	Create (see page 6499)	Creates and initializes an instance of TCustomAdapterGrid (see page 6496).
	Destroy (see page 6499)	Frees an instance of TCustomAdapterGrid (see page 6496).
	FindField (see page 1082)	This is FindField, a member of class IWebDataFields.
	GetAdapter (see page 6513)	This is GetAdapter, a member of class IGetAdapterOfDisplay.
	GetAdapterModeOfAdapter (see page 6512)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 6512)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.

	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.
	GetDesigntimeWarnings (see page 1029)	Populates a design-time warnings object with any warnings that the dataset values list needs to emit.
	GetFieldsList (see page 1082)	This is GetFieldsList, a member of class IWebDataFields.
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.
	GetVisibleFields (see page 1083)	This is GetVisibleFields, a member of class IWebDataFields.
	IsFieldInUse (see page 1083)	This is IsFieldInUse, a member of class IWebDataFields.
	NotifyAdapterChange (see page 1058)	Responds when the adapter changes.
	RemoveNotify (see page 1059)	Unregisters interest in change notifications.

Public Properties

	Name	Description
	Adapter (see page 6352)	Specifies the adapter that supplies values to or receives values from the controls in the group.
	AdapterMode (see page 6353)	Specifies the mode of the adapter that the controls in the group support.
R	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.
	AddDefaultFields (see page 6353)	Specifies whether the adapter control group generates controls for the adapter's default fields when you do not explicitly add Web items.
	HeadingAttributes (see page 6502)	Determines the display characteristics of the table's header.
	RowAttributes (see page 6503)	Determines the display characteristics of the table's body.
	TableAttributes (see page 6503)	Determines the basic display characteristics of the table.
R	VisibleFields (see page 1083)	This is VisibleFields, a member of class IWebDataFields.
R	VisibleFields (see page 6354)	Lists the child Web items that generate the visible HTML controls this adapter control group arranges.

62.1.28.2 TCustomAdapterGrid.Create Constructor

Creates and initializes an instance of TCustomAdapterGrid (see page 6496).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomAdapterGrid(TComponent * AOwner);
```

Description

Call Create to instantiate TCustomAdapterGrid (see page 6496) at runtime. TCustomAdapterGrid (see page 6496) objects added at design time using the Web Page editor are instantiated automatically.

62.1.28.3 TCustomAdapterGrid.Destroy Destructor

Frees an instance of TCustomAdapterGrid (see page 6496).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomAdapterGrid();
```

Description

Destroy removes the Web control group from its parent's list of components that generate HTML before freeing its own resources.

62.1.28.4 TCustomAdapterGrid Methods

The methods of the TCustomAdapterGrid class are listed here.

Protected Methods

	Name	Description
	GetAdapterDisplayCharacteristics (see page 6500)	This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterGrid.
	GetAdapterFormLayout (see page 6500)	This is GetAdapterFormLayout, a member of class TCustomAdapterGrid.
	GetAddAllFieldsItem (see page 6500)	This is GetAddAllFieldsItem, a member of class TCustomAdapterGrid.
	GetAddFieldsDlgCaption (see page 6501)	This is GetAddFieldsDlgCaption, a member of class TCustomAdapterGrid.
	GetAddFieldsItem (see page 6501)	This is GetAddFieldsItem, a member of class TCustomAdapterGrid.
	GetNewFieldPrefix (see page 6501)	This is GetNewFieldPrefix, a member of class TCustomAdapterGrid.
V	ImplCanAddClass (see page 6501)	Provides the underlying implementation for the CanAddClass method.
V	ImplContent (see page 6502)	Provides the underlying implementation for the Content method.

62.1.28.4.1 TCustomAdapterGrid.GetAdapterDisplayCharacteristics Method

Pascal

```
function GetAdapterDisplayCharacteristics: TAdapterDisplayCharacteristics;
```

C++

```
__fastcall TAdapterDisplayCharacteristics GetAdapterDisplayCharacteristics();
```

Description

This is GetAdapterDisplayCharacteristics, a member of class TCustomAdapterGrid.

62.1.28.4.2 TCustomAdapterGrid.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class TCustomAdapterGrid.

62.1.28.4.3 TCustomAdapterGrid.GetAddAllFieldsItem Method

Pascal

```
function GetAddAllFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddAllFieldsItem();
```

Description

This is GetAddAllFieldsItem, a member of class TCustomAdapterGrid.

62.1.28.4.4 TCustomAdapterGrid.GetAddFieldsDlgCaption Method

Pascal

```
function GetAddFieldsDlgCaption: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsDlgCaption();
```

Description

This is GetAddFieldsDlgCaption, a member of class TCustomAdapterGrid.

62.1.28.4.5 TCustomAdapterGrid.GetAddFieldsItem Method

Pascal

```
function GetAddFieldsItem: string;
```

C++

```
__fastcall UnicodeString GetAddFieldsItem();
```

Description

This is GetAddFieldsItem, a member of class TCustomAdapterGrid.

62.1.28.4.6 TCustomAdapterGrid.GetNewFieldPrefix Method

Pascal

```
function GetNewFieldPrefix: string;
```

C++

```
__fastcall UnicodeString GetNewFieldPrefix();
```

Description

This is GetNewFieldPrefix, a member of class TCustomAdapterGrid.

62.1.28.4.7 TCustomAdapterGrid.ImplCanAddClass Method

Provides the underlying implementation for the CanAddClass method.

Pascal

```
function ImplCanAddClass(AParent: TComponent; AClass: TClass): Boolean; override;
```

C++

```
virtual __fastcall Boolean ImplCanAddClass(TComponent * AParent, TClass AClass);
```

Description

The CanAddClass method calls ImpleCanAddClass to determine whether the TWebControlGroup descendant can add a component of type AClass to its WebComponents property list. AParent is the TWebControlGroup instance to which the component will be added.

In TWebControlGroup, ImplCanAddClass always returns true. TWebControlGroup descendants override ImplCanAddClass to indicate what types of Web Items they can use when generating their HTML content.

See Also

CanAddClass

WebFieldControls

62.1.28.4.8 TCustomAdapterGrid.ImplContent Method

Provides the underlying implementation for the Content method.

Pascal

```
function ImplContent(Options: TWebContentOptions; ParentLayout: TLayout): string; override;
```

C++

```
virtual __fastcall UnicodeString ImplContent(TWebContentOptions Options, TLayout ParentLayout);
```

Description

The Content method calls ImplContent to generate the group of HTML controls. As implemented in TWebControlGroup, ImplContent returns an empty string. TWebControlGroup descendants override it to generate HTML for the group of controls.

Options contains a set of flags that limit what can be included in the generated HTML.

ParentLayout specifies a helper object that the caller supplies for determining how the TWebControlGroup should format the HTML controls it generates. It implements the ILayoutWebContent interface.

ImplContent returns the generated HTML.

ILayoutWebContent (see page 6084)

62.1.28.5 TCustomAdapterGrid Properties

The properties of the TCustomAdapterGrid class are listed here.

Public Properties

	Name	Description
	HeadingAttributes (see page 6502)	Determines the display characteristics of the table's header.
	RowAttributes (see page 6503)	Determines the display characteristics of the table's body.
	TableAttributes (see page 6503)	Determines the basic display characteristics of the table.

62.1.28.5.1 TCustomAdapterGrid.HeadingAttributes Property

Determines the display characteristics of the table's header.

Pascal

```
property HeadingAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes HeadingAttributes;
```

Description

Use HeadingAttributes to specify any display attributes that apply only to the heading of the generated HTML table.

HeadingAttributes determines the options that are added to the <TR> tag that defines the header of the grid. These include the color of the header, the alignment of the caption for each column, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the rows of the grid, use the TableAttributes (see page 6503) or RowAttributes (see page 6503) property instead.

See Also

TableAttributes (see page 6503)

RowAttributes (see page 6503)

62.1.28.5.2 TCustomAdapterGrid.RowAttributes Property

Determines the display characteristics of the table's body.

Pascal

```
property RowAttributes: TGridRowAttributes;
```

C++

```
__property TGridRowAttributes RowAttributes;
```

Description

Use RowAttributes to specify any display attributes that apply only to the rows of the generated HTML table. RowAttributes determines the options that are added to the <TR> tag for each row in the body of the grid. These include the color of the rows, the alignment of data within each cell, and any custom options or style rules.

Note: To influence the display attributes of the grid as a whole or only the header of the grid, use the TableAttributes (see page 6503) or HeadingAttributes (see page 6502) property instead.

See Also

TableAttributes (see page 6503)

HeadingAttributes (see page 6502)

62.1.28.5.3 TCustomAdapterGrid.TableAttributes Property

Determines the basic display characteristics of the table.

Pascal

```
property TableAttributes: TGridAttributes;
```

C++

```
__property TGridAttributes TableAttributes;
```

Description

Use TableAttributes to specify values for the most common options on the HTML <TABLE> tag. TableAttributes lets you specify the alignment of the table in its HTML document, its color and border size, the offset of data within each table cell, as well as any custom options or style rules.

Note: To influence the display attributes of only the header of the grid, or only the rows in its body, use the TableAttributes or HeadingAttributes (see page 6502) property instead.

See Also

RowAttributes (see page 6503)

HeadingAttributes (see page 6502)

62.1.29 TDesigntimeWarnings Class

Class Hierarchy

Pascal

```
TDesigntimeWarnings = class(TAbstractDesigntimeWarnings);
```

C++

```
class TDesigntimeWarnings : public TAbstractDesigntimeWarnings;
```

File

WebForm

Description

This is class WebForm.TDesigntimeWarnings.

62.1.29.1 TDesigntimeWarnings Members

The following tables list the members exposed by TDesigntimeWarnings.

Public Methods

	Name	Description
	AddObject (see page 6505)	Requests any design time warnings from a specified object.
	AddString (see page 6505)	Adds a warning string to the set of warnings that appear at design time.
	Create (see page 6504)	This is Create, a member of class TDesigntimeWarnings.
	Destroy (see page 6504)	This is Destroy, a member of class TDesigntimeWarnings.

Public Properties

	Name	Description
	Strings (see page 6506)	This is Strings, a member of class TDesigntimeWarnings.

62.1.29.2 TDesigntimeWarnings.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TDesigntimeWarnings();
```

Description

This is Create, a member of class TDesigntimeWarnings.

62.1.29.3 TDesigntimeWarnings.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDesigntimeWarnings();
```

Description

This is Destroy, a member of class TDesigntimeWarnings.

62.1.29.4 TDesigntimeWarnings Methods

The methods of the TDesigntimeWarnings class are listed here.

Public Methods

	Name	Description
	AddObject (see page 6505)	Requests any design time warnings from a specified object.
	AddString (see page 6505)	Adds a warning string to the set of warnings that appear at design time.

62.1.29.4.1 TDesigntimeWarnings.AddObject Method

Requests any design time warnings from a specified object.

Pascal

```
procedure AddObject(AObject: TObject); override;
```

C++

```
virtual __fastcall AddObject(TObject * AObject);
```

Description

AddObject collects the design time warnings from the specified object by calling its GetDesigntimeWarnings method (if it has one). If the object has already been added by a previous call to AddObject, AddObject detects this and does nothing.

AObject is the Web item from which to request design-time warnings.

See Also

GetDesigntimeWarnings (see page 6384)

AddString (see page 964)

62.1.29.4.2 TDesigntimeWarnings.AddString Method

Adds a warning string to the set of warnings that appear at design time.

Pascal

```
procedure AddString(AWarning: string); override;
```

C++

```
virtual __fastcall AddString(UnicodeString AWarning);
```

Description

AddString adds a string to the design-time warnings object. The adapter page producer displays all such warning strings in the HTML form that appears in the HTML view of the editor.

AWarning is a warning string that describes a problem that the developer can rectify (such as an invalid property value or missing component).

See Also

TAdapterPageProducer (see page 1136)

AddObject (see page 964)

62.1.29.5 TDesigntimeWarnings Properties

The properties of the TDesigntimeWarnings class are listed here.

Public Properties

	Name	Description
	Strings (see page 6506)	This is Strings, a member of class TDesigntimeWarnings.

62.1.29.5.1 TDesigntimeWarnings.Strings Property

Pascal

```
property Strings: TStrings;
```

C++

```
__property TStrings Strings;
```

Description

This is Strings, a member of class TDesigntimeWarnings.

62.1.30 TGeneratedFunctions Class

Class Hierarchy

Pascal

```
TGeneratedFunctions = class;
```

C++

```
class TGeneratedFunctions;
```

File

WebForm

Description

This is class WebForm.TGeneratedFunctions.

62.1.30.1 TGeneratedFunctions Members

The following tables list the members exposed by TGeneratedFunctions.

Public Methods

	Name	Description
	Add (see page 6507)	This is Add, a member of class TGeneratedFunctions.

	Create (see page 6507)	This is Create, a member of class TGeneratedFunctions.
V	Destroy (see page 6507)	This is Destroy, a member of class TGeneratedFunctions.
	Exists (see page 6508)	This is Exists, a member of class TGeneratedFunctions.

Public Properties

	Name	Description
R	ItemCount (see page 6508)	This is ItemCount, a member of class TGeneratedFunctions.
R	Names (see page 6508)	This is Names, a member of class TGeneratedFunctions.
R	Script (see page 6508)	This is Script, a member of class TGeneratedFunctions.

62.1.30.2 TGeneratedFunctions.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TGeneratedFunctions();
```

Description

This is Create, a member of class TGeneratedFunctions.

62.1.30.3 TGeneratedFunctions.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TGeneratedFunctions();
```

Description

This is Destroy, a member of class TGeneratedFunctions.

62.1.30.4 TGeneratedFunctions Methods

The methods of the TGeneratedFunctions class are listed here.

Public Methods

	Name	Description
	Add (see page 6507)	This is Add, a member of class TGeneratedFunctions.
	Exists (see page 6508)	This is Exists, a member of class TGeneratedFunctions.

62.1.30.4.1 TGeneratedFunctions.Add Method

Pascal

```
procedure Add(const AName: string; const AScript: string);
```

C++

```
__fastcall Add(const UnicodeString AName, const UnicodeString AScript);
```

Description

This is Add, a member of class TGeneratedFunctions.

62.1.30.4.2 TGeneratedFunctions.Exists Method

Pascal

```
function Exists(const AName: string): Boolean;
```

C++

```
__fastcall Boolean Exists(const UnicodeString AName);
```

Description

This is Exists, a member of class TGeneratedFunctions.

62.1.30.5 TGeneratedFunctions Properties

The properties of the TGeneratedFunctions class are listed here.

Public Properties

	Name	Description
	ItemCount (see page 6508)	This is ItemCount, a member of class TGeneratedFunctions.
	Names (see page 6508)	This is Names, a member of class TGeneratedFunctions.
	Script (see page 6508)	This is Script, a member of class TGeneratedFunctions.

62.1.30.5.1 TGeneratedFunctions.ItemCount Property

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

This is ItemCount, a member of class TGeneratedFunctions.

62.1.30.5.2 TGeneratedFunctions.Names Property

Pascal

```
property Names [I: Integer]: string;
```

C++

```
__property UnicodeString Names[int I];
```

Description

This is Names, a member of class TGeneratedFunctions.

62.1.30.5.3 TGeneratedFunctions.Script Property

Pascal

```
property Script [I: Integer]: string;
```

C++

```
__property UnicodeString Script[int I];
```

Description

This is Script, a member of class TGeneratedFunctions.

62.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IAdapterDisplay (see page 6510)	This is class WebForm.IAdapterDisplay.
	IGetAdapterFormLayout (see page 6510)	This is class WebForm.IGetAdapterFormLayout.
	IGetAdapterModeOfDisplay (see page 6511)	This is class WebForm.IGetAdapterModeOfDisplay.
	IGetAdapterOfDisplay (see page 6512)	This is class WebForm.IGetAdapterOfDisplay.
	IGetAdapterVariableName (see page 6513)	This is class WebForm.IGetAdapterVariableName.
	IGetControlRequirements (see page 6515)	This is class WebForm.IGetControlRequirements.
	IGetFormRequirements (see page 6516)	This is class WebForm.IGetFormRequirements.
	IGetVariablesContainerOfDisplay (see page 6517)	This is class WebForm.IGetVariablesContainerOfDisplay.

62.2.1 IAdapterDisplay Interface

Class Hierarchy

WebForm.IAdapterDisplay

Pascal

```
IAdapterDisplay = interface;
```

C++

```
__interface IAdapterDisplay;
```

File

WebForm

Description

This is class WebForm.IAdapterDisplay.

62.2.2 IGetAdapterFormLayout Interface

Class Hierarchy

WebForm.IGetAdapterFormLayout

Pascal

```
IGetAdapterFormLayout = interface;
```

C++

```
__interface IGetAdapterFormLayout;
```

File

WebForm

Description

This is class WebForm.IGetAdapterFormLayout.

62.2.2.1 IGetAdapterFormLayout Members

The following tables list the members exposed by IGetAdapterFormLayout.

Public Methods

	Name	Description
	GetAdapterFormLayout (see page 6511)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.

62.2.2.2 IGetAdapterFormLayout Methods

The methods of the IGetAdapterFormLayout class are listed here.

Public Methods

	Name	Description
	GetAdapterFormLayout (see page 6511)	This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.

62.2.2.2.1 IGetAdapterFormLayout.GetAdapterFormLayout Method

Pascal

```
function GetAdapterFormLayout: TAdapterFormLayout;
```

C++

```
__fastcall TAdapterFormLayout GetAdapterFormLayout();
```

Description

This is GetAdapterFormLayout, a member of class IGetAdapterFormLayout.

62.2.3 IGetAdapterModeOfDisplay Interface

Class Hierarchy

Pascal

```
IGetAdapterModeOfDisplay = interface;
```

C++

```
__interface IGetAdapterModeOfDisplay;
```

File

WebForm

Description

This is class WebForm.IGetAdapterModeOfDisplay.

62.2.3.1 IGetAdapterModeOfDisplay Members

The following tables list the members exposed by IGetAdapterModeOfDisplay.

Public Methods

	Name	Description
	GetAdapterModeOfAdapter (see page 6512)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 6512)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.

62.2.3.2 IGetAdapterModeOfDisplay Methods

The methods of the IGetAdapterModeOfDisplay class are listed here.

Public Methods

	Name	Description
	GetAdapterModeOfAdapter (see page 6512)	This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.
	GetAdapterModeOfDisplay (see page 6512)	This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.

62.2.3.2.1 IGetAdapterModeOfDisplay.GetAdapterModeOfAdapter Method

Pascal

```
function GetAdapterModeOfAdapter: string;
```

C++

```
__fastcall UnicodeString GetAdapterModeOfAdapter();
```

Description

This is GetAdapterModeOfAdapter, a member of class IGetAdapterModeOfDisplay.

62.2.3.2.2 IGetAdapterModeOfDisplay.GetAdapterModeOfDisplay Method

Pascal

```
function GetAdapterModeOfDisplay: string;
```

C++

```
__fastcall UnicodeString GetAdapterModeOfDisplay();
```

Description

This is GetAdapterModeOfDisplay, a member of class IGetAdapterModeOfDisplay.

62.2.4 IGetAdapterOfDisplay Interface

Class Hierarchy

Pascal

```
IGetAdapterOfDisplay = interface;
```

C++

```
__interface IGetAdapterOfDisplay;
```

File

WebForm

Description

This is class WebForm.IGetAdapterOfDisplay.

62.2.4.1 IGetAdapterOfDisplay Members

The following tables list the members exposed by IGetAdapterOfDisplay.

Public Methods

	Name	Description
	GetAdapter (see page 6513)	This is GetAdapter, a member of class IGetAdapterOfDisplay.

62.2.4.2 IGetAdapterOfDisplay Methods

The methods of the IGetAdapterOfDisplay class are listed here.

Public Methods

	Name	Description
	GetAdapter (see page 6513)	This is GetAdapter, a member of class IGetAdapterOfDisplay.

62.2.4.2.1 IGetAdapterOfDisplay.GetAdapter Method

Pascal

```
function GetAdapter: TComponent;
```

C++

```
__fastcall TComponent * GetAdapter();
```

Description

This is GetAdapter, a member of class IGetAdapterOfDisplay.

62.2.5 IGetAdapterVariableName Interface

Class Hierarchy

Pascal

```
IGetAdapterVariableName = interface;
```

C++

```
__interface IGetAdapterVariableName;
```

File

WebForm

Description

This is class WebForm.IGetAdapterVariableName.

62.2.5.1 IGetAdapterVariableName Members

The following tables list the members exposed by IGetAdapterVariableName.

Public Methods

	Name	Description
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.

Public Properties

	Name	Description
	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.

62.2.5.2 IGetAdapterVariableName Methods

The methods of the IGetAdapterVariableName class are listed here.

Public Methods

	Name	Description
	GetAdapterVariableName (see page 6514)	This is GetAdapterVariableName, a member of class IGetAdapterVariableName.

62.2.5.2.1 IGetAdapterVariableName.GetAdapterVariableName Method

Pascal

```
function GetAdapterVariableName: string;
```

C++

```
__fastcall UnicodeString GetAdapterVariableName();
```

Description

This is GetAdapterVariableName, a member of class IGetAdapterVariableName.

62.2.5.3 IGetAdapterVariableName Properties

The properties of the IGetAdapterVariableName class are listed here.

Public Properties

	Name	Description
	AdapterVariableName (see page 6515)	This is AdapterVariableName, a member of class IGetAdapterVariableName.

62.2.5.3.1 IGetAdapterVariableName.AdapterVariableName Property

Pascal

```
property AdapterVariableName: string;
```

C++

```
__property UnicodeString AdapterVariableName;
```

Description

This is AdapterVariableName, a member of class IGetAdapterVariableName.

62.2.6 IGetControlRequirements Interface

Class Hierarchy

Pascal

```
IGetControlRequirements = interface;
```

C++

```
__interface IGetControlRequirements;
```

File

WebForm

Description

This is class WebForm.IGetControlRequirements.

62.2.6.1 IGetControlRequirements Members

The following tables list the members exposed by IGetControlRequirements.

Public Methods

	Name	Description
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.

62.2.6.2 IGetControlRequirements Methods

The methods of the IGetControlRequirements class are listed here.

Public Methods

	Name	Description
	GetControlRequirements (see page 6516)	This is GetControlRequirements, a member of class IGetControlRequirements.

62.2.6.2.1 IGetControlRequirements.GetControlRequirements Method

Pascal

```
procedure GetControlRequirements(ARequirements: TAbstractControlRequirements);
```

C++

```
__fastcall GetControlRequirements(TAbstractControlRequirements ARequirements);
```

Description

This is GetControlRequirements, a member of class IGetControlRequirements.

62.2.7 IGetFormRequirements Interface

Class Hierarchy

Pascal

```
IGetFormRequirements = interface;
```

C++

```
__interface IGetFormRequirements;
```

File

WebForm

Description

This is class WebForm.IGetFormRequirements.

62.2.7.1 IGetFormRequirements Members

The following tables list the members exposed by IGetFormRequirements.

Public Methods

	Name	Description
	GetFormRequirements (see page 6517)	This is GetFormRequirements, a member of class IGetFormRequirements.

62.2.7.2 IGetFormRequirements Methods

The methods of the IGetFormRequirements class are listed here.

Public Methods

	Name	Description
	GetFormRequirements (see page 6517)	This is GetFormRequirements, a member of class IGetFormRequirements.

62.2.7.2.1 IGetFormRequirements.GetFormRequirements Method

Pascal

```
procedure GetFormRequirements(ARequirements: TAbstractFormRequirements);
```

C++

```
__fastcall GetFormRequirements(TAbstractFormRequirements ARequirements);
```

Description

This is GetFormRequirements, a member of class IGetFormRequirements.

62.2.8 IGetVariablesContainerOfDisplay Interface

Class Hierarchy

Pascal

```
IGetVariablesContainerOfDisplay = interface;
```

C++

```
__interface IGetVariablesContainerOfDisplay;
```

File

WebForm

Description

This is class WebForm.IGetVariablesContainerOfDisplay.

62.2.8.1 IGetVariablesContainerOfDisplay Members

The following tables list the members exposed by IGetVariablesContainerOfDisplay.

Public Methods

	Name	Description
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.

62.2.8.2 IGetVariablesContainerOfDisplay Methods

The methods of the IGetVariablesContainerOfDisplay class are listed here.

Public Methods

	Name	Description
	GetVariablesContainer (see page 6518)	This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.

62.2.8.2.1 IGetVariablesContainerOfDisplay.GetVariablesContainer Method

Pascal

```
function GetVariablesContainer: TComponent;
```

C++

```
__fastcall TComponent * GetVariablesContainer();
```

Description

This is GetVariablesContainer, a member of class IGetVariablesContainerOfDisplay.

62.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	CalcDisplayFieldHTMLElementType (see page 6519)	This is function WebForm.CalcDisplayFieldHTMLElementType.
	CalcDisplayFieldViewMode (see page 6519)	This is function WebForm.CalcDisplayFieldViewMode.
	FindVariablesContainer (see page 6520)	This is function WebForm.FindVariablesContainer.
	FindVariablesContainerInParent (see page 6520)	This is function WebForm.FindVariablesContainerInParent.
	GetAdapterModeOfAdapterInParent (see page 6520)	This is function WebForm.GetAdapterModeOfAdapterInParent.
	MakeAdapterHTMLName (see page 6521)	This is function WebForm.MakeAdapterHTMLName.
	MakeAdapterVariableName (see page 6521)	This is function WebForm.MakeAdapterVariableName.

62.3.1 WebForm.CalcDisplayFieldHTMLElementType Function

Pascal

```
function CalcDisplayFieldHTMLElementType(AField: TComponent; const AAdapterMode: string;
ADisplayType: TDisplayFieldHTMLElementType; var AType: TDisplayFieldHTMLElementType): Boolean;
```

C++

```
Boolean CalcDisplayFieldHTMLElementType(TComponent * AField, const UnicodeString AAdapterMode,
TDisplayFieldHTMLElementType ADisplayType, TDisplayFieldHTMLElementType AType);
```

File

WebForm

Description

This is function WebForm.CalcDisplayFieldHTMLElementType.

62.3.2 WebForm.CalcDisplayFieldViewMode Function

Pascal

```
function CalcDisplayFieldViewMode(AField: TComponent; const AAdapterMode: string; AViewMode:
TDisplayFieldViewMode; var AMode: TDisplayFieldViewMode): Boolean;
```

C++

```
Boolean CalcDisplayFieldViewMode(TComponent * AField, const UnicodeString AAdapterMode,
TDisplayFieldViewMode AViewMode, TDisplayFieldViewMode AMode);
```

File

WebForm

Description

This is function WebForm.CalcDisplayFieldViewMode.

62.3.3 WebForm.FindVariablesContainer Function

Pascal

```
function FindVariablesContainer(AComponent: TComponent): TComponent;
```

C++

```
TComponent * FindVariablesContainer(TComponent * AComponent);
```

File

WebForm

Description

This is function WebForm.FindVariablesContainer.

62.3.4 WebForm.FindVariablesContainerInParent Function

Pascal

```
function FindVariablesContainerInParent(AComponent: TComponent): TComponent;
```

C++

```
TComponent * FindVariablesContainerInParent(TComponent * AComponent);
```

File

WebForm

Description

This is function WebForm.FindVariablesContainerInParent.

62.3.5 WebForm.GetAdapterModeOfAdapterInParent Function

Pascal

```
function GetAdapterModeOfAdapterInParent(AComponent: TComponent): string;
```

C++

```
UnicodeString GetAdapterModeOfAdapterInParent(TComponent * AComponent);
```

File

WebForm

Description

This is function WebForm.GetAdapterModeOfAdapterInParent.

62.3.6 WebForm.MakeAdapterHTMLName Function

Pascal

```
function MakeAdapterHTMLName(AVarName: string): string;
```

C++

```
UnicodeString MakeAdapterHTMLName(UnicodeString AVarName);
```

File

WebForm

Description

This is function WebForm.MakeAdapterHTMLName.

62.3.7 WebForm.MakeAdapterVariableName Function

Pascal

```
function MakeAdapterVariableName(AComponent: TComponent): string;
```

C++

```
UnicodeString MakeAdapterVariableName(TComponent * AComponent);
```

File

WebForm

Description

This is function WebForm.MakeAdapterVariableName.

62.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TActionButtonHideOption (see page 6522)	TActionButtonHideOptions (see page 6528) indicates when a control to represent an adapter action should not be generated.
	TColumnHTMLElementType (see page 6523)	This is record WebForm.TColumnHTMLElementType.
	TCommandHTMLElementType (see page 6523)	TCommandHTMLElementType identifies an HTML control type that can be used execute an adapter action.
	TDisplayFieldHideOption (see page 6524)	TDisplayFieldHideOptions (see page 6528) indicates when a control to represent a dataset field should not be generated.
	TDisplayFieldHTMLElementType (see page 6525)	TDisplayFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.
	TDisplayFieldViewMode (see page 6525)	TDisplayFieldViewMode indicates the mode in which an adapter field's value is displayed.
	TInputFieldHTMLElementType (see page 6526)	TInputFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.
	TLayoutState (see page 6527)	This is record WebForm.TLayoutState.

62.4.1 WebForm.TActionButtonHideOption Enumeration

TActionButtonHideOptions (see page 6528) indicates when a control to represent an adapter action should not be generated.

Pascal

```
TActionButtonHideOption = (
  bhoHideOnNoExecuteAccess,
  bhoHideOnActionNotVisible,
  bhoHideOnDisabledAction,
  bhoHideAlways
);
```

C++

```
enum TActionButtonHideOption {
  bhoHideOnNoExecuteAccess,
  bhoHideOnActionNotVisible,
  bhoHideOnDisabledAction,
  bhoHideAlways
};
```

File

WebForm

Description

TActionButtonHideOptions (see page 6528) is a set of TActionButtonHideOption values. It can include zero or more of the following values:

Value	Meaning
bhoHideOnNoExecuteAccess	Suppress the HTML control when the user does not have rights to execute the associated action, as indicated by the action's HasExecuteAccess method. When this flag is set, server-side script can suppress the control by setting the action's CanExecute property to false.

bhoHideOnActionNotVisible	Suppress the HTML control when the action returns false from its GetVisible method. When this flag is set, server-side script can suppress the control by setting the action's Visible property to false. This flag is set by default.
bhoHideOnDisabledAction	Suppress the HTML control when the action returns false from its WebEnabled method. When this flag is set, server-side script can suppress the control by setting the action's Enabled property to false.
bhoHideAlways	Always suppress the HTML control.

62.4.2 WebForm.TColumnHTMLElementType Enumeration

Pascal

```
TColumnHTMLElementType = (
  coltDefault,
  coltText,
  coltImage,
  coltList
);
```

C++

```
enum TColumnHTMLElementType {
  coltDefault,
  coltText,
  coltImage,
  coltList
};
```

File

WebForm

Description

This is record WebForm.TColumnHTMLElementType.

62.4.3 WebForm.TCommandHTMLElementType Enumeration

TCommandHTMLElementType identifies an HTML control type that can be used execute an adapter action.

Pascal

```
TCommandHTMLElementType = (
  ctDefault,
  ctButton,
  ctImage,
  ctAnchor,
  ctEventImages
);
```

C++

```
enum TCommandHTMLElementType {
  ctDefault,
  ctButton,
  ctImage,
  ctAnchor,
```

```
  ctEventImages
};
```

File

WebForm

Description

Each element type indicates a different HTML element. TCommandHTMLElementType defines HTML elements that the user can click to execute a command.

The following table lists the possible values:

Value	Meaning
ctDefault	Generate the element type that the adapter action object suggests.
ctButton	Generate a push button with a text label.
ctImage	Generate an image that the user can click.
ctAnchor	Generate a hypertext link.
ctEventImages	Generate an element that displays a different image, depending on the users action. That is, the image changes dynamically depending on user events such as whether the mouse is over the control, whether the user is clicking the control, and so on.

See Also

DisplayType (see page 6439)

62.4.4 WebForm.TDisplayFieldHideOption Enumeration

TDisplayFieldHideOptions (see page 6528) indicates when a control to represent a dataset field should not be generated.

Pascal

```
TDisplayFieldHideOption = (
  hoHideOnNoInputAccess,
  hoHideOnNoDisplayAccess,
  hoHideOnFieldNotVisible,
  hoHideAlways
);
```

C++

```
enum TDisplayFieldHideOption {
  hoHideOnNoInputAccess,
  hoHideOnNoDisplayAccess,
  hoHideOnFieldNotVisible,
  hoHideAlways
};
```

File

WebForm

Description

TDisplayFieldHideOptions (see page 6528) is a set of TDisplayFieldHideOption values. It can include zero or more of the following values:

Value	Meaning
hoHideOnNoInputAccess	Do not generate a control if the user does not have permission to modify this field.
hoHideOnNoDisplayAccess	Do not generate a control if the user does not have permission to view this field.
hoHideOnFieldNotVisable	Do not generate a control if the field is marked as hidden.
hoHideAlways	Never generate a control for the field.

62.4.5 WebForm.TDisplayFieldHTMLElementType Enumeration

TDisplayFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.

Pascal

```
TDisplayFieldHTMLElementType = (
  dftDefault,
  dftText,
  dftImage,
  dftList
);
```

C++

```
enum TDisplayFieldHTMLElementType {
  dftDefault,
  dftText,
  dftImage,
  dftList
};
```

File

WebForm

Description

Each element type indicates a different HTML element. TDisplayFieldHTMLElementType defines read-only HTML elements.

The following table lists the possible values:

Value	Meaning
dftDefault	Use the default display type of the component that generates the HTML control
dftText	Display as a text string.
dftImage	Display as an image.
dftList	Display as a list of values.

62.4.6 WebForm.TDisplayFieldViewMode Enumeration

TDisplayFieldViewMode indicates the mode in which an adapter field's value is displayed.

Pascal

```
TDisplayFieldViewMode = (
  vmDefault,
  vmInput,
  vmDisplay,
  vmToggleOnAccess
);
```

C++

```
enum TDisplayFieldViewMode {
  vmDefault,
  vmInput,
  vmDisplay,
  vmToggleOnAccess
};
```

File

WebForm

Description

The following table lists the possible values for the TDisplayFieldViewMode type and the meaning corresponding to each:

Value	Meaning
vmDefault	Use the default mode associated with the adapter.
vmInput	Generate an input control for the field.
vmDisplay	Generate a read-only control for the field.
vmToggleOnAccess	Generate a control that toggles between read-only and input mode when the user tries to access it.

62.4.7 WebForm.TInputFieldHTMLElementType Enumeration

TInputFieldHTMLElementType identifies an HTML type that can be used to display the value(s) associated with an adapter field.

Pascal

```
TInputFieldHTMLElementType = (
  iftDefault,
  iftTextInput,
  iftPasswordInput,
  iftSelect,
  iftSelectMultiple,
  iftRadio,
  iftCheckBox,
  iftTextArea,
  iftFile
);
```

C++

```
enum TInputFieldHTMLElementType {
  iftDefault,
  iftTextInput,
  iftPasswordInput,
  iftSelect,
  iftSelectMultiple,
  iftRadio,
  iftCheckBox,
  iftTextArea,
```

```
  iftFile
};
```

File

WebForm

Description

TInputFieldHTMLElementType defines the set of possible HTML controls that can be used to input an adapter field value. The following table lists the possible values for the TInputFieldHTMLElementType type and the meaning corresponding to each flag:

Flag	Input (see page 3827) field type
iftCheckBox	The input field is a check box.
iftDefault	The input field is the default type.
iftFile	The input field is a file.
iftPasswordInput	The input field is a password prompt.
iftRadio	The input field is a radio button.
iftSelect	The input field is selectable. iftSelect is only used with iftCheckBox and iftRadio.
iftSelectMultiple	More than one input field may be selected at a time. iftSelectMultiple is only used with iftCheckBox and iftRadio.
iftTextArea	The field is a text area.
iftTextInput	The input field is a text input box.

62.4.8 WebForm.TLayoutState Enumeration

Pascal

```
TLayoutState = (
  lsUnknown,
  lsFields,
  lsButtons
);
```

C++

```
enum TLayoutState {
  lsUnknown,
  lsFields,
  lsButtons
};
```

File

WebForm

Description

This is record WebForm.TLayoutState.

62.5 Types

The following table lists types in this documentation.

Types

Name	Description
TActionButtonHideOptions (see page 6528)	This is type WebForm.TActionButtonHideOptions.
TAdapterDataDisplayClass (see page 6528)	This is type WebForm.TAdapterDataDisplayClass.
TDisplayFieldHideOptions (see page 6528)	This is type WebForm.TDisplayFieldHideOptions.

62.5.1 WebForm.TActionButtonHideOptions Type

Pascal

```
TActionButtonHideOptions = set of TActionButtonHideOption;
```

C++

```
TActionButtonHideOption TActionButtonHideOptions;
```

File

WebForm

Description

This is type WebForm.TActionButtonHideOptions.

62.5.2 WebForm.TAdapterDataDisplayClass Type

Pascal

```
TAdapterDataDisplayClass = class of TAdapterDataDisplay;
```

C++

```
TAdapterDataDisplay TAdapterDataDisplayClass;
```

File

WebForm

Description

This is type WebForm.TAdapterDataDisplayClass.

62.5.3 WebForm.TDisplayFieldHideOptions Type

Pascal

```
TDisplayFieldHideOptions = set of TDisplayFieldHideOption;
```

C++

```
TDisplayFieldHideOption TDisplayFieldHideOptions;
```

File

WebForm

Description

This is type WebForm.TDisplayFieldHideOptions.

62.6 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sDisplayText (see page 6530)	This is constant WebForm.sDisplayText.
sFieldText (see page 6530)	This is constant WebForm.sFieldText.
sFormGet (see page 6531)	This is constant WebForm.sFormGet.
sFormPost (see page 6531)	This is constant WebForm.sFormPost.
sMultipartForm (see page 6531)	This is constant WebForm.sMultipartForm.

62.6.1 WebForm.sDisplayText Constant

Pascal

```
sDisplayText = '<%%= %0:s.DisplayText %%>';
```

C++

```
sDisplayText = '<%%= %0:s.DisplayText %%>';
```

File

WebForm

Description

This is constant WebForm.sDisplayText.

62.6.2 WebForm.sFieldText Constant

Pascal

```
sFieldText = '<%%= %0:s.EditText %%>';
```

C++

```
sFieldText = '<%%= %0:s.EditText %%>';
```

File

WebForm

Description

This is constant WebForm.sFieldText.

62.6.3 WebForm.sFormGet Constant

Pascal

```
sFormGet = 'get';
```

C++

```
sFormGet = 'get';
```

File

WebForm

Description

This is constant WebForm.sFormGet.

62.6.4 WebForm.sFormPost Constant

Pascal

```
sFormPost = 'post';
```

C++

```
sFormPost = 'post';
```

File

WebForm

Description

This is constant WebForm.sFormPost.

62.6.5 WebForm.sMultipartForm Constant

Pascal

```
sMultipartForm = 'multipart/form-data';
```

C++

```
sMultipartForm = 'multipart/form-data';
```

File

WebForm

Description

This is constant WebForm.sMultipartForm.

63 WebModu Namespace

This is namespace WebModu.

Topics

Name	Description
Classes (see page 6535)	The following table lists classes in this documentation.
Functions (see page 6612)	The following table lists functions in this documentation.
Types (see page 6614)	The following table lists types in this documentation.

Classes

	Name	Description
	EWebModuleException (see page 6535)	EWebModuleException is the exception that is raised when a WebSnap application tries to use a Web module to perform a task it does not support.
	TAdapterActionName (see page 6536)	TAdapterActionName describes an adapter action by name.
	TCustomWebAppDataModule (see page 6539)	TCustomWebAppDataModule is the base class from which to derive new WebSnap application data modules.
	TCustomWebAppPageModule (see page 6544)	TCustomWebAppPageModule is the base class for WebSnap application data modules that can produce Web pages.
	TCustomWebDataModule (see page 6550)	TCustomWebDataModule is the base class for all Web modules in a WebSnap application.
	TCustomWebPageModule (see page 6556)	TCustomWebPageModule is the base class for WebSnap modules that generate a Web page.
	TSiteModuleHelper (see page 6565)	TSiteModuleHelper manages common tasks for Web modules in a WebSnap application.
	TSitePageModuleHelper (see page 6574)	TSitePageModuleHelper manages common tasks for Web page modules in a WebSnap application.
	TWebAppDataModule (see page 6585)	TWebAppDataModule is used as the WebSnap application module when there is no need to generate a page.
	TWebAppPageModule (see page 6588)	TWebAppPageModule is used as the WebSnap application module when the application module generates a page.
	TWebAppPageModuleHelper (see page 6594)	This is class WebModu.TWebAppPageModuleHelper.
	TWebDataModule (see page 6597)	TWebDataModule is a container for components in a WebSnap application.
	TWebNotifyContainer (see page 6599)	This is class WebModu.TWebNotifyContainer.
	TWebPageModule (see page 6603)	TWebPageModule is a WebSnap module that generates a page.
	TWebPageModuleHelper (see page 6609)	This is class WebModu.TWebPageModuleHelper.

Functions

	Name	Description
	FindNamedModuleVariable (see page 6612)	This is function WebModu.FindNamedModuleVariable.
	GetModuleVariable (see page 6612)	This is function WebModu.GetModuleVariable.
	GetModuleVariableCount (see page 6612)	This is function WebModu.GetModuleVariableCount.

Types

Name	Description
TGetParamsEvent (see page 6614)	This is type WebModu.TGetParamsEvent.

63.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EWebModuleException (see page 6535)	EWebModuleException is the exception that is raised when a WebSnap application tries to use a Web module to perform a task it does not support.
	TAdapterActionName (see page 6536)	TAdapterActionName describes an adapter action by name.
	TCustomWebAppDataModule (see page 6539)	TCustomWebAppDataModule is the base class from which to derive new WebSnap application data modules.
	TCustomWebAppPageModule (see page 6544)	TCustomWebAppPageModule is the base class for WebSnap application data modules that can produce Web pages.
	TCustomWebDataModule (see page 6550)	TCustomWebDataModule is the base class for all Web modules in a WebSnap application.
	TCustomWebPageModule (see page 6556)	TCustomWebPageModule is the base class for WebSnap modules that generate a Web page.
	TSiteModuleHelper (see page 6565)	TSiteModuleHelper manages common tasks for Web modules in a WebSnap application.
	TSitePageModuleHelper (see page 6574)	TSitePageModuleHelper manages common tasks for Web page modules in a WebSnap application.
	TWebAppDataModule (see page 6585)	TWebAppDataModule is used as the WebSnap application module when there is no need to generate a page.
	TWebAppPageModule (see page 6588)	TWebAppPageModule is used as the WebSnap application module when the application module generates a page.
	TWebAppPageModuleHelper (see page 6594)	This is class WebModu.TWebAppPageModuleHelper.
	TWebDataModule (see page 6597)	TWebDataModule is a container for components in a WebSnap application.
	TWebNotifyContainer (see page 6599)	This is class WebModu.TWebNotifyContainer.
	TWebPageModule (see page 6603)	TWebPageModule is a WebSnap module that generates a page.
	TWebPageModuleHelper (see page 6609)	This is class WebModu.TWebPageModuleHelper.

63.1.1 EWebModuleException Class

EWebModuleException is the exception that is raised when a WebSnap application tries to use a Web module to perform a task it does not support.

Class Hierarchy

Pascal

```
EWebModuleException = class(EWebBrokerException);
```

C++

```
class EWebModuleException : public EWebBrokerException;
```

File

WebModu

Description

EWebModuleException is the exception that is raised when a server-side script in a WebSnap application tries to do direct a Web module to perform a task it does not know how to handle. For example, Web modules raise this exception when a script

tries to access a variable in a Web module that does not support the use of variables.

See Also

TWebDataModule (see page 6597)

TWebAppDataModule (see page 6585)

TWebPageModule (see page 6603)

TWebAppPageModule (see page 6588)

63.1.2 TAdapterActionName Class

TAdapterActionName describes an adapter action by name.

Class Hierarchy

Pascal

```
TAdapterActionName = class(TPersistent);
```

C++

```
class TAdapterActionName : public TPersistent;
```

File

WebModu

Description

TAdapterAction represents a TAdapterAction object. It is used when the action is referenced by name rather than directly as a component. TAdapterAction publishes properties that specify the name of the action and the parent adapter component to which it belongs. The read-only Action (see page 6538) property provides access to the action component with the specified name that belongs to the specified adapter.

See Also

TAdapter (see page 5190)

TAdapterAction (see page 5201)

63.1.2.1 TAdapterActionName Members

The following tables list the members exposed by TAdapterActionName.

Protected Methods

	Name	Description
	AssignTo (see page 6537)	Copies the properties of an object to a destination object.

Public Properties

	Name	Description
	Action (see page 6538)	Indicates the action that this object specifies.

Published Methods

	Name	Description
	Create (see page 6537)	Creates and initializes an instance of TAdapterActionName (see page 6536).

Published Properties

	Name	Description
	ActionName (see page 6539)	Specifies the name of the action this object represents.
	Adapter (see page 6539)	Specifies the adapter to which the action belongs.

63.1.2.2 TAdapterActionName.Create Constructor

Creates and initializes an instance of TAdapterActionName (see page 6536).

Pascal

```
constructor Create(AModule: TComponent);
```

C++

```
__fastcall TAdapterActionName(TComponent * AModule);
```

Description

Call Create to instantiate TAdapterActionName (see page 6536).

AModule is the Web module instance that should be notified if the adapter specified by the Adapter (see page 6539) property is deleted. The TAdapterActionName (see page 6536) constructor calls this Adapter (see page 6539)'s FreeNotification method so that the adapter will notify the Web module if it (and its actions) are freed.

See Also

FreeNotification

Adapter (see page 6539)

63.1.2.3 TAdapterActionName Methods

The methods of the TAdapterActionName class are listed here.

Protected Methods

	Name	Description
	AssignTo (see page 6537)	Copies the properties of an object to a destination object.

63.1.2.3.1 TAdapterActionName.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should

be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError (see page 3919)

63.1.2.4 TAdapterActionName Properties

The properties of the TAdapterActionName class are listed here.

Public Properties

	Name	Description
	Action (see page 6538)	Indicates the action that this object specifies.

Published Properties

	Name	Description
	ActionName (see page 6539)	Specifies the name of the action this object represents.
	Adapter (see page 6539)	Specifies the adapter to which the action belongs.

63.1.2.4.1 TAdapterActionName.Action Property

Indicates the action that this object specifies.

Pascal

```
property Action: TComponent;
```

C++

```
__property TComponent * Action;
```

Description

Read (see page 3634) Action to access the adapter action component specified by the Adapter (see page 6539) and ActionName (see page 6539) properties. That is, Action is the action with the name specified by ActionName (see page 6539) that belongs to the adapter specified by Adapter (see page 6539).

See Also

ActionName (see page 6539)

Adapter (see page 6539)

TAdapterAction (see page 5201)

63.1.2.4.2 TAdapterActionName.ActionName Property

Specifies the name of the action this object represents.

Pascal

```
property ActionName: string;
```

C++

```
__property UnicodeString ActionName;
```

Description

Set ActionName to the name of the desired action. This is the name of one of the actions that belongs to the adapter that the Adapter (see page 6539) property specifies.

See Also

Action (see page 6538)

Adapter (see page 6539)

Actions (see page 5572)

63.1.2.4.3 TAdapterActionName.Adapter Property

Specifies the adapter to which the action belongs.

Pascal

```
property Adapter: TComponent;
```

C++

```
__property TComponent * Adapter;
```

Description

Set Adapter to the adapter component to which the named action belongs. The TAdapterActionName (see page 6536) object represents the action that this adapter returns when you call its FindAction method, passing in the value of the ActionName (see page 6539) property.

See Also

Action (see page 6538)

ActionName (see page 6539)

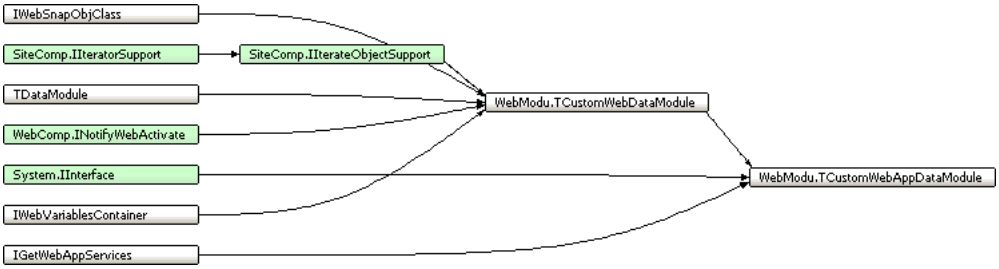
Actions (see page 5572)

FindAction (see page 5543)

63.1.3 TCustomWebAppDataModule Class

TCustomWebAppDataModule is the base class from which to derive new WebSnap application data modules.

Class Hierarchy



Pascal

```
TCustomWebAppDataModule = class(TCustomWebDataModule, IGetWebAppServices, IInterface);
```

C++

```
class TCustomWebAppDataModule : public TCustomWebDataModule, public IGetWebAppServices, public
IInterface;
```

File

WebModu

Description

Use TCustomWebAppDataModule as a base class for defining data modules that function as the main Web module in a WebSnap application. As the application module, TCustomWebAppDataModule provides access to the IWebAppServices interface that allows the WebSnap application to create a Web context for incoming requests and to forward requests to a dispatcher for handling.

If you want an application module that also has an associated HTML page, then derive from TCustomWebAppPageModule (see page 6544) instead.

See Also

TWebAppDataModule (see page 6585)

63.1.3.1 TCustomWebAppDataModule Members

The following tables list the members exposed by TCustomWebAppDataModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6553)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetWebAppServices (see page 6542)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
	GetWebSnapObjClass (see page 6553)	Returns the class type for this adapter field.
	Notification (see page 6543)	Responds to notifications that components are about to be inserted or removed.
	QueryInterface (see page 6543)	Returns a reference to a specified interface if the module supports that interface.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6555)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.

Public Events

	Name	Description
	OnActivate (see page 6556)	Occurs when the Web module is activated.
	OnDeactivate (see page 6556)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	Create (see page 6541)	Creates a new TCustomWebAppDataModule (see page 6539) instance.
V	CreateNew (see page 6541)	Creates a data module without using the associated form file to initialize it.
V	Destroy (see page 6542)	Frees a Web application data module instance.
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

Public Properties

	Name	Description
	AppServices (see page 6544)	Provides read and write access to the application services stored in this TCustomWebAppDataModule (see page 6539) object.
R	Request (see page 6554)	Provides access to the current request object.
R	Response (see page 6554)	Provides access to the current response object.
R	Session (see page 6555)	Provides access to the current Web session.

63.1.3.2 TCustomWebAppDataModule.Create Constructor

Creates a new TCustomWebAppDataModule (see page 6539) instance.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebAppDataModule(TComponent * AOwner);
```

Description

Use this constructor to create a new TCustomWebAppDataModule (see page 6539). WebSnap modules are registered with a factory that is responsible for creating modules as needed. The module's source unit defines a function that returns an instance of the module.

AOwner is the component that becomes the value of the Owner property.

63.1.3.3 TCustomWebAppDataModule.CreateNew Constructor

Creates a data module without using the associated form file to initialize it.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); override;
```

C++

```
virtual __fastcall TCustomWebAppDataModule(TComponent * AOwner, int Dummy = 0);
```

Description

Use CreateNew instead of Create (see page 6541) to create a data module without using the associated form file to initialize it.

AOwner is the component that becomes the value of the Owner property.

Dummy is not used.

63.1.3.4 TCustomWebAppDataModule.Destroy Destructor

Frees a Web application data module instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebAppDataModule();
```

Description

```
destructor Destroy; override;
```

Destroy is the destructor for the object instance. It clears the AppServices (see page 6544) property and calls the inherited destructor. The AppServices (see page 6544) interface is cleared to prevent design time problems that could otherwise occur because the object that implements AppServices (see page 6544) may also be owned by a Web page module.

63.1.3.5 TCustomWebAppDataModule Methods

The methods of the TCustomWebAppDataModule class are listed here.

Protected Methods

	Name	Description
	GetWebAppServices (see page 6542)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
V	Notification (see page 6543)	Responds to notifications that components are about to be inserted or removed.
V	QueryInterface (see page 6543)	Returns a reference to a specified interface if the module supports that interface.

63.1.3.5.1 TCustomWebAppDataModule.GetWebAppServices Method

Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.

Pascal

```
function GetWebAppServices: IWebAppServices;
```

C++

```
__fastcall IWebAppServices GetWebAppServices();
```

Description

GetWebAppServices returns the IWebAppServices interface that is stored in this TCustomWebDataModule (see page 6550). This is the same as the value of the AppServices (see page 6544) property.

See Also

AppServices (see page 6544)

63.1.3.5.2 TCustomWebAppDataModule.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TCustomWebAppDataModule (see page 6539) uses this method to check whether the component that implements AppServices (see page 6544) is about to be removed, and if so, sets the value of the AppServices (see page 6544) property to nil (Delphi) or NULL (C++).

See Also

AppServices (see page 6544)

63.1.3.5.3 TCustomWebAppDataModule.QueryInterface Method

Returns a reference to a specified interface if the module supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the Web application module supports the interface specified by IID. If so, QueryInterface

increments the reference count.

sets the Obj parameter so that it points to an instance of the specified interface.

returns 0 to indicate success.

If the Web application module does not support the interface, QueryInterface returns a nonzero error code such as E_NoInterface.

See Also

_AddRef (see page 3503)

63.1.3.6 TCustomWebAppDataModule Properties

The properties of the TCustomWebAppDataModule class are listed here.

Public Properties

	Name	Description
	AppServices (see page 6544)	Provides read and write access to the application services stored in this TCustomWebAppDataModule (see page 6539) object.

63.1.3.6.1 TCustomWebAppDataModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppDataModule (see page 6539) object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents (see page 6243) object.

See Also

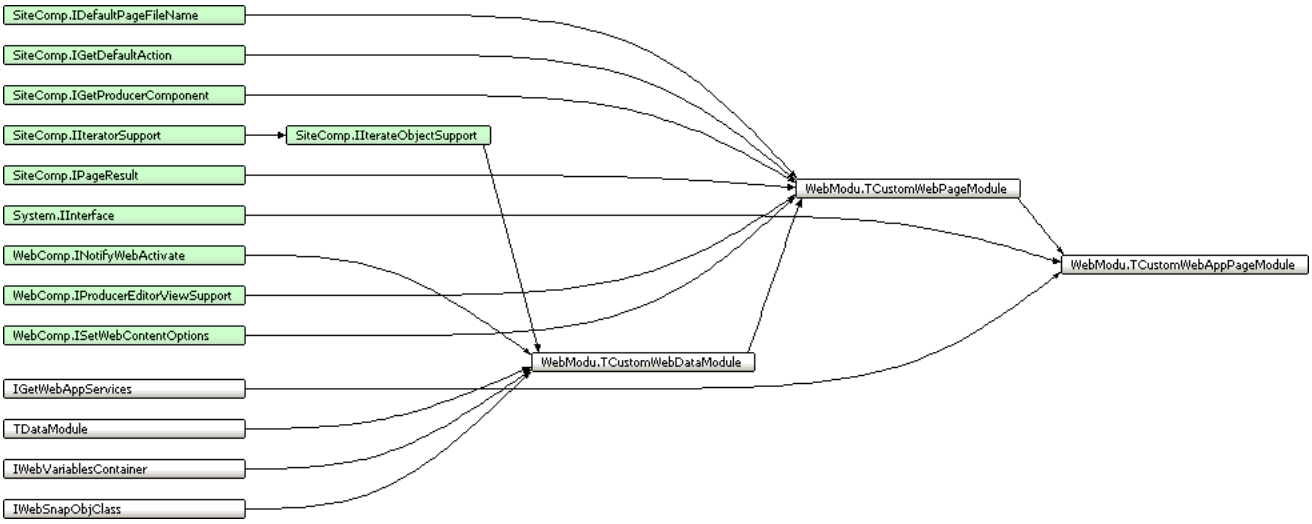
TWebAppComponents (see page 6243)

WebContext (see page 6003)

63.1.4 TCustomWebAppPageModule Class

TCustomWebAppPageModule is the base class for WebSnap application data modules that can produce Web pages.

Class Hierarchy



Pascal

```
TCustomWebAppPageModule = class(TCustomWebPageModule, IGetWebAppServices, IInterface);
```

C++

```
class TCustomWebAppPageModule : public TCustomWebPageModule, public IGetWebAppServices, public
IInterface;
```

File

WebModu

Description

Use TCustomWebAppPageModule as a base class for defining data modules that function as the main Web module in a WebSnap application and that have an associated Web page. As the application module, TCustomWebAppPageModule provides access to the IWebAppServices interface that allows the WebSnap application to create a Web context for incoming requests and to forward requests to a dispatcher for handling. As a Web page module, TCustomWebAppPageModule generates an associated Web page. This Web page is returned by default when incoming request messages do not specify what Web page they want.

See Also

IWebAppServices

TWebAppPageModule (see page 6588)

WebContext (see page 6003)

63.1.4.1 TCustomWebAppPageModule Members

The following tables list the members exposed by TCustomWebAppPageModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6553)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetSiteModuleHelper (see page 6560)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetSitePageModuleHelper (see page 6561)	Returns the value of the SitePageModuleHelper (see page 6562) property.
	GetWebAppServices (see page 6548)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
	GetWebSnapObjClass (see page 6553)	Returns the class type for this adapter field.
	Notification (see page 6548)	Responds to notifications that components are about to be inserted or removed.
	QueryInterface (see page 6548)	Returns a reference to a specified interface if the module supports that interface.
	SetAppServices (see page 6549)	Sets the value of the AppServices (see page 6549) property.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6555)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.
	SitePageModuleHelper (see page 6562)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnActivate (see page 6556)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6563)	Occurs after the page module generates its Web page.
	OnAfterRedirectToPage (see page 6563)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6564)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnBeforeRedirectToPage (see page 6564)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 6556)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	Create (see page 6546)	Creates and initializes an instance of TCustomWebAppPageModule (see page 6544).
V	CreateNew (see page 6547)	Creates and initializes an instance of TCustomWebAppPageModule (see page 6544) without using an associated form file.
V	Destroy (see page 6547)	Frees an instance of TCustomWebAppPageModule (see page 6544).
	DispatchPage (see page 1065)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultAction (see page 1028)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetProducerComponent (see page 1035)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 6090)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 6090)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 6090)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 6091)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 6091)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 6091)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 6091)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 1065)	This is IncludePage, a member of class IPageResult.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RedirectToPage (see page 1066)	This is RedirectToPage, a member of class IPageResult.
	SetDefaultPageFileName (see page 1015)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetWebContentOptions (see page 6092)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

Public Properties

	Name	Description
	AppServices (see page 6549)	Provides read and write access to the application services stored in this TCustomWebAppPageModule (see page 6544) object.
R	DefaultAction (see page 1028)	This is DefaultAction, a member of class IGetDefaultAction.
	DefaultAction (see page 6561)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6562)	Indicates the interface of the page producer that generates the content of the Web page.
R	Request (see page 6554)	Provides access to the current request object.
R	Response (see page 6554)	Provides access to the current response object.
R	Session (see page 6555)	Provides access to the current Web session.

63.1.4.2 TCustomWebAppPageModule.Create Constructor

Creates and initializes an instance of TCustomWebAppPageModule (see page 6544).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebAppPageModule(TComponent * AOwner);
```

Description

Do not call the TCustomWebAppPageModule (see page 6544) constructor. Instead, use a TWebAppPageModuleFactory

object to create Web module instances.

AOwner is the component that becomes the value of the Owner property.

See Also

TWebAppPageModuleFactory (see page 6297)

Owner

63.1.4.3 TCustomWebAppPageModule.CreateNew Constructor

Creates and initializes an instance of TCustomWebAppPageModule (see page 6544) without using an associated form file.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); override;
```

C++

```
virtual __fastcall TCustomWebAppPageModule(TComponent * AOwner, int Dummy = 0);
```

Description

Use CreateNew instead of Create (see page 6546) to create a data module without using the associated form file to initialize it.

AOwner is the component that becomes the value of the Owner property.

Dummy is not used.

See Also

TWebAppPageModuleFactory (see page 6297)

Owner

63.1.4.4 TCustomWebAppPageModule.Destroy Destructor

Frees an instance of TCustomWebAppPageModule (see page 6544).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebAppPageModule();
```

Description

Destroy is the destructor for the object instance. It clears the AppServices (see page 6549) property and calls the inherited destructor. The AppServices (see page 6549) interface is cleared to prevent design time problems that could otherwise occur because the object that implements AppServices (see page 6549) may also be owned by a Web page module.

See Also

AppServices (see page 6549)

System::TObject::Free (see page 3372)

63.1.4.5 TCustomWebAppPageModule Methods

The methods of the TCustomWebAppPageModule class are listed here.

Protected Methods

	Name	Description
	GetWebAppServices (see page 6548)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
V	Notification (see page 6548)	Responds to notifications that components are about to be inserted or removed.
V	QueryInterface (see page 6548)	Returns a reference to a specified interface if the module supports that interface.
	SetAppServices (see page 6549)	Sets the value of the AppServices (see page 6549) property.

63.1.4.5.1 TCustomWebAppPageModule.GetWebAppServices Method

Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.

Pascal

```
function GetWebAppServices: IWebAppServices;
```

C++

```
__fastcall IWebAppServices GetWebAppServices();
```

Description

GetWebAppServices returns the IWebAppServices interface that is stored in this Web application module. This is the same as the value of the AppServices (see page 6549) property.

See Also

AppServices (see page 6549)

63.1.4.5.2 TCustomWebAppPageModule.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TCustomWebAppPageModule (see page 6544) uses this method to check whether the component that implements AppServices (see page 6549) is about to be removed, and if so, sets the value of the AppServices (see page 6549) property to nil (Delphi) or NULL (C++).

See Also

AppServices (see page 6549)

63.1.4.5.3 TCustomWebAppPageModule.QueryInterface Method

Returns a reference to a specified interface if the module supports that interface.

Pascal

```
function QueryInterface(const IID: TGUID; out Obj): HResult; override;
```

C++

```
virtual __fastcall HRESULT QueryInterface(const TGUID IID,  Obj);
```

Description

QueryInterface checks whether the Web application module supports the interface specified by IID. If so, QueryInterface

increments the reference count.

sets the Obj parameter so that it points to an instance of the specified interface.

returns 0 to indicate success.

If the Web application module does not support the interface, QueryInterface returns a nonzero error code such as E_NoInterface.

See Also

_AddRef (see page 3503)

63.1.4.5.4 TCustomWebAppPageModule.SetAppServices Method

Sets the value of the AppServices (see page 6549) property.

Pascal

```
procedure SetAppServices(const Value: IWebAppServices);
```

C++

```
__fastcall SetAppServices(const IWebAppServices Value);
```

Description

SetAppServices is the protected write implemenation of the AppServices (see page 6549) property.

See Also

AppServices (see page 6549)

63.1.4.6 TCustomWebAppPageModule Properties

The properties of the TCustomWebAppPageModule class are listed here.

Public Properties

	Name	Description
	AppServices (see page 6549)	Provides read and write access to the application services stored in this TCustomWebAppPageModule (see page 6544) object.

63.1.4.6.1 TCustomWebAppPageModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppPageModule (see page 6544) object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents (see page 6243) object.

See Also

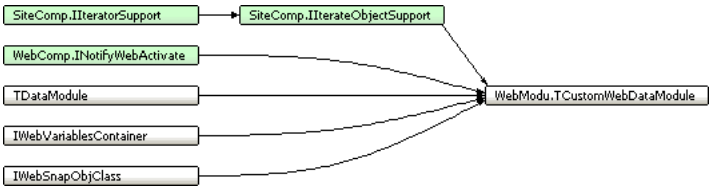
TWebAppComponents (see page 6243)

WebContext (see page 6003)

63.1.5 TCustomWebDataModule Class

TCustomWebDataModule is the base class for all Web modules in a WebSnap application.

Class Hierarchy



Pascal

```
TCustomWebDataModule = class(TDataModule, IWebVariablesContainer, INotifyWebActivate,
IIterateObjectSupport, IWebSnapObjClass);
```

C++

```
class TCustomWebDataModule : public TDataModule, public IWebVariablesContainer, public
INotifyWebActivate, public IIterateObjectSupport, public IWebSnapObjClass;
```

File

WebModu

Description

TCustomWebDataModule is the common base class for Web modules that can be used in a WebSnap application. This class introduces properties for the current HTTP request and response objects, a property to hold the current session object, and events that let you respond when the Web module is activated and deactivated. It also introduces support for interacting with server-side script and managing the WebSnap components that are placed into the Web module.

Do not create instances of TCustomWebDataModule. It is intended only as a base class. Instead, use the Web module wizard or the WebSnap application wizard to add a TCustomWebDataModule descendant to your WebSnap application. Descendant classes include TWebAppDataModule (see page 6585), TWebAppPageModule (see page 6588), TWebPageModule (see page 6603), and TWebDataModule (see page 6597).

See Also

TWebAppDataModule (see page 6585)

TWebAppPageModule (see page 6588)

TWebPageModule (see page 6603)

TWebDataModule (see page 6597)

63.1.5.1 TCustomWebDataModule Members

The following tables list the members exposed by TCustomWebDataModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6553)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetWebSnapObjClass (see page 6553)	Returns the class type for this adapter field.
	Notification (see page 6553)	Responds to notifications that components are about to be inserted or removed.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6555)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.

Public Events

	Name	Description
	OnActivate (see page 6556)	Occurs when the Web module is activated.
	OnDeactivate (see page 6556)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	Create (see page 6551)	Creates and initializes an instance of TCustomWebDataModule (see page 6550).
	CreateNew (see page 6552)	Creates and initializes an instance of TCustomWebDataModule (see page 6550) without using an associated form file.
	Destroy (see page 6552)	Frees an instance of TCustomWebDataModule (see page 6550).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

Public Properties

	Name	Description
	Request (see page 6554)	Provides access to the current request object.
	Response (see page 6554)	Provides access to the current response object.
	Session (see page 6555)	Provides access to the current Web session.

63.1.5.2 TCustomWebDataModule.Create Constructor

Creates and initializes an instance of TCustomWebDataModule (see page 6550).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebDataModule(TComponent * AOwner);
```

Description

Do not call the TCustomWebDataModule (see page 6550) constructor. Instead, use a Web module factory object to create Web module instances.

AOwner is the component that becomes the value of the Owner property.

See Also

TWebAppPageModuleFactory (see page 6297)

TWebAppDataModuleFactory (see page 6295)

TWebDataModuleFactory (see page 6299)

TWebPageModuleFactory (see page 6303)

Owner

63.1.5.3 TCustomWebDataModule.CreateNew Constructor

Creates and initializes an instance of TCustomWebDataModule (see page 6550) without using an associated form file.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); override;
```

C++

```
virtual __fastcall TCustomWebDataModule(TComponent * AOwner, int Dummy = 0);
```

Description

Use CreateNew instead of Create (see page 6551) to create a Web module without using the associated form file to initialize it.

AOwner is the component that becomes the value of the Owner property.

Dummy is not used.

See Also

TWebAppPageModuleFactory (see page 6297)

Owner

63.1.5.4 TCustomWebDataModule.Destroy Destructor

Frees an instance of TCustomWebDataModule (see page 6550).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebDataModule();
```

Description

Typically, WebSnap applications do not explicitly free Web module instances. Instead, the FinishContext method of the Web application services object frees or deactivates Web modules automatically when the application has finished processing an HTTP request.

See Also

FinishContext

System::TObject::Free (see page 3372)

63.1.5.5 TCustomWebDataModule Methods

The methods of the TCustomWebDataModule class are listed here.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6553)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetWebSnapObjClass (see page 6553)	Returns the class type for this adapter field.
	Notification (see page 6553)	Responds to notifications that components are about to be inserted or removed.

63.1.5.5.1 TCustomWebDataModule.GetSiteModuleHelper Method

Returns the value of the SiteModuleHelper (see page 6555) property.

Pascal

```
function GetSiteModuleHelper: TSiteModuleHelper; virtual;
```

C++

```
virtual __fastcall TSiteModuleHelper GetSiteModuleHelper();
```

Description

GetSiteModuleHelper is the protected read implementation of the SiteModuleHelper (see page 6555) property.

See Also

SiteModuleHelper (see page 6555)

63.1.5.5.2 TCustomWebDataModule.GetWebSnapObjClass Method

Returns the class type for this adapter field.

Pascal

```
function GetWebSnapObjClass: TObjectScripterClass; virtual;
```

C++

```
virtual __fastcall TObjectScripterClass GetWebSnapObjClass();
```

Description

This function returns the class type for this adapter field, which is used by the script engine to create a script object. GetWebSnapObjClass tells the script engine what type of object to create.

63.1.5.5.3 TCustomWebDataModule.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TCustomWebDataModule (

see page 6550) overrides this method to pass the notification on to the object that is the value of the SiteModuleHelper (see page 6555) property.

See Also

SiteModuleHelper (see page 6555)

63.1.5.6 TCustomWebDataModule Properties

The properties of the TCustomWebDataModule class are listed here.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6555)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.

Public Properties

	Name	Description
	Request (see page 6554)	Provides access to the current request object.
	Response (see page 6554)	Provides access to the current response object.
	Session (see page 6555)	Provides access to the current Web session.

63.1.5.6.1 TCustomWebDataModule.Request Property

Provides access to the current request object.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Read (see page 3634) Request to obtain information about the current HTTP request message. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 6554)

63.1.5.6.2 TCustomWebDataModule.Response Property

Provides access to the current response object.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Read (see page 3634) Response to obtain information about or add to the response message that the application builds as a reply to the message that the Request (see page 6554) property specifies. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 6554)

63.1.5.6.3 TCustomWebDataModule.Session Property

Provides access to the current Web session.

Pascal

```
property Session: TAbstractWebSession;
```

C++

```
__property TAbstractWebSession Session;
```

Description

Read (see page 3634) Session to obtain information from or add information to the current Web session. All requests are assigned a Web session, although you can only use the session to store information about the current user if the WebSnap application includes a TSessionsService component. Web sessions persist over multiple calls from the same end user until they are terminated (for example, when the user logs out or when a timeout period elapses).

See Also

TSessionsService (see page 6756)

63.1.5.6.4 TCustomWebDataModule.SiteModuleHelper Property

References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.

Pascal

```
property SiteModuleHelper: TSiteModuleHelper;
```

C++

```
__property TSiteModuleHelper SiteModuleHelper;
```

Description

Applications can't use the protected SiteModuleHelper property. TCustomWebDataModule (see page 6550) uses this property internally to delegate tasks involved in managing the WebSnap components it contains and to generate the OnActivate (see page 6556) and OnDeactivate (see page 6556) events when the Web module is activated and deactivated.

See Also

OnActivate (see page 6556)

OnDeactivate (see page 6556)

63.1.5.7 TCustomWebDataModule Events

The events of the TCustomWebDataModule class are listed here.

Public Events

	Name	Description
	OnActivate (see page 6556)	Occurs when the Web module is activated.
	OnDeactivate (see page 6556)	Occurs when the Web module is deactivated.

63.1.5.7.1 TCustomWebDataModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write (see page 3707) an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 6556)

CreateMode

63.1.5.7.2 TCustomWebDataModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write (see page 3707) an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

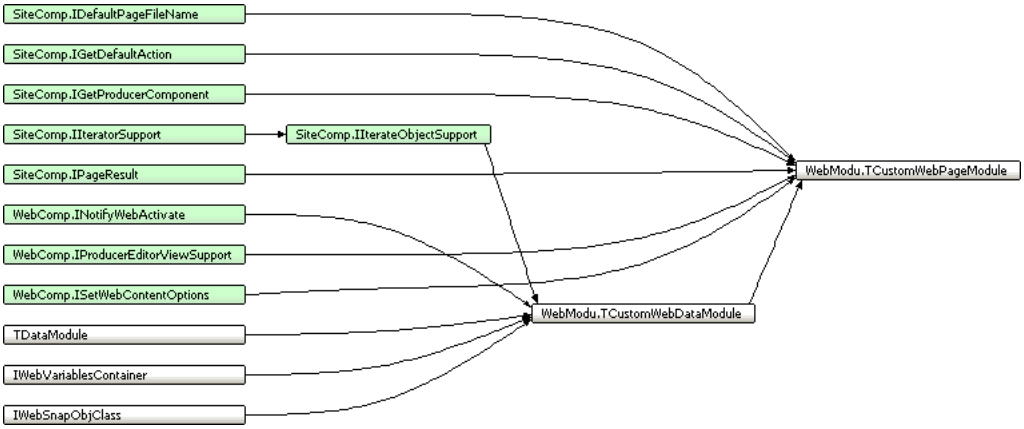
See Also

OnActivate (see page 6556)

63.1.6 TCustomWebPageModule Class

TCustomWebPageModule is the base class for WebSnap modules that generate a Web page.

Class Hierarchy



Pascal

```
TCustomWebPageModule = class(TCustomWebDataModule, IDefaultPageFileName, IPageResult,
ISetWebContentOptions, IGetDefaultAction, IGetProducerComponent, IProducerEditorViewSupport);
```

C++

```
class TCustomWebPageModule : public TCustomWebDataModule, public IDefaultPageFileName, public
IPageResult, public ISetWebContentOptions, public IGetDefaultAction, public
IGetProducerComponent, public IProducerEditorViewSupport;
```

File

WebModu

Description

TCustomWebPageModule is the common base class for Web modules that generate a Web page for a WebSnap application. This class introduces two new properties:

PageProducer (see page 6562), which is a page producer component that generates the Web page associated with this module.

DefaultAction (see page 6561), which is an adapter action associated with the module's Web page. Typically, the action sets up parameters that appear in HTTP requests for the Web page.

TCustomWebPageModule also introduces events that occur when the WebSnap application calls on the Web page module to generate its page or when it generates a redirect message to redirect a request to the associated page.

Do not create instances of TCustomWebPageModule. It is intended only as a base class. Instead, use the Web module wizard or the WebSnap application wizard to add a TCustomWebPageModule descendant to your WebSnap application. Descendant classes include TWebAppPageModule (see page 6588) and TWebPageModule (see page 6603).

See Also

TWebPageModule (see page 6603)

TWebAppPageModule (see page 6588)

63.1.6.1 TCustomWebPageModule Members

The following tables list the members exposed by TCustomWebPageModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6560)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetSitePageModuleHelper (see page 6561)	Returns the value of the SitePageModuleHelper (see page 6562) property.
	GetWebSnapObjClass (see page 6553)	Returns the class type for this adapter field.
	Notification (see page 6561)	Responds to notifications that components are about to be inserted or removed.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6555)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.
	SitePageModuleHelper (see page 6562)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnActivate (see page 6556)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6563)	Occurs after the page module generates its Web page.
	OnAfterRedirectToPage (see page 6563)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6564)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnBeforeRedirectToPage (see page 6564)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 6556)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	Create (see page 6559)	Creates and initializes an instance of TCustomWebPageModule (see page 6556).
	CreateNew (see page 6559)	Creates and initializes an instance of TCustomWebPageModule (see page 6556) without using an associated form file.
	Destroy (see page 6560)	Frees an instance of TCustomWebPageModule (see page 6556).
	DispatchPage (see page 1065)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultAction (see page 1028)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetProducerComponent (see page 1035)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 6090)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 6090)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 6090)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 6091)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 6091)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 6091)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 6091)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 1065)	This is IncludePage, a member of class IPageResult.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RedirectToPage (see page 1066)	This is RedirectToPage, a member of class IPageResult.
	SetDefaultPageFileName (see page 1015)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetWebContentOptions (see page 6092)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

Public Properties

	Name	Description
	DefaultAction (see page 6561)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6562)	Indicates the interface of the page producer that generates the content of the Web page.
R	Request (see page 6554)	Provides access to the current request object.
R	Response (see page 6554)	Provides access to the current response object.
R	Session (see page 6555)	Provides access to the current Web session.

63.1.6.2 TCustomWebPageModule.Create Constructor

Creates and initializes an instance of TCustomWebPageModule (see page 6556).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebPageModule(TComponent * AOwner);
```

Description

Do not call the TCustomWebPageModule (see page 6556) constructor. Instead, use a Web page module factory object to create Web page module instances.

AOwner is the component that becomes the value of the Owner property.

See Also

TWebAppPageModuleFactory (see page 6297)

TWebPageModuleFactory (see page 6303)

Owner

63.1.6.3 TCustomWebPageModule.CreateNew Constructor

Creates and initializes an instance of TCustomWebPageModule (see page 6556) without using an associated form file.

Pascal

```
constructor CreateNew(AOwner: TComponent; Dummy: Integer = 0); override;
```

C++

```
virtual __fastcall TCustomWebPageModule(TComponent * AOwner, int Dummy = 0);
```

Description

Use CreateNew instead of Create (see page 6559) to create a Web page module without using the associated form file to initialize it.

AOwner is the component that becomes the value of the Owner property.

Dummy is not used.

See Also

TWebAppPageModuleFactory (see page 6297)

Owner

63.1.6.4 TCustomWebPageModule.Destroy Destructor

Frees an instance of TCustomWebPageModule (see page 6556).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebPageModule();
```

Description

Typically, WebSnap applications do not explicitly free Web page module instances. Instead, the FinishContext method of the Web application services object frees or deactivates Web modules automatically when the application has finished processing an HTTP request.

See Also

FinishContext

System::TObject::Free (see page 3372)

63.1.6.5 TCustomWebPageModule Methods

The methods of the TCustomWebPageModule class are listed here.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6560)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetSitePageModuleHelper (see page 6561)	Returns the value of the SitePageModuleHelper (see page 6562) property.
	Notification (see page 6561)	Responds to notifications that components are about to be inserted or removed.

63.1.6.5.1 TCustomWebPageModule.GetSiteModuleHelper Method

Returns the value of the SiteModuleHelper (see page 6555) property.

Pascal

```
function GetSiteModuleHelper: TSiteModuleHelper; override;
```

C++

```
virtual __fastcall TSiteModuleHelper GetSiteModuleHelper();
```

Description

GetSiteModuleHelper is the protected read implementation of the SiteModuleHelper (see page 6555) property. TCustomWebPageModule (see page 6556) overrides the inherited method to return the value of the SitePageModuleHelper (see page 6562) property.

See Also

SiteModuleHelper (see page 6555)

SitePageModuleHelper (see page 6562)

63.1.6.5.2 TCustomWebPageModule.GetSitePageModuleHelper Method

Returns the value of the SitePageModuleHelper (see page 6562) property.

Pascal

```
function GetSitePageModuleHelper: TSitePageModuleHelper; virtual;
```

C++

```
virtual __fastcall TSitePageModuleHelper GetSitePageModuleHelper();
```

Description

GetSitePageModuleHelper is the protected read implementation of the SitePageModuleHelper (see page 6562) property.

See Also

SitePageModuleHelper (see page 6562)

63.1.6.5.3 TCustomWebPageModule.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TCustomWebPageModule (see page 6556) overrides this method to update the PageProducer (see page 6562) and DefaultAction (see page 6561) properties as appropriate.

See Also

PageProducer (see page 6562)

DefaultAction (see page 6561)

63.1.6.6 TCustomWebPageModule Properties

The properties of the TCustomWebPageModule class are listed here.

Protected Properties

	Name	Description
	SitePageModuleHelper (see page 6562)	References the helper object that assists in assembling the module's Web page.

Public Properties

	Name	Description
	DefaultAction (see page 6561)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6562)	Indicates the interface of the page producer that generates the content of the Web page.

63.1.6.6.1 TCustomWebPageModule.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TAdapterActionName;
```

C++

```
__property TAdapterActionName DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 6562)

63.1.6.6.2 TCustomWebPageModule.PageProducer Property

Indicates the interface of the page producer that generates the content of the Web page.

Pascal

```
property PageProducer: IProduceContent;
```

C++

```
__property IProduceContent PageProducer;
```

Description

PageProducer is the interface that supplies the content of the Web page this module creates. It is the interface of a page producer component that is included in the Web page module. If PageProducer is nil (Delphi) or NULL (C++), the Web page module can't produce a Web page.

See Also

TAdapterPageProducer (see page 1136)

TDataSetPageProducer

TXSLPageProducer (see page 7893)

TPageProducer

TDataSetTableProducer

TQueryTableProducer

TInetXPageProducer

63.1.6.6.3 TCustomWebPageModule.SitePageModuleHelper Property

References the helper object that assists in assembling the module's Web page.

Pascal

```
property SitePageModuleHelper: TSitePageModuleHelper;
```

C++

```
__property TSitePageModuleHelper SitePageModuleHelper;
```

Description

Applications can't use the protected SitePageModuleHelper property. TCustomWebPageModule (see page 6556) uses this property internally to delegate tasks involved in assembling the content of its Web page and in interacting with editor views at design time.

63.1.6.7 TCustomWebPageModule Events

The events of the TCustomWebPageModule class are listed here.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 6563)	Occurs after the page module generates its Web page.
	OnAfterRedirectToPage (see page 6563)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6564)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnBeforeRedirectToPage (see page 6564)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

63.1.6.7.1 TCustomWebPageModule.OnAfterDispatchPage Event

Occurs after the page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write (see page 3707) an OnAfterDispatchPage event handler to take any final action after the page producer in the Web page module has generated its Web page. For example, the OnAfterDispatchPage event handler can make adjustments to the headers of the response message.

When OnAfterDispatchPage occurs, the Web page module has already added the content to the response message, but has not yet sent the response. This event does not occur if the BeforeDispatchPage event handler handles the request, bypassing the automatic use of the module's page producer.

Note: If the Web page module does not include a page producer, the OnAfterDispatchPage event still occurs, but the response message has no content.

See Also

OnBeforeDispatchPage (see page 6564)

PageProducer (see page 6562)

Response (see page 6554)

63.1.6.7.2 TCustomWebPageModule.OnAfterRedirectToPage Event

Occurs after the Web page module assembles a response message that represents a redirection to its Web page.

Pascal

```
property OnAfterRedirectToPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterRedirectToPage;
```

Description

Write (see page 3707) an OnAfterRedirectToPage event handler to take any final action before returns a response message that redirects the user to this Web page. For example, the OnAfterRedirectToPage event handler can make adjustments to the headers of the response message.

This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost) to this page.

See Also

OnBeforeRedirectToPage (see page 6564)

OnAfterDispatchPage (see page 6563)

RedirectOptions (see page 5476)

Response (see page 6554)

63.1.6.7.3 TCustomWebPageModule.OnBeforeDispatchPage Event

Occurs before the Web module calls on the page producer to generate the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write (see page 3707) an OnBeforeDispatchPage event handler to process an HTTP request message before the Web page module performs the default processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the Web page module from fetching the template file for the page and calling on the page producer to generate the page content.

If the event handler does not handle the request (for example, if it is merely initializing values that the page producer uses), it can leave the Handled parameter as false and the Web page module will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, use the Request (see page 6554) and Response (see page 6554) properties.

See Also

OnAfterDispatchPage (see page 6563)

Request (see page 6554)

Response (see page 6554)

PageProducer (see page 6562)

63.1.6.7.4 TCustomWebPageModule.OnBeforeRedirectToPage Event

Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Pascal

```
property OnBeforeRedirectToPage: TDispatchPageParamsHandledEvent;
```

C++

```
__property TDispatchPageParamsHandledEvent OnBeforeRedirectToPage;
```

Description

Write (see page 3707) an OnBeforeRedirectToPage event handler to perform any tasks necessary for redirecting a request to the associated Web page. For example, the OnBeforeRedirectToPage event handler can add parameters to the Params parameter so that they appear in the request that results from the redirection. This event only occurs if an adapter in the WebSnap application executes an adapter action whose options include a redirection (roRedirectHTTPGet or roRedirectHTTPPost).

If the event handler sets Handled to true, the Web page module assumes it has handled the redirection and performs no further processing. Otherwise, after the event handler exits, the Web page module sets up the response message to encode the redirection parameters and calls SendRedirect.

See Also

OnAfterRedirectToPage (see page 6563)

OnBeforeDispatchPage (see page 6564)

SendRedirect

Request (see page 6554)

Response (see page 6554)

63.1.7 TSiteModuleHelper Class

TSiteModuleHelper manages common tasks for Web modules in a WebSnap application.

Class Hierarchy

Pascal

```
TSiteModuleHelper = class(TObject);
```

C++

```
class TSiteModuleHelper : public TObject;
```

File

WebModu

Description

Web modules create and use an instance of TSiteModuleHelper to keep track of WebSnap objects contained in the module and to generate OnActivate (see page 6573) and OnDeactivate (see page 6573) events when the Web module is activated and deactivated.

You should not need to work directly with TSiteModuleHelper instances. The Web module creates and uses this object.

See Also

TCustomWebDataModule (see page 6550)

63.1.7.1 TSiteModuleHelper Members

The following tables list the members exposed by TSiteModuleHelper.

Protected Methods

	Name	Description
	EndIterator (see page 6568)	This is EndIterator, a member of class TSiteModuleHelper.
	FindNamedVariable (see page 6568)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6569)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6569)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6569)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetVariable (see page 6569)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6569)	This is GetVariableCount, a member of class TSiteModuleHelper.
	NextIteration (see page 6570)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6570)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6570)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	StartIterator (see page 6571)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
	Module (see page 6571)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 6573)	Occurs when the Web module is activated.
	OnDeactivate (see page 6573)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6567)	Creates and initializes an instance of TSiteModuleHelper (see page 6565).
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 6567)	Frees an instance of TSiteModuleHelper (see page 6565).
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.

	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 6570)	Responds to notifications that components are about to be inserted or removed.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Request (see page 6571)	Provides access to the current request object.
R	Response (see page 6572)	Provides access to the current response object.
R	Session (see page 6572)	Provides access to the current Web session.
R	WebModuleContext (see page 6572)	Keeps track of name/value pairs that store information for the Web module.

63.1.7.2 TSiteModuleHelper.Create Constructor

Creates and initializes an instance of TSiteModuleHelper (see page 6565).

Pascal

```
constructor Create(AModule: TComponent); virtual;
```

C++

```
virtual __fastcall TSiteModuleHelper(TComponent * AModule);
```

Description

Web modules call the TSiteModuleHelper (see page 6565) constructor from their own constructors.

AModule is the Web module that is using the TSiteModuleHelper (see page 6565) object to keep track of its components and activation events. The TSiteModuleHelper (see page 6565) object becomes the value of the module's SiteModuleHelper property.

See Also

SiteModuleHelper (see page 6555)

63.1.7.3 TSiteModuleHelper.Destroy Destructor

Frees an instance of TSiteModuleHelper (see page 6565).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSiteModuleHelper();
```

Description

Do not free TSiteModuleHelper (see page 6565) instances. This object is freed by the Web module that uses it.

See Also

System::TObject::Free (see page 3372)

63.1.7.4 TSiteModuleHelper Methods

The methods of the TSiteModuleHelper class are listed here.

Protected Methods

	Name	Description
	EndIterator (see page 6568)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 6568)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6569)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6569)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6569)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetVariable (see page 6569)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6569)	This is GetVariableCount, a member of class TSiteModuleHelper.
	NextIteration (see page 6570)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6570)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6570)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	StartIterator (see page 6571)	This is StartIterator, a member of class TSiteModuleHelper.

Public Methods

	Name	Description
	Notification (see page 6570)	Responds to notifications that components are about to be inserted or removed.

63.1.7.4.1 TSiteModuleHelper.EndIterator Method

Pascal

```
procedure EndIterator(OwnerData: Pointer);
```

C++

```
__fastcall EndIterator(void * OwnerData);
```

Description

This is EndIterator, a member of class TSiteModuleHelper.

63.1.7.4.2 TSiteModuleHelper.FindNamedVariable Method

Pascal

```
function FindNamedVariable(const AName: string): TComponent; virtual;
```

C++

```
virtual __fastcall TComponent * FindNamedVariable(const UnicodeString AName);
```

Description

This is FindNamedVariable, a member of class TSiteModuleHelper.

63.1.7.4.3 TSiteModuleHelper.FindVariable Method

Pascal

```
function FindVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariable(const UnicodeString AName);
```

Description

This is FindVariable, a member of class TSiteModuleHelper.

63.1.7.4.4 TSiteModuleHelper.FindVariableContainer Method

Pascal

```
function FindVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindVariableContainer(const UnicodeString AName);
```

Description

This is FindVariableContainer, a member of class TSiteModuleHelper.

63.1.7.4.5 TSiteModuleHelper.GetCurrentObject Method

Pascal

```
function GetCurrentObject(OwnerData: Pointer): TObject;
```

C++

```
__fastcall TObject * GetCurrentObject(void * OwnerData);
```

Description

This is GetCurrentObject, a member of class TSiteModuleHelper.

63.1.7.4.6 TSiteModuleHelper.GetVariable Method

Pascal

```
function GetVariable(I: Integer): TComponent;
```

C++

```
__fastcall TComponent * GetVariable(int I);
```

Description

This is GetVariable, a member of class TSiteModuleHelper.

63.1.7.4.7 TSiteModuleHelper.GetVariableCount Method

Pascal

```
function GetVariableCount: Integer;
```

C++

```
__fastcall int GetVariableCount();
```

Description

This is GetVariableCount, a member of class TSiteModuleHelper.

63.1.7.4.8 TSiteModuleHelper.NextIteration Method

Pascal

```
function NextIteration(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean NextIteration(void * OwnerData);
```

Description

This is NextIteration, a member of class TSiteModuleHelper.

63.1.7.4.9 TSiteModuleHelper.Notification Method

Responds to notifications that components are about to be inserted or removed.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation);
```

C++

```
__fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Notification is called automatically when components are added to or removed from the application. TSiteModuleHelper (see page 6565) overrides this method to ensure that any WebSnap objects added to the associated module receive notifications when the module is activated or deactivated.

63.1.7.4.10 TSiteModuleHelper.NotifyActivate Method

Pascal

```
procedure NotifyActivate;
```

C++

```
__fastcall NotifyActivate();
```

Description

This is NotifyActivate, a member of class TSiteModuleHelper.

63.1.7.4.11 TSiteModuleHelper.NotifyDeactivate Method

Pascal

```
procedure NotifyDeactivate;
```

C++

```
__fastcall NotifyDeactivate();
```

Description

This is NotifyDeactivate, a member of class TSiteModuleHelper.

63.1.7.4.12 TSiteModuleHelper.StartIterator Method

Pascal

```
function StartIterator(var OwnerData: Pointer): Boolean;
```

C++

```
__fastcall Boolean StartIterator(void * OwnerData);
```

Description

This is StartIterator, a member of class TSiteModuleHelper.

63.1.7.5 TSiteModuleHelper Properties

The properties of the TSiteModuleHelper class are listed here.

Protected Properties

	Name	Description
	Module (see page 6571)	This is Module, a member of class TSiteModuleHelper.

Public Properties

	Name	Description
	Request (see page 6571)	Provides access to the current request object.
	Response (see page 6572)	Provides access to the current response object.
	Session (see page 6572)	Provides access to the current Web session.
	WebModuleContext (see page 6572)	Keeps track of name/value pairs that store information for the Web module.

63.1.7.5.1 TSiteModuleHelper.Module Property

Pascal

```
property Module: TComponent;
```

C++

```
__property TComponent * Module;
```

Description

This is Module, a member of class TSiteModuleHelper.

63.1.7.5.2 TSiteModuleHelper.Request Property

Provides access to the current request object.

Pascal

```
property Request: TWebRequest;
```

C++

```
__property TWebRequest Request;
```

Description

Read (see page 3634) Request to obtain information about the current HTTP request message. The request object provides access to the headers of the request message, as well as the content of the message.

See Also

Response (see page 6572)

63.1.7.5.3 TSiteModuleHelper.Response Property

Provides access to the current response object.

Pascal

```
property Response: TWebResponse;
```

C++

```
__property TWebResponse Response;
```

Description

Read (see page 3634) Response to obtain information about or add to the response message that the application builds as a reply to the message that the Request (see page 6571) property specifies. The response object provides access to the headers of the response message, as well as the content of the message.

See Also

Request (see page 6571)

63.1.7.5.4 TSiteModuleHelper.Session Property

Provides access to the current Web session.

Pascal

```
property Session: TAbstractWebSession;
```

C++

```
__property TAbstractWebSession Session;
```

Description

Read (see page 3634) Session to obtain information from or add information to the current Web session. All requests are assigned a Web session, although you can only use the session to store information about the current user if the WebSnap application includes a TSessionsService component. Web sessions persist over multiple calls from the same end user until they are terminated (for example, when the user logs out or when a time-out period elapses).

See Also

TSessionsService (see page 6756)

63.1.7.5.5 TSiteModuleHelper.WebModuleContext Property

Keeps track of name/value pairs that store information for the Web module.

Pascal

```
property WebModuleContext: TWebModuleContext;
```

C++

```
__property TWebModuleContext WebModuleContext;
```

Description

Use WebModuleContext to access the TWebModuleContext object. The TWebModuleContext object maintains a list of named variables that the components in the Web module can use.

See Also

WebModuleContext

63.1.7.6 TSiteModuleHelper Events

The events of the TSiteModuleHelper class are listed here.

Public Events

	Name	Description
	OnActivate (see page 6573)	Occurs when the Web module is activated.
	OnDeactivate (see page 6573)	Occurs when the Web module is deactivated.

63.1.7.6.1 TSiteModuleHelper.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

OnActivate uses the same event handler as that of the Web module's OnActivate event. The TSiteModuleHelper (see page 6565) object generates this event when the Web module is first activated.

See Also

OnDeactivate (see page 6573)

OnActivate (see page 6556)

63.1.7.6.2 TSiteModuleHelper.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

OnDeactivate uses the same event handler as that of the Web module's OnDeactivate event. The TSiteModuleHelper (see page 6565) object generates this event when the Web module is deactivated.

See Also

OnActivate (see page 6573)

OnDeactivate (see page 6556)

63.1.8 TSitePageModuleHelper Class

TSitePageModuleHelper manages common tasks for Web page modules in a WebSnap application.

Class Hierarchy

Pascal

```
TSitePageModuleHelper = class(TSiteModuleHelper);
```

C++

```
class TSitePageModuleHelper : public TSiteModuleHelper;
```

File

WebModu

Description

Web page modules create and use an instance of TSitePageModuleHelper to assist in the following tasks:

Assembling the content of the associated Web page.

Interacting with editor views at design time.

Keeping track of WebSnap objects contained in the module.

Generating the events that occur when the Web module is activated or deactivated, and when it dispatches or redirects a request for a Web page.

You should not need to work directly with TSitePageModuleHelper instances. The Web page module creates and uses this object.

See Also

TCustomWebPageModule (see page 6556)

TCustomWebDataModule (see page 6550)

63.1.8.1 TSitePageModuleHelper Members

The following tables list the members exposed by TSitePageModuleHelper.

Protected Methods

	Name	Description
	DispatchPage (see page 6577)	This is DispatchPage, a member of class TSitePageModuleHelper.
	EndIterator (see page 6568)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 6568)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6569)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6569)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6569)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetDefaultAction (see page 6578)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 6578)	This is GetPageProducer, a member of class TSitePageModuleHelper.
	GetProducerComponent (see page 6578)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 6578)	This is GetRedirectParams, a member of class TSitePageModuleHelper.

	GetTemplateFileType (see page 6579)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 6579)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetVariable (see page 6569)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6569)	This is GetVariableCount, a member of class TSiteModuleHelper.
	GetXMLData (see page 6579)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 6579)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 6579)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 6580)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 6580)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 6580)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 6580)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 6581)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 6581)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 6581)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 6581)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 6582)	This is IncludePage, a member of class TSitePageModuleHelper.
	NextIteration (see page 6570)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6570)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6570)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	RedirectToPage (see page 6582)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 6582)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 6582)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.
	StartIterator (see page 6571)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
R	Module (see page 6571)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 6573)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6583)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 6584)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6584)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 6584)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 6573)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
V	Create (see page 6576)	Creates and initializes an instance of TSitePageModuleHelper (see page 6574).
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6577)	Frees an instance of TSitePageModuleHelper (see page 6574).

	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 6570)	Responds to notifications that components are about to be inserted or removed.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	DefaultAction (see page 6583)	Represents the adapter action associated with the Web page module.
R	Request (see page 6571)	Provides access to the current request object.
R	Response (see page 6572)	Provides access to the current response object.
R	Session (see page 6572)	Provides access to the current Web session.
R	WebModuleContext (see page 6572)	Keeps track of name/value pairs that store information for the Web module.

63.1.8.2 TSitePageModuleHelper.Create Constructor

Creates and initializes an instance of TSitePageModuleHelper (see page 6574).

Pascal

```
constructor Create(AModule: TComponent); override;
```

C++

```
virtual __fastcall TSitePageModuleHelper(TComponent * AModule);
```

Description

Web page modules call the TSitePageModuleHelper (see page 6574) constructor from their own constructors.

AModule is the Web page module that is using the TSitePageModuleHelper (see page 6574) object to generate events and help assemble its Web content. The TSitePageModuleHelper (see page 6574) object becomes the value of the module's SitePageModuleHelper property.

See Also

SitePageModuleHelper (see page 6562)

63.1.8.3 TSitePageModuleHelper.Destroy Destructor

Frees an instance of TSitePageModuleHelper (see page 6574).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TSitePageModuleHelper();
```

Description

Do not free TSitePageModuleHelper (see page 6574) instances. This object is freed by the Web page module that uses it.

See Also

System::TObject::Free (see page 3372)

63.1.8.4 TSitePageModuleHelper Methods

The methods of the TSitePageModuleHelper class are listed here.

Protected Methods

	Name	Description
	DispatchPage (see page 6577)	This is DispatchPage, a member of class TSitePageModuleHelper.
	GetDefaultAction (see page 6578)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 6578)	This is GetPageProducer, a member of class TSitePageModuleHelper.
	GetProducerComponent (see page 6578)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 6578)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 6579)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 6579)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetXMLData (see page 6579)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 6579)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 6579)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 6580)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 6580)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 6580)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 6580)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 6581)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 6581)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 6581)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 6581)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 6582)	This is IncludePage, a member of class TSitePageModuleHelper.
	RedirectToPage (see page 6582)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 6582)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 6582)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.

63.1.8.4.1 TSitePageModuleHelper.DispatchPage Method

Pascal

```
function DispatchPage(const APageName: string; AWebResponse: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean DispatchPage(const UnicodeString APageName, TWebResponse AWebResponse);
```

Description

This is DispatchPage, a member of class TSitePageModuleHelper.

63.1.8.4.2 TSitePageModuleHelper.GetDefaultAction Method

Pascal

```
function GetDefaultAction: TComponent;
```

C++

```
__fastcall TComponent * GetDefaultAction();
```

Description

This is GetDefaultAction, a member of class TSitePageModuleHelper.

63.1.8.4.3 TSitePageModuleHelper.GetPageProducer Method

Pascal

```
function GetPageProducer: IProduceContent; virtual;
```

C++

```
virtual __fastcall IProduceContent GetPageProducer();
```

Description

This is GetPageProducer, a member of class TSitePageModuleHelper.

63.1.8.4.4 TSitePageModuleHelper.GetProducerComponent Method

Pascal

```
function GetProducerComponent: TComponent;
```

C++

```
__fastcall TComponent * GetProducerComponent();
```

Description

This is GetProducerComponent, a member of class TSitePageModuleHelper.

63.1.8.4.5 TSitePageModuleHelper.GetRedirectParams Method

Pascal

```
procedure GetRedirectParams(const APageName: string; AParams: TStrings);
```

C++

```
__fastcall GetRedirectParams(const UnicodeString APageName, TStrings AParams);
```

Description

This is GetRedirectParams, a member of class TSitePageModuleHelper.

63.1.8.4.6 TSitePageModuleHelper.GetTemplateFileType Method

Pascal

```
function GetTemplateFileType: string;
```

C++

```
__fastcall UnicodeString GetTemplateFileType();
```

Description

This is GetTemplateFileType, a member of class TSitePageModuleHelper.

63.1.8.4.7 TSitePageModuleHelper.GetTemplateStream Method

Pascal

```
function GetTemplateStream(const APage: string; out AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream GetTemplateStream(const UnicodeString APage, Boolean AOwned);
```

Description

This is GetTemplateStream, a member of class TSitePageModuleHelper.

63.1.8.4.8 TSitePageModuleHelper.GetXMLData Method

Pascal

```
function GetXMLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXMLData(Boolean Owned);
```

Description

This is GetXMLData, a member of class TSitePageModuleHelper.

63.1.8.4.9 TSitePageModuleHelper.GetXSLData Method

Pascal

```
function GetXSLData(var Owned: Boolean): TStream;
```

C++

```
__fastcall TStream GetXSLData(Boolean Owned);
```

Description

This is GetXSLData, a member of class TSitePageModuleHelper.

63.1.8.4.10 TSitePageModuleHelper.HasHTMLBrowserView Method

Pascal

```
function HasHTMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasHTMLBrowserView();
```

Description

This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.

63.1.8.4.11 TSitePageModuleHelper.HasScriptView Method

Pascal

```
function HasScriptView: Boolean;
```

C++

```
__fastcall Boolean HasScriptView();
```

Description

This is HasScriptView, a member of class TSitePageModuleHelper.

63.1.8.4.12 TSitePageModuleHelper.HasXMLBrowserView Method

Pascal

```
function HasXMLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXMLBrowserView();
```

Description

This is HasXMLBrowserView, a member of class TSitePageModuleHelper.

63.1.8.4.13 TSitePageModuleHelper.HasXSLBrowserView Method

Pascal

```
function HasXSLBrowserView: Boolean;
```

C++

```
__fastcall Boolean HasXSLBrowserView();
```

Description

This is HasXSLBrowserView, a member of class TSitePageModuleHelper.

63.1.8.4.14 TSitePageModuleHelper.HTMLFromTemplate Method

Pascal

```
function HTMLFromTemplate(AStream: TStream): string;
```

C++

```
__fastcall UnicodeString HTMLFromTemplate(TStream AStream);
```

Description

This is HTMLFromTemplate, a member of class TSitePageModuleHelper.

63.1.8.4.15 TSitePageModuleHelper.ImplDispatchPage Method

Pascal

```
function ImplDispatchPage(const APageName: string; AWebResponse: TWebResponse): Boolean;
virtual;
```

C++

```
virtual __fastcall Boolean ImplDispatchPage(const UnicodeString APageName, TWebResponse
AWebResponse);
```

Description

This is ImplDispatchPage, a member of class TSitePageModuleHelper.

63.1.8.4.16 TSitePageModuleHelper.ImplIncludePage Method

Pascal

```
function ImplIncludePage(const APageName: string; var AOwned: Boolean): TStream; virtual;
```

C++

```
virtual __fastcall TStream ImplIncludePage(const UnicodeString APageName, Boolean AOwned);
```

Description

This is ImplIncludePage, a member of class TSitePageModuleHelper.

63.1.8.4.17 TSitePageModuleHelper.ImplRedirectToPage Method

Pascal

```
function ImplRedirectToPage(const APageName: string; AParams: TStrings; AResponse:
TWebResponse): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean ImplRedirectToPage(const UnicodeString APageName, TStrings AParams,
TWebResponse AResponse);
```

Description

This is ImplRedirectToPage, a member of class TSitePageModuleHelper.

63.1.8.4.18 TSitePageModuleHelper.ImplSetWebContentOptions Method

Pascal

```
procedure ImplSetWebContentOptions(AOptions: TWebContentOptions); virtual;
```

C++

```
virtual __fastcall ImplSetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.

63.1.8.4.19 TSitePageModuleHelper.IncludePage Method

Pascal

```
function IncludePage(const APageName: string; var AOwned: Boolean): TStream;
```

C++

```
__fastcall TStream IncludePage(const UnicodeString APageName, Boolean AOwned);
```

Description

This is IncludePage, a member of class TSitePageModuleHelper.

63.1.8.4.20 TSitePageModuleHelper.RedirectToPage Method

Pascal

```
function RedirectToPage(const APageName: string; AParams: TStrings; AResponse: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean RedirectToPage(const UnicodeString APageName, TStrings AParams,
TWebResponse AResponse);
```

Description

This is RedirectToPage, a member of class TSitePageModuleHelper.

63.1.8.4.21 TSitePageModuleHelper.SetDefaultPageFileName Method

Pascal

```
procedure SetDefaultPageFileName(const AValue: string);
```

C++

```
__fastcall SetDefaultPageFileName(const UnicodeString AValue);
```

Description

This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.

63.1.8.4.22 TSitePageModuleHelper.SetWebContentOptions Method

Pascal

```
procedure SetWebContentOptions(AOptions: TWebContentOptions);
```

C++

```
__fastcall SetWebContentOptions(TWebContentOptions AOptions);
```

Description

This is SetWebContentOptions, a member of class TSitePageModuleHelper.

63.1.8.5 TSitePageModuleHelper Properties

The properties of the TSitePageModuleHelper class are listed here.

Public Properties

	Name	Description
	DefaultAction (see page 6583)	Represents the adapter action associated with the Web page module.

63.1.8.5.1 TSitePageModuleHelper.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TAdapterActionName;
```

C++

```
__property TAdapterActionName DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 6562)

63.1.8.6 TSitePageModuleHelper Events

The events of the TSitePageModuleHelper class are listed here.

Public Events

	Name	Description
	OnAfterDispatchPage (see page 6583)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 6584)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6584)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 6584)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

63.1.8.6.1 TSitePageModuleHelper.OnAfterDispatchPage Event

Occurs after the Web page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

OnAfterDispatchPage uses the same event handler as that of the Web page module's OnAfterDispatchPage event. The TSitePageModuleHelper (see page 6574) object generates this event after the Web page module writes the content for its Web page to the response object.

See Also

OnDeactivate (see page 6573)

OnAfterDispatchPage (see page 6563)

63.1.8.6.2 TSitePageModuleHelper.OnAfterRedirectToPage Event

Occurs after the Web page module assembles a response message that represents a redirection to its Web page.

Pascal

```
property OnAfterRedirectToPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterRedirectToPage;
```

Description

OnAfterRedirectToPage uses the same event handler as that of the Web page module's OnAfterRedirectToPage event. The TSitePageModuleHelper (see page 6574) object generates this event after the Web page module sends a response redirecting the caller to its Web page.

See Also

OnBeforeRedirectToPage (see page 6584)

OnAfterRedirectToPage (see page 6563)

63.1.8.6.3 TSitePageModuleHelper.OnBeforeDispatchPage Event

Occurs before the Web module generates the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

OnBeforeDispatchPage uses the same event handler as that of the Web page module's OnBeforeDispatchPage event. The TSitePageModuleHelper (see page 6574) object generates this event before the Web page module generates the content for its Web page.

See Also

OnAfterDispatchPage (see page 6583)

OnBeforeDispatchPage (see page 6564)

63.1.8.6.4 TSitePageModuleHelper.OnBeforeRedirectToPage Event

Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Pascal

```
property OnBeforeRedirectToPage: TDispatchPageParamsHandledEvent;
```

C++

```
__property TDispatchPageParamsHandledEvent OnBeforeRedirectToPage;
```

Description

OnBeforeRedirectToPage uses the same event handler as that of the Web page module's OnBeforeRedirectToPage event. The TSitePageModuleHelper (see page 6574) object generates this event before the Web page module assembles and sends a response redirecting the caller to its Web page.

See Also

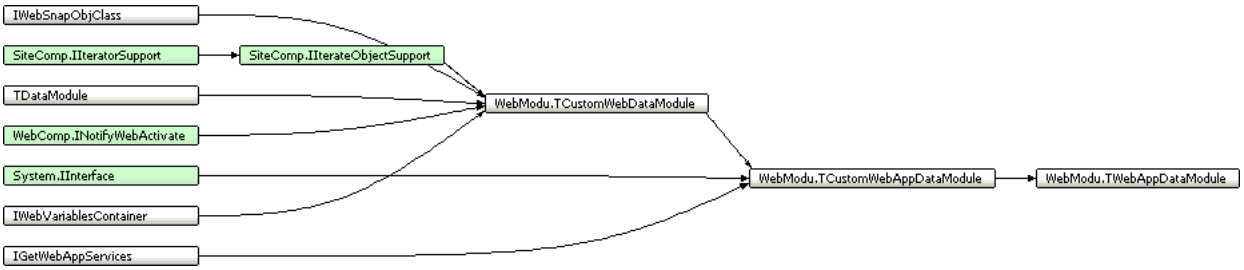
OnAfterRedirectToPage (see page 6584)

OnBeforeRedirectToPage (see page 6564)

63.1.9 TWebAppDataModule Class

TWebAppDataModule is used as the WebSnap application module when there is no need to generate a page.

Class Hierarchy



Pascal

```
TWebAppDataModule = class(TCustomWebAppDataModule);
```

C++

```
class TWebAppDataModule : public TCustomWebAppDataModule;
```

File

WebModu

Description

TWebAppDataModule is a container for WebSnap system components such as dispatchers, global adapters, user list, and session components. The WebSnap Application Wizard automatically adds system components to the TWebAppDataModule when it creates a TWebAppDataModule. System (see page 3159) components may be added or removed later. TWebAppComponents (see page 6243) is the component in a TWebAppDataModule that references all of the system components in use by the WebSnap application.

Web Modules

63.1.9.1 TWebAppDataModule Members

The following tables list the members exposed by TWebAppDataModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6553)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetWebAppServices (see page 6542)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
	GetWebSnapObjClass (see page 6553)	Returns the class type for this adapter field.
	Notification (see page 6543)	Responds to notifications that components are about to be inserted or removed.
	Notification (see page 6553)	Responds to notifications that components are about to be inserted or removed.
	QueryInterface (see page 6543)	Returns a reference to a specified interface if the module supports that interface.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6555)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	Create (see page 6541)	Creates a new TCustomWebAppDataModule (see page 6539) instance.
	Create (see page 6551)	Creates and initializes an instance of TCustomWebDataModule (see page 6550).
	CreateNew (see page 6541)	Creates a data module without using the associated form file to initialize it.
	CreateNew (see page 6552)	Creates and initializes an instance of TCustomWebDataModule (see page 6550) without using an associated form file.
	Destroy (see page 6542)	Frees a Web application data module instance.
	Destroy (see page 6552)	Frees an instance of TCustomWebDataModule (see page 6550).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

Public Properties

	Name	Description
	Request (see page 6554)	Provides access to the current request object.
	Response (see page 6554)	Provides access to the current response object.
	Session (see page 6555)	Provides access to the current Web session.

Published Events

	Name	Description
	OnActivate (see page 6587)	Occurs when the Web module is activated.
	OnDeactivate (see page 6588)	Occurs when the Web module is deactivated.

Published Properties

	Name	Description
	AppServices (see page 6587)	Provides read and write access to the application services stored in this TCustomWebAppDataModule object.

63.1.9.2 TWebAppDataModule Properties

The properties of the TWebAppDataModule class are listed here.

Published Properties

	Name	Description
	AppServices (see page 6587)	Provides read and write access to the application services stored in this TCustomWebAppDataModule object.

63.1.9.2.1 TWebAppDataModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppDataModule object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents object.

See Also

TWebAppComponents (see page 6243)

WebContext (see page 6003)

63.1.9.3 TWebAppDataModule Events

The events of the TWebAppDataModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 6587)	Occurs when the Web module is activated.
	OnDeactivate (see page 6588)	Occurs when the Web module is deactivated.

63.1.9.3.1 TWebAppDataModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 6556)

CreateMode

63.1.9.3.2 TWebAppDataModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

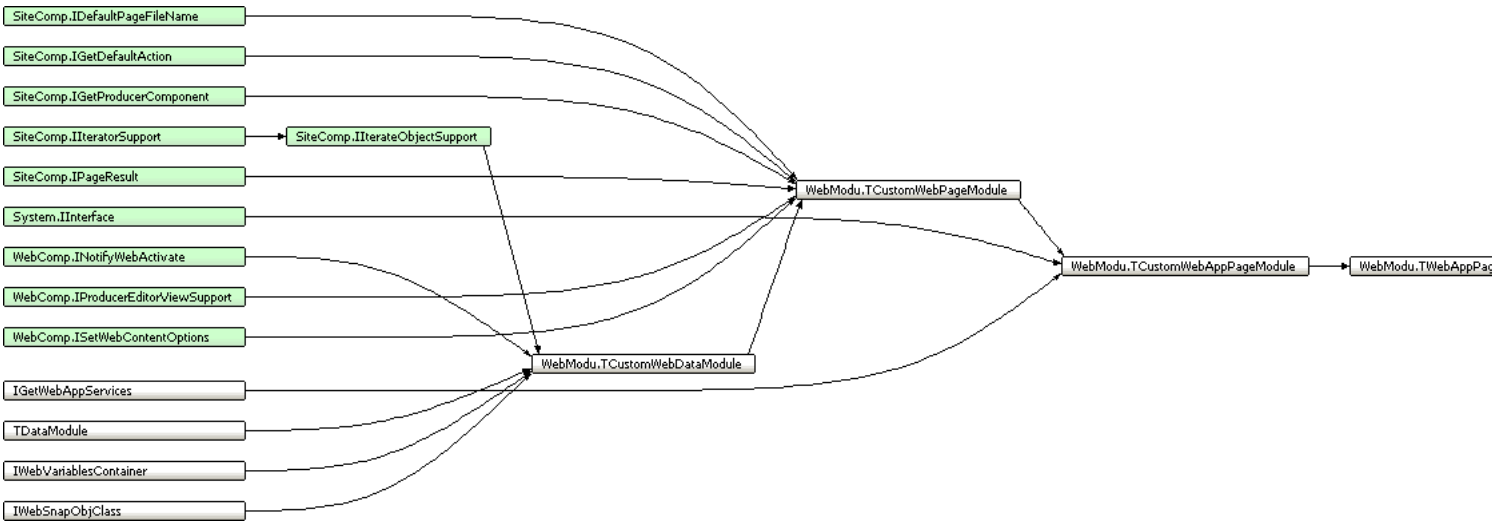
See Also

OnActivate (see page 6556)

63.1.10 TWebAppPageModule Class

TWebAppPageModule is used as the WebSnap application module when the application module generates a page.

Class Hierarchy



Pascal

```
TWebAppPageModule = class(TCustomWebAppPageModule);
```

C++

```
class TWebAppPageModule : public TCustomWebAppPageModule;
```

File

WebModu

Description

Like TWebAppDataModule (see page 6585), TWebAppPageModule is a container for WebSnap system components such as dispatchers, global adapters, user list, and session components. The WebSnap Application Wizard automatically adds system components to the TWebAppPageModule when it creates a TWebAppPageModule. System (see page 3159) components may be added or removed later. TWebAppComponents (see page 6243) is the component in a TWebAppPageModule that references all of the system components in use by the WebSnap application.

The WebAppPageModule is different from TWebAppDataModule (see page 6585) because it generates a page. The PageProducer (see page 6592) property references the producer component responsible for generating content. This property must not be nil (Delphi) or NULL (C++) or no content will be generated. The WebSnap Application Wizard automatically adds a page producer component when it creates a new TWebAppPageModule.

See Also

Web Modules

63.1.10.1 TWebAppPageModule Members

The following tables list the members exposed by TWebAppPageModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6553)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetSiteModuleHelper (see page 6560)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetSitePageModuleHelper (see page 6561)	Returns the value of the SitePageModuleHelper (see page 6562) property.
	GetWebAppServices (see page 6548)	Returns the IWebAppServices interface of the component that centralizes the dispatching of requests.
	GetWebSnapObjClass (see page 6553)	Returns the class type for this adapter field.
	Notification (see page 6548)	Responds to notifications that components are about to be inserted or removed.
	Notification (see page 6553)	Responds to notifications that components are about to be inserted or removed.
	Notification (see page 6561)	Responds to notifications that components are about to be inserted or removed.
	QueryInterface (see page 6548)	Returns a reference to a specified interface if the module supports that interface.
	SetAppServices (see page 6549)	Sets the value of the AppServices (see page 6549) property.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6555)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.
	SitePageModuleHelper (see page 6562)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnAfterRedirectToPage (see page 6563)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeRedirectToPage (see page 6564)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	Create (see page 6546)	Creates and initializes an instance of TCustomWebAppPageModule (see page 6544).

	Create (see page 6551)	Creates and initializes an instance of TCustomWebDataModule (see page 6550).
	Create (see page 6559)	Creates and initializes an instance of TCustomWebPageModule (see page 6556).
	CreateNew (see page 6547)	Creates and initializes an instance of TCustomWebAppPageModule (see page 6544) without using an associated form file.
	CreateNew (see page 6552)	Creates and initializes an instance of TCustomWebDataModule (see page 6550) without using an associated form file.
	CreateNew (see page 6559)	Creates and initializes an instance of TCustomWebPageModule (see page 6556) without using an associated form file.
	Destroy (see page 6547)	Frees an instance of TCustomWebAppPageModule (see page 6544).
	Destroy (see page 6552)	Frees an instance of TCustomWebDataModule (see page 6550).
	Destroy (see page 6560)	Frees an instance of TCustomWebPageModule (see page 6556).
	DispatchPage (see page 1065)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultAction (see page 1028)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetProducerComponent (see page 1035)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 6090)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 6090)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 6090)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 6091)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 6091)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 6091)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 6091)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 1065)	This is IncludePage, a member of class IPageResult.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RedirectToPage (see page 1066)	This is RedirectToPage, a member of class IPageResult.
	SetDefaultPageFileName (see page 1015)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetWebContentOptions (see page 6092)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

Public Properties

	Name	Description
	Request (see page 6554)	Provides access to the current request object.
	Response (see page 6554)	Provides access to the current response object.
	Session (see page 6555)	Provides access to the current Web session.

Published Events

	Name	Description
	OnActivate (see page 6592)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6593)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 6593)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 6594)	Occurs when the Web module is deactivated.

Published Properties

	Name	Description
	AppServices (see page 6591)	Provides read and write access to the application services stored in this TCustomWebAppPageModule object.
	DefaultAction (see page 6591)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6592)	Indicates the interface of the page producer that generates the content of the Web page.

63.1.10.2 TWebAppPageModule Properties

The properties of the TWebAppPageModule class are listed here.

Published Properties

	Name	Description
	AppServices (see page 6591)	Provides read and write access to the application services stored in this TCustomWebAppPageModule object.
	DefaultAction (see page 6591)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6592)	Indicates the interface of the page producer that generates the content of the Web page.

63.1.10.2.1 TWebAppPageModule.AppServices Property

Provides read and write access to the application services stored in this TCustomWebAppPageModule object.

Pascal

```
property AppServices: IWebAppServices;
```

C++

```
__property IWebAppServices AppServices;
```

Description

AppServices provides access to the application services implemented by a component in this Web application module. The application services component sets up the Web context for each incoming request message, passes incoming request objects on to a dispatcher for handling, and provides the final backstop for exceptions that arise while processing request messages.

Typically, this property references the interface of a TWebAppComponents object.

See Also

TWebAppComponents (see page 6243)

WebContext (see page 6003)

63.1.10.2.2 TWebAppPageModule.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TComponent;
```

C++

```
__property TAdapterActionName DefaultAction;__property TComponent * DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 6562)

63.1.10.2.3 TWebAppPageModule.PageProducer Property

Indicates the interface of the page producer that generates the content of the Web page.

Pascal

```
property PageProducer: IProduceContent;
```

C++

```
__property IProduceContent PageProducer;
```

Description

PageProducer is the interface that supplies the content of the Web page this module creates. It is the interface of a page producer component that is included in the Web page module. If PageProducer is nil (Delphi) or NULL (C++), the Web page module can't produce a Web page.

See Also

TAdapterPageProducer (see page 1136)

TDataSetPageProducer

TXSLPageProducer (see page 7893)

TPageProducer

TDataSetTableProducer

TQueryTableProducer

TInetXPageProducer

63.1.10.3 TWebAppPageModule Events

The events of the TWebAppPageModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 6592)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6593)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 6593)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 6594)	Occurs when the Web module is deactivated.

63.1.10.3.1 TWebAppPageModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the

CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 6556)

CreateMode

63.1.10.3.2 TWebAppPageModule.OnAfterDispatchPage Event

Occurs after the page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take any final action after the page producer in the Web page module has generated its Web page. For example, the OnAfterDispatchPage event handler can make adjustments to the headers of the response message.

When OnAfterDispatchPage occurs, the Web page module has already added the content to the response message, but has not yet sent the response. This event does not occur if the BeforeDispatchPage event handler handles the request, bypassing the automatic use of the module's page producer.

Note: If the Web page module does not include a page producer, the OnAfterDispatchPage event still occurs, but the response message has no content.

See Also

OnBeforeDispatchPage (see page 6564)

PageProducer (see page 6562)

Response (see page 6554)

63.1.10.3.3 TWebAppPageModule.OnBeforeDispatchPage Event

Occurs before the Web module calls on the page producer to generate the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the Web page module performs the default processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the Web page module from fetching the template file for the page and calling on the page producer to generate the page content.

If the event handler does not handle the request (for example, if it is merely initializing values that the page producer uses), it can leave the Handled parameter as false and the Web page module will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, use the Request and Response properties.

See Also

OnAfterDispatchPage (see page 6563)

Request (see page 6554)

Response (see page 6554)

PageProducer (see page 6562)

63.1.10.3.4 TWebAppPageModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 6556)

63.1.11 TWebAppPageModuleHelper Class

Class Hierarchy

Pascal

```
TWebAppPageModuleHelper = class(TSitePageModuleHelper);
```

C++

```
class TWebAppPageModuleHelper : public TSitePageModuleHelper;
```

File

WebModu

Description

This is class WebModu.TWebAppPageModuleHelper.

63.1.11.1 TWebAppPageModuleHelper Members

The following tables list the members exposed by TWebAppPageModuleHelper.

Protected Methods

	Name	Description
	DispatchPage (see page 6577)	This is DispatchPage, a member of class TSitePageModuleHelper.
	EndIterator (see page 6568)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 6568)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6569)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6569)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6569)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetDefaultAction (see page 6578)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 6597)	This is GetPageProducer, a member of class TWebAppPageModuleHelper.
	GetProducerComponent (see page 6578)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 6578)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 6579)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 6579)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetVariable (see page 6569)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6569)	This is GetVariableCount, a member of class TSiteModuleHelper.
	GetXMLData (see page 6579)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 6579)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 6579)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 6580)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 6580)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 6580)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 6580)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 6581)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.
V	ImplIncludePage (see page 6581)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
V	ImplRedirectToPage (see page 6581)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
V	ImplSetWebContentOptions (see page 6581)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 6582)	This is IncludePage, a member of class TSitePageModuleHelper.
	NextIteration (see page 6570)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6570)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6570)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	RedirectToPage (see page 6582)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 6582)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 6582)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.
	StartIterator (see page 6571)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
R	Module (see page 6571)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 6573)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6583)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 6584)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6584)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 6584)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 6573)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.

	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 6567)	Creates and initializes an instance of TSiteModuleHelper (see page 6565).
	Create (see page 6576)	Creates and initializes an instance of TSitePageModuleHelper (see page 6574).
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Destroy (see page 6567)	Frees an instance of TSiteModuleHelper (see page 6565).
	Destroy (see page 6577)	Frees an instance of TSitePageModuleHelper (see page 6574).
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 6570)	Responds to notifications that components are about to be inserted or removed.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	DefaultAction (see page 6583)	Represents the adapter action associated with the Web page module.
R	Request (see page 6571)	Provides access to the current request object.
R	Response (see page 6572)	Provides access to the current response object.
R	Session (see page 6572)	Provides access to the current Web session.
R	WebModuleContext (see page 6572)	Keeps track of name/value pairs that store information for the Web module.

63.1.11.2 TWebAppPageModuleHelper Methods

The methods of the TWebAppPageModuleHelper class are listed here.

Protected Methods

	Name	Description
	GetPageProducer (see page 6597)	This is GetPageProducer, a member of class TWebAppPageModuleHelper.

63.1.11.2.1 TWebAppPageModuleHelper.GetPageProducer Method

Pascal

```
function GetPageProducer: IProduceContent; override;
```

C++

```
virtual __fastcall IProduceContent GetPageProducer();
```

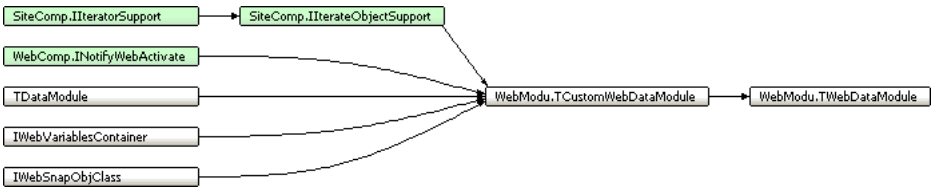
Description

This is GetPageProducer, a member of class TWebAppPageModuleHelper.

63.1.12 TWebDataModule Class

TWebDataModule is a container for components in a WebSnap application.

Class Hierarchy



Pascal

```
TWebDataModule = class(TCustomWebDataModule);
```

C++

```
class TWebDataModule : public TCustomWebDataModule;
```

File

WebModu

Description

Use TWebDataModule as a container for components that may be used by other modules in your WebSnap application. TWebDataModule is compatible with WebSnap applications. The initialization section of TWebDataModule registers a factory that is used by the WebSnap application to create the data module.

See Also

Web Modules

63.1.12.1 TWebDataModule Members

The following tables list the members exposed by TWebDataModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6553)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetWebSnapObjClass (see page 6553)	Returns the class type for this adapter field.
	Notification (see page 6553)	Responds to notifications that components are about to be inserted or removed.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6555)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.

Public Methods

	Name	Description
	Create (see page 6551)	Creates and initializes an instance of TCustomWebDataModule (see page 6550).
	CreateNew (see page 6552)	Creates and initializes an instance of TCustomWebDataModule (see page 6550) without using an associated form file.
	Destroy (see page 6552)	Frees an instance of TCustomWebDataModule (see page 6550).
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

Public Properties

	Name	Description
	Request (see page 6554)	Provides access to the current request object.
	Response (see page 6554)	Provides access to the current response object.
	Session (see page 6555)	Provides access to the current Web session.

Published Events

	Name	Description
	OnActivate (see page 6598)	Occurs when the Web module is activated.
	OnDeactivate (see page 6599)	Occurs when the Web module is deactivated.

63.1.12.2 TWebDataModule Events

The events of the TWebDataModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 6598)	Occurs when the Web module is activated.
	OnDeactivate (see page 6599)	Occurs when the Web module is deactivated.

63.1.12.2.1 TWebDataModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 6556)

CreateMode

63.1.12.2.2 TWebDataModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are deactivated after the HTTP request has been processed, just before the Web context is freed.

See Also

OnActivate (see page 6556)

63.1.13 TWebNotifyContainer Class

Class Hierarchy

Pascal

```
TWebNotifyContainer = class(TObject);
```

C++

```
class TWebNotifyContainer : public TObject;
```

File

WebModu

Description

This is class WebModu.TWebNotifyContainer.

63.1.13.1 TWebNotifyContainer Members

The following tables list the members exposed by TWebNotifyContainer.

Protected Fields

	Name	Description
	FList (see page 6602)	This is FList, a member of class TWebNotifyContainer.

Protected Methods

	Name	Description
	GetCount (see page 6602)	This is GetCount, a member of class TWebNotifyContainer.

Public Methods

	Name	Description
	Add (see page 6602)	This is Add, a member of class TWebNotifyContainer.
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6601)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 6601)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NotifyWebActivate (see page 6603)	This is NotifyWebActivate, a member of class TWebNotifyContainer.
	NotifyWebDeactivate (see page 6603)	This is NotifyWebDeactivate, a member of class TWebNotifyContainer.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

63.1.13.2 TWebNotifyContainer.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebNotifyContainer();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

63.1.13.3 TWebNotifyContainer.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebNotifyContainer();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

63.1.13.4 TWebNotifyContainer Fields

The fields of the TWebNotifyContainer class are listed here.

Protected Fields

	Name	Description
	FList (see page 6602)	This is FList, a member of class TWebNotifyContainer.

63.1.13.4.1 TWebNotifyContainer.FList Field

Pascal

```
FList: TComponentList;
```

C++

```
TComponentList FList;
```

Description

This is FList, a member of class TWebNotifyContainer.

63.1.13.5 TWebNotifyContainer Methods

The methods of the TWebNotifyContainer class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 6602)	This is GetCount, a member of class TWebNotifyContainer.

Public Methods

	Name	Description
	Add (see page 6602)	This is Add, a member of class TWebNotifyContainer.
	NotifyWebActivate (see page 6603)	This is NotifyWebActivate, a member of class TWebNotifyContainer.
	NotifyWebDeactivate (see page 6603)	This is NotifyWebDeactivate, a member of class TWebNotifyContainer.

63.1.13.5.1 TWebNotifyContainer.Add Method

Pascal

```
procedure Add(AComponent: TComponent);
```

C++

```
__fastcall Add(TComponent * AComponent);
```

Description

This is Add, a member of class TWebNotifyContainer.

63.1.13.5.2 TWebNotifyContainer.GetCount Method

Pascal

```
function GetCount: Integer;
```

C++

```
__fastcall int GetCount();
```

Description

This is GetCount, a member of class TWebNotifyContainer.

63.1.13.5.3 TWebNotifyContainer.NotifyWebActivate Method

Pascal

```
procedure NotifyWebActivate;
```

C++

```
__fastcall NotifyWebActivate();
```

Description

This is NotifyWebActivate, a member of class TWebNotifyContainer.

63.1.13.5.4 TWebNotifyContainer.NotifyWebDeactivate Method

Pascal

```
procedure NotifyWebDeactivate;
```

C++

```
__fastcall NotifyWebDeactivate();
```

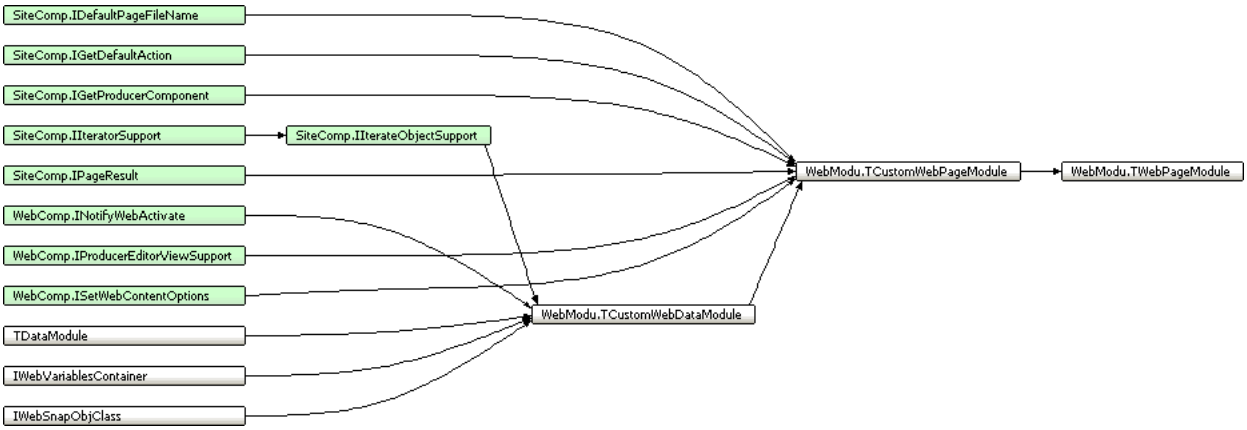
Description

This is NotifyWebDeactivate, a member of class TWebNotifyContainer.

63.1.14 TWebPageModule Class

TWebPageModule is a WebSnap module that generates a page.

Class Hierarchy



Pascal

```
TWebPageModule = class(TCustomWebPageModule);
```

C++

```
class TWebPageModule : public TCustomWebPageModule;
```

File

WebModu

Description

Use TWebPageModule in a WebSnap application to hold all the components needed for generating a specific Web page. When you use the WebSnap page module wizard to create a TWebPageModule descendant, the wizard adds a page producer to the module. The page producer generates the content of the Web page and adds code to the unit it creates (in Delphi, the code is added to the initialization section; in C++, it is added to a #pragma startup). The added code registers the TWebPageModule descendant with a factory object that the WebSnap application can use to create the Web page module.

The page producer that the wizard adds to the Web page module becomes the value of the PageProducer (see page 6606) property. If the PageProducer (see page 6606) property is nil (Delphi) or NULL (C++), the Web page module can't generate the content of a Web page. Add additional components to the Web page module that assist the page producer in creating its content. Other modules in the WebSnap application can access any components you add to the Web page module, but typically Web page module components are intended only for internal use.

TWebAppPageModule (see page 6588)

TWebDataModule (see page 6597)

TWebPageModuleFactory (see page 6303)

Web Modules

63.1.14.1 TWebPageModule Members

The following tables list the members exposed by TWebPageModule.

Protected Methods

	Name	Description
	GetSiteModuleHelper (see page 6553)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetSiteModuleHelper (see page 6560)	Returns the value of the SiteModuleHelper (see page 6555) property.
	GetSitePageModuleHelper (see page 6561)	Returns the value of the SitePageModuleHelper (see page 6562) property.
	GetWebSnapObjClass (see page 6553)	Returns the class type for this adapter field.
	Notification (see page 6553)	Responds to notifications that components are about to be inserted or removed.
	Notification (see page 6561)	Responds to notifications that components are about to be inserted or removed.

Protected Properties

	Name	Description
	SiteModuleHelper (see page 6555)	References the helper object that keeps track of WebSnap objects in the module and generates OnActivate (see page 6556) and OnDeactivate (see page 6556) events.
	SitePageModuleHelper (see page 6562)	References the helper object that assists in assembling the module's Web page.

Public Events

	Name	Description
	OnAfterRedirectToPage (see page 6563)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.

	OnBeforeRedirectToPage (see page 6564)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.

Public Methods

	Name	Description
	Create (see page 6551)	Creates and initializes an instance of TCustomWebDataModule (see page 6550).
	Create (see page 6559)	Creates and initializes an instance of TCustomWebPageModule (see page 6556).
	CreateNew (see page 6552)	Creates and initializes an instance of TCustomWebDataModule (see page 6550) without using an associated form file.
	CreateNew (see page 6559)	Creates and initializes an instance of TCustomWebPageModule (see page 6556) without using an associated form file.
	Destroy (see page 6552)	Frees an instance of TCustomWebDataModule (see page 6550).
	Destroy (see page 6560)	Frees an instance of TCustomWebPageModule (see page 6556).
	DispatchPage (see page 1065)	This is DispatchPage, a member of class IPageResult.
	EndIterator (see page 1056)	Signals the end of the iterating operation.
	GetCurrentObject (see page 1052)	This is GetCurrentObject, a member of class IIterateObjectSupport.
	GetDefaultAction (see page 1028)	This is GetDefaultAction, a member of class IGetDefaultAction.
	GetProducerComponent (see page 1035)	This is GetProducerComponent, a member of class IGetProducerComponent.
	GetTemplateFileType (see page 6090)	This is GetTemplateFileType, a member of class IProducerEditorViewSupport.
	GetXMLData (see page 6090)	This is GetXMLData, a member of class IProducerEditorViewSupport.
	GetXSLData (see page 6090)	This is GetXSLData, a member of class IProducerEditorViewSupport.
	HasHTMLBrowserView (see page 6091)	This is HasHTMLBrowserView, a member of class IProducerEditorViewSupport.
	HasScriptView (see page 6091)	This is HasScriptView, a member of class IProducerEditorViewSupport.
	HasXMLBrowserView (see page 6091)	This is HasXMLBrowserView, a member of class IProducerEditorViewSupport.
	HasXSLBrowserView (see page 6091)	This is HasXSLBrowserView, a member of class IProducerEditorViewSupport.
	IncludePage (see page 1065)	This is IncludePage, a member of class IPageResult.
	NextIteration (see page 1056)	Advances to the objects next item.
	NotifyActivate (see page 6089)	This is NotifyActivate, a member of class INotifyWebActivate.
	NotifyDeactivate (see page 6089)	This is NotifyDeactivate, a member of class INotifyWebActivate.
	RedirectToPage (see page 1066)	This is RedirectToPage, a member of class IPageResult.
	SetDefaultPageFileName (see page 1015)	This is SetDefaultPageFileName, a member of class IDefaultPageFileName.
	SetWebContentOptions (see page 6092)	This is SetWebContentOptions, a member of class ISetWebContentOptions.
	StartIterator (see page 1056)	Positions the object on its first item and starts the iteration process.

Public Properties

	Name	Description
	Request (see page 6554)	Provides access to the current request object.
	Response (see page 6554)	Provides access to the current response object.
	Session (see page 6555)	Provides access to the current Web session.

Published Events

	Name	Description
	OnActivate (see page 6607)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6607)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 6608)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 6608)	Occurs when the Web module is deactivated.

Published Properties

	Name	Description
	DefaultAction (see page 6606)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6606)	Indicates the interface of the page producer that generates the content of the Web page.

63.1.14.2 TWebPageModule Properties

The properties of the TWebPageModule class are listed here.

Published Properties

	Name	Description
	DefaultAction (see page 6606)	Represents the adapter action associated with the Web page module.
	PageProducer (see page 6606)	Indicates the interface of the page producer that generates the content of the Web page.

63.1.14.2.1 TWebPageModule.DefaultAction Property

Represents the adapter action associated with the Web page module.

Pascal

```
property DefaultAction: TComponent;
```

C++

```
__property TAdapterActionName DefaultAction;__property TComponent * DefaultAction;
```

Description

Use DefaultAction to associate an adapter action with the Web page module. Server-side script can reference this action by calling on the default action of the Web page.

Typically, the default action sets up parameters that appear in HTTP requests for the Web page. By adding a default action, the parameters can then appear in requests for the Web page, which the page producer in the Web page module uses in generating its page. In addition, this action can be called to set up parameters in redirections to this Web page.

See Also

PageProducer (see page 6562)

63.1.14.2.2 TWebPageModule.PageProducer Property

Indicates the interface of the page producer that generates the content of the Web page.

Pascal

```
property PageProducer: IProduceContent;
```

C++

```
__property IProduceContent PageProducer;
```

Description

PageProducer is the interface that supplies the content of the Web page this module creates. It is the interface of a page producer component that is included in the Web page module. If PageProducer is nil (Delphi) or NULL (C++), the Web page module can't produce a Web page.

See Also

TAdapterPageProducer (see page 1136)

TDataSetPageProducer

TXSLPageProducer (see page 7893)

TPageProducer

TDataSetTableProducer

TQueryTableProducer

TInetXPageProducer

63.1.14.3 TWebPageModule Events

The events of the TWebPageModule class are listed here.

Published Events

	Name	Description
	OnActivate (see page 6607)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6607)	Occurs after the page module generates its Web page.
	OnBeforeDispatchPage (see page 6608)	Occurs before the Web module calls on the page producer to generate the content of the Web page.
	OnDeactivate (see page 6608)	Occurs when the Web module is deactivated.

63.1.14.3.1 TWebPageModule.OnActivate Event

Occurs when the Web module is activated.

Pascal

```
property OnActivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnActivate;
```

Description

Write an OnActivate event handler to perform any initializations when the Web module is first activated. The Web application module is the first module activated, and it is activated for every HTTP request. Other Web modules are activated based on the CreateMode of their corresponding factory objects, and whether they are needed to process the current request message.

See Also

OnDeactivate (see page 6556)

CreateMode

63.1.14.3.2 TWebPageModule.OnAfterDispatchPage Event

Occurs after the page module generates its Web page.

Pascal

```
property OnAfterDispatchPage: TDispatchPageEvent;
```

C++

```
__property TDispatchPageEvent OnAfterDispatchPage;
```

Description

Write an OnAfterDispatchPage event handler to take any final action after the page producer in the Web page module has generated its Web page. For example, the OnAfterDispatchPage event handler can make adjustments to the headers of the response message.

When OnAfterDispatchPage occurs, the Web page module has already added the content to the response message, but has not yet sent the response. This event does not occur if the BeforeDispatchPage event handler handles the request, bypassing the

automatic use of the module's page producer.

Note: If the Web page module does not include a page producer, the OnAfterDispatchPage event still occurs, but the response message has no content.

See Also

OnBeforeDispatchPage (see page 6564)

PageProducer (see page 6562)

Response (see page 6554)

63.1.14.3.3 TWebPageModule.OnBeforeDispatchPage Event

Occurs before the Web module calls on the page producer to generate the content of the Web page.

Pascal

```
property OnBeforeDispatchPage: TDispatchPageHandledEvent;
```

C++

```
__property TDispatchPageHandledEvent OnBeforeDispatchPage;
```

Description

Write an OnBeforeDispatchPage event handler to process an HTTP request message before the Web page module performs the default processing.

This event can provide an alternate mechanism for handling request messages, and then set the Handled parameter to true to prevent the Web page module from fetching the template file for the page and calling on the page producer to generate the page content.

If the event handler does not handle the request (for example, if it is merely initializing values that the page producer uses), it can leave the Handled parameter as false and the Web page module will continue with the default processing.

Tip: To access the Web request and response objects from within an OnBeforeDispatchPage event handler, use the Request and Response properties.

See Also

OnAfterDispatchPage (see page 6563)

Request (see page 6554)

Response (see page 6554)

PageProducer (see page 6562)

63.1.14.3.4 TWebPageModule.OnDeactivate Event

Occurs when the Web module is deactivated.

Pascal

```
property OnDeactivate: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnDeactivate;
```

Description

Write an OnDeactivate event handler to perform any final cleanup when the Web module is deactivated. Web modules are

deactivated after the HTTP request has been processed, just before the Web context is freed.

63.1.15 TWebPageModuleHelper Class

Class Hierarchy

Pascal

```
TWebPageModuleHelper = class(TSitePageModuleHelper);
```

C++

```
class TWebPageModuleHelper : public TSitePageModuleHelper;
```

File

WebModu

Description

This is class WebModu.TWebPageModuleHelper.

63.1.15.1 TWebPageModuleHelper Members

The following tables list the members exposed by TWebPageModuleHelper.

Protected Methods

	Name	Description
	DispatchPage (see page 6577)	This is DispatchPage, a member of class TSitePageModuleHelper.
	EndIterator (see page 6568)	This is EndIterator, a member of class TSiteModuleHelper.
V	FindNamedVariable (see page 6568)	This is FindNamedVariable, a member of class TSiteModuleHelper.
	FindVariable (see page 6569)	This is FindVariable, a member of class TSiteModuleHelper.
	FindVariableContainer (see page 6569)	This is FindVariableContainer, a member of class TSiteModuleHelper.
	GetCurrentObject (see page 6569)	This is GetCurrentObject, a member of class TSiteModuleHelper.
	GetDefaultAction (see page 6578)	This is GetDefaultAction, a member of class TSitePageModuleHelper.
V	GetPageProducer (see page 6611)	This is GetPageProducer, a member of class TWebPageModuleHelper.
	GetProducerComponent (see page 6578)	This is GetProducerComponent, a member of class TSitePageModuleHelper.
	GetRedirectParams (see page 6578)	This is GetRedirectParams, a member of class TSitePageModuleHelper.
	GetTemplateFileType (see page 6579)	This is GetTemplateFileType, a member of class TSitePageModuleHelper.
	GetTemplateStream (see page 6579)	This is GetTemplateStream, a member of class TSitePageModuleHelper.
	GetVariable (see page 6569)	This is GetVariable, a member of class TSiteModuleHelper.
	GetVariableCount (see page 6569)	This is GetVariableCount, a member of class TSiteModuleHelper.
	GetXMLData (see page 6579)	This is GetXMLData, a member of class TSitePageModuleHelper.
	GetXSLData (see page 6579)	This is GetXSLData, a member of class TSitePageModuleHelper.
	HasHTMLBrowserView (see page 6579)	This is HasHTMLBrowserView, a member of class TSitePageModuleHelper.
	HasScriptView (see page 6580)	This is HasScriptView, a member of class TSitePageModuleHelper.
	HasXMLBrowserView (see page 6580)	This is HasXMLBrowserView, a member of class TSitePageModuleHelper.
	HasXSLBrowserView (see page 6580)	This is HasXSLBrowserView, a member of class TSitePageModuleHelper.
	HTMLFromTemplate (see page 6580)	This is HTMLFromTemplate, a member of class TSitePageModuleHelper.
V	ImplDispatchPage (see page 6581)	This is ImplDispatchPage, a member of class TSitePageModuleHelper.

	ImplIncludePage (see page 6581)	This is ImplIncludePage, a member of class TSitePageModuleHelper.
	ImplRedirectToPage (see page 6581)	This is ImplRedirectToPage, a member of class TSitePageModuleHelper.
	ImplSetWebContentOptions (see page 6581)	This is ImplSetWebContentOptions, a member of class TSitePageModuleHelper.
	IncludePage (see page 6582)	This is IncludePage, a member of class TSitePageModuleHelper.
	NextIteration (see page 6570)	This is NextIteration, a member of class TSiteModuleHelper.
	NotifyActivate (see page 6570)	This is NotifyActivate, a member of class TSiteModuleHelper.
	NotifyDeactivate (see page 6570)	This is NotifyDeactivate, a member of class TSiteModuleHelper.
	RedirectToPage (see page 6582)	This is RedirectToPage, a member of class TSitePageModuleHelper.
	SetDefaultPageFileName (see page 6582)	This is SetDefaultPageFileName, a member of class TSitePageModuleHelper.
	SetWebContentOptions (see page 6582)	This is SetWebContentOptions, a member of class TSitePageModuleHelper.
	StartIterator (see page 6571)	This is StartIterator, a member of class TSiteModuleHelper.

Protected Properties

	Name	Description
	Module (see page 6571)	This is Module, a member of class TSiteModuleHelper.

Public Events

	Name	Description
	OnActivate (see page 6573)	Occurs when the Web module is activated.
	OnAfterDispatchPage (see page 6583)	Occurs after the Web page module generates its Web page.
	OnAfterRedirectToPage (see page 6584)	Occurs after the Web page module assembles a response message that represents a redirection to its Web page.
	OnBeforeDispatchPage (see page 6584)	Occurs before the Web module generates the content of the Web page.
	OnBeforeRedirectToPage (see page 6584)	Occurs before the Web page module assembles a response that redirects the caller to its Web page.
	OnDeactivate (see page 6573)	Occurs when the Web module is deactivated.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 6567)	Creates and initializes an instance of TSiteModuleHelper (see page 6565).
	Create (see page 6576)	Creates and initializes an instance of TSitePageModuleHelper (see page 6574).
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Destroy (see page 6567)	Frees an instance of TSiteModuleHelper (see page 6565).
	Destroy (see page 6577)	Frees an instance of TSitePageModuleHelper (see page 6574).
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	Notification (see page 6570)	Responds to notifications that components are about to be inserted or removed.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	DefaultAction (see page 6583)	Represents the adapter action associated with the Web page module.
R	Request (see page 6571)	Provides access to the current request object.
R	Response (see page 6572)	Provides access to the current response object.
R	Session (see page 6572)	Provides access to the current Web session.
R	WebModuleContext (see page 6572)	Keeps track of name/value pairs that store information for the Web module.

63.1.15.2 TWebPageModuleHelper Methods

The methods of the TWebPageModuleHelper class are listed here.

Protected Methods

	Name	Description
V	GetPageProducer (see page 6611)	This is GetPageProducer, a member of class TWebPageModuleHelper.

63.1.15.2.1 TWebPageModuleHelper.GetPageProducer Method

Pascal

```
function GetPageProducer: IProduceContent; override;
```

C++

```
virtual __fastcall IProduceContent GetPageProducer();
```

Description

This is GetPageProducer, a member of class TWebPageModuleHelper.

63.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	FindNamedModuleVariable (see page 6612)	This is function WebModu.FindNamedModuleVariable.
	GetModuleVariable (see page 6612)	This is function WebModu.GetModuleVariable.
	GetModuleVariableCount (see page 6612)	This is function WebModu.GetModuleVariableCount.

63.2.1 WebModu.FindNamedModuleVariable Function

Pascal

```
function FindNamedModuleVariable(AModule: TComponent; const AName: string): TComponent;
```

C++

```
TComponent * FindNamedModuleVariable(TComponent * AModule, const UnicodeString AName);
```

File

WebModu

Description

This is function WebModu.FindNamedModuleVariable.

63.2.2 WebModu.GetModuleVariable Function

Pascal

```
function GetModuleVariable(AModule: TComponent; Index: Integer): TComponent;
```

C++

```
TComponent * GetModuleVariable(TComponent * AModule, int Index);
```

File

WebModu

Description

This is function WebModu.GetModuleVariable.

63.2.3 WebModu.GetModuleVariableCount Function

Pascal

```
function GetModuleVariableCount(AModule: TComponent): Integer;
```

C++

```
int GetModuleVariableCount(TComponent * AModule);
```

File

WebModu

Description

This is function WebModu.GetModuleVariableCount.

63.3 Types

The following table lists types in this documentation.

Types

Name	Description
TGetParamsEvent (see page 6614)	This is type WebModu.TGetParamsEvent.

63.3.1 WebModu.TGetParamsEvent Type

Pascal

```
TGetParamsEvent = procedure (Sender: TObject; Params: TStrings);
```

C++

```
(Sender: TObject; Params: TStrings) ( TGetParamsEvent)();
```

File

WebModu

Description

This is type WebModu.TGetParamsEvent.

64 WebNode Namespace

This is namespace WebNode.

Topics

Name	Description
Interfaces (see page 6616)	The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebNode (see page 6616)	IWebNode is the interface for executing invokable interface calls from the client of a Web Service.

64.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebNode (see page 6616)	IWebNode is the interface for executing invokable interface calls from the client of a Web Service.

64.1.1 IWebNode Interface

IWebNode is the interface for executing invokable interface calls from the client of a Web Service.

Class Hierarchy

Pascal

```
IWebNode = interface;
```

C++

```
__interface IWebNode;
```

File

WebNode

Description

TRIO objects use IWebNode to execute method calls on an invokable interface. IWebNode takes an encoded method call, executes it, and returns the encoded results. Typically, objects that implement IWebNode use a specific transport protocol to forward the encoded method call to a remote server. For example, the THTTPReqResp class implements this interface for making interface calls to a remote Web Service application using HTTP.

When implementing the IWebNode interface, you can use another IWebNode implementation to delegate part of the method execution. For example, you can write a class that compresses or encrypts the encoded method call, passes it to another IWebNode implementation that expects the compressed or encrypted string, and then decompresses or decrypts the results returned by the other IWebNode implementation.

Note: C++ method declarations that use IWebNode use the _di_IWebNode type instead. This type is a DelphiInterface (see page 3256) wrapper around the IWebNode interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< >  _di_IWebNode;
```

See Also

THTTPReqResp (see page 1276)

TRIO

64.1.1.1 IWebNode Members

The following tables list the members exposed by IWebNode.

Public Methods

	Name	Description
	BeforeExecute (see page 6617)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 6618)	This is the overview for the Execute method overload.
	GetMimeBoundary (see page 6619)	Returns the value of the MimeBoundary (see page 6619) property.
	SetMimeBoundary (see page 6619)	Sets the value of the MimeBoundary (see page 6619) property.

Public Properties

	Name	Description
	MimeBoundary (see page 6619)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

64.1.1.2 IWebNode Methods

The methods of the IWebNode class are listed here.

Public Methods

	Name	Description
	BeforeExecute (see page 6617)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 6618)	This is the overview for the Execute method overload.
	GetMimeBoundary (see page 6619)	Returns the value of the MimeBoundary (see page 6619) property.
	SetMimeBoundary (see page 6619)	Sets the value of the MimeBoundary (see page 6619) property.

64.1.1.2.1 IWebNode.BeforeExecute Method

Performs any transport-specific setup before executing an encoded method call.

Pascal

```
procedure BeforeExecute(const IntfMD: TIntfMetaData; const MethMD: TIntfMethEntry;
MethodIndex: Integer; AttachHandler: IMimeAttachmentHandler);
```

C++

```
__fastcall BeforeExecute(const TIntfMetaData IntfMD, const TIntfMethEntry MethMD, int
MethodIndex, IMimeAttachmentHandler AttachHandler);
```

Description

BeforeExecute handles transport-specific tasks such as dynamically querying a WSDL document or setting up serialization options before a call is made to the Execute (see page 6618) method. Remote interfaced objects (TRio) call this method after their OnBeforeExecute event, but before delegating the execution of the method to the Execute (see page 6618) method.

IntfMD is the runtime type information (RTTI) of the invokable interface that includes the method to execute.

MethMD is describes the method that is about to be executed.

MethodIndex indicates which overload to use when methMD describes an overloaded method. 0 indicates the first overload, 1 indicates the second overload, and so on.

AttachHandler is an interface to use for handling any attachments that are used as parameters of the method.

See Also

Execute (see page 6618)

OnBeforeExecute

64.1.1.2.2 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	IWebNode.Execute (String, TStream) (see page 6618)	Executes an encoded method call and returns the encoded results in a stream.
	IWebNode.Execute (TStream) (see page 6618)	Executes an encoded method call and returns the encoded results in a stream.
	IWebNode.Execute (TStream, TStream) (see page 6618)	Executes an encoded method call and returns the encoded results in a stream.

64.1.1.2.2.1 IWebNode.Execute Method (String, TStream)

Executes an encoded method call and returns the encoded results in a stream.

Pascal

```
procedure Execute(const DataMsg: String; Response: TStream); overload; deprecated;
procedure Execute(const Request: TStream; Response: TStream); overload;
function Execute(const Request: TStream): TStream; overload;
```

C++

```
__fastcall Execute(const UnicodeString DataMsg, TStream Response);
__fastcall Execute(const TStream Request, TStream Response);
__fastcall TStream Execute(const TStream Request);
```

Description

Execute interprets an encoded method call, executes it, and returns the encoded results using a stream. Typically, this method works in conjunction with an object that implements the IOPConvert interface, which marshals a method call into the DataMsg or Request string and unmarshals the return value.

DataMsg is an encoded method call. It represents the results of marshaling a method call on an invokable interface into a transportable string. The use of this syntax is not recommended.

Request is a stream from which to read the same string that is the value of the DataMsg parameter. This syntax is preferred because the stream need not store this value in memory (for example, it can be a file stream).

Response is a stream object that receives the encoded results that arise from executing the method call.

When using the third syntax, Execute returns a stream from which to read the encoded results from executing the method call. In this case, the caller is responsible for freeing the stream.

See Also

IOPConvert

BeforeExecute (see page 6617)

64.1.1.2.3 IWebNode.GetMimeBoundary Method

Returns the value of the MimeBoundary (see page 6619) property.

Pascal

```
function GetMimeBoundary: string;
```

C++

```
__fastcall UnicodeString GetMimeBoundary();
```

Description

GetMimeBoundary is the read access method for the MimeBoundary (see page 6619) property.

See Also

MimeBoundary (see page 6619)

64.1.1.2.4 IWebNode.SetMimeBoundary Method

Sets the value of the MimeBoundary (see page 6619) property.

Pascal

```
procedure SetMimeBoundary(Value: string);
```

C++

```
__fastcall SetMimeBoundary(UnicodeString Value);
```

Description

SetMimeBoundary is the write implementation for the MimeBoundary (see page 6619) property.

Value is the new value for MimeBoundary (see page 6619).

See Also

MimeBoundary (see page 6619)

64.1.1.3 IWebNode Properties

The properties of the IWebNode class are listed here.

Public Properties

	Name	Description
	MimeBoundary (see page 6619)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

64.1.1.3.1 IWebNode.MimeBoundary Property

Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

Pascal

```
property MimeBoundary: string;
```

C++

```
__property UnicodeString MimeBoundary;
```

Description

When the method call is included in a multipart form, MimeBoundary is the value of the MIME boundary header that uniquely identifies the part of the form that contains the method call. If the method call is not included in a multipart form, MimeBoundary is an empty string.

See Also

Execute (see page 6618)

65 WebReq Namespace

This is namespace WebReq.

Topics

Name	Description
Classes (see page 6622)	The following table lists classes in this documentation.
Functions (see page 6642)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 6643)	The following table lists structs, records, enums in this documentation.
Variables (see page 6644)	The following table lists variables in this documentation.

Classes

	Name	Description
	TWebModuleFactoryList (see page 6622)	
	TWebModuleList (see page 6626)	TWebModuleList lists the WebModules in a WebSnap application and provides access to their factory objects.
	TWebRequestHandler (see page 6633)	TWebRequestHandler maintains the Web modules in an application and creates request and response objects when the application receives HTTP request messages.

Functions

	Name	Description
	WebRequestHandler (see page 6642)	Returns a TWebRequestHandler (see page 6633) object.

Structs, Records, Enums

	Name	Description
	TRequestNotification (see page 6643)	This is record WebReq.TRequestNotification.

Variables

Name	Description
WebRequestHandlerProc (see page 6644)	This is variable WebReq.WebRequestHandlerProc.

65.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWebModuleFactoryList (see page 6622)	
	TWebModuleList (see page 6626)	TWebModuleList lists the WebModules in a WebSnap application and provides access to their factory objects.
	TWebRequestHandler (see page 6633)	TWebRequestHandler maintains the Web modules in an application and creates request and response objects when the application receives HTTP request messages.

65.1.1 TWebModuleFactoryList Class

Class Hierarchy

Pascal

```
TWebModuleFactoryList = class(TObject);
```

C++

```
class TWebModuleFactoryList : public TObject;
```

File

WebReq

65.1.1.1 TWebModuleFactoryList Members

The following tables list the members exposed by TWebModuleFactoryList.

Protected Methods

	Name	Description
	GetItem (see page 6625)	This is GetItem, a member of class TWebModuleFactoryList.

Public Methods

	Name	Description
	AddFactory (see page 6624)	Adds a factory to the web module factory list.
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.

	Create (see page 6623)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6624)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AppModuleFactory (see page 6625)	
R	ItemCount (see page 6625)	Lists the number of items in the web module factory list.
R	Items (see page 6626)	

65.1.1.2 TWebModuleFactoryList.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebModuleFactoryList();
```

Description

Do not create instances of Create. Instead, construct descendants of Create using the new keyword, passing any arguments for the descendant object's constructor.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

new

65.1.1.3 TWebModuleFactoryList.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebModuleFactoryList();
```

Description

Do not call ~Destroy directly. Instead, use the delete keyword when destroying VCL objects.

~Destroy deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

Warning: Never destroy a component from one of its own event handlers or from the event handler of a component it owns or contains. For example, don't destroy a button, or the form that owns the button, in the button's OnClick event handler.

To destroy a form, call its Release (see page 3641) method, which destroys the form and releases the memory allocated for it after all its event handlers and those of the components it contains have executed.

delete

65.1.1.4 TWebModuleFactoryList Methods

The methods of the TWebModuleFactoryList class are listed here.

Protected Methods

	Name	Description
	GetItem (see page 6625)	This is GetItem, a member of class TWebModuleFactoryList.

Public Methods

	Name	Description
	AddFactory (see page 6624)	Adds a factory to the web module factory list.

65.1.1.4.1 TWebModuleFactoryList.AddFactory Method

Adds a factory to the web module factory list.

Pascal

```
procedure AddFactory(AFactory: TAbstractWebModuleFactory);
```

C++

```
__fastcall AddFactory(TAbstractWebModuleFactory AFactory);
```

Description

Use the AddFactory method to add a factory to the web module factory list (more here, obviously).

See Also

AppModuleFactory (see page 6625)

65.1.1.4.2 TWebModuleFactoryList.GetItem Method

Pascal

```
function GetItem(I: Integer): TAbstractWebModuleFactory;
```

C++

```
__fastcall TAbstractWebModuleFactory GetItem(int I);
```

Description

This is GetItem, a member of class TWebModuleFactoryList.

65.1.1.5 TWebModuleFactoryList Properties

The properties of the TWebModuleFactoryList class are listed here.

Public Properties

	Name	Description
	AppModuleFactory (see page 6625)	
	ItemCount (see page 6625)	Lists the number of items in the web module factory list.
	Items (see page 6626)	

65.1.1.5.1 TWebModuleFactoryList.AppModuleFactory Property

Pascal

```
property AppModuleFactory: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory AppModuleFactory;
```

See Also

AddFactory (see page 6624)

65.1.1.5.2 TWebModuleFactoryList.ItemCount Property

Lists the number of items in the web module factory list.

Pascal

```
property ItemCount: Integer;
```

C++

```
__property int ItemCount;
```

Description

Use the ItemCount property to list the number of items in the web module factory list.

See Also

Items (see page 6626)

65.1.1.5.3 TWebModuleFactoryList.Items Property

Pascal

```
property Items [I: Integer]: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory Items[int I];
```

See Also

AddFactory (see page 6624)

ItemCount (see page 6625)

65.1.2 TWebModuleList Class

TWebModuleList lists the WebModules in a WebSnap application and provides access to their factory objects.

Class Hierarchy

Pascal

```
TWebModuleList = class(TAbstractWebModuleList);
```

C++

```
class TWebModuleList : public TAbstractWebModuleList;
```

File

WebReq

Description

TWebModuleList contains every Web module that has been instantiated in order to serve the current request. In addition, it lists the factory objects for all Web modules in the application, including any that are not instantiated.

When a WebSnap application handles multiple requests concurrently, it includes multiple Web modules lists, each on a separate thread and each associated with a different request.

The Web context, which can be accessed using the global WebContext (see page 6003) function, provides access to the TWebModuleList object that is associated with the current request. Use the Web context's WebModules property to obtain a reference to the Web module list.

See Also

TWebModuleFactoryList (see page 6622)

TAbstractWebModuleFactory

WebContext (see page 6003)

TAbstractWebContext (see page 5960)

65.1.2.1 TWebModuleList Members

The following tables list the members exposed by TWebModuleList.

Protected Methods

	Name	Description
	GetFactory (see page 6632)	This is GetFactory, a member of class TWebModuleList.
	GetFactoryCount (see page 6632)	
	GetItem (see page 6632)	This is GetItem, a member of class TWebModuleList.
	GetItemCount (see page 6632)	
	GetOnModuleAdded (see page 6633)	
	SetOnModuleAdded (see page 6633)	

Protected Properties

	Name	Description
	Factories (see page 6633)	This is Factories, a member of class TWebModuleList.

Public Methods

	Name	Description
	AddModule (see page 6628)	Adds a module to the Items property array.
	AddModuleClass (see page 6629)	Creates a new Web module, given its class, and adds it to the Items property array.
	AddModuleName (see page 6629)	Creates a new Web module, given its name, and adds it to the Items property array.
	AutoCreateModules (see page 6630)	Instantiates the Web modules that are flagged to handle all incoming requests.
	AutoDestroyModules (see page 6630)	Frees all Web modules that are flagged as inappropriate for caching between requests.
	Create (see page 6627)	Creates and initializes a TWebModuleList (see page 6626) object.
	Destroy (see page 6628)	Frees a TWebModuleList (see page 6626) instance.
	FindModuleClass (see page 6631)	Locates a Web module given its class reference.
	FindModuleName (see page 6631)	Locates a Web module given its name.

65.1.2.2 TWebModuleList.Create Constructor

Creates and initializes a TWebModuleList (see page 6626) object.

Pascal

```
constructor Create(const AFactories: TWebModuleFactoryList);
```

C++

```
__fastcall TWebModuleList(const TWebModuleFactoryList AFactories);
```

Description

There is no need to call the TWebModuleList (see page 6626) constructor. Web module lists are created automatically for each incoming HTTP request.

AFactories is the list of Web module factories in the WebSnap application. TWebModuleList (see page 6626) uses this list to implement the Factory property.

See Also

Factory

65.1.2.3 TWebModuleList.Destroy Destructor

Frees a TWebModuleList (see page 6626) instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebModuleList();
```

Description

Do not free TWebModuleList (see page 6626) objects. Web module lists are freed automatically when the WebSnap application finishes processing the HTTP request.

65.1.2.4 TWebModuleList Methods

The methods of the TWebModuleList class are listed here.

Protected Methods

	Name	Description
	GetFactory (see page 6632)	This is GetFactory, a member of class TWebModuleList.
	GetFactoryCount (see page 6632)	
	GetItem (see page 6632)	This is GetItem, a member of class TWebModuleList.
	GetItemCount (see page 6632)	
	GetOnModuleAdded (see page 6633)	
	SetOnModuleAdded (see page 6633)	

Public Methods

	Name	Description
	AddModule (see page 6628)	Adds a module to the Items property array.
	AddModuleClass (see page 6629)	Creates a new Web module, given its class, and adds it to the Items property array.
	AddModuleName (see page 6629)	Creates a new Web module, given its name, and adds it to the Items property array.
	AutoCreateModules (see page 6630)	Instantiates the Web modules that are flagged to handle all incoming requests.
	AutoDestroyModules (see page 6630)	Frees all Web modules that are flagged as inappropriate for caching between requests.
	FindModuleClass (see page 6631)	Locates a Web module given its class reference.
	FindModuleName (see page 6631)	Locates a Web module given its name.

65.1.2.4.1 TWebModuleList.AddModule Method

Adds a module to the Items property array.

Pascal

```
procedure AddModule(AComponent: TComponent);
```

C++

```
__fastcall AddModule(TComponent * AComponent);
```

Description

Call AddModule to add a newly instantiated Web module to the Items property array.

AComponent is a Web module instance that is not already listed in the Items property array. It must be one of the objects created by a Web module factory from the Factory property array.

See Also

AddModuleName (see page 6629)

AddModuleClass (see page 6629)

Items

Factory

65.1.2.4.2 TWebModuleList.AddModuleClass Method

Creates a new Web module, given its class, and adds it to the Items property array.

Pascal

```
function AddModuleClass(AClass: TComponentClass): TComponent; override;
```

C++

```
virtual __fastcall TComponent * AddModuleClass(TComponentClass AClass);
```

Description

AddModuleClass searches for a Web module factory that can create a Web module of the specified class. If it finds a match, it instantiates the Web module and adds it to the Items property array.

AClass is a class reference to the Web module you want to instantiate. It should not match the class type of any Web module already listed in the Items property array.

AddModuleClass returns the new Web module instance. If the Factory property array does not include a Web module factory that can create a Web module of the specified class, AddModuleClass returns nil (Delphi) or NULL (C++).

See Also

AddModuleName (see page 6629)

AddModule (see page 6628)

Items

Factory

FindModuleClass (see page 6631)

65.1.2.4.3 TWebModuleList.AddModuleName Method

Creates a new Web module, given its name, and adds it to the Items property array.

Pascal

```
function AddModuleName(const AName: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * AddModuleName(const UnicodeString AName);
```

Description

AddModuleName searches for a Web module factory that can create a Web module of the specified name. If it finds a match, it instantiates the Web module and adds it to the Items property array.

AName is the name of the Web module you want to instantiate. It should not match the name of any Web module already listed

in the Items property array.

AddModuleClass (see page 6629) returns the new Web module instance. If the Factory property array does not include a Web module factory that can create a Web module of the specified name, AddModuleClass (see page 6629) returns nil (Delphi) or NULL (C++).

See Also

AddModuleClass (see page 6629)

AddModule (see page 6628)

Items

Factory

FindModuleName (see page 6631)

65.1.2.4.4 TWebModuleList.AutoCreateModules Method

Instantiates the Web modules that are flagged to handle all incoming requests.

Pascal

```
procedure AutoCreateModules;
```

C++

```
__fastcall AutoCreateModules();
```

Description

TWebRequestHandler (see page 6633) calls AutoCreateModules to instantiate all of the Web modules that should be used to handle every incoming request object.

AutoCreateModules searches the module factory list for factory objects that have a CreateMode property with the crAlways flag. For each such factory object, AutoCreateModules creates the corresponding Web module if it does not already exist and adds it to the Items property array.

See Also

CreateMode

AutoDestroyModules (see page 6630)

Items

Factory

TWebRequestHandler (see page 6633)

65.1.2.4.5 TWebModuleList.AutoDestroyModules Method

Frees all Web modules that are flagged as inappropriate for caching between requests.

Pascal

```
procedure AutoDestroyModules;
```

C++

```
__fastcall AutoDestroyModules();
```

Description

TWebRequestHandler (see page 6633) calls AutoDestroyModules when it finishes processing an HTTP request message.

This allows the Web module list to free those Web modules that should not be cached for reuse with another request message.

AutoDestroyModules searches the module factory list for factory objects that have a CacheMode property with the caDestroy flag. For each such factory object, AutoDestroyModules frees the Web module if it exists and removes it from Items property array.

See Also

CacheMode

AutoCreateModules (see page 6630)

Items

TWebRequestHandler (see page 6633)

Factory

65.1.2.4.6 TWebModuleList.FindModuleClass Method

Locates a Web module given its class reference.

Pascal

```
function FindModuleClass(AClass: TComponentClass): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleClass(TComponentClass AClass);
```

Description

Call FindModuleClass to locate the Web module instance of a given class type. FindModuleClass searches the Items property array for a Web module instance of the specified class.

AClass is a class reference to the class type of the desired Web module.

FindModuleClass returns the requested Web module instance if it exists. If there is no Web module of the specified class, FindModuleClass returns nil (Delphi) or NULL (C++).

See Also

FindModuleName (see page 6631)

Items

65.1.2.4.7 TWebModuleList.FindModuleName Method

Locates a Web module given its name.

Pascal

```
function FindModuleName(const AName: string): TComponent; override;
```

C++

```
virtual __fastcall TComponent * FindModuleName(const UnicodeString AName);
```

Description

Call FindModuleName to locate the Web module instance of a given name. FindModuleClass (see page 6631) searches the Items property array for a Web module instance of the specified name.

AName is the name of the desired Web module.

FindModuleName returns the requested Web module instance if it exists. If there is no Web module with the specified name,

FindModuleClass (see page 6631) returns nil (Delphi) or NULL (C++).

See Also

FindModuleClass (see page 6631)

Items

65.1.2.4.8 TWebModuleList.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractWebModuleFactory; override;
```

C++

```
virtual __fastcall TAbstractWebModuleFactory GetFactory(int I);
```

Description

This is GetFactory, a member of class TWebModuleList.

65.1.2.4.9 TWebModuleList.GetFactoryCount Method

Pascal

```
function GetFactoryCount: Integer; override;
```

C++

```
virtual __fastcall int GetFactoryCount();
```

See Also

GetFactory

FactoryCount

65.1.2.4.10 TWebModuleList.GetItem Method

Pascal

```
function GetItem(I: Integer): TComponent; override;
```

C++

```
virtual __fastcall TComponent * GetItem(int I);
```

Description

This is GetItem, a member of class TWebModuleList.

65.1.2.4.11 TWebModuleList.GetItemCount Method

Pascal

```
function GetItemCount: Integer; override;
```

C++

```
virtual __fastcall int GetItemCount();
```

See Also

GetItem

ItemCount

65.1.2.4.12 TWebModuleList.GetOnModuleAdded Method

Pascal

```
function GetOnModuleAdded: TModuleAddedProc; override;
```

C++

```
virtual __fastcall TModuleAddedProc GetOnModuleAdded();
```

See Also

OnModuleAdded

SetOnModuleAdded

65.1.2.4.13 TWebModuleList.SetOnModuleAdded Method

Pascal

```
procedure SetOnModuleAdded(AProc: TModuleAddedProc); override;
```

C++

```
virtual __fastcall SetOnModuleAdded(TModuleAddedProc AProc);
```

See Also

GetOnModuleAdded

OnModuleAdded

65.1.2.5 TWebModuleList Properties

The properties of the TWebModuleList class are listed here.

Protected Properties

	Name	Description
	Factories (see page 6633)	This is Factories, a member of class TWebModuleList.

65.1.2.5.1 TWebModuleList.Factories Property

Pascal

```
property Factories: TWebModuleFactoryList;
```

C++

```
__property TWebModuleFactoryList Factories;
```

Description

This is Factories, a member of class TWebModuleList.

65.1.3 TWebRequestHandler Class

TWebRequestHandler maintains the Web modules in an application and creates request and response objects when the

application receives HTTP request messages.

Class Hierarchy

Pascal

```
TWebRequestHandler = class(TComponent);
```

C++

```
class TWebRequestHandler : public TComponent;
```

File

WebReq

Description

TWebRequestHandler keeps a pool of active Web modules. In response to a request from the application, TWebRequestHandler creates a request object and assigns it to one of the active Web modules.

Do not create instances of TWebRequestHandler. Use TWebRequestHandler as a base class when declaring nonvisual components that can appear on the component palette and be used in the form designer. Properties and methods of TWebRequestHandler provide basic behavior that descendant classes inherit as well as behavior that components can override to customize their behavior.

See Also

TWebApplication (see page 5936)

TWebModule

65.1.3.1 TWebRequestHandler Members

The following tables list the members exposed by TWebRequestHandler.

Protected Methods

	Name	Description
	ActivateWebModules (see page 6636)	Activates a Web module for the application and returns it.
	DeactivateWebModules (see page 6636)	Deactivates the Web module of the application.
	HandleRequest (see page 6637)	Responds to an HTTP request message received by the server.

Public Methods

	Name	Description
	AddWebModuleFactory (see page 6636)	Adds a Web module factory to the request handler.
V	Create (see page 6635)	Creates an instance of TWebRequestHandler (see page 6633).
V	Destroy (see page 6635)	Destroys the TWebRequestHandler (see page 6633) instance and frees its memory.
	HandleException (see page 6637)	Responds to exceptions related to TWebRequestHandler (see page 6633) objects.

Public Properties

	Name	Description
R	ActiveCount (see page 6638)	Indicates the number of active connections currently being serviced by the application.
	CacheConnections (see page 6638)	Determines whether the Web modules used by the application are cached for re-use.
R	InactiveCount (see page 6639)	Indicates the number of Web modules cached for later reuse.
	MaxConnections (see page 6640)	Sets or returns the MaxConnections used by the socket.

	WebModuleClass (see page 6640)	Contains a reference to a Web module.
R	WebModuleFactory (see page 6640)	A list of Web module factory objects.
R	WebModuleFactoryCount (see page 6641)	The number of Web module factories in use by the request handler.

65.1.3.2 TWebRequestHandler.Create Constructor

Creates an instance of TWebRequestHandler (see page 6633).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWebRequestHandler(TComponent * AOwner);
```

Description

Call Create to instantiate a TWebRequestHandler (see page 6633) object.

See Also

Destroy (see page 6635)

65.1.3.3 TWebRequestHandler.Destroy Destructor

Destroys the TWebRequestHandler (see page 6633) instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebRequestHandler();
```

Description

Destroy cleans up references in the global fix-up list for form linking. It then calls the inherited destructor.

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

System::TObject::Destroy (see page 3356)

65.1.3.4 TWebRequestHandler Methods

The methods of the TWebRequestHandler class are listed here.

Protected Methods

	Name	Description
	ActivateWebModules (see page 6636)	Activates a Web module for the application and returns it.
	DeactivateWebModules (see page 6636)	Deactivates the Web module of the application.
	HandleRequest (see page 6637)	Responds to an HTTP request message received by the server.

Public Methods

	Name	Description
	AddWebModuleFactory (see page 6636)	Adds a Web module factory to the request handler.
	HandleException (see page 6637)	Responds to exceptions related to TWebRequestHandler (see page 6633) objects.

65.1.3.4.1 TWebRequestHandler.ActivateWebModules Method

Activates a Web module for the application and returns it.

Pascal

```
function ActivateWebModules: TWebModuleList;
```

C++

```
__fastcall TWebModuleList ActivateWebModules();
```

Description

ActivateWebModules is called internally when the application receives an HTTP request message. If the InactiveCount (see page 6639) property is greater than zero, a cached Web module is reactivated. Otherwise, a new instance of the Web module is created.

Before ActivateWebModules is called, the CreateForm method must be called to register the data module.

Note: In cross-platform applications, a Web application object contains only a single Web module. Usually, that Web module is a TWebModule object, but it may also be an ordinary data module that contains a TWebDispatcher object. If no Web module is associated with the Web application, ActivateWebModule raises an exception. If the ActiveCount (see page 6638) property is already at MaxConnections (see page 6640) when ActivateWebModules is called, ActivateWebModules raises an exception.

See Also

CreateForm (see page 5938)

ActiveCount (see page 6638)

InactiveCount (see page 6639)

MaxConnections (see page 6640)

65.1.3.4.2 TWebRequestHandler.AddWebModuleFactory Method

Adds a Web module factory to the request handler.

Pascal

```
procedure AddWebModuleFactory(AFactory: TAbstractWebModuleFactory);
```

C++

```
__fastcall AddWebModuleFactory(TAbstractWebModuleFactory AFactory);
```

Description

AddWebModuleFactory is used to add a Web module factory to the Web request handler. Web module factories are for internal use, and should not require any attention from developers.

65.1.3.4.3 TWebRequestHandler.DeactivateWebModules Method

Deactivates the Web module of the application.

Pascal

```
procedure DeactivateWebModules(WebModules: TWebModuleList);
```

C++

```
__fastcall DeactivateWebModules(TWebModuleList WebModules);
```

Description

Do not call DeactivateWebModules directly. The Web application calls DeactivateWebModules internally after handling an HTTP request message. When CacheConnections (see page 6638) is true, the Web module remains inactive until the next request message is received. When CacheConnections (see page 6638) is false, the runtime instance of the Web module is destroyed.

See Also

ActivateWebModules (see page 6636)

CacheConnections (see page 6638)

HandleRequest (see page 6637)

InactiveCount (see page 6639)

65.1.3.4.4 TWebRequestHandler.HandleException Method

Responds to exceptions related to TWebRequestHandler (see page 6633) objects.

Pascal

```
procedure HandleException(Sender: TObject);
```

C++

```
__fastcall HandleException(TObject * Sender);
```

Description

When exceptions occur in TWebRequestHandler (see page 6633) and descendant objects, HandleException will attempt to deal with it. If it cannot do so, it displays an error message to the user.

65.1.3.4.5 TWebRequestHandler.HandleRequest Method

Responds to an HTTP request message received by the server.

Pascal

```
function HandleRequest(Request: TWebRequest; Response: TWebResponse): Boolean;
```

C++

```
__fastcall Boolean HandleRequest(TWebRequest Request, TWebResponse Response);
```

Description

When a descendant of TWebApplication receives an HTTP request message, it creates a TWebRequest object to represent the message, and a TWebResponse message to match the request. It then calls HandleRequest, passing those objects as the Request and Response parameters.

HandleRequest activates the Web module associated with the Web application. It then passes the request and response objects to the dispatcher, so that it can dispatch the request to the appropriate action items. When the dispatcher returns, HandleRequest checks whether the response was handled but not sent, and if not, sends it. Finally, HandleRequest deactivates the data module.

HandleRequest returns a Boolean value indicating whether the request message was handled and sent.

See Also

ActivateWebModules (see page 6636)

DeactivateWebModules (see page 6636)

65.1.3.5 TWebRequestHandler Properties

The properties of the TWebRequestHandler class are listed here.

Public Properties

	Name	Description
R	ActiveCount (see page 6638)	Indicates the number of active connections currently being serviced by the application.
	CacheConnections (see page 6638)	Determines whether the Web modules used by the application are cached for re-use.
R	InactiveCount (see page 6639)	Indicates the number of Web modules cached for later reuse.
	MaxConnections (see page 6640)	Sets or returns the MaxConnections used by the socket.
	WebModuleClass (see page 6640)	Contains a reference to a Web module.
R	WebModuleFactory (see page 6640)	A list of Web module factory objects.
R	WebModuleFactoryCount (see page 6641)	The number of Web module factories in use by the request handler.

65.1.3.5.1 TWebRequestHandler.ActiveCount Property

Indicates the number of active connections currently being serviced by the application.

Pascal

```
property ActiveCount: Integer;
```

C++

```
__property int ActiveCount;
```

Description

Use ActiveCount to monitor the number of HTTP request messages the application is servicing at any one time. Over time, this value provides an indication of the optimal value for the MaxConnections (see page 6640) property.

Each time an Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) application receives an HTTP request message, it generates a new instance of the Web module. After the response is returned to the Web client, the Web module is either destroyed or deactivated and cached for later reuse. Each active Web module resides in a separate execution thread.

ActiveCount is the number of Web modules currently in use. InactiveCount (see page 6639) is the number of deactivated Web modules cached for later reuse. MaxConnections (see page 6640) is the maximum number of Web modules that can be active at any time. ActiveCount can never exceed MaxConnections (see page 6640).

Note: ActiveCount is only meaningful for Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only)

applications. Each CGI application handles only a single request message.

See Also

InactiveCount (see page 6639)

65.1.3.5.2 TWebRequestHandler.CacheConnections Property

Determines whether the Web modules used by the application are cached for re-use.

Pascal

```
property CacheConnections: Boolean;
```

C++

```
__property Boolean CacheConnections;
```

Description

Each time an Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) application receives an HTTP request message, it spawns a thread to handle the request and creates a new Web module that contains instances of all the objects used in the Web application. To improve performance, these Web modules can be saved in a cache when the thread associated with the HTTP request message finishes executing.

Set CacheConnections to true to have the Web application save inactive Web modules in a cache. Caching the Web modules speeds performance as new instances of the Web module and its contents do not need to be created every time a request message is received. Set CacheConnections to false to have the Web application create a new Web module for every request thread. Recreating the Web module ensures that changes made to the module or its contents when servicing the last request do not cause unexpected behavior the next time the module is activated.

CacheConnections is only relevant to Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) Web applications.

See Also

MaxConnections (see page 6640)

65.1.3.5.3 TWebRequestHandler.InactiveCount Property

Indicates the number of Web modules cached for later reuse.

Pascal

```
property InactiveCount: Integer;
```

C++

```
__property int InactiveCount;
```

Description

Use InactiveCount to monitor the number of unused Web modules. Over time, this value provides an indication of the optimal value for the MaxConnections (see page 6640) property.

When CacheConnections (see page 6638) is true, each time an Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only) application receives an HTTP request message, it reactivates one of the inactive Web modules. The application generates a new instance of the Web module if InactiveCount is 0. After the response is returned to the Web client, the Web module is deactivated again, and counted by the InactiveCount property.

When CacheConnections (see page 6638) is false, a new Web module is created for each HTTP request message and destroyed when the response is returned. InactiveCount is always 0 when CacheConnections (see page 6638) is false.

Note: InactiveCount is only meaningful for Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only)

applications. Each CGI application handles only a single request message, so there is no need to cache unused data modules.

See Also

ActiveCount (see page 6638)

65.1.3.5.4 TWebRequestHandler.MaxConnections Property

Sets or returns the MaxConnections used by the socket.

Pascal

```
property MaxConnections: Integer;
```

C++

```
__property int MaxConnections;
```

Description

Set MaxConnections to adjust the number of HTTP request messages the application can handle simultaneously. Use the ActiveCount (see page 6638) and InactiveCount (see page 6639) properties to get a sense of the frequency and duration of request messages. Then set MaxConnections so that it is high enough to avoid exceptions when the application runs out of Web modules, but low enough not to degrade performance too severely by running too many simultaneous threads.

If a request message is received when ActiveCount (see page 6638) is already at MaxConnections, the application raises an exception.

Note: InactiveCount (see page 6639) is only meaningful for Apache (cross-platform), ISAPI (Windows only), or NSAPI (Windows only)

applications. Each CGI application handles only a single request message, so there is no need to cache unused data modules.

See Also

CacheConnections (see page 6638)

65.1.3.5.5 TWebRequestHandler.WebModuleClass Property

Contains a reference to a Web module.

Pascal

```
property WebModuleClass: TComponentClass;
```

C++

```
__property TComponentClass WebModuleClass;
```

Description

WebModuleClass is a reference to a Web module, and is for internal use only. When ActivateWebModules (see page 6636) is called, it is used in that method to help generate infrastructure for a Web module.

See Also

ActivateWebModules (see page 6636)

65.1.3.5.6 TWebRequestHandler.WebModuleFactory Property

A list of Web module factory objects.

Pascal

```
property WebModuleFactory [I: Integer]: TAbstractWebModuleFactory;
```

C++

```
__property TAbstractWebModuleFactory WebModuleFactory[int I];
```

Description

This is a list of Web module factory objects, which are intended for internal use.

See Also

WebModuleFactoryCount (see page 6641)

65.1.3.5.7 TWebRequestHandler.WebModuleFactoryCount Property

The number of Web module factories in use by the request handler.

Pascal

```
property WebModuleFactoryCount: Integer;
```

C++

```
__property int WebModuleFactoryCount;
```

Description

WebModuleFactoryCount is the number of Web module factories in use by the request handler. This property is intended for internal use.

See Also

WebModuleFactory (see page 6640)

65.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	WebRequestHandler (see page 6642)	Returns a TWebRequestHandler (see page 6633) object.

65.2.1 WebReq.WebRequestHandler Function

Returns a TWebRequestHandler (see page 6633) object.

Pascal

```
function WebRequestHandler: TWebRequestHandler;
```

C++

```
TWebRequestHandler WebRequestHandler();
```

File

WebReq

Description

Use the WebRequestHandler function to obtain a reference to the global TWebRequestHandler (see page 6633) object. This object manages all the Web modules in the application, and creates Web request and response objects when the application receives HTTP request messages.

See Also

TWebApplication (see page 5936)

TWebModule

65.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TRequestNotification (see page 6643)	This is record WebReq.TRequestNotification.

65.3.1 WebReq.TRequestNotification Enumeration

Pascal

```
TRequestNotification = (
  rnActivateModule,
  rnDeactivateModule,
  rnCreateModule,
  rnFreeModule,
  rnStartRequest,
  rnFinishRequest
);
```

C++

```
enum TRequestNotification {
  rnActivateModule,
  rnDeactivateModule,
  rnCreateModule,
  rnFreeModule,
  rnStartRequest,
  rnFinishRequest
};
```

File

WebReq

Description

This is record WebReq.TRequestNotification.

65.4 Variables

The following table lists variables in this documentation.

Variables

Name	Description
WebRequestHandlerProc (see page 6644)	This is variable WebReq.WebRequestHandlerProc.

65.4.1 WebReq.WebRequestHandlerProc Variable

Pascal

```
WebRequestHandlerProc: function: TWebRequestHandler = nil;
```

C++

```
function: TWebRequestHandler WebRequestHandlerProc = nil;
```

File

WebReq

Description

This is variable WebReq.WebRequestHandlerProc.

66 WebScript Namespace

This is namespace WebScript.

Topics

Name	Description
Classes (see page 6647)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 6720)	The following table lists structs, records, enums in this documentation.
Types (see page 6722)	The following table lists types in this documentation.
Constants (see page 6723)	The following table lists constants in this documentation.

Classes

	Name	Description
	ERecursiveIncludeFile (see page 6647)	This is class WebScript.ERecursiveIncludeFile.
	EScriptEvalError (see page 6648)	This is class WebScript.EScriptEvalError.
	TAbstractScriptEngine (see page 6648)	This is class WebScript.TAbstractScriptEngine.
	TAbstractScriptObjectFactories (see page 6652)	This is class WebScript.TAbstractScriptObjectFactories.
	TAbstractScriptObjectFactory (see page 6655)	This is class WebScript.TAbstractScriptObjectFactory.
	TCurrentWebPageInfo (see page 6657)	This is class WebScript.TCurrentWebPageInfo.
	THTMLItem (see page 6662)	This is class WebScript.THTMLItem.
	THTMLItems (see page 6665)	This is class WebScript.THTMLItems.
	TLineNumberMap (see page 6668)	This is class WebScript.TLineNumberMap.
	TScriptCodeItem (see page 6671)	This is class WebScript.TScriptCodeItem.
	TScriptEnginesList (see page 6673)	This is class WebScript.TScriptEnginesList.
	TScriptError (see page 6677)	This is class WebScript.TScriptError.
	TScriptErrors (see page 6681)	This is class WebScript.TScriptErrors.
	TScriptFile (see page 6683)	This is class WebScript.TScriptFile.
	TScriptGlobalObjects (see page 6687)	This is class WebScript.TScriptGlobalObjects.
	TScriptIncludeFile (see page 6692)	This is class WebScript.TScriptIncludeFile.
	TScriptIncludeFiles (see page 6693)	This is class WebScript.TScriptIncludeFiles.
	TScriptIncludeItem (see page 6696)	This is class WebScript.TScriptIncludeItem.
	TScriptItem (see page 6698)	This is class WebScript.TScriptItem.
	TScriptItems (see page 6700)	This is class WebScript.TScriptItems.
	TScriptObjectFactories (see page 6702)	This is class WebScript.TScriptObjectFactories.
	TScriptProducer (see page 6707)	This is class WebScript.TScriptProducer.
	TVariableLookup (see page 6716)	This is class WebScript.TVariableLookup.

Constants

Name	Description
GlobalScriptVariableNames (see page 6723)	This is constant WebScript.GlobalScriptVariableNames.

Structs, Records, Enums

	Name	Description
	TGlobalScriptVariables (see page 6720)	This is record WebScript.TGlobalScriptVariables.
	TIncludeType (see page 6721)	This is record WebScript.TIncludeType.
	TLineNumbers (see page 6721)	This is record WebScript.TLineNumbers.

Types

Name	Description
CreateComponentStubFactory (see page 6722)	This is type WebScript.CreateComponentStubFactory.
PLineNumbers (see page 6722)	This is type WebScript.PLineNumbers.

66.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	ERecursiveIncludeFile (see page 6647)	This is class WebScript.ERecursiveIncludeFile.
	EScriptEvalError (see page 6648)	This is class WebScript.EScriptEvalError.
	TAbstractScriptEngine (see page 6648)	This is class WebScript.TAbstractScriptEngine.
	TAbstractScriptObjectFactories (see page 6652)	This is class WebScript.TAbstractScriptObjectFactories.
	TAbstractScriptObjectFactory (see page 6655)	This is class WebScript.TAbstractScriptObjectFactory.
	TCurrentWebPageInfo (see page 6657)	This is class WebScript.TCurrentWebPageInfo.
	THTMLItem (see page 6662)	This is class WebScript.THTMLItem.
	THTMLItems (see page 6665)	This is class WebScript.THTMLItems.
	TLineNumberMap (see page 6668)	This is class WebScript.TLineNumberMap.
	TScriptCodeItem (see page 6671)	This is class WebScript.TScriptCodeItem.
	TScriptEnginesList (see page 6673)	This is class WebScript.TScriptEnginesList.
	TScriptError (see page 6677)	This is class WebScript.TScriptError.
	TScriptErrors (see page 6681)	This is class WebScript.TScriptErrors.
	TScriptFile (see page 6683)	This is class WebScript.TScriptFile.
	TScriptGlobalObjects (see page 6687)	This is class WebScript.TScriptGlobalObjects.
	TScriptIncludeFile (see page 6692)	This is class WebScript.TScriptIncludeFile.
	TScriptIncludeFiles (see page 6693)	This is class WebScript.TScriptIncludeFiles.
	TScriptIncludeItem (see page 6696)	This is class WebScript.TScriptIncludeItem.
	TScriptItem (see page 6698)	This is class WebScript.TScriptItem.
	TScriptItems (see page 6700)	This is class WebScript.TScriptItems.
	TScriptObjectFactories (see page 6702)	This is class WebScript.TScriptObjectFactories.
	TScriptProducer (see page 6707)	This is class WebScript.TScriptProducer.
	TVariableLookup (see page 6716)	This is class WebScript.TVariableLookup.

66.1.1 ERecursiveIncludeFile Class

Class Hierarchy

Pascal

```
ERecursiveIncludeFile = class(EScriptError);
```

C++

```
class ERecursiveIncludeFile : public EScriptError;
```

File

WebScript

Description

This is class WebScript.ERecursiveIncludeFile.

66.1.2 EScriptEvalError Class

Class Hierarchy

Pascal

```
EScriptEvalError = class(EWebBrokerException);
```

C++

```
class EScriptEvalError : public EWebBrokerException;
```

File

WebScript

Description

This is class WebScript.EScriptEvalError.

66.1.3 TAbstractScriptEngine Class

Class Hierarchy

Pascal

```
TAbstractScriptEngine = class(TObject);
```

C++

```
class TAbstractScriptEngine : public TObject;
```

File

WebScript

Description

This is class WebScript.TAbstractScriptEngine.

66.1.3.1 TAbstractScriptEngine Members

The following tables list the members exposed by TAbstractScriptEngine.

Public Methods

	Name	Description
	AddObjectFactory (see page 6650)	This is AddObjectFactory, a member of class TAbstractScriptEngine.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.

	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6649)	This is Create, a member of class TAbstractScriptEngine.
	CreateComponentStub (see page 6651)	This is CreateComponentStub, a member of class TAbstractScriptEngine.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6649)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
A	ListLanguageNames (see page 6651)	This is ListLanguageNames, a member of class TAbstractScriptEngine.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
A	SupportsLanguage (see page 6651)	This is SupportsLanguage, a member of class TAbstractScriptEngine.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Name (see page 6651)	This is Name, a member of class TAbstractScriptEngine.
R	ScriptObjectFactories (see page 6652)	This is ScriptObjectFactories, a member of class TAbstractScriptEngine.
	ScriptProducerClass (see page 6652)	This is ScriptProducerClass, a member of class TAbstractScriptEngine.

66.1.3.2 TAbstractScriptEngine.Create Constructor

Pascal

```
constructor Create(const AName: string);
```

C++

```
__fastcall TAbstractScriptEngine(const UnicodeString AName);
```

Description

This is Create, a member of class TAbstractScriptEngine.

66.1.3.3 TAbstractScriptEngine.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TAbstractScriptEngine();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

66.1.3.4 TAbstractScriptEngine Methods

The methods of the TAbstractScriptEngine class are listed here.

Public Methods

	Name	Description
	AddObjectFactory (see page 6650)	This is AddObjectFactory, a member of class TAbstractScriptEngine.
	CreateComponentStub (see page 6651)	This is CreateComponentStub, a member of class TAbstractScriptEngine.
	ListLanguageNames (see page 6651)	This is ListLanguageNames, a member of class TAbstractScriptEngine.
	SupportsLanguage (see page 6651)	This is SupportsLanguage, a member of class TAbstractScriptEngine.

66.1.3.4.1 TAbstractScriptEngine.AddObjectFactory Method

Pascal

```
procedure AddObjectFactory(AFactory: TAbstractScriptObjectFactory);
```

C++

```
__fastcall AddObjectFactory(TAbstractScriptObjectFactory AFactory);
```

Description

This is AddObjectFactory, a member of class TAbstractScriptEngine.

66.1.3.4.2 TAbstractScriptEngine.CreateComponentStub Method

Pascal

```
function CreateComponentStub(AObject: TObject): IInterface;
```

C++

```
__fastcall IInterface CreateComponentStub(TObject * AObject);
```

Description

This is CreateComponentStub, a member of class TAbstractScriptEngine.

66.1.3.4.3 TAbstractScriptEngine.ListLanguageNames Method

Pascal

```
procedure ListLanguageNames(AList: TStrings); virtual; abstract;
```

C++

```
virtual __fastcall ListLanguageNames(TStrings AList) = 0;
```

Description

This is ListLanguageNames, a member of class TAbstractScriptEngine.

66.1.3.4.4 TAbstractScriptEngine.SupportsLanguage Method

Pascal

```
function SupportsLanguage(const AName: string): Boolean; virtual; abstract;
```

C++

```
virtual __fastcall Boolean SupportsLanguage(const UnicodeString AName) = 0;
```

Description

This is SupportsLanguage, a member of class TAbstractScriptEngine.

66.1.3.5 TAbstractScriptEngine Properties

The properties of the TAbstractScriptEngine class are listed here.

Public Properties

	Name	Description
	Name (see page 6651)	This is Name, a member of class TAbstractScriptEngine.
	ScriptObjectFactories (see page 6652)	This is ScriptObjectFactories, a member of class TAbstractScriptEngine.
	ScriptProducerClass (see page 6652)	This is ScriptProducerClass, a member of class TAbstractScriptEngine.

66.1.3.5.1 TAbstractScriptEngine.Name Property

Pascal

```
property Name: string;
```

C++

```
__property UnicodeString Name;
```

Description

This is Name, a member of class TAbstractScriptEngine.

66.1.3.5.2 TAbstractScriptEngine.ScriptObjectFactories Property

Pascal

```
property ScriptObjectFactories: TAbstractScriptObjectFactories;
```

C++

```
__property TAbstractScriptObjectFactories ScriptObjectFactories;
```

Description

This is ScriptObjectFactories, a member of class TAbstractScriptEngine.

66.1.3.5.3 TAbstractScriptEngine.ScriptProducerClass Property

Pascal

```
property ScriptProducerClass: TScriptProducerClass;
```

C++

```
__property TScriptProducerClass ScriptProducerClass;
```

Description

This is ScriptProducerClass, a member of class TAbstractScriptEngine.

66.1.4 TAbstractScriptObjectFactories Class

Class Hierarchy

Pascal

```
TAbstractScriptObjectFactories = class(TObject);
```

C++

```
class TAbstractScriptObjectFactories : public TObject;
```

File

WebScript

Description

This is class WebScript.TAbstractScriptObjectFactories.

66.1.4.1 TAbstractScriptObjectFactories Members

The following tables list the members exposed by TAbstractScriptObjectFactories.

Protected Methods

	Name	Description
	GetCount (see page 6654)	This is GetCount, a member of class TAbstractScriptObjectFactories.
	GetFactory (see page 6654)	This is GetFactory, a member of class TAbstractScriptObjectFactories.
	GetObjectList (see page 6654)	This is GetObjectList, a member of class TAbstractScriptObjectFactories.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Count (see page 6655)	This is Count, a member of class TAbstractScriptObjectFactories.
	Factories (see page 6655)	This is Factories, a member of class TAbstractScriptObjectFactories.
	ObjectList (see page 6655)	This is ObjectList, a member of class TAbstractScriptObjectFactories.

66.1.4.2 TAbstractScriptObjectFactories Methods

The methods of the TAbstractScriptObjectFactories class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 6654)	This is GetCount, a member of class TAbstractScriptObjectFactories.
	GetFactory (see page 6654)	This is GetFactory, a member of class TAbstractScriptObjectFactories.
	GetObjectList (see page 6654)	This is GetObjectList, a member of class TAbstractScriptObjectFactories.

66.1.4.2.1 TAbstractScriptObjectFactories.GetCount Method

Pascal

```
function GetCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCount() = 0;
```

Description

This is GetCount, a member of class TAbstractScriptObjectFactories.

66.1.4.2.2 TAbstractScriptObjectFactories.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractScriptObjectFactory; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractScriptObjectFactory GetFactory(int I) = 0;
```

Description

This is GetFactory, a member of class TAbstractScriptObjectFactories.

66.1.4.2.3 TAbstractScriptObjectFactories.GetObjectList Method

Pascal

```
function GetObjectList: TObjectList; virtual; abstract;
```

C++

```
virtual __fastcall TObjectList GetObjectList() = 0;
```

Description

This is GetObjectList, a member of class TAbstractScriptObjectFactories.

66.1.4.3 TAbstractScriptObjectFactories Properties

The properties of the TAbstractScriptObjectFactories class are listed here.

Public Properties

	Name	Description
	Count (see page 6655)	This is Count, a member of class TAbstractScriptObjectFactories.
	Factories (see page 6655)	This is Factories, a member of class TAbstractScriptObjectFactories.
	ObjectList (see page 6655)	This is ObjectList, a member of class TAbstractScriptObjectFactories.

66.1.4.3.1 TAbstractScriptObjectFactories.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TAbstractScriptObjectFactories.

66.1.4.3.2 TAbstractScriptObjectFactories.Factories Property

Pascal

```
property Factories [I: Integer]: TAbstractScriptObjectFactory;
```

C++

```
__property TAbstractScriptObjectFactory Factories[int I];
```

Description

This is Factories, a member of class TAbstractScriptObjectFactories.

66.1.4.3.3 TAbstractScriptObjectFactories.ObjectList Property

Pascal

```
property ObjectList: TObjectList;
```

C++

```
__property TObjectList ObjectList;
```

Description

This is ObjectList, a member of class TAbstractScriptObjectFactories.

66.1.5 TAbstractScriptObjectFactory Class

Class Hierarchy

Pascal

```
TAbstractScriptObjectFactory = class;
```

C++

```
class TAbstractScriptObjectFactory;
```

File

WebScript

Description

This is class WebScript.TAbstractScriptObjectFactory.

66.1.5.1 TAbstractScriptObjectFactory Members

The following tables list the members exposed by TAbstractScriptObjectFactory.

Protected Methods

	Name	Description
	AddGlobalObjects (see page 6656)	This is AddGlobalObjects, a member of class TAbstractScriptObjectFactory.
	CreateComponentObject (see page 6656)	This is CreateComponentObject, a member of class TAbstractScriptObjectFactory.
	CreateProducerObject (see page 6657)	This is CreateProducerObject, a member of class TAbstractScriptObjectFactory.
	GetScriptEngine (see page 6657)	This is GetScriptEngine, a member of class TAbstractScriptObjectFactory.

Public Methods

	Name	Description
	CreateGlobalObject (see page 6657)	This is CreateGlobalObject, a member of class TAbstractScriptObjectFactory.

66.1.5.2 TAbstractScriptObjectFactory Methods

The methods of the TAbstractScriptObjectFactory class are listed here.

Protected Methods

	Name	Description
	AddGlobalObjects (see page 6656)	This is AddGlobalObjects, a member of class TAbstractScriptObjectFactory.
	CreateComponentObject (see page 6656)	This is CreateComponentObject, a member of class TAbstractScriptObjectFactory.
	CreateProducerObject (see page 6657)	This is CreateProducerObject, a member of class TAbstractScriptObjectFactory.
	GetScriptEngine (see page 6657)	This is GetScriptEngine, a member of class TAbstractScriptObjectFactory.

Public Methods

	Name	Description
	CreateGlobalObject (see page 6657)	This is CreateGlobalObject, a member of class TAbstractScriptObjectFactory.

66.1.5.2.1 TAbstractScriptObjectFactory.AddGlobalObjects Method

Pascal

```
procedure AddGlobalObjects(AScriptGlobalObjects: TScriptGlobalObjects); virtual;
```

C++

```
virtual __fastcall AddGlobalObjects(TScriptGlobalObjects AScriptGlobalObjects);
```

Description

This is AddGlobalObjects, a member of class TAbstractScriptObjectFactory.

66.1.5.2.2 TAbstractScriptObjectFactory.CreateComponentObject Method

Pascal

```
function CreateComponentObject(AComponent: TObject; AClassKey: TClass): IInterface; virtual;
abstract;
```

C++

```
virtual __fastcall IInterface CreateComponentObject(TObject * AComponent, TClass AClassKey) =
0;
```

Description

This is CreateComponentObject, a member of class TAbstractScriptObjectFactory.

66.1.5.2.3 TAbstractScriptObjectFactory.CreateGlobalObject Method

Pascal

```
function CreateGlobalObject(AVariable: TGlobalScriptVariables; AContext: IScriptContext):
IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateGlobalObject(TGlobalScriptVariables AVariable,
IScriptContext AContext) = 0;
```

Description

This is CreateGlobalObject, a member of class TAbstractScriptObjectFactory.

66.1.5.2.4 TAbstractScriptObjectFactory.CreateProducerObject Method

Pascal

```
function CreateProducerObject(AVariable: TGlobalScriptVariables; AProducer: IScriptProducer):
IInterface; virtual; abstract;
```

C++

```
virtual __fastcall IInterface CreateProducerObject(TGlobalScriptVariables AVariable,
IScriptProducer AProducer) = 0;
```

Description

This is CreateProducerObject, a member of class TAbstractScriptObjectFactory.

66.1.5.2.5 TAbstractScriptObjectFactory.GetScriptEngine Method

Pascal

```
function GetScriptEngine: TAbstractScriptEngine; virtual; abstract;
```

C++

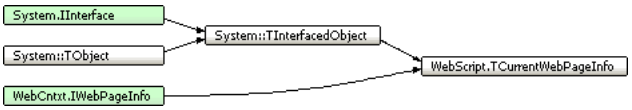
```
virtual __fastcall TAbstractScriptEngine GetScriptEngine() = 0;
```

Description

This is GetScriptEngine, a member of class TAbstractScriptObjectFactory.

66.1.6 TCurrentWebPageInfo Class

Class Hierarchy



Pascal

```
TCurrentWebPageInfo = class(TInterfacedObject, IWebPageInfo);
```

C++

```
class TCurrentWebPageInfo : public TInterfacedObject, public IWebPageInfo;
```

File

WebScript

Description

This is class WebScript.TCurrentWebPageInfo.

66.1.6.1 TCurrentWebPageInfo Members

The following tables list the members exposed by TCurrentWebPageInfo.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	GetHasViewAccess (see page 6660)	Returns the value of the HasViewAccess property.
	GetLoginRequired (see page 6660)	Returns the value of the LoginRequired property.
	GetPageDescription (see page 6660)	Returns the value of the PageDescription property.
	GetPageHREF (see page 6661)	Returns the value of the PageHREF property.
	GetPageIsPublished (see page 6661)	Returns the value of the PageIsPublished property.
	GetPageName (see page 6661)	Returns the value of the PageName property.
	GetPageTitle (see page 6662)	Returns the value of the PageTitle property.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	WebPageInfo (see page 6662)	This is WebPageInfo, a member of class TCurrentWebPageInfo.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6659)	This is Create, a member of class TCurrentWebPageInfo.

	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	HasViewAccess (see page 6000)	Indicates whether the current user has access rights to view the Web page.
	LoginRequired (see page 6000)	Indicates whether callers must log in before accessing this Web page.
	PageDescription (see page 6000)	Describes the Web page.
	PageHREF (see page 6001)	Identifies the HREF to use for references to the associated Web page.
	PageIsPublished (see page 6001)	Indicates whether the WebSnap application automatically displays the Web page in response to request messages where the pathinfo portion of the target URL matches PageName (see page 6002).
	PageName (see page 6002)	Denotes the logical name for the Web page.
	PageTitle (see page 6002)	Indicates the title that appears on the Web page.
	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.

66.1.6.2 TCurrentWebPageInfo.Create Constructor

Pascal

```
constructor Create(AContext: IScriptContext);
```

C++

```
__fastcall TCurrentWebPageInfo(IScriptContext AContext);
```

Description

This is Create, a member of class TCurrentWebPageInfo.

66.1.6.3 TCurrentWebPageInfo Methods

The methods of the TCurrentWebPageInfo class are listed here.

Protected Methods

	Name	Description
	GetHasViewAccess (see page 6660)	Returns the value of the HasViewAccess property.
	GetLoginRequired (see page 6660)	Returns the value of the LoginRequired property.
	GetPageDescription (see page 6660)	Returns the value of the PageDescription property.
	GetPageHREF (see page 6661)	Returns the value of the PageHREF property.
	GetPageIsPublished (see page 6661)	Returns the value of the PageIsPublished property.
	GetPageName (see page 6661)	Returns the value of the PageName property.
	GetPageTitle (see page 6662)	Returns the value of the PageTitle property.
	WebPageInfo (see page 6662)	This is WebPageInfo, a member of class TCurrentWebPageInfo.

66.1.6.3.1 TCurrentWebPageInfo.GetHasViewAccess Method

Returns the value of the HasViewAccess property.

Pascal

```
function GetHasViewAccess: Boolean;
```

C++

```
__fastcall Boolean GetHasViewAccess();
```

Description

GetHasViewAccess is the read implementation of the HasViewAccess property.

See Also

HasViewAccess (see page 6000)

66.1.6.3.2 TCurrentWebPageInfo.GetLoginRequired Method

Returns the value of the LoginRequired property.

Pascal

```
function GetLoginRequired: Boolean;
```

C++

```
__fastcall Boolean GetLoginRequired();
```

Description

GetLoginRequired is the read implementation of the LoginRequired property.

See Also

LoginRequired (see page 6000)

66.1.6.3.3 TCurrentWebPageInfo.GetPageDescription Method

Returns the value of the PageDescription property.

Pascal

```
function GetPageDescription: string;
```

C++

```
__fastcall UnicodeString GetPageDescription();
```

Description

GetPageDescription is the read implementation of the PageDescription property.

See Also

PageDescription (see page 6000)

66.1.6.3.4 TCurrentWebPageInfo.GetPageHREF Method

Returns the value of the PageHREF property.

Pascal

```
function GetPageHREF: string;
```

C++

```
__fastcall UnicodeString GetPageHREF();
```

Description

GetPageHREF is the read implementation of the PageHREF property.

See Also

PageHREF (see page 6001)

66.1.6.3.5 TCurrentWebPageInfo.GetPageIsPublished Method

Returns the value of the PageIsPublished property.

Pascal

```
function GetPageIsPublished: Boolean;
```

C++

```
__fastcall Boolean GetPageIsPublished();
```

Description

GetPageIsPublished is the read implementation of the PageIsPublished property.

See Also

PageIsPublished (see page 6001)

66.1.6.3.6 TCurrentWebPageInfo.GetPageName Method

Returns the value of the PageName property.

Pascal

```
function GetPageName: string;
```

C++

```
__fastcall UnicodeString GetPageName();
```

Description

GetPageName is the read implementation of the PageName property.

See Also

PageName (see page 6002)

66.1.6.3.7 TCurrentWebPageInfo.GetPageTitle Method

Returns the value of the PageTitle property.

Pascal

```
function GetPageTitle: string;
```

C++

```
__fastcall UnicodeString GetPageTitle();
```

Description

GetPageTitle is the read implementation of the PageTitle property.

See Also

PageTitle (see page 6002)

66.1.6.3.8 TCurrentWebPageInfo.WebPageInfo Method

Pascal

```
function WebPageInfo: IWebPageInfo;
```

C++

```
__fastcall IWebPageInfo WebPageInfo();
```

Description

This is WebPageInfo, a member of class TCurrentWebPageInfo.

66.1.7 THTMLItem Class

Class Hierarchy

Pascal

```
THTMLItem = class(TObject);
```

C++

```
class THTMLItem : public TObject;
```

File

WebScript

Description

This is class WebScript.THTMLItem.

66.1.7.1 THTMLItem Members

The following tables list the members exposed by THTMLItem.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	AssignString (see page 6664)	This is AssignString, a member of class THTMLItem.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6664)	This is Create, a member of class THTMLItem.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	HTML (see page 6664)	This is HTML, a member of class THTMLItem.
	Ident (see page 6665)	This is Ident, a member of class THTMLItem.
	ItemLength (see page 6665)	This is ItemLength, a member of class THTMLItem.
	TagToken (see page 6665)	This is TagToken, a member of class THTMLItem.

66.1.7.2 THTMLItem.Create Constructor

Pascal

```
constructor Create(AItems: THTMLItems);
```

C++

```
__fastcall THTMLItem(THTMLItems AItems);
```

Description

This is Create, a member of class THTMLItem.

66.1.7.3 THTMLItem Methods

The methods of the THTMLItem class are listed here.

Public Methods

	Name	Description
	AssignString (see page 6664)	This is AssignString, a member of class THTMLItem.

66.1.7.3.1 THTMLItem.AssignString Method

Pascal

```
procedure AssignString(AOffset: Integer; AHTML: PAnsiChar; ALength: Integer; AEncoding:
TEncoding);
```

C++

```
__fastcall AssignString(int AOffset, PAnsiChar AHTML, int ALength, TEncoding AEncoding);
```

Description

This is AssignString, a member of class THTMLItem.

66.1.7.4 THTMLItem Properties

The properties of the THTMLItem class are listed here.

Public Properties

	Name	Description
R	HTML (see page 6664)	This is HTML, a member of class THTMLItem.
R	Ident (see page 6665)	This is Ident, a member of class THTMLItem.
R	ItemLength (see page 6665)	This is ItemLength, a member of class THTMLItem.
	TagToken (see page 6665)	This is TagToken, a member of class THTMLItem.

66.1.7.4.1 THTMLItem.HTML Property

Pascal

```
property HTML: string;
```

C++

```
__property UnicodeString HTML;
```

Description

This is HTML, a member of class THTMLItem.

66.1.7.4.2 THTMLItem.Ident Property

Pascal

```
property Ident: string;
```

C++

```
__property UnicodeString Ident;
```

Description

This is Ident, a member of class THTMLItem.

66.1.7.4.3 THTMLItem.ItemLength Property

Pascal

```
property ItemLength: Integer;
```

C++

```
__property int ItemLength;
```

Description

This is ItemLength, a member of class THTMLItem.

66.1.7.4.4 THTMLItem.TagToken Property

Pascal

```
property TagToken: Boolean;
```

C++

```
__property Boolean TagToken;
```

Description

This is TagToken, a member of class THTMLItem.

66.1.8 THTMLItems Class

Class Hierarchy

Pascal

```
THTMLItems = class(TObjectList);
```

C++

```
class THTMLItems : public TObjectList;
```

File

WebScript

Description

This is class WebScript.THTMLItems.

66.1.8.1 THTMLItems Members

The following tables list the members exposed by THTMLItems.

Public Methods

	Name	Description
	Create (see page 6666)	This is Create, a member of class THTMLItems.
V	Destroy (see page 6666)	Destroys an instance of TList.
	GetHTMLItem (see page 6667)	This is GetHTMLItem, a member of class THTMLItems.
	MakeIdentifier (see page 6667)	This is MakeIdentifier, a member of class THTMLItems.

Public Properties

	Name	Description
R	Items (see page 6667)	Lists the object references.

66.1.8.2 THTMLItems.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall THTMLItems(TScriptProducer AProducer);
```

Description

This is Create, a member of class THTMLItems.

66.1.8.3 THTMLItems.Destroy Destructor

Destroys an instance of TList.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~THTMLItems();
```

Description

Do not call Destroy directly. Instead, call Free. Free verifies that the TList reference is not nil, and only then calls Destroy.

Destroy frees the memory used to store the list of items.

Note: Destroy does not free the memory pointed to by the elements of the list.

See Also

System::TObject::Free (see page 3372)

66.1.8.4 THTMLItems Methods

The methods of the THTMLItems class are listed here.

Public Methods

	Name	Description
	GetHTMLItem (see page 6667)	This is GetHTMLItem, a member of class THTMLItems.
	MakeIdentifier (see page 6667)	This is MakeIdentifier, a member of class THTMLItems.

66.1.8.4.1 THTMLItems.GetHTMLItem Method

Pascal

```
function GetHTMLItem(I: Integer): THTMLItem;
```

C++

```
__fastcall THTMLItem GetHTMLItem(int I);
```

Description

This is GetHTMLItem, a member of class THTMLItems.

66.1.8.4.2 THTMLItems.MakeIdentifier Method

Pascal

```
function MakeIdentifier(AItem: THTMLItem): string;
```

C++

```
__fastcall UnicodeString MakeIdentifier(THTMLItem AItem);
```

Description

This is MakeIdentifier, a member of class THTMLItems.

66.1.8.5 THTMLItems Properties

The properties of the THTMLItems class are listed here.

Public Properties

	Name	Description
R	Items (see page 6667)	Lists the object references.

66.1.8.5.1 THTMLItems.Items Property

Lists the object references.

Pascal

```
property Items [Index: Integer]: THTMLItem;
```

C++

```
__property THTMLItem Items[int Index];
```

Description

Use Items to access objects in the list. Items is a zero-based array: The first object is indexed as 0, the second object is indexed as 1, and so forth. You can read or change the value at a specific index, or use Items with the Count property to iterate through the list.

If OwnsObjects is true, reassigning an Items index frees the object that previously occupied that position in the list.

Items can contain nil (Delphi) or NULL (C++) references. To remove nil (Delphi) or NULL (C++) references and reduce the size of the array, call the Pack method.

Note: In Delphi, Items is the default property of TObjectList. This means you can omit the property name. Thus, the following two lines of code are both acceptable and do the same thing:

Note: ObjectList1.Items[i] := Form1.FindChildControl(ListBox1.Items[i]);

Note: ObjectList1[i] := Form1.FindChildControl(ListBox1.Items[i]);

66.1.9 TLineNumberMap Class

Class Hierarchy

Pascal

```
TLineNumberMap = class(TObject);
```

C++

```
class TLineNumberMap : public TObject;
```

File

WebScript

Description

This is class WebScript.TLineNumberMap.

66.1.9.1 TLineNumberMap Members

The following tables list the members exposed by TLineNumberMap.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	DestLineToSourceLine (see page 6670)	This is DestLineToSourceLine, a member of class TLineNumberMap.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	New (see page 6670)	This is New, a member of class TLineNumberMap.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Count (see page 6670)	This is Count, a member of class TLineNumberMap.
	Items (see page 6671)	This is Items, a member of class TLineNumberMap.

66.1.9.2 TLineNumberMap Methods

The methods of the TLineNumberMap class are listed here.

Public Methods

	Name	Description
	DestLineToSourceLine (see page 6670)	This is DestLineToSourceLine, a member of class TLineNumberMap.
	New (see page 6670)	This is New, a member of class TLineNumberMap.

66.1.9.2.1 TLineNumberMap.DestLineToSourceLine Method

Pascal

```
function DestLineToSourceLine(ALine: Integer; var AFileName: string): Integer;
```

C++

```
__fastcall int DestLineToSourceLine(int ALine, UnicodeString AFileName);
```

Description

This is DestLineToSourceLine, a member of class TLineNumberMap.

66.1.9.2.2 TLineNumberMap.New Method

Pascal

```
function New: PLineNumbers;
```

C++

```
__fastcall PLineNumbers New();
```

Description

This is New, a member of class TLineNumberMap.

66.1.9.3 TLineNumberMap Properties

The properties of the TLineNumberMap class are listed here.

Public Properties

	Name	Description
R	Count (see page 6670)	This is Count, a member of class TLineNumberMap.
R	Items (see page 6671)	This is Items, a member of class TLineNumberMap.

66.1.9.3.1 TLineNumberMap.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TLineNumberMap.

66.1.9.3.2 TLineNumberMap.Items Property

Pascal

```
property Items [I: Integer]: PLineNumbers;
```

C++

```
__property PLineNumbers Items[int I];
```

Description

This is Items, a member of class TLineNumberMap.

66.1.10 TScriptCodeItem Class

Class Hierarchy

Pascal

```
TScriptCodeItem = class(TScriptItem);
```

C++

```
class TScriptCodeItem : public TScriptItem;
```

File

WebScript

Description

This is class WebScript.TScriptCodeItem.

66.1.10.1 TScriptCodeItem Members

The following tables list the members exposed by TScriptCodeItem.

Protected Methods

	Name	Description
	GetScript (see page 6673)	This is GetScript, a member of class TScriptCodeItem.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	AssignString (see page 6672)	This is AssignString, a member of class TScriptCodeItem.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.

	Create (see page 6699)	This is Create, a member of class TScriptItem.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Script (see page 6700)	This is Script, a member of class TScriptItem.

66.1.10.2 TScriptCodeItem Methods

The methods of the TScriptCodeItem class are listed here.

Protected Methods

	Name	Description
V	GetScript (see page 6673)	This is GetScript, a member of class TScriptCodeItem.

Public Methods

	Name	Description
	AssignString (see page 6672)	This is AssignString, a member of class TScriptCodeItem.

66.1.10.2.1 TScriptCodeItem.AssignString Method

Pascal

```
procedure AssignString(const AValue: string);
```

C++

```
__fastcall AssignString(const UnicodeString AValue);
```

Description

This is AssignString, a member of class TScriptCodeItem.

66.1.10.2.2 TScriptCodeItem.GetScript Method

Pascal

```
function GetScript: string; override;
```

C++

```
virtual __fastcall UnicodeString GetScript();
```

Description

This is GetScript, a member of class TScriptCodeItem.

66.1.11 TScriptEnginesList Class

Class Hierarchy

Pascal

```
TScriptEnginesList = class(TAbstractScriptEnginesList);
```

C++

```
class TScriptEnginesList : public TAbstractScriptEnginesList;
```

File

WebScript

Description

This is class WebScript.TScriptEnginesList.

66.1.11.1 TScriptEnginesList Members

The following tables list the members exposed by TScriptEnginesList.

Public Methods

	Name	Description
	AddEngine (see page 6675)	This is AddEngine, a member of class TScriptEnginesList.
	AddObjectFactory (see page 6675)	This is AddObjectFactory, a member of class TScriptEnginesList.
	Create (see page 6674)	Constructs an object and initializes its data before the object is first used.
V	Destroy (see page 6674)	Disposes of an object instance.
	Find (see page 6675)	This is Find, a member of class TScriptEnginesList.
V	FindScriptProducerClass (see page 6676)	This is FindScriptProducerClass, a member of class TScriptEnginesList.
	ListLanguageNames (see page 6676)	This is ListLanguageNames, a member of class TScriptEnginesList.
	RemoveEngine (see page 6676)	This is RemoveEngine, a member of class TScriptEnginesList.

Public Properties

	Name	Description
R	Count (see page 6676)	This is Count, a member of class TScriptEnginesList.
R	Items (see page 6677)	This is Items, a member of class TScriptEnginesList.

66.1.11.2 TScriptEnginesList.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScriptEnginesList();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

66.1.11.3 TScriptEnginesList.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptEnginesList();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

66.1.11.4 TScriptEnginesList Methods

The methods of the TScriptEnginesList class are listed here.

Public Methods

	Name	Description
	AddEngine (see page 6675)	This is AddEngine, a member of class TScriptEnginesList.
	AddObjectFactory (see page 6675)	This is AddObjectFactory, a member of class TScriptEnginesList.
	Find (see page 6675)	This is Find, a member of class TScriptEnginesList.
	FindScriptProducerClass (see page 6676)	This is FindScriptProducerClass, a member of class TScriptEnginesList.
	ListLanguageNames (see page 6676)	This is ListLanguageNames, a member of class TScriptEnginesList.
	RemoveEngine (see page 6676)	This is RemoveEngine, a member of class TScriptEnginesList.

66.1.11.4.1 TScriptEnginesList.AddEngine Method

Pascal

```
procedure AddEngine(AEngine: TAbstractScriptEngine);
```

C++

```
__fastcall AddEngine(TAbstractScriptEngine AEngine);
```

Description

This is AddEngine, a member of class TScriptEnginesList.

66.1.11.4.2 TScriptEnginesList.AddObjectFactory Method

Pascal

```
procedure AddObjectFactory(AFactory: TAbstractScriptObjectFactory; const AEngineName: string);
```

C++

```
__fastcall AddObjectFactory(TAbstractScriptObjectFactory AFactory, const UnicodeString
AEngineName);
```

Description

This is AddObjectFactory, a member of class TScriptEnginesList.

66.1.11.4.3 TScriptEnginesList.Find Method

Pascal

```
function Find(const AName: string): TAbstractScriptEngine;
```

C++

```
__fastcall TAbstractScriptEngine Find(const UnicodeString AName);
```

Description

This is Find, a member of class TScriptEnginesList.

66.1.11.4.4 TScriptEnginesList.FindScriptProducerClass Method

Pascal

```
function FindScriptProducerClass(const ALanguageName: string): TScriptProducerClass; override;
```

C++

```
virtual __fastcall TScriptProducerClass FindScriptProducerClass(const UnicodeString
ALanguageName);
```

Description

This is FindScriptProducerClass, a member of class TScriptEnginesList.

66.1.11.4.5 TScriptEnginesList.ListLanguageNames Method

Pascal

```
procedure ListLanguageNames(AList: TStrings);
```

C++

```
__fastcall ListLanguageNames(TStrings AList);
```

Description

This is ListLanguageNames, a member of class TScriptEnginesList.

66.1.11.4.6 TScriptEnginesList.RemoveEngine Method

Pascal

```
procedure RemoveEngine(AEngine: TAbstractScriptEngine);
```

C++

```
__fastcall RemoveEngine(TAbstractScriptEngine AEngine);
```

Description

This is RemoveEngine, a member of class TScriptEnginesList.

66.1.11.5 TScriptEnginesList Properties

The properties of the TScriptEnginesList class are listed here.

Public Properties

	Name	Description
	Count (see page 6676)	This is Count, a member of class TScriptEnginesList.
	Items (see page 6677)	This is Items, a member of class TScriptEnginesList.

66.1.11.5.1 TScriptEnginesList.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TScriptEnginesList.

66.1.11.5.2 TScriptEnginesList.Items Property

Pascal

```
property Items [I: Integer]: TAbstractScriptEngine;
```

C++

```
__property TAbstractScriptEngine Items[int I];
```

Description

This is Items, a member of class TScriptEnginesList.

66.1.12 TScriptError Class

Class Hierarchy

Pascal

```
TScriptError = class(TAbstractScriptError);
```

C++

```
class TScriptError : public TAbstractScriptError;
```

File

WebScript

Description

This is class WebScript.TScriptError.

66.1.12.1 TScriptError Members

The following tables list the members exposed by TScriptError.

Protected Fields

	Name	Description
	FCharPos (see page 6678)	This is FCharPos, a member of class TScriptError.
	FDescription (see page 6678)	This is FDescription, a member of class TScriptError.
	FFileName (see page 6679)	This is FFileName, a member of class TScriptError.
	FLine (see page 6679)	This is FLine, a member of class TScriptError.
	FSourceLine (see page 6679)	This is FSourceLine, a member of class TScriptError.

Protected Methods

	Name	Description
	GetCharPos (see page 6679)	This is GetCharPos, a member of class TScriptError.
	GetDescription (see page 6680)	This is GetDescription, a member of class TScriptError.
	GetFileName (see page 6680)	This is GetFileName, a member of class TScriptError.
	GetLine (see page 6680)	This is GetLine, a member of class TScriptError.

	GetSourceLine (see page 6680)	This is GetSourceLine, a member of class TScriptError.
	SetDescription (see page 6681)	This is SetDescription, a member of class TScriptError.

Public Methods

	Name	Description
	Create (see page 6678)	This is Create, a member of class TScriptError.

66.1.12.2 TScriptError.Create Constructor

Pascal

```
constructor Create(E: Exception); overload;
```

C++

```
__fastcall TScriptError(Exception E);
```

Description

This is Create, a member of class TScriptError.

66.1.12.3 TScriptError Fields

The fields of the TScriptError class are listed here.

Protected Fields

	Name	Description
	FCharPos (see page 6678)	This is FCharPos, a member of class TScriptError.
	FDescription (see page 6678)	This is FDescription, a member of class TScriptError.
	FFileName (see page 6679)	This is FFileName, a member of class TScriptError.
	FLine (see page 6679)	This is FLine, a member of class TScriptError.
	FSourceLine (see page 6679)	This is FSourceLine, a member of class TScriptError.

66.1.12.3.1 TScriptError.FCharPos Field

Pascal

```
FCharPos: Integer;
```

C++

```
int FCharPos;
```

Description

This is FCharPos, a member of class TScriptError.

66.1.12.3.2 TScriptError.FDescription Field

Pascal

```
FDescription: string;
```

C++

```
UnicodeString FDescription;
```

Description

This is FDescription, a member of class TScriptError.

66.1.12.3.3 TScriptError.FFileName Field

Pascal

```
FFileName: string;
```

C++

```
UnicodeString FFileName;
```

Description

This is FFileName, a member of class TScriptError.

66.1.12.3.4 TScriptError.FLine Field

Pascal

```
FLine: Integer;
```

C++

```
int FLine;
```

Description

This is FLine, a member of class TScriptError.

66.1.12.3.5 TScriptError.FSourceLine Field

Pascal

```
FSourceLine: string;
```

C++

```
UnicodeString FSourceLine;
```

Description

This is FSourceLine, a member of class TScriptError.

66.1.12.4 TScriptError Methods

The methods of the TScriptError class are listed here.

Protected Methods

	Name	Description
	GetCharPos (see page 6679)	This is GetCharPos, a member of class TScriptError.
	GetDescription (see page 6680)	This is GetDescription, a member of class TScriptError.
	GetFileName (see page 6680)	This is GetFileName, a member of class TScriptError.
	GetLine (see page 6680)	This is GetLine, a member of class TScriptError.
	GetSourceLine (see page 6680)	This is GetSourceLine, a member of class TScriptError.
	SetDescription (see page 6681)	This is SetDescription, a member of class TScriptError.

66.1.12.4.1 TScriptError.GetCharPos Method

Pascal

```
function GetCharPos: Integer; override;
```

C++

```
virtual __fastcall int GetCharPos();
```

Description

This is GetCharPos, a member of class TScriptError.

66.1.12.4.2 TScriptError.GetDescription Method

Pascal

```
function GetDescription: string; override;
```

C++

```
virtual __fastcall UnicodeString GetDescription();
```

Description

This is GetDescription, a member of class TScriptError.

66.1.12.4.3 TScriptError.GetFileName Method

Pascal

```
function GetFileName: string; override;
```

C++

```
virtual __fastcall UnicodeString GetFileName();
```

Description

This is GetFileName, a member of class TScriptError.

66.1.12.4.4 TScriptError.GetLine Method

Pascal

```
function GetLine: Integer; override;
```

C++

```
virtual __fastcall int GetLine();
```

Description

This is GetLine, a member of class TScriptError.

66.1.12.4.5 TScriptError.GetSourceLine Method

Pascal

```
function GetSourceLine: string; override;
```

C++

```
virtual __fastcall UnicodeString GetSourceLine();
```

Description

This is GetSourceLine, a member of class TScriptError.

66.1.12.4.6 TScriptError.SetDescription Method

Pascal

```
procedure SetDescription(const AValue: string); override;
```

C++

```
virtual __fastcall SetDescription(const UnicodeString AValue);
```

Description

This is SetDescription, a member of class TScriptError.

66.1.13 TScriptErrors Class

Class Hierarchy

Pascal

```
TScriptErrors = class(TAbstractScriptErrors);
```

C++

```
class TScriptErrors : public TAbstractScriptErrors;
```

File

WebScript

Description

This is class WebScript.TScriptErrors.

66.1.13.1 TScriptErrors Members

The following tables list the members exposed by TScriptErrors.

Protected Methods

	Name	Description
	GetError (see page 6683)	This is GetError, a member of class TScriptErrors.
	GetErrorCount (see page 6683)	This is GetErrorCount, a member of class TScriptErrors.

Public Methods

	Name	Description
	Add (see page 6683)	This is Add, a member of class TScriptErrors.
	Create (see page 6681)	Constructs an object and initializes its data before the object is first used.
	Destroy (see page 6682)	Disposes of an object instance.

66.1.13.2 TScriptErrors.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScriptErrors();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

66.1.13.3 TScriptErrors.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptErrors();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

66.1.13.4 TScriptErrors Methods

The methods of the TScriptErrors class are listed here.

Protected Methods

	Name	Description
	GetError (see page 6683)	This is GetError, a member of class TScriptErrors.
	GetErrorCount (see page 6683)	This is GetErrorCount, a member of class TScriptErrors.

Public Methods

	Name	Description
	Add (see page 6683)	This is Add, a member of class TScriptErrors.

66.1.13.4.1 TScriptErrors.Add Method

Pascal

```
procedure Add(const AError: TAbstractScriptError); override;
```

C++

```
virtual __fastcall Add(const TAbstractScriptError AError);
```

Description

This is Add, a member of class TScriptErrors.

66.1.13.4.2 TScriptErrors.GetError Method

Pascal

```
function GetError(I: Integer): TAbstractScriptError; override;
```

C++

```
virtual __fastcall TAbstractScriptError GetError(int I);
```

Description

This is GetError, a member of class TScriptErrors.

66.1.13.4.3 TScriptErrors.GetErrorCount Method

Pascal

```
function GetErrorCount: Integer; override;
```

C++

```
virtual __fastcall int GetErrorCount();
```

Description

This is GetErrorCount, a member of class TScriptErrors.

66.1.14 TScriptFile Class

Class Hierarchy

Pascal

```
TScriptFile = class;
```

C++

```
class TScriptFile;
```

File

WebScript

Description

This is class WebScript.TScriptFile.

66.1.14.1 TScriptFile Members

The following tables list the members exposed by TScriptFile.

Public Fields

	Name	Description
	FLineNumberMap (see page 6685)	This is FLineNumberMap, a member of class TScriptFile.

Public Methods

	Name	Description
	Create (see page 6684)	This is Create, a member of class TScriptFile.
V	Destroy (see page 6684)	This is Destroy, a member of class TScriptFile.
	ParseStream (see page 6685)	This is ParseStream, a member of class TScriptFile.
	ParseString (see page 6685)	This is ParseString, a member of class TScriptFile.

Public Properties

	Name	Description
R	ApplicationName (see page 6686)	This is ApplicationName, a member of class TScriptFile.
R	LongName (see page 6686)	This is LongName, a member of class TScriptFile.
R	Script (see page 6686)	This is Script, a member of class TScriptFile.
R	ShortName (see page 6687)	This is ShortName, a member of class TScriptFile.
R	Source (see page 6687)	This is Source, a member of class TScriptFile.

66.1.14.2 TScriptFile.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall TScriptFile(TScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptFile.

66.1.14.3 TScriptFile.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptFile();
```

Description

This is Destroy, a member of class TScriptFile.

66.1.14.4 TScriptFile Fields

The fields of the TScriptFile class are listed here.

Public Fields

	Name	Description
	FLineNumberMap (see page 6685)	This is FLineNumberMap, a member of class TScriptFile.

66.1.14.4.1 TScriptFile.FLineNumberMap Field

Pascal

```
FLineNumberMap: TLineNumberMap;
```

C++

```
TLineNumberMap FLineNumberMap;
```

Description

This is FLineNumberMap, a member of class TScriptFile.

66.1.14.5 TScriptFile Methods

The methods of the TScriptFile class are listed here.

Public Methods

	Name	Description
	ParseStream (see page 6685)	This is ParseStream, a member of class TScriptFile.
	ParseString (see page 6685)	This is ParseString, a member of class TScriptFile.

66.1.14.5.1 TScriptFile.ParseStream Method

Pascal

```
procedure ParseStream(ASource: TStream; AOwned: Boolean);
```

C++

```
__fastcall ParseStream(TStream ASource, Boolean AOwned);
```

Description

This is ParseStream, a member of class TScriptFile.

66.1.14.5.2 TScriptFile.ParseString Method

Pascal

```
procedure ParseString(const ASource: string);
```

C++

```
__fastcall ParseString(const UnicodeString ASource);
```

Description

This is ParseString, a member of class TScriptFile.

66.1.14.6 TScriptFile Properties

The properties of the TScriptFile class are listed here.

Public Properties

	Name	Description
	ApplicationName (see page 6686)	This is ApplicationName, a member of class TScriptFile.
	LongName (see page 6686)	This is LongName, a member of class TScriptFile.
	Script (see page 6686)	This is Script, a member of class TScriptFile.
	ShortName (see page 6687)	This is ShortName, a member of class TScriptFile.
	Source (see page 6687)	This is Source, a member of class TScriptFile.

66.1.14.6.1 TScriptFile.ApplicationName Property

Pascal

```
property ApplicationName: string;
```

C++

```
__property UnicodeString ApplicationName;
```

Description

This is ApplicationName, a member of class TScriptFile.

66.1.14.6.2 TScriptFile.LongName Property

Pascal

```
property LongName: string;
```

C++

```
__property UnicodeString LongName;
```

Description

This is LongName, a member of class TScriptFile.

66.1.14.6.3 TScriptFile.Script Property

Pascal

```
property Script: string;
```

C++

```
__property UnicodeString Script;
```

Description

This is Script, a member of class TScriptFile.

66.1.14.6.4 TScriptFile.ShortName Property

Pascal

```
property ShortName: string;
```

C++

```
__property UnicodeString ShortName;
```

Description

This is ShortName, a member of class TScriptFile.

66.1.14.6.5 TScriptFile.Source Property

Pascal

```
property Source: string;
```

C++

```
__property UnicodeString Source;
```

Description

This is Source, a member of class TScriptFile.

66.1.15 TScriptGlobalObjects Class

Class Hierarchy

Pascal

```
TScriptGlobalObjects = class(TObject);
```

C++

```
class TScriptGlobalObjects : public TObject;
```

File

WebScript

Description

This is class WebScript.TScriptGlobalObjects.

66.1.15.1 TScriptGlobalObjects Members

The following tables list the members exposed by TScriptGlobalObjects.

Protected Methods

	Name	Description
	GetScriptEngine (see page 6690)	This is GetScriptEngine, a member of class TScriptGlobalObjects.

Public Methods

	Name	Description
	AddNamedIntf (see page 6690)	This is AddNamedIntf, a member of class TScriptGlobalObjects.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6688)	This is Create, a member of class TScriptGlobalObjects.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6689)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindNamedItemIntf (see page 6690)	This is FindNamedItemIntf, a member of class TScriptGlobalObjects.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetNamedItemCount (see page 6690)	This is GetNamedItemCount, a member of class TScriptGlobalObjects.
	GetNamedItemName (see page 6690)	This is GetNamedItemName, a member of class TScriptGlobalObjects.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	NamedItemCount (see page 6691)	This is NamedItemCount, a member of class TScriptGlobalObjects.
R	NamedItemName (see page 6691)	This is NamedItemName, a member of class TScriptGlobalObjects.
R	Producer (see page 6691)	This is Producer, a member of class TScriptGlobalObjects.
R	ScriptEngine (see page 6692)	This is ScriptEngine, a member of class TScriptGlobalObjects.

66.1.15.2 TScriptGlobalObjects.Create Constructor

Pascal

```
constructor Create(AProducer: IScriptProducer);
```

C++

```
__fastcall TScriptGlobalObjects(IScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptGlobalObjects.

66.1.15.3 TScriptGlobalObjects.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptGlobalObjects();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

66.1.15.4 TScriptGlobalObjects Methods

The methods of the TScriptGlobalObjects class are listed here.

Protected Methods

	Name	Description
	GetScriptEngine (see page 6690)	This is GetScriptEngine, a member of class TScriptGlobalObjects.

Public Methods

	Name	Description
	AddNamedIntf (see page 6690)	This is AddNamedIntf, a member of class TScriptGlobalObjects.
	FindNamedItemIntf (see page 6690)	This is FindNamedItemIntf, a member of class TScriptGlobalObjects.
	GetNamedItemCount (see page 6690)	This is GetNamedItemCount, a member of class TScriptGlobalObjects.
	GetNamedItemName (see page 6690)	This is GetNamedItemName, a member of class TScriptGlobalObjects.

66.1.15.4.1 TScriptGlobalObjects.AddNamedIntf Method

Pascal

```
procedure AddNamedIntf(const AName: string; AIntf: IUnknown);
```

C++

```
__fastcall AddNamedIntf(const UnicodeString AName, IUnknown AIntf);
```

Description

This is AddNamedIntf, a member of class TScriptGlobalObjects.

66.1.15.4.2 TScriptGlobalObjects.FindNamedItemIntf Method

Pascal

```
function FindNamedItemIntf(const AName: string): IUnknown;
```

C++

```
__fastcall IUnknown FindNamedItemIntf(const UnicodeString AName);
```

Description

This is FindNamedItemIntf, a member of class TScriptGlobalObjects.

66.1.15.4.3 TScriptGlobalObjects.GetNamedItemCount Method

Pascal

```
function GetNamedItemCount: Integer;
```

C++

```
__fastcall int GetNamedItemCount();
```

Description

This is GetNamedItemCount, a member of class TScriptGlobalObjects.

66.1.15.4.4 TScriptGlobalObjects.GetNamedItemName Method

Pascal

```
function GetNamedItemName(I: Integer): string;
```

C++

```
__fastcall UnicodeString GetNamedItemName(int I);
```

Description

This is GetNamedItemName, a member of class TScriptGlobalObjects.

66.1.15.4.5 TScriptGlobalObjects.GetScriptEngine Method

Pascal

```
function GetScriptEngine: TAbstractScriptEngine; virtual; abstract;
```

C++

```
virtual __fastcall TAbstractScriptEngine GetScriptEngine() = 0;
```

Description

This is GetScriptEngine, a member of class TScriptGlobalObjects.

66.1.15.5 TScriptGlobalObjects Properties

The properties of the TScriptGlobalObjects class are listed here.

Public Properties

	Name	Description
	NamedItemCount (see page 6691)	This is NamedItemCount, a member of class TScriptGlobalObjects.
	NamedItemName (see page 6691)	This is NamedItemName, a member of class TScriptGlobalObjects.
	Producer (see page 6691)	This is Producer, a member of class TScriptGlobalObjects.
	ScriptEngine (see page 6692)	This is ScriptEngine, a member of class TScriptGlobalObjects.

66.1.15.5.1 TScriptGlobalObjects.NamedItemCount Property

Pascal

```
property NamedItemCount: Integer;
```

C++

```
__property int NamedItemCount;
```

Description

This is NamedItemCount, a member of class TScriptGlobalObjects.

66.1.15.5.2 TScriptGlobalObjects.NamedItemName Property

Pascal

```
property NamedItemName [I: Integer]: string;
```

C++

```
__property UnicodeString NamedItemName[int I];
```

Description

This is NamedItemName, a member of class TScriptGlobalObjects.

66.1.15.5.3 TScriptGlobalObjects.Producer Property

Pascal

```
property Producer: IScriptProducer;
```

C++

```
__property IScriptProducer Producer;
```

Description

This is Producer, a member of class TScriptGlobalObjects.

66.1.15.5.4 TScriptGlobalObjects.ScriptEngine Property

Pascal

```
property ScriptEngine: TAbstractScriptEngine;
```

C++

```
__property TAbstractScriptEngine ScriptEngine;
```

Description

This is ScriptEngine, a member of class TScriptGlobalObjects.

66.1.16 TScriptIncludeFile Class

Class Hierarchy

Pascal

```
TScriptIncludeFile = class(TScriptFile);
```

C++

```
class TScriptIncludeFile : public TScriptFile;
```

File

WebScript

Description

This is class WebScript.TScriptIncludeFile.

66.1.16.1 TScriptIncludeFile Members

The following tables list the members exposed by TScriptIncludeFile.

Public Fields

	Name	Description
	FLineNumberMap (see page 6685)	This is FLineNumberMap, a member of class TScriptFile.

Public Methods

	Name	Description
	Create (see page 6693)	This is Create, a member of class TScriptIncludeFile.
V	Destroy (see page 6684)	This is Destroy, a member of class TScriptFile.
	LoadFile (see page 6693)	This is LoadFile, a member of class TScriptIncludeFile.
	ParseStream (see page 6685)	This is ParseStream, a member of class TScriptFile.
	ParseString (see page 6685)	This is ParseString, a member of class TScriptFile.

Public Properties

	Name	Description
R	ApplicationName (see page 6686)	This is ApplicationName, a member of class TScriptFile.
R	LongName (see page 6686)	This is LongName, a member of class TScriptFile.
R	Script (see page 6686)	This is Script, a member of class TScriptFile.

	ShortName (see page 6687)	This is ShortName, a member of class TScriptFile.
	Source (see page 6687)	This is Source, a member of class TScriptFile.

66.1.16.2 TScriptIncludeFile.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer; AIncludeType: TIncludeType; const AFileName:
string);
```

C++

```
__fastcall TScriptIncludeFile(TScriptProducer AProducer, TIncludeType AIncludeType, const
UnicodeString AFileName);
```

Description

This is Create, a member of class TScriptIncludeFile.

66.1.16.3 TScriptIncludeFile Methods

The methods of the TScriptIncludeFile class are listed here.

Public Methods

	Name	Description
	LoadFile (see page 6693)	This is LoadFile, a member of class TScriptIncludeFile.

66.1.16.3.1 TScriptIncludeFile.LoadFile Method

Pascal

```
procedure LoadFile;
```

C++

```
__fastcall LoadFile();
```

Description

This is LoadFile, a member of class TScriptIncludeFile.

66.1.17 TScriptIncludeFiles Class

Class Hierarchy

Pascal

```
TScriptIncludeFiles = class(TObjectList);
```

C++

```
class TScriptIncludeFiles : public TObjectList;
```

File

WebScript

Description

This is class WebScript.TScriptIncludeFiles.

66.1.17.1 TScriptIncludeFiles Members

The following tables list the members exposed by TScriptIncludeFiles.

Public Methods

	Name	Description
	Create (see page 6694)	This is Create, a member of class TScriptIncludeFiles.
	GetScriptIncludeFile (see page 6694)	This is GetScriptIncludeFile, a member of class TScriptIncludeFiles.

Public Properties

	Name	Description
	Items (see page 6695)	Lists the object references.

66.1.17.2 TScriptIncludeFiles.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall TScriptIncludeFiles(TScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptIncludeFiles.

66.1.17.3 TScriptIncludeFiles Methods

The methods of the TScriptIncludeFiles class are listed here.

Public Methods

	Name	Description
	GetScriptIncludeFile (see page 6694)	This is GetScriptIncludeFile, a member of class TScriptIncludeFiles.

66.1.17.3.1 TScriptIncludeFiles.GetScriptIncludeFile Method

Pascal

```
function GetScriptIncludeFile(I: Integer): TScriptIncludeFile;
```

C++

```
__fastcall TScriptIncludeFile GetScriptIncludeFile(int I);
```

Description

This is GetScriptIncludeFile, a member of class TScriptIncludeFiles.

66.1.17.4 TScriptIncludeFiles Properties

The properties of the TScriptIncludeFiles class are listed here.

Public Properties

	Name	Description
	Items (see page 6695)	Lists the object references.

66.1.17.4.1 TScriptIncludeFiles.Items Property

Lists the object references.

Pascal

```
property Items [Index: Integer]: TScriptIncludeFile;
```

C++

```
__property TScriptIncludeFile Items[int Index];
```

Description

Use Items to access objects in the list. Items is a zero-based array: The first object is indexed as 0, the second object is indexed as 1, and so forth. You can read or change the value at a specific index, or use Items with the Count property to iterate through the list.

If OwnsObjects is true, reassigning an Items index frees the object that previously occupied that position in the list.

Items can contain nil (Delphi) or NULL (C++) references. To remove nil (Delphi) or NULL (C++) references and reduce the size of the array, call the Pack method.

Note: In Delphi, Items is the default property of TObjectList. This means you can omit the property name. Thus, the following two lines of code are both acceptable and do the same thing:

Note: ObjectList1.Items[i] := Form1.FindChildControl(ListBox1.Items[i]);

Note: ObjectList1[i] := Form1.FindChildControl(ListBox1.Items[i]);

66.1.18 TScriptIncludeItem Class

Class Hierarchy

Pascal

```
TScriptIncludeItem = class(TScriptItem);
```

C++

```
class TScriptIncludeItem : public TScriptItem;
```

File

WebScript

Description

This is class WebScript.TScriptIncludeItem.

66.1.18.1 TScriptIncludeItem Members

The following tables list the members exposed by TScriptIncludeItem.

Protected Methods

	Name	Description
	GetScript (see page 6697)	This is GetScript, a member of class TScriptIncludeItem.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6697)	This is Create, a member of class TScriptIncludeItem.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Script (see page 6700)	This is Script, a member of class TScriptItem.

66.1.18.2 TScriptIncludeItem.Create Constructor

Pascal

```
constructor Create(AItems: TScriptItems; AIncludeFile: TScriptIncludeFile);
```

C++

```
__fastcall TScriptIncludeItem(TScriptItems AItems, TScriptIncludeFile AIncludeFile);
```

Description

This is Create, a member of class TScriptIncludeItem.

66.1.18.3 TScriptIncludeItem Methods

The methods of the TScriptIncludeItem class are listed here.

Protected Methods

	Name	Description
V	GetScript (see page 6697)	This is GetScript, a member of class TScriptIncludeItem.

66.1.18.3.1 TScriptIncludeItem.GetScript Method

Pascal

```
function GetScript: string; override;
```

C++

```
virtual __fastcall UnicodeString GetScript();
```

Description

This is GetScript, a member of class TScriptIncludeItem.

66.1.19 TScriptItem Class

Class Hierarchy

Pascal

```
TScriptItem = class(TObject);
```

C++

```
class TScriptItem : public TObject;
```

File

WebScript

Description

This is class WebScript.TScriptItem.

66.1.19.1 TScriptItem Members

The following tables list the members exposed by TScriptItem.

Protected Methods

	Name	Description
	GetScript (see page 6699)	This is GetScript, a member of class TScriptItem.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6699)	This is Create, a member of class TScriptItem.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.

	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	Script (see page 6700)	This is Script, a member of class TScriptItem.

66.1.19.2 TScriptItem.Create Constructor

Pascal

```
constructor Create(AItems: TScriptItems);
```

C++

```
__fastcall TScriptItem(TScriptItems AItems);
```

Description

This is Create, a member of class TScriptItem.

66.1.19.3 TScriptItem Methods

The methods of the TScriptItem class are listed here.

Protected Methods

	Name	Description
V	GetScript (see page 6699)	This is GetScript, a member of class TScriptItem.

66.1.19.3.1 TScriptItem.GetScript Method

Pascal

```
function GetScript: string; virtual;
```

C++

```
virtual __fastcall UnicodeString GetScript();
```

Description

This is GetScript, a member of class TScriptItem.

66.1.19.4 TScriptItem Properties

The properties of the TScriptItem class are listed here.

Public Properties

	Name	Description
	Script (see page 6700)	This is Script, a member of class TScriptItem.

66.1.19.4.1 TScriptItem.Script Property

Pascal

```
property Script: string;
```

C++

```
__property UnicodeString Script;
```

Description

This is Script, a member of class TScriptItem.

66.1.20 TScriptItems Class

Class Hierarchy

Pascal

```
TScriptItems = class(TObjectList);
```

C++

```
class TScriptItems : public TObjectList;
```

File

WebScript

Description

This is class WebScript.TScriptItems.

66.1.20.1 TScriptItems Members

The following tables list the members exposed by TScriptItems.

Public Methods

	Name	Description
	Create (see page 6701)	This is Create, a member of class TScriptItems.
	GetScriptItem (see page 6701)	This is GetScriptItem, a member of class TScriptItems.

Public Properties

	Name	Description
	Items (see page 6701)	Lists the object references.

66.1.20.2 TScriptItems.Create Constructor

Pascal

```
constructor Create(AProducer: TScriptProducer);
```

C++

```
__fastcall TScriptItems(TScriptProducer AProducer);
```

Description

This is Create, a member of class TScriptItems.

66.1.20.3 TScriptItems Methods

The methods of the TScriptItems class are listed here.

Public Methods

	Name	Description
	GetScriptItem (see page 6701)	This is GetScriptItem, a member of class TScriptItems.

66.1.20.3.1 TScriptItems.GetScriptItem Method

Pascal

```
function GetScriptItem(I: Integer): TScriptItem;
```

C++

```
__fastcall TScriptItem GetScriptItem(int I);
```

Description

This is GetScriptItem, a member of class TScriptItems.

66.1.20.4 TScriptItems Properties

The properties of the TScriptItems class are listed here.

Public Properties

	Name	Description
R	Items (see page 6701)	Lists the object references.

66.1.20.4.1 TScriptItems.Items Property

Lists the object references.

Pascal

```
property Items [Index: Integer]: TScriptItem;
```

C++

```
__property TScriptItem Items[int Index];
```

Description

Use Items to access objects in the list. Items is a zero-based array: The first object is indexed as 0, the second object is indexed

as 1, and so forth. You can read or change the value at a specific index, or use Items with the Count property to iterate through the list.

If OwnsObjects is true, reassigning an Items index frees the object that previously occupied that position in the list.

Items can contain nil (Delphi) or NULL (C++) references. To remove nil (Delphi) or NULL (C++) references and reduce the size of the array, call the Pack method.

Note: In Delphi, Items is the default property of TObjectList. This means you can omit the property name. Thus, the following two lines of code are both acceptable and do the same thing:

Note: ObjectList1.Items[i] := Form1.FindChildControl(ListBox1.Items[i]);

Note: ObjectList1[i] := Form1.FindChildControl(ListBox1.Items[i]);

66.1.21 TScriptObjectFactories Class

Class Hierarchy

Pascal

```
TScriptObjectFactories = class(TAbstractScriptObjectFactories);
```

C++

```
class TScriptObjectFactories : public TAbstractScriptObjectFactories;
```

File

WebScript

Description

This is class WebScript.TScriptObjectFactories.

66.1.21.1 TScriptObjectFactories Members

The following tables list the members exposed by TScriptObjectFactories.

Protected Methods

	Name	Description
	GetCount (see page 6705)	This is GetCount, a member of class TScriptObjectFactories.
	GetFactory (see page 6705)	This is GetFactory, a member of class TScriptObjectFactories.
	GetObjectList (see page 6706)	This is GetObjectList, a member of class TScriptObjectFactories.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6704)	Constructs an object and initializes its data before the object is first used.
	CreateGlobalObject (see page 6705)	This is CreateGlobalObject, a member of class TScriptObjectFactories.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 6704)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Count (see page 6706)	This is Count, a member of class TScriptObjectFactories.
	Factories (see page 6706)	This is Factories, a member of class TScriptObjectFactories.
	ObjectList (see page 6655)	This is ObjectList, a member of class TAbstractScriptObjectFactories.

66.1.21.2 TScriptObjectFactories.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TScriptObjectFactories();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

66.1.21.3 TScriptObjectFactories.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptObjectFactories();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

66.1.21.4 TScriptObjectFactories Methods

The methods of the TScriptObjectFactories class are listed here.

Protected Methods

	Name	Description
	GetCount (see page 6705)	This is GetCount, a member of class TScriptObjectFactories.
	GetFactory (see page 6705)	This is GetFactory, a member of class TScriptObjectFactories.
	GetObjectList (see page 6706)	This is GetObjectList, a member of class TScriptObjectFactories.

Public Methods

	Name	Description
	CreateGlobalObject (see page 6705)	This is CreateGlobalObject, a member of class TScriptObjectFactories.

66.1.21.4.1 TScriptObjectFactories.CreateGlobalObject Method

Pascal

```
function CreateGlobalObject(AVariable: TGlobalScriptVariables; AContext: IScriptContext):
IInterface;
```

C++

```
__fastcall IInterface CreateGlobalObject(TGlobalScriptVariables AVariable, IScriptContext
AContext);
```

Description

This is CreateGlobalObject, a member of class TScriptObjectFactories.

66.1.21.4.2 TScriptObjectFactories.GetCount Method

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

This is GetCount, a member of class TScriptObjectFactories.

66.1.21.4.3 TScriptObjectFactories.GetFactory Method

Pascal

```
function GetFactory(I: Integer): TAbstractScriptObjectFactory; override;
```

C++

```
virtual __fastcall TAbstractScriptObjectFactory GetFactory(int I);
```

Description

This is GetFactory, a member of class TScriptObjectFactories.

66.1.21.4.4 TScriptObjectFactories.GetObjectList Method

Pascal

```
function GetObjectList: TObjectList; override;
```

C++

```
virtual __fastcall TObjectList GetObjectList();
```

Description

This is GetObjectList, a member of class TScriptObjectFactories.

66.1.21.5 TScriptObjectFactories Properties

The properties of the TScriptObjectFactories class are listed here.

Public Properties

	Name	Description
	Count (see page 6706)	This is Count, a member of class TScriptObjectFactories.
	Factories (see page 6706)	This is Factories, a member of class TScriptObjectFactories.

66.1.21.5.1 TScriptObjectFactories.Count Property

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

This is Count, a member of class TScriptObjectFactories.

66.1.21.5.2 TScriptObjectFactories.Factories Property

Pascal

```
property Factories [I: Integer]: TAbstractScriptObjectFactory;
```

C++

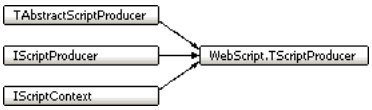
```
__property TAbstractScriptObjectFactory Factories[int I];
```

Description

This is Factories, a member of class TScriptObjectFactories.

66.1.22 TScriptProducer Class

Class Hierarchy



Pascal

```
TScriptProducer = class(TAbstractScriptProducer, IScriptProducer, IScriptContext);
```

C++

```
class TScriptProducer : public TAbstractScriptProducer, public IScriptProducer, public
IScriptContext;
```

File

WebScript

Description

This is class WebScript.TScriptProducer.

66.1.22.1 TScriptProducer Members

The following tables list the members exposed by TScriptProducer.

Protected Fields

	Name	Description
	FErrors (see page 6709)	This is FErrors, a member of class TScriptProducer.
	FScriptEngine (see page 6709)	This is FScriptEngine, a member of class TScriptProducer.
	FScriptFile (see page 6709)	This is FScriptFile, a member of class TScriptProducer.

Protected Methods

	Name	Description
	Evaluate (see page 6710)	This is Evaluate, a member of class TScriptProducer.
A	EvaluateExpression (see page 6710)	This is EvaluateExpression, a member of class TScriptProducer.
	GetContent (see page 6710)	This is GetContent, a member of class TScriptProducer.
	GetErrors (see page 6711)	This is GetErrors, a member of class TScriptProducer.
	GetHTMLBlock (see page 6711)	This is GetHTMLBlock, a member of class TScriptProducer.
	GetHTMLBlockCount (see page 6711)	This is GetHTMLBlockCount, a member of class TScriptProducer.
	GetWebModuleContext (see page 6711)	This is GetWebModuleContext, a member of class TScriptProducer.
	HandleParserError (see page 6712)	This is HandleParserError, a member of class TScriptProducer.
	HandleScriptError (see page 6712)	This is HandleScriptError, a member of class TScriptProducer.
A	ImplHandleScriptError (see page 6712)	This is ImplHandleScriptError, a member of class TScriptProducer.
	ParseStream (see page 6712)	This is ParseStream, a member of class TScriptProducer.
	ParseString (see page 6712)	This is ParseString, a member of class TScriptProducer.
	ReplaceTags (see page 6713)	This is ReplaceTags, a member of class TScriptProducer.
	SetContent (see page 6713)	This is SetContent, a member of class TScriptProducer.
	Write (see page 6713)	This is the overview for the Write method overload.
	WriteItem (see page 6714)	This is WriteItem, a member of class TScriptProducer.

Protected Properties

	Name	Description
	Component (see page 6714)	This is Component, a member of class TScriptProducer.
	Content (see page 6715)	This is Content, a member of class TScriptProducer.
	Designing (see page 6715)	This is Designing, a member of class TScriptProducer.
	Errors (see page 6715)	This is Errors, a member of class TScriptProducer.
	Script (see page 6715)	This is Script, a member of class TScriptProducer.

Public Methods

	Name	Description
	Create (see page 6708)	This is Create, a member of class TScriptProducer.
	Destroy (see page 6708)	Disposes of an object instance.

66.1.22.2 TScriptProducer.Create Constructor

Pascal

```
constructor Create(AWebModuleContext: TWebModuleContext; AStripParamQuotes: Boolean;
AHandleTag: THandleTagProc; const AScriptEngine: string; ALocateFileService:
ILocateFileService); override;
```

C++

```
virtual __fastcall TScriptProducer(TWebModuleContext AWebModuleContext, Boolean
AStripParamQuotes, THandleTagProc AHandleTag, const UnicodeString AScriptEngine,
ILocateFileService ALocateFileService);
```

Description

This is Create, a member of class TScriptProducer.

66.1.22.3 TScriptProducer.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TScriptProducer();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the

object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

66.1.22.4 TScriptProducer Fields

The fields of the TScriptProducer class are listed here.

Protected Fields

	Name	Description
	FErrors (see page 6709)	This is FErrors, a member of class TScriptProducer.
	FScriptEngine (see page 6709)	This is FScriptEngine, a member of class TScriptProducer.
	FScriptFile (see page 6709)	This is FScriptFile, a member of class TScriptProducer.

66.1.22.4.1 TScriptProducer.FErrors Field

Pascal

```
FErrors: TAbstractScriptErrors;
```

C++

```
TAbstractScriptErrors FErrors;
```

Description

This is FErrors, a member of class TScriptProducer.

66.1.22.4.2 TScriptProducer.FScriptEngine Field

Pascal

```
FScriptEngine: string;
```

C++

```
UnicodeString FScriptEngine;
```

Description

This is FScriptEngine, a member of class TScriptProducer.

66.1.22.4.3 TScriptProducer.FScriptFile Field

Pascal

```
FScriptFile: TScriptFile;
```

C++

```
TScriptFile FScriptFile;
```

Description

This is FScriptFile, a member of class TScriptProducer.

66.1.22.5 TScriptProducer Methods

The methods of the TScriptProducer class are listed here.

Protected Methods

	Name	Description
	Evaluate (see page 6710)	This is Evaluate, a member of class TScriptProducer.
A	EvaluateExpression (see page 6710)	This is EvaluateExpression, a member of class TScriptProducer.
	GetContent (see page 6710)	This is GetContent, a member of class TScriptProducer.
	GetErrors (see page 6711)	This is GetErrors, a member of class TScriptProducer.
	GetHTMLBlock (see page 6711)	This is GetHTMLBlock, a member of class TScriptProducer.
	GetHTMLBlockCount (see page 6711)	This is GetHTMLBlockCount, a member of class TScriptProducer.
	GetWebModuleContext (see page 6711)	This is GetWebModuleContext, a member of class TScriptProducer.
	HandleParserError (see page 6712)	This is HandleParserError, a member of class TScriptProducer.
	HandleScriptError (see page 6712)	This is HandleScriptError, a member of class TScriptProducer.
A	ImplHandleScriptError (see page 6712)	This is ImplHandleScriptError, a member of class TScriptProducer.
	ParseStream (see page 6712)	This is ParseStream, a member of class TScriptProducer.
	ParseString (see page 6712)	This is ParseString, a member of class TScriptProducer.
	ReplaceTags (see page 6713)	This is ReplaceTags, a member of class TScriptProducer.
	SetContent (see page 6713)	This is SetContent, a member of class TScriptProducer.
	Write (see page 6713)	This is the overview for the Write method overload.
	WriteItem (see page 6714)	This is WriteItem, a member of class TScriptProducer.

66.1.22.5.1 TScriptProducer.Evaluate Method

Pascal

```
function Evaluate: string;
```

C++

```
__fastcall UnicodeString Evaluate();
```

Description

This is Evaluate, a member of class TScriptProducer.

66.1.22.5.2 TScriptProducer.EvaluateExpression Method

Pascal

```
function EvaluateExpression(AScriptFile: TScriptFile): string; virtual; abstract;
```

C++

```
virtual __fastcall UnicodeString EvaluateExpression(TScriptFile AScriptFile) = 0;
```

Description

This is EvaluateExpression, a member of class TScriptProducer.

66.1.22.5.3 TScriptProducer.GetContent Method

Pascal

```
function GetContent: string;
```

C++

```
__fastcall UnicodeString GetContent();
```

Description

This is GetContent, a member of class TScriptProducer.

66.1.22.5.4 TScriptProducer.GetErrors Method

Pascal

```
function GetErrors: TAbstractScriptErrors;
```

C++

```
__fastcall TAbstractScriptErrors GetErrors();
```

Description

This is GetErrors, a member of class TScriptProducer.

66.1.22.5.5 TScriptProducer.GetHTMLBlock Method

Pascal

```
function GetHTMLBlock(I: Integer): string;
```

C++

```
__fastcall UnicodeString GetHTMLBlock(int I);
```

Description

This is GetHTMLBlock, a member of class TScriptProducer.

66.1.22.5.6 TScriptProducer.GetHTMLBlockCount Method

Pascal

```
function GetHTMLBlockCount: Integer;
```

C++

```
__fastcall int GetHTMLBlockCount();
```

Description

This is GetHTMLBlockCount, a member of class TScriptProducer.

66.1.22.5.7 TScriptProducer.GetWebModuleContext Method

Pascal

```
function GetWebModuleContext: TWebModuleContext;
```

C++

```
__fastcall TWebModuleContext GetWebModuleContext();
```

Description

This is GetWebModuleContext, a member of class TScriptProducer.

66.1.22.5.8 TScriptProducer.HandleParserError Method

Pascal

```
procedure HandleParserError(E: Exception);
```

C++

```
__fastcall HandleParserError(Exception E);
```

Description

This is HandleParserError, a member of class TScriptProducer.

66.1.22.5.9 TScriptProducer.HandleScriptError Method

Pascal

```
function HandleScriptError(const ScriptError: IUnknown): HRESULT;
```

C++

```
__fastcall HRESULT HandleScriptError(const IUnknown ScriptError);
```

Description

This is HandleScriptError, a member of class TScriptProducer.

66.1.22.5.10 TScriptProducer.ImplHandleScriptError Method

Pascal

```
function ImplHandleScriptError(const ScriptError: IUnknown): HRESULT; virtual; abstract;
```

C++

```
virtual __fastcall HRESULT ImplHandleScriptError(const IUnknown ScriptError) = 0;
```

Description

This is ImplHandleScriptError, a member of class TScriptProducer.

66.1.22.5.11 TScriptProducer.ParseStream Method

Pascal

```
procedure ParseStream(Stream: TStream; Owned: Boolean);
```

C++

```
__fastcall ParseStream(TStream Stream, Boolean Owned);
```

Description

This is ParseStream, a member of class TScriptProducer.

66.1.22.5.12 TScriptProducer.ParseString Method

Pascal

```
procedure ParseString(const S: string);
```

C++

```
__fastcall ParseString(const UnicodeString S);
```

Description

This is ParseString, a member of class TScriptProducer.

66.1.22.5.13 TScriptProducer.ReplaceTags Method

Pascal

```
function ReplaceTags(const AValue: string): string;
```

C++

```
__fastcall UnicodeString ReplaceTags(const UnicodeString AValue);
```

Description

This is ReplaceTags, a member of class TScriptProducer.

66.1.22.5.14 TScriptProducer.SetContent Method

Pascal

```
procedure SetContent(const Value: string);
```

C++

```
__fastcall SetContent(const UnicodeString Value);
```

Description

This is SetContent, a member of class TScriptProducer.

66.1.22.5.15 Write Method

This is the overview for the Write method overload.

Overload List

	Name	Description
	TScriptProducer.Write (PAnsiChar) (see page 6713)	This is Write, a member of class TScriptProducer.
	TScriptProducer.Write (PWideChar, Integer) (see page 6714)	This is Write, a member of class TScriptProducer.
	TScriptProducer.Write (string) (see page 6714)	This is Write, a member of class TScriptProducer.

66.1.22.5.15.1 TScriptProducer.Write Method (PAnsiChar)

Pascal

```
procedure Write(Value: PAnsiChar); overload;
```

C++

```
__fastcall Write(PAnsiChar Value);
```

Description

This is Write, a member of class TScriptProducer.

66.1.22.5.15.2 TScriptProducer.Write Method (PWideChar, Integer)

Pascal

```
procedure Write(const AValue: PWideChar; ALength: Integer); overload;
```

C++

```
__fastcall Write(const PWideChar AValue, int ALength);
```

Description

This is Write, a member of class TScriptProducer.

66.1.22.5.15.3 TScriptProducer.Write Method (string)

Pascal

```
procedure Write(const Value: string); overload;
```

C++

```
__fastcall Write(const UnicodeString Value);
```

Description

This is Write, a member of class TScriptProducer.

66.1.22.5.16 TScriptProducer.WriteItem Method

Pascal

```
procedure WriteItem(Index: Integer);
```

C++

```
__fastcall WriteItem(int Index);
```

Description

This is WriteItem, a member of class TScriptProducer.

66.1.22.6 TScriptProducer Properties

The properties of the TScriptProducer class are listed here.

Protected Properties

	Name	Description
	Component (see page 6714)	This is Component, a member of class TScriptProducer.
	Content (see page 6715)	This is Content, a member of class TScriptProducer.
	Designing (see page 6715)	This is Designing, a member of class TScriptProducer.
	Errors (see page 6715)	This is Errors, a member of class TScriptProducer.
	Script (see page 6715)	This is Script, a member of class TScriptProducer.

66.1.22.6.1 TScriptProducer.Component Property

Pascal

```
property Component: TComponent;
```

C++

```
__property TComponent * Component;
```

Description

This is Component, a member of class TScriptProducer.

66.1.22.6.2 TScriptProducer.Content Property

Pascal

```
property Content: string;
```

C++

```
__property UnicodeString Content;
```

Description

This is Content, a member of class TScriptProducer.

66.1.22.6.3 TScriptProducer.Designing Property

Pascal

```
property Designing: Boolean;
```

C++

```
__property Boolean Designing;
```

Description

This is Designing, a member of class TScriptProducer.

66.1.22.6.4 TScriptProducer.Errors Property

Pascal

```
property Errors: TAbstractScriptErrors;
```

C++

```
__property TAbstractScriptErrors Errors;
```

Description

This is Errors, a member of class TScriptProducer.

66.1.22.6.5 TScriptProducer.Script Property

Pascal

```
property Script: string;
```

C++

```
__property UnicodeString Script;
```

Description

This is Script, a member of class TScriptProducer.

66.1.23 TVariableLookup Class

Class Hierarchy

Pascal

```
TVariableLookup = class(TObject);
```

C++

```
class TVariableLookup : public TObject;
```

File

WebScript

Description

This is class WebScript.TVariableLookup.

66.1.23.1 TVariableLookup Members

The following tables list the members exposed by TVariableLookup.

Public Methods

	Name	Description
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6717)	This is Create, a member of class TVariableLookup.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindGlobalVariable (see page 6717)	This is FindGlobalVariable, a member of class TVariableLookup.
	FindGlobalVariableContainer (see page 6718)	This is FindGlobalVariableContainer, a member of class TVariableLookup.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.

	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	LookupObject (see page 6718)	This is LookupObject, a member of class TVariableLookup.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	Ident (see page 6718)	This is Ident, a member of class TVariableLookup.
R	Obj (see page 6718)	This is Obj, a member of class TVariableLookup.

66.1.23.2 TVariableLookup.Create Constructor

Pascal

```
constructor Create(const AIdent: string; AWebModuleContext: TWebModuleContext);
```

C++

```
__fastcall TVariableLookup(const UnicodeString AIdent, TWebModuleContext AWebModuleContext);
```

Description

This is Create, a member of class TVariableLookup.

66.1.23.3 TVariableLookup Methods

The methods of the TVariableLookup class are listed here.

Public Methods

	Name	Description
	FindGlobalVariable (see page 6717)	This is FindGlobalVariable, a member of class TVariableLookup.
	FindGlobalVariableContainer (see page 6718)	This is FindGlobalVariableContainer, a member of class TVariableLookup.
	LookupObject (see page 6718)	This is LookupObject, a member of class TVariableLookup.

66.1.23.3.1 TVariableLookup.FindGlobalVariable Method

Pascal

```
function FindGlobalVariable(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindGlobalVariable(const UnicodeString AName);
```

Description

This is FindGlobalVariable, a member of class TVariableLookup.

66.1.23.3.2 TVariableLookup.FindGlobalVariableContainer Method

Pascal

```
function FindGlobalVariableContainer(const AName: string): TComponent;
```

C++

```
__fastcall TComponent * FindGlobalVariableContainer(const UnicodeString AName);
```

Description

This is FindGlobalVariableContainer, a member of class TVariableLookup.

66.1.23.3.3 TVariableLookup.LookupObject Method

Pascal

```
function LookupObject: Boolean;
```

C++

```
__fastcall Boolean LookupObject();
```

Description

This is LookupObject, a member of class TVariableLookup.

66.1.23.4 TVariableLookup Properties

The properties of the TVariableLookup class are listed here.

Public Properties

	Name	Description
	Ident (see page 6718)	This is Ident, a member of class TVariableLookup.
R	Obj (see page 6718)	This is Obj, a member of class TVariableLookup.

66.1.23.4.1 TVariableLookup.Ident Property

Pascal

```
property Ident: string;
```

C++

```
__property UnicodeString Ident;
```

Description

This is Ident, a member of class TVariableLookup.

66.1.23.4.2 TVariableLookup.Obj Property

Pascal

```
property Obj: TObject;
```

C++

```
__property TObject * Obj;
```

Description

This is Obj, a member of class TVariableLookup.

66.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TGlobalScriptVariables (see page 6720)	This is record WebScript.TGlobalScriptVariables.
	TIncludeType (see page 6721)	This is record WebScript.TIncludeType.

Records

	Name	Description
	TLineNumbers (see page 6721)	This is record WebScript.TLineNumbers.

66.2.1 WebScript.TGlobalScriptVariables Enumeration

Pascal

```
TGlobalScriptVariables = (
  svPage,
  svPages,
  svModules,
  svApplication,
  svSession,
  svEndUser,
  svResponse,
  svRequest,
  svHTMLItems,
  svProducer
);
```

C++

```
enum TGlobalScriptVariables {
  svPage,
  svPages,
  svModules,
  svApplication,
  svSession,
  svEndUser,
  svResponse,
  svRequest,
  svHTMLItems,
  svProducer
};
```

File

WebScript

Description

This is record WebScript.TGlobalScriptVariables.

66.2.2 WebScript.TIncludeType Enumeration

Pascal

```
TIncludeType = (
  incFile,
  incPage
);
```

C++

```
enum TIncludeType {
  incFile,
  incPage
};
```

File

WebScript

Description

This is record WebScript.TIncludeType.

66.2.3 WebScript.TLineNumbers Record

Pascal

```
TLineNumbers = record
  SourceStartLine: Integer;
  SourceLineCount: Integer;
  DestStartLine: Integer;
  DestLineCount: Integer;
  ScriptIncludeFile: TScriptIncludeFile;
end;
```

C++

```
struct TLineNumbers {
  int SourceStartLine;
  int SourceLineCount;
  int DestStartLine;
  int DestLineCount;
  TScriptIncludeFile ScriptIncludeFile;
};
```

File

WebScript

Description

This is record WebScript.TLineNumbers.

66.3 Types

The following table lists types in this documentation.

Types

Name	Description
CreateComponentStubFactory (see page 6722)	This is type WebScript.CreateComponentStubFactory.
PLineNumbers (see page 6722)	This is type WebScript.PLineNumbers.

66.3.1 WebScript.CreateComponentStubFactory Type

Pascal

```
CreateComponentStubFactory = function (AComponent: TObject; AComponentClass: TClass):
IInterface;
```

C++

```
(AComponent: TObject; AComponentClass: TClass): IInterface ( CreateComponentStubFactory)();
```

File

WebScript

Description

This is type WebScript.CreateComponentStubFactory.

66.3.2 WebScript.PLineNumbers Type

Pascal

```
PLineNumbers = ^TLineNumbers;
```

C++

```
^TLineNumbers PLineNumbers;
```

File

WebScript

Description

This is type WebScript.PLineNumbers.

66.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
GlobalScriptVariableNames (see page 6723)	This is constant WebScript.GlobalScriptVariableNames.

66.4.1 WebScript.GlobalScriptVariableNames Constant

Pascal

```
GlobalScriptVariableNames: array[TGlobalScriptVariables] of PChar = ('Page', 'Pages',
'Modules', 'Application', 'Session', 'EndUser', 'Response', 'Request', 'HTML_', 'Producer');
```

C++

```
array[TGlobalScriptVariables] of PChar GlobalScriptVariableNames = ('Page', 'Pages',
'Modules', 'Application', 'Session', 'EndUser', 'Response', 'Request', 'HTML_', 'Producer');
```

File

WebScript

Description

This is constant WebScript.GlobalScriptVariableNames.

67 WebServExp Namespace

This is namespace WebServExp.

Topics

Name	Description
Classes (see page 6727)	The following table lists classes in this documentation.
Interfaces (see page 6735)	The following table lists interfaces in this documentation.
Functions (see page 6738)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 6740)	The following table lists structs, records, enums in this documentation.
Types (see page 6742)	The following table lists types in this documentation.

Classes

	Name	Description
	TWebServExp (see page 6727)	This is class WebServExp.TWebServExp.

Functions

	Name	Description
	GetAliasBaseTypeInfo (see page 6738)	This is function WebServExp.GetAliasBaseTypeInfo.
	GetBindingType (see page 6738)	This is function WebServExp.GetBindingType.
	IsBaseClassTypeInfo (see page 6739)	This is function WebServExp.IsBaseClassTypeInfo.

Interfaces

	Name	Description
	IWebServExp (see page 6735)	IWebServExp is the interface for classes that generate schema definitions for a WSDL publisher.
	IWebServExpAccess (see page 6737)	This is class WebServExp.IWebServExpAccess.

Structs, Records, Enums

	Name	Description
	ArgumentType (see page 6740)	This is record WebServExp.ArgumentType.
	MessageType (see page 6740)	This is record WebServExp.MessageType.
	TSchemaType (see page 6741)	This is record WebServExp.TSchemaType.

Types

Name	Description
TAfterPublishingWSDLEvent (see page 6742)	TAfterPublishingWSDLEvent is the type of the OnAfterPublishingWSDL event of TWSDLHTMLPublish.

TBeforePublishingTypesEvent (see page 6742)	TBeforePublishingTypesEvent is the type of the OnBeforePublishingTypes event of TWSDLHTMLPublish.
TPublishingTypeEvent (see page 6743)	TPublishingTypeEvent is the type of the OnPublishingType event of TWSDLHTMLPublish.
TSchemaTypeArray (see page 6744)	This is type WebServExp.TSchemaTypeArray.

67.1 Classes

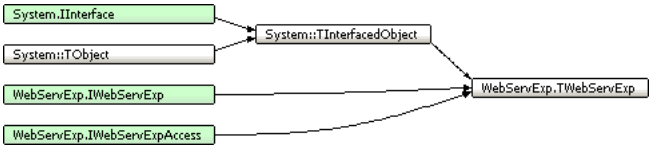
The following table lists classes in this documentation.

Classes

	Name	Description
	TWebServExp (see page 6727)	This is class WebServExp.TWebServExp.

67.1.1 TWebServExp Class

Class Hierarchy



Pascal

```
TWebServExp = class(TInterfacedObject, IWebServExp, IWebServExpAccess);
```

C++

```
class TWebServExp : public TInterfacedObject, public IWebServExp, public IWebServExpAccess;
```

File

WebServExp

Description

This is class WebServExp.TWebServExp.

67.1.1.1 TWebServExp Members

The following tables list the members exposed by TWebServExp.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6729)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6729)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindOrAddSchema (see page 6736)	Ensures that a schema is eventually generated for a specified type.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GenerateXMLSchema (see page 6730)	Adds schema information to represent a specified type.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetWebServExp (see page 6731)	This is GetWebServExp, a member of class TWebServExp.
	GetWSDLForInterface (see page 6731)	This is GetWSDLForInterface, a member of class TWebServExp.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	ImportLocations (see page 6732)	This is ImportLocations, a member of class TWebServExp.
	ImportNames (see page 6732)	This is ImportNames, a member of class TWebServExp.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	TargetNameSpace (see page 6732)	This is TargetNameSpace, a member of class TWebServExp.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 6733)	This is OnAfterPublishingWSDL, a member of class TWebServExp.
	OnBeforePublishingTypes (see page 6733)	This is OnBeforePublishingTypes, a member of class TWebServExp.
	OnPublishingType (see page 6733)	This is OnPublishingType, a member of class TWebServExp.

Published Properties

	Name	Description
	ArrayAsComplexContent (see page 6731)	This is ArrayAsComplexContent, a member of class TWebServExp.
	BindingType (see page 6732)	This is BindingType, a member of class TWebServExp.
	ServiceAddress (see page 6732)	This is ServiceAddress, a member of class TWebServExp.
	WSDLElements (see page 6733)	This is WSDLElements, a member of class TWebServExp.

67.1.1.2 TWebServExp.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebServExp();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

67.1.1.3 TWebServExp.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebServExp();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and

call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

67.1.1.4 TWebServExp Methods

The methods of the TWebServExp class are listed here.

Public Methods

	Name	Description
	GenerateXMLSchema (see page 6730)	Adds schema information to represent a specified type.
	GetWebServExp (see page 6731)	This is GetWebServExp, a member of class TWebServExp.
	GetWSDLForInterface (see page 6731)	This is GetWSDLForInterface, a member of class TWebServExp.

67.1.1.4.1 TWebServExp.GenerateXMLSchema Method

Adds schema information to represent a specified type.

Pascal

```
procedure GenerateXMLSchema(SchemaDef: IXMLSchemaDef; const ATypeInfo: PTypeinfo; const
ParentInfo: PTypeinfo; Namespace: InvString);
```

C++

```
__fastcall GenerateXMLSchema(IXMLSchemaDef SchemaDef, const PTypeinfo ATypeInfo, const
PTypeinfo ParentInfo, InvString Namespace);
```

Description

GenerateXMLSchema adds information to an emerging schema to represent information about a specified type.

SchemaDef is the interface for the emerging schema. GenerateXMLSchema uses the properties and methods of this interface to add schema information for the specified type.

ATypeInfo is the runtime type information (RTT) for the type to add.

ParentInfo is the RTTI for the type from which the type specified by ATypeInfo is derived. If ATypeInfo does not describe a descendant type, ParentInfo is nil (Delphi) or NULL (C++).

Namespace is the namespace URI in which the schema definition is defined.

See Also

FindOrAddSchema (see page 6736)

67.1.1.4.2 TWebServExp.GetWebServExp Method

Pascal

```
function GetWebServExp: TWebServExp;
```

C++

```
__fastcall TWebServExp GetWebServExp();
```

Description

This is GetWebServExp, a member of class TWebServExp.

67.1.1.4.3 TWebServExp.GetWSDLForInterface Method

Pascal

```
procedure GetWSDLForInterface(const IntfTypeInfo: Pointer; WSDLDoc: IWSDLDocument; PortNames:
array of InvString; Locations: array of InvString);
```

C++

```
__fastcall GetWSDLForInterface(const void * IntfTypeInfo, IWSDLDocument WSDLDoc, array of
InvString PortNames, array of InvString Locations);
```

Description

This is GetWSDLForInterface, a member of class TWebServExp.

67.1.1.5 TWebServExp Properties

The properties of the TWebServExp class are listed here.

Public Properties

	Name	Description
	ImportLocations (see page 6732)	This is ImportLocations, a member of class TWebServExp.
	ImportNames (see page 6732)	This is ImportNames, a member of class TWebServExp.
	TargetNameSpace (see page 6732)	This is TargetNameSpace, a member of class TWebServExp.

Published Properties

	Name	Description
	ArrayAsComplexContent (see page 6731)	This is ArrayAsComplexContent, a member of class TWebServExp.
	BindingType (see page 6732)	This is BindingType, a member of class TWebServExp.
	ServiceAddress (see page 6732)	This is ServiceAddress, a member of class TWebServExp.
	WSDLElements (see page 6733)	This is WSDLElements, a member of class TWebServExp.

67.1.1.5.1 TWebServExp.ArrayAsComplexContent Property

Pascal

```
property ArrayAsComplexContent: Boolean;
```

C++

```
__property Boolean ArrayAsComplexContent;
```

Description

This is ArrayAsComplexContent, a member of class TWebServExp.

67.1.1.5.2 TWebServExp.BindingType Property

Pascal

```
property BindingType: TWebServiceBindingType;
```

C++

```
__property TWebServiceBindingType BindingType;
```

Description

This is BindingType, a member of class TWebServExp.

67.1.1.5.3 TWebServExp.ImportLocations Property

Pascal

```
property ImportLocations [const Index: Integer]: InvString;
```

C++

```
__property InvString ImportLocations[int const Index];
```

Description

This is ImportLocations, a member of class TWebServExp.

67.1.1.5.4 TWebServExp.ImportNames Property

Pascal

```
property ImportNames [const Index: Integer]: InvString;
```

C++

```
__property InvString ImportNames[int const Index];
```

Description

This is ImportNames, a member of class TWebServExp.

67.1.1.5.5 TWebServExp.ServiceAddress Property

Pascal

```
property ServiceAddress: InvString;
```

C++

```
__property InvString ServiceAddress;
```

Description

This is ServiceAddress, a member of class TWebServExp.

67.1.1.5.6 TWebServExp.TargetNameSpace Property

Pascal

```
property TargetNameSpace: InvString;
```

C++

```
__property InvString TargetNameSpace;
```

Description

This is TargetNameSpace, a member of class TWebServExp.

67.1.1.5.7 TWebServExp.WSDLElements Property

Pascal

```
property WSDLElements: TWSDLElements;
```

C++

```
__property TWSDLElements WSDLElements;
```

Description

This is WSDLElements, a member of class TWebServExp.

67.1.1.6 TWebServExp Events

The events of the TWebServExp class are listed here.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 6733)	This is OnAfterPublishingWSDL, a member of class TWebServExp.
	OnBeforePublishingTypes (see page 6733)	This is OnBeforePublishingTypes, a member of class TWebServExp.
	OnPublishingType (see page 6733)	This is OnPublishingType, a member of class TWebServExp.

67.1.1.6.1 TWebServExp.OnAfterPublishingWSDL Event

Pascal

```
property OnAfterPublishingWSDL: TAfterPublishingWSDLEvent;
```

C++

```
__property TAfterPublishingWSDLEvent OnAfterPublishingWSDL;
```

Description

This is OnAfterPublishingWSDL, a member of class TWebServExp.

67.1.1.6.2 TWebServExp.OnBeforePublishingTypes Event

Pascal

```
property OnBeforePublishingTypes: TBeforePublishingTypesEvent;
```

C++

```
__property TBeforePublishingTypesEvent OnBeforePublishingTypes;
```

Description

This is OnBeforePublishingTypes, a member of class TWebServExp.

67.1.1.6.3 TWebServExp.OnPublishingType Event

Pascal

```
property OnPublishingType: TPublishingTypeEvent;
```

C++

```
__property TPublishingTypeEvent OnPublishingType;
```

Description

This is OnPublishingType, a member of class TWebServExp.

67.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWebServExp (see page 6735)	IWebServExp is the interface for classes that generate schema definitions for a WSDL publisher.
	IWebServExpAccess (see page 6737)	This is class WebServExp.IWebServExpAccess.

67.2.1 IWebServExp Interface

IWebServExp is the interface for classes that generate schema definitions for a WSDL publisher.

Class Hierarchy

Pascal

```
IWebServExp = interface;
```

C++

```
__interface IWebServExp;
```

File

WebServExp

Description

IWebServExp is an interface for generating the schema definitions that represent types in a WSDL document.

Note: C++ method declarations that use IWebServExp use the _di_IWebServExp type instead. This type is a DelphiInterface (see page 3256) wrapper around the IWebServExp interface:

Note: typedef System::DelphiInterface (see page 3256)< IWebServExp > _di_IWebServExp;

See Also

TWSDLHTMLPublish (see page 7280)

67.2.1.1 IWebServExp Members

The following tables list the members exposed by IWebServExp.

Public Methods

	Name	Description
	FindOrAddSchema (see page 6736)	Ensures that a schema is eventually generated for a specified type.
	GenerateXMLSchema (see page 6736)	Adds schema information to represent a specified type.

67.2.1.2 IWebServExp Methods

The methods of the IWebServExp class are listed here.

Public Methods

	Name	Description
	FindOrAddSchema (see page 6736)	Ensures that a schema is eventually generated for a specified type.
	GenerateXMLSchema (see page 6736)	Adds schema information to represent a specified type.

67.2.1.2.1 IWebServExp.FindOrAddSchema Method

Ensures that a schema is eventually generated for a specified type.

Pascal

```
function FindOrAddSchema(const ATypeInfo: PTypeinfo; const TnsURI: string): Boolean;
```

C++

```
__fastcall Boolean FindOrAddSchema(const PTypeinfo ATypeInfo, const UnicodeString TnsURI);
```

Description

Call FindOrAddSchema to indicate that a schema should be generated for a given type.

ATypeInfo is the runtime type information (RTTI) for the type.

TnsURI is the namespace URI in which the schema for the type should be defined.

FindOrAddSchema returns true if there is already a schema for the specified type. It returns false if the type has not previously been added.

See Also

GenerateXMLSchema (see page 6736)

67.2.1.2.2 IWebServExp.GenerateXMLSchema Method

Adds schema information to represent a specified type.

Pascal

```
procedure GenerateXMLSchema(SchemaDef: IXMLSchemaDef; const ATypeInfo: PTypeinfo; const
ParentInfo: PTypeinfo; Namespace: InvString);
```

C++

```
__fastcall GenerateXMLSchema(IXMLSchemaDef SchemaDef, const PTypeinfo ATypeInfo, const
PTypeinfo ParentInfo, InvString Namespace);
```

Description

GenerateXMLSchema adds information to an emerging schema to represent information about a specified type.

SchemaDef is the interface for the emerging schema. GenerateXMLSchema uses the properties and methods of this interface to add schema information for the specified type.

ATypeInfo is the runtime type information (RTT) for the type to add.

ParentInfo is the RTTI for the type from which the type specified by ATypeInfo is derived. If ATypeInfo does not describe a descendant type, ParentInfo is nil (Delphi) or NULL (C++).

Namespace is the namespace URI in which the schema definition is defined.

See Also

FindOrAddSchema (see page 6736)

67.2.2 IWebServExpAccess Interface

Class Hierarchy

Pascal

```
IWebServExpAccess = interface;
```

C++

```
__interface IWebServExpAccess;
```

File

WebServExp

Description

This is class WebServExp.IWebServExpAccess.

67.2.2.1 IWebServExpAccess Members

The following tables list the members exposed by IWebServExpAccess.

Public Methods

	Name	Description
	GetWebServExp (see page 6737)	This is GetWebServExp, a member of class IWebServExpAccess.

67.2.2.2 IWebServExpAccess Methods

The methods of the IWebServExpAccess class are listed here.

Public Methods

	Name	Description
	GetWebServExp (see page 6737)	This is GetWebServExp, a member of class IWebServExpAccess.

67.2.2.2.1 IWebServExpAccess.GetWebServExp Method

Pascal

```
function GetWebServExp: TWebServExp;
```

C++

```
__fastcall TWebServExp GetWebServExp();
```

Description

This is GetWebServExp, a member of class IWebServExpAccess.

67.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetAliasBaseTypeInfo (see page 6738)	This is function WebServExp.GetAliasBaseTypeInfo.
	GetBindingType (see page 6738)	This is function WebServExp.GetBindingType.
	IsBaseClassTypeInfo (see page 6739)	This is function WebServExp.IsBaseClassTypeInfo.

67.3.1 WebServExp.GetAliasBaseTypeInfo Function

Pascal

```
function GetAliasBaseTypeInfo(const ParamType: TTypeKind): PTypeInfo;
```

C++

```
PTypeInfo GetAliasBaseTypeInfo(const TTypeKind ParamType);
```

File

WebServExp

Description

This is function WebServExp.GetAliasBaseTypeInfo.

67.3.2 WebServExp.GetBindingType Function

Pascal

```
function GetBindingType(const MethEntry: TIntfMethEntry; Input: Boolean):
TWebServiceBindingType; overload;
```

C++

```
TWebServiceBindingType GetBindingType(const TIntfMethEntry MethEntry, Boolean Input);
```

File

WebServExp

Description

This is function WebServExp.GetBindingType.

67.3.3 WebServExp.IsBaseClassTypeInfo Function

Pascal

```
function IsBaseClassTypeInfo(const ATypeInfo: PTypeInfo): Boolean;
```

C++

```
Boolean IsBaseClassTypeInfo(const PTypeInfo ATypeInfo);
```

File

WebServExp

Description

This is function WebServExp.IsBaseClassTypeInfo.

67.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	ArgumentType (see page 6740)	This is record WebServExp.ArgumentType.
	MessageType (see page 6740)	This is record WebServExp.MessageType.

Records

	Name	Description
	TSchemaType (see page 6741)	This is record WebServExp.TSchemaType.

67.4.1 WebServExp.ArgumentType Enumeration

Pascal

```
ArgumentType = (
  argIn,
  argOut,
  argInOut,
  argReturn
);
```

C++

```
enum ArgumentType {
  argIn,
  argOut,
  argInOut,
  argReturn
};
```

File

WebServExp

Description

This is record WebServExp.ArgumentType.

67.4.2 WebServExp.MessageType Enumeration

Pascal

```
MessageType = (
  mtInput,
  mtOutput,
  mtHeaderInput,
  mtHeaderOutput,
  mtFault
);
```

C++

```
enum MessageType {
  mtInput,
  mtOutput,
  mtHeaderInput,
  mtHeaderOutput,
  mtFault
};
```

File

WebServExp

Description

This is record WebServExp.MessageType.

67.4.3 WebServExp.TSchemaType Record

Pascal

```
TSchemaType = record
  TypeName: InvString;
  NameSpace: InvString;
  TypeInfo: PTypeinfo;
  NSPrefix: InvString;
  XSGenerated: Boolean;
end;
```

C++

```
struct TSchemaType {
  InvString TypeName;
  InvString NameSpace;
  PTypeinfo TypeInfo;
  InvString NSPrefix;
  Boolean XSGenerated;
};
```

File

WebServExp

Description

This is record WebServExp.TSchemaType.

67.5 Types

The following table lists types in this documentation.

Types

Name	Description
TAfterPublishingWSDLEvent (see page 6742)	TAfterPublishingWSDLEvent is the type of the OnAfterPublishingWSDL event of TWSDLHTMLPublish.
TBeforePublishingTypesEvent (see page 6742)	TBeforePublishingTypesEvent is the type of the OnBeforePublishingTypes event of TWSDLHTMLPublish.
TPublishingTypeEvent (see page 6743)	TPublishingTypeEvent is the type of the OnPublishingType event of TWSDLHTMLPublish.
TSchemaTypeArray (see page 6744)	This is type WebServExp.TSchemaTypeArray.

67.5.1 WebServExp.TAfterPublishingWSDLEvent Type

TAfterPublishingWSDLEvent is the type of the OnAfterPublishingWSDL event of TWSDLHTMLPublish.

Pascal

```
TAfterPublishingWSDLEvent = procedure (const WSDLDoc: IWSDLDocument) of object;
```

C++

```
(const WSDLDoc: IWSDLDocument) ( TAfterPublishingWSDLEvent)();
```

File

WebServExp

Description

TAfterPublishingWSDLEvent is the type of the OnAfterPublishingWSDL event handler, which is called after the publisher generates the WSDL describing a Web Service application.

WSDLDoc is an interface to the generated WSDL document. You can use this interface to make any final modifications to the generated document.

See Also

Procedural types

Creating events

67.5.2 WebServExp.TBeforePublishingTypesEvent Type

TBeforePublishingTypesEvent is the type of the OnBeforePublishingTypes event of TWSDLHTMLPublish.

Pascal

```
TBeforePublishingTypesEvent = procedure (const WebServ: IWebServExp) of object;
```

C++

```
(const WebServ: IWebServExp) ( TBeforePublishingTypesEvent)();
```

File

WebServExp

Description

TBeforePublishingTypesEvent is the type of the OnBeforePublishingTypes event handler, which is called before adding information about types to the WSDL document.

WebServ is an interface for adding type information to the WSDL document.

See Also

Procedural types

Creating events

67.5.3 WebServExp.TPublishingTypeEvent Type

TPublishingTypeEvent is the type of the OnPublishingType event of TWSDLHTMLPublish.

Pascal

```
TPublishingTypeEvent = procedure (const WebServ: IWebServExp; const SchemaDef: IXMLSchemaDef;
const ATypeInfo: PTypeinfo; Namespace: InvString) of object;
```

C++

```
(const WebServ: IWebServExp; const SchemaDef: IXMLSchemaDef; const ATypeInfo: PTypeinfo;
Namespace: InvString) ( TPublishingTypeEvent)();
```

File

WebServExp

Description

TPublishingTypeEvent is the type of the OnPublishingType event handler, which is called before adding information about a given type to a WSDL document.

WebServ is an interface for adding type information to the WSDL document.

SchemaDef is the interface that represents the current schema information in the WSDL document. Its properties and methods can be used to add additional schema information about the current type.

ATypeInfo is the runtime type information (RTTI) for the type to add.

Namespace is the namespace URI in which the generated schema definitions are defined.

See Also

Procedural types

Creating events

67.5.4 WebServExp.TSchemaTypeArray Type

Pascal

```
TSchemaTypeArray = array of TSchemaType;
```

C++

```
array of TSchemaType TSchemaTypeArray;
```

File

WebServExp

Description

This is type WebServExp.TSchemaTypeArray.

68 WebSess Namespace

This is namespace WebSess.

Topics

Name	Description
Classes (see page 6746)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 6773)	The following table lists structs, records, enums in this documentation.
Types (see page 6774)	The following table lists types in this documentation.

Classes

	Name	Description
	TCustomSessionsService (see page 6746)	TCustomSessionsService stores end user data that is needed for a short period of time.
	TSessionsService (see page 6756)	TSessionsService stores end user data that is needed for a short period of time.
	TWebSessionIDsImpl (see page 6759)	This is class WebSess.TWebSessionIDsImpl.
	TWebSessionImpl (see page 6763)	This is class WebSess.TWebSessionImpl.

Structs, Records, Enums

	Name	Description
	TEndSessionReason (see page 6773)	TEndSessionReason indicates the reason a session ended.

Types

Name	Description
TEndSessionEvent (see page 6774)	TEndSessionEvent is the type for event handlers that are called when a session terminates.
TStartSessionEvent (see page 6774)	TStartSessionEvent is the type for event handlers that are called when a session starts up.

68.1 Classes

The following table lists classes in this documentation.

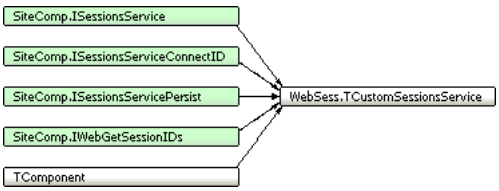
Classes

	Name	Description
	TCustomSessionsService (see page 6746)	TCustomSessionsService stores end user data that is needed for a short period of time.
	TSessionsService (see page 6756)	TSessionsService stores end user data that is needed for a short period of time.
	TWebSessionIDsImpl (see page 6759)	This is class WebSess.TWebSessionIDsImpl.
	TWebSessionImpl (see page 6763)	This is class WebSess.TWebSessionImpl.

68.1.1 TCustomSessionsService Class

TCustomSessionsService stores end user data that is needed for a short period of time.

Class Hierarchy



Pascal

```
TCustomSessionsService = class(TComponent, ISessionsService, ISessionsServiceConnectID,
IWebGetSessionIDs, ISessionsServicePersist);
```

C++

```
class TCustomSessionsService : public TComponent, public ISessionsService, public
ISessionsServiceConnectID, public IWebGetSessionIDs, public ISessionsServicePersist;
```

File

WebSess

Description

TCustomSessionsService is the base class for classes that manage the sessions in a WebSnap application. When a WebSnap application contains a TCustomSessionsService descendant, then each HTTP request is associated with a session. TCustomSessionsService can manage multiple sessions on behalf of different users, each on a separate thread of execution. Only one session is available when handling a request. This is called the current session. The current session is available as the Session property of the global Web context, which is accessed using the global WebContext function.

TCustomSessionsService stores session IDs and name/value pairs for all sessions in memory. This information must remain in memory between requests. Thus, Web application types that do not remain in memory between requests, such as CGI, do not support TCustomSessionsService.

TCustomSessionsService implements the ISessionsService (see page 1066) interface.

See Also

TSessionsService (see page 6756)

TEndUserSessionAdapter (see page 5792)

TAbstractWebContext (see page 5960)

TWebSession (see page 6251)

WebContext (see page 6003)

ISessionsService (see page 1066)

68.1.1.1 TCustomSessionsService Members

The following tables list the members exposed by TCustomSessionsService.

Protected Methods

	Name	Description
	CheckStatusChange (see page 6748)	Checks whether any sessions have started or terminated.
	Clear (see page 6749)	Deletes all sessions from memory.
	Connect (see page 6749)	Obtains the interface for a Web session, given its Session ID.
	ConnectActive (see page 6750)	Obtains the interface for an active Web session, given its Session ID.
	DoEndSession (see page 6750)	Triggers the OnEndSession (see page 6755) event when appropriate.
	DoStartSession (see page 6750)	Triggers the OnStartSession (see page 6755) event when appropriate.
	GetSessionIDs (see page 6751)	Returns a list of the session IDs for all sessions currently in memory.
	LoadFromFile (see page 6751)	Loads the list of sessions from a file.
	LoadFromStream (see page 6751)	Loads the list of sessions from a stream.
	NewSession (see page 6752)	Starts a new session.
	NotifyStatusChange (see page 6752)	Generates an OnEndSession (see page 6755) or OnStartSession (see page 6755) event, as approrpriate.
	SaveToFile (see page 6753)	Saves the list of sessions to a file.
	SaveToStream (see page 6753)	Saves the list of sessions to a stream.

Public Events

	Name	Description
	OnEndSession (see page 6755)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 6755)	Occurs when the sessions service detects that a new session has started.

Public Methods

	Name	Description
	Create (see page 6747)	Creates and initializes an instance of TCustomSessionsService (see page 6746).

Public Properties

	Name	Description
	DefaultTimeout (see page 6754)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 6754)	Indicates the maximum number of sessions the TCustomSessionsService (see page 6746) can keep in memory.

68.1.1.2 TCustomSessionsService.Create Constructor

Creates and initializes an instance of TCustomSessionsService (see page 6746).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomSessionsService(TComponent * AOwner);
```

Description

Call Create to instantiate a sessions service at runtime. Typically, this is unnecessary, because a WebSnap application needs at most a single sessions service component, and in most cases that is added at design time.

AOwner is the component that becomes the value of the TCustomSessionsService (see page 6746) object's Owner property. This should be the Web application module.

See Also

Owner

68.1.1.3 TCustomSessionsService Methods

The methods of the TCustomSessionsService class are listed here.

Protected Methods

	Name	Description
	CheckStatusChange (see page 6748)	Checks whether any sessions have started or terminated.
	Clear (see page 6749)	Deletes all sessions from memory.
	Connect (see page 6749)	Obtains the interface for a Web session, given its Session ID.
	ConnectActive (see page 6750)	Obtains the interface for an active Web session, given its Session ID.
V	DoEndSession (see page 6750)	Triggers the OnEndSession (see page 6755) event when appropriate.
V	DoStartSession (see page 6750)	Triggers the OnStartSession (see page 6755) event when appropriate.
	GetSessionIDs (see page 6751)	Returns a list of the session IDs for all sessions currently in memory.
	LoadFromFile (see page 6751)	Loads the list of sessions from a file.
	LoadFromStream (see page 6751)	Loads the list of sessions from a stream.
	NewSession (see page 6752)	Starts a new session.
	NotifyStatusChange (see page 6752)	Generates an OnEndSession (see page 6755) or OnStartSession (see page 6755) event, as approrpriate.
	SaveToFile (see page 6753)	Saves the list of sessions to a file.
	SaveToStream (see page 6753)	Saves the list of sessions to a stream.

68.1.1.3.1 TCustomSessionsService.CheckStatusChange Method

Checks whether any sessions have started or terminated.

Pascal

```
function CheckStatusChange: Boolean;
```

C++

```
__fastcall Boolean CheckStatusChange();
```

Description

CheckStatusChange is called automatically when the application creates a new Web context or initializes a new Web module. That is, this method is called at least once every time the application receives a new HTTP request message.

If CheckStatusChange detects that a session has started or terminated since the last call, it returns true. Otherwise, it returns false.

See Also

NotifyStatusChange (see page 6752)

TWebContext (see page 5976)

68.1.1.3.2 TCustomSessionsService.Clear Method

Deletes all sessions from memory.

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

Call Clear to empty the sessions service of all the sessions it has stored in memory.

Clear does not generate an OnEndSession (see page 6755) event for the sessions it deletes when it frees their memory, it simply removes them from memory. To shut down all sessions in a more orderly fashion, iterate through all the active sessions by calling ConnectActive (see page 6750) for every session ID that the GetSessionIDs (see page 6751) method returns, and terminate each one. Then call NotifyStatusChange (see page 6752) to generate the OnEndSession (see page 6755) events for every terminated session. At that point, calling Clear does not prevent the application from receiving an OnEndSession (see page 6755) event for any session that the sessions service manages.

See Also

NewSession (see page 6752)

GetSessionIDs (see page 6751)

ConnectActive (see page 6750)

NotifyStatusChange (see page 6752)

68.1.1.3.3 TCustomSessionsService.Connect Method

Obtains the interface for a Web session, given its Session ID.

Pascal

```
function Connect(AID: TSessionID): IWebSession;
```

C++

```
__fastcall IWebSession Connect(TSessionID AID);
```

Description

Call Connect to access the session that has a specified Session ID. Unlike the ConnectActive (see page 6750) method, Connect may return a session that has expired or been terminated but that has not yet been freed from memory.

AID is the session ID of the session to locate.

Connect returns the IWebSession (see page 1102) interface for the located session. This interface has a single method, Terminate, which lets you terminate the session. If the sessions service does not have a session with the specified session ID, Connect returns nil (Delphi) or NULL (C++).

Note: Calling Connect does not count as accessing a session. That is, if you call Connect for any session, it does not affect the time when that session times out.

See Also

ConnectActive (see page 6750)

GetSessionIDs (see page 6751)

68.1.1.3.4 TCustomSessionsService.ConnectActive Method

Obtains the interface for an active Web session, given its Session ID.

Pascal

```
function ConnectActive(AID: TSessionID): IWebSession;
```

C++

```
__fastcall IWebSession ConnectActive(TSessionID AID);
```

Description

Call ConnectActive to access the session that has a specified Session ID. Unlike the Connect (see page 6749) method, ConnectActive never returns a session that has expired or been terminated.

AID is the session ID of the session to locate.

ConnectActive returns the IWebSession (see page 1102) interface for the located session. This interface has a single method, Terminate, which lets you terminate the session. If the sessions service does not have an active session with the specified session ID, ConnectActive returns nil (Delphi) or NULL (C++).

Note: Calling ConnectActive counts as accessing a session. That is, if you call ConnectActive for any session, the session will not time out until the entire time-out period elapses after the call to ConnectActive.

See Also

Connect (see page 6749)

GetSessionIDs (see page 6751)

68.1.1.3.5 TCustomSessionsService.DoEndSession Method

Triggers the OnEndSession (see page 6755) event when appropriate.

Pascal

```
procedure DoEndSession(ASession: TAbstractWebSession; AReason: TEndSessionReason); virtual;
```

C++

```
virtual __fastcall DoEndSession(TAbstractWebSession ASession, TEndSessionReason AReason);
```

Description

Use DoEndSession to trigger an OnEndSession (see page 6755) event, if it is appropriate to do so.

See Also

OnEndSession (see page 6755)

68.1.1.3.6 TCustomSessionsService.DoStartSession Method

Triggers the OnStartSession (see page 6755) event when appropriate.

Pascal

```
procedure DoStartSession(ASession: TAbstractWebSession); virtual;
```

C++

```
virtual __fastcall DoStartSession(TAbstractWebSession ASession);
```

Description

Use DoStartSession to trigger an OnStartSession (see page 6755) event, if it is appropriate to do so.

See Also

OnStartSession (see page 6755)

68.1.1.3.7 TCustomSessionsService.GetSessionIDs Method

Returns a list of the session IDs for all sessions currently in memory.

Pascal

```
function GetSessionIDs: IWebSessionIDs;
```

C++

```
__fastcall IWebSessionIDs GetSessionIDs();
```

Description

Call GetSessionIDs to obtain a list of the session IDs for all the sessions that the sessions service is storing. GetSessionIDs returns an IWebSessionIDs (see page 1109) interface, which lists the session IDs.

See Also

Connect (see page 6749)

68.1.1.3.8 TCustomSessionsService.LoadFromFile Method

Loads the list of sessions from a file.

Pascal

```
procedure LoadFromFile(const Filename: string);
```

C++

```
__fastcall LoadFromFile(const UnicodeString Filename);
```

Description

Call LoadFromFile to replace the current list of sessions with a set of sessions stored in a file. The file must be previously created by a call to the SaveToFile (see page 6753) method.

Filename is the name of the file that contains the saved list of sessions.

See Also

SaveToFile (see page 6753)

LoadFromStream (see page 6751)

68.1.1.3.9 TCustomSessionsService.LoadFromStream Method

Loads the list of sessions from a stream.

Pascal

```
procedure LoadFromStream(S: TStream);
```

C++

```
__fastcall LoadFromStream(TStream S);
```

Description

Call LoadFromStream to replace the current list of sessions with a set of sessions read from a stream. The sessions must be previously saved by a call to the SaveToStream (see page 6753) method.

S is the stream from which to read the list of sessions.

See Also

SaveToStream (see page 6753)

LoadFromFile (see page 6751)

68.1.1.3.10 TCustomSessionsService.NewSession Method

Starts a new session.

Pascal

```
function NewSession: IWebSession;
```

C++

```
__fastcall IWebSession NewSession();
```

Description

Call NewSession to generate a new session. NewSession starts a new session and returns an interface that can be used to terminate that session.

If the sessions service already has MaxSessions (see page 6754) sessions, NewSession raises an ESessionsException (see page 374) exception.

Note: The OnStartSession (see page 6755) event does not occur immediately when you call NewSession to start a new session. It occurs on the next call to NotifyStatusChange (see page 6752).

Tip: To reconnect to an existing session, call the ConnectActive (see page 6750) method instead.

See Also

MaxSessions (see page 6754)

OnStartSession (see page 6755)

ConnectActive (see page 6750)

NotifyStatusChange (see page 6752)

68.1.1.3.11 TCustomSessionsService.NotifyStatusChange Method

Generates an OnEndSession (see page 6755) or OnStartSession (see page 6755) event, as approrpriate.

Pascal

```
procedure NotifyStatusChange;
```

C++

```
__fastcall NotifyStatusChange();
```

Description

Call NotifyStatusChange to generate the OnStartSession (see page 6755) event for any new sessions that have been created since the last call and to generate the OnEndSession (see page 6755) event for any sessions that terminated since the last call. For any terminated sessions, NotifyStatusChange frees the memory allocated to the session after the OnEndSession (see page 6755) event handler exits.

NotifyStatusChange is called automatically every time the WebSnap application initializes a new Web module.

See Also

OnEndSession (see page 6755)

OnStartSession (see page 6755)

CheckStatusChange (see page 6748)

68.1.1.3.12 TCustomSessionsService.SaveToFile Method

Saves the list of sessions to a file.

Pascal

```
procedure SaveToFile(const Filename: string);
```

C++

```
__fastcall SaveToFile(const UnicodeString Filename);
```

Description

Call SaveToFile to save the current list of sessions to a file. SaveToFile saves all of the sessions, including their session IDs, name/value lists, time-out period, and status information about when they were last accessed.

The file can be read back into a sessions service by calling the LoadFromFile (see page 6751) method.

Filename is the name of the file to which the list of sessions is saved.

See Also

SaveToStream (see page 6753)

LoadFromFile (see page 6751)

68.1.1.3.13 TCustomSessionsService.SaveToStream Method

Saves the list of sessions to a stream.

Pascal

```
procedure SaveToStream(S: TStream);
```

C++

```
__fastcall SaveToStream(TStream S);
```

Description

Call SaveToStream to write the current list of sessions to a stream. SaveToStream saves all of the sessions, including their session IDs, name/value lists, time-out period, and status information about when they were last accessed.

The sessions can be read back into a sessions service by calling the LoadFromStream (see page 6751) method.

S is the stream to which the list of sessions is written.

See Also

LoadFromStream (see page 6751)

SaveToFile (see page 6753)

68.1.1.4 TCustomSessionsService Properties

The properties of the TCustomSessionsService class are listed here.

Public Properties

	Name	Description
	DefaultTimeout (see page 6754)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 6754)	Indicates the maximum number of sessions the TCustomSessionsService (see page 6746) can keep in memory.

68.1.1.4.1 TCustomSessionsService.DefaultTimeout Property

Specifies the number of minutes a session can persist without being accessed.

Pascal

```
property DefaultTimeout: Integer;
```

C++

```
__property int DefaultTimeout;
```

Description

Each session that the sessions service manages has a time-out period. When a session is not accessed within that time-out period, the sessions service automatically terminates the session, discarding its session ID and name/value pairs.

Set DefaultTimeout to specify the time-out period, in minutes, for the sessions in the WebSnap application. Individual sessions can override this value by setting their TimeoutMinutes property.

See Also

TimeoutMinutes

68.1.1.4.2 TCustomSessionsService.MaxSessions Property

Indicates the maximum number of sessions the TCustomSessionsService (see page 6746) can keep in memory.

Pascal

```
property MaxSessions: Integer;
```

C++

```
__property int MaxSessions;
```

Description

Set MaxSessions to limit the number of sessions that the sessions service stores in memory. If MaxSessions is –1, then there is no limit to the number of sessions, and the application can continue creating sessions until it runs out of memory. When MaxSessions is greater than or equal to zero, any attempt to create a new session when the sessions service has MaxSessions already stored in memory causes an ESessionsException (see page 374) exception. The Exception (see page 3949) occurs before the OnStartSession (see page 6755) event.

Note: When the application terminates sessions, it frees up memory for new sessions. Thus, after reaching the limit imposed by MaxSessions, the application can add subsequent sessions after explicitly terminating a session or waiting for one to time out.

See Also

ESessionsException (see page 374)

OnStartSession (see page 6755)

Terminate (see page 6255)

68.1.1.5 TCustomSessionsService Events

The events of the TCustomSessionsService class are listed here.

Public Events

	Name	Description
	OnEndSession (see page 6755)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 6755)	Occurs when the sessions service detects that a new session has started.

68.1.1.5.1 TCustomSessionsService.OnEndSession Event

Occurs when the sessions service detects that a session has terminated.

Pascal

```
property OnEndSession: TEndSessionEvent;
```

C++

```
__property TEndSessionEvent OnEndSession;
```

Description

Write (see page 3707) an OnEndSession event handler to take specific action when a session terminates. For example, an OnEndSession event handler could store information from sessions that time out in a more persistent form such as a database.

See Also

OnStartSession (see page 6755)

Terminate (see page 6255)

TimeoutMinutes

68.1.1.5.2 TCustomSessionsService.OnStartSession Event

Occurs when the sessions service detects that a new session has started.

Pascal

```
property OnStartSession: TStartSessionEvent;
```

C++

```
__property TStartSessionEvent OnStartSession;
```

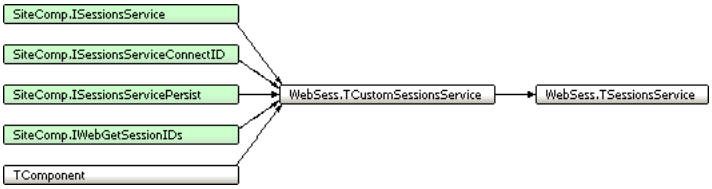
Description

Write (see page 3707) an OnStartSession event handler to take specific action when a session starts. For example, you can use this event to customize the time-out period for new sessions or initialize them by adding name/value pairs.

68.1.2 TSessionsService Class

TSessionsService stores end user data that is needed for a short period of time.

Class Hierarchy



Pascal

```
TSessionsService = class(TCustomSessionsService);
```

C++

```
class TSessionsService : public TCustomSessionsService;
```

File

WebSess

Description

Add TSessionsService to a WebSnap application when you want to store temporary end user data in a WebSnap session. For example, TSessionsService can keep track of all users that are currently logged in and automatically log a user out after a period of inactivity.

When a WebSnap application contains a TSessionsService component, each HTTP request is associated with a session. The WebSnap application can manage multiple sessions on behalf of different users, each on a separate thread of execution. When handling a request, only one session is available, which is called the current session. The current session is available as the Session property of the global Web context, which is accessed using the global WebContext function.

TSessionsService stores session IDs and name/value pairs for all sessions in memory. This information must remain in memory between requests. Web application types that do not remain in memory between requests, such as CGI, do not support TSessionsService. When testing Web App Debugger executables, be sure to start the executables before browsing so that the executable remains running between requests.

Use TEndUserSessionsAdapter and TSessionsAdapter together to keep track of end user name and login state.

See Also

TEndUserSessionAdapter (see page 5792)

TAbstractWebContext (see page 5960)

TWebSession (see page 6251)

WebContext (see page 6003)

Adding Login Support

Using the Sessions Service

68.1.2.1 TSessionsService Members

The following tables list the members exposed by TSessionsService.

Protected Methods

	Name	Description
	CheckStatusChange (see page 6748)	Checks whether any sessions have started or terminated.
	Clear (see page 6749)	Deletes all sessions from memory.
	Connect (see page 6749)	Obtains the interface for a Web session, given its Session ID.
	ConnectActive (see page 6750)	Obtains the interface for an active Web session, given its Session ID.
	DoEndSession (see page 6750)	Triggers the OnEndSession (see page 6755) event when appropriate.
	DoStartSession (see page 6750)	Triggers the OnStartSession (see page 6755) event when appropriate.
	GetSessionIDs (see page 6751)	Returns a list of the session IDs for all sessions currently in memory.
	LoadFromFile (see page 6751)	Loads the list of sessions from a file.
	LoadFromStream (see page 6751)	Loads the list of sessions from a stream.
	NewSession (see page 6752)	Starts a new session.
	NotifyStatusChange (see page 6752)	Generates an OnEndSession (see page 6755) or OnStartSession (see page 6755) event, as apprорpriate.
	SaveToFile (see page 6753)	Saves the list of sessions to a file.
	SaveToStream (see page 6753)	Saves the list of sessions to a stream.

Public Methods

	Name	Description
	CheckStatusChange (see page 1067)	Checks whether any sessions have started or terminated.
	Clear (see page 1067)	Deletes all sessions from memory.
	Connect (see page 1069)	This is Connect, a member of class ISessionsServiceConnectID.
	ConnectActive (see page 1069)	This is ConnectActive, a member of class ISessionsServiceConnectID.
	Create (see page 6747)	Creates and initializes an instance of TCustomSessionsService (see page 6746).
	GetSessionIDs (see page 1097)	This is GetSessionIDs, a member of class IWebGetSessionIDs.
	LoadFromFile (see page 1070)	This is LoadFromFile, a member of class ISessionsServicePersist.
	LoadFromStream (see page 1071)	This is LoadFromStream, a member of class ISessionsServicePersist.
	NewSession (see page 1068)	Starts a new session.
	NotifyStatusChange (see page 1068)	Generates an OnEndSession or OnStartSession event, as apprорpriate.
	SaveToFile (see page 1071)	This is SaveToFile, a member of class ISessionsServicePersist.
	SaveToStream (see page 1071)	This is SaveToStream, a member of class ISessionsServicePersist.

Published Events

	Name	Description
	OnEndSession (see page 6759)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 6759)	Occurs when the sessions service detects that a new session has started.

Published Properties

	Name	Description
	DefaultTimeout (see page 6758)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 6758)	Indicates the maximum number of sessions the TCustomSessionsService can keep in memory.

68.1.2.2 TSessionsService Properties

The properties of the TSessionsService class are listed here.

Published Properties

	Name	Description
	DefaultTimeout (see page 6758)	Specifies the number of minutes a session can persist without being accessed.
	MaxSessions (see page 6758)	Indicates the maximum number of sessions the TCustomSessionsService can keep in memory.

68.1.2.2.1 TSessionsService.DefaultTimeout Property

Specifies the number of minutes a session can persist without being accessed.

Pascal

```
property DefaultTimeout: Integer;
```

C++

```
__property int DefaultTimeout;
```

Description

Each session that the sessions service manages has a time-out period. When a session is not accessed within that time-out period, the sessions service automatically terminates the session, discarding its session ID and name/value pairs.

Set DefaultTimeout to specify the time-out period, in minutes, for the sessions in the WebSnap application. Individual sessions can override this value by setting their TimeoutMinutes property.

See Also

TimeoutMinutes

68.1.2.2.2 TSessionsService.MaxSessions Property

Indicates the maximum number of sessions the TCustomSessionsService can keep in memory.

Pascal

```
property MaxSessions: Integer;
```

C++

```
__property int MaxSessions;
```

Description

Set MaxSessions to limit the number of sessions that the sessions service stores in memory. If MaxSessions is –1, then there is no limit to the number of sessions, and the application can continue creating sessions until it runs out of memory. When MaxSessions is greater than or equal to zero, any attempt to create a new session when the sessions service has MaxSessions already stored in memory causes an ESessionsException exception. The Exception occurs before the OnStartSession event.

Note: When the application terminates sessions, it frees up memory for new sessions. Thus, after reaching the limit imposed by MaxSessions, the application can add subsequent sessions after explicitly terminating a session or waiting for one to time out.

See Also

ESessionsException (see page 374)

OnStartSession (see page 6755)

Terminate (see page 6255)

68.1.2.3 TSessionsService Events

The events of the TSessionsService class are listed here.

Published Events

	Name	Description
	OnEndSession (see page 6759)	Occurs when the sessions service detects that a session has terminated.
	OnStartSession (see page 6759)	Occurs when the sessions service detects that a new session has started.

68.1.2.3.1 TSessionsService.OnEndSession Event

Occurs when the sessions service detects that a session has terminated.

Pascal

```
property OnEndSession: TEndSessionEvent;
```

C++

```
__property TEndSessionEvent OnEndSession;
```

Description

Write an OnEndSession event handler to take specific action when a session terminates. For example, an OnEndSession event handler could store information from sessions that time out in a more persistent form such as a database.

See Also

OnStartSession (see page 6755)

Terminate (see page 6255)

TimeoutMinutes

68.1.2.3.2 TSessionsService.OnStartSession Event

Occurs when the sessions service detects that a new session has started.

Pascal

```
property OnStartSession: TStartSessionEvent;
```

C++

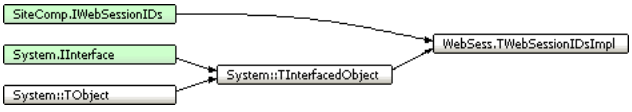
```
__property TStartSessionEvent OnStartSession;
```

Description

Write an OnStartSession event handler to take specific action when a session starts. For example, you can use this event to customize the time-out period for new sessions or initialize them by adding name/value pairs.

68.1.3 TWebSessionIDsImpl Class

Class Hierarchy



Pascal

```
TWebSessionIDsImpl = class(TInterfacedObject, IWebSessionIDs);
```

C++

```
class TWebSessionIDsImpl : public TInterfacedObject, public IWebSessionIDs;
```

File

WebSess

Description

This is class WebSess.TWebSessionIDsImpl.

68.1.3.1 TWebSessionIDsImpl Members

The following tables list the members exposed by TWebSessionIDsImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	GetID (see page 6762)	Returns the value of the IDs property.
	GetIDCount (see page 6763)	Returns the value of the IDCount property.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6761)	Constructs an object and initializes its data before the object is first used.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6761)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.

	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
V	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	IDCount (see page 1111)	Indicates the number of session IDs (see page 1111) available.
R	IDs (see page 1111)	Lists the session IDs for all the sessions stored by the sessions service.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.

68.1.3.2 TWebSessionIDsImpl.Create Constructor

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create;
```

C++

```
__fastcall TWebSessionIDsImpl();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

68.1.3.3 TWebSessionIDsImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebSessionIDsImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

68.1.3.4 TWebSessionIDsImpl Methods

The methods of the TWebSessionIDsImpl class are listed here.

Protected Methods

	Name	Description
	GetID (see page 6762)	Returns the value of the IDs property.
	GetIDCount (see page 6763)	Returns the value of the IDCount property.

68.1.3.4.1 TWebSessionIDsImpl.GetID Method

Returns the value of the IDs property.

Pascal

```
function GetID(I: Integer): TSessionID;
```

C++

```
__fastcall TSessionID GetID(int I);
```

Description

GetID is the read implementation of the IDs property.

I is the index of the session ID to return.

See Also

IDs (see page 1111)

68.1.3.4.2 TWebSessionIDsImpl.GetIDCount Method

Returns the value of the IDCount property.

Pascal

```
function GetIDCount: Integer;
```

C++

```
__fastcall int GetIDCount();
```

Description

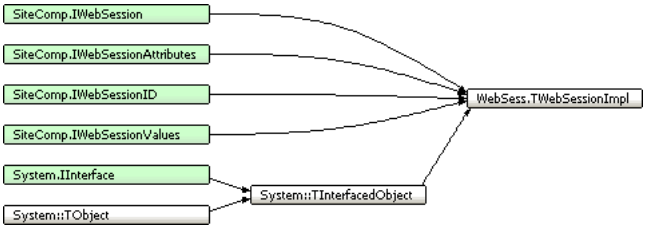
GetIDCount is the read implementation of the IDCount property.

See Also

IDCount (see page 1111)

68.1.4 TWebSessionImpl Class

Class Hierarchy



Pascal

```
TWebSessionImpl = class(TInterfacedObject, IWebSession, IWebSessionID, IWebSessionValues,
IWebSessionAttributes);
```

C++

```
class TWebSessionImpl : public TInterfacedObject, public IWebSession, public IWebSessionID,
public IWebSessionValues, public IWebSessionAttributes;
```

File

WebSess

Description

This is class WebSess.TWebSessionImpl.

68.1.4.1 TWebSessionImpl Members

The following tables list the members exposed by TWebSessionImpl.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	GetExpirationTime (see page 6766)	This is GetExpirationTime, a member of class TWebSessionImpl.
	GetExpired (see page 6767)	This is GetExpired, a member of class TWebSessionImpl.
	GetID (see page 6767)	This is GetID, a member of class TWebSessionImpl.
	GetIsActive (see page 6767)	This is GetIsActive, a member of class TWebSessionImpl.
	GetItemCount (see page 6767)	This is GetItemCount, a member of class TWebSessionImpl.
	GetItems (see page 6767)	This is GetItems, a member of class TWebSessionImpl.
	GetStartTime (see page 6768)	This is GetStartTime, a member of class TWebSessionImpl.
	GetTerminated (see page 6768)	This is GetTerminated, a member of class TWebSessionImpl.
	GetTimeoutMinutes (see page 6768)	This is GetTimeoutMinutes, a member of class TWebSessionImpl.
	GetTouchTime (see page 6768)	This is GetTouchTime, a member of class TWebSessionImpl.
	GetValue (see page 6769)	This is GetValue, a member of class TWebSessionImpl.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	SetTimeoutMinutes (see page 6769)	This is SetTimeoutMinutes, a member of class TWebSessionImpl.
	SetValue (see page 6769)	This is SetValue, a member of class TWebSessionImpl.
	Terminate (see page 6769)	Terminates the session.

Protected Properties

	Name	Description
R	ExpirationTime (see page 6770)	This is ExpirationTime, a member of class TWebSessionImpl.
R	Expired (see page 6770)	This is Expired, a member of class TWebSessionImpl.
R	ID (see page 6770)	This is ID, a member of class TWebSessionImpl.
R	StartTime (see page 6771)	This is StartTime, a member of class TWebSessionImpl.
R	Terminated (see page 6771)	This is Terminated, a member of class TWebSessionImpl.
R	TimeoutMinutes (see page 6771)	This is TimeoutMinutes, a member of class TWebSessionImpl.
R	TouchTime (see page 6771)	This is TouchTime, a member of class TWebSessionImpl.
	Values (see page 6771)	This is Values, a member of class TWebSessionImpl.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Create (see page 6765)	This is Create, a member of class TWebSessionImpl.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 6765)	Disposes of an object instance.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	ToString (see page 3380)	Returns a string containing the class name.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
	IsActive (see page 1107)	This is IsActive, a member of class IWebSessionAttributes.
	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.

68.1.4.2 TWebSessionImpl.Create Constructor

Pascal

```
constructor Create(AID: TSessionID);
```

C++

```
__fastcall TWebSessionImpl(TSessionID AID);
```

Description

This is Create, a member of class TWebSessionImpl.

68.1.4.3 TWebSessionImpl.Destroy Destructor

Disposes of an object instance.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebSessionImpl();
```

Description

Do not call System::TObject::Destroy directly. Call System::TObject::Free instead. Free verifies that the object reference is not nil before calling System::TObject::Destroy.

The System::TObject::Destroy method defined by System::TObject deallocates memory. Descendant objects usually define a destructor that is customized for that particular kind of object.

When declaring a System::TObject::Destroy method in a descendant, always add the override directive to the declaration and call the inherited System::TObject::Destroy as the last statement in the overriding method. Since System::TObject::Destroy is a virtual method, overriding it ensures that the proper inherited behavior occurs.

Note: If an exception escapes from the constructor, the destructor is called to destroy the partially constructed object instance that failed to initialize completely. Therefore, destructors should check that allocated resources, such as handles, were actually allocated before trying to release them, since their value might be zero.

System::TObject::Destroy should be implemented so that it calls System::TObject::Free on all subobjects created within the object's constructor (that is, allocated by the constructor). Unlike System::TObject::Destroy, System::TObject::Free provides a safeguard when destroying objects that are nil.

See Also

System::TObject::Free (see page 3372)

68.1.4.4 TWebSessionImpl Methods

The methods of the TWebSessionImpl class are listed here.

Protected Methods

	Name	Description
	GetExpirationTime (see page 6766)	This is GetExpirationTime, a member of class TWebSessionImpl.
	GetExpired (see page 6767)	This is GetExpired, a member of class TWebSessionImpl.
	GetID (see page 6767)	This is GetID, a member of class TWebSessionImpl.
	GetIsActive (see page 6767)	This is GetIsActive, a member of class TWebSessionImpl.
	GetItemCount (see page 6767)	This is GetItemCount, a member of class TWebSessionImpl.
	GetItems (see page 6767)	This is GetItems, a member of class TWebSessionImpl.
	GetStartTime (see page 6768)	This is GetStartTime, a member of class TWebSessionImpl.
	GetTerminated (see page 6768)	This is GetTerminated, a member of class TWebSessionImpl.
	GetTimeoutMinutes (see page 6768)	This is GetTimeoutMinutes, a member of class TWebSessionImpl.
	GetTouchTime (see page 6768)	This is GetTouchTime, a member of class TWebSessionImpl.
	GetValue (see page 6769)	This is GetValue, a member of class TWebSessionImpl.
	SetTimeoutMinutes (see page 6769)	This is SetTimeoutMinutes, a member of class TWebSessionImpl.
	SetValue (see page 6769)	This is SetValue, a member of class TWebSessionImpl.
	Terminate (see page 6769)	Terminates the session.

68.1.4.4.1 TWebSessionImpl.GetExpirationTime Method

Pascal

```
function GetExpirationTime: TDateTime;
```

C++

```
__fastcall TDateTime GetExpirationTime();
```

Description

This is GetExpirationTime, a member of class TWebSessionImpl.

68.1.4.4.2 TWebSessionImpl.GetExpired Method

Pascal

```
function GetExpired: Boolean;
```

C++

```
__fastcall Boolean GetExpired();
```

Description

This is GetExpired, a member of class TWebSessionImpl.

68.1.4.4.3 TWebSessionImpl.GetID Method

Pascal

```
function GetID: TSessionID;
```

C++

```
__fastcall TSessionID GetID();
```

Description

This is GetID, a member of class TWebSessionImpl.

68.1.4.4.4 TWebSessionImpl.GetIsActive Method

Pascal

```
function GetIsActive: Boolean;
```

C++

```
__fastcall Boolean GetIsActive();
```

Description

This is GetIsActive, a member of class TWebSessionImpl.

68.1.4.4.5 TWebSessionImpl.GetItemCount Method

Pascal

```
function GetItemCount: Integer;
```

C++

```
__fastcall int GetItemCount();
```

Description

This is GetItemCount, a member of class TWebSessionImpl.

68.1.4.4.6 TWebSessionImpl.GetItems Method

Pascal

```
procedure GetItems(var AItems: TAbstractNamedVariants);
```

C++

```
__fastcall GetItems(TAbstractNamedVariants AItems);
```

Description

This is GetItems, a member of class TWebSessionImpl.

68.1.4.4.7 TWebSessionImpl.GetStartTime Method

Pascal

```
function GetStartTime: TDateTime;
```

C++

```
__fastcall TDateTime GetStartTime();
```

Description

This is GetStartTime, a member of class TWebSessionImpl.

68.1.4.4.8 TWebSessionImpl.GetTerminated Method

Pascal

```
function GetTerminated: Boolean;
```

C++

```
__fastcall Boolean GetTerminated();
```

Description

This is GetTerminated, a member of class TWebSessionImpl.

68.1.4.4.9 TWebSessionImpl.GetTimeoutMinutes Method

Pascal

```
function GetTimeoutMinutes: Integer;
```

C++

```
__fastcall int GetTimeoutMinutes();
```

Description

This is GetTimeoutMinutes, a member of class TWebSessionImpl.

68.1.4.4.10 TWebSessionImpl.GetTouchTime Method

Pascal

```
function GetTouchTime: TDateTime;
```

C++

```
__fastcall TDateTime GetTouchTime();
```

Description

This is GetTouchTime, a member of class TWebSessionImpl.

68.1.4.4.11 TWebSessionImpl.GetValue Method

Pascal

```
function GetValue(const AName: string): Variant;
```

C++

```
__fastcall Variant GetValue(const UnicodeString AName);
```

Description

This is GetValue, a member of class TWebSessionImpl.

68.1.4.4.12 TWebSessionImpl.SetTimeoutMinutes Method

Pascal

```
procedure SetTimeoutMinutes(AValue: Integer);
```

C++

```
__fastcall SetTimeoutMinutes(int AValue);
```

Description

This is SetTimeoutMinutes, a member of class TWebSessionImpl.

68.1.4.4.13 TWebSessionImpl.SetValue Method

Pascal

```
procedure SetValue(const AName: string; const AValue: Variant);
```

C++

```
__fastcall SetValue(const UnicodeString AName, const Variant AValue);
```

Description

This is SetValue, a member of class TWebSessionImpl.

68.1.4.4.14 TWebSessionImpl.Terminate Method

Terminates the session.

Pascal

```
procedure Terminate;
```

C++

```
__fastcall Terminate();
```

Description

Call Terminate to terminate a session. Once a session terminates, the application can no longer access its Values.

Sessions are terminated automatically when the application does not receive any requests for the session for TimeOutMinutes minutes.

TimeoutMinutes

Values

68.1.4.5 TWebSessionImpl Properties

The properties of the TWebSessionImpl class are listed here.

Protected Properties

	Name	Description
R	ExpirationTime (see page 6770)	This is ExpirationTime, a member of class TWebSessionImpl.
R	Expired (see page 6770)	This is Expired, a member of class TWebSessionImpl.
R	ID (see page 6770)	This is ID, a member of class TWebSessionImpl.
R	StartTime (see page 6771)	This is StartTime, a member of class TWebSessionImpl.
R	Terminated (see page 6771)	This is Terminated, a member of class TWebSessionImpl.
R	TimeoutMinutes (see page 6771)	This is TimeoutMinutes, a member of class TWebSessionImpl.
R	TouchTime (see page 6771)	This is TouchTime, a member of class TWebSessionImpl.
	Values (see page 6771)	This is Values, a member of class TWebSessionImpl.

68.1.4.5.1 TWebSessionImpl.ExpirationTime Property

Pascal

```
property ExpirationTime: TDateTime;
```

C++

```
__property TDateTime ExpirationTime;
```

Description

This is ExpirationTime, a member of class TWebSessionImpl.

68.1.4.5.2 TWebSessionImpl.Expired Property

Pascal

```
property Expired: Boolean;
```

C++

```
__property Boolean Expired;
```

Description

This is Expired, a member of class TWebSessionImpl.

68.1.4.5.3 TWebSessionImpl.ID Property

Pascal

```
property ID: TSessionID;
```

C++

```
__property TSessionID ID;
```

Description

This is ID, a member of class TWebSessionImpl.

68.1.4.5.4 TWebSessionImpl.StartTime Property

Pascal

```
property StartTime: TDateTime;
```

C++

```
__property TDateTime StartTime;
```

Description

This is StartTime, a member of class TWebSessionImpl.

68.1.4.5.5 TWebSessionImpl.Terminated Property

Pascal

```
property Terminated: Boolean;
```

C++

```
__property Boolean Terminated;
```

Description

This is Terminated, a member of class TWebSessionImpl.

68.1.4.5.6 TWebSessionImpl.TimeoutMinutes Property

Pascal

```
property TimeoutMinutes: Integer;
```

C++

```
__property int TimeoutMinutes;
```

Description

This is TimeoutMinutes, a member of class TWebSessionImpl.

68.1.4.5.7 TWebSessionImpl.TouchTime Property

Pascal

```
property TouchTime: TDateTime;
```

C++

```
__property TDateTime TouchTime;
```

Description

This is TouchTime, a member of class TWebSessionImpl.

68.1.4.5.8 TWebSessionImpl.Values Property

Pascal

```
property Values [const AName: string]: Variant;
```

C++

```
__property Variant Values[UnicodeString const AName];
```

Description

This is Values, a member of class TWebSessionImpl.

68.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TEndSessionReason (see page 6773)	TEndSessionReason indicates the reason a session ended.

68.2.1 WebSess.TEndSessionReason Enumeration

TEndSessionReason indicates the reason a session ended.

Pascal

```
TEndSessionReason = (
  esTimeout,
  esTerminate
);
```

C++

```
enum TEndSessionReason {
  esTimeout,
  esTerminate
};
```

File

WebSess

Description

The following table gives the possible values:

Value	Meaning
esTimeout	The session's time-out period elapsed without the application accessing the session.
esTerminate	The application called the session's Terminate method. This can be an explicit call in application call, or an implicit call when the user logs out in an application that uses TEndUserSessionsAdpater.

68.3 Types

The following table lists types in this documentation.

Types

Name	Description
TEndSessionEvent (see page 6774)	TEndSessionEvent is the type for event handlers that are called when a session terminates.
TStartSessionEvent (see page 6774)	TStartSessionEvent is the type for event handlers that are called when a session starts up.

68.3.1 WebSess.TEndSessionEvent Type

TEndSessionEvent is the type for event handlers that are called when a session terminates.

Pascal

```
TEndSessionEvent = procedure (ASender: TObject; ASession: TAbstractWebSession; AReason:
TEndSessionReason) of object;
```

C++

```
(ASender: TObject; ASession: TAbstractWebSession; AReason: TEndSessionReason) (
TEndSessionEvent)();
```

File

WebSess

Description

ASender is the sessions service component that manages the sessions in the WebSnap application.

ASession is the session that just terminated. The event handler can read its session ID and name/value pairs before they are deleted from memory.

AReason indicates the reason that the session was terminated.

See Also

Procedural types

Creating events

68.3.2 WebSess.TStartSessionEvent Type

TStartSessionEvent is the type for event handlers that are called when a session starts up.

Pascal

```
TStartSessionEvent = procedure (ASender: TObject; ASession: TAbstractWebSession) of object;
```

C++

```
(ASender: TObject; ASession: TAbstractWebSession) ( TStartSessionEvent)();
```

File

WebSess

Description

ASender is the sessions service component that manages the sessions in the WebSnap application.

ASession is the session object for the new session. Note that the object for a session may change over the lifetime of the session. The name/value pairs, session ID, and time-out period persist over changes in the session object.

See Also

Procedural types

Creating events

69 WebUsers Namespace

This is namespace WebUsers.

Topics

Name	Description
Classes (see page 6779)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 6801)	The following table lists structs, records, enums in this documentation.
Types (see page 6802)	The following table lists types in this documentation.

Classes

	Name	Description
	EUserIDNotFoundException (see page 6779)	EUserIDNotFoundException is raised when a Web user list attempts to locate information about a user that is not in the list.
	EValidateUserException (see page 6779)	EValidateUserException is raised when a Web user list fails to validate a user.
	EWebUsersListException (see page 6780)	EWebUsersListException is the base class for exceptions that TWebUserList (see page 6796) raises.
	TCustomWebUserList (see page 6781)	The TCustomWebUserList component uses a TWebUserItems (see page 6792) object to store the account information about a collection of users.
	TWebUserItem (see page 6787)	TWebUserItem stores the user identification, password, and access rights for a single user.
	TWebUserItems (see page 6792)	TWebUserItems stores multiple sets of user information.
	TWebUserList (see page 6796)	TWebUserList validates login and checks access rights for a particular user.

Structs, Records, Enums

	Name	Description
	TValidateUserError (see page 6801)	TValidateUserError indicates the type of problem that was encountered when trying to validate a user.

Types

Name	Description
TCheckAccessRightsEvent (see page 6802)	TCheckAccessRightsEvent is the type for event handlers that check the current user's access rights against a rights string.
TCheckAccessRightsHandledEvent (see page 6802)	TCheckAccessRightsHandledEvent is the type for event handlers that can potentially replace the built-in checking of a user's rights against an access string.
TValidateUserErrorEvent (see page 6803)	TValidateUserErrorEvent is the type for event handlers that compensate for errors that occur when trying to validate a user that is logging in.
TValidateUserEvent (see page 6804)	TValidateUserEvent is the type for event handlers that respond immediately after a user is validated.

TValidateUserHandledEvent (see page 6804)	TValidateUserHandledEvent is the type for event handlers that can validate a user that has just logged in.

69.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EUserIDNotFoundException (see page 6779)	EUserIDNotFoundException is raised when a Web user list attempts to locate information about a user that is not in the list.
	EValidateUserException (see page 6779)	EValidateUserException is raised when a Web user list fails to validate a user.
	EWebUsersListException (see page 6780)	EWebUsersListException is the base class for exceptions that TWebUserList (see page 6796) raises.
	TCustomWebUserList (see page 6781)	The TCustomWebUserList component uses a TWebUserItems (see page 6792) object to store the account information about a collection of users.
	TWebUserItem (see page 6787)	TWebUserItem stores the user identification, password, and access rights for a single user.
	TWebUserItems (see page 6792)	TWebUserItems stores multiple sets of user information.
	TWebUserList (see page 6796)	TWebUserList validates login and checks access rights for a particular user.

69.1.1 EUserIDNotFoundException Class

EUserIDNotFoundException is raised when a Web user list attempts to locate information about a user that is not in the list.

Class Hierarchy

Pascal

```
EUserIDNotFoundException = class(EWebUsersListException);
```

C++

```
class EUserIDNotFoundException : public EWebUsersListException;
```

File

WebUsers

Description

When a Web user list (TWebUserList (see page 6796)) attempts to look up information about a user and fails to find an entry for that user, it generates an OnUserIDNotFound event. If that event handler does not handle the situation, then the Web user list raises an EUserIDNotFoundException exception.

See Also

TWebUserList (see page 6796)

TCustomWebUserList (see page 6781)

69.1.2 EValidateUserException Class

EValidateUserException is raised when a Web user list fails to validate a user.

Class Hierarchy

Pascal

```
EValidateUserException = class(EWebUsersListException);
```

C++

```
class EValidateUserException : public EWebUsersListException;
```

File

WebUsers

Description

When a WebSnap application that contains a Web user list (TWebUserList (see page 6796)) tries to log a user in, the Web user list raises an EValidateUserException if it can't validate the supplied user ID and password and its OnValidateUserError event handler does not handle the situation.

The Web user list may fail to validate a user ID and password for any of the following reasons:

The WebSnap application failed to supply a password or user ID when trying to validate the user.

The supplied user ID does not refer to a user in the list.

The supplied password is not correct for the specified user.

See Also

TWebUserList (see page 6796)

TCustomWebUserList (see page 6781)

69.1.3 EWebUsersListException Class

EWebUsersListException is the base class for exceptions that TWebUserList (see page 6796) raises.

Class Hierarchy

Pascal

```
EWebUsersListException = class(EWebBrokerException);
```

C++

```
class EWebUsersListException : public EWebBrokerException;
```

File

WebUsers

Description

EWebUsersListException is the common base class for all exceptions that represent errors which TWebUserList (see page 6796) encounters. Its descendants include

EUserIDNotFoundException (see page 6779), which is raised when a WebSnap application tries to use the Web user list to look up information about a user that is not listed.

EValidateUserException (see page 6779), which is raised when the WebSnap application tries to log in a user and the Web

user list fails to validate the supplied user id and password.

See Also

TWebUserList (see page 6796)

EUserIDNotFoundException (see page 6779)

EValidateUserException (see page 6779)

69.1.4 TCustomWebUserList Class

The TCustomWebUserList component uses a TWebUserItems (see page 6792) object to store the account information about a collection of users.

Class Hierarchy

Pascal

```
TCustomWebUserList = class(TComponent, IWebUserList);
```

C++

```
class TCustomWebUserList : public TComponent, public IWebUserList;
```

File

WebUsers

Description

The TCustomWebUserList component uses a TWebUserItems (see page 6792) object to store the account information about a collection of users. It also provides a way to save and load the user list from a file. Several events are triggered at stages that occur when a user is logging in that allow checks to be performed during the user validation process, including the verification of user rights.

See Also

TWebUserItems (see page 6792)

TWebUserList (see page 6796)

69.1.4.1 TCustomWebUserList Members

The following tables list the members exposed by TCustomWebUserList.

Protected Methods

	Name	Description
	CheckAccessRights (see page 6783)	Checks whether a specified user has a given access rights string.
	ValidateUser (see page 6784)	Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6781) object.

Public Events

	Name	Description
	OnAfterCheckAccessRights (see page 6785)	Triggered at the start of the CheckAccessRights (see page 6783) protected function.

	OnAfterValidateUser (see page 6786)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 6786)	Triggered at the end of the CheckAccessRights (see page 6783) protected function.
	OnBeforeValidateUser (see page 6786)	Triggered at the beginning of the ValidateUser (see page 6784) function.
	OnUserIDNotFound (see page 6787)	Triggered if the UserID is not found in the TCustomWebUserList (see page 6781) object.
	OnValidateUserError (see page 6787)	Triggered if an error occurs during the validation process.

Public Methods

	Name	Description
V	Create (see page 6782)	Creates a newTCustomWebUserList object.
V	Destroy (see page 6782)	Frees the TCustomWebUserList (see page 6781) object.
	LoadFromFile (see page 6783)	Loads the data from the file with the given filename.
	SaveToFile (see page 6784)	This procedure saves the collection of the user's account information to a file with the given filename.

Public Properties

	Name	Description
	UserItems (see page 6784)	Stores the account information about a collection of users.
R	Users (see page 6785)	Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6787).

69.1.4.2 TCustomWebUserList.Create Constructor

Creates a newTCustomWebUserList object.

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TCustomWebUserList(TComponent * AOwner);
```

Description

Creates a newTCustomWebUserList object and initializes the TWebUserItems (see page 6792) object that will store the user's account information.

69.1.4.3 TCustomWebUserList.Destroy Destructor

Frees the TCustomWebUserList (see page 6781) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TCustomWebUserList();
```

Description

Frees the TCustomWebUserList (see page 6781) object initialized by the constructor.

69.1.4.4 TCustomWebUserList Methods

The methods of the TCustomWebUserList class are listed here.

Protected Methods

	Name	Description
	CheckAccessRights (see page 6783)	Checks whether a specified user has a given access rights string.
	ValidateUser (see page 6784)	Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6781) object.

Public Methods

	Name	Description
	LoadFromFile (see page 6783)	Loads the data from the file with the given filename.
	SaveToFile (see page 6784)	This procedure saves the collection of the user's account information to a file with the given filename.

69.1.4.4.1 TCustomWebUserList.CheckAccessRights Method

Checks whether a specified user has a given access rights string.

Pascal

```
function CheckAccessRights(AUserID: Variant; ARights: string): Boolean;
```

C++

```
__fastcall Boolean CheckAccessRights(Variant AUserID, UnicodeString ARights);
```

Description

Call CheckAccessRights to determine whether the current end user is authorized to view Web pages or adapters whose access rights string is Rights. The end user must be logged in before CheckAccessRights can determine the user's access rights.

UserID is the user ID of the user to check.

Rights is the access rights string that CheckAccessRights must look for. Typically, this is the value of the ViewRights property on a Web page information object that describes the page the user wants to access or on an adapter that the user wants to call.

See Also

HasViewRights (see page 5510)

HasModifyRights (see page 5509)

HasExecuteRights (see page 5509)

ViewAccess

ViewAccess (see page 5574)

69.1.4.4.2 TCustomWebUserList.LoadFromFile Method

Loads the data from the file with the given filename.

Pascal

```
procedure LoadFromFile(FileName: string);
```

C++

```
__fastcall LoadFromFile(UnicodeString FileName);
```

Description

Loads the data from the file with the given filename into the TCustomWebUserList (see page 6781) object.

69.1.4.4.3 TCustomWebUserList.SaveToFile Method

This procedure saves the collection of the user's account information to a file with the given filename.

Pascal

```
procedure SaveToFile(FileName: string);
```

C++

```
__fastcall SaveToFile(UnicodeString FileName);
```

Description

Saves the collection of the user's account information to a file with the given filename. This file can later be reloaded by calling LoadFromFile (see page 6783).

69.1.4.4.4 TCustomWebUserList.ValidateUser Method

Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6781) object.

Pascal

```
function ValidateUser(Strings: TStrings): Variant;
```

C++

```
__fastcall Variant ValidateUser(TStrings Strings);
```

Description

This function verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6781) object. Before the validation begins, it triggers the OnBeforeValidateUser (see page 6786) event. If an error occurs during the validation check, the OnValidateUserError (see page 6787) event will be triggered and a description of the error is sent, which could be either a missing or invalid password, or a missing or unknown user name. After the validation is complete, this function triggers the OnAfterValidateUser (see page 6786) event.

69.1.4.5 TCustomWebUserList Properties

The properties of the TCustomWebUserList class are listed here.

Public Properties

	Name	Description
	UserItems (see page 6784)	Stores the account information about a collection of users.
R	Users (see page 6785)	Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6787).

69.1.4.5.1 TCustomWebUserList.UserItems Property

Stores the account information about a collection of users.

Pascal

```
property UserItems: TWebUserItems;
```

C++

```
__property TWebUserItems UserItems;
```

Description

Use this object to store the account information about a collection of users. This property provides read and write access to the stored collection.

See Also

Users (see page 6785)

69.1.4.5.2 TCustomWebUserList.Users Property

Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6787).

Pascal

```
property Users [I: Integer]: TWebUserItem;
```

C++

```
__property TWebUserItem Users[int I];
```

Description

Use this property to provide read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6787). An individual TWebUserItem (see page 6787) object can be indexed from the array using the standard bracketed array notation.

See Also

UserItems (see page 6784)

69.1.4.6 TCustomWebUserList Events

The events of the TCustomWebUserList class are listed here.

Public Events

	Name	Description
	OnAfterCheckAccessRights (see page 6785)	Triggered at the start of the CheckAccessRights (see page 6783) protected function.
	OnAfterValidateUser (see page 6786)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 6786)	Triggered at the end of the CheckAccessRights (see page 6783) protected function.
	OnBeforeValidateUser (see page 6786)	Triggered at the beginning of the ValidateUser (see page 6784) function.
	OnUserIDNotFound (see page 6787)	Triggered if the UserID is not found in the TCustomWebUserList (see page 6781) object.
	OnValidateUserError (see page 6787)	Triggered if an error occurs during the validation process.

69.1.4.6.1 TCustomWebUserList.OnAfterCheckAccessRights Event

Triggered at the start of the CheckAccessRights (see page 6783) protected function.

Pascal

```
property OnAfterCheckAccessRights: TCheckAccessRightsEvent;
```

C++

```
__property TCheckAccessRightsEvent OnAfterCheckAccessRights;
```

Description

This event is triggered at the start of the CheckAccessRights (see page 6783) protected function. This event can be used if

any additional checking or initializing is desired before the access rights are checked.

See Also

OnBeforeCheckAccessRights (see page 6786)

69.1.4.6.2 TCustomWebUserList.OnAfterValidateUser Event

Occurs after a user has been validated.

Pascal

```
property OnAfterValidateUser: TValidateUserEvent;
```

C++

```
__property TValidateUserEvent OnAfterValidateUser;
```

Description

This event is triggered at the end of the ValidateUser (see page 6784) function. It can be used if any additional processing needs to be done after a user's name and password are verified.

See Also

OnBeforeValidateUser (see page 6786)

ValidateUser (see page 6784)

69.1.4.6.3 TCustomWebUserList.OnBeforeCheckAccessRights Event

Triggered at the end of the CheckAccessRights (see page 6783) protected function.

Pascal

```
property OnBeforeCheckAccessRights: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnBeforeCheckAccessRights;
```

Description

This event is triggered at the end of the CheckAccessRights (see page 6783) protected function. It can be used to perform your own custom checking instead of the default checking by the Web user list.

See Also

OnAfterCheckAccessRights (see page 6785)

69.1.4.6.4 TCustomWebUserList.OnBeforeValidateUser Event

Triggered at the beginning of the ValidateUser (see page 6784) function.

Pascal

```
property OnBeforeValidateUser: TValidateUserHandledEvent;
```

C++

```
__property TValidateUserHandledEvent OnBeforeValidateUser;
```

Description

This event is triggered at the beginning of the ValidateUser (see page 6784) function. It can be used to identify a user given a name and password and supply a user ID for the user, once identified.

See Also

OnAfterValidateUser (see page 6786)

69.1.4.6.5 TCustomWebUserList.OnUserIDNotFound Event

Triggered if the UserID is not found in the TCustomWebUserList (see page 6781) object.

Pascal

```
property OnUserIDNotFound: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnUserIDNotFound;
```

Description

This event is triggered if the UserID is not found in the TCustomWebUserList (see page 6781) object. The CheckAccessRights (see page 6783) protected function triggers this function if the UserID is not found while checking the access rights.

69.1.4.6.6 TCustomWebUserList.OnValidateUserError Event

Triggered if an error occurs during the validation process.

Pascal

```
property OnValidateUserError: TValidateUserErrorEvent;
```

C++

```
__property TValidateUserErrorEvent OnValidateUserError;
```

Description

This event is triggered if an error occurs during the validation process. The ValidateUser (see page 6784) function calls this event with a description of the error. Examples of error descriptions include a missing or unknown user name or a missing or invalid password. Any additional processing that needs to be completed in the case of one of these error conditions can be added to this event handler.

See Also

ValidateUser (see page 6784)

69.1.5 TWebUserItem Class

TWebUserItem stores the user identification, password, and access rights for a single user.

Class Hierarchy

Pascal

```
TWebUserItem = class(TCollectionItem);
```

C++

```
class TWebUserItem : public TCollectionItem;
```

File

WebUsers

Description

TWebUserItem stores the user ID and password along with the associated access rights for a single user. Methods are provided to set the access rights as well as methods to retrieve the access rights in the form of a single delimited string, or as a collection in the form of a TString.

See Also

TWebUserList (see page 6796)

TWebUserItems (see page 6792)

69.1.5.1 TWebUserItem Members

The following tables list the members exposed by TWebUserItem.

Public Methods

	Name	Description
	Assign (see page 6789)	Copies the UserName (see page 6791), Password (see page 6791), and AccessRights (see page 6790) from the given TWebUserItem (see page 6787).
	CheckRights (see page 6790)	Checks the user's stored access rights against the access rights passed in.
	Create (see page 6788)	Creates an instance of Create.
	Destroy (see page 6789)	Destroys an instance of TWebUserItem (see page 6787).

Public Properties

	Name	Description
	AccessRightsStrings (see page 6791)	Stores the access rights for the user as a collection of individual strings in the form of a TStrings object.
	UserID (see page 6791)	Provides read-only access to the user ID.

Published Properties

	Name	Description
	AccessRights (see page 6790)	Stores the user rights as a comma, semicolon, or space delimited string.
	Password (see page 6791)	Stores the user's password as a string.
	UserName (see page 6791)	Stores the user's name.

69.1.5.2 TWebUserItem.Create Constructor

Creates an instance of Create.

Pascal

```
constructor Create(Collection: TCollection); override;
```

C++

```
virtual __fastcall TWebUserItem(TCollection Collection);
```

Description

Do not call Create. It is called automatically when the Create object is created.

69.1.5.3 TWebUserItem.Destroy Destructor

Destroys an instance of TWebUserItem (see page 6787).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWebUserItem();
```

Description

The Destroy destructor frees all objects owned by the TWebUserItem (see page 6787) object. Never call the destructor explicitly; it is called automatically when the TWebUserItem (see page 6787) object is destroyed (for example, when the object falls out of the scope of the program).

See Also

delete

69.1.5.4 TWebUserItem Methods

The methods of the TWebUserItem class are listed here.

Public Methods

	Name	Description
	Assign (see page 6789)	Copies the UserName (see page 6791), Password (see page 6791), and AccessRights (see page 6790) from the given TWebUserItem (see page 6787).
	CheckRights (see page 6790)	Checks the user's stored access rights against the access rights passed in.

69.1.5.4.1 TWebUserItem.Assign Method

Copies the UserName (see page 6791), Password (see page 6791), and AccessRights (see page 6790) from the given TWebUserItem (see page 6787).

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

The Assign procedure copies the UserName (see page 6791), Password (see page 6791), and AccessRights (see page 6790) from the given TWebUserItem (see page 6787).

See Also

UserName (see page 6791)

Password (see page 6791)

AccessRights (see page 6790)

69.1.5.4.2 TWebUserItem.CheckRights Method

Checks the user's stored access rights against the access rights passed in.

Pascal

```
function CheckRights(const ARights: string): Boolean;
```

C++

```
__fastcall Boolean CheckRights(const UnicodeString ARights);
```

Description

This function checks the user's stored access rights against the access rights passed in. If the user has a matching right, then the function returns true or it will return false if the rights do not match.

See Also

AccessRights (see page 6790)

69.1.5.5 TWebUserItem Properties

The properties of the TWebUserItem class are listed here.

Public Properties

	Name	Description
R	AccessRightsStrings (see page 6791)	Stores the access rights for the user as a collection of individual strings in the form of a TStrings object.
R	UserID (see page 6791)	Provides read-only access to the user ID.

Published Properties

	Name	Description
	AccessRights (see page 6790)	Stores the user rights as a comma, semicolon, or space delimited string.
	Password (see page 6791)	Stores the user's password as a string.
	UserName (see page 6791)	Stores the user's name.

69.1.5.5.1 TWebUserItem.AccessRights Property

Stores the user rights as a comma, semicolon, or space delimited string.

Pascal

```
property AccessRights: string;
```

C++

```
__property UnicodeString AccessRights;
```

Description

The AccessRights property stores the user rights as a comma, semicolon, or space delimited string. This variable can be read or written directly or set as a single string using SetAccessRights. The individual rights can be obtained as a collection in the form of a TString by calling the GetAccessRightsStrings function.

See Also

CheckRights (see page 6790)

69.1.5.5.2 TWebUserItem.AccessRightsStrings Property

Stores the access rights for the user as a collection of individual strings in the form of a TStrings object.

Pascal

```
property AccessRightsStrings: TStrings;
```

C++

```
__property TStrings AccessRightsStrings;
```

Description

The AccessRightsStrings property stores the access rights for the user as a collection of individual strings in the form of a TStrings object.

See Also

AccessRights (see page 6790)

TStrings

69.1.5.5.3 TWebUserItem.Password Property

Stores the user's password as a string.

Pascal

```
property Password: string;
```

C++

```
__property UnicodeString Password;
```

Description

The Password property stores the user's password as a string.

69.1.5.5.4 TWebUserItem.UserID Property

Provides read-only access to the user ID.

Pascal

```
property UserID: Variant;
```

C++

```
__property Variant UserID;
```

Description

The UserID property provides read-only access to the user ID.

See Also

System::Variant (see page 3421)

69.1.5.5.5 TWebUserItem.UserName Property

Stores the user's name.

Pascal

```
property UserName: string;
```

C++

```
__property UnicodeString UserName;
```

Description

The UserName property stores the user's name. This property can be read or written directly.

69.1.6 TWebUserItems Class

TWebUserItems stores multiple sets of user information.

Class Hierarchy

Pascal

```
TWebUserItems = class(TCollection);
```

C++

```
class TWebUserItems : public TCollection;
```

File

WebUsers

Description

The TWebUserItems stores multiple TWebUserItem (see page 6787) modules as an array. It also provides methods to access a particular user's information by giving the user name or user ID.

69.1.6.1 TWebUserItems Members

The following tables list the members exposed by TWebUserItems.

Protected Methods

	Name	Description
	GetAttr (see page 6794)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
	GetAttrCount (see page 6794)	Returns the number of custom attributes associated with items in the collection.
	GetItemAttr (see page 6795)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 6795)	Returns the owner of an object.

Public Methods

	Name	Description
	Create (see page 6793)	Constructor used for the TWebUserItems (see page 6792) object.
	FindUserID (see page 6793)	Returns the user ID, password, and access rights information for the user.
	FindUserName (see page 6793)	Returns the user ID, password, and access rights information for the user.

Public Properties

	Name	Description
	Items (see page 6796)	Allows public read and write access to individual TWebUserItem (see page 6787) records as if they were stored in an array.

69.1.6.2 TWebUserItems.Create Constructor

Constructor used for the TWebUserItems (see page 6792) object.

Pascal

```
constructor Create(AOwner: TComponent; ItemClass: TCollectionItemClass);
```

C++

```
__fastcall TWebUserItems(TComponent * AOwner, TCollectionItemClass ItemClass);
```

Description

The constructor used for the TWebUserItems (see page 6792) object. This method creates a new TWebUserItem (see page 6787) and sets the owner.

69.1.6.3 TWebUserItems Methods

The methods of the TWebUserItems class are listed here.

Protected Methods

	Name	Description
	GetAttr (see page 6794)	Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.
	GetAttrCount (see page 6794)	Returns the number of custom attributes associated with items in the collection.
	GetItemAttr (see page 6795)	Returns the value of a custom attribute assigned to one of the collection's items.
	GetOwner (see page 6795)	Returns the owner of an object.

Public Methods

	Name	Description
	FindUserID (see page 6793)	Returns the user ID, password, and access rights information for the user.
	FindUserName (see page 6793)	Returns the user ID, password, and access rights information for the user.

69.1.6.3.1 TWebUserItems.FindUserID Method

Returns the user ID, password, and access rights information for the user.

Pascal

```
function FindUserID(AUserID: Variant): TWebUserItem;
```

C++

```
__fastcall TWebUserItem FindUserID(Variant AUserID);
```

Description

This method returns the user ID, password, and access rights information for the user with the given user name in the form of a TWebUserItem (see page 6787) object.

69.1.6.3.2 TWebUserItems.FindUserName Method

Returns the user ID, password, and access rights information for the user.

Pascal

```
function FindUserName(AUserName: string): TWebUserItem;
```

C++

```
__fastcall TWebUserItem FindUserName(UnicodeString AUserName);
```

Description

This method returns the user ID, password, and access rights information for the user with the given user ID in the form of a TWebUserItem (see page 6787) object.

69.1.6.3.3 TWebUserItems.GetAttr Method

Returns the name of a custom attribute that can be retrieved using the GetItemAttr method.

Pascal

```
function GetAttr(Index: Integer): string; override;
```

C++

```
virtual __fastcall UnicodeString GetAttr(int Index);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. The GetAttr method returns the name of an attribute.

Index identifies the attribute whose name is requested. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

As implemented by TCollection, GetAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttrCount

GetItemAttr

69.1.6.3.4 TWebUserItems.GetAttrCount Method

Returns the number of custom attributes associated with items in the collection.

Pascal

```
function GetAttrCount: Integer; override;
```

C++

```
virtual __fastcall int GetAttrCount();
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetAttrCount returns the number of distinct attributes assigned to each item in the collection.

As implemented in TCollection, GetAttrCount always returns 0, because TCollection defines no custom attributes.

See Also

GetAttr

GetItemAttr

69.1.6.3.5 TWebUserItems.GetItemAttr Method

Returns the value of a custom attribute assigned to one of the collection's items.

Pascal

```
function GetItemAttr(Index: Integer; ItemIndex: Integer): string; override;
```

C++

```
virtual __fastcall UnicodeString GetItemAttr(int Index, int ItemIndex);
```

Description

TCollection descendants can associate user-defined attributes with the items in the collection. Each attribute has a name and, for each item in the collection, a value that is a string. GetItemAttr returns the value of one of these attributes for a specified item in the collection.

Index identifies which attribute's value is desired. This is a value between 0 and n-1, where n is the value returned by GetAttrCount.

ItemIndex identifies the item whose attribute value is desired. This is an index into the Items property array.

As implemented in TCollection, GetItemAttr always returns an empty string, because TCollection defines no custom attributes.

See Also

GetAttr

GetAttrCount

69.1.6.3.6 TWebUserItems.GetOwner Method

Returns the owner of an object.

Pascal

```
function GetOwner: TPersistent; override;
```

C++

```
virtual __fastcall TPersistent * GetOwner();
```

Description

GetOwner is used by the GetNamePath method to find the owner of a persistent object. GetNamePath and GetOwner are introduced in TPersistent so descendants such as collections can appear in the Object Inspector. As implemented in TPersistent, GetOwner returns nil (Delphi) or NULL (C++).

For TCollection, GetOwner returns the owner of the collection. For collection items, it returns the collection object into which the collection item has been inserted. For TComponent it is the value of the Owner property.

See Also

GetNamePath

TCollection

TComponent

Owner

69.1.6.4 TWebUserItems Properties

The properties of the TWebUserItems class are listed here.

Public Properties

	Name	Description
	Items (see page 6796)	Allows public read and write access to individual TWebUserItem (see page 6787) records as if they were stored in an array.

69.1.6.4.1 TWebUserItems.Items Property

Allows public read and write access to individual TWebUserItem (see page 6787) records as if they were stored in an array.

Pascal

```
property Items [Index: Integer]: TWebUserItem;
```

C++

```
__property TWebUserItem Items[int Index];
```

Description

The Items property allows public read and write access to individual TWebUserItem (see page 6787) records as if they were stored in an array. It also provides methods to access a particular user's information by giving the user name or user ID.

69.1.7 TWebUserList Class

TWebUserList validates login and checks access rights for a particular user.

Class Hierarchy

Pascal

```
TWebUserList = class(TCustomWebUserList);
```

C++

```
class TWebUserList : public TCustomWebUserList;
```

File

WebUsers

Description

Use TWebUserList, which contains a list of user names, passwords, and access rights, to validate login and to check a user's access rights.

The TWebUserList component provides events that are triggered during the initial stages when a user is logging in, before and after the user is validated, before and after the user's access rights are checked, in the case of an error, and when detecting an invalid user.

See Also

TWebUserItems (see page 6792)

TWebUserItem (see page 6787)

Adding Login Support

69.1.7.1 TWebUserList Members

The following tables list the members exposed by TWebUserList.

Protected Methods

	Name	Description
	CheckAccessRights (see page 6783)	Checks whether a specified user has a given access rights string.
	ValidateUser (see page 6784)	Verifies that the given user name and password matches one of the entries stored in the TCustomWebUserList (see page 6781) object.

Public Methods

	Name	Description
	CheckAccessRights (see page 1117)	Checks whether a specified user has a given access rights string.
V	Create (see page 6782)	Creates a newTCustomWebUserList object.
V	Destroy (see page 6782)	Frees the TCustomWebUserList (see page 6781) object.
	LoadFromFile (see page 6783)	Loads the data from the file with the given filename.
	SaveToFile (see page 6784)	This procedure saves the collection of the user's account information to a file with the given filename.
	ValidateUser (see page 1117)	Validates a user login.

Public Properties

	Name	Description
R	Users (see page 6785)	Provides read-only access to an individual user's account data in the form of an array of TWebUserItem (see page 6787).

Published Events

	Name	Description
	OnAfterCheckAccessRights (see page 6798)	Triggered at the start of the CheckAccessRights protected function.
	OnAfterValidateUser (see page 6798)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 6799)	Triggered at the end of the CheckAccessRights protected function.
	OnBeforeValidateUser (see page 6799)	Triggered at the beginning of the ValidateUser function.
	OnUserIDNotFound (see page 6799)	Triggered if the UserID is not found in the TCustomWebUserList object.
	OnValidateUserError (see page 6800)	Triggered if an error occurs during the validation process.

Published Properties

	Name	Description
	UserItems (see page 6797)	Stores the account information about a collection of users.

69.1.7.2 TWebUserList Properties

The properties of the TWebUserList class are listed here.

Published Properties

	Name	Description
	UserItems (see page 6797)	Stores the account information about a collection of users.

69.1.7.2.1 TWebUserList.UserItems Property

Stores the account information about a collection of users.

Pascal

```
property UserItems: TWebUserItems;
```

C++

```
__property TWebUserItems UserItems;
```

Description

Use this object to store the account information about a collection of users. This property provides read and write access to the stored collection.

See Also

Users (see page 6785)

69.1.7.3 TWebUserList Events

The events of the TWebUserList class are listed here.

Published Events

	Name	Description
	OnAfterCheckAccessRights (see page 6798)	Triggered at the start of the CheckAccessRights protected function.
	OnAfterValidateUser (see page 6798)	Occurs after a user has been validated.
	OnBeforeCheckAccessRights (see page 6799)	Triggered at the end of the CheckAccessRights protected function.
	OnBeforeValidateUser (see page 6799)	Triggered at the beginning of the ValidateUser function.
	OnUserIDNotFound (see page 6799)	Triggered if the UserID is not found in the TCustomWebUserList object.
	OnValidateUserError (see page 6800)	Triggered if an error occurs during the validation process.

69.1.7.3.1 TWebUserList.OnAfterCheckAccessRights Event

Triggered at the start of the CheckAccessRights protected function.

Pascal

```
property OnAfterCheckAccessRights: TCheckAccessRightsEvent;
```

C++

```
__property TCheckAccessRightsEvent OnAfterCheckAccessRights;
```

Description

This event is triggered at the start of the CheckAccessRights protected function. This event can be used if any additional checking or initializing is desired before the access rights are checked.

See Also

OnBeforeCheckAccessRights (see page 6786)

69.1.7.3.2 TWebUserList.OnAfterValidateUser Event

Occurs after a user has been validated.

Pascal

```
property OnAfterValidateUser: TValidateUserEvent;
```

C++

```
__property TValidateUserEvent OnAfterValidateUser;
```

Description

This event is triggered at the end of the ValidateUser function. It can be used if any additional processing needs to be done after a user's name and password are verified.

See Also

OnBeforeValidateUser (see page 6786)

ValidateUser (see page 6784)

69.1.7.3.3 TWebUserList.OnBeforeCheckAccessRights Event

Triggered at the end of the CheckAccessRights protected function.

Pascal

```
property OnBeforeCheckAccessRights: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnBeforeCheckAccessRights;
```

Description

This event is triggered at the end of the CheckAccessRights protected function. It can be used to perform your own custom checking instead of the default checking by the Web user list.

See Also

OnAfterCheckAccessRights (see page 6785)

69.1.7.3.4 TWebUserList.OnBeforeValidateUser Event

Triggered at the beginning of the ValidateUser function.

Pascal

```
property OnBeforeValidateUser: TValidateUserHandledEvent;
```

C++

```
__property TValidateUserHandledEvent OnBeforeValidateUser;
```

Description

This event is triggered at the beginning of the ValidateUser function. It can be used to identify a user given a name and password and supply a user ID for the user, once identified.

See Also

OnAfterValidateUser (see page 6786)

69.1.7.3.5 TWebUserList.OnUserIDNotFound Event

Triggered if the UserID is not found in the TCustomWebUserList object.

Pascal

```
property OnUserIDNotFound: TCheckAccessRightsHandledEvent;
```

C++

```
__property TCheckAccessRightsHandledEvent OnUserIDNotFound;
```

Description

This event is triggered if the UserID is not found in the TCustomWebUserList object. The CheckAccessRights protected function triggers this function if the UserID is not found while checking the access rights.

69.1.7.3.6 TWebUserList.OnValidateUserError Event

Triggered if an error occurs during the validation process.

Pascal

```
property OnValidateUserError: TValidateUserErrorEvent;
```

C++

```
__property TValidateUserErrorEvent OnValidateUserError;
```

Description

This event is triggered if an error occurs during the validation process. The ValidateUser function calls this event with a description of the error. Examples of error descriptions include a missing or unknown user name or a missing or invalid password. Any additional processing that needs to be completed in the case of one of these error conditions can be added to this event handler.

See Also

ValidateUser (see page 6784)

69.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TValidateUserError (see page 6801)	TValidateUserError indicates the type of problem that was encountered when trying to validate a user.

69.2.1 WebUsers.TValidateUserError Enumeration

TValidateUserError indicates the type of problem that was encountered when trying to validate a user.

Pascal

```
TValidateUserError = (
  vuBlankPassword,
  vuBlankUserName,
  vuUnknownUserName,
  vuUnknownPassword
);
```

C++

```
enum TValidateUserError {
  vuBlankPassword,
  vuBlankUserName,
  vuUnknownUserName,
  vuUnknownPassword
};
```

File

WebUsers

Description

The following table lists the possible values:

Value	Meaning
vuBlankPassword	The user did not supply a password, or supplied an empty string.
vuBlankUserName	The user did not supply a user name, or supplied an empty string.
vuUnknownUserName	The user supplied a user name that the Web user list could not identify.
vuUnknownPassword	The user supplied a password that the Web user list could not find associated with the specified user.

69.3 Types

The following table lists types in this documentation.

Types

Name	Description
TCheckAccessRightsEvent (see page 6802)	TCheckAccessRightsEvent is the type for event handlers that check the current user's access rights against a rights string.
TCheckAccessRightsHandledEvent (see page 6802)	TCheckAccessRightsHandledEvent is the type for event handlers that can potentially replace the built-in checking of a user's rights against an access string.
TValidateUserErrorEvent (see page 6803)	TValidateUserErrorEvent is the type for event handlers that compensate for errors that occur when trying to validate a user that is logging in.
TValidateUserEvent (see page 6804)	TValidateUserEvent is the type for event handlers that respond immediately after a user is validated.
TValidateUserHandledEvent (see page 6804)	TValidateUserHandledEvent is the type for event handlers that can validate a user that has just logged in.

69.3.1 WebUsers.TCheckAccessRightsEvent Type

TCheckAccessRightsEvent is the type for event handlers that check the current user's access rights against a rights string.

Pascal

```
TCheckAccessRightsEvent = procedure (UserID: Variant; Rights: string; var HasRight: Boolean)
of object;
```

C++

```
(UserID: Variant; Rights: string; var HasRight: Boolean) ( TCheckAccessRightsEvent)();
```

File

WebUsers

Description

UserID is the user ID of the user whose rights should be checked.

Rights is a string that represents the rights the user should have to be granted access. Typically, this value comes from the ViewRights property of a Web page information object that describes the page that the user wants to access or of an adapter that the user wants to call.

HasRight returns true if the event handler grants the user access rights, false if the event handler denies access.

See Also

Procedural types

Creating events

69.3.2 WebUsers.TCheckAccessRightsHandledEvent Type

TCheckAccessRightsHandledEvent is the type for event handlers that can potentially replace the built-in checking of a user's

rights against an access string.

Pascal

```
TCheckAccessRightsHandledEvent = procedure (UserID: Variant; Rights: string; var HasRight:
Boolean; var Handled: Boolean) of object;
```

C++

```
(UserID: Variant; Rights: string; var HasRight: Boolean; var Handled: Boolean) (
TCheckAccessRightsHandledEvent)();
```

File

WebUsers

Description

UserID is the user ID of the user whose rights should be checked.

Rights is a string that represents the rights the user should have to be granted access. Typically, this value comes from the ViewRights property of a Web page information object that describes the page that the user wants to access or of an adapter that the user wants to call.

HasRight returns true if the event handler grants the user access rights, false if the event handler denies access.

Handled returns true if the event handler has checked the end user's rights, false if the HasRight parameter has no meaning on exit. If Handled returns false, the Web user list continues with its default processing, such as checking of the end user's rights or denying access. If Handled returns true, the Web user list skips this step.

See Also

Procedural types

Creating events

69.3.3 WebUsers.TValidateUserErrorEvent Type

TValidateUserErrorEvent is the type for event handlers that compensate for errors that occur when trying to validate a user that is logging in.

Pascal

```
TValidateUserErrorEvent = procedure (Error: TValidateUserError; Strings: TStrings; var UserID:
Variant; var Handled: Boolean) of object;
```

C++

```
(Error: TValidateUserError; Strings: TStrings; var UserID: Variant; var Handled: Boolean) (
TValidateUserErrorEvent)();
```

File

WebUsers

Description

Error (see page 3560) indicates what type of problem was encountered while trying to validate the user.

Strings is a string list that contains information the user supplied while logging in. At a minimum, this includes two strings, of the form UserName=Name and Password=Pword, where Name and Pword are strings that the user supplied. If the application uses a custom login form, additional strings may be included as well.

UserID returns an ID that the event handler supplies to uniquely identify the user that just logged in.

Handled returns true if the event handler compensated for the error and identified the user given the parameters in Strings and supplied an ID using the UserID parameter. Error (see page 3560) returns false if the event handler could not compensate for the error.

See Also

Procedural types

Creating events

69.3.4 WebUsers.TValidateUserEvent Type

TValidateUserEvent is the type for event handlers that respond immediately after a user is validated.

Pascal

```
TValidateUserEvent = procedure (Strings: TStrings; var UserID: Variant) of object;
```

C++

```
(Strings: TStrings; var UserID: Variant) ( TValidateUserEvent)();
```

File

WebUsers

Description

Strings is a string list that contains information the user supplied while logging in. At a minimum, this includes two strings, of the form UserName=Name and Password=Pword, where Name and Pword are strings that the user supplied. If the application uses a custom login form, additional strings may be included as well.

UserID is the ID that the Web user list assigned to the user based on the supplied name and password.

See Also

Procedural types

Creating events

69.3.5 WebUsers.TValidateUserHandledEvent Type

TValidateUserHandledEvent is the type for event handlers that can validate a user that has just logged in.

Pascal

```
TValidateUserHandledEvent = procedure (Strings: TStrings; var UserID: Variant; var Handled:
Boolean) of object;
```

C++

```
(Strings: TStrings; var UserID: Variant; var Handled: Boolean) ( TValidateUserHandledEvent)();
```

File

WebUsers

Description

Strings is a string list that contains information the user supplied while logging in. At a minimum, this includes two strings, of the form UserName=Name and Password=Pword, where Name and Pword are strings that the user supplied. If the application uses

a custom login form, additional strings may be included as well.

UserID returns an ID that the event handler supplies to uniquely identify the user that just logged in.

Handled returns true if the event handler identified the user given the parameters in Strings and supplied an ID using the UserID parameter. Handled returns false if the event handler did not return a user ID for the current user. If Handled returns false, the Web user list proceeds with its own attempt to identify the user and assign a user ID.

70 WideStrings Namespace

This is namespace WideStrings.

Topics

Name	Description
Classes (see page 6808)	The following table lists classes in this documentation.
Interfaces (see page 6859)	The following table lists interfaces in this documentation.
Structs, Records, Enums (see page 6861)	The following table lists structs, records, enums in this documentation.
Types (see page 6862)	The following table lists types in this documentation.

Classes

	Name	Description
	TWideStringList (see page 6808)	TWideStringList maintains a list of strings.
	TWideStrings (see page 6825)	TWideStrings is the base class for objects that represent a list of Unicode strings.
	TWideStringsEnumerator (see page 6856)	Enumerates through the strings of a TWideStrings (see page 6825) object.

Interfaces

	Name	Description
	IWideStringsAdapter (see page 6859)	This is class WideStrings.IWideStringsAdapter.

Structs, Records, Enums

	Name	Description
	TWideStringItem (see page 6861)	TWideStringItem defines a TWideStringList (see page 6808) entry.

Types

Name	Description
PWideStringItem (see page 6862)	PWideStringItem is a TWideStringItem (see page 6861) pointer.
PWideStringItemList (see page 6862)	PWideStringItemList is a TWideStringItemList (see page 6863) pointer.
TWideStringItemList (see page 6863)	TWideStringItemList defines an array of TWideStringItems.
TWideStringListSortCompare (see page 6863)	TWideStringListSortCompare is a type of callback function called used internally by the TWideStringList (see page 6808) class.

70.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWideStringList (see page 6808)	TWideStringList maintains a list of strings.
	TWideStrings (see page 6825)	TWideStrings is the base class for objects that represent a list of Unicode strings.
	TWideStringsEnumerator (see page 6856)	Enumerates through the strings of a TWideStrings (see page 6825) object.

70.1.1 TWideStringList Class

TWideStringList maintains a list of strings.

Class Hierarchy

Pascal

```
TWideStringList = class(TWideStrings);
```

C++

```
class TWideStringList : public TWideStrings;
```

File

WideStrings

Description

Use a string list object to store and manipulate a list of strings. TWideStringList implements the abstract properties and methods introduced by TWideStrings (see page 6825), and introduces new properties, events, and methods to:

Sort (see page 6821) the strings in the list;

Prohibit duplicate strings in sorted lists;

Respond to changes in the contents of the list;

Control whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.

Working with Lists

70.1.1.1 TWideStringList Members

The following tables list the members exposed by TWideStringList.

Protected Methods

	Name	Description
	AssignTo (see page 6832)	Copies the properties of an object to a destination object.
	Changed (see page 6813)	This is Changed, a member of class TWideStringList.
	Changing (see page 6814)	This is Changing, a member of class TWideStringList.
	CompareStrings (see page 6814)	Compares two strings.
	DefineProperties (see page 6834)	Reads and writes the Strings (see page 6853) property as if it were published.
	Error (see page 6836)	This is the overview for the Error method overload.
	ExtractName (see page 6837)	Returns the name portion of a string that is a name value pair.
	Get (see page 6817)	Returns a string given its index.
	GetCapacity (see page 6817)	Returns the currently allocated size of the list of strings.
	GetCount (see page 6817)	Returns the number of strings in the list
	GetObject (see page 6818)	Returns the object associated with the string at a specified index.
	GetTextStr (see page 6839)	Returns the value of the Text (see page 6854) property.
	InsertItem (see page 6819)	This is InsertItem, a member of class TWideStringList.
	Put (see page 6820)	Changes the value of the string with a specified index.
	PutObject (see page 6820)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 6820)	Changes the amount of memory allocated to hold strings in the list.
	SetTextStr (see page 6846)	Sets the Text (see page 6854) property.
	SetUpdateState (see page 6821)	Performs internal adjustments before or after a series of updates.

Protected Properties

	Name	Description
	UpdateCount (see page 6855)	Indicates the number of calls to BeginUpdate (see page 6832) that have not been matched by a call to EndUpdate (see page 6835).

Public Events

	Name	Description
	OnChange (see page 6824)	Occurs immediately after the list of strings changes.
	OnChanging (see page 6825)	Occurs immediately before the list of strings changes.

Public Methods

	Name	Description
	Add (see page 6812)	Adds a new string to the list.
	AddObject (see page 6813)	Adds a string to the list, and associates an object with the string.
	AddStrings (see page 6830)	This is the overview for the AddStrings method overload.
	Append (see page 6831)	Adds a string to the list.
	Assign (see page 6831)	Sets the strings in the list, and possibly associated objects, from a source object.
	BeginUpdate (see page 6832)	Enables the TWideStrings (see page 6825) object to track when the list of strings is changing.
	Clear (see page 6814)	Deletes all the strings from the list.
	Create (see page 6810)	This is the overview for the Create constructor overload.
	CustomSort (see page 6815)	Sorts the strings in the list in a customized order.
	Delete (see page 6815)	Removes the string specified by the Index parameter.
	Destroy (see page 6811)	Destroys an instance of TWideStringList (see page 6808).
	EndUpdate (see page 6835)	Enables the TWideStrings (see page 6825) object to keep track of when the list of strings has finished changing.
	Equals (see page 6835)	Compares the list of strings to the list from another TWideStrings (see page 6825) object and returns true if the two lists match.
	Exchange (see page 6816)	Swaps the position of two strings in the list.

	Find (see page 6816)	Locates the index for a string in a sorted list and indicates whether a string with that value already exists in the list.
	GetEnumerator (see page 6838)	Returns a TWideStrings (see page 6825) enumerator.
	GetText (see page 6839)	Allocates a text buffer and fills it with the value of the Text (see page 6854) property.
	IndexOf (see page 6818)	Returns the position of a string in the list.
	IndexOfName (see page 6840)	Returns the position of the first name-value pair with the specified name.
	IndexOfObject (see page 6841)	Returns the index of the first string in the list associated with a given object.
	Insert (see page 6819)	Inserts a string to the list at the position specified by `Index`.
	InsertObject (see page 6819)	Inserts a string into the list at the specified position, and associates it with an object.
	LoadFromFile (see page 6842)	Fills the list with the lines of text in a specified file.
	LoadFromStream (see page 6842)	Fills the list with lines of text read from a stream.
	Move (see page 6843)	Changes the position of a string in the list.
	SaveToFile (see page 6844)	Saves the strings in the list to the specified file.
	SaveToStream (see page 6845)	Writes the value of the Text (see page 6854) property to a stream object.
	SetText (see page 6845)	Sets the Text (see page 6854) property.
	Sort (see page 6821)	Sorts the strings in the list in ascending order.

Public Properties

	Name	Description
	Capacity (see page 6847)	Indicates the number of strings the TWideStrings (see page 6825) object can hold.
	CaseSensitive (see page 6822)	Controls whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.
	CommaText (see page 6848)	Lists the strings in the TWideStrings (see page 6825) object in system data format (SDF).
R	Count (see page 6849)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 6849)	Represents all the strings in the TWideStrings (see page 6825) object as a single delimited string.
	Delimiter (see page 6850)	Specifies the delimiter used by the DelimitedText (see page 6849) property.
	Duplicates (see page 6822)	Specifies whether duplicate strings can be added to sorted lists.
	LineBreak (see page 6850)	Defines the line break character(s).
R	Names (see page 6850)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 6851)	Indicates the character used to separate names from values.
	Objects (see page 6851)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 6853) property.
	OwnsObjects (see page 6823)	This is OwnsObjects, a member of class TWideStringList.
	QuoteChar (see page 6852)	Specifies the quote character used by the DelimitedText (see page 6849) property.
	Sorted (see page 6823)	Specifies whether the strings in the list should be automatically sorted.
	StrictDelimiter (see page 6852)	Determines how the Delimiter (see page 6850) property is used.
	Strings (see page 6853)	References the strings in the list by their positions.
	StringsAdapter (see page 6854)	Implements an IWideStringsAdapter (see page 6859) interface for the TWideStrings (see page 6825) object.
	Text (see page 6854)	Lists the strings in the TWideStrings (see page 6825) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 6855)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 6856)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

70.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TWideStringList.Create () (see page 6811)	Constructs an object and initializes its data before the object is first used.
	TWideStringList.Create (Boolean) (see page 6811)	This is Create, a member of class TWideStringList.

70.1.1.2.1 TWideStringList.Create Constructor ()

Constructs an object and initializes its data before the object is first used.

Pascal

```
constructor Create; overload;
```

C++

```
__fastcall TWideStringList();
```

Description

System::TObject::Create constructs an object. The purpose, size, and behavior of objects differ greatly. The System::TObject::Create constructor defined by System::TObject allocates memory but does not initialize data.

Descendant objects usually define a constructor that creates the particular kind of object and initializes its data.

Note: If an exception escapes from a constructor, the object's destructor is called to clean up the failed instance.

See Also

System::TObject::Destroy (see page 3356)

System::TObject::Free (see page 3372)

70.1.1.2.2 TWideStringList.Create Constructor (Boolean)

Pascal

```
constructor Create(OwnsObjects: Boolean); overload;
```

C++

```
__fastcall TWideStringList(Boolean OwnsObjects);
```

Description

This is Create, a member of class TWideStringList.

70.1.1.3 TWideStringList.Destroy Destructor

Destroys an instance of TWideStringList (see page 6808).

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWideStringList();
```

Description

Do not call Destroy directly in an application. Instead, call Free. Free verifies that the TWideStringList (see page 6808) reference is not nil and only then calls Destroy.

Destroy frees the memory allocated to hold the list of strings and object references before calling the inherited destructor.

See Also

System::TObject::Free (see page 3372)

70.1.1.4 TWideStringList Methods

The methods of the TWideStringList class are listed here.

Protected Methods

	Name	Description
	Changed (see page 6813)	This is Changed, a member of class TWideStringList.
	Changing (see page 6814)	This is Changing, a member of class TWideStringList.
	CompareStrings (see page 6814)	Compares two strings.
	Get (see page 6817)	Returns a string given its index.
	GetCapacity (see page 6817)	Returns the currently allocated size of the list of strings.
	GetCount (see page 6817)	Returns the number of strings in the list
	GetObject (see page 6818)	Returns the object associated with the string at a specified index.
	InsertItem (see page 6819)	This is InsertItem, a member of class TWideStringList.
	Put (see page 6820)	Changes the value of the string with a specified index.
	PutObject (see page 6820)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 6820)	Changes the amount of memory allocated to hold strings in the list.
	SetUpdateState (see page 6821)	Performs internal adjustments before or after a series of updates.

Public Methods

	Name	Description
	Add (see page 6812)	Adds a new string to the list.
	AddObject (see page 6813)	Adds a string to the list, and associates an object with the string.
	Clear (see page 6814)	Deletes all the strings from the list.
	CustomSort (see page 6815)	Sorts the strings in the list in a customized order.
	Delete (see page 6815)	Removes the string specified by the Index parameter.
	Exchange (see page 6816)	Swaps the position of two strings in the list.
	Find (see page 6816)	Locates the index for a string in a sorted list and indicates whether a string with that value already exists in the list.
	IndexOf (see page 6818)	Returns the position of a string in the list.
	Insert (see page 6819)	Inserts a string to the list at the position specified by `Index`.
	InsertObject (see page 6819)	Inserts a string into the list at the specified position, and associates it with an object.
	Sort (see page 6821)	Sorts the strings in the list in ascending order.

70.1.1.4.1 TWideStringList.Add Method

Adds a new string to the list.

Pascal

```
function Add(const S: WideString): Integer; override;
```

C++

```
virtual __fastcall int Add(const BSTR S);
```

Description

Call Add to add the string S to the list. If the list is sorted, S is added to the appropriate position in the sort order. If the list is not sorted, S is added to the end of the list. Add returns the position of the item in the list, where the first item in the list has a value of 0.

Note: For sorted lists, Add will raise an EListError exception if the string S already appears in the list and Duplicates (see page 6822) is set to dupError. If Duplicates (see page 6822) is set to dupIgnore, trying to add a duplicate string causes Add to return the index of the existing entry.

See Also

AddStrings (see page 6830)

Append (see page 6831)

Delete (see page 6815)

Duplicates (see page 6822)

Insert (see page 6819)

Sorted (see page 6823)

70.1.1.4.2 TWideStringList.AddObject Method

Adds a string to the list, and associates an object with the string.

Pascal

```
function AddObject(const S: WideString; AObject: TObject): Integer; override;
```

C++

```
virtual __fastcall int AddObject(const BSTR S, TObject * AObject);
```

Description

Call AddObject to add a string and its associated object to the list. AddObject returns the index of the new string and object.

Note: The TWideStringList (see page 6808) object does not own the objects you add this way. Objects (see page 6851) added to the TWideStringList (see page 6808) object still exist even if the TWideStringList (see page 6808) instance is destroyed. They must be explicitly destroyed by the application.

Note: For sorted lists, AddObject raises an EListError exception if the string S already appears in the list and Duplicates (see page 6822) is set to dupError. If Duplicates (see page 6822) is set to dupIgnore, trying to add a duplicate string causes AddObject to return the index of the existing entry.

See Also

Add (see page 6812)

AddStrings (see page 6830)

70.1.1.4.3 TWideStringList.Changed Method

Pascal

```
procedure Changed; virtual;
```

C++

```
virtual __fastcall Changed();
```

Description

This is Changed, a member of class TWideStringList.

70.1.1.4.4 TWideStringList.Changing Method

Pascal

```
procedure Changing; virtual;
```

C++

```
virtual __fastcall Changing();
```

Description

This is Changing, a member of class TWideStringList.

70.1.1.4.5 TWideStringList.Clear Method

Deletes all the strings from the list.

Pascal

```
procedure Clear; override;
```

C++

```
virtual __fastcall Clear();
```

Description

Call clear to empty the list of strings. All references to associated objects are also removed. However, the objects themselves are not freed.

See Also

Delete (see page 6815)

Objects (see page 6851)

Strings (see page 6853)

70.1.1.4.6 TWideStringList.CompareStrings Method

Compares two strings.

Pascal

```
function CompareStrings(const S1: WideString; const S2: WideString): Integer; override;
```

C++

```
virtual __fastcall int CompareStrings(const BSTR S1, const BSTR S2);
```

Description

TWideStrings uses CompareStrings internally to compare the values of strings that appear in the list. For example, the IndexOf and IndexOfName methods use CompareStrings to compare a specified string with the strings in the list.

S1 and S2 are the strings to compare.

CompareStrings returns a value less than 0 if S1 < S2, 0 if S1 == S2, and a value greater than 0 if S1 > S2.

As implemented in TWideStrings, CompareStrings uses the global WideCompareText function, which compares strings case insensitively. Some descendant classes override this method to change the way strings are compared (for example, to introduce case sensitivity).

See Also

WideCompareText (see page 4313)

IndexOf (see page 6840)

IndexOfName (see page 6840)

70.1.1.4.7 TWideStringList.CustomSort Method

Sorts the strings in the list in a customized order.

Pascal

```
procedure CustomSort(Compare: TWideStringListSortCompare); virtual;
```

C++

```
virtual __fastcall CustomSort(TWideStringListSortCompare Compare);
```

Description

Use CustomSort to sort the strings in the list, where the sort order is defined by the Compare parameter.

Supply a value for the Compare function that compares two strings in the string list. The List parameter provides access to the string list, while the Index1 and Index2 parameters identify the strings to be compared.

Do not pass nil (Delphi) or NULL (C++) as the value of the Compare parameter.

Note: You must explicitly call the CustomSort method. Setting the Sorted (see page 6823) property only sorts strings using ANSI (Windows) or UTF-8 (Linux) order, as implemented in the Sort (see page 6821) method.

See Also

Sort (see page 6821)

Strings (see page 6853)

Sorted (see page 6823)

70.1.1.4.8 TWideStringList.Delete Method

Removes the string specified by the Index parameter.

Pascal

```
procedure Delete(Index: Integer); override;
```

C++

```
virtual __fastcall Delete(int Index);
```

Description

Call Delete to remove a single string from the list. If an object is associated with the string, the reference to the object is removed as well. Index gives the position of the string, where 0 is the first string, 1 is the second string, and so on.

See Also

Add (see page 6812)

AddObject (see page 6813)

Clear (see page 6814)

IndexOf (see page 6818)

InsertObject (see page 6819)

Objects (see page 6851)

Strings (see page 6853)

70.1.1.4.9 TWideStringList.Exchange Method

Swaps the position of two strings in the list.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); override;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

Call Exchange to rearrange the strings in the list. The strings are specified by their index values in the Index1 and Index2 parameters. Indexes are zero-based, so the first string in the list has an index value of 0, the second has an index value of 1, and so on.

If either string has an associated object, Exchange changes the index of the object as well.

Warning: Do not call Exchange on a sorted list except to swap two identical strings with different associated objects. Exchange does not check whether the list is sorted, and can destroy the sort order of a sorted list.

See Also

Move (see page 6843)

Objects (see page 6851)

Sorted (see page 6823)

Strings (see page 6853)

70.1.1.4.10 TWideStringList.Find Method

Locates the index for a string in a sorted list and indicates whether a string with that value already exists in the list.

Pascal

```
function Find(const S: WideString; var Index: Integer): Boolean; virtual;
```

C++

```
virtual __fastcall Boolean Find(const BSTR S, int Index);
```

Description

Use Find to obtain the index in a sorted list where the string S should be added. If the string S, or a string that differs from S only in case when CaseSensitive (see page 6822) is false, already exists in the list, Find returns true. If the list does not contain a string that matches S, Find returns false. The index where S should go is returned in the Index parameter. The value of Index is zero-based, where the first string has the index 0, the second string has the index 1, and so on.

Note: Only use Find with sorted lists. For unsorted lists, use the IndexOf (see page 6818) method instead.

See Also

Duplicates (see page 6822)

IndexOf (see page 6818)

Sorted (see page 6823)

Strings (see page 6853)

70.1.1.4.11 TWideStringList.Get Method

Returns a string given its index.

Pascal

```
function Get(Index: Integer): WideString; override;
```

C++

```
virtual __fastcall BSTR Get(int Index);
```

Description

Get is the protected read implementation of the Strings property.

In TWideStrings Get is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the string with the specified index.

See Also

Strings (see page 6853)

70.1.1.4.12 TWideStringList.GetCapacity Method

Returns the currently allocated size of the list of strings.

Pascal

```
function GetCapacity: Integer; override;
```

C++

```
virtual __fastcall int GetCapacity();
```

Description

GetCapacity is the protected read implementation of the Capacity property. In TWideStrings, GetCapacity returns the value of the Count property. Descendants of TWideStrings can override this property to let a string list allocate memory for entries that have not been added to the list.

See Also

Capacity (see page 6847)

Count (see page 6849)

70.1.1.4.13 TWideStringList.GetCount Method

Returns the number of strings in the list

Pascal

```
function GetCount: Integer; override;
```

C++

```
virtual __fastcall int GetCount();
```

Description

GetCount is the protected read implementation of the Count property.

In TWideStrings GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the number of strings that have been added to the list.

See Also

Count (see page 6849)

70.1.1.4.14 TWideStringList.GetObject Method

Returns the object associated with the string at a specified index.

Pascal

```
function GetObject(Index: Integer): TObject; override;
```

C++

```
virtual __fastcall TObject * GetObject(int Index);
```

Description

GetObject is the protected read implementation of the Objects property.

Index is the index of the string with which the object is associated.

In TWideStrings, GetObject always returns nil (Delphi) or NULL (C++). This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override GetObject to return the specified object.

See Also

Objects (see page 6851)

70.1.1.4.15 TWideStringList.IndexOf Method

Returns the position of a string in the list.

Pascal

```
function IndexOf(const S: WideString): Integer; override;
```

C++

```
virtual __fastcall int IndexOf(const BSTR S);
```

Description

Call IndexOf to obtain the position of the first occurrence of a string that matches S. A string matches S if it is identical to S or, if CaseSensitive (see page 6822) is false, if it differs only in case.

IndexOf returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOf returns 0, if S is the second string, IndexOf returns 1, and so on. If the string does not have a match in the string list, IndexOf returns -1.

See Also

Find (see page 6816)

IndexOfName (see page 6840)

IndexOfObject (see page 6841)

Strings (see page 6853)

70.1.1.4.16 TWideStringList.Insert Method

Inserts a string to the list at the position specified by `Index`.

Pascal

```
procedure Insert(Index: Integer; const S: WideString); override;
```

C++

```
virtual __fastcall Insert(int Index, const BSTR S);
```

Description

Call Insert to add the string S to the list at the position specified by Index. If Index is 0, the string is inserted at the beginning of the list. If Index is 1, the string is put in the second position of the list, and so on.

If the string has an associated object, use the InsertObject (see page 6819) method instead.

Note: If the list is sorted, calling Insert or InsertObject (see page 6819) will raise an EListError exception. Use Add (see page 6812) or AddObject (see page 6813) with sorted lists.

See Also

Add (see page 6812)

AddObject (see page 6813)

EListError

InsertObject (see page 6819)

Sorted (see page 6823)

Strings (see page 6853)

70.1.1.4.17 TWideStringList.InsertItem Method

Pascal

```
procedure InsertItem(Index: Integer; const S: WideString; AObject: TObject); virtual;
```

C++

```
virtual __fastcall InsertItem(int Index, const BSTR S, TObject * AObject);
```

Description

This is InsertItem, a member of class TWideStringList.

70.1.1.4.18 TWideStringList.InsertObject Method

Inserts a string into the list at the specified position, and associates it with an object.

Pascal

```
procedure InsertObject(Index: Integer; const S: WideString; AObject: TObject); override;
```

C++

```
virtual __fastcall InsertObject(int Index, const BSTR S, TObject * AObject);
```

Description

Call InsertObject to insert the string S into the list at the position identified by Index, and associate it with the object AObject. If Index is 0, the string is inserted at the beginning of the list. If Index is 1, the string is put in the second position of the list, and so on.

See Also

Insert (see page 6819)

Objects (see page 6851)

70.1.1.4.19 TWideStringList.Put Method

Changes the value of the string with a specified index.

Pascal

```
procedure Put(Index: Integer; const S: WideString); override;
```

C++

```
virtual __fastcall Put(int Index, const BSTR S);
```

Description

Put is the protected write implementation of the Strings property.

Put changes the value of the string with the index specified by `Index` to S. Put does not change the object at the specified position. That is, any object associated with the previous string becomes associated with the new string.

See Also

Strings (see page 6853)

Objects (see page 6851)

70.1.1.4.20 TWideStringList.PutObject Method

Changes the object associated with the string at a specified index.

Pascal

```
procedure PutObject(Index: Integer; AObject: TObject); override;
```

C++

```
virtual __fastcall PutObject(int Index, TObject * AObject);
```

Description

PutObject is the protected write implementation of the Objects property.

As implemented in TWideStrings, PutObject does nothing. This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override PutObject to change the specified object.

See Also

Objects (see page 6851)

70.1.1.4.21 TWideStringList.SetCapacity Method

Changes the amount of memory allocated to hold strings in the list.

Pascal

```
procedure SetCapacity(NewCapacity: Integer); override;
```

C++

```
virtual __fastcall SetCapacity(int NewCapacity);
```

Description

SetCapacity is the protected read implementation of the Capacity property.

Integer is the number of strings the list can hold after the capacity has changed.

In TWideStrings, SetCapacity does nothing. Descendant classes override this method to change the number of strings that the list can hold. For descendant classes that implement SetCapacity, assigning a value smaller than Count removes strings from the end of the list. Assigning a value greater than Count allocates space for more strings to be added.

See Also

Capacity (see page 6847)

Count (see page 6849)

70.1.1.4.22 TWideStringList.SetUpdateState Method

Performs internal adjustments before or after a series of updates.

Pascal

```
procedure SetUpdateState(Updating: Boolean); override;
```

C++

```
virtual __fastcall SetUpdateState(Boolean Updating);
```

Description

SetUpdateState is called at the beginning or end of a series of updates. When the BeginUpdate method is first called and the TWideStrings object is not already in the middle of an update, TWideStrings calls SetUpdateState internally, with Updating set to true. When the EndUpdate method is called and it cancels out the last unmatched call to BeginUpdate, TWideStrings calls SetUpdateState internally, with Updating set to false.

As implemented in TWideStrings, SetUpdateState does nothing. Descendant classes can override this method to optimize the response to updates.

See Also

BeginUpdate (see page 6832)

EndUpdate (see page 6835)

70.1.1.4.23 TWideStringList.Sort Method

Sorts the strings in the list in ascending order.

Pascal

```
procedure Sort; virtual;
```

C++

```
virtual __fastcall Sort();
```

Description

Call Sort to sort the strings in a list that has the Sorted (see page 6823) property set to false. String lists with the Sorted (see page 6823) property set to true are automatically sorted.

Note: Sort uses WideCompareStr (see page 4313) to sort the strings when CaseSensitive (see page 6822) is true and WideCompareText (see page 4313) when CaseSensitive (see page 6822) is false. To provide your own comparison operator instead, use the CustomSort (see page 6815) method.

See Also

CustomSort (see page 6815)

Sorted (see page 6823)

Strings (see page 6853)

WideCompareStr (see page 4313)

WideCompareText (see page 4313)

70.1.1.5 TWideStringList Properties

The properties of the TWideStringList class are listed here.

Public Properties

	Name	Description
	CaseSensitive (see page 6822)	Controls whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.
	Duplicates (see page 6822)	Specifies whether duplicate strings can be added to sorted lists.
	OwnsObjects (see page 6823)	This is OwnsObjects, a member of class TWideStringList.
	Sorted (see page 6823)	Specifies whether the strings in the list should be automatically sorted.

70.1.1.5.1 TWideStringList.CaseSensitive Property

Controls whether strings are located, sorted, and identified as duplicates in a case-sensitive or case-insensitive manner.

Pascal

```
property CaseSensitive: Boolean;
```

C++

```
__property Boolean CaseSensitive;
```

Description

Use CaseSensitive to indicate whether strings in the list should be compared in a case-sensitive or case-insensitive manner. Set CaseSensitive to true to make the string list locate, check for duplicates, and sort its strings in a case-sensitive manner. Set CaseSensitive to false to make the string list perform these operations case-insensitively.

See Also

CustomSort (see page 6815)

Sort (see page 6821)

70.1.1.5.2 TWideStringList.Duplicates Property

Specifies whether duplicate strings can be added to sorted lists.

Pascal

```
property Duplicates: TDuplicates;
```

C++

```
__property TDuplicates Duplicates;
```

Description

Set Duplicates to specify what should happen when an attempt is made to add a duplicate string to a sorted list. The CaseSensitive (see page 6822) property controls whether two strings are considered duplicates if they are identical except for differences in case.

The value of Duplicates should be one of the following.

Value	Meaning
dupIgnore	Ignore attempts to add duplicate strings to the list.
dupError	raise an EStringListError exception when an attempt is made to add duplicate strings to the sorted list.
dupAccept	Permit duplicate strings in the sorted list.

Set Duplicates before adding any strings to the list. Setting Duplicates to dupIgnore or dupError does nothing about duplicate strings that are already in the list.

Note: Duplicates does nothing if the list is not sorted.

See Also

Add (see page 6812)

EStringListError

Sorted (see page 6823)

CaseSensitive (see page 6822)

70.1.1.5.3 TWideStringList.OwnsObjects Property

Pascal

```
property OwnsObjects: Boolean;
```

C++

```
__property Boolean OwnsObjects;
```

Description

This is OwnsObjects, a member of class TWideStringList.

70.1.1.5.4 TWideStringList.Sorted Property

Specifies whether the strings in the list should be automatically sorted.

Pascal

```
property Sorted: Boolean;
```

C++

```
__property Boolean Sorted;
```

Description

Set Sorted to true to cause the strings in the list to be automatically sorted in ascending order. Set Sorted to false to allow strings to remain where they are inserted. When Sorted is false, the strings in the list can be put in ascending order at any time by calling the Sort (see page 6821) method.

When Sorted is true, do not use Insert (see page 6819) to add strings to the list. Instead, use Add (see page 6812), which will insert the new strings in the appropriate position. When Sorted is false, use Insert (see page 6819) to add strings to an arbitrary position in the list, or Add (see page 6812) to add strings to the end of the list.

Note: The CaseSensitive (see page 6822) property controls whether the strings in the list are sorted based on a case-sensitive or case-insensitive comparison. The sort order takes into account the locale of the system on which the application is running.

See Also

Add (see page 6812)

Duplicates (see page 6822)

Insert (see page 6819)

Sort (see page 6821)

WideCompareStr (see page 4313)

CaseSensitive (see page 6822)

70.1.1.6 TWideStringList Events

The events of the TWideStringList class are listed here.

Public Events

	Name	Description
	OnChange (see page 6824)	Occurs immediately after the list of strings changes.
	OnChanging (see page 6825)	Occurs immediately before the list of strings changes.

70.1.1.6.1 TWideStringList.OnChange Event

Occurs immediately after the list of strings changes.

Pascal

```
property OnChange: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChange;
```

Description

Write (see page 3707) an OnChange event handler to respond to changes in the list of strings. For example, if the string list is associated with a control, the OnChange event handler could tell the control to repaint itself whenever the content of the list changes.

Whenever strings in the list are added, deleted, moved, or modified, the following events take place:

1. An OnChanging (see page 6825) event occurs before the change.
2. The strings are added, deleted, moved, or modified.

3. An OnChange event occurs.

   Note: OnChange occurs for every change made to the list, regardless of whether the application calls BeginUpdate (see page 6832) and EndUpdate (see page 6835) around a series of changes.

See Also

BeginUpdate (see page 6832)

EndUpdate (see page 6835)

OnChanging (see page 6825)

70.1.1.6.2 TWideStringList.OnChanging Event

Occurs immediately before the list of strings changes.

Pascal

```
property OnChanging: TNotifyEvent;
```

C++

```
__property TNotifyEvent OnChanging;
```

Description

Write (see page 3707) an OnChanging event handler to prepare for changes in the list of strings. For example, if the string list is associated with a control, the OnChanging event handler could tell the control to disable repaints until the OnChange (see page 6824) event when the list has finished changing.

Whenever strings in the list are added, deleted, moved, or modified, the following events take place:

1. An OnChanging event occurs.
2. The strings are added, deleted, moved, or modified.
3. An OnChange (see page 6824) event occurs after the changes are complete.

   Note: OnChanging occurs for every change made to the list, regardless of whether the application calls BeginUpdate (see page 6832) and EndUpdate (see page 6835) around a series of changes.

See Also

BeginUpdate (see page 6832)

EndUpdate (see page 6835)

OnChange (see page 6824)

70.1.2 TWideStrings Class

TWideStrings is the base class for objects that represent a list of Unicode strings.

Class Hierarchy

Pascal

```
TWideStrings = class(TPersistent);
```

C++

```
class TWideStrings : public TPersistent;
```

File

WideStrings

Description

Derive a class from TWideStrings to store and manipulate a list of strings. TWideStrings contains abstract or, in C++ terminology, pure virtual methods and should not be directly instantiated.

Descendants of TWideStrings can represent several individual strings, such as the individual lines that appear in a list box. Some objects use descendants of TWideStrings to represent one long body of text so that it can be manipulated in smaller chunks.

TWideStrings introduces many properties and methods to:

- Add (see page 6829) or delete strings at specified positions in the list.
- Rearrange the strings in the list.
- Access the string at a particular location.
- Read (see page 3634) the strings from or write the strings to a file or stream.
- Associate an object with each string in the list.
- Store and retrieve strings as name-value pairs.

For an explanation of name-value pairs, refer to the NameValueSeparator (see page 6851) property.

TWideStringsEnumerator (see page 6856)

70.1.2.1 TWideStrings Members

The following tables list the members exposed by TWideStrings.

Protected Methods

	Name	Description
	AssignTo (see page 6832)	Copies the properties of an object to a destination object.
	CompareStrings (see page 6833)	Compares two strings.
	DefineProperties (see page 6834)	Reads and writes the Strings (see page 6853) property as if it were published.
	Error (see page 6836)	This is the overview for the Error method overload.
	ExtractName (see page 6837)	Returns the name portion of a string that is a name value pair.
	Get (see page 6837)	Returns a string given its index.
	GetCapacity (see page 6837)	Returns the currently allocated size of the list of strings.

	GetCount (see page 6838)	Returns the number of strings in the list
	GetObject (see page 6838)	Returns the object associated with the string at a specified index.
	GetTextStr (see page 6839)	Returns the value of the Text (see page 6854) property.
	Put (see page 6843)	Changes the value of the string with a specified index.
	PutObject (see page 6844)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 6845)	Changes the amount of memory allocated to hold strings in the list.
	SetTextStr (see page 6846)	Sets the Text (see page 6854) property.
	SetUpdateState (see page 6846)	Performs internal adjustments before or after a series of updates.

Protected Properties

	Name	Description
	UpdateCount (see page 6855)	Indicates the number of calls to BeginUpdate (see page 6832) that have not been matched by a call to EndUpdate (see page 6835).

Public Methods

	Name	Description
	Add (see page 6829)	Adds a string at the end of the list.
	AddObject (see page 6830)	Adds a string to the list, and associates an object with the string.
	AddStrings (see page 6830)	This is the overview for the AddStrings method overload.
	Append (see page 6831)	Adds a string to the list.
	Assign (see page 6831)	Sets the strings in the list, and possibly associated objects, from a source object.
	BeginUpdate (see page 6832)	Enables the TWideStrings (see page 6825) object to track when the list of strings is changing.
	Clear (see page 6833)	Introduces an abstract (Delphi) or pure virtual (C++) method to empty the list and any associated objects.
	Delete (see page 6834)	Introduces an abstract (Delphi) or pure virtual (C++) method to delete a specified Unicode string from the list.
	Destroy (see page 6828)	Destroys the TPersistent instance and frees its memory.
	EndUpdate (see page 6835)	Enables the TWideStrings (see page 6825) object to keep track of when the list of strings has finished changing.
	Equals (see page 6835)	Compares the list of strings to the list from another TWideStrings (see page 6825) object and returns true if the two lists match.
	Exchange (see page 6836)	Swaps the position of two strings in the list.
	GetEnumerator (see page 6838)	Returns a TWideStrings (see page 6825) enumerator.
	GetText (see page 6839)	Allocates a text buffer and fills it with the value of the Text (see page 6854) property.
	IndexOf (see page 6840)	Returns the position of a string in the list.
	IndexOfName (see page 6840)	Returns the position of the first name-value pair with the specified name.
	IndexOfObject (see page 6841)	Returns the index of the first string in the list associated with a given object.
	Insert (see page 6841)	Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.
	InsertObject (see page 6842)	Inserts a string into the list at the specified position, and associates it with an object.
	LoadFromFile (see page 6842)	Fills the list with the lines of text in a specified file.
	LoadFromStream (see page 6842)	Fills the list with lines of text read from a stream.
	Move (see page 6843)	Changes the position of a string in the list.
	SaveToFile (see page 6844)	Saves the strings in the list to the specified file.
	SaveToStream (see page 6845)	Writes the value of the Text (see page 6854) property to a stream object.
	SetText (see page 6845)	Sets the Text (see page 6854) property.

Public Properties

	Name	Description
	Capacity (see page 6847)	Indicates the number of strings the TWideStrings (see page 6825) object can hold.
	CommaText (see page 6848)	Lists the strings in the TWideStrings (see page 6825) object in system data format (SDF).
	Count (see page 6849)	Introduces an abstract property to represent the number of strings in the list.

	DelimitedText (see page 6849)	Represents all the strings in the TWideStrings (see page 6825) object as a single delimited string.
	Delimiter (see page 6850)	Specifies the delimiter used by the DelimitedText (see page 6849) property.
	LineBreak (see page 6850)	Defines the line break character(s).
R	Names (see page 6850)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 6851)	Indicates the character used to separate names from values.
	Objects (see page 6851)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 6853) property.
	QuoteChar (see page 6852)	Specifies the quote character used by the DelimitedText (see page 6849) property.
	StrictDelimiter (see page 6852)	Determines how the Delimiter (see page 6850) property is used.
	Strings (see page 6853)	References the strings in the list by their positions.
	StringsAdapter (see page 6854)	Implements an IWideStringsAdapter (see page 6859) interface for the TWideStrings (see page 6825) object.
	Text (see page 6854)	Lists the strings in the TWideStrings (see page 6825) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 6855)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 6856)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

70.1.2.2 TWideStrings.Destroy Destructor

Destroys the TPersistent instance and frees its memory.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWideStrings();
```

Description

Do not call Destroy directly. Call Free instead. Free checks that the object reference is not nil before calling Destroy.

See Also

System::TObject::Free (see page 3372)

System::TObject::Destroy (see page 3356)

70.1.2.3 TWideStrings Methods

The methods of the TWideStrings class are listed here.

Protected Methods

	Name	Description
V	AssignTo (see page 6832)	Copies the properties of an object to a destination object.
V	CompareStrings (see page 6833)	Compares two strings.
V	DefineProperties (see page 6834)	Reads and writes the Strings (see page 6853) property as if it were published.
	Error (see page 6836)	This is the overview for the Error method overload.
	ExtractName (see page 6837)	Returns the name portion of a string that is a name value pair.
A	Get (see page 6837)	Returns a string given its index.
V	GetCapacity (see page 6837)	Returns the currently allocated size of the list of strings.
A	GetCount (see page 6838)	Returns the number of strings in the list
V	GetObject (see page 6838)	Returns the object associated with the string at a specified index.
V	GetTextStr (see page 6839)	Returns the value of the Text (see page 6854) property.

	Put (see page 6843)	Changes the value of the string with a specified index.
	PutObject (see page 6844)	Changes the object associated with the string at a specified index.
	SetCapacity (see page 6845)	Changes the amount of memory allocated to hold strings in the list.
	SetTextStr (see page 6846)	Sets the Text (see page 6854) property.
	SetUpdateState (see page 6846)	Performs internal adjustments before or after a series of updates.

Public Methods

	Name	Description
	Add (see page 6829)	Adds a string at the end of the list.
	AddObject (see page 6830)	Adds a string to the list, and associates an object with the string.
	AddStrings (see page 6830)	This is the overview for the AddStrings method overload.
	Append (see page 6831)	Adds a string to the list.
	Assign (see page 6831)	Sets the strings in the list, and possibly associated objects, from a source object.
	BeginUpdate (see page 6832)	Enables the TWideStrings (see page 6825) object to track when the list of strings is changing.
	Clear (see page 6833)	Introduces an abstract (Delphi) or pure virtual (C++) method to empty the list and any associated objects.
	Delete (see page 6834)	Introduces an abstract (Delphi) or pure virtual (C++) method to delete a specified Unicode string from the list.
	EndUpdate (see page 6835)	Enables the TWideStrings (see page 6825) object to keep track of when the list of strings has finished changing.
	Equals (see page 6835)	Compares the list of strings to the list from another TWideStrings (see page 6825) object and returns true if the two lists match.
	Exchange (see page 6836)	Swaps the position of two strings in the list.
	GetEnumerator (see page 6838)	Returns a TWideStrings (see page 6825) enumerator.
	GetText (see page 6839)	Allocates a text buffer and fills it with the value of the Text (see page 6854) property.
	IndexOf (see page 6840)	Returns the position of a string in the list.
	IndexOfName (see page 6840)	Returns the position of the first name-value pair with the specified name.
	IndexOfObject (see page 6841)	Returns the index of the first string in the list associated with a given object.
	Insert (see page 6841)	Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.
	InsertObject (see page 6842)	Inserts a string into the list at the specified position, and associates it with an object.
	LoadFromFile (see page 6842)	Fills the list with the lines of text in a specified file.
	LoadFromStream (see page 6842)	Fills the list with lines of text read from a stream.
	Move (see page 6843)	Changes the position of a string in the list.
	SaveToFile (see page 6844)	Saves the strings in the list to the specified file.
	SaveToStream (see page 6845)	Writes the value of the Text (see page 6854) property to a stream object.
	SetText (see page 6845)	Sets the Text (see page 6854) property.

70.1.2.3.1 TWideStrings.Add Method

Adds a string at the end of the list.

Pascal

```
function Add(const S: WideString): Integer; virtual;
```

C++

```
virtual __fastcall int Add(const BSTR S);
```

Description

Call Add to add a string to the end of the list. Add returns the index of the new string.

See Also

AddStrings (see page 6830)

Append (see page 6831)

Count (see page 6849)

IndexOf (see page 6840)

Insert (see page 6841)

70.1.2.3.2 TWideStrings.AddObject Method

Adds a string to the list, and associates an object with the string.

Pascal

```
function AddObject(const S: WideString; AObject: TObject): Integer; virtual;
```

C++

```
virtual __fastcall int AddObject(const BSTR S, TObject * AObject);
```

Description

Call AddObject to add a string and its associated object to the list. AddObject returns the index of the new string and object.

Note: The TWideStrings (see page 6825) object does not own the objects you add this way. Objects (see page 6851) added to the TWideStrings (see page 6825) object still exist even if the TWideStrings (see page 6825) instance is destroyed. They must be explicitly destroyed by the application.

See Also

Add (see page 6829)

AddStrings (see page 6830)

Count (see page 6849)

IndexOfObject (see page 6841)

Objects (see page 6851)

70.1.2.3.3 AddStrings Method

This is the overview for the AddStrings method overload.

Overload List

	Name	Description
	TWideStrings.AddStrings (TStrings) (see page 6830)	Adds a group of strings to the list.
	TWideStrings.AddStrings (TWideStrings) (see page 6830)	Adds a group of strings to the list.

70.1.2.3.3.1 TWideStrings.AddStrings Method (TStrings)

Adds a group of strings to the list.

Pascal

```
procedure AddStrings(Strings: TStrings); virtual; overload;
procedure AddStrings(Strings: TWideStrings); virtual; overload;
```

C++

```
virtual __fastcall AddStrings(TStrings Strings);
virtual __fastcall AddStrings(TWideStrings Strings);
```

Description

Call AddStrings to add the strings from another TWideStrings (see page 6825) object to the list. If both the source and destination TWideStrings (see page 6825) objects support objects associated with their strings, references to the associated objects will be added as well.

See Also

Add (see page 6829)

AddObject (see page 6830)

Assign (see page 6831)

Count (see page 6849)

Objects (see page 6851)

70.1.2.3.4 TWideStrings.Append Method

Adds a string to the list.

Pascal

```
procedure Append(const S: WideString);
```

C++

```
__fastcall Append(const BSTR S);
```

Description

Append is the same as the Add (see page 6829) method, except that it does not return a value. Use Append when there is no need to know the index of the string after it has been added, or with descendants of TWideStrings (see page 6825) for which the index returned is not meaningful.

For example, the TWideStrings (see page 6825) descendant used by memo objects uses an index to determine where to insert a string, but the inserted string does not necessarily end up as a single string in the list. Part of the inserted text may become part of the previous string, and part may be broken off into a subsequent string. The index returned by Add (see page 6829) is not meaningful in this case.

See Also

Add (see page 6829)

70.1.2.3.5 TWideStrings.Assign Method

Sets the strings in the list, and possibly associated objects, from a source object.

Pascal

```
procedure Assign(Source: TPersistent); override;
```

C++

```
virtual __fastcall Assign(TPersistent * Source);
```

Description

Use Assign to set the value of the TWideStrings (see page 6825) object from another object. If Source is of type TWideStrings

(see page 6825), the list is set to the list of the source TWideStrings (see page 6825) object, and if associated objects are supported, any associated objects are copied from the Source as well.

If Source is not of type TWideStrings (see page 6825), the inherited Assign will set the value of the list from any object that supports TWideStrings (see page 6825) in its AssignTo (see page 6832) method.

See Also

AddStrings (see page 6830)

Objects (see page 6851)

Strings (see page 6853)

AssignTo

70.1.2.3.6 TWideStrings.AssignTo Method

Copies the properties of an object to a destination object.

Pascal

```
procedure AssignTo(Dest: TPersistent); override;
```

C++

```
virtual __fastcall AssignTo(TPersistent * Dest);
```

Description

Override the AssignTo method to extend the functionality of the Assign method of destination objects so that they handle newly created object classes. When defining a new object class, override the Assign method for every existing object class that should be able to copy its properties to the new class. Override the AssignTo method for every existing class to which the new class can copy.

The Assign method of TPersistent calls AssignTo if the descendant object does not succeed in copying the properties of a source object. The AssignTo method defined by TPersistent raises an EConvertError exception.

For example, given the following code in which A and B are instance variables:

```
A.Assign(B); {Delphi}
A->Assign(B); // C++
```

if A knows how to handle B, then it does so and returns. If A doesn't know how to handle B's type, execution will trickle to the TPersistent version of Assign, which calls:

```
B.AssignTo(A); {Delphi}
B->AssignTo(A); // C++
```

If B knows how to copy to A, the assignment succeeds. Otherwise, TPersistent raises an exception.

See Also

Assign

EConvertError (see page 3919)

70.1.2.3.7 TWideStrings.BeginUpdate Method

Enables the TWideStrings (see page 6825) object to track when the list of strings is changing.

Pascal

```
procedure BeginUpdate;
```

C++

```
__fastcall BeginUpdate();
```

Description

BeginUpdate is called automatically by any property or method that changes the list of strings. Once the changes are complete, the property or method calls EndUpdate (see page 6835). Call BeginUpdate before directly modifying the strings in the list, and EndUpdate (see page 6835) after. When implementing properties or methods that change the list in descendants of TWideStrings (see page 6825), call BeginUpdate before the changes are made, and EndUpdate (see page 6835) when the changes are complete.

TWideStrings (see page 6825) simply keeps track of when the list of strings is being changed. Some descendants of TWideStrings (see page 6825) use this information to perform certain actions, such as telling a control to repaint, when updates are complete.

See Also

EndUpdate (see page 6835)

UpdateCount (see page 6855)

70.1.2.3.8 TWideStrings.Clear Method

Introduces an abstract (Delphi) or pure virtual (C++) method to empty the list and any associated objects.

Pascal

```
procedure Clear; virtual; abstract;
```

C++

```
virtual __fastcall Clear() = 0;
```

Description

Descendants of TWideStrings (see page 6825) implement a Clear method to delete all the strings in the list, and to remove any references to associated objects.

See Also

Delete (see page 6834)

Objects (see page 6851)

Strings (see page 6853)

70.1.2.3.9 TWideStrings.CompareStrings Method

Compares two strings.

Pascal

```
function CompareStrings(const S1: WideString; const S2: WideString): Integer; virtual;
```

C++

```
virtual __fastcall int CompareStrings(const BSTR S1, const BSTR S2);
```

Description

TWideStrings (see page 6825) uses CompareStrings internally to compare the values of strings that appear in the list. For example, the IndexOf (see page 6840) and IndexOfName (see page 6840) methods use CompareStrings to compare a specified string with the strings in the list.

S1 and S2 are the strings to compare.

CompareStrings returns a value less than 0 if S1 < S2, 0 if S1 == S2, and a value greater than 0 if S1 > S2.

As implemented in TWideStrings (see page 6825), CompareStrings uses the global WideCompareText (see page 4313) function, which compares strings case insensitively. Some descendant classes override this method to change the way strings are compared (for example, to introduce case sensitivity).

See Also

WideCompareText (see page 4313)

IndexOf (see page 6840)

IndexOfName (see page 6840)

70.1.2.3.10 TWideStrings.DefineProperties Method

Reads and writes the Strings (see page 6853) property as if it were published.

Pascal

```
procedure DefineProperties(Filer: TFiler); override;
```

C++

```
virtual __fastcall DefineProperties(TFiler Filer);
```

Description

TWideStrings (see page 6825) overrides DefineProperties so that the strings in the list can be loaded and saved with a form file as if the Strings (see page 6853) property were published.

See Also

DefineProperties

Strings (see page 6853)

70.1.2.3.11 TWideStrings.Delete Method

Introduces an abstract (Delphi) or pure virtual (C++) method to delete a specified Unicode string from the list.

Pascal

```
procedure Delete(Index: Integer); virtual; abstract;
```

C++

```
virtual __fastcall Delete(int Index) = 0;
```

Description

Descendants of TWideStrings (see page 6825) implement a Delete method to remove a specified string from the list. If an object is associated with the string, the reference to the object is removed as well. Index gives the position of the string, where 0 is the first string, 1 is the second string, and so on.

See Also

AddObject (see page 6830)

Clear (see page 6833)

IndexOf (see page 6840)

InsertObject (see page 6842)

Objects (see page 6851)

Strings (see page 6853)

70.1.2.3.12 TWideStrings.EndUpdate Method

Enables the TWideStrings (see page 6825) object to keep track of when the list of strings has finished changing.

Pascal

```
procedure EndUpdate;
```

C++

```
__fastcall EndUpdate();
```

Description

EndUpdate is called automatically by any property or method that changes the list of strings. Call BeginUpdate (see page 6832) before directly modifying the strings in the list, and EndUpdate after. When implementing properties or methods that change the list in descendants of TWideStrings (see page 6825), call BeginUpdate (see page 6832) before the changes are made, and EndUpdate when the changes are complete.

TWideStrings (see page 6825) simply keeps track of when the list of strings is being changed. Some descendants of TWideStrings (see page 6825) use this information to perform certain actions, such as telling a control to repaint, when updates are complete.

See Also

BeginUpdate (see page 6832)

UpdateCount (see page 6855)

70.1.2.3.13 TWideStrings.Equals Method

Compares the list of strings to the list from another TWideStrings (see page 6825) object and returns true if the two lists match.

Pascal

```
function Equals(Strings: TWideStrings): Boolean; reintroduce;
```

C++

```
__fastcall Boolean Equals(TWideStrings Strings);
```

Description

Call Equals to compare the lists in two TWideStrings (see page 6825) objects. Equals compares only the strings, not any references to associated objects. Equals returns true if the lists for both TWideStrings (see page 6825) objects have the same number of strings and the strings in each list match. Equals returns false if the lists are different in length, if they contain different strings, or if the order of the strings in the two lists differ.

Note: The Equals method uses an overridden Get (see page 6837) method to perform the compare, thus it does not provide a context-insensitive option.

See Also

Count (see page 6849)

Strings (see page 6853)

CompareStrings (see page 6833)

70.1.2.3.14 Error Method

This is the overview for the Error method overload.

Overload List

	Name	Description
	TWideStrings.Error (PResStringRec, Integer) (see page 6836)	Raises an EStringListError exception.
	TWideStrings.Error (WideString, Integer) (see page 6836)	Raises an EStringListError exception.

70.1.2.3.14.1 TWideStrings.Error Method (PResStringRec, Integer)

Raises an EStringListError exception.

Pascal

```
procedure Error(const Msg: WideString; Data: Integer); overload;
procedure Error(Msg: PResStringRec; Data: Integer); overload;
```

C++

```
__fastcall Error(const BSTR Msg, int Data);
__fastcall Error(PResStringRec Msg, int Data);
```

Description

TWideStrings (see page 6825) calls Error internally to raise an EStringListError exception when it encounters a problem.

Msg specifies the string with a single format specifier for an integer, that appears in the exception message box. It can be either a string, or a pointer to a record structure that indicates the module and resource identifier for a string.

Data is an integer value that is inserted into Msg.

See Also

EStringListError

70.1.2.3.15 TWideStrings.Exchange Method

Swaps the position of two strings in the list.

Pascal

```
procedure Exchange(Index1: Integer; Index2: Integer); virtual;
```

C++

```
virtual __fastcall Exchange(int Index1, int Index2);
```

Description

Call Exchange to rearrange the strings in the list. The strings are specified by their index values in the Index1 and Index2 parameters. Indexes are zero-based, so the first string in the list has an index value of 0, the second has an index value of 1, and so on.

If either string has an associated object, Exchange changes the position of the object as well.

See Also

Move (see page 6843)

Objects (see page 6851)

Strings (see page 6853)

70.1.2.3.16 TWideStrings.ExtractName Method

Returns the name portion of a string that is a name value pair.

Pascal

```
function ExtractName(const S: WideString): WideString;
```

C++

```
__fastcall BSTR ExtractName(const BSTR S);
```

Description

TWideStrings (see page 6825) calls ExtractName internally to parse strings that are name-value pairs and return the name portion.

S is the string to parse.

If S is a name-value pair, ExtractName returns the name portion. Otherwise, ExtractName returns an empty string.

See Also

Names (see page 6850)

70.1.2.3.17 TWideStrings.Get Method

Returns a string given its index.

Pascal

```
function Get(Index: Integer): WideString; virtual; abstract;
```

C++

```
virtual __fastcall BSTR Get(int Index) = 0;
```

Description

Get is the protected read implementation of the Strings (see page 6853) property.

In TWideStrings (see page 6825) Get is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the string with the specified index.

See Also

Strings (see page 6853)

70.1.2.3.18 TWideStrings.GetCapacity Method

Returns the currently allocated size of the list of strings.

Pascal

```
function GetCapacity: Integer; virtual;
```

C++

```
virtual __fastcall int GetCapacity();
```

Description

GetCapacity is the protected read implementation of the Capacity (see page 6847) property. In TWideStrings (see page 6825), GetCapacity returns the value of the Count (see page 6849) property. Descendants of TWideStrings (see page 6825) can override this property to let a string list allocate memory for entries that have not been added to the list.

See Also

Capacity (see page 6847)

Count (see page 6849)

70.1.2.3.19 TWideStrings.GetCount Method

Returns the number of strings in the list

Pascal

```
function GetCount: Integer; virtual; abstract;
```

C++

```
virtual __fastcall int GetCount() = 0;
```

Description

GetCount is the protected read implementation of the Count (see page 6849) property.

In TWideStrings (see page 6825) GetCount is abstract or, in C++ terminology, pure virtual, meaning it has no implementation. Descendant classes must override this method to return the number of strings that have been added to the list.

See Also

Count (see page 6849)

70.1.2.3.20 TWideStrings.GetEnumerator Method

Returns a TWideStrings (see page 6825) enumerator.

Pascal

```
function GetEnumerator: TWideStringsEnumerator;
```

C++

```
__fastcall TWideStringsEnumerator GetEnumerator();
```

Description

GetEnumerator returns a TWideStringsEnumerator (see page 6856) reference, which enumerates the strings in a TWideStrings (see page 6825) object.

To process all these strings, call the TWideStringsEnumerator (see page 6856) GetCurrent method within a While MoveNext do loop.

See Also

TWideStringsEnumerator (see page 6856)

70.1.2.3.21 TWideStrings.GetObject Method

Returns the object associated with the string at a specified index.

Pascal

```
function GetObject(Index: Integer): TObject; virtual;
```

C++

```
virtual __fastcall TObject * GetObject(int Index);
```

Description

GetObject is the protected read implementation of the Objects (see page 6851) property.

Index is the index of the string with which the object is associated.

In TWideStrings (see page 6825), GetObject always returns nil (Delphi) or NULL (C++). This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override GetObject to return the specified object.

See Also

Objects (see page 6851)

70.1.2.3.22 TWideStrings.GetText Method

Allocates a text buffer and fills it with the value of the Text (see page 6854) property.

Pascal

```
function GetText: PwideChar; virtual;
```

C++

```
virtual __fastcall PwideChar GetText();
```

Description

Call GetText to obtain a dynamically allocated character buffer containing all of the strings in the list. Individual strings are separated by a carriage return and (on Windows) line feed. The caller is responsible for freeing the returned value using the StrDispose (see page 4247) procedure.

See Also

SetText (see page 6845)

Strings (see page 6853)

Text (see page 6854)

StrDispose (see page 4247)

70.1.2.3.23 TWideStrings.GetTextStr Method

Returns the value of the Text (see page 6854) property.

Pascal

```
function GetTextStr: WideString; virtual;
```

C++

```
virtual __fastcall BSTR GetTextStr();
```

Description

GetTextStr is the protected read implementation of the Text (see page 6854) property. It returns a string that lists all the strings in the list, with individual strings separated by a carriage return and (on Windows) line feed.

See Also

GetText (see page 6839)

Text (see page 6854)

70.1.2.3.24 TWideStrings.IndexOf Method

Returns the position of a string in the list.

Pascal

```
function IndexOf(const S: WideString): Integer; virtual;
```

C++

```
virtual __fastcall int IndexOf(const BSTR S);
```

Description

Call IndexOf to obtain the position of the first occurrence of the string S, or of a string that differs from S only by case. IndexOf returns the 0-based index of the string. Thus, if S matches the first string in the list, IndexOf returns 0, if S is the second string, IndexOf returns 1, and so on. If the string is not in the string list, IndexOf returns -1.

Note: If the string appears in the list more than once, IndexOf returns the position of the first occurrence.

See Also

IndexOfName (see page 6840)

IndexOfObject (see page 6841)

Strings (see page 6853)

70.1.2.3.25 TWideStrings.IndexOfName Method

Returns the position of the first name-value pair with the specified name.

Pascal

```
function IndexOfName(const Name: WideString): Integer; virtual;
```

C++

```
virtual __fastcall int IndexOfName(const BSTR Name);
```

Description

Call IndexOfName to locate the first occurrence of a name-value pair where the name part is equal to the `Name` parameter or differs only in case. IndexOfName returns the 0-based index of the string. If no string in the list has the indicated name, IndexOfName returns -1.

Note: If there is more than one name-value pair with a name portion matching the `Name` parameter, IndexOfName returns the position of the first such string.

See Also

IndexOf (see page 6840)

Names (see page 6850)

Values (see page 6856)

70.1.2.3.26 TWideStrings.IndexOfObject Method

Returns the index of the first string in the list associated with a given object.

Pascal

```
function IndexOfObject(AObject: TObject): Integer; virtual;
```

C++

```
virtual __fastcall int IndexOfObject(TObject * AObject);
```

Description

Call IndexOfObject to locate the first string in the list associated with the object AObject. Specify the object you want to locate as the value of the AObject parameter. IndexOfObject returns the 0-based index of the string and object. If the object is not associated with any of the strings, IndexOfObject returns -1.

See Also

IndexOf (see page 6840)

Objects (see page 6851)

70.1.2.3.27 TWideStrings.Insert Method

Introduces abstract (Delphi) or pure virtual (C++) method to insert a string at a specified position.

Pascal

```
procedure Insert(Index: Integer; const S: WideString); virtual; abstract;
```

C++

```
virtual __fastcall Insert(int Index, const BSTR S) = 0;
```

Description

Descendants of TWideStrings (see page 6825) implement an Insert method to add the string S to the list at the position specified by `Index`. If `Index` is 0, the string is inserted at the beginning of the list. If `Index` is 1, the string is put in the second position of the list, and so on.

All methods that add strings to the list use the Insert method to add the string.

If the string has an associated object, use the InsertObject (see page 6842) method instead.

See Also

Add (see page 6829)

AddObject (see page 6830)

AddStrings (see page 6830)

Append (see page 6831)

BeginUpdate (see page 6832)

EndUpdate (see page 6835)

InsertObject (see page 6842)

Strings (see page 6853)

70.1.2.3.28 TWideStrings.InsertObject Method

Inserts a string into the list at the specified position, and associates it with an object.

Pascal

```
procedure InsertObject(Index: Integer; const S: WideString; AObject: TObject); virtual;
```

C++

```
virtual __fastcall InsertObject(int Index, const BSTR S, TObject * AObject);
```

Description

Call InsertObject to insert the string S into the list at the position identified by `Index`, and associate it with the object AObject. If `Index` is 0, the string is inserted at the beginning of the list. If `Index` is 1, the string is put in the second position of the list, and so on.

See Also

Insert (see page 6841)

Objects (see page 6851)

70.1.2.3.29 TWideStrings.LoadFromFile Method

Fills the list with the lines of text in a specified file.

Pascal

```
procedure LoadFromFile(const FileName: WideString); virtual;
```

C++

```
virtual __fastcall LoadFromFile(const BSTR FileName);
```

Description

Call LoadFromFile to fill the list of the TWideStrings (see page 6825) object from the file specified by FileName. LoadFromFile first clears any strings already in the list. Then, each line in the file, as indicated by carriage return or linefeed characters, is appended as a string in the list.

Note: LoadFromFile uses the Add (see page 6829) method to add the strings that are read from the file.

See Also

Add (see page 6829)

LoadFromStream (see page 6842)

SaveToFile (see page 6844)

Strings (see page 6853)

Text (see page 6854)

70.1.2.3.30 TWideStrings.LoadFromStream Method

Fills the list with lines of text read from a stream.

Pascal

```
procedure LoadFromStream(Stream: TStream); virtual;
```

C++

```
virtual __fastcall LoadFromStream(TStream Stream);
```

Description

Call LoadFromStream to fill the list of the TWideStrings (see page 6825) object from the stream specified by Stream. The text read from the stream is parsed into strings separated by carriage return or linefeed characters. Thus, LoadFromStream reads the value of the Text (see page 6854) property.

If the stream is a file stream, LoadFromStream does the same thing as LoadFromFile (see page 6842), except the application must create and destroy the file stream.

See Also

Add (see page 6829)

LoadFromFile (see page 6842)

SaveToStream (see page 6845)

Text (see page 6854)

70.1.2.3.31 TWideStrings.Move Method

Changes the position of a string in the list.

Pascal

```
procedure Move(CurIndex: Integer; NewIndex: Integer); virtual;
```

C++

```
virtual __fastcall Move(int CurIndex, int NewIndex);
```

Description

Use Move to move the string at position CurIndex so that it occupies the position NewIndex. The positions are specified as 0-based indexes. For example, the following lines of code move the string in the first position to the last position.

```
MyStringsObject.Move(0, MyStringsObject.Count)
MyStringsObject->Move(0, MyStringsObject->Count - 1);
```

If the string has an associated object, the object remains associated with the string in its new position.

See Also

Count (see page 6849)

Objects (see page 6851)

Strings (see page 6853)

70.1.2.3.32 TWideStrings.Put Method

Changes the value of the string with a specified index.

Pascal

```
procedure Put(Index: Integer; const S: WideString); virtual;
```

C++

```
virtual __fastcall Put(int Index, const BSTR S);
```

Description

Put is the protected write implementation of the Strings (see page 6853) property.

Put changes the value of the string with the index specified by `Index` to S. Put does not change the object at the specified position. That is, any object associated with the previous string becomes associated with the new string.

See Also

Strings (see page 6853)

Objects (see page 6851)

70.1.2.3.33 TWideStrings.PutObject Method

Changes the object associated with the string at a specified index.

Pascal

```
procedure PutObject(Index: Integer; AObject: TObject); virtual;
```

C++

```
virtual __fastcall PutObject(int Index, TObject * AObject);
```

Description

PutObject is the protected write implementation of the Objects (see page 6851) property.

As implemented in TWideStrings (see page 6825), PutObject does nothing. This provides a default implementation for descendants that do not support associating objects with the strings in the list. Descendants that support this feature override PutObject to change the specified object.

See Also

Objects (see page 6851)

70.1.2.3.34 TWideStrings.SaveToFile Method

Saves the strings in the list to the specified file.

Pascal

```
procedure SaveToFile(const FileName: WideString); virtual;
```

C++

```
virtual __fastcall SaveToFile(const BSTR FileName);
```

Description

Call SaveToFile to save the strings in the list to the file specified by FileName. Each string in the list is written to a separate line in the file.

Note: In Linux, SaveToFile saves the strings as they appear in the list. If the last string does not have an end-of-line marker, the resulting file may be considered incomplete by some editors.

See Also

LoadFromFile (see page 6842)

SaveToStream (see page 6845)

Strings (see page 6853)

Text (see page 6854)

70.1.2.3.35 TWideStrings.SaveToStream Method

Writes the value of the Text (see page 6854) property to a stream object.

Pascal

```
procedure SaveToStream(Stream: TStream); virtual;
```

C++

```
virtual __fastcall SaveToStream(TStream Stream);
```

Description

Call SaveToStream to save the strings in the list to the stream specified by the Stream parameter. SaveToStream writes the strings delimited by carriage return, line feed pairs. If the stream is a file stream, SaveToStream does the same thing as SaveToFile (see page 6844), except the application must create and destroy the file stream.

See Also

LoadFromStream (see page 6842)

SaveToFile (see page 6844)

Strings (see page 6853)

Text (see page 6854)

70.1.2.3.36 TWideStrings.SetCapacity Method

Changes the amount of memory allocated to hold strings in the list.

Pascal

```
procedure SetCapacity(NewCapacity: Integer); virtual;
```

C++

```
virtual __fastcall SetCapacity(int NewCapacity);
```

Description

SetCapacity is the protected read implementation of the Capacity (see page 6847) property.

Integer is the number of strings the list can hold after the capacity has changed.

In TWideStrings (see page 6825), SetCapacity does nothing. Descendant classes override this method to change the number of strings that the list can hold. For descendant classes that implement SetCapacity, assigning a value smaller than Count (see page 6849) removes strings from the end of the list. Assigning a value greater than Count (see page 6849) allocates space for more strings to be added.

See Also

Capacity (see page 6847)

Count (see page 6849)

70.1.2.3.37 TWideStrings.SetText Method

Sets the Text (see page 6854) property.

Pascal

```
procedure SetText(Text: PwideChar); virtual;
```

C++

```
virtual __fastcall SetText(PwideChar Text);
```

Description

Call SetText to replace the list with the strings specified by the Text (see page 6854) parameter. SetText adds strings one at a time to the list, using the carriage returns or linefeed characters in Text (see page 6854) as delimiters indicating when to add a new string.

See Also

SetTextStr (see page 6846)

Text (see page 6854)

70.1.2.3.38 TWideStrings.SetTextStr Method

Sets the Text (see page 6854) property.

Pascal

```
procedure SetTextStr(const Value: WideString); virtual;
```

C++

```
virtual __fastcall SetTextStr(const BSTR Value);
```

Description

GetTextStr (see page 6839) is the protected write implementation of the Text (see page 6854) property. It replaces the list with the strings specified by the Value parameter. SetTextStr adds strings one at a time to the list, using the carriage returns or linefeed characters in Value as delimiters indicating when to add a new string.

See Also

SetText (see page 6845)

Text (see page 6854)

70.1.2.3.39 TWideStrings.SetUpdateState Method

Performs internal adjustments before or after a series of updates.

Pascal

```
procedure SetUpdateState(Updating: Boolean); virtual;
```

C++

```
virtual __fastcall SetUpdateState(Boolean Updating);
```

Description

SetUpdateState is called at the beginning or end of a series of updates. When the BeginUpdate (see page 6832) method is first called and the TWideStrings (see page 6825) object is not already in the middle of an update, TWideStrings (see page 6825) calls SetUpdateState internally, with Updating set to true. When the EndUpdate (see page 6835) method is called and it cancels out the last unmatched call to BeginUpdate (see page 6832), TWideStrings (see page 6825) calls SetUpdateState internally, with Updating set to false.

As implemented in TWideStrings (see page 6825), SetUpdateState does nothing. Descendant classes can override this method to optimize the response to updates.

See Also

BeginUpdate (see page 6832)

EndUpdate (see page 6835)

70.1.2.4 TWideStrings Properties

The properties of the TWideStrings class are listed here.

Protected Properties

	Name	Description
R	UpdateCount (see page 6855)	Indicates the number of calls to BeginUpdate (see page 6832) that have not been matched by a call to EndUpdate (see page 6835).

Public Properties

	Name	Description
	Capacity (see page 6847)	Indicates the number of strings the TWideStrings (see page 6825) object can hold.
	CommaText (see page 6848)	Lists the strings in the TWideStrings (see page 6825) object in system data format (SDF).
R	Count (see page 6849)	Introduces an abstract property to represent the number of strings in the list.
	DelimitedText (see page 6849)	Represents all the strings in the TWideStrings (see page 6825) object as a single delimited string.
	Delimiter (see page 6850)	Specifies the delimiter used by the DelimitedText (see page 6849) property.
	LineBreak (see page 6850)	Defines the line break character(s).
R	Names (see page 6850)	Indicates the name part of strings that are name-value pairs.
	NameValueSeparator (see page 6851)	Indicates the character used to separate names from values.
	Objects (see page 6851)	Represents a set of objects that are associated one with each of the strings in the Strings (see page 6853) property.
	QuoteChar (see page 6852)	Specifies the quote character used by the DelimitedText (see page 6849) property.
	StrictDelimiter (see page 6852)	Determines how the Delimiter (see page 6850) property is used.
	Strings (see page 6853)	References the strings in the list by their positions.
	StringsAdapter (see page 6854)	Implements an IWideStringsAdapter (see page 6859) interface for the TWideStrings (see page 6825) object.
	Text (see page 6854)	Lists the strings in the TWideStrings (see page 6825) object as a single string with the individual strings delimited by carriage returns and line feeds.
	ValueFromIndex (see page 6855)	Represents the value part of a string with a given index, on strings that are name-value pairs.
	Values (see page 6856)	Represents the value part of a string associated with a given name, on strings that are name-value pairs.

70.1.2.4.1 TWideStrings.Capacity Property

Indicates the number of strings the TWideStrings (see page 6825) object can hold.

Pascal

```
property Capacity: Integer;
```

C++

```
__property int Capacity;
```

Description

Read (see page 3634) Capacity to determine the currently allocated size of the string list. For the TWideStrings (see page 6825) object, reading Capacity returns the Count (see page 6849) property, and setting Capacity does nothing. Descendants of TWideStrings (see page 6825) can override this property to allow a string list to allocate memory for entries that have not

been added to the list.

See Also

Count (see page 6849)

70.1.2.4.2 TWideStrings.CommaText Property

Lists the strings in the TWideStrings (see page 6825) object in system data format (SDF).

Pascal

```
property CommaText: WideString;
```

C++

```
__property BSTR CommaText;
```

Description

Use CommaText to get or set all the strings in the TWideStrings (see page 6825) object in a single comma-delimited string.

When retrieving CommaText, any string in the list that include spaces, commas or quotes will be contained in double quotes, and any double quotes in a string will be repeated. For example, if the list contains the following strings:

```
Stri,ng 1
Stri"ng 2
String 3
String4
```

CommaText will return:

```
"Stri,ng 1","Stri""ng 2","String 3",String4
```

When assigning CommaText, the value is parsed as SDF formatted text. For SDF format, strings are separated by commas or spaces, and optionally enclosed in double quotes. Double quote marks that are part of the string are repeated to distinguish them from the quotes that surround the string. Spaces and commas that are not contained within double quote marks are delimiters. Two commas next to each other will indicate an empty string, but spaces that appear next to another delimiter are ignored. For example, suppose CommaText is set to:

```
"Stri,ng 1", "Stri""ng 2" , String 3,String4
```

The list will then contain:

```
Stri,ng 1
Stri"ng 2
String
3
String4
```

Note: CommaText is the same as the DelimitedText (see page 6849) property with a delimiter of ',' and a quote character of "".

Including a trailing comma in the source string causes a blank item to be included in the string list. For example, if CommaText is set to

```
"String1, String 2, String 3,"
```

the string list will contain

```
String1
String2
String3
<Blank>
```

Strings (see page 6853)

Text (see page 6854)

DelimitedText (see page 6849)

70.1.2.4.3 TWideStrings.Count Property

Introduces an abstract property to represent the number of strings in the list.

Pascal

```
property Count: Integer;
```

C++

```
__property int Count;
```

Description

Descendants of TWideStrings (see page 6825) implement a Count property to indicate the number of strings in the list.

Use the Count property when iterating over all the strings in the list, or when trying to locate the position of a string relative to the last string in the list.

See Also

IndexOf (see page 6840)

Strings (see page 6853)

70.1.2.4.4 TWideStrings.DelimitedText Property

Represents all the strings in the TWideStrings (see page 6825) object as a single delimited string.

Pascal

```
property DelimitedText: WideString;
```

C++

```
__property BSTR DelimitedText;
```

Description

Use DelimitedText to get or set all the strings in the TWideStrings (see page 6825) object in a single string.

When retrieving DelimitedText, the resulting value delimits individual strings in two ways: each string is surrounded (before and after) by the quote character specified by the QuoteChar (see page 6852) property. In addition, individual strings are separated by the character specified by the Delimiter (see page 6850) property.

When assigning DelimitedText, individual strings must be separated using QuoteChar (see page 6852) at both ends, using Delimiter (see page 6850) as a separator, or using both these methods.

If StrictDelimiter (see page 6852) is set to false, the space character is also interpreted as a delimiter, regardless of the value of Delimiter (see page 6850). This is not true when the space character occurs between quotation marks.

Note: CommaText (see page 6848) is the same as the DelimitedText property when Delimiter (see page 6850) is ',' and QuoteChar (see page 6852) is '"'.

See Also

CommaText (see page 6848)

Delimiter (see page 6850)

Text (see page 6854)

QuoteChar (see page 6852)

StrictDelimiter (see page 6852)

70.1.2.4.5 TWideStrings.Delimiter Property

Specifies the delimiter used by the DelimitedText (see page 6849) property.

Pascal

```
property Delimiter: WideChar;
```

C++

```
__property WideChar Delimiter;
```

Description

Use Delimiter to get or set the delimiter used by the DelimitedText (see page 6849) property. DelimitedText (see page 6849) represents all of the strings in the TWideStrings (see page 6825) object as a single string, with individual strings separated by the character that is the value of Delimiter.

See Also

DelimitedText (see page 6849)

QuoteChar (see page 6852)

70.1.2.4.6 TWideStrings.LineBreak Property

Defines the line break character(s).

Pascal

```
property LineBreak: WideString;
```

C++

```
__property BSTR LineBreak;
```

Description

LineBreak can be read and set. It is used internally in TWideStrings (see page 6825) to terminate strings in multi-string output operations.

For example, the GetText (see page 6839) method returns a long string containing all TWideStrings (see page 6825) strings, each of which is terminated by the LineBreak value.

Note: In Windows, the default LineBreak value is a carriage return and line feed combination (#13#10), whereas on Linux, it is just a carriage return (#13).

See Also

GetText (see page 6839)

70.1.2.4.7 TWideStrings.Names Property

Indicates the name part of strings that are name-value pairs.

Pascal

```
property Names [Index: Integer]: WideString;
```

C++

```
__property BSTR Names[int Index];
```

Description

When the list of strings for the TWideStrings (see page 6825) object includes strings that are name-value pairs, read Names to access the name part of a string. Names is the name part of the string at `Index`, where 0 is the first string, 1 is the second string, and so on. If the string is not a name-value pair, Names contains an empty string.

See Also

NameValueSeparator (see page 6851)

IndexOfName (see page 6840)

Strings (see page 6853)

Values (see page 6856)

70.1.2.4.8 TWideStrings.NameValueSeparator Property

Indicates the character used to separate names from values.

Pascal

```
property NameValueSeparator: WideChar;
```

C++

```
__property WideChar NameValueSeparator;
```

Description

Strings (see page 6853) that contain the NameValueSeparator character are considered name-value pairs. NameValueSeparator defaults to the equal sign (=). TWideStrings (see page 6825) defines various methods for accessing names and values and for searching for specific names.

Strings (see page 6853) that are name-value pairs consist of a name part, the separator character, and a value part. Any spaces around the separator character are part of the name or value. This convention corresponds to the format used in many initialization files. For example:

```
DisplayGrid=1
SnapToGrid=1
GridSizeX=8
GridSizeY=8
```

See Also

ValueFromIndex (see page 6855)

Names (see page 6850)

IndexOfName (see page 6840)

Strings (see page 6853)

Values (see page 6856)

70.1.2.4.9 TWideStrings.Objects Property

Represents a set of objects that are associated one with each of the strings in the Strings (see page 6853) property.

Pascal

```
property Objects [Index: Integer]: TObject;
```

C++

```
__property TObject * Objects[int Index];
```

Description

Setting the Objects property for TWideStrings (see page 6825) does nothing. Reading the Objects property for TWideStrings (see page 6825) returns nil (Delphi) or NULL (C++). Descendant classes can associate objects with the strings in the set by implementing the Objects property.

Use the Objects property of a descendant of TWideStrings (see page 6825) to get or set the object associated with the string at the position indicated by `Index`. Index gives the position of the string associated with the object, where 0 is the first string, 1 is the second string, and so on. If a descendant of TWideStrings (see page 6825) does not support the Objects property, reading this property returns nil (Delphi) or NULL (C++).

Note: The TWideStrings (see page 6825) object does not own the objects in the Objects array. Objects added to the Objects array still exist even if the TWideStrings (see page 6825) object is destroyed. They must be explicitly destroyed by the application.

See Also

AddObject (see page 6830)

IndexOfObject (see page 6841)

InsertObject (see page 6842)

Strings (see page 6853)

70.1.2.4.10 TWideStrings.QuoteChar Property

Specifies the quote character used by the DelimitedText (see page 6849) property.

Pascal

```
property QuoteChar: WideChar;
```

C++

```
__property WideChar QuoteChar;
```

Description

Use QuoteChar to get or set the quote character that is used to enclose individual strings in the DelimitedText (see page 6849) property.

See Also

Delimiter (see page 6850)

DelimitedText (see page 6849)

CommaText (see page 6848)

70.1.2.4.11 TWideStrings.StrictDelimiter Property

Determines how the Delimiter (see page 6850) property is used.

Pascal

```
property StrictDelimiter: Boolean;
```

C++

```
__property Boolean StrictDelimiter;
```

Description

Use this property to specify whether the Delimiter (see page 6850) is the only value used within the DelimitedText (see page 6849) property. If set to True, individual strings in DelimitedText (see page 6849) are separated only by the character that is the value of Delimiter (see page 6850). If set to False, individual strings in DelimitedText (see page 6849) can be separated by a space, a non-printable character, or the character that is the value of Delimiter (see page 6850).

70.1.2.4.12 TWideStrings.Strings Property

References the strings in the list by their positions.

Pascal

```
property Strings [Index: Integer]: WideString;
```

C++

```
__property BSTR Strings[int Index];
```

Description

Descendants of TWideStrings (see page 6825) must implement an accessor function for the Strings property to return the string at the position indicated by `Index`. `Index` gives the position of the string, where 0 is the first string, 1 is the second string, and so on.

Use the Strings property to get or set the string at a particular position.

To store a string as a name-value pair, assign Strings a value that includes the NameValueSeparator (see page 6851) character. The name and value will then be accessible separately using the Names (see page 6850) and Values (see page 6856) properties.

Note: In Delphi, Strings is the default property of TWideStrings (see page 6825) objects. The Strings identifier can be omitted when accessing the Strings property of a descendant of TWideStrings (see page 6825). For example, the following two lines of code are both acceptable and do the same thing:

```
MyStrings.Strings[0] := 'This is the first string';
        MyStrings[0] := 'This is the first string';
```

See Also

ValueFromIndex (see page 6855)

Objects (see page 6851)

Text (see page 6854)

70.1.2.4.13 TWideStrings.StringsAdapter Property

Implements an IWideStringsAdapter (see page 6859) interface for the TWideStrings (see page 6825) object.

Pascal

```
property StringsAdapter: IWideStringsAdapter;
```

C++

```
__property IWideStringsAdapter StringsAdapter;
```

Description

Do not use the StringsAdapter property. StringsAdapter is used internally.

See Also

TStringsAdapter

70.1.2.4.14 TWideStrings.Text Property

Lists the strings in the TWideStrings (see page 6825) object as a single string with the individual strings delimited by carriage returns and line feeds.

Pascal

```
property Text: WideString;
```

C++

```
__property BSTR Text;
```

Description

Use Text to get or set all the strings in the TWideStrings (see page 6825) object in a single string delimited by carriage return, line feed pairs.

When reading Text, the strings in the list will be separated by carriage return and (on Windows) line feed. If any of the strings in the list contain a carriage return (and line feed), the resulting value of Text will appear to contain more strings than is indicated by the Count (see page 6849) property.

When setting Text, the value will be parsed by separating into substrings whenever a carriage return or linefeed is encountered. (The two do not need to form pairs).

If the strings in the list contain carriage return or linefeed characters, a less ambiguous format for the strings is available through the CommaText (see page 6848) or DelimitedText (see page 6849) property.

See Also

Add (see page 6829)

CommaText (see page 6848)

Count (see page 6849)

Strings (see page 6853)

GetText (see page 6839)

SetText (see page 6845)

DelimitedText (see page 6849)

70.1.2.4.15 TWideStrings.UpdateCount Property

Indicates the number of calls to BeginUpdate (see page 6832) that have not been matched by a call to EndUpdate (see page 6835).

Pascal

```
property UpdateCount: Integer;
```

C++

```
__property int UpdateCount;
```

Description

TWideStrings (see page 6825) uses UpdateCount to keep track of calls to the BeginUpdate (see page 6832) and EndUpdate (see page 6835) methods. Every time a call is made to BeginUpdate (see page 6832), TWideStrings (see page 6825) increments the value of UpdateCount. Every call to EndUpdate (see page 6835) causes TWideStrings (see page 6825) to decrement UpdateCount.

When UpdateCount changes from 0 to 1, TWideStrings (see page 6825) calls the SetUpdateState (see page 6846) method with a parameter of true. When UpdateCount changes from 1 to 0, TStrings calls the SetUpdateState (see page 6846) method with a parameter of false. This allows descendant classes to perform optimizations when handling multiple updates.

See Also

BeginUpdate (see page 6832)

EndUpdate (see page 6835)

SetUpdateState (see page 6846)

70.1.2.4.16 TWideStrings.ValueFromIndex Property

Represents the value part of a string with a given index, on strings that are name-value pairs.

Pascal

```
property ValueFromIndex [Index: Integer]: WideString;
```

C++

```
__property BSTR ValueFromIndex[int Index];
```

Description

When the list of strings for the TWideStrings (see page 6825) object includes strings that are name-value pairs, use ValueFromIndex to get or set the value part of a string associated with an index.

For more information on name-value pairs, refer to the NameValueSeparator (see page 6851) property.

See Also

NameValueSeparator (see page 6851)

IndexOfName (see page 6840)

Strings (see page 6853)

Values (see page 6856)

70.1.2.4.17 TWideStrings.Values Property

Represents the value part of a string associated with a given name, on strings that are name-value pairs.

Pascal

```
property Values [const Name: WideString]: WideString;
```

C++

```
__property BSTR Values[BSTR const Name];
```

Description

When the list of strings for the TWideStrings (see page 6825) object includes strings that are name-value pairs, use Values to get or set the value part of a string associated with a specific name part.

For more information on name-value pairs, refer to the NameValueSeparator (see page 6851) property.

Note: The `Name` index is case-insensitive. That is, Values is the value part for the first occurrence of `Name` or an equivalent string that differs only in case.

See Also

ValueFromIndex (see page 6855)

NameValueSeparator (see page 6851)

IndexOfName (see page 6840)

Names (see page 6850)

Strings (see page 6853)

70.1.3 TWideStringsEnumerator Class

Enumerates through the strings of a TWideStrings (see page 6825) object.

Class Hierarchy

Pascal

```
TWideStringsEnumerator = class;
```

C++

```
class TWideStringsEnumerator;
```

File

WideStrings

Description

TWideStringsEnumerator provides an enumerator for TWideStrings (see page 6825) objects.

70.1.3.1 TWideStringsEnumerator Members

The following tables list the members exposed by TWideStringsEnumerator.

Public Methods

	Name	Description
	Create (see page 6857)	Creates a TWideStrings (see page 6825) enumerator.
	GetCurrent (see page 6857)	Gets the current string.
	MoveNext (see page 6857)	Moves the enumerator to the next string in the TWideStrings (see page 6825) collection.

Public Properties

	Name	Description
R	Current (see page 6858)	The current string.

70.1.3.2 TWideStringsEnumerator.Create Constructor

Creates a TWideStrings (see page 6825) enumerator.

Pascal

```
constructor Create(AStrings: TWideStrings);
```

C++

```
__fastcall TWideStringsEnumerator(TWideStrings AStrings);
```

Description

Creates an instance of TWideStringsEnumerator (see page 6856).

70.1.3.3 TWideStringsEnumerator Methods

The methods of the TWideStringsEnumerator class are listed here.

Public Methods

	Name	Description
	GetCurrent (see page 6857)	Gets the current string.
	MoveNext (see page 6857)	Moves the enumerator to the next string in the TWideStrings (see page 6825) collection.

70.1.3.3.1 TWideStringsEnumerator.GetCurrent Method

Gets the current string.

Pascal

```
function GetCurrent: WideString;
```

C++

```
__fastcall BSTR GetCurrent();
```

Description

Use GetCurrent to get the current string in the TWideStrings (see page 6825) object being enumerated.

70.1.3.3.2 TWideStringsEnumerator.MoveNext Method

Moves the enumerator to the next string in the TWideStrings (see page 6825) collection.

Pascal

```
function MoveNext: Boolean;
```

C++

```
__fastcall Boolean MoveNext();
```

Description

Use MoveNext to move the TWideStringsEnumerator (see page 6856) to the next string in the TWideStrings (see page 6825) object being enumerated.

70.1.3.4 TWideStringsEnumerator Properties

The properties of the TWideStringsEnumerator class are listed here.

Public Properties

	Name	Description
	Current (see page 6858)	The current string.

70.1.3.4.1 TWideStringsEnumerator.Current Property

The current string.

Pascal

```
property Current: WideString;
```

C++

```
__property BSTR Current;
```

Description

Current contains the current string in the TWideStrings (see page 6825) object being enumerated.

70.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWideStringsAdapter (see page 6859)	This is class WideStrings.IWideStringsAdapter.

70.2.1 IWideStringsAdapter Interface

Class Hierarchy

WideStrings.IWideStringsAdapter

Pascal

```
IWideStringsAdapter = interface;
```

C++

```
__interface IWideStringsAdapter;
```

File

WideStrings

Description

This is class WideStrings.IWideStringsAdapter.

70.2.1.1 IWideStringsAdapter Members

The following tables list the members exposed by IWideStringsAdapter.

Public Methods

	Name	Description
	ReferenceStrings (see page 6860)	This is ReferenceStrings, a member of class IWideStringsAdapter.
	ReleaseStrings (see page 6860)	This is ReleaseStrings, a member of class IWideStringsAdapter.

70.2.1.2 IWideStringsAdapter Methods

The methods of the IWideStringsAdapter class are listed here.

Public Methods

	Name	Description
	ReferenceStrings (see page 6860)	This is ReferenceStrings, a member of class IWideStringsAdapter.
	ReleaseStrings (see page 6860)	This is ReleaseStrings, a member of class IWideStringsAdapter.

70.2.1.2.1 IWideStringsAdapter.ReferenceStrings Method

Pascal

```
procedure ReferenceStrings(S: TWideStrings);
```

C++

```
__fastcall ReferenceStrings(TWideStrings S);
```

Description

This is ReferenceStrings, a member of class IWideStringsAdapter.

70.2.1.2.2 IWideStringsAdapter.ReleaseStrings Method

Pascal

```
procedure ReleaseStrings;
```

C++

```
__fastcall ReleaseStrings();
```

Description

This is ReleaseStrings, a member of class IWideStringsAdapter.

70.3 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Records

	Name	Description
	TWideStringItem (see page 6861)	TWideStringItem defines a TWideStringList (see page 6808) entry.

70.3.1 WideStrings.TWideStringItem Record

TWideStringItem defines a TWideStringList (see page 6808) entry.

Pascal

```
TWideStringItem = record
  FString: WideString;
  FObject: TObject;
end;
```

C++

```
struct TWideStringItem {
  BSTR FString;
  TObject * FObject;
};
```

File

WideStrings

Description

The TWideStringItem type defines a data structure used internally in Delphi.

It is used by TWideStringList (see page 6808) to hold a list entry.

FString defines an Unicode string for a list entry.

FObject points to an optional `TObject (see page 3354)` associated with the string.

See Also

TWideStringList (see page 6808)

70.4 Types

The following table lists types in this documentation.

Types

Name	Description
PWideStringItem (see page 6862)	PWideStringItem is a TWideStringItem (see page 6861) pointer.
PWideStringItemList (see page 6862)	PWideStringItemList is a TWideStringItemList (see page 6863) pointer.
TWideStringItemList (see page 6863)	TWideStringItemList defines an array of TWideStringItems.
TWideStringListSortCompare (see page 6863)	TWideStringListSortCompare is a type of callback function called used internally by the TWideStringList (see page 6808) class.

70.4.1 WideStrings.PWideStringItem Type

PWideStringItem is a TWideStringItem (see page 6861) pointer.

Pascal

```
PWideStringItem = ^TWideStringItem;
```

C++

```
^TWideStringItem PWideStringItem;
```

File

WideStrings

Description

PWideStringItem is used internally by TWideStringList (see page 6808) to point to a TWideStringItem (see page 6861) value.

TWideStringItem (see page 6861) comprises :

FString defines an Unicode string for a list entry.

FObject points to an optional System::TObject (see page 3354) associated with the string.

See Also

TWideStringItem (see page 6861)

TWideStringList (see page 6808)

70.4.2 WideStrings.PWideStringItemList Type

PWideStringItemList is a TWideStringItemList (see page 6863) pointer.

Pascal

```
PWideStringItemList = ^TWideStringItemList;
```

C++

```
^TWideStringItemList PWideStringItemList;
```

File

WideStrings

Description

PWideStringItemList is used internally by TWideStringList (see page 6808) to refer to its internal array of TWideStringItem (see page 6861) values. This array holds the list of strings.

TWideStringItem (see page 6861) comprises :

FString defines an Unicode string for a list entry.

FObject points to an optional System::TObject (see page 3354) associated with the string.

See Also

TWideStringItem (see page 6861)

TWideStringList (see page 6808)

70.4.3 WideStrings.TWideStringItemList Type

TWideStringItemList defines an array of TWideStringItems.

Pascal

```
TWideStringItemList = array[0..MaxListSize] of TWideStringItem;
```

C++

```
array[0..MaxListSize] of TWideStringItem TWideStringItemList;
```

File

WideStrings

Description

TWideStringItemList is used internally by TWideStringList (see page 6808) to refer to its internal array of TWideStringItem (see page 6861) values. This array holds the list of strings.

TWideStringItem (see page 6861) comprises :

FString defines an Unicode string for a list entry.

FObject points to an optional System::TObject (see page 3354) associated with the string.

See Also

TWideStringItem (see page 6861)

TWideStringList (see page 6808)

70.4.4 WideStrings.TWideStringListSortCompare Type

TWideStringListSortCompare is a type of callback function called used internally by the TWideStringList (see page 6808) class.

Pascal

```
TWideStringListSortCompare = function (List: TWideStringList; Index1, Index2: Integer):
```

```
Integer;
```

C++

```
(List: TWideStringList; Index1, Index2: Integer): Integer ( TWideStringListSortCompare)();
```

File

WideStrings

Description

You define a TWideStringListSortCompare function when you need to use the TWideStringList (see page 6808) CustomSort method. The procedure defined by TWideStringListSortCompare is invoked by CustomSort to sort the TWideStringList (see page 6808) elements into sequence.

CustomSort is used instead of Sort when the sort sequence required differs from the default alphanumeric sequence.

List is the list of Unicode strings.

Index1 and **Index2** are indexes into the list. When these are passed to the TListSortCompare function, the CustomSort method is asking which order they should be in.

You return 0 if the entry referred to by **Index1** equals the entry referred to by **Index2**

You return less than 0 if the entry referred to by **Index1** is less than the entry referred to by **Index2**

You return a number above 0 if the entry referred to by **Index1** is greater than the entry referred to by **Index2**

Note: One of the principle advantages of the CustomSort method is that a TWideStringList (see page 6808) may be sorted according to the objects optionally attachable to each string.

See Also

CustomSort (see page 6815)

TWideStringList (see page 6808)

71 WideStrUtils Namespace

This is namespace WideStrUtils.

Topics

Name	Description
Functions (see page 6867)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 6889)	The following table lists structs, records, enums in this documentation.
Types (see page 6890)	The following table lists types in this documentation.
Constants (see page 6891)	The following table lists constants in this documentation.

Constants

Name	Description
sUTF8BOMString (see page 6891)	Represents the UTF-8 byte-order mark.

Functions

	Name	Description
	AnsiToUtf8Ex (see page 6868)	Converts a string encoded in ANSI to UTF-8 with a given code page.
	ConvertStreamFromAnsiToUTF8 (see page 6868)	Converts a stream from ANSI to UTF-8 encoding.
	ConvertStreamFromUTF8ToAnsi (see page 6869)	Converts a stream from UTF-8 to ANSI encoding.
	DetectUTF8Encoding (see page 6869)	Detects the encoding of a given WideString (see page 3467).
	HasExtendCharacter (see page 6870)	Checks whether the string contains non-ASCII characters.
	HasUTF8BOM (see page 6870)	Detects if a string or a stream contains the UTF-8 byte-order mark.
	HasUTF8BOM (see page 6870)	Detects if a string or a stream contains the UTF-8 byte-order mark.
	inOpArray (see page 6871)	Checks if a WideChar is contained in a given array.
	inOpSet (see page 6871)	Checks if a WideChar is contained in a given set.
	IsUTF8LeadByte (see page 6871)	Checks whether a character is a valid UTF-8 lead byte.
	IsUTF8String (see page 6872)	Detects if a given string is UTF-8 encoded.
	IsUTF8TrailByte (see page 6872)	Checks whether a character is a valid UTF-8 trail byte.
	LoadResWideString (see page 6873)	Loads a WideString (see page 3467) resource.
	LoadWideStr (see page 6873)	Loads a WideString (see page 3467) resource.
	UTF8CharLength (see page 6874)	Returns the number of bytes that follow a lead UTF-8 byte.
	UTF8CharSize (see page 6874)	Returns the number of bytes that follow a lead UTF-8 byte.
	UTF8LowerCase (see page 6875)	Returns the UTF-8 string converted to lower case.
	Utf8ToAnsiEx (see page 6875)	Converts a string encoded in UTF-8 to ANSI with a given code page.
	UTF8UpperCase (see page 6876)	Returns the UTF-8 string converted to uppercase.

	WideAdjustLineBreaks (see page 6876)	Adjusts line break characters in a WideString (see page 3467) to reflect Windows or Linux style.
	WideDequotedStr (see page 6877)	Converts a quoted WideString (see page 3467) into an unquoted WideString (see page 3467).
	WideExtractQuotedStr (see page 6877)	Converts a quoted PWideChar into an unquoted WideString (see page 3467).
	WideLastChar (see page 6878)	Gets last character in a WideString (see page 3467).
	WideQuotedStr (see page 6878)	Returns the quoted version of a WideString (see page 3467).
	WideReplaceStr (see page 6879)	Replaces all occurrences of a substring within a string, using case-sensitive search.
	WideReplaceText (see page 6880)	Replaces all occurrences of a substring in a WideString (see page 3467).
	WideStringReplace (see page 6880)	Replaces occurrences of a substring within a string.
	WStrAlloc (see page 6881)	Allocates a buffer for a PWideChar and returns a pointer to its first character.
	WStrBufSize (see page 6881)	Returns the maximum number of characters that can be stored in a PWideChar allocated by WStrAlloc (see page 6881).
	WStrCat (see page 6882)	Appends a PWideChar to another PWideChar.
	WStrComp (see page 6882)	Compares two PWideChar values with case sensitivity.
	WStrCopy (see page 6883)	Copies a PWideChar to another PWideChar.
	WStrDispose (see page 6883)	Disposes of a PWideChar.
	WStrEnd (see page 6884)	Returns a pointer to the end of a PWideChar.
	WStrLCopy (see page 6884)	Copies up to a specified maximum number of characters from a PWideChar.
	WStrLen (see page 6885)	Returns number of characters in a PWideChar excluding the null terminator.
	WStrMove (see page 6885)	Copies a specified number of characters from a PWideChar to another PWideChar.
	WStrNew (see page 6886)	Allocates space on and copies a PWideChar to the heap, returning a new PWideChar.
	WStrPCopy (see page 6886)	Copies a WideString (see page 3467) to a PWideChar.
	WStrPLCopy (see page 6887)	Copies characters from a WideString (see page 3467) into a PWideChar.
	WStrPos (see page 6887)	Returns a pointer to the first occurrence of a PWideChar in another PWideChar.
	WStrScan (see page 6888)	Returns a pointer to the first occurrence of a specified character in a PWideChar.

Structs, Records, Enums

	Name	Description
	TEncodeType (see page 6889)	Defines a list of encodings.

Types

Name	Description
CharSet (see page 6890)	Represents a set of allowed characters.

71.1 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	AnsiToUtf8Ex (see page 6868)	Converts a string encoded in ANSI to UTF-8 with a given code page.
	ConvertStreamFromAnsiToUTF8 (see page 6868)	Converts a stream from ANSI to UTF-8 encoding.
	ConvertStreamFromUTF8ToAnsi (see page 6869)	Converts a stream from UTF-8 to ANSI encoding.
	DetectUTF8Encoding (see page 6869)	Detects the encoding of a given WideString (see page 3467).
	HasExtendCharacter (see page 6870)	Checks whether the string contains non-ASCII characters.
	HasUTF8BOM (see page 6870)	Detects if a string or a stream contains the UTF-8 byte-order mark.
	HasUTF8BOM (see page 6870)	Detects if a string or a stream contains the UTF-8 byte-order mark.
	inOpArray (see page 6871)	Checks if a WideChar is contained in a given array.
	inOpSet (see page 6871)	Checks if a WideChar is contained in a given set.
	IsUTF8LeadByte (see page 6871)	Checks whether a character is a valid UTF-8 lead byte.
	IsUTF8String (see page 6872)	Detects if a given string is UTF-8 encoded.
	IsUTF8TrailByte (see page 6872)	Checks whether a character is a valid UTF-8 trail byte.
	LoadResWideString (see page 6873)	Loads a WideString (see page 3467) resource.
	LoadWideStr (see page 6873)	Loads a WideString (see page 3467) resource.
	UTF8CharLength (see page 6874)	Returns the number of bytes that follow a lead UTF-8 byte.
	UTF8CharSize (see page 6874)	Returns the number of bytes that follow a lead UTF-8 byte.
	UTF8LowerCase (see page 6875)	Returns the UTF-8 string converted to lower case.
	Utf8ToAnsiEx (see page 6875)	Converts a string encoded in UTF-8 to ANSI with a given code page.
	UTF8UpperCase (see page 6876)	Returns the UTF-8 string converted to uppercase.
	WideAdjustLineBreaks (see page 6876)	Adjusts line break characters in a WideString (see page 3467) to reflect Windows or Linux style.
	WideDequotedStr (see page 6877)	Converts a quoted WideString (see page 3467) into an unquoted WideString (see page 3467).
	WideExtractQuotedStr (see page 6877)	Converts a quoted PWideChar into an unquoted WideString (see page 3467).
	WideLastChar (see page 6878)	Gets last character in a WideString (see page 3467).
	WideQuotedStr (see page 6878)	Returns the quoted version of a WideString (see page 3467).
	WideReplaceStr (see page 6879)	Replaces all occurrences of a substring within a string, using case-sensitive search.
	WideReplaceText (see page 6880)	Replaces all occurrences of a substring in a WideString (see page 3467).
	WideStringReplace (see page 6880)	Replaces occurrences of a substring within a string.
	WStrAlloc (see page 6881)	Allocates a buffer for a PWideChar and returns a pointer to its first character.
	WStrBufSize (see page 6881)	Returns the maximum number of characters that can be stored in a PWideChar allocated by WStrAlloc (see page 6881).
	WStrCat (see page 6882)	Appends a PWideChar to another PWideChar.
	WStrComp (see page 6882)	Compares two PWideChar values with case sensitivity.
	WStrCopy (see page 6883)	Copies a PWideChar to another PWideChar.
	WStrDispose (see page 6883)	Disposes of a PWideChar.
	WStrEnd (see page 6884)	Returns a pointer to the end of a PWideChar.
	WStrLCopy (see page 6884)	Copies up to a specified maximum number of characters from a PWideChar.
	WStrLen (see page 6885)	Returns number of characters in a PWideChar excluding the null terminator.
	WStrMove (see page 6885)	Copies a specified number of characters from a PWideChar to another PWideChar.
	WStrNew (see page 6886)	Allocates space on and copies a PWideChar to the heap, returning a new PWideChar.
	WStrPCopy (see page 6886)	Copies a WideString (see page 3467) to a PWideChar.
	WStrPLCopy (see page 6887)	Copies characters from a WideString (see page 3467) into a PWideChar.

	WStrPos (see page 6887)	Returns a pointer to the first occurrence of a PWideChar in another PWideChar.
	WStrScan (see page 6888)	Returns a pointer to the first occurrence of a specified character in a PWideChar.

71.1.1 WideStrUtils.AnsiToUtf8Ex Function

Converts a string encoded in ANSI to UTF-8 with a given code page.

Pascal

```
function AnsiToUtf8Ex(const S: AnsiString; const cp: integer): UTF8String;
```

C++

```
UTF8String AnsiToUtf8Ex(const AnsiString S, const int cp);
```

File

WideStrUtils

Description

AnsiToUtf8Ex converts the string specified by `S` to UTF-8. The code page used by the input **AnsiString** is specified in the `cp` parameter.

If the specified code page is `CP_UTF8` then a direct assignment is made; otherwise a conversion is performed.

See Also

Utf8ToAnsiEx (see page 6875)

AnsiToUtf8 (see page 3517)

Utf8ToAnsi (see page 3698)

71.1.2 WideStrUtils.ConvertStreamFromAnsiToUTF8 Function

Converts a stream from ANSI to UTF-8 encoding.

Pascal

```
procedure ConvertStreamFromAnsiToUTF8(Src: TStream; Dst: TStream; cp: integer = CP_ACP);
```

C++

```
ConvertStreamFromAnsiToUTF8(TStream Src, TStream Dst, int cp = CP_ACP);
```

File

WideStrUtils

Description

ConvertStreamFromAnsiToUTF8 converts an input stream specified by `Src` to an output stream specified by `Dst`. The function assumes that the input stream contains text encoded in ANSI and converts it to UTF-8. Optionally, the code page of the input ANSI stream is specified.

If the specified code page is `CP_UTF8` then a direct copy is made; otherwise a conversion is performed.

See Also

ConvertStreamFromUTF8ToAnsi (see page 6869)

71.1.3 WideStrUtils.ConvertStreamFromUTF8ToAnsi Function

Converts a stream from UTF-8 to ANSI encoding.

Pascal

```
procedure ConvertStreamFromUTF8ToAnsi(Src: TStream; Dst: TStream; cp: integer = CP_ACP);
```

C++

```
ConvertStreamFromUTF8ToAnsi(TStream Src, TStream Dst, int cp = CP_ACP);
```

File

WideStrUtils

Description

ConvertStreamFromUTF8ToAnsi converts an input stream specified by `Src` to an output stream specified by `Dst`. The function assumes that the input stream contains text encoded in UTF-8 and converts it to ANSI. Optionally, the code page of the output ANSI stream is specified.

If the specified code page is `CP_UTF8` then a direct copy is made; otherwise a conversion is performed.

71.1.4 WideStrUtils.DetectUTF8Encoding Function

Detects the encoding of a given WideString (see page 3467).

Pascal

```
function DetectUTF8Encoding(const s: RawByteString): TEncodeType;
```

C++

```
TEncodeType DetectUTF8Encoding(const RawByteString s);
```

File

WideStrUtils

Description

Call DetectUTF8Encoding to detect if a given WideString (see page 3467) is UTF-8, ASCII, or ANSI encoded.

Note: DetectUTF8Encoding does not guarantee that the detected encoding is correct. DetectUTF8Encoding attempts to identify the encoding by checking the characters present in the string.

See Also

TEncodeType (see page 6889)

HasExtendCharacter (see page 6870)

IsUTF8String (see page 6872)

71.1.5 WideStrUtils.HasExtendCharacter Function

Checks whether the string contains non-ASCII characters.

Pascal

```
function HasExtendCharacter(const s: RawByteString): Boolean;
```

C++

```
Boolean HasExtendCharacter(const RawByteString s);
```

File

WideStrUtils

Description

Call HasExtendCharacter to detect if a given string contains non-ASCII characters. All characters over `128` (`$FF`) are considered to be non-ASCII.

See Also

DetectUTF8Encoding (see page 6869)

HasUTF8BOM (see page 6870)

71.1.6 WideStrUtils.HasUTF8BOM Function

Detects if a string or a stream contains the UTF-8 byte-order mark.

Pascal

```
function HasUTF8BOM(S: TStream): boolean; overload;
function HasUTF8BOM(const S: RawByteString): boolean; overload;
```

C++

```
boolean HasUTF8BOM(TStream S);
boolean HasUTF8BOM(const RawByteString S);
```

File

WideStrUtils

Description

Call HasUTF8BOM to detect if a given string or stream contains the byte-order mark.

See Also

sUTF8BOMString (see page 6891)

DetectUTF8Encoding (see page 6869)

HasExtendCharacter (see page 6870)

71.1.7 WideStrUtils.inOpArray Function

Checks if a WideChar is contained in a given array.

Pascal

```
function inOpArray(W: WideChar; sets: array of WideChar): boolean;
```

C++

```
boolean inOpArray(WideChar W, array of WideChar sets);
```

File

WideStrUtils

Description

Call inOpArray to check whether a WideChar identified by `W` parameter is present in the `sets` array.

See Also

CharSet (see page 6890)

inOpSet (see page 6871)

71.1.8 WideStrUtils.inOpSet Function

Checks if a WideChar is contained in a given set.

Pascal

```
function inOpSet(W: WideChar; sets: CharSet): boolean;
```

C++

```
boolean inOpSet(WideChar W, CharSet sets);
```

File

WideStrUtils

Description

Call inOpSet to check whether a WideChar identified by `W` parameter is present in the set of characters identified by `sets` parameter.

If the ordinal value of `W` is less than 255, the **in** operator is used on the input set; otherwise the function returns false.

See Also

CharSet (see page 6890)

inOpArray (see page 6871)

71.1.9 WideStrUtils.IsUTF8LeadByte Function

Checks whether a character is a valid UTF-8 lead byte.

Pascal

```
function IsUTF8LeadByte(Lead: AnsiChar): Boolean;
```

C++

```
Boolean IsUTF8LeadByte(AnsiChar Lead);
```

File

WideStrUtils

Description

Call IsUTF8LeadByte to check whether a character is a valid UTF-8 lead byte.

All bytes between `0 .. 127 ($7F)` and `194 ($C2) .. 253 ($FD)` are valid UTF-8 lead bytes.

See Also

IsUTF8TrailByte (see page 6872)

HasExtendCharacter (see page 6870)

71.1.10 WideStrUtils.IsUTF8String Function

Detects if a given string is UTF-8 encoded.

Pascal

```
function IsUTF8String(const s: RawByteString): Boolean;
```

C++

```
Boolean IsUTF8String(const RawByteString s);
```

File

WideStrUtils

Description

Call IsUTF8String to detect if a given string is UTF-8 encoded.

Note: IsUTF8String does not guarantee that the string is UTF-8 encoded. IsUTF8String attempts to determine the encoding by checking the characters present in the string.

See Also

DetectUTF8Encoding (see page 6869)

HasExtendCharacter (see page 6870)

71.1.11 WideStrUtils.IsUTF8TrailByte Function

Checks whether a character is a valid UTF-8 trail byte.

Pascal

```
function IsUTF8TrailByte(Lead: AnsiChar): Boolean;
```

C++

```
Boolean IsUTF8TrailByte(AnsiChar Lead);
```

File

WideStrUtils

Description

Call IsUTF8TrailByte to check whether a character is a valid UTF-8 trail byte.

All bytes between `128 ($80) .. 191 ($BF)` are valid UTF-8 trail bytes.

See Also

IsUTF8LeadByte (see page 6871)

HasExtendCharacter (see page 6870)

71.1.12 WideStrUtils.LoadResWideString Function

Loads a WideString (see page 3467) resource.

Pascal

```
function LoadResWideString(ResStringRec: PResStringRec): WideString;
```

C++

```
BSTR LoadResWideString(PResStringRec ResStringRec);
```

File

WideStrUtils

Description

LoadResWideString loads the WideString (see page 3467) resource given by `ResStringRec` from an application module or shared library. If the resource does not exist, LoadResWideString returns an empty string.

Moving display strings into string resources makes an application easier to localize without rewriting the program.

See Also

LoadWideStr (see page 6873)

LoadStr (see page 4224)

LoadResString (see page 3610)

71.1.13 WideStrUtils.LoadWideStr Function

Loads a WideString (see page 3467) resource.

Pascal

```
function LoadWideStr(Ident: Integer): WideString;
```

C++

```
BSTR LoadWideStr(int Ident);
```

File

WideStrUtils

Description

LoadWideStr loads the WideString (see page 3467) resource given by `Ident` from an application module or shared library. If the resource does not exist, LoadWideStr returns an empty string.

Moving display strings into string resources makes an application easier to localize without rewriting the program.

See Also

LoadResWideString (see page 6873)

LoadStr (see page 4224)

LoadResString (see page 3610)

71.1.14 WideStrUtils.UTF8CharLength Function

Returns the number of bytes that follow a lead UTF-8 byte.

Pascal

```
function UTF8CharLength(Lead: AnsiChar): Integer;
```

C++

```
int UTF8CharLength(AnsiChar Lead);
```

File

WideStrUtils

Description

Call UTF8CharLength to determine the number of bytes that follow a lead UTF-8 character (including the lead byte).

In UTF-8, each lead character can be followed by a variable number of other characters. This combination of UTF-8 characters is used to encode a single Unicode character.

Note: UTF8CharLength always returns 1, if the given character is not a valid UTF-8 lead byte.

See Also

IsUTF8LeadByte (see page 6871)

UTF8CharSize (see page 6874)

71.1.15 WideStrUtils.UTF8CharSize Function

Returns the number of bytes that follow a lead UTF-8 byte.

Pascal

```
function UTF8CharSize(Lead: AnsiChar): Integer;
```

C++

```
int UTF8CharSize(AnsiChar Lead);
```

File

WideStrUtils

Description

Call UTF8CharSize to determine the number of bytes that follow a lead UTF-8 character (including the lead byte).

In UTF-8, each lead character can be followed by a variable number of other characters. This combination of UTF-8 characters is used to encode a single Unicode character.

Note: UTF8CharSize always returns 0, if the given character is not a valid UTF-8 lead byte.

See Also

IsUTF8LeadByte (see page 6871)

UTF8CharLength (see page 6874)

71.1.16 WideStrUtils.UTF8LowerCase Function

Returns the UTF-8 string converted to lower case.

Pascal

```
function UTF8LowerCase(const S: UTF8string): UTF8string;
```

C++

```
UTF8string UTF8LowerCase(const UTF8string S);
```

File

WideStrUtils

Description

UTF8LowerCase converts all characters in the given **UTF8String (see page 3804)** to lower case. The conversion is not locale specific.

See Also

UTF8UpperCase (see page 6876)

AnsiLowerCase

LowerCase

WideLowerCase (see page 4316)

71.1.17 WideStrUtils.Utf8ToAnsiEx Function

Converts a string encoded in UTF-8 to ANSI with a given code page.

Pascal

```
function Utf8ToAnsiEx(const S: UTF8String; const cp: integer): AnsiString;
```

C++

```
AnsiString Utf8ToAnsiEx(const UTF8String S, const int cp);
```

File

WideStrUtils

Description

Utf8ToAnsiEx converts the string specified by S to ANSI. The code page of the output string is specified by the `cp` parameter.

If the specified code page is `CP_UTF8` then a direct assignment is made; otherwise a conversion is performed.

See Also

AnsiToUtf8Ex (see page 6868)

AnsiToUtf8 (see page 3517)

Utf8ToAnsi (see page 3698)

71.1.18 WideStrUtils.UTF8UpperCase Function

Returns the UTF-8 string converted to uppercase.

Pascal

```
function UTF8UpperCase(const S: UTF8string): UTF8string;
```

C++

```
UTF8string UTF8UpperCase(const UTF8string S);
```

File

WideStrUtils

Description

UTF8UpperCase converts all characters in the given **UTF8String (see page 3804)** to uppercase. The conversion is not locale specific.

See Also

UTF8LowerCase (see page 6875)

AnsiUpperCase

UpperCase

WideUpperCase (see page 4318)

71.1.19 WideStrUtils.WideAdjustLineBreaks Function

Adjusts line break characters in a WideString (see page 3467) to reflect Windows or Linux style.

Pascal

```
function WideAdjustLineBreaks(const S: WideString; Style: TTextLineBreakStyle = tlbsCRLF):
WideString;
```

C++

```
BSTR WideAdjustLineBreaks(const BSTR S, TTextLineBreakStyle Style = tlbsCRLF);
```

File

WideStrUtils

Description

WideAdjustLineBreaks returns a text string with its line breaks adjusted to fit a specified style.

`S` is the WideString (see page 3467) to convert.

`Style` indicates whether the line breaks should all be Windows-style breaks with a carriage return and line feed (**tlbsCRLF**), or Linux-style breaks with a single line feed character (**tlbsLF**). If `Style` is omitted, the style for the compile target is used.

See Also

TrimLeft (see page 4301)

TrimRight (see page 4302)

71.1.20 WideStrUtils.WideDequotedStr Function

Converts a quoted WideString (see page 3467) into an unquoted WideString (see page 3467).

Pascal

```
function WideDequotedStr(const S: WideString; AQuote: WideChar): WideString;
```

C++

```
BSTR WideDequotedStr(const BSTR S, WideChar AQuote);
```

File

WideStrUtils

Description

WideDequotedStr removes the quotation marks from the beginning and end of a quoted string, and reduces pairs of quotation marks within the string to a single quotation mark. The `AQuote` parameter defines what character to use as a quotation mark. If the `S` parameter does not begin and end with the quotation mark, WideDequotedStr returns `S` unchanged.

See Also

WideQuotedStr (see page 6878)

WideExtractQuotedStr (see page 6877)

71.1.21 WideStrUtils.WideExtractQuotedStr Function

Converts a quoted PWideChar into an unquoted WideString (see page 3467).

Pascal

```
function WideExtractQuotedStr(var Src: PWideChar; Quote: WideChar): WideString;
```

C++

```
BSTR WideExtractQuotedStr(PWideChar Src, WideChar Quote);
```

File

WideStrUtils

Description

WideExtractQuotedStr removes the quotation marks from the beginning and end of a quoted string, and reduces pairs of quotation marks within the string to a single quotation mark. The `Quote` parameter defines what character to use as a quotation mark. If the first character in `Src` is not the value of the `Quote` parameter, WideExtractQuotedStr returns an empty string.

The function copies characters from `Src` to the result string until the second solitary quotation mark or the first null character in `Src`. The `Src` parameter is updated to point to the first character following the quoted string. If `Src` does not contain a matching end quotation mark, the `Src` parameter is updated to point to the terminating null character.

See Also

WideQuotedStr (see page 6878)

71.1.22 WideStrUtils.WideLastChar Function

Gets last character in a WideString (see page 3467).

Pascal

```
function WideLastChar(const S: WideString): PWideChar;
```

C++

```
PWideChar WideLastChar(const BSTR S);
```

File

WideStrUtils

Description

WideLastChar returns a pointer to the last character in the **WideString (see page 3467)**.

See Also

WideCompareStr (see page 4313)

WideCompareText (see page 4313)

71.1.23 WideStrUtils.WideQuotedStr Function

Returns the quoted version of a WideString (see page 3467).

Pascal

```
function WideQuotedStr(const S: WideString; Quote: WideChar): WideString;
```

C++

```
BSTR WideQuotedStr(const BSTR S, WideChar Quote);
```

File

WideStrUtils

Description

Use WideQuotedStr to convert a string (S) to a quoted string, using the provided `Quote` character. A `Quote` character is inserted at the beginning and end of `S`, and each `Quote` character in the string is doubled.

See Also

WideExtractQuotedStr (see page 6877)

71.1.24 WideStrUtils.WideReplaceStr Function

Replaces all occurrences of a substring within a string, using case-sensitive search.

Pascal

```
function WideReplaceStr(const AText: WideString; const AFromText: WideString; const AToText:
WideString): WideString;
```

C++

```
BSTR WideReplaceStr(const BSTR AText, const BSTR AFromText, const BSTR AToText);
```

File

WideStrUtils

Description

Use WideReplaceStr to replace all occurrences of the substring `AFromText` with the string `AToText`, within the string `AText`. WideReplaceStr returns the string obtained after replacement.

Use WideReplaceText (see page 6880) to do a case-insensitive replacement.

Note: Both the parameters and the return value are of type `WideString` (see page 3467). To do the replacement in a `UnicodeString` (see page 3381) context, use the ReplaceStr function. Also, to do the replacement in an `AnsiString` context, use the ReplaceStr function.

Note: Recursive replacement of substrings is not supported. This means that if the substitution of `AToText` results in a new match for `AFromText`, that match is not replaced.

The WideStringReplace (see page 6880) function is a more general replacement routine, giving case-sensitivity options, as well as the option to decide whether to replace all occurrences or the first occurrence of the substring in the string.

See Also

ReplaceStr (see page 3044)

ReplaceStr

WStrPos (see page 6887)

WideReplaceText (see page 6880)

WideStringReplace (see page 6880)

71.1.25 WideStrUtils.WideReplaceText Function

Replaces all occurrences of a substring in a WideString (see page 3467).

Pascal

```
function WideReplaceText(const AText: WideString; const AFromText: WideString; const AToText:
WideString): WideString;
```

C++

```
BSTR WideReplaceText(const BSTR AText, const BSTR AFromText, const BSTR AToText);
```

File

WideStrUtils

Description

WideReplaceText replaces all occurrences of a substring in a **WideString (see page 3467)** with another substring without case sensitivity.

Use WideReplaceStr (see page 6879) to make this replacement with case sensitivity.

Note: Recursion substring replacement is not supported.

See Also

WideReplaceStr (see page 6879)

WideStringReplace (see page 6880)

71.1.26 WideStrUtils.WideStringReplace Function

Replaces occurrences of a substring within a string.

Pascal

```
function WideStringReplace(const S: Widestring; const OldPattern: Widestring; const
NewPattern: Widestring; Flags: TReplaceFlags): Widestring;
```

C++

```
BSTR WideStringReplace(const BSTR S, const BSTR OldPattern, const BSTR NewPattern,
TReplaceFlags Flags);
```

File

WideStrUtils

Description

WideStringReplace replaces occurrences of the substring specified by `OldPattern` with the substring specified by `NewPattern` in the string `S`.

`Flags` is a TReplaceFlags (see page 4343) type parameter. If `rfIgnoreCase` is set, the replacement is case-sensitive; otherwise case is ignored. If `rfReplaceAll` is on, all occurrences of `OldPattern` are replaced; if not, only the first occurrence is replaced.

Note: The parameters `S`, `OldPattern`, `NewPattern`, and the return value are of type `WideString` (see page 3467). To do the replacement in a `UnicodeString` (see page 3381) context, use the StringReplace (see page 4253)

function. Also, to do the replacement in an `AnsiString` context, use the StringReplace (see page 4253) function.

Note: Recursive replacement of substrings is not supported. This means that if the substitution of `OldPattern` results in a new match for `NewPattern`, that match is not replaced.

To replace all occurrences of the substring within the string, you may also use the WideReplaceStr (see page 6879) function to do a case-sensitive search, or WideReplaceText (see page 6880) to do a case-insensitive search.

See Also

TReplaceFlags (see page 4343)

71.1.27 WideStrUtils.WStrAlloc Function

Allocates a buffer for a PWideChar and returns a pointer to its first character.

Pascal

```
function WStrAlloc(Size: Cardinal): PWideChar;
```

C++

```
PWideChar WStrAlloc(unsigned Size);
```

File

WideStrUtils

Description

WStrAlloc allocates a buffer for a PWideChar with a maximum length of `Size - 1` (1 byte must be reserved for the termination character). The result points to the location where the first character of the string is to be stored. A 32-bit number giving the total amount of memory allocated is stored in the four bytes preceding the first character; it is equal to `Size * 2 + 4`. If space for a string is allocated with WStrAlloc, it should be deallocated via WStrDispose (see page 6883).

See Also

WStrDispose (see page 6883)

WStrNew (see page 6886)

WStrBufSize (see page 6881)

71.1.28 WideStrUtils.WStrBufSize Function

Returns the maximum number of characters that can be stored in a PWideChar allocated by WStrAlloc (see page 6881).

Pascal

```
function WStrBufSize(const Str: PWideChar): Cardinal;
```

C++

```
unsigned WStrBufSize(const PWideChar Str);
```

File

WideStrUtils

Description

WStrBufSize returns the number of characters in `Str` (see page 3676), including the byte for the termination character.

Note: If `Str` (see page 3676) does not point to a string buffer allocated by WStrAlloc (see page 6881) or WStrNew (see page 6886), no error message is returned, and the result is unpredictable.

See Also

WStrAlloc (see page 6881)

WStrNew (see page 6886)

71.1.29 WideStrUtils.WStrCat Function

Appends a PWideChar to another PWideChar.

Pascal

```
function WStrCat(Dest: PWideChar; const Source: PWideChar): PWideChar;
```

C++

```
PWideChar WStrCat(PWideChar Dest, const PWideChar Source);
```

File

WideStrUtils

Description

Use WStrCat to concatenate `Source` to the end of `Dest`. WStrCat does not perform any length check. The destination buffer must have room for at least `WStrLen` (see page 6885)`(Dest) + WStrLen` (see page 6885)`(Source) + 1` characters.

See Also

WStrLen (see page 6885)

71.1.30 WideStrUtils.WStrComp Function

Compares two PWideChar values with case sensitivity.

Pascal

```
function WStrComp(const Str1: PWideChar; const Str2: PWideChar): Integer;
```

C++

```
int WStrComp(const PWideChar Str1, const PWideChar Str2);
```

File

WideStrUtils

Description

Call WStrComp to compare two PWideChar strings, with case sensitivity. The return value is indicated in the following table.

Return value	Condition
<0	`Str1` sorts before `Str2`
=0	`Str1` is the same as `Str2`
>0	`Str1` sorts after `Str2`

See Also

WideCompareStr (see page 4313)

WideSameStr (see page 4316)

WideSameText (see page 4316)

71.1.31 WideStrUtils.WStrCopy Function

Copies a PWideChar to another PWideChar.

Pascal

```
function WStrCopy(Dest: PWideChar; const Source: PWideChar): PWideChar;
```

C++

```
PWideChar WStrCopy(PWideChar Dest, const PWideChar Source);
```

File

WideStrUtils

Description

Use WStrCopy to copy `Source` to `Dest`. WStrCopy returns `Dest`.

WStrCopy does not perform any length check. The destination buffer must have room for at least `WStrLen (see page 6885)(Source) + 1` characters.

For length checking, use the WStrLCopy (see page 6884) function.

See Also

WStrLCopy (see page 6884)

WStrPCopy (see page 6886)

WStrPLCopy (see page 6887)

71.1.32 WideStrUtils.WStrDispose Function

Disposes of a PWideChar.

Pascal

```
procedure WStrDispose(Str: PWideChar);
```

C++

```
WStrDispose(PWideChar Str);
```

File

WideStrUtils

Description

WStrDispose is provided for backward compatibility. WStrDispose disposes of a PWideChar that was previously allocated with WStrAlloc (see page 6881) or WStrNew (see page 6886).

If `Str (see page 3676)` is **nil** (Delphi) or **NULL** (C++), WStrDispose does nothing.

See Also

WStrAlloc (see page 6881)

WStrNew (see page 6886)

71.1.33 WideStrUtils.WStrEnd Function

Returns a pointer to the end of a PWideChar.

Pascal

```
function WStrEnd(const Str: PWideChar): PWideChar;
```

C++

```
PWideChar WStrEnd(const PWideChar Str);
```

File

WideStrUtils

Description

WStrEnd returns a pointer to the null character at the end of `Str (see page 3676)`.

See Also

WStrLen (see page 6885)

71.1.34 WideStrUtils.WStrLCopy Function

Copies up to a specified maximum number of characters from a PWideChar.

Pascal

```
function WStrLCopy(Dest: PWideChar; const Source: PWideChar; MaxLen: Cardinal): PWideChar;
```

C++

```
PWideChar WStrLCopy(PWideChar Dest, const PWideChar Source, unsigned MaxLen);
```

File

WideStrUtils

Description

WStrLCopy copies at most `MaxLen` characters from `Source` to `Dest`, then adds a null terminator to `Dest` and returns it. The **SizeOf (see page 3670)** standard function (Delphi) or the **sizeof** operator (C++) can be used to determine the `MaxLen` parameter. Usually, `MaxLen` equals `((SizeOf (see page 3670)(Dest) div 2) - 1`.

Note: WStrLCopy copies a null terminator as well as `MaxLen` characters. Be sure that `Dest` is large enough to accommodate the null terminator at the end.

See Also

SizeOf (see page 3670)

WStrCopy (see page 6883)

WStrLen (see page 6885)

71.1.35 WideStrUtils.WStrLen Function

Returns number of characters in a PWideChar excluding the null terminator.

Pascal

```
function WStrLen(const Str: PWideChar): Cardinal;
```

C++

```
unsigned WStrLen(const PWideChar Str);
```

File

WideStrUtils

Description

WStrLen returns the number of characters in `Str (see page 3676)`, not counting the null terminator.

See Also

WStrEnd (see page 6884)

71.1.36 WideStrUtils.WStrMove Function

Copies a specified number of characters from a PWideChar to another PWideChar.

Pascal

```
function WStrMove(Dest: PWideChar; const Source: PWideChar; Count: Cardinal): PWideChar;
```

C++

```
PWideChar WStrMove(PWideChar Dest, const PWideChar Source, unsigned Count);
```

File

WideStrUtils

Description

WStrMove copies exactly `Count` characters from `Source` to `Dest` and returns `Dest`. `Source` and `Dest` can overlap.

See Also

Move (see page 3617)

71.1.37 WideStrUtils.WStrNew Function

Allocates space on and copies a PWideChar to the heap, returning a new PWideChar.

Pascal

```
function WStrNew(const Str: PWideChar): PWideChar;
```

C++

```
PWideChar WStrNew(const PWideChar Str);
```

File

WideStrUtils

Description

WStrNew allocates a copy of `Str (see page 3676)` on the heap.

If `Str (see page 3676)` is **nil** (Delphi) or **NULL** (C++) or points to an empty string, WStrNew returns a pointer to a new empty PWideChar.

Otherwise, WStrNew makes a duplicate of `Str (see page 3676)`, obtaining space with a call to WStrAlloc (see page 6881), and returns a pointer to the duplicated PWideChar.

The allocated space is the length of `Str (see page 3676) * 2 + 5` bytes.

See Also

GetMem (see page 3584)

WStrDispose (see page 6883)

WStrAlloc (see page 6881)

71.1.38 WideStrUtils.WStrPCopy Function

Copies a WideString (see page 3467) to a PWideChar.

Pascal

```
function WStrPCopy(Dest: PWideChar; const Source: WideString): PWideChar;
```

C++

```
PWideChar WStrPCopy(PWideChar Dest, const BSTR Source);
```

File

WideStrUtils

Description

WStrPCopy copies `Source` into a PWideChar `Dest`. It returns a pointer to `Dest`.

WStrPCopy does not perform any length checking.

The destination buffer must have room for at least `Length (` see page 3607`)(Source) + 1` characters.

See Also

WStrCopy (see page 6883)

71.1.39 WideStrUtils.WStrPLCopy Function

Copies characters from a WideString (see page 3467) into a PWideChar.

Pascal

```
function WStrPLCopy(Dest: PWideChar; const Source: WideString; MaxLen: Cardinal): PWideChar;
```

C++

```
PWideChar WStrPLCopy(PWideChar Dest, const BSTR Source, unsigned MaxLen);
```

File

WideStrUtils

Description

WStrPLCopy copies up to a maximum of `MaxLen` characters from `Source` into the PWideChar `Dest`. WStrPLCopy returns a pointer to `Dest`.

Note: `Dest` should point to a location with room for `MaxLen + 1` characters, including the null terminator.

See Also

WStrPCopy (see page 6886)

WStrLCopy (see page 6884)

71.1.40 WideStrUtils.WStrPos Function

Returns a pointer to the first occurrence of a PWideChar in another PWideChar.

Pascal

```
function WStrPos(const Str1: PWideChar; const Str2: PWideChar): PWideChar;
```

C++

```
PWideChar WStrPos(const PWideChar Str1, const PWideChar Str2);
```

File

WideStrUtils

Description

WStrPos returns a pointer to the first occurrence of `Str2` in `Str1`. If `Str2` does not occur in `Str1`, WStrPos returns **nil** (Delphi) or **NULL** (C++).

See Also

AnsiStrPos (see page 4060)

StrPos (see page 4272)

Pos (see page 3627)

71.1.41 WideStrUtils.WStrScan Function

Returns a pointer to the first occurrence of a specified character in a PWideChar.

Pascal

```
function WStrScan(Str: PWideChar; Chr: WideChar): PWideChar;
```

C++

```
PWideChar WStrScan(PWideChar Str, WideChar Chr);
```

File

WideStrUtils

Description

WStrScan returns a pointer to the first occurrence of `Chr` (see page 3536) in `Str` (see page 3676). If `Chr` (see page 3536) does not occur in `Str` (see page 3676), WStrScan returns **nil** (Delphi) or **NULL** (C++). The null terminator is considered to be part of the string.

See Also

AnsiStrScan (see page 4061)

StrScan (see page 4275)

71.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TEncodeType (see page 6889)	Defines a list of encodings.

71.2.1 WideStrUtils.TEncodeType Enumeration

Defines a list of encodings.

Pascal

```
TEncodeType = (
  etUSASCII,
  etUTF8,
  etANSI
);
```

C++

```
enum TEncodeType {
  etUSASCII,
  etUTF8,
  etANSI
};
```

File

WideStrUtils

Description

TEncodeType defines a list of the most used encodings. There are three encodings defined:

Value	Meaning
etUSASCII	The standard USA ASCII encoding.
etUTF8	The UTF-8 encoding.
etANSI	The standard ANSI encoding.

See Also

DetectUTF8Encoding (see page 6869)

TEncoding (see page 3969)

CharSet (see page 6890)

71.3 Types

The following table lists types in this documentation.

Types

Name	Description
CharSet (see page 6890)	Represents a set of allowed characters.

71.3.1 WideStrUtils.CharSet Type

Represents a set of allowed characters.

Pascal

```
CharSet = set of ansichar;
```

C++

```
ansichar CharSet;
```

File

WideStrUtils

Description

CharSet is used to identify the allowed characters in a character set. Several routines in WideStrUtils (see page 6865) unit require such a parameter.

See Also

TEncoding (see page 3969)

inOpArray (see page 6871)

inOpSet (see page 6871)

71.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
sUTF8BOMString (see page 6891)	Represents the UTF-8 byte-order mark.

71.4.1 WideStrUtils.sUTF8BOMString Constant

Represents the UTF-8 byte-order mark.

Pascal

```
sUTF8BOMString: array[1..3] of AnsiChar = (AnsiChar(#$EF), AnsiChar(#$BB), AnsiChar(#$BF));
```

C++

```
array[1..3] of AnsiChar sUTF8BOMString = (AnsiChar(#$EF), AnsiChar(#$BB), AnsiChar(#$BF));
```

File

WideStrUtils

Description

sUTF8BOMString is a 3 byte array that represents the UTF-8 byte-order mark. The byte-order mark is used to detect if a given text is UTF-8 encoded.

To manually check if a given text is UTF-8 encoded, check whether the first 3 bytes match the ones defined by sUTF8BOMString constant.

See Also

HasUTF8BOM (see page 6870)

IsUTF8String (see page 6872)

72 WinHelpViewer Namespace

This is namespace WinHelpViewer.

Topics

Name	Description
Interfaces (see page 6894)	The following table lists interfaces in this documentation.
Variables (see page 6897)	The following table lists variables in this documentation.

Interfaces

	Name	Description
	IWinHelpTester (see page 6894)	This is class WinHelpViewer.IWinHelpTester.

Variables

Name	Description
ViewerName (see page 6897)	This is variable WinHelpViewer.ViewerName.
WinHelpTester (see page 6897)	This is variable WinHelpViewer.WinHelpTester.

72.1 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IWinHelpTester (see page 6894)	This is class WinHelpViewer.IWinHelpTester.

72.1.1 IWinHelpTester Interface

Class Hierarchy

Pascal

```
IWinHelpTester = interface(IInterface);
```

C++

```
__interface IWinHelpTester : public IInterface;
```

File

WinHelpViewer

Description

This is class WinHelpViewer.IWinHelpTester.

72.1.1.1 IWinHelpTester Members

The following tables list the members exposed by IWinHelpTester.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	CanShowALink (see page 6895)	This is CanShowALink, a member of class IWinHelpTester.
	CanShowContext (see page 6895)	This is CanShowContext, a member of class IWinHelpTester.
	CanShowTopic (see page 6895)	This is CanShowTopic, a member of class IWinHelpTester.
	GetDefaultHelpFile (see page 6895)	This is GetDefaultHelpFile, a member of class IWinHelpTester.
	GetHelpPath (see page 6896)	This is GetHelpPath, a member of class IWinHelpTester.
	GetHelpStrings (see page 6896)	This is GetHelpStrings, a member of class IWinHelpTester.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.

72.1.1.2 IWinHelpTester Methods

The methods of the IWinHelpTester class are listed here.

Public Methods

	Name	Description
	CanShowALink (see page 6895)	This is CanShowALink, a member of class IWinHelpTester.
	CanShowContext (see page 6895)	This is CanShowContext, a member of class IWinHelpTester.
	CanShowTopic (see page 6895)	This is CanShowTopic, a member of class IWinHelpTester.
	GetDefaultHelpFile (see page 6895)	This is GetDefaultHelpFile, a member of class IWinHelpTester.
	GetHelpPath (see page 6896)	This is GetHelpPath, a member of class IWinHelpTester.
	GetHelpStrings (see page 6896)	This is GetHelpStrings, a member of class IWinHelpTester.

72.1.1.2.1 IWinHelpTester.CanShowALink Method

Pascal

```
function CanShowALink(const ALink: String; const FileName: String): Boolean;
```

C++

```
__fastcall Boolean CanShowALink(const UnicodeString ALink, const UnicodeString FileName);
```

Description

This is CanShowALink, a member of class IWinHelpTester.

72.1.1.2.2 IWinHelpTester.CanShowContext Method

Pascal

```
function CanShowContext(const Context: Integer; const FileName: String): Boolean;
```

C++

```
__fastcall Boolean CanShowContext(const int Context, const UnicodeString FileName);
```

Description

This is CanShowContext, a member of class IWinHelpTester.

72.1.1.2.3 IWinHelpTester.CanShowTopic Method

Pascal

```
function CanShowTopic(const Topic: String; const FileName: String): Boolean;
```

C++

```
__fastcall Boolean CanShowTopic(const UnicodeString Topic, const UnicodeString FileName);
```

Description

This is CanShowTopic, a member of class IWinHelpTester.

72.1.1.2.4 IWinHelpTester.GetDefaultHelpFile Method

Pascal

```
[FileIOPermission(SecurityAction.Demand, Unrestricted=True)]
function GetDefaultHelpFile: String;
```

C++

```
[FileIOPermission(SecurityAction.Demand, Unrestricted=True)]
__fastcall UnicodeString GetDefaultHelpFile();
```

Description

This is GetDefaultHelpFile, a member of class IWinHelpTester.

72.1.1.2.5 IWinHelpTester.GetHelpPath Method

Pascal

```
[FileIOPermission(SecurityAction.Demand, Unrestricted=True)]
function GetHelpPath: String;
```

C++

```
[FileIOPermission(SecurityAction.Demand, Unrestricted=True)]
__fastcall UnicodeString GetHelpPath();
```

Description

This is GetHelpPath, a member of class IWinHelpTester.

72.1.1.2.6 IWinHelpTester.GetHelpStrings Method

Pascal

```
function GetHelpStrings(const ALink: String): TStringList;
```

C++

```
__fastcall TStringList GetHelpStrings(const UnicodeString ALink);
```

Description

This is GetHelpStrings, a member of class IWinHelpTester.

72.2 Variables

The following table lists variables in this documentation.

Variables

Name	Description
ViewerName (see page 6897)	This is variable WinHelpViewer.ViewerName.
WinHelpTester (see page 6897)	This is variable WinHelpViewer.WinHelpTester.

72.2.1 WinHelpViewer.ViewerName Variable

Pascal

```
ViewerName: String;
```

C++

```
UnicodeString ViewerName;
```

File

WinHelpViewer

Description

This is variable WinHelpViewer.ViewerName.

72.2.2 WinHelpViewer.WinHelpTester Variable

Pascal

```
WinHelpTester: IWinHelpTester;
```

C++

```
IWinHelpTester WinHelpTester;
```

File

WinHelpViewer

Description

This is variable WinHelpViewer.WinHelpTester.

73 WSDLBind Namespace

This is namespace WSDLBind.

Topics

Name	Description
Classes (see page 6902)	The following table lists classes in this documentation.
Interfaces (see page 7078)	The following table lists interfaces in this documentation.
Functions (see page 7171)	The following table lists functions in this documentation.
Constants (see page 7173)	The following table lists constants in this documentation.

Classes

	Name	Description
	TBinding (see page 6902)	This is class WSDLBind.TBinding.
	TBindingOperation (see page 6909)	This is class WSDLBind.TBindingOperation.
	TBindingOperations (see page 6917)	This is class WSDLBind.TBindingOperations.
	TBindings (see page 6923)	This is class WSDLBind.TBindings.
	TDefinition (see page 6930)	This is class WSDLBind.TDefinition.
	TDocumentation (see page 6938)	This is class WSDLBind.TDocumentation.
	TDocumentationCollection (see page 6939)	This is class WSDLBind.TDocumentationCollection.
	TDocumented (see page 6945)	This is class WSDLBind.TDocumented.
	TFault (see page 6951)	This is class WSDLBind.TFault.
	TFaults (see page 6952)	This is class WSDLBind.TFaults.
	TImport (see page 6958)	This is class WSDLBind.TImport.
	TImports (see page 6965)	This is class WSDLBind.TImports.
	TMessage (see page 6971)	This is class WSDLBind.TMessage.
	TMessages (see page 6978)	This is class WSDLBind.TMessages.
	TOperation (see page 6984)	This is class WSDLBind.TOperation.
	TOperations (see page 6991)	This is class WSDLBind.TOperations.
	TParam (see page 6998)	This is class WSDLBind.TParam.
	TPart (see page 7005)	This is class WSDLBind.TPart.
	TParts (see page 7012)	This is class WSDLBind.TParts.
	TPort (see page 7018)	This is class WSDLBind.TPort.
	TPorts (see page 7025)	This is class WSDLBind.TPorts.
	TPortType (see page 7031)	This is class WSDLBind.TPortType.
	TPortTypes (see page 7038)	This is class WSDLBind.TPortTypes.
	TService (see page 7044)	This is class WSDLBind.TService.

	TServices (see page 7051)	This is class WSDLBind.TServices.
	TTypes (see page 7057)	This is class WSDLBind.TTypes.
	TWSDLDocument (see page 7063)	TWSDLDocument represents a WSDL document.
	TXMLSchemaDefs (see page 7071)	This is class WSDLBind.TXMLSchemaDefs.

Constants

Name	Description
SBinding (see page 7173)	This is constant WSDLBind.SBinding.
SDefinitions (see page 7173)	This is constant WSDLBind.SDefinitions.
SFault (see page 7174)	This is constant WSDLBind.SFault.
SImport (see page 7174)	This is constant WSDLBind.SImport.
SInput (see page 7174)	This is constant WSDLBind.SInput.
SLocation (see page 7175)	This is constant WSDLBind.SLocation.
SMessage (see page 7175)	This is constant WSDLBind.SMessage.
SNamespace (see page 7175)	This is constant WSDLBind.SNamespace.
SOperation (see page 7176)	This is constant WSDLBind.SOperation.
SOutput (see page 7176)	This is constant WSDLBind.SOutput.
SPart (see page 7176)	This is constant WSDLBind.SPart.
SPort (see page 7177)	This is constant WSDLBind.SPort.
SPortType (see page 7177)	This is constant WSDLBind.SPortType.
SService (see page 7177)	This is constant WSDLBind.SService.
SType (see page 7178)	This is constant WSDLBind.SType.
STypes (see page 7178)	This is constant WSDLBind.STypes.

Functions

	Name	Description
	GetDefinition (see page 7171)	This is function WSDLBind.GetDefinition.
	LoadWSDLDoc (see page 7171)	This is function WSDLBind.LoadWSDLDoc.
	NewWSDLDoc (see page 7171)	This is function WSDLBind.NewWSDLDoc.

Interfaces

	Name	Description
	IBinding (see page 7078)	This is class WSDLBind.IBinding.
	IBindingInput (see page 7082)	This is class WSDLBind.IBindingInput.
	IBindingOperation (see page 7083)	This is class WSDLBind.IBindingOperation.
	IBindingOperations (see page 7087)	This is class WSDLBind.IBindingOperations.
	IBindingOutput (see page 7090)	This is class WSDLBind.IBindingOutput.
	IBindings (see page 7091)	This is class WSDLBind.IBindings.
	IDefinition (see page 7094)	This is class WSDLBind.IDefinition.
	IDocumentation (see page 7100)	This is class WSDLBind.IDocumentation.
	IDocumentationCollection (see page 7101)	This is class WSDLBind.IDocumentationCollection.
	IDocumented (see page 7104)	This is class WSDLBind.IDocumented.
	IFault (see page 7106)	This is class WSDLBind.IFault.
	IFaults (see page 7107)	This is class WSDLBind.IFaults.
	IImport (see page 7110)	This is class WSDLBind.IImport.
	IImports (see page 7113)	This is class WSDLBind.IImports.
	IMessage (see page 7116)	This is class WSDLBind.IMessage.
	IMessages (see page 7120)	This is class WSDLBind.IMessages.
	IOperation (see page 7123)	This is class WSDLBind.IOperation.
	IOperations (see page 7127)	This is class WSDLBind.IOperations.
	IParam (see page 7131)	This is class WSDLBind.IParam.
	IPart (see page 7134)	This is class WSDLBind.IPart.
	IParts (see page 7139)	This is class WSDLBind.IParts.
	IPort (see page 7142)	This is class WSDLBind.IPort.
	IPorts (see page 7145)	This is class WSDLBind.IPorts.

	IPortType (see page 7148)	This is class WSDLBind.IPortType.
	IPortTypes (see page 7152)	This is class WSDLBind.IPortTypes.
	IService (see page 7155)	This is class WSDLBind.IService.
	IServices (see page 7158)	This is class WSDLBind.IServices.
	ITypes (see page 7161)	This is class WSDLBind.ITypes.
	IWSDLDocument (see page 7164)	IWSDLDocument provides low-level access to the definitions in a WSDL document.
	IXMLSchemaDefs (see page 7168)	This is class WSDLBind.IXMLSchemaDefs.

73.1 Classes

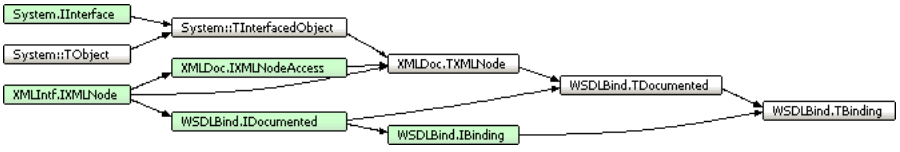
The following table lists classes in this documentation.

Classes

	Name	Description
	TBinding (see page 6902)	This is class WSDLBind.TBinding.
	TBindingOperation (see page 6909)	This is class WSDLBind.TBindingOperation.
	TBindingOperations (see page 6917)	This is class WSDLBind.TBindingOperations.
	TBindings (see page 6923)	This is class WSDLBind.TBindings.
	TDefinition (see page 6930)	This is class WSDLBind.TDefinition.
	TDocumentation (see page 6938)	This is class WSDLBind.TDocumentation.
	TDocumentationCollection (see page 6939)	This is class WSDLBind.TDocumentationCollection.
	TDocumented (see page 6945)	This is class WSDLBind.TDocumented.
	TFault (see page 6951)	This is class WSDLBind.TFault.
	TFaults (see page 6952)	This is class WSDLBind.TFaults.
	TImport (see page 6958)	This is class WSDLBind.TImport.
	TImports (see page 6965)	This is class WSDLBind.TImports.
	TMessage (see page 6971)	This is class WSDLBind.TMessage.
	TMessages (see page 6978)	This is class WSDLBind.TMessages.
	TOperation (see page 6984)	This is class WSDLBind.TOperation.
	TOperations (see page 6991)	This is class WSDLBind.TOperations.
	TParam (see page 6998)	This is class WSDLBind.TParam.
	TPart (see page 7005)	This is class WSDLBind.TPart.
	TParts (see page 7012)	This is class WSDLBind.TParts.
	TPort (see page 7018)	This is class WSDLBind.TPort.
	TPorts (see page 7025)	This is class WSDLBind.TPorts.
	TPortType (see page 7031)	This is class WSDLBind.TPortType.
	TPortTypes (see page 7038)	This is class WSDLBind.TPortTypes.
	TService (see page 7044)	This is class WSDLBind.TService.
	TServices (see page 7051)	This is class WSDLBind.TServices.
	TTypes (see page 7057)	This is class WSDLBind.TTypes.
	TWSDLDocument (see page 7063)	TWSDLDocument represents a WSDL document.
	TXMLSchemaDefs (see page 7071)	This is class WSDLBind.TXMLSchemaDefs.

73.1.1 TBinding Class

Class Hierarchy



Pascal

```
TBinding = class(TDocumented, IBinding);
```

C++

```
class TBinding : public TDocumented, public IBinding;
```

File

WSDLBind

Description

This is class WSDLBind.TBinding.

73.1.1.1 TBinding Members

The following tables list the members exposed by TBinding.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.

	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBindingOperations (see page 6908)	This is GetBindingOperations, a member of class TBinding.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetName (see page 6908)	This is GetName, a member of class TBinding.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetType_ (see page 6909)	This is GetType_, a member of class TBinding.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.

	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetName (see page 6909)	This is SetName, a member of class TBinding.
	SetNodeValue (see page 7435)	Sets the value of this node.
	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	SetType_ (see page 6909)	This is SetType_, a member of class TBinding.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 6908)	Responds after the last constructor executes.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.

	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.

	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	BindingOperations (see page 7082)	This is BindingOperations, a member of class IBinding.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7082)	This is Name, a member of class IBinding.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
	Type_ (see page 7082)	This is Type_, a member of class IBinding.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.1.2 TBinding Methods

The methods of the TBinding class are listed here.

Protected Methods

	Name	Description
	GetBindingOperations (see page 6908)	This is GetBindingOperations, a member of class TBinding.
	GetName (see page 6908)	This is GetName, a member of class TBinding.
	GetType_ (see page 6909)	This is GetType_, a member of class TBinding.
	SetName (see page 6909)	This is SetName, a member of class TBinding.
	SetType_ (see page 6909)	This is SetType_, a member of class TBinding.

Public Methods

	Name	Description
	AfterConstruction (see page 6908)	Responds after the last constructor executes.

73.1.1.2.1 TBinding.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3346)

System::TInterfacedObject::NewInstance (see page 3346)

System::TInterfacedObject::RefCount (see page 3347)

73.1.1.2.2 TBinding.GetBindingOperations Method

Pascal

```
function GetBindingOperations: IBindingOperations;
```

C++

```
__fastcall IBindingOperations GetBindingOperations();
```

Description

This is GetBindingOperations, a member of class TBinding.

73.1.1.2.3 TBinding.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TBinding.

73.1.1.2.4 TBinding.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class TBinding.

73.1.1.2.5 TBinding.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TBinding.

73.1.1.2.6 TBinding.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

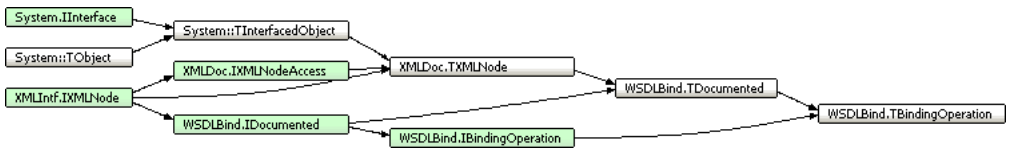
```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class TBinding.

73.1.2 TBindingOperation Class

Class Hierarchy



Pascal

```
TBindingOperation = class(TDocumented, IBindingOperation);
```

C++

```
class TBindingOperation : public TDocumented, public IBindingOperation;
```

File

WSDLBind

Description

This is class WSDLBind.TBindingOperation.

73.1.2.1 TBindingOperation Members

The following tables list the members exposed by TBindingOperation.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.

	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetFaults (see page 6915)	This is GetFaults, a member of class TBindingOperation.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetInput (see page 6916)	This is GetInput, a member of class TBindingOperation.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetName (see page 6916)	This is GetName, a member of class TBindingOperation.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOutput (see page 6916)	This is GetOutput, a member of class TBindingOperation.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.

	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetName (see page 6916)	This is SetName, a member of class TBindingOperation.
	SetNodeValue (see page 7435)	Sets the value of this node.
	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 6915)	Responds after the last constructor executes.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.

	Destroy (see page 3356)	Disposes of an object instance.
	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.

	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	Faults (see page 7086)	This is Faults, a member of class IBindingOperation.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	Input (see page 7086)	This is Input, a member of class IBindingOperation.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7087)	This is Name, a member of class IBindingOperation.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	Output (see page 7087)	This is Output, a member of class IBindingOperation.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.2.2 TBindingOperation Methods

The methods of the TBindingOperation class are listed here.

Protected Methods

	Name	Description
	GetFaults (see page 6915)	This is GetFaults, a member of class TBindingOperation.
	GetInput (see page 6916)	This is GetInput, a member of class TBindingOperation.
	GetName (see page 6916)	This is GetName, a member of class TBindingOperation.
	GetOutput (see page 6916)	This is GetOutput, a member of class TBindingOperation.
	SetName (see page 6916)	This is SetName, a member of class TBindingOperation.

Public Methods

	Name	Description
	AfterConstruction (see page 6915)	Responds after the last constructor executes.

73.1.2.2.1 TBindingOperation.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3346)

System::TInterfacedObject::NewInstance (see page 3346)

System::TInterfacedObject::RefCount (see page 3347)

73.1.2.2.2 TBindingOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class TBindingOperation.

73.1.2.2.3 TBindingOperation.GetInput Method

Pascal

```
function GetInput: IBindingInput;
```

C++

```
__fastcall IBindingInput GetInput();
```

Description

This is GetInput, a member of class TBindingOperation.

73.1.2.2.4 TBindingOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TBindingOperation.

73.1.2.2.5 TBindingOperation.GetOutput Method

Pascal

```
function GetOutput: IBindingOutput;
```

C++

```
__fastcall IBindingOutput GetOutput();
```

Description

This is GetOutput, a member of class TBindingOperation.

73.1.2.2.6 TBindingOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

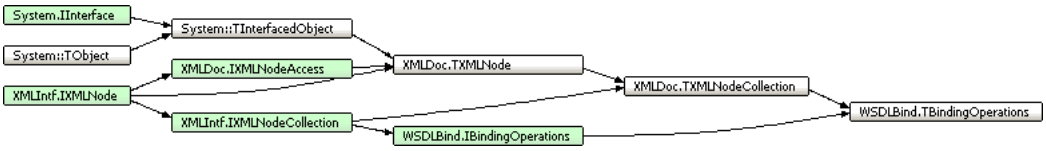
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TBindingOperation.

73.1.3 TBindingOperations Class

Class Hierarchy



Pascal

```
TBindingOperations = class(TXMLNodeCollection, IBindingOperations);
```

C++

```
class TBindingOperations : public TXMLNodeCollection, public IBindingOperations;
```

File

WSDLBind

Description

This is class WSDLBind.TBindingOperations.

73.1.3.1 TBindingOperations Members

The following tables list the members exposed by TBindingOperations.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 6922)	This is Add, a member of class TBindingOperations.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.

	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBindingOperation (see page 6923)	This is GetBindingOperation, a member of class TBindingOperations.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.

	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 6923)	This is Insert, a member of class TBindingOperations.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.

R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.

	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.

	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	BindingOperation (see page 7090)	This is BindingOperation, a member of class IBindingOperations.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.3.2 TBindingOperations Methods

The methods of the TBindingOperations class are listed here.

Protected Methods

	Name	Description
	Add (see page 6922)	This is Add, a member of class TBindingOperations.
	GetBindingOperation (see page 6923)	This is GetBindingOperation, a member of class TBindingOperations.
	Insert (see page 6923)	This is Insert, a member of class TBindingOperations.

73.1.3.2.1 TBindingOperations.Add Method

Pascal

```
function Add(const Name: WideString): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Add(const BSTR Name);
```

Description

This is Add, a member of class TBindingOperations.

73.1.3.2.2 TBindingOperations.GetBindingOperation Method

Pascal

```
function GetBindingOperation(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation GetBindingOperation(int Index);
```

Description

This is GetBindingOperation, a member of class TBindingOperations.

73.1.3.2.3 TBindingOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IBindingOperation;
```

C++

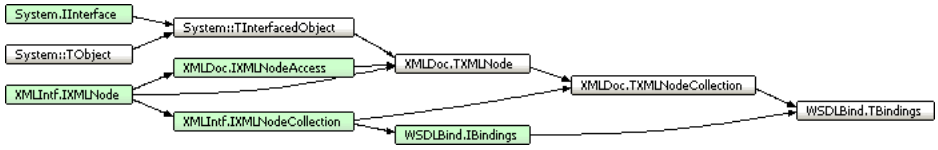
```
__fastcall IBindingOperation Insert(int Index);
```

Description

This is Insert, a member of class TBindingOperations.

73.1.4 TBindings Class

Class Hierarchy



Pascal

```
TBindings = class(TXMLNodeCollection, IBindings);
```

C++

```
class TBindings : public TXMLNodeCollection, public IBindings;
```

File

WSDLBind

Description

This is class WSDLBind.TBindings.

73.1.4.1 TBindings Members

The following tables list the members exposed by TBindings.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 6929)	This is Add, a member of class TBindings.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.

	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBinding (see page 6929)	This is GetBinding, a member of class TBindings.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 6929)	This is Insert, a member of class TBindings.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.

	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
	Count (see page 7457)	Indicates the number of repeating child nodes.
	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.
	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 3345)	Responds after the last constructor executes.
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.

	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.

	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	Binding (see page 7094)	This is Binding, a member of class IBindings.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.

	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.4.2 TBindings Methods

The methods of the TBindings class are listed here.

Protected Methods

	Name	Description
	Add (see page 6929)	This is Add, a member of class TBindings.
	GetBinding (see page 6929)	This is GetBinding, a member of class TBindings.
	Insert (see page 6929)	This is Insert, a member of class TBindings.

73.1.4.2.1 TBindings.Add Method

Pascal

```
function Add(const Name: WideString; const AType: WideString): IBinding;
```

C++

```
__fastcall IBinding Add(const BSTR Name, const BSTR AType);
```

Description

This is Add, a member of class TBindings.

73.1.4.2.2 TBindings.GetBinding Method

Pascal

```
function GetBinding(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding GetBinding(int Index);
```

Description

This is GetBinding, a member of class TBindings.

73.1.4.2.3 TBindings.Insert Method

Pascal

```
function Insert(Index: Integer): IBinding;
```

C++

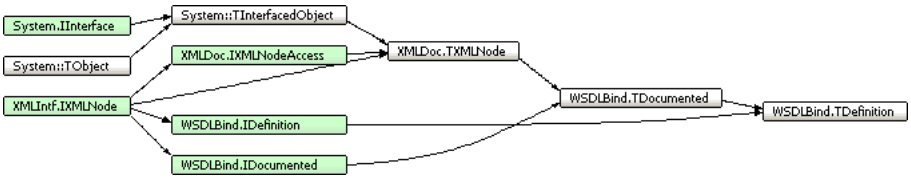
```
__fastcall IBinding Insert(int Index);
```

Description

This is Insert, a member of class TBindings.

73.1.5 TDefinition Class

Class Hierarchy



Pascal

```
TDefinition = class(TDocumented, IDefinition);
```

C++

```
class TDefinition : public TDocumented, public IDefinition;
```

File

WSDLBind

Description

This is class WSDLBind.TDefinition.

73.1.5.1 TDefinition Members

The following tables list the members exposed by TDefinition.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.

	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBindings (see page 6936)	This is GetBindings, a member of class TDefinition.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetImports (see page 6936)	This is GetImports, a member of class TDefinition.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetMessages (see page 6936)	This is GetMessages, a member of class TDefinition.
	GetName (see page 6936)	This is GetName, a member of class TDefinition.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPortTypes (see page 6937)	This is GetPortTypes, a member of class TDefinition.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetServices (see page 6937)	This is GetServices, a member of class TDefinition.
	GetTargetNamespace (see page 6937)	This is GetTargetNamespace, a member of class TDefinition.
	GetText (see page 7426)	Returns the text value of the node.
	GetTypes (see page 6937)	This is GetTypes, a member of class TDefinition.

	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetName (see page 6938)	This is SetName, a member of class TDefinition.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetTargetNamespace (see page 6938)	This is SetTargetNamespace, a member of class TDefinition.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 6935)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.

	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.

	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	Bindings (see page 7099)	This is Bindings, a member of class IDefinition.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.

	Imports (see page 7099)	This is Imports, a member of class IDefinition.
	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Messages (see page 7099)	This is Messages, a member of class IDefinition.
	Name (see page 7099)	This is Name, a member of class IDefinition.
	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7693)	Indicates the node name.
	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
	PortTypes (see page 7099)	This is PortTypes, a member of class IDefinition.
	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Services (see page 7100)	This is Services, a member of class IDefinition.
	TargetNamespace (see page 7100)	This is TargetNamespace, a member of class IDefinition.
	Text (see page 7697)	Represents the Text of the node.
	Types (see page 7100)	This is Types, a member of class IDefinition.
	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.5.2 TDefinition Methods

The methods of the TDefinition class are listed here.

Protected Methods

	Name	Description
	GetBindings (see page 6936)	This is GetBindings, a member of class TDefinition.
	GetImports (see page 6936)	This is GetImports, a member of class TDefinition.
	GetMessages (see page 6936)	This is GetMessages, a member of class TDefinition.
	GetName (see page 6936)	This is GetName, a member of class TDefinition.
	GetPortTypes (see page 6937)	This is GetPortTypes, a member of class TDefinition.
	GetServices (see page 6937)	This is GetServices, a member of class TDefinition.
	GetTargetNamespace (see page 6937)	This is GetTargetNamespace, a member of class TDefinition.
	GetTypes (see page 6937)	This is GetTypes, a member of class TDefinition.
	SetName (see page 6938)	This is SetName, a member of class TDefinition.
	SetTargetNamespace (see page 6938)	This is SetTargetNamespace, a member of class TDefinition.

Public Methods

	Name	Description
	AfterConstruction (see page 6935)	Responds after the last constructor executes.

73.1.5.2.1 TDefinition.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3346)

System::TInterfacedObject::NewInstance (see page 3346)

System::TInterfacedObject::RefCount (see page 3347)

73.1.5.2.2 TDefinition.GetBindings Method

Pascal

```
function GetBindings: IBindings;
```

C++

```
__fastcall IBindings GetBindings();
```

Description

This is GetBindings, a member of class TDefinition.

73.1.5.2.3 TDefinition.GetImports Method

Pascal

```
function GetImports: IImports;
```

C++

```
__fastcall IImports GetImports();
```

Description

This is GetImports, a member of class TDefinition.

73.1.5.2.4 TDefinition.GetMessages Method

Pascal

```
function GetMessages: IMessages;
```

C++

```
__fastcall IMessages GetMessages();
```

Description

This is GetMessages, a member of class TDefinition.

73.1.5.2.5 TDefinition.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TDefinition.

73.1.5.2.6 TDefinition.GetPortTypes Method

Pascal

```
function GetPortTypes: IPortTypes;
```

C++

```
__fastcall IPortTypes GetPortTypes();
```

Description

This is GetPortTypes, a member of class TDefinition.

73.1.5.2.7 TDefinition.GetServices Method

Pascal

```
function GetServices: IServices;
```

C++

```
__fastcall IServices GetServices();
```

Description

This is GetServices, a member of class TDefinition.

73.1.5.2.8 TDefinition.GetTargetNamespace Method

Pascal

```
function GetTargetNamespace: WideString;
```

C++

```
__fastcall BSTR GetTargetNamespace();
```

Description

This is GetTargetNamespace, a member of class TDefinition.

73.1.5.2.9 TDefinition.GetTypes Method

Pascal

```
function GetTypes: ITypes;
```

C++

```
__fastcall ITypes GetTypes();
```

Description

This is GetTypes, a member of class TDefinition.

73.1.5.2.10 TDefinition.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TDefinition.

73.1.5.2.11 TDefinition.SetTargetNamespace Method

Pascal

```
procedure SetTargetNamespace(Value: WideString);
```

C++

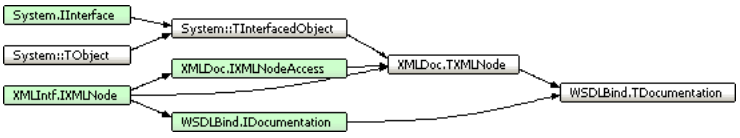
```
__fastcall SetTargetNamespace(BSTR Value);
```

Description

This is SetTargetNamespace, a member of class TDefinition.

73.1.6 TDocumentation Class

Class Hierarchy



Pascal

```
TDocumentation = class(TXMLNode, IDocumentation);
```

C++

```
class TDocumentation : public TXMLNode, public IDocumentation;
```

File

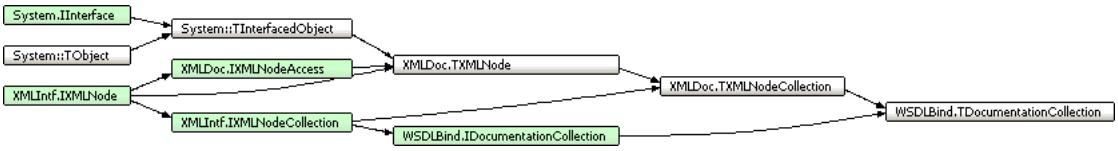
WSDLBind

Description

This is class WSDLBind.TDocumentation.

73.1.7 TDocumentationCollection Class

Class Hierarchy



Pascal

```
TDocumentationCollection = class(TXMLNodeCollection, IDocumentationCollection);
```

C++

```
class TDocumentationCollection : public TXMLNodeCollection, public IDocumentationCollection;
```

File

WSDLBind

Description

This is class WSDLBind.TDocumentationCollection.

73.1.7.1 TDocumentationCollection Members

The following tables list the members exposed by TDocumentationCollection.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 6944)	This is Add, a member of class TDocumentationCollection.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.

	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDocumentation (see page 6945)	This is GetDocumentation, a member of class TDocumentationCollection.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.

	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 6945)	This is Insert, a member of class TDocumentationCollection.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.

R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.

	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.

	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	Documentation (see page 7104)	This is Documentation, a member of class IDocumentationCollection.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.7.2 TDocumentationCollection Methods

The methods of the TDocumentationCollection class are listed here.

Protected Methods

	Name	Description
	Add (see page 6944)	This is Add, a member of class TDocumentationCollection.
	GetDocumentation (see page 6945)	This is GetDocumentation, a member of class TDocumentationCollection.
	Insert (see page 6945)	This is Insert, a member of class TDocumentationCollection.

73.1.7.2.1 TDocumentationCollection.Add Method

Pascal

```
function Add(const Text: WideString): IDocumentation;
```

C++

```
__fastcall IDocumentation Add(const BSTR Text);
```

Description

This is Add, a member of class TDocumentationCollection.

73.1.7.2.2 TDocumentationCollection.GetDocumentation Method

Pascal

```
function GetDocumentation(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation GetDocumentation(int Index);
```

Description

This is GetDocumentation, a member of class TDocumentationCollection.

73.1.7.2.3 TDocumentationCollection.Insert Method

Pascal

```
function Insert(Index: Integer): IDocumentation;
```

C++

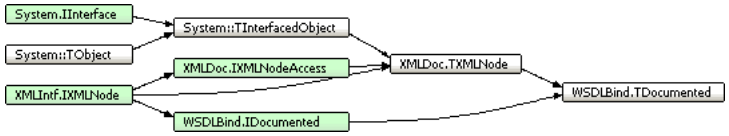
```
__fastcall IDocumentation Insert(int Index);
```

Description

This is Insert, a member of class TDocumentationCollection.

73.1.8 TDocumented Class

Class Hierarchy



Pascal

```
TDocumented = class(TXMLNode, IDocumented);
```

C++

```
class TDocumented : public TXMLNode, public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.TDocumented.

73.1.8.1 TDocumented Members

The following tables list the members exposed by TDocumented.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.

	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.

R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 6950)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.

	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.

	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.8.2 TDocumented Methods

The methods of the TDocumented class are listed here.

Protected Methods

	Name	Description
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.

Public Methods

	Name	Description
V	AfterConstruction (see page 6950)	Responds after the last constructor executes.

73.1.8.2.1 TDocumented.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3346)

System::TInterfacedObject::NewInstance (see page 3346)

System::TInterfacedObject::RefCount (see page 3347)

73.1.8.2.2 TDocumented.GetDocumentationCollection Method

Pascal

```
function GetDocumentationCollection: IDocumentationCollection;
```

C++

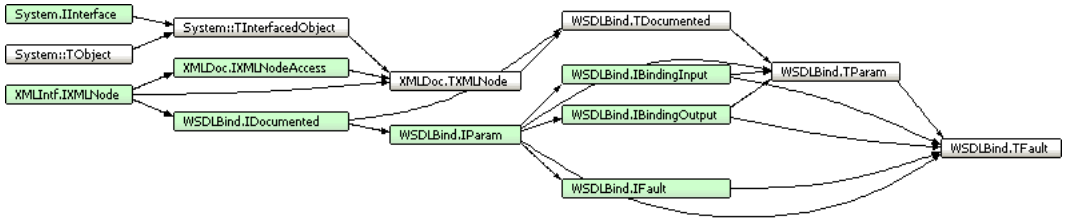
```
__fastcall IDocumentationCollection GetDocumentationCollection();
```

Description

This is GetDocumentationCollection, a member of class TDocumented.

73.1.9 TFault Class

Class Hierarchy



Pascal

```
TFault = class(TParam, IParam, IFault, IBindingInput, IBindingOutput);
```

C++

```
class TFault : public TParam, public IParam, public IFault, public IBindingInput, public
IBindingOutput;
```

File

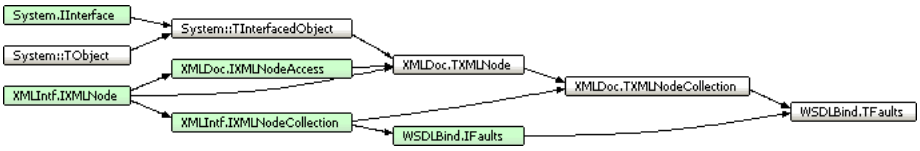
WSDLBind

Description

This is class WSDLBind.TFault.

73.1.10 TFaults Class

Class Hierarchy



Pascal

```
TFaults = class(TXMLNodeCollection, IFaults);
```

C++

```
class TFaults : public TXMLNodeCollection, public IFaults;
```

File

WSDLBind

Description

This is class WSDLBind.TFaults.

73.1.10.1 TFaults Members

The following tables list the members exposed by TFaults.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 6957)	This is Add, a member of class TFaults.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.

	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetFault (see page 6958)	This is GetFault, a member of class TFaults.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.

	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 6958)	This is Insert, a member of class TFaults.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.

R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.

	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.

	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	Fault (see page 7110)	This is Fault, a member of class IFaults.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.10.2 TFaults Methods

The methods of the TFaults class are listed here.

Protected Methods

	Name	Description
	Add (see page 6957)	This is Add, a member of class TFaults.
	GetFault (see page 6958)	This is GetFault, a member of class TFaults.
	Insert (see page 6958)	This is Insert, a member of class TFaults.

73.1.10.2.1 TFaults.Add Method

Pascal

```
function Add(const Name: WideString; const Message: WideString): IFault;
```

C++

```
__fastcall IFault Add(const BSTR Name, const BSTR Message);
```

Description

This is Add, a member of class TFaults.

73.1.10.2.2 TFaults.GetFault Method

Pascal

```
function GetFault(Index: Integer): IFault;
```

C++

```
__fastcall IFault GetFault(int Index);
```

Description

This is GetFault, a member of class TFaults.

73.1.10.2.3 TFaults.Insert Method

Pascal

```
function Insert(Index: Integer): IFault;
```

C++

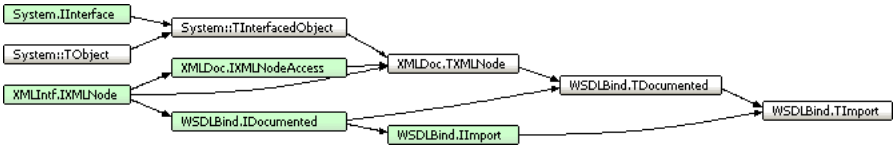
```
__fastcall IFault Insert(int Index);
```

Description

This is Insert, a member of class TFaults.

73.1.11 TImport Class

Class Hierarchy



Pascal

```
TImport = class(TDocumented, IImport);
```

C++

```
class TImport : public TDocumented, public IImport;
```

File

WSDLBind

Description

This is class WSDLBind.TImport.

73.1.11.1 TImport Members

The following tables list the members exposed by TImport.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.

	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetLocation (see page 6964)	This is GetLocation, a member of class TImport.
	GetNamespace (see page 6964)	This is GetNamespace, a member of class TImport.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetLocation (see page 6964)	This is SetLocation, a member of class TImport.
	SetNamespace (see page 6964)	This is SetNamespace, a member of class TImport.
	SetNodeValue (see page 7435)	Sets the value of this node.
	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 3345)	Responds after the last constructor executes.
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	AfterConstruction (see page 6950)	Responds after the last constructor executes.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.

	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.

	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Location (see page 7113)	This is Location, a member of class IImport.
	Namespace (see page 7113)	This is Namespace, a member of class IImport.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.11.2 TImport Methods

The methods of the TImport class are listed here.

Protected Methods

	Name	Description
	GetLocation (see page 6964)	This is GetLocation, a member of class TImport.
	GetNamespace (see page 6964)	This is GetNamespace, a member of class TImport.
	SetLocation (see page 6964)	This is SetLocation, a member of class TImport.
	SetNamespace (see page 6964)	This is SetNamespace, a member of class TImport.

73.1.11.2.1 TImport.GetLocation Method

Pascal

```
function GetLocation: WideString;
```

C++

```
__fastcall BSTR GetLocation();
```

Description

This is GetLocation, a member of class TImport.

73.1.11.2.2 TImport.GetNamespace Method

Pascal

```
function GetNamespace: WideString;
```

C++

```
__fastcall BSTR GetNamespace();
```

Description

This is GetNamespace, a member of class TImport.

73.1.11.2.3 TImport.SetLocation Method

Pascal

```
procedure SetLocation(Value: WideString);
```

C++

```
__fastcall SetLocation(BSTR Value);
```

Description

This is SetLocation, a member of class TImport.

73.1.11.2.4 TImport.SetNamespace Method

Pascal

```
procedure SetNamespace(Value: WideString);
```

C++

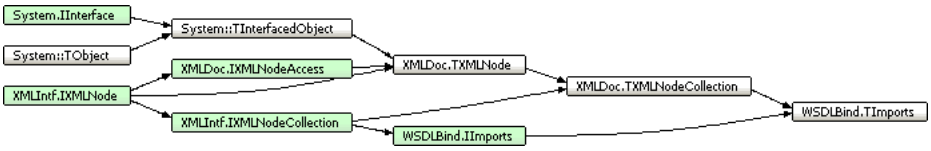
```
__fastcall SetNamespace(BSTR Value);
```

Description

This is SetNamespace, a member of class TImport.

73.1.12 TImports Class

Class Hierarchy



Pascal

```
TImports = class(TXMLNodeCollection, IImports);
```

C++

```
class TImports : public TXMLNodeCollection, public IImports;
```

File

WSDLBind

Description

This is class WSDLBind.TImports.

73.1.12.1 TImports Members

The following tables list the members exposed by TImports.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 6970)	This is Add, a member of class TImports.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.

	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetImport (see page 6971)	This is GetImport, a member of class TImports.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.

	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 6971)	This is Insert, a member of class TImports.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.

R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.

	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.

	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	Import (see page 7116)	This is Import, a member of class IImports.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.12.2 TImports Methods

The methods of the TImports class are listed here.

Protected Methods

	Name	Description
	Add (see page 6970)	This is Add, a member of class TImports.
	GetImport (see page 6971)	This is GetImport, a member of class TImports.
	Insert (see page 6971)	This is Insert, a member of class TImports.

73.1.12.2.1 TImports.Add Method

Pascal

```
function Add(const Namespace: WideString; const Location: WideString): IImport;
```

C++

```
__fastcall IImport Add(const BSTR Namespace, const BSTR Location);
```

Description

This is Add, a member of class TImports.

73.1.12.2.2 TImports.GetImport Method

Pascal

```
function GetImport(Index: Integer): IImport;
```

C++

```
__fastcall IImport GetImport(int Index);
```

Description

This is GetImport, a member of class TImports.

73.1.12.2.3 TImports.Insert Method

Pascal

```
function Insert(Index: Integer): IImport;
```

C++

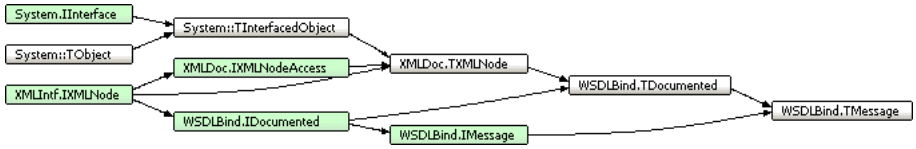
```
__fastcall IImport Insert(int Index);
```

Description

This is Insert, a member of class TImports.

73.1.13 TMessage Class

Class Hierarchy



Pascal

```
TMessage = class(TDocumented, IMessage);
```

C++

```
class TMessage : public TDocumented, public IMessage;
```

File

WSDLBind

Description

This is class WSDLBind.TMessage.

73.1.13.1 TMessage Members

The following tables list the members exposed by TMessage.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.

	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetName (see page 6977)	This is GetName, a member of class TMessage.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetParts (see page 6977)	This is GetParts, a member of class TMessage.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetName (see page 6977)	This is SetName, a member of class TMessage.
	SetNodeValue (see page 7435)	Sets the value of this node.
	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 6977)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.

	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7119)	This is Name, a member of class IMessage.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Parts (see page 7119)	This is Parts, a member of class IMessage.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.13.2 TMessage Methods

The methods of the TMessage class are listed here.

Protected Methods

	Name	Description
	GetName (see page 6977)	This is GetName, a member of class TMessage.
	GetParts (see page 6977)	This is GetParts, a member of class TMessage.
	SetName (see page 6977)	This is SetName, a member of class TMessage.

Public Methods

	Name	Description
V	AfterConstruction (see page 6977)	Responds after the last constructor executes.

73.1.13.2.1 TMessage.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3346)

System::TInterfacedObject::NewInstance (see page 3346)

System::TInterfacedObject::RefCount (see page 3347)

73.1.13.2.2 TMessage.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TMessage.

73.1.13.2.3 TMessage.GetParts Method

Pascal

```
function GetParts: IParts;
```

C++

```
__fastcall IParts GetParts();
```

Description

This is GetParts, a member of class TMessage.

73.1.13.2.4 TMessage.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

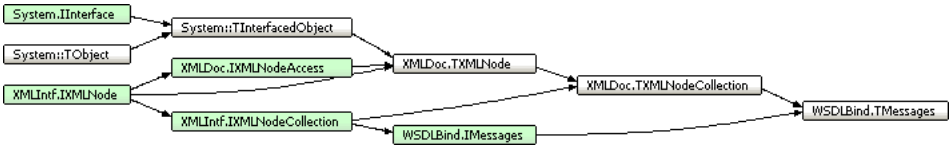
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TMessage.

73.1.14 TMessages Class

Class Hierarchy



Pascal

```
TMessages = class(TXMLNodeCollection, IMessages);
```

C++

```
class TMessages : public TXMLNodeCollection, public IMessages;
```

File

WSDLBind

Description

This is class WSDLBind.TMessages.

73.1.14.1 TMessages Members

The following tables list the members exposed by TMessages.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 6984)	This is Add, a member of class TMessages.

	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 6984)	This is GetMessage, a member of class TMessages.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.

	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 6984)	This is Insert, a member of class TMessages.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.

	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.
R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.

	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	Message (see page 7123)	This is Message, a member of class IMessages.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.14.2 TMessages Methods

The methods of the TMessages class are listed here.

Protected Methods

	Name	Description
	Add (see page 6984)	This is Add, a member of class TMessages.
	GetMessage (see page 6984)	This is GetMessage, a member of class TMessages.
	Insert (see page 6984)	This is Insert, a member of class TMessages.

73.1.14.2.1 TMessages.Add Method

Pascal

```
function Add(const Name: WideString): IMessage;
```

C++

```
__fastcall IMessage Add(const BSTR Name);
```

Description

This is Add, a member of class TMessages.

73.1.14.2.2 TMessages.GetMessage Method

Pascal

```
function GetMessage(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage GetMessage(int Index);
```

Description

This is GetMessage, a member of class TMessages.

73.1.14.2.3 TMessages.Insert Method

Pascal

```
function Insert(Index: Integer): IMessage;
```

C++

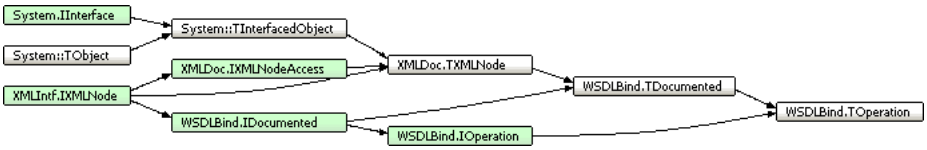
```
__fastcall IMessage Insert(int Index);
```

Description

This is Insert, a member of class TMessages.

73.1.15 TOperation Class

Class Hierarchy



Pascal

```
TOperation = class(TDocumented, IOperation);
```

C++

```
class TOperation : public TDocumented, public IOperation;
```

File

WSDLBind

Description

This is class WSDLBind.TOperation.

73.1.15.1 TOperation Members

The following tables list the members exposed by TOperation.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.

	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetFaults (see page 6990)	This is GetFaults, a member of class TOperation.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetInput (see page 6990)	This is GetInput, a member of class TOperation.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetName (see page 6991)	This is GetName, a member of class TOperation.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOutput (see page 6991)	This is GetOutput, a member of class TOperation.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.

	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetName (see page 6991)	This is SetName, a member of class TOperation.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 6990)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.

	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.

	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	Faults (see page 7126)	This is Faults, a member of class IOperation.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	Input (see page 7126)	This is Input, a member of class IOperation.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7127)	This is Name, a member of class IOperation.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	Output (see page 7127)	This is Output, a member of class IOperation.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.15.2 TOperation Methods

The methods of the TOperation class are listed here.

Protected Methods

	Name	Description
	GetFaults (see page 6990)	This is GetFaults, a member of class TOperation.

	GetInput (see page 6990)	This is GetInput, a member of class TOperation.
	GetName (see page 6991)	This is GetName, a member of class TOperation.
	GetOutput (see page 6991)	This is GetOutput, a member of class TOperation.
	SetName (see page 6991)	This is SetName, a member of class TOperation.

Public Methods

	Name	Description
	AfterConstruction (see page 6990)	Responds after the last constructor executes.

73.1.15.2.1 TOperation.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3346)

System::TInterfacedObject::NewInstance (see page 3346)

System::TInterfacedObject::RefCount (see page 3347)

73.1.15.2.2 TOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class TOperation.

73.1.15.2.3 TOperation.GetInput Method

Pascal

```
function GetInput: IParam;
```

C++

```
__fastcall IParam GetInput();
```

Description

This is GetInput, a member of class TOperation.

73.1.15.2.4 TOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TOperation.

73.1.15.2.5 TOperation.GetOutput Method

Pascal

```
function GetOutput: IParam;
```

C++

```
__fastcall IParam GetOutput();
```

Description

This is GetOutput, a member of class TOperation.

73.1.15.2.6 TOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

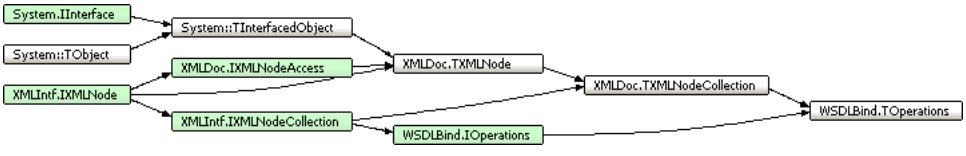
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TOperation.

73.1.16 TOperations Class

Class Hierarchy



Pascal

```
TOperations = class(TXMLNodeCollection, IOperations);
```

C++

```
class TOperations : public TXMLNodeCollection, public IOperations;
```

File

WSDLBind

Description

This is class WSDLBind.TOperations.

73.1.16.1 TOperations Members

The following tables list the members exposed by TOperations.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 6997)	This is the overview for the Add method overload.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.

	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOperation (see page 6998)	This is GetOperation, a member of class TOperations.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 6998)	This is Insert, a member of class TOperations.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.

	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.
R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	Add (see page 7129)	This is the overview for the Add method overload.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.

	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	Destroy (see page 3356)	Disposes of an object instance.
	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.

	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.

	Collection (see page 7690)	Indicates the collection in which this node appears.
	Count (see page 7702)	Indicates the number of repeating child nodes.
	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7693)	Indicates the node name.
	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
	Operation (see page 7130)	This is Operation, a member of class IOperations.
	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.16.2 TOperations Methods

The methods of the TOperations class are listed here.

Protected Methods

	Name	Description
	Add (see page 6997)	This is the overview for the Add method overload.
	GetOperation (see page 6998)	This is GetOperation, a member of class TOperations.
	Insert (see page 6998)	This is Insert, a member of class TOperations.

73.1.16.2.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	TOperations.Add (WideString) (see page 6997)	This is Add, a member of class TOperations.
	TOperations.Add (WideString, WideString, WideString, WideString) (see page 6998)	This is Add, a member of class TOperations.

73.1.16.2.1.1 TOperations.Add Method (WideString)

Pascal

```
function Add(const Name: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name);
```

Description

This is Add, a member of class TOperations.

73.1.16.2.1.2 TOperations.Add Method (WideString, WideString, WideString, WideString)

Pascal

```
function Add(const Name: WideString; const InputMessage: WideString; const InputName:
WideString; const OutputMessage: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name, const BSTR InputMessage, const BSTR InputName,
const BSTR OutputMessage);
```

Description

This is Add, a member of class TOperations.

73.1.16.2.2 TOperations.GetOperation Method

Pascal

```
function GetOperation(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation GetOperation(int Index);
```

Description

This is GetOperation, a member of class TOperations.

73.1.16.2.3 TOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IOperation;
```

C++

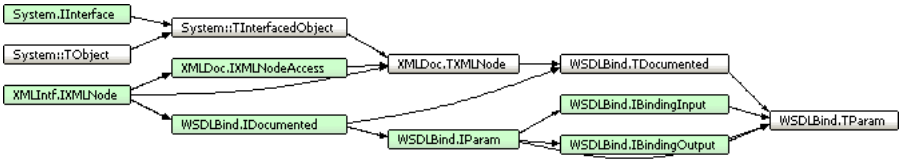
```
__fastcall IOperation Insert(int Index);
```

Description

This is Insert, a member of class TOperations.

73.1.17 TParam Class

Class Hierarchy



Pascal

```
TParam = class(TDocumented, IParam, IBindingInput, IBindingOutput);
```

C++

```
class TParam : public TDocumented, public IParam, public IBindingInput, public IBindingOutput;
```

File

WSDLBind

Description

This is class WSDLBind.TParam.

73.1.17.1 TParam Members

The following tables list the members exposed by TParam.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.

	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 7004)	This is GetMessage, a member of class TParam.
	GetName (see page 7004)	This is GetName, a member of class TParam.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetMessage (see page 7004)	This is SetMessage, a member of class TParam.

	SetName (see page 7004)	This is SetName, a member of class TParam.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 6950)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.

	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Message (see page 7134)	This is Message, a member of class IParam.
	Name (see page 7134)	This is Name, a member of class IParam.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.17.2 TParam Methods

The methods of the TParam class are listed here.

Protected Methods

	Name	Description
	GetMessage (see page 7004)	This is GetMessage, a member of class TParam.
	GetName (see page 7004)	This is GetName, a member of class TParam.

	SetMessage (see page 7004)	This is SetMessage, a member of class TParam.
	SetName (see page 7004)	This is SetName, a member of class TParam.

73.1.17.2.1 TParam.GetMessage Method

Pascal

```
function GetMessage: WideString;
```

C++

```
__fastcall BSTR GetMessage();
```

Description

This is GetMessage, a member of class TParam.

73.1.17.2.2 TParam.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TParam.

73.1.17.2.3 TParam.SetMessage Method

Pascal

```
procedure SetMessage(Value: WideString);
```

C++

```
__fastcall SetMessage(BSTR Value);
```

Description

This is SetMessage, a member of class TParam.

73.1.17.2.4 TParam.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

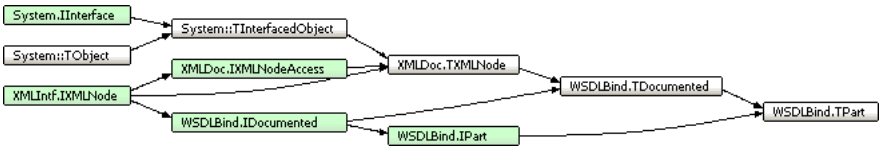
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TParam.

73.1.18 TPart Class

Class Hierarchy



Pascal

```
TPart = class(TDocumented, IPart);
```

C++

```
class TPart : public TDocumented, public IPart;
```

File

WSDLBind

Description

This is class WSDLBind.TPart.

73.1.18.1 TPart Members

The following tables list the members exposed by TPart.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.

	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetElement (see page 7010)	This is GetElement, a member of class TPart.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetName (see page 7010)	This is GetName, a member of class TPart.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetType_ (see page 7011)	This is GetType_, a member of class TPart.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.

	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetElement (see page 7011)	This is SetElement, a member of class TPart.
	SetName (see page 7011)	This is SetName, a member of class TPart.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	SetType_ (see page 7011)	This is SetType_, a member of class TPart.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 6950)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.

	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.

	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
	Element (see page 7138)	This is Element, a member of class IPart.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7138)	This is Name, a member of class IPart.

	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7693)	Indicates the node name.
	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
	Type_ (see page 7138)	This is Type_, a member of class IPart.
	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.18.2 TPart Methods

The methods of the TPart class are listed here.

Protected Methods

	Name	Description
	GetElement (see page 7010)	This is GetElement, a member of class TPart.
	GetName (see page 7010)	This is GetName, a member of class TPart.
	GetType_ (see page 7011)	This is GetType_, a member of class TPart.
	SetElement (see page 7011)	This is SetElement, a member of class TPart.
	SetName (see page 7011)	This is SetName, a member of class TPart.
	SetType_ (see page 7011)	This is SetType_, a member of class TPart.

73.1.18.2.1 TPart.GetElement Method

Pascal

```
function GetElement: WideString;
```

C++

```
__fastcall BSTR GetElement();
```

Description

This is GetElement, a member of class TPart.

73.1.18.2.2 TPart.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TPart.

73.1.18.2.3 TPart.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class TPart.

73.1.18.2.4 TPart.SetElement Method

Pascal

```
procedure SetElement(Value: WideString);
```

C++

```
__fastcall SetElement(BSTR Value);
```

Description

This is SetElement, a member of class TPart.

73.1.18.2.5 TPart.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TPart.

73.1.18.2.6 TPart.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

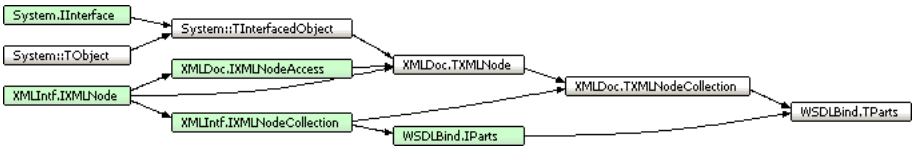
```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class TPart.

73.1.19 TParts Class

Class Hierarchy



Pascal

```
TParts = class(TXMLNodeCollection, IParts);
```

C++

```
class TParts : public TXMLNodeCollection, public IParts;
```

File

WSDLBind

Description

This is class WSDLBind.TParts.

73.1.19.1 TParts Members

The following tables list the members exposed by TParts.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 7017)	This is Add, a member of class TParts.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.

	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPart (see page 7018)	This is GetPart, a member of class TParts.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.

	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 7018)	This is Insert, a member of class TParts.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.

R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.

	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.

	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Part (see page 7142)	This is Part, a member of class IParts.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.19.2 TParts Methods

The methods of the TParts class are listed here.

Protected Methods

	Name	Description
	Add (see page 7017)	This is Add, a member of class TParts.
	GetPart (see page 7018)	This is GetPart, a member of class TParts.
	Insert (see page 7018)	This is Insert, a member of class TParts.

73.1.19.2.1 TParts.Add Method

Pascal

```
function Add(const Name: WideString; const Element: WideString; const AType: WideString = ''):
IPart;
```

C++

```
__fastcall IPart Add(const BSTR Name, const BSTR Element, const BSTR AType = '');
```

Description

This is Add, a member of class TParts.

73.1.19.2.2 TParts.GetPart Method

Pascal

```
function GetPart(Index: Integer): IPart;
```

C++

```
__fastcall IPart GetPart(int Index);
```

Description

This is GetPart, a member of class TParts.

73.1.19.2.3 TParts.Insert Method

Pascal

```
function Insert(Index: Integer): IPart;
```

C++

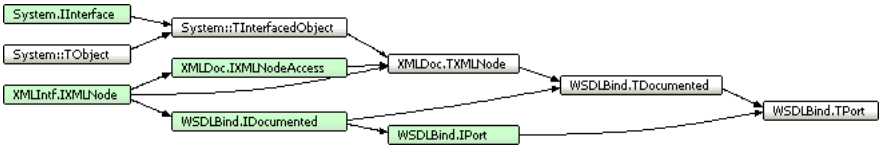
```
__fastcall IPart Insert(int Index);
```

Description

This is Insert, a member of class TParts.

73.1.20 TPort Class

Class Hierarchy



Pascal

```
TPort = class(TDocumented, IPort);
```

C++

```
class TPort : public TDocumented, public IPort;
```

File

WSDLBind

Description

This is class WSDLBind.TPort.

73.1.20.1 TPort Members

The following tables list the members exposed by TPort.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetBinding (see page 7024)	This is GetBinding, a member of class TPort.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.

	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetName (see page 7024)	This is GetName, a member of class TPort.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetBinding (see page 7024)	This is SetBinding, a member of class TPort.
	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetName (see page 7024)	This is SetName, a member of class TPort.
	SetNodeValue (see page 7435)	Sets the value of this node.
	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 3345)	Responds after the last constructor executes.
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	AfterConstruction (see page 6950)	Responds after the last constructor executes.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.

	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.

	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
	Binding (see page 7145)	This is Binding, a member of class IPort.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7145)	This is Name, a member of class IPort.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.20.2 TPort Methods

The methods of the TPort class are listed here.

Protected Methods

	Name	Description
	GetBinding (see page 7024)	This is GetBinding, a member of class TPort.
	GetName (see page 7024)	This is GetName, a member of class TPort.
	SetBinding (see page 7024)	This is SetBinding, a member of class TPort.
	SetName (see page 7024)	This is SetName, a member of class TPort.

73.1.20.2.1 TPort.GetBinding Method

Pascal

```
function GetBinding: WideString;
```

C++

```
__fastcall BSTR GetBinding();
```

Description

This is GetBinding, a member of class TPort.

73.1.20.2.2 TPort.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TPort.

73.1.20.2.3 TPort.SetBinding Method

Pascal

```
procedure SetBinding(Value: WideString);
```

C++

```
__fastcall SetBinding(BSTR Value);
```

Description

This is SetBinding, a member of class TPort.

73.1.20.2.4 TPort.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

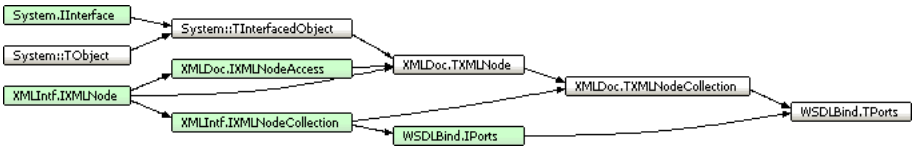
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TPort.

73.1.21 TPorts Class

Class Hierarchy



Pascal

```
TPorts = class(TXMLNodeCollection, IPorts);
```

C++

```
class TPorts : public TXMLNodeCollection, public IPorts;
```

File

WSDLBind

Description

This is class WSDLBind.TPorts.

73.1.21.1 TPorts Members

The following tables list the members exposed by TPorts.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 7030)	This is Add, a member of class TPorts.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.

	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPort (see page 7031)	This is GetPort, a member of class TPorts.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.

	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 7031)	This is Insert, a member of class TPorts.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.

R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.

	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.

	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Port (see page 7148)	This is Port, a member of class IPorts.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.21.2 TPorts Methods

The methods of the TPorts class are listed here.

Protected Methods

	Name	Description
	Add (see page 7030)	This is Add, a member of class TPorts.
	GetPort (see page 7031)	This is GetPort, a member of class TPorts.
	Insert (see page 7031)	This is Insert, a member of class TPorts.

73.1.21.2.1 TPorts.Add Method

Pascal

```
function Add(const Name: WideString; const Binding: WideString): IPort;
```

C++

```
__fastcall IPort Add(const BSTR Name, const BSTR Binding);
```

Description

This is Add, a member of class TPorts.

73.1.21.2.2 TPorts.GetPort Method

Pascal

```
function GetPort(Index: Integer): IPort;
```

C++

```
__fastcall IPort GetPort(int Index);
```

Description

This is GetPort, a member of class TPorts.

73.1.21.2.3 TPorts.Insert Method

Pascal

```
function Insert(Index: Integer): IPort;
```

C++

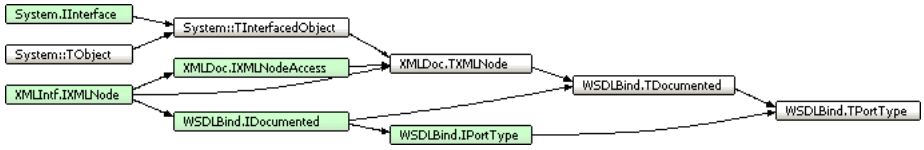
```
__fastcall IPort Insert(int Index);
```

Description

This is Insert, a member of class TPorts.

73.1.22 TPortType Class

Class Hierarchy



Pascal

```
TPortType = class(TDocumented, IPortType);
```

C++

```
class TPortType : public TDocumented, public IPortType;
```

File

WSDLBind

Description

This is class WSDLBind.TPortType.

73.1.22.1 TPortType Members

The following tables list the members exposed by TPortType.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.

	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetName (see page 7037)	This is GetName, a member of class TPortType.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOperations (see page 7037)	This is GetOperations, a member of class TPortType.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetName (see page 7037)	This is SetName, a member of class TPortType.
	SetNodeValue (see page 7435)	Sets the value of this node.
	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7037)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.

	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7151)	This is Name, a member of class IPortType.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	Operations (see page 7151)	This is Operations, a member of class IPortType.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.22.2 TPortType Methods

The methods of the TPortType class are listed here.

Protected Methods

	Name	Description
	GetName (see page 7037)	This is GetName, a member of class TPortType.
	GetOperations (see page 7037)	This is GetOperations, a member of class TPortType.
	SetName (see page 7037)	This is SetName, a member of class TPortType.

Public Methods

	Name	Description
V	AfterConstruction (see page 7037)	Responds after the last constructor executes.

73.1.22.2.1 TPortType.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3346)

System::TInterfacedObject::NewInstance (see page 3346)

System::TInterfacedObject::RefCount (see page 3347)

73.1.22.2.2 TPortType.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TPortType.

73.1.22.2.3 TPortType.GetOperations Method

Pascal

```
function GetOperations: IOperations;
```

C++

```
__fastcall IOperations GetOperations();
```

Description

This is GetOperations, a member of class TPortType.

73.1.22.2.4 TPortType.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

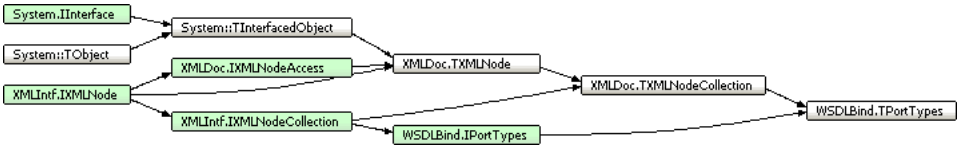
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TPortType.

73.1.23 TPortTypes Class

Class Hierarchy



Pascal

```
TPortTypes = class(TXMLNodeCollection, IPortTypes);
```

C++

```
class TPortTypes : public TXMLNodeCollection, public IPortTypes;
```

File

WSDLBind

Description

This is class WSDLBind.TPortTypes.

73.1.23.1 TPortTypes Members

The following tables list the members exposed by TPortTypes.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 7044)	This is Add, a member of class TPortTypes.

	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.

	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPortType (see page 7044)	This is GetPortType, a member of class TPortTypes.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 7044)	This is Insert, a member of class TPortTypes.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.

	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.
R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.

	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.

	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	PortType (see page 7155)	This is PortType, a member of class IPortTypes.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.23.2 TPortTypes Methods

The methods of the TPortTypes class are listed here.

Protected Methods

	Name	Description
	Add (see page 7044)	This is Add, a member of class TPortTypes.
	GetPortType (see page 7044)	This is GetPortType, a member of class TPortTypes.
	Insert (see page 7044)	This is Insert, a member of class TPortTypes.

73.1.23.2.1 TPortTypes.Add Method

Pascal

```
function Add(const Name: WideString): IPortType; overload;
```

C++

```
__fastcall IPortType Add(const BSTR Name);
```

Description

This is Add, a member of class TPortTypes.

73.1.23.2.2 TPortTypes.GetPortType Method

Pascal

```
function GetPortType(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType GetPortType(int Index);
```

Description

This is GetPortType, a member of class TPortTypes.

73.1.23.2.3 TPortTypes.Insert Method

Pascal

```
function Insert(Index: Integer): IPortType;
```

C++

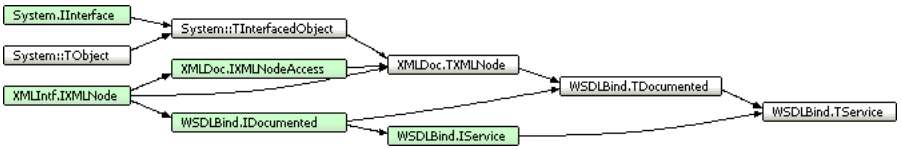
```
__fastcall IPortType Insert(int Index);
```

Description

This is Insert, a member of class TPortTypes.

73.1.24 TService Class

Class Hierarchy



Pascal

```
TService = class(TDocumented, IService);
```

C++

```
class TService : public TDocumented, public IService;
```

File

WSDLBind

Description

This is class WSDLBind.TService.

73.1.24.1 TService Members

The following tables list the members exposed by TService.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.

	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetName (see page 7050)	This is GetName, a member of class TService.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPorts (see page 7050)	This is GetPorts, a member of class TService.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetName (see page 7051)	This is SetName, a member of class TService.

	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7050)	Responds after the last constructor executes.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.

	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.

	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7158)	This is Name, a member of class IService.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Ports (see page 7158)	This is Ports, a member of class IService.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.24.2 TService Methods

The methods of the TService class are listed here.

Protected Methods

	Name	Description
	GetName (see page 7050)	This is GetName, a member of class TService.
	GetPorts (see page 7050)	This is GetPorts, a member of class TService.
	SetName (see page 7051)	This is SetName, a member of class TService.

Public Methods

	Name	Description
	AfterConstruction (see page 7050)	Responds after the last constructor executes.

73.1.24.2.1 TService.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3346)

System::TInterfacedObject::NewInstance (see page 3346)

System::TInterfacedObject::RefCount (see page 3347)

73.1.24.2.2 TService.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class TService.

73.1.24.2.3 TService.GetPorts Method

Pascal

```
function GetPorts: IPorts;
```

C++

```
__fastcall IPorts GetPorts();
```

Description

This is GetPorts, a member of class TService.

73.1.24.2.4 TService.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

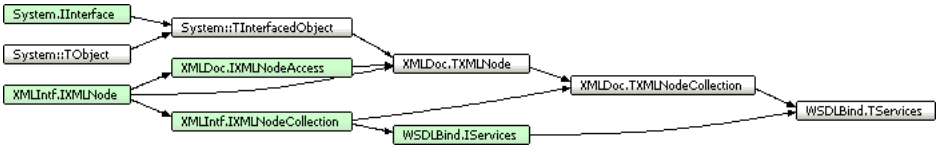
```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class TService.

73.1.25 TServices Class

Class Hierarchy



Pascal

```
TServices = class(TXMLNodeCollection, IServices);
```

C++

```
class TServices : public TXMLNodeCollection, public IServices;
```

File

WSDLBind

Description

This is class WSDLBind.TServices.

73.1.25.1 TServices Members

The following tables list the members exposed by TServices.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 7057)	This is Add, a member of class TServices.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.

	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetService (see page 7057)	This is GetService, a member of class TServices.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	Insert (see page 7057)	This is Insert, a member of class TServices.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
	Count (see page 7457)	Indicates the number of repeating child nodes.
	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.
	List (see page 7459)	Lists the interfaces for the children that are repeated elements.
	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 3345)	Responds after the last constructor executes.
	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	Destroy (see page 3356)	Disposes of an object instance.

	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.

	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
R	Service (see page 7161)	This is Service, a member of class IServices.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.25.2 TServices Methods

The methods of the TServices class are listed here.

Protected Methods

	Name	Description
	Add (see page 7057)	This is Add, a member of class TServices.
	GetService (see page 7057)	This is GetService, a member of class TServices.
	Insert (see page 7057)	This is Insert, a member of class TServices.

73.1.25.2.1 TServices.Add Method

Pascal

```
function Add(const Name: WideString): IService;
```

C++

```
__fastcall IService Add(const BSTR Name);
```

Description

This is Add, a member of class TServices.

73.1.25.2.2 TServices.GetService Method

Pascal

```
function GetService(Index: Integer): IService;
```

C++

```
__fastcall IService GetService(int Index);
```

Description

This is GetService, a member of class TServices.

73.1.25.2.3 TServices.Insert Method

Pascal

```
function Insert(Index: Integer): IService;
```

C++

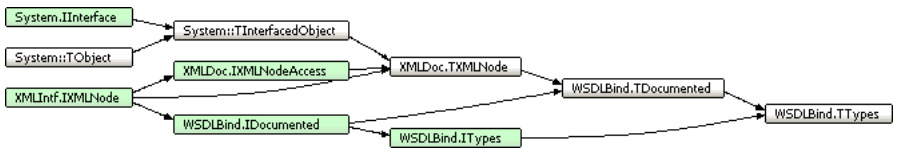
```
__fastcall IService Insert(int Index);
```

Description

This is Insert, a member of class TServices.

73.1.26 TTypes Class

Class Hierarchy



Pascal

```
TTypes = class(TDocumented, ITypes);
```

C++

```
class TTypes : public TDocumented, public ITypes;
```

File

WSDLBind

Description

This is class WSDLBind.TTypes.

73.1.26.1 TTypes Members

The following tables list the members exposed by TTypes.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.
	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.

	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetDocumentationCollection (see page 6951)	This is GetDocumentationCollection, a member of class TDocumented.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetSchemaDefs (see page 7063)	This is GetSchemaDefs, a member of class TTypes.
	GetText (see page 7426)	Returns the text value of the node.
	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.

	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.

Protected Properties

	Name	Description
	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 7063)	Responds after the last constructor executes.
	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Destroy (see page 3356)	Disposes of an object instance.
	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.

	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.

	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
R	SchemaDefs (see page 7163)	This is SchemaDefs, a member of class ITypes.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.26.2 TTypes Methods

The methods of the TTypes class are listed here.

Protected Methods

	Name	Description
	GetSchemaDefs (see page 7063)	This is GetSchemaDefs, a member of class TTypes.

Public Methods

	Name	Description
	AfterConstruction (see page 7063)	Responds after the last constructor executes.

73.1.26.2.1 TTypes.AfterConstruction Method

Responds after the last constructor executes.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

System::TInterfacedObject::AfterConstruction is called automatically after the object's last constructor has executed. Do not call it explicitly in your applications.

When an instance of System::TInterfacedObject is allocated, System::TInterfacedObject::RefCount is incremented to prevent its destruction while processing the constructor. System::TInterfacedObject::AfterConstruction decrements that System::TInterfacedObject::RefCount to re-establish the correct reference count after all constructors have executed.

See Also

System::TInterfacedObject::BeforeDestruction (see page 3346)

System::TInterfacedObject::NewInstance (see page 3346)

System::TInterfacedObject::RefCount (see page 3347)

73.1.26.2.2 TTypes.GetSchemaDefs Method

Pascal

```
function GetSchemaDefs: IXMLSchemaDefs;
```

C++

```
__fastcall IXMLSchemaDefs GetSchemaDefs();
```

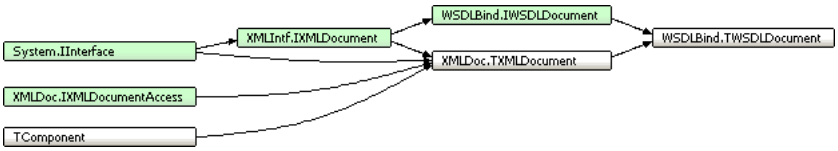
Description

This is GetSchemaDefs, a member of class TTypes.

73.1.27 TWSDLDocument Class

TWSDLDocument represents a WSDL document.

Class Hierarchy



Pascal

```
TWSDLDocument = class(TXMLDocument, IWSDLDocument);
```

C++

```
class TWSDLDocument : public TXMLDocument, public IWSDLDocument;
```

File

WSDLBind

Description

Use TWSDLDocument to represent a WSDL (Web Services Definition (see page 7070) Language) document. A WSDL document is a special form of XML document that describes the contents of a Web Service application and how you call the services it implements.

TWSDLDocument can read an existing WSDL document from a file, it can be associated with an in-memory string that is the contents of a WSDL document, or it can create a new, empty WSDL document. TWSDLDocument uses an external DOM (Document Object Model) parser to analyze the WSDL document. This parser is usually assigned by specifying the DOMVendor property. When you set the Active property to true, TWSDLDocument uses the DOM parser to parse the WSDL document so that you can examine or modify it.

When TWSDLDocument is created without an Owner, it behaves like an interfaced object. That is, when all references to its interface are released, the TWSDLDocument instance is automatically freed. When TWSDLDocument is created with an Owner, however, it behaves like any other component, and is freed by its Owner.

Tip: Although you can work directly with TWSDLDocument to access a WSDL document, it is often easier to use TWSDLItems, a TWSDLDocument descendant. TWSDLItems implements a number of methods for getting at the definitions in a WSDL document.

See Also

TWSDLItems (see page 7211)

TWSDLView (see page 7271)

73.1.27.1 TWSDLDocument Members

The following tables list the members exposed by TWSDLDocument.

Protected Methods

	Name	Description
	_AddRef (see page 7354)	Called when an application uses a component interface.
	_Release (see page 7354)	Called when an application releases a component interface.
	AssignParseOptions (see page 7356)	This is AssignParseOptions, a member of class TXMLDocument.
	CheckActive (see page 7356)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 7356)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 7356)	This is CheckDOM, a member of class TXMLDocument.
V	DefineProperties (see page 7358)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 7359)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 7359)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 7359)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 7360)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 7360)	This is DoNodeChange, a member of class TXMLDocument.
V	GetActive (see page 7360)	Returns the value of the Active property.
	GetAsyncLoadState (see page 7361)	Returns the value of the AsyncLoadState property.

V	GetChildNodeClass (see page 7361)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 7361)	Returns the value of the ChildNodes property.
	GetDefinition (see page 7069)	Returns the value of the Definition property.
	GetDocumentElement (see page 7362)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 7362)	Returns the value of the Node property.
	GetDocumentObject (see page 7363)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 7363)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 7363)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 7363)	Returns the value of the Encoding property.
	GetFileName (see page 7364)	Returns the value of the FileName property.
	GetModified (see page 7364)	Returns the value of the Modified property.
	GetNodeIndentStr (see page 7364)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 7365)	Returns the value of the Options property.
	GetParseOptions (see page 7365)	Returns the value of the ParseOptions property.
	GetPrologNode (see page 7365)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 7366)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 7366)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 7366)	Returns the value of the StandAlone property.
	GetVersion (see page 7366)	Returns the value of the Version property.
	GetXML (see page 7367)	Returns the value of the XML property.
	InternalSetPrologValue (see page 7367)	This is InternalSetPrologValue, a member of class TXMLDocument.
V	LoadData (see page 7069)	This is LoadData, a member of class TWSDLDocument.
V	Loaded (see page 7368)	Initializes the component after the form file has been read into memory.
	ReadDOMVendor (see page 7371)	This is ReadDOMVendor, a member of class TXMLDocument.
	ReleaseDoc (see page 7372)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 7374)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 7375)	Saves the XML (see page 7392) document to an internal string list.
V	SetActive (see page 7375)	Sets the value of the Active property.
	SetDefinition (see page 7070)	Sets the value of the Definition property.
	SetDocumentElement (see page 7375)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 7376)	Sets the value of the DOMDocument property.
	SetEncoding (see page 7376)	Sets the value of the Encoding property.
	SetFileName (see page 7376)	Sets the value of the FileName property.
	SetModified (see page 7377)	This is SetModified, a member of class TXMLDocument.
	SetNodeIndentStr (see page 7377)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 7377)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 7378)	Sets the value of the Options property.
	SetParseOptions (see page 7378)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 7378)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 7378)	Sets the value of the StandAlone property.
	SetVersion (see page 7379)	Sets the value of the Version property.
	SetXML (see page 7379)	Sets the value of the XML property.
	SetXMLStrings (see page 7379)	This is SetXMLStrings, a member of class TXMLDocument.
	WriteDOMVendor (see page 7380)	This is WriteDOMVendor, a member of class TXMLDocument.
	XMLStringsChanging (see page 7380)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
R	DocBindingInfo (see page 7383)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 7383)	This is DocSource, a member of class TXMLDocument.
R	DOMParseOptions (see page 7385)	This is DOMParseOptions, a member of class TXMLDocument.
R	DOMPersist (see page 7386)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 7391)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7354)	This is the overview for the AddChild method overload.
	AddChild (see page 7643)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 7069)	Initializes the TWSDLDocument (see page 7063) object after the last constructor has executed.
	Create (see page 7351)	This is the overview for the Create constructor overload.
	CreateElement (see page 7357)	Creates a new element node that is associated with this document.
	CreateElement (see page 7644)	Creates a new element node that is associated with this document.
	CreateNode (see page 7357)	Creates a new node that is associated with this document.
	CreateNode (see page 7645)	Creates a new node that is associated with this document.
V	Destroy (see page 7352)	Disposes of a TXMLDocument (see page 7347) object.
	GeneratePrefix (see page 7360)	Generates a unique namespace prefix that can be used for a node in the document.
	GeneratePrefix (see page 7646)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 7646)	Returns the value of the Active (see page 7661) property.
	GetAsyncLoadState (see page 7647)	Returns the value of the AsyncLoadState (see page 7662) property.
	GetChildNodes (see page 7647)	Returns the value of the ChildNodes (see page 7663) property.
	GetDocBinding (see page 7362)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 7647)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 7648)	Returns the value of the DocumentElement (see page 7663) property.
	GetDocumentNode (see page 7648)	Returns the value of the Node (see page 7665) property.
	GetDocumentObject (see page 7479)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 7648)	Returns the value of the DOMDocument (see page 7663) property.
	GetDOMPersist (see page 7479)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 7649)	Returns the value of the Encoding (see page 7664) property.
	GetFileName (see page 7649)	Returns the value of the FileName (see page 7664) property.
	GetModified (see page 7649)	Returns the value of the Modified (see page 7665) property.
	GetNodeIndentStr (see page 7650)	Returns the value of the NodeIndentStr (see page 7666) property.
	GetOptions (see page 7650)	Returns the value of the Options (see page 7666) property.
	GetParseOptions (see page 7650)	Returns the value of the ParseOptions (see page 7667) property.
	GetSchemaRef (see page 7650)	Returns the value of the SchemaRef (see page 7667) property.
	GetStandAlone (see page 7651)	Returns the value of the StandAlone (see page 7668) property.
	GetVersion (see page 7651)	Returns the value of the Version (see page 7668) property.
	GetXML (see page 7651)	Returns the value of the XML (see page 7668) property.
	IsEmptyDoc (see page 7367)	Indicates whether the TXMLDocument (see page 7347) instance represents an empty document.
	IsEmptyDoc (see page 7652)	Indicates whether the IXMLDocument (see page 7640) instance represents an empty document.
	LoadFromFile (see page 7368)	Loads an XML (see page 7392) document and activates it.
	LoadFromFile (see page 7652)	Loads an XML (see page 7668) document from disk.
	LoadFromStream (see page 7369)	Loads an XML (see page 7392) document from a stream and activates it.
	LoadFromStream (see page 7653)	Loads an XML (see page 7668) document from a stream and activates it.
	LoadFromXML (see page 7370)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 7653)	This is the overview for the LoadFromXML method overload.
V	NewInstance (see page 7370)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7371)	Updates the parsed XML (see page 7392) document to reflect external changes.
	Refresh (see page 7654)	Updates the parsed XML (see page 7668) document to reflect external changes.

	RegisterDocBinding (see page 7372)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 7654)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7372)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 7655)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7373)	Saves the XML (see page 7392) document to disk.
	SaveToFile (see page 7655)	Saves the XML (see page 7668) document to disk.
	SaveToStream (see page 7373)	Saves the XML (see page 7392) document to a stream.
	SaveToStream (see page 7656)	Saves the XML (see page 7668) document to a stream.
	SaveToXML (see page 7374)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 7656)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7657)	Sets the value of the Active (see page 7661) property.
	SetDocumentElement (see page 7657)	Sets the value of the DocumentElement (see page 7663) property.
	SetDOMDocument (see page 7658)	Sets the value of the DOMDocument (see page 7663) property.
	SetEncoding (see page 7658)	Sets the value of the Encoding (see page 7664) property.
	SetFileName (see page 7658)	Sets the value of the FileName (see page 7664) property.
	SetNodeIndentStr (see page 7659)	Sets the value of the NodeIndentStr (see page 7666) property.
	SetOnAsyncLoad (see page 7659)	Supplies an event handler that responds when the AsyncLoadState (see page 7662) property changes.
	SetOptions (see page 7659)	Sets the value of the Options (see page 7666) property.
	SetParseOptions (see page 7660)	Sets the value of the ParseOptions (see page 7667) property.
	SetStandAlone (see page 7660)	Sets the value of the StandAlone (see page 7668) property.
	SetVersion (see page 7660)	Sets the value of the Version (see page 7668) property.
	SetXML (see page 7661)	Sets the value of the XML (see page 7668) property.

Public Properties

	Name	Description
	Active (see page 7661)	Specifies whether the XML (see page 7668) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 7382)	Indicates the state of the DOM parser when it parses the XML (see page 7392) document asynchronously.
R	AsyncLoadState (see page 7662)	Indicates the state of the DOM parser when it parses the XML (see page 7668) document asynchronously.
R	ChildNodes (see page 7383)	Lists all of the child nodes of the document.
R	ChildNodes (see page 7663)	Lists all of the child nodes of the document.
	Definition (see page 7070)	Provides access to the definitions contained in the WSDL document.
	DocumentElement (see page 7383)	Provides access to the root node of the XML (see page 7392) document.
	DocumentElement (see page 7663)	Provides access to the root node of the XML (see page 7668) document.
R	DocumentObject (see page 7479)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 7384)	Provides access to the DOM interface for the parsed XML (see page 7392) document.
	DOMDocument (see page 7663)	Provides access to the DOM interface for the parsed XML (see page 7668) document.
	DOMImplementation (see page 7385)	Provides access to the DOM interface for document-independent functions.
R	DOMPersist (see page 7480)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 7386)	Indicates the character set that the XML (see page 7392) document uses to encode characters.
	Encoding (see page 7664)	Indicates the character set that the XML (see page 7668) document uses to encode characters.
	FileName (see page 7664)	Indicates the XML (see page 7668) document file, if any, that this interface represents.
R	Modified (see page 7387)	Indicates whether the XML (see page 7392) document has been modified.
R	Modified (see page 7665)	Indicates whether the XML (see page 7668) document has been modified.
R	Node (see page 7388)	Provides access to the document node for the XML (see page 7392) document.
R	Node (see page 7665)	Provides access to the document node for the XML (see page 7668) document.

	NodeIndentStr (see page 7666)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7668) text.
	NSPrefixBase (see page 7389)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 7666)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7667)	Specifies implementation-specific options that are followed when parsing the XML (see page 7668) document.
R	SchemaRef (see page 7391)	Returns the name of the schema associated with this XML (see page 7392) document.
R	SchemaRef (see page 7667)	Returns the name of the schema associated with this XML (see page 7668) document.
	StandAlone (see page 7391)	Indicates whether the XML (see page 7392) document includes any external markup declarations.
	StandAlone (see page 7668)	Indicates whether the XML (see page 7668) document includes any external markup declarations.
	Version (see page 7391)	Indicates the XML (see page 7392) version that the document uses.
	Version (see page 7668)	Indicates the XML (see page 7668) version that the document uses.
	XML (see page 7668)	Specifies the content of the XML document associated with this IXMLDocument (see page 7640) interface.

Published Events

	Name	Description
	AfterClose (see page 7393)	Occurs after the XML (see page 7392) document is closed.
	AfterNodeChange (see page 7393)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 7394)	Occurs immediately after the XML (see page 7392) document is opened.
	BeforeClose (see page 7394)	Occurs immediately before the XML (see page 7392) document is closed.
	BeforeNodeChange (see page 7394)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 7395)	Occurs immediately before the XML (see page 7392) document is opened.
	OnAsyncLoad (see page 7395)	Occurs at various stages during the asynchronous parsing of an XML (see page 7392) document.

Published Properties

	Name	Description
	Active (see page 7381)	Specifies whether the XML (see page 7392) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 7386)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 7392) document.
	FileName (see page 7387)	Specifies the file name for the XML (see page 7392) document associated with this TXMLDocument (see page 7347) object.
	NodeIndentStr (see page 7388)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7392) text.
	Options (see page 7389)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7390)	Specifies implementation-specific options that are followed when parsing the XML (see page 7392) document.
	XML (see page 7392)	Specifies the content of the XML document associated with this TXMLDocument (see page 7347) object.

73.1.27.2 TWSDLDocument Methods

The methods of the TWSDLDocument class are listed here.

Protected Methods

	Name	Description
	GetDefinition (see page 7069)	Returns the value of the Definition property.
V	LoadData (see page 7069)	This is LoadData, a member of class TWSDLDocument.
	SetDefinition (see page 7070)	Sets the value of the Definition property.

Public Methods

	Name	Description
	AfterConstruction (see page 7069)	Initializes the TWSDLDocument (see page 7063) object after the last constructor has executed.

73.1.27.2.1 TWSDLDocument.AfterConstruction Method

Initializes the TWSDLDocument (see page 7063) object after the last constructor has executed.

Pascal

```
procedure AfterConstruction; override;
```

C++

```
virtual __fastcall AfterConstruction();
```

Description

The AfterConstruction method is called automatically after the last constructor has finished executing. TWSDLDocument (see page 7063) overrides this method to register an implementation class for the document element. That class implements the IDefinition (see page 7094) interface that is the value of the Definition (see page 7070) property.

See Also

RegisterDocBinding (see page 7372)

Definition (see page 7070)

73.1.27.2.2 TWSDLDocument.GetDefinition Method

Returns the value of the Definition property.

Pascal

```
function GetDefinition: IDefinition;
```

C++

```
__fastcall IDefinition GetDefinition();
```

Description

GetDefinition is the read access method for the Definition property.

See Also

Definition (see page 7167)

73.1.27.2.3 TWSDLDocument.LoadData Method

Pascal

```
procedure LoadData; override;
```

C++

```
virtual __fastcall LoadData();
```

Description

This is LoadData, a member of class TWSDLDocument.

73.1.27.2.4 TWSDLDocument.SetDefinition Method

Sets the value of the Definition property.

Pascal

```
procedure SetDefinition(const Value: IDefinition);
```

C++

```
__fastcall SetDefinition(const IDefinition Value);
```

Description

SetDefinition is the write method for the Definition property.

See Also

Definition (see page 7167)

73.1.27.3 TWSDLDocument Properties

The properties of the TWSDLDocument class are listed here.

Public Properties

	Name	Description
	Definition (see page 7070)	Provides access to the definitions contained in the WSDL document.

73.1.27.3.1 TWSDLDocument.Definition Property

Provides access to the definitions contained in the WSDL document.

Pascal

```
property Definition: IDefinition;
```

C++

```
__property IDefinition Definition;
```

Description

Definition is the IDefinition (see page 7094) interface of the root node in the WSDL document. This interface is implemented by the node specified by DocumentElement.

You can use the IDefinition (see page 7094) interface to access the Bindings, Messages, PortTypes, Services, and Types (see page 4649) defined in the WSDL document by reading properties of the same names. Alternately, you can use the methods of TWSDLItems (a TWSDLDocument (see page 7063) descendant) to access those definitions.

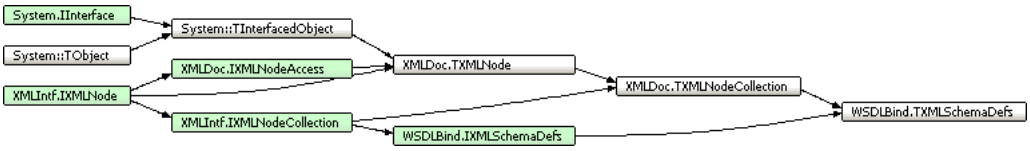
See Also

DocumentElement (see page 7383)

TWSDLItems (see page 7211)

73.1.28 TXMLSchemaDefs Class

Class Hierarchy



Pascal

```
TXMLSchemaDefs = class(TXMLNodeCollection, IXMLSchemaDefs);
```

C++

```
class TXMLSchemaDefs : public TXMLNodeCollection, public IXMLSchemaDefs;
```

File

WSDLBind

Description

This is class WSDLBind.TXMLSchemaDefs.

73.1.28.1 TXMLSchemaDefs Members

The following tables list the members exposed by TXMLSchemaDefs.

Protected Data Members

	Name	Description
	FRefCount (see page 3344)	This is FRefCount, a member of class TInterfacedObject.

Protected Events

	Name	Description
	OnHostAttrNotify (see page 7443)	Occurs when changes occur to the attribute list of this node's HostNode (see page 7441).
	OnHostChildNotify (see page 7444)	Occurs when changes occur to the list of child nodes on this node's HostNode (see page 7441).

Protected Methods

	Name	Description
	_AddRef (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_AddRef method.
	_AddRef (see page 7403)	Increments the reference count for this node.
	_Release (see page 3345)	Implements the IInterface (see page 3502) System::TInterfacedObject::_Release method.
	_Release (see page 7404)	Decrements the reference count for this node.
	Add (see page 7076)	This is Add, a member of class TXMLSchemaDefs.
	AddChild (see page 7404)	This is the overview for the AddChild method overload.
	AddHostedNode (see page 7405)	Adds a node to the HostedNodes (see page 7441) property list.
V	AddItem (see page 7451)	Adds a new repetition of the repeating child element to this node.
	AttributeListNotify (see page 7406)	Responds to notifications of changes in the list of attributes.
	CheckNotHosted (see page 7406)	Raises an EXMLDocError (see page 7639) exception if this is a hosted node.

	CheckReadOnly (see page 7407)	Raises an EXMLDocError (see page 7639) exception if this is a read-only node.
	CheckTextNode (see page 7407)	Generates a DOM text node implementation if it does not yet exist.
V	ChildListNotify (see page 7408)	Responds to notifications of changes in the list of child nodes.
V	ChildListNotify (see page 7452)	Responds to notifications of changes in the list of child nodes.
	Clear (see page 7452)	Removes all child nodes in the List (see page 7459) property from the ChildNodes (see page 7439) and List (see page 7459) properties.
	ClearDocumentRef (see page 7408)	Sets the value of OwnerDocument (see page 7442) to nil (Delphi) or NULL (C++).
	CloneNode (see page 7409)	Creates a copy of this node and returns its interface.
	CreateAttributeList (see page 7409)	Creates the object that implements the AttributeNodes (see page 7438) property.
V	CreateAttributeNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for an attribute of this node.
	CreateChildList (see page 7410)	Creates the object that implements the ChildNodes (see page 7439) property.
V	CreateChildNode (see page 7410)	Creates a new TXMLNode (see page 7396) object for a child node of this node.
	CreateCollection (see page 7411)	Creates an instance of a TXMLNodeCollection (see page 7444) descendant and returns it.
	CreateItemList (see page 7453)	Creates the object that implements the List (see page 7459) property.
	DeclareNamespace (see page 7412)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7453)	Removes one of the repeating child nodes from this node.
	DOMElement (see page 7412)	Returns the IDOMElement (see page 7542) interface for this node if it exists.
V	DoNodeChange (see page 7413)	Generates a BeforeNodeChange or AfterNodeChange event on this node's document.
	FindHostedNode (see page 7413)	Returns the IXMLNode (see page 7669) interface for a hosted node given its implementation class.
	FindNamespaceDecl (see page 7414)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7414)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7415)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7415)	Returns the value of the AttributeNodes (see page 7438) property.
	GetAttributeNS (see page 7416)	Returns the value of a specified attribute when you must explicitly specify the namespace for the attribute.
	GetChildNodeClasses (see page 7416)	Returns a list of the classes that can implement child nodes of this node.
	GetChildNodes (see page 7417)	Returns the value of the ChildNodes (see page 7439) property.
	GetChildValue (see page 7417)	Returns the value of a specified child node.
	GetCollection (see page 7418)	Returns the value of the Collection (see page 7439) property.
	GetCount (see page 7454)	Returns the value of the Count (see page 7457) property.
	GetDOMNode (see page 7418)	Returns the value of the DOMNode (see page 7440) property.
	GetHasChildNodes (see page 7418)	Indicates whether this node has any child nodes.
	GetHostedNodes (see page 7419)	Returns a list an array of the hosted nodes that share this node's attribute and child node lists.
	GetHostNode (see page 7419)	Returns the value of the HostNode (see page 7441) property.
	GetIsTextElement (see page 7419)	Indicates whether the node has a single text value.
V	GetList (see page 7454)	Returns the value of the List (see page 7459) property.
	GetLocalName (see page 7420)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7421)	Returns the URI for the namespace used in the qualified node name.
	GetNode (see page 7454)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7421)	Returns the node name.
	GetNodeObject (see page 7422)	Returns a reference to this TXMLNode (see page 7396) object.
	GetNodeType (see page 7422)	Returns the type of the node.
	GetNodeValue (see page 7423)	Returns the value of this node.
	GetOwnerDocument (see page 7423)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7424)	Returns the interface for the node's parent node.
	GetPrefix (see page 7424)	Returns the namespace prefix of the node's name.
	GetPrefixedName (see page 7425)	Returns a node name includes a namespace prefix for a specified namespace URI.
	GetReadOnly (see page 7425)	Indicates whether the node can be modified.
	GetText (see page 7426)	Returns the text value of the node.

	GetXML (see page 7426)	Returns the XML that corresponds to the subtree rooted at this node.
	GetXMLSchemaDef (see page 7077)	This is GetXMLSchemaDef, a member of class TXMLSchemaDefs.
	HasAttribute (see page 7426)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7427)	This is the overview for the HasChildNode method overload.
	InsertInCollection (see page 7455)	Copies a child node from the ChildNodes (see page 7439) property to the List (see page 7459) property.
	InternalAddChild (see page 7428)	Provides the underlying implementation for the AddChild (see page 7404) method.
	IsCollectionItem (see page 7455)	Indicates whether a specified node represents the type of node that appears as a repeating child of this node.
	NestingLevel (see page 7428)	Returns the number of parents for this node in the node hierarchy.
	NextSibling (see page 7429)	Returns the next child of this node's parent.
	Normalize (see page 7429)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7430)	Returns the previous child of this node's parent.
	QueryInterface (see page 3347)	Implements the IInterface (see page 3502) System::TInterfacedObject::QueryInterface method.
	RegisterChildNode (see page 7430)	Registers a descendant of TXMLNode (see page 7396) that can represent the children of this node.
	RegisterChildNodes (see page 7431)	Registers a set of TXMLNode (see page 7396) descendants that can represent the children of this node.
	Remove (see page 7456)	Removes one of the repeating child nodes from this node.
	RemoveHostedNode (see page 7431)	Removes a node from the HostedNodes (see page 7441) property list.
	Resync (see page 7432)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7432)	Sets the value of one of this node's attributes.
V	SetAttributeNodes (see page 7432)	Sets the value of the AttributeNodes (see page 7438) property.
	SetAttributeNS (see page 7433)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
V	SetChildNodes (see page 7433)	Sets the value of the ChildNodes (see page 7439) property.
V	SetChildNodes (see page 7456)	Sets the value of the ChildNodes (see page 7439) property.
	SetChildValue (see page 7434)	Sets the value of a specified child node.
	SetCollection (see page 7434)	Sets the value of the Collection (see page 7439) property.
	SetNodeValue (see page 7435)	Sets the value of this node.
V	SetParentNode (see page 7435)	Sets the value of the ParentNode (see page 7443) property.
	SetReadOnly (see page 7436)	Specifies whether the node can be modified.
	SetText (see page 7436)	Sets the text value of the node.
	TransformNode (see page 7437)	This is the overview for the TransformNode method overload.
	UpdateCollectionList (see page 7457)	Updates the List (see page 7459) property to reflect changes to the set of child nodes.

Protected Properties

	Name	Description
R	AttributeNodes (see page 7438)	Lists the interfaces for nodes that represent attributes of this node.
R	ChildNodeClasses (see page 7438)	Lists the classes that the XML Data Binding wizard defines to represent child nodes of this node.
	ChildNodes (see page 7439)	Lists the child nodes of this node.
	Collection (see page 7439)	Indicates the collection in which this node appears.
R	Count (see page 7457)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7440)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HostedNodes (see page 7441)	Lists the nodes that share this node's lists of child and attribute nodes.
	HostNode (see page 7441)	Indicates the main object for the node to which this node corresponds when it represents a specialized view.
	ItemInterface (see page 7458)	Indicates the interface type for the repeating child nodes.
	ItemNS (see page 7458)	Indicates the default namespace URI for the tag names of repeating child elements.
	ItemTag (see page 7459)	Indicates the tag name that occurs on the repeating child elements.
R	List (see page 7459)	Lists the interfaces for the children that are repeated elements.

R	OwnerDocument (see page 7442)	Provides access to the document that contains this node.
R	ParentNode (see page 7443)	Identifies the object that represents this node's parent node.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7482)	This is AddChild, a member of class IXMLNodeAccess.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
V	AfterConstruction (see page 3345)	Responds after the last constructor executes.
V	AfterConstruction (see page 3357)	Responds after the last constructor has executed.
V	AfterConstruction (see page 7451)	Initializes the node collection object once it is fully created.
V	BeforeDestruction (see page 3346)	Checks that the reference count is zero before allowing the interfaced object to be destroyed.
V	BeforeDestruction (see page 3358)	Responds before the first destructor executes.
	CheckTextNode (see page 7483)	This is CheckTextNode, a member of class IXMLNodeAccess.
	ClassInfo (see page 3358)	Returns a pointer to the runtime type information (RTTI) table for the object type.
	ClassName (see page 3359)	Returns a string indicating the type of the object instance (as opposed to the type of the variable passed as an argument).
	ClassNameIs (see page 3361)	Determines whether an object is of a specific type.
	ClassParent (see page 3361)	Returns the type of the immediate ancestor of a class.
	ClassType (see page 3364)	Returns the class reference for the object's class.
	CleanupInstance (see page 3367)	Performs finalization on long strings, variants, and interface variables within a class.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	ClearDocumentRef (see page 7483)	This is ClearDocumentRef, a member of class IXMLNodeAccess.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	Create (see page 3355)	Constructs an object and initializes its data before the object is first used.
	Create (see page 7400)	Instantiates a Create object.
	CreateAttributeNode (see page 7483)	This is CreateAttributeNode, a member of class IXMLNodeAccess.
	CreateChildNode (see page 7483)	This is CreateChildNode, a member of class IXMLNodeAccess.
	CreateCollection (see page 7483)	This is CreateCollection, a member of class IXMLNodeAccess.
	CreateHosted (see page 7401)	Creates a TXMLNode (see page 7396) instance that represents the same DOM node as another "host" node.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
V	DefaultHandler (see page 3367)	Provides the interface for a method that processes message records.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
V	Destroy (see page 3356)	Disposes of an object instance.
V	Destroy (see page 7401)	Frees the memory associated with the TXMLNode (see page 7396) object.
V	Dispatch (see page 3369)	Calls message-handling methods for the object, based on the contents of the Message parameter.
	DOMElement (see page 7484)	This is DOMElement, a member of class IXMLNodeAccess.
V	Equals (see page 3371)	Checks if the current instance and the parameter are equal.
	FieldAddress (see page 3371)	This is the overview for the FieldAddress method overload.
	FindHostedNode (see page 7484)	This is FindHostedNode, a member of class IXMLNodeAccess.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	Free (see page 3372)	Destroys an object and frees its associated memory, if necessary.
V	FreeInstance (see page 3374)	Deallocates memory allocated by a previous call to the System::TObject::NewInstance (see page 3379) method.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodeClasses (see page 7484)	This is GetChildNodeClasses, a member of class IXMLNodeAccess.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.

	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
V	GetHashCode (see page 3375)	Returns an integer containing the hash code.
	GetHostNode (see page 7484)	This is GetHostNode, a member of class IXMLNodeAccess.
	GetInterface (see page 3375)	Retrieves a specified interface.
	GetInterfaceEntry (see page 3376)	Returns the entry for a specific interface implemented in a class.
	GetInterfaceTable (see page 3376)	Returns a pointer to a structure containing all of the interfaces implemented by a given class.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeObject (see page 7485)	This is GetNodeObject, a member of class IXMLNodeAccess.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	HasChildNode (see page 7485)	This is the overview for the HasChildNode method overload.
	InheritsFrom (see page 3376)	Determines the relationship of two object types.
	InitInstance (see page 3377)	Initializes a newly allocated object instance to all zeros and initializes the instance's virtual method table pointer.
	InstanceSize (see page 3377)	Returns the size in bytes of each instance of the object type.
	InternalAddChild (see page 7485)	This is InternalAddChild, a member of class IXMLNodeAccess.
	MethodAddress (see page 3378)	This is the overview for the MethodAddress method overload.
	MethodName (see page 3379)	Returns the name of a class method by address.
	NestingLevel (see page 7486)	This is NestingLevel, a member of class IXMLNodeAccess.
V	NewInstance (see page 3346)	Allocates memory for each instance of an interfaced object.
V	NewInstance (see page 3379)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	RegisterChildNode (see page 7486)	This is RegisterChildNode, a member of class IXMLNodeAccess.
	RegisterChildNodes (see page 7486)	This is RegisterChildNodes, a member of class IXMLNodeAccess.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
V	SafeCallException (see page 3380)	Handles exceptions in methods declared using the safecall calling convention.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetCollection (see page 7486)	This is SetCollection, a member of class IXMLNodeAccess.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetParentNode (see page 7487)	This is SetParentNode, a member of class IXMLNodeAccess.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.

	SetText (see page 7686)	Sets the text value of the node.
V	ToString (see page 3380)	Returns a string containing the class name.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.
	UnitName (see page 3380)	Returns a string containing the unit name.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodeClasses (see page 7487)	This is ChildNodeClasses, a member of class IXMLNodeAccess.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	HostNode (see page 7487)	This is HostNode, a member of class IXMLNodeAccess.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	RefCount (see page 3347)	Indicates the number of interface pointers currently dependent upon the object.
R	SchemaDef (see page 7170)	This is SchemaDef, a member of class IXMLSchemaDefs.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.1.28.2 TXMLSchemaDefs Methods

The methods of the TXMLSchemaDefs class are listed here.

Protected Methods

	Name	Description
	Add (see page 7076)	This is Add, a member of class TXMLSchemaDefs.
	GetXMLSchemaDef (see page 7077)	This is GetXMLSchemaDef, a member of class TXMLSchemaDefs.

73.1.28.2.1 TXMLSchemaDefs.Add Method

Pascal

```
function Add(const NamespaceURI: WideString = ''; const TargetNamespace: WideString = ''):
IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef Add(const BSTR NamespaceURI = '', const BSTR TargetNamespace = '');
```

Description

This is Add, a member of class TXMLSchemaDefs.

73.1.28.2.2 TXMLSchemaDefs.GetXMLSchemaDef Method

Pascal

```
function GetXMLSchemaDef(Index: Integer): IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef GetXMLSchemaDef(int Index);
```

Description

This is GetXMLSchemaDef, a member of class TXMLSchemaDefs.

73.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IBinding (see page 7078)	This is class WSDLBind.IBinding.
	IBindingInput (see page 7082)	This is class WSDLBind.IBindingInput.
	IBindingOperation (see page 7083)	This is class WSDLBind.IBindingOperation.
	IBindingOperations (see page 7087)	This is class WSDLBind.IBindingOperations.
	IBindingOutput (see page 7090)	This is class WSDLBind.IBindingOutput.
	IBindings (see page 7091)	This is class WSDLBind.IBindings.
	IDefinition (see page 7094)	This is class WSDLBind.IDefinition.
	IDocumentation (see page 7100)	This is class WSDLBind.IDocumentation.
	IDocumentationCollection (see page 7101)	This is class WSDLBind.IDocumentationCollection.
	IDocumented (see page 7104)	This is class WSDLBind.IDocumented.
	IFault (see page 7106)	This is class WSDLBind.IFault.
	IFaults (see page 7107)	This is class WSDLBind.IFaults.
	IImport (see page 7110)	This is class WSDLBind.IImport.
	IImports (see page 7113)	This is class WSDLBind.IImports.
	IMessage (see page 7116)	This is class WSDLBind.IMessage.
	IMessages (see page 7120)	This is class WSDLBind.IMessages.
	IOperation (see page 7123)	This is class WSDLBind.IOperation.
	IOperations (see page 7127)	This is class WSDLBind.IOperations.
	IParam (see page 7131)	This is class WSDLBind.IParam.
	IPart (see page 7134)	This is class WSDLBind.IPart.
	IParts (see page 7139)	This is class WSDLBind.IParts.
	IPort (see page 7142)	This is class WSDLBind.IPort.
	IPorts (see page 7145)	This is class WSDLBind.IPorts.
	IPortType (see page 7148)	This is class WSDLBind.IPortType.
	IPortTypes (see page 7152)	This is class WSDLBind.IPortTypes.
	IService (see page 7155)	This is class WSDLBind.IService.
	IServices (see page 7158)	This is class WSDLBind.IServices.
	ITypes (see page 7161)	This is class WSDLBind.ITypes.
	IWSDLDocument (see page 7164)	IWSDLDocument provides low-level access to the definitions in a WSDL document.
	IXMLSchemaDefs (see page 7168)	This is class WSDLBind.IXMLSchemaDefs.

73.2.1 IBinding Interface

Class Hierarchy

Pascal

```
IBinding = interface(IDocumented);
```

C++

```
__interface IBinding : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IBinding.

73.2.1.1 IBinding Members

The following tables list the members exposed by IBinding.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetBindingOperations (see page 7080)	This is GetBindingOperations, a member of class IBinding.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetName (see page 7081)	This is GetName, a member of class IBinding.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetType_ (see page 7081)	This is GetType_, a member of class IBinding.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetName (see page 7081)	This is SetName, a member of class IBinding.

	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	SetType_ (see page 7081)	This is SetType_, a member of class IBinding.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	BindingOperations (see page 7082)	This is BindingOperations, a member of class IBinding.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7082)	This is Name, a member of class IBinding.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
	Type_ (see page 7082)	This is Type_, a member of class IBinding.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.1.2 IBinding Methods

The methods of the IBinding class are listed here.

Public Methods

	Name	Description
	GetBindingOperations (see page 7080)	This is GetBindingOperations, a member of class IBinding.
	GetName (see page 7081)	This is GetName, a member of class IBinding.
	GetType_ (see page 7081)	This is GetType_, a member of class IBinding.
	SetName (see page 7081)	This is SetName, a member of class IBinding.
	SetType_ (see page 7081)	This is SetType_, a member of class IBinding.

73.2.1.2.1 IBinding.GetBindingOperations Method

Pascal

```
function GetBindingOperations: IBindingOperations;
```

C++

```
__fastcall IBindingOperations GetBindingOperations();
```

Description

This is GetBindingOperations, a member of class IBinding.

73.2.1.2.2 IBinding.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IBinding.

73.2.1.2.3 IBinding.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class IBinding.

73.2.1.2.4 IBinding.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IBinding.

73.2.1.2.5 IBinding.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class IBinding.

73.2.1.3 IBinding Properties

The properties of the IBinding class are listed here.

Public Properties

	Name	Description
	BindingOperations (see page 7082)	This is BindingOperations, a member of class IBinding.
	Name (see page 7082)	This is Name, a member of class IBinding.
	Type_ (see page 7082)	This is Type_, a member of class IBinding.

73.2.1.3.1 IBinding.BindingOperations Property

Pascal

```
property BindingOperations: IBindingOperations;
```

C++

```
__property IBindingOperations BindingOperations;
```

Description

This is BindingOperations, a member of class IBinding.

73.2.1.3.2 IBinding.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IBinding.

73.2.1.3.3 IBinding.Type_ Property

Pascal

```
property Type_: WideString;
```

C++

```
__property BSTR Type_;
```

Description

This is Type_, a member of class IBinding.

73.2.2 IBindingInput Interface

Class Hierarchy

Pascal

```
IBindingInput = interface(IParam);
```

C++

```
__interface IBindingInput : public IParam;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingInput.

73.2.3 IBindingOperation Interface

Class Hierarchy

Pascal

```
IBindingOperation = interface(IDocumented);
```

C++

```
__interface IBindingOperation : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingOperation.

73.2.3.1 IBindingOperation Members

The following tables list the members exposed by IBindingOperation.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetFaults (see page 7085)	This is GetFaults, a member of class IBindingOperation.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetInput (see page 7085)	This is GetInput, a member of class IBindingOperation.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetName (see page 7085)	This is GetName, a member of class IBindingOperation.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.

	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOutput (see page 7085)	This is GetOutput, a member of class IBindingOperation.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetName (see page 7086)	This is SetName, a member of class IBindingOperation.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	Faults (see page 7086)	This is Faults, a member of class IBindingOperation.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	Input (see page 7086)	This is Input, a member of class IBindingOperation.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7087)	This is Name, a member of class IBindingOperation.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	Output (see page 7087)	This is Output, a member of class IBindingOperation.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.3.2 IBindingOperation Methods

The methods of the IBindingOperation class are listed here.

Public Methods

	Name	Description
	GetFaults (see page 7085)	This is GetFaults, a member of class IBindingOperation.
	GetInput (see page 7085)	This is GetInput, a member of class IBindingOperation.
	GetName (see page 7085)	This is GetName, a member of class IBindingOperation.
	GetOutput (see page 7085)	This is GetOutput, a member of class IBindingOperation.
	SetName (see page 7086)	This is SetName, a member of class IBindingOperation.

73.2.3.2.1 IBindingOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class IBindingOperation.

73.2.3.2.2 IBindingOperation.GetInput Method

Pascal

```
function GetInput: IBindingInput;
```

C++

```
__fastcall IBindingInput GetInput();
```

Description

This is GetInput, a member of class IBindingOperation.

73.2.3.2.3 IBindingOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IBindingOperation.

73.2.3.2.4 IBindingOperation.GetOutput Method

Pascal

```
function GetOutput: IBindingOutput;
```

C++

```
__fastcall IBindingOutput GetOutput();
```

Description

This is GetOutput, a member of class IBindingOperation.

73.2.3.2.5 IBindingOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IBindingOperation.

73.2.3.3 IBindingOperation Properties

The properties of the IBindingOperation class are listed here.

Public Properties

	Name	Description
	Faults (see page 7086)	This is Faults, a member of class IBindingOperation.
	Input (see page 7086)	This is Input, a member of class IBindingOperation.
	Name (see page 7087)	This is Name, a member of class IBindingOperation.
	Output (see page 7087)	This is Output, a member of class IBindingOperation.

73.2.3.3.1 IBindingOperation.Faults Property

Pascal

```
property Faults: IFaults;
```

C++

```
__property IFaults Faults;
```

Description

This is Faults, a member of class IBindingOperation.

73.2.3.3.2 IBindingOperation.Input Property

Pascal

```
property Input: IBindingInput;
```

C++

```
__property IBindingInput Input;
```

Description

This is Input, a member of class IBindingOperation.

73.2.3.3.3 IBindingOperation.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IBindingOperation.

73.2.3.3.4 IBindingOperation.Output Property

Pascal

```
property Output: IBindingOutput;
```

C++

```
__property IBindingOutput Output;
```

Description

This is Output, a member of class IBindingOperation.

73.2.4 IBindingOperations Interface

Class Hierarchy

Pascal

```
IBindingOperations = interface(IXMLNodeCollection);
```

C++

```
__interface IBindingOperations : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingOperations.

73.2.4.1 IBindingOperations Members

The following tables list the members exposed by IBindingOperations.

Public Methods

	Name	Description
	Add (see page 7089)	This is Add, a member of class IBindingOperations.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.

	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetBindingOperation (see page 7089)	This is GetBindingOperation, a member of class IBindingOperations.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7090)	This is Insert, a member of class IBindingOperations.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	BindingOperation (see page 7090)	This is BindingOperation, a member of class IBindingOperations.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.

R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.4.2 IBindingOperations Methods

The methods of the IBindingOperations class are listed here.

Public Methods

	Name	Description
	Add (see page 7089)	This is Add, a member of class IBindingOperations.
	GetBindingOperation (see page 7089)	This is GetBindingOperation, a member of class IBindingOperations.
	Insert (see page 7090)	This is Insert, a member of class IBindingOperations.

73.2.4.2.1 IBindingOperations.Add Method

Pascal

```
function Add(const Name: WideString): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Add(const BSTR Name);
```

Description

This is Add, a member of class IBindingOperations.

73.2.4.2.2 IBindingOperations.GetBindingOperation Method

Pascal

```
function GetBindingOperation(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation GetBindingOperation(int Index);
```

Description

This is GetBindingOperation, a member of class IBindingOperations.

73.2.4.2.3 IBindingOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation Insert(int Index);
```

Description

This is Insert, a member of class IBindingOperations.

73.2.4.3 IBindingOperations Properties

The properties of the IBindingOperations class are listed here.

Public Properties

	Name	Description
	BindingOperation (see page 7090)	This is BindingOperation, a member of class IBindingOperations.

73.2.4.3.1 IBindingOperations.BindingOperation Property

Pascal

```
property BindingOperation [Index: Integer]: IBindingOperation;
```

C++

```
__property IBindingOperation BindingOperation[int Index];
```

Description

This is BindingOperation, a member of class IBindingOperations.

73.2.5 IBindingOutput Interface

Class Hierarchy

Pascal

```
IBindingOutput = interface(IParam);
```

C++

```
__interface IBindingOutput : public IParam;
```

File

WSDLBind

Description

This is class WSDLBind.IBindingOutput.

73.2.6 IBindings Interface

Class Hierarchy

Pascal

```
IBindings = interface(IXMLNodeCollection);
```

C++

```
__interface IBindings : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IBindings.

73.2.6.1 IBindings Members

The following tables list the members exposed by IBindings.

Public Methods

	Name	Description
	Add (see page 7093)	This is Add, a member of class IBindings.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetBinding (see page 7093)	This is GetBinding, a member of class IBindings.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.

	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7093)	This is Insert, a member of class IBindings.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	Binding (see page 7094)	This is Binding, a member of class IBindings.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.6.2 IBindings Methods

The methods of the IBindings class are listed here.

Public Methods

	Name	Description
	Add (see page 7093)	This is Add, a member of class IBindings.
	GetBinding (see page 7093)	This is GetBinding, a member of class IBindings.
	Insert (see page 7093)	This is Insert, a member of class IBindings.

73.2.6.2.1 IBindings.Add Method

Pascal

```
function Add(const Name: WideString; const AType: WideString): IBinding;
```

C++

```
__fastcall IBinding Add(const BSTR Name, const BSTR AType);
```

Description

This is Add, a member of class IBindings.

73.2.6.2.2 IBindings.GetBinding Method

Pascal

```
function GetBinding(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding GetBinding(int Index);
```

Description

This is GetBinding, a member of class IBindings.

73.2.6.2.3 IBindings.Insert Method

Pascal

```
function Insert(Index: Integer): IBinding;
```

C++

```
__fastcall IBinding Insert(int Index);
```

Description

This is Insert, a member of class IBindings.

73.2.6.3 IBindings Properties

The properties of the IBindings class are listed here.

Public Properties

	Name	Description
	Binding (see page 7094)	This is Binding, a member of class IBindings.

73.2.6.3.1 IBindings.Binding Property

Pascal

```
property Binding [Index: Integer]: IBinding;
```

C++

```
__property IBinding Binding[int Index];
```

Description

This is Binding, a member of class IBindings.

73.2.7 IDefinition Interface

Class Hierarchy

Pascal

```
IDefinition = interface(IXMLNode);
```

C++

```
__interface IDefinition : public IXMLNode;
```

File

WSDLBind

Description

This is class WSDLBind.IDefinition.

73.2.7.1 IDefinition Members

The following tables list the members exposed by IDefinition.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetBindings (see page 7096)	This is GetBindings, a member of class IDefinition.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetImports (see page 7096)	This is GetImports, a member of class IDefinition.

	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetMessages (see page 7097)	This is GetMessages, a member of class IDefinition.
	GetName (see page 7097)	This is GetName, a member of class IDefinition.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPortTypes (see page 7097)	This is GetPortTypes, a member of class IDefinition.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetServices (see page 7097)	This is GetServices, a member of class IDefinition.
	GetTargetNamespace (see page 7097)	This is GetTargetNamespace, a member of class IDefinition.
	GetText (see page 7681)	Returns the text value of the node.
	GetTypes (see page 7098)	This is GetTypes, a member of class IDefinition.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetName (see page 7098)	This is SetName, a member of class IDefinition.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetTargetNamespace (see page 7098)	This is SetTargetNamespace, a member of class IDefinition.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	Bindings (see page 7099)	This is Bindings, a member of class IDefinition.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	Imports (see page 7099)	This is Imports, a member of class IDefinition.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	Messages (see page 7099)	This is Messages, a member of class IDefinition.
	Name (see page 7099)	This is Name, a member of class IDefinition.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.

R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	PortTypes (see page 7099)	This is PortTypes, a member of class IDefinition.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	Services (see page 7100)	This is Services, a member of class IDefinition.
	TargetNamespace (see page 7100)	This is TargetNamespace, a member of class IDefinition.
	Text (see page 7697)	Represents the Text of the node.
R	Types (see page 7100)	This is Types, a member of class IDefinition.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.7.2 IDefinition Methods

The methods of the IDefinition class are listed here.

Public Methods

	Name	Description
	GetBindings (see page 7096)	This is GetBindings, a member of class IDefinition.
	GetImports (see page 7096)	This is GetImports, a member of class IDefinition.
	GetMessages (see page 7097)	This is GetMessages, a member of class IDefinition.
	GetName (see page 7097)	This is GetName, a member of class IDefinition.
	GetPortTypes (see page 7097)	This is GetPortTypes, a member of class IDefinition.
	GetServices (see page 7097)	This is GetServices, a member of class IDefinition.
	GetTargetNamespace (see page 7097)	This is GetTargetNamespace, a member of class IDefinition.
	GetTypes (see page 7098)	This is GetTypes, a member of class IDefinition.
	SetName (see page 7098)	This is SetName, a member of class IDefinition.
	SetTargetNamespace (see page 7098)	This is SetTargetNamespace, a member of class IDefinition.

73.2.7.2.1 IDefinition.GetBindings Method

Pascal

```
function GetBindings: IBindings;
```

C++

```
__fastcall IBindings GetBindings();
```

Description

This is GetBindings, a member of class IDefinition.

73.2.7.2.2 IDefinition.GetImports Method

Pascal

```
function GetImports: IImports;
```

C++

```
__fastcall IImports GetImports();
```

Description

This is GetImports, a member of class IDefinition.

73.2.7.2.3 IDefinition.GetMessages Method

Pascal

```
function GetMessages: IMessages;
```

C++

```
__fastcall IMessages GetMessages();
```

Description

This is GetMessages, a member of class IDefinition.

73.2.7.2.4 IDefinition.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IDefinition.

73.2.7.2.5 IDefinition.GetPortTypes Method

Pascal

```
function GetPortTypes: IPortTypes;
```

C++

```
__fastcall IPortTypes GetPortTypes();
```

Description

This is GetPortTypes, a member of class IDefinition.

73.2.7.2.6 IDefinition.GetServices Method

Pascal

```
function GetServices: IServices;
```

C++

```
__fastcall IServices GetServices();
```

Description

This is GetServices, a member of class IDefinition.

73.2.7.2.7 IDefinition.GetTargetNamespace Method

Pascal

```
function GetTargetNamespace: WideString;
```

C++

```
__fastcall BSTR GetTargetNamespace();
```

Description

This is GetTargetNamespace, a member of class IDefinition.

73.2.7.2.8 IDefinition.GetTypes Method

Pascal

```
function GetTypes: ITypes;
```

C++

```
__fastcall ITypes GetTypes();
```

Description

This is GetTypes, a member of class IDefinition.

73.2.7.2.9 IDefinition.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IDefinition.

73.2.7.2.10 IDefinition.SetTargetNamespace Method

Pascal

```
procedure SetTargetNamespace(Value: WideString);
```

C++

```
__fastcall SetTargetNamespace(BSTR Value);
```

Description

This is SetTargetNamespace, a member of class IDefinition.

73.2.7.3 IDefinition Properties

The properties of the IDefinition class are listed here.

Public Properties

	Name	Description
R	Bindings (see page 7099)	This is Bindings, a member of class IDefinition.
R	Imports (see page 7099)	This is Imports, a member of class IDefinition.
R	Messages (see page 7099)	This is Messages, a member of class IDefinition.
	Name (see page 7099)	This is Name, a member of class IDefinition.
R	PortTypes (see page 7099)	This is PortTypes, a member of class IDefinition.
R	Services (see page 7100)	This is Services, a member of class IDefinition.
	TargetNamespace (see page 7100)	This is TargetNamespace, a member of class IDefinition.
R	Types (see page 7100)	This is Types, a member of class IDefinition.

73.2.7.3.1 IDefinition.Bindings Property

Pascal

```
property Bindings: IBindings;
```

C++

```
__property IBindings Bindings;
```

Description

This is Bindings, a member of class IDefinition.

73.2.7.3.2 IDefinition.Imports Property

Pascal

```
property Imports: IImports;
```

C++

```
__property IImports Imports;
```

Description

This is Imports, a member of class IDefinition.

73.2.7.3.3 IDefinition.Messages Property

Pascal

```
property Messages: IMessages;
```

C++

```
__property IMessages Messages;
```

Description

This is Messages, a member of class IDefinition.

73.2.7.3.4 IDefinition.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IDefinition.

73.2.7.3.5 IDefinition.PortTypes Property

Pascal

```
property PortTypes: IPortTypes;
```

C++

```
__property IPortTypes PortTypes;
```

Description

This is PortTypes, a member of class IDefinition.

73.2.7.3.6 IDefinition.Services Property

Pascal

```
property Services: IServices;
```

C++

```
__property IServices Services;
```

Description

This is Services, a member of class IDefinition.

73.2.7.3.7 IDefinition.TargetNamespace Property

Pascal

```
property TargetNamespace: WideString;
```

C++

```
__property BSTR TargetNamespace;
```

Description

This is TargetNamespace, a member of class IDefinition.

73.2.7.3.8 IDefinition.Types Property

Pascal

```
property Types: ITypes;
```

C++

```
__property ITypes Types;
```

Description

This is Types, a member of class IDefinition.

73.2.8 IDocumentation Interface

Class Hierarchy

Pascal

```
IDocumentation = interface(IXMLNode);
```

C++

```
__interface IDocumentation : public IXMLNode;
```

File

WSDLBind

Description

This is class WSDLBind.IDocumentation.

73.2.9 IDocumentationCollection Interface

Class Hierarchy

Pascal

```
IDocumentationCollection = interface(IXMLNodeCollection);
```

C++

```
__interface IDocumentationCollection : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IDocumentationCollection.

73.2.9.1 IDocumentationCollection Members

The following tables list the members exposed by IDocumentationCollection.

Public Methods

	Name	Description
	Add (see page 7103)	This is Add, a member of class IDocumentationCollection.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDocumentation (see page 7103)	This is GetDocumentation, a member of class IDocumentationCollection.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.

	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7103)	This is Insert, a member of class IDocumentationCollection.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	Documentation (see page 7104)	This is Documentation, a member of class IDocumentationCollection.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.9.2 IDocumentationCollection Methods

The methods of the IDocumentationCollection class are listed here.

Public Methods

	Name	Description
	Add (see page 7103)	This is Add, a member of class IDocumentationCollection.
	GetDocumentation (see page 7103)	This is GetDocumentation, a member of class IDocumentationCollection.
	Insert (see page 7103)	This is Insert, a member of class IDocumentationCollection.

73.2.9.2.1 IDocumentationCollection.Add Method

Pascal

```
function Add(const Text: WideString): IDocumentation;
```

C++

```
__fastcall IDocumentation Add(const BSTR Text);
```

Description

This is Add, a member of class IDocumentationCollection.

73.2.9.2.2 IDocumentationCollection.GetDocumentation Method

Pascal

```
function GetDocumentation(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation GetDocumentation(int Index);
```

Description

This is GetDocumentation, a member of class IDocumentationCollection.

73.2.9.2.3 IDocumentationCollection.Insert Method

Pascal

```
function Insert(Index: Integer): IDocumentation;
```

C++

```
__fastcall IDocumentation Insert(int Index);
```

Description

This is Insert, a member of class IDocumentationCollection.

73.2.9.3 IDocumentationCollection Properties

The properties of the IDocumentationCollection class are listed here.

Public Properties

	Name	Description
R	Documentation (see page 7104)	This is Documentation, a member of class IDocumentationCollection.

73.2.9.3.1 IDocumentationCollection.Documentation Property

Pascal

```
property Documentation [Index: Integer]: IDocumentation;
```

C++

```
__property IDocumentation Documentation[int Index];
```

Description

This is Documentation, a member of class IDocumentationCollection.

73.2.10 IDocumented Interface

Class Hierarchy

Pascal

```
IDocumented = interface(IXMLNode);
```

C++

```
__interface IDocumented : public IXMLNode;
```

File

WSDLBind

Description

This is class WSDLBind.IDocumented.

73.2.10.1 IDocumented Members

The following tables list the members exposed by IDocumented.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.

	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.10.2 IDocumented Methods

The methods of the IDocumented class are listed here.

Public Methods

	Name	Description
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.

73.2.10.2.1 IDocumented.GetDocumentationCollection Method

Pascal

```
function GetDocumentationCollection: IDocumentationCollection;
```

C++

```
__fastcall IDocumentationCollection GetDocumentationCollection();
```

Description

This is GetDocumentationCollection, a member of class IDocumented.

73.2.10.3 IDocumented Properties

The properties of the IDocumented class are listed here.

Public Properties

	Name	Description
	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.

73.2.10.3.1 IDocumented.Documentation Property

Pascal

```
property Documentation: IDocumentationCollection;
```

C++

```
__property IDocumentationCollection Documentation;
```

Description

This is Documentation, a member of class IDocumented.

73.2.11 IFault Interface

Class Hierarchy

Pascal

```
IFault = interface(IParam);
```

C++

```
__interface IFault : public IParam;
```

File

WSDLBind

Description

This is class WSDLBind.IFault.

73.2.12 IFaults Interface

Class Hierarchy

Pascal

```
IFaults = interface(IXMLNodeCollection);
```

C++

```
__interface IFaults : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IFaults.

73.2.12.1 IFaults Members

The following tables list the members exposed by IFaults.

Public Methods

	Name	Description
	Add (see page 7109)	This is Add, a member of class IFaults.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetFault (see page 7109)	This is GetFault, a member of class IFaults.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.

	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7109)	This is Insert, a member of class IFaults.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	Fault (see page 7110)	This is Fault, a member of class IFaults.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.12.2 IFaults Methods

The methods of the IFaults class are listed here.

Public Methods

	Name	Description
	Add (see page 7109)	This is Add, a member of class IFaults.
	GetFault (see page 7109)	This is GetFault, a member of class IFaults.
	Insert (see page 7109)	This is Insert, a member of class IFaults.

73.2.12.2.1 IFaults.Add Method

Pascal

```
function Add(const Name: WideString; const Message: WideString): IFault;
```

C++

```
__fastcall IFault Add(const BSTR Name, const BSTR Message);
```

Description

This is Add, a member of class IFaults.

73.2.12.2.2 IFaults.GetFault Method

Pascal

```
function GetFault(Index: Integer): IFault;
```

C++

```
__fastcall IFault GetFault(int Index);
```

Description

This is GetFault, a member of class IFaults.

73.2.12.2.3 IFaults.Insert Method

Pascal

```
function Insert(Index: Integer): IFault;
```

C++

```
__fastcall IFault Insert(int Index);
```

Description

This is Insert, a member of class IFaults.

73.2.12.3 IFaults Properties

The properties of the IFaults class are listed here.

Public Properties

	Name	Description
	Fault (see page 7110)	This is Fault, a member of class IFaults.

73.2.12.3.1 IFaults.Fault Property

Pascal

```
property Fault [Index: Integer]: IFault;
```

C++

```
__property IFault Fault[int Index];
```

Description

This is Fault, a member of class IFaults.

73.2.13 IImport Interface

Class Hierarchy

Pascal

```
IImport = interface(IDocumented);
```

C++

```
__interface IImport : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IImport.

73.2.13.1 IImport Members

The following tables list the members exposed by IImport.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.

	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetLocation (see page 7112)	This is GetLocation, a member of class IImport.
	GetNamespace (see page 7112)	This is GetNamespace, a member of class IImport.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetLocation (see page 7112)	This is SetLocation, a member of class IImport.
	SetNamespace (see page 7112)	This is SetNamespace, a member of class IImport.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Location (see page 7113)	This is Location, a member of class IImport.
	Namespace (see page 7113)	This is Namespace, a member of class IImport.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.13.2 IImport Methods

The methods of the IImport class are listed here.

Public Methods

	Name	Description
	GetLocation (see page 7112)	This is GetLocation, a member of class IImport.
	GetNamespace (see page 7112)	This is GetNamespace, a member of class IImport.
	SetLocation (see page 7112)	This is SetLocation, a member of class IImport.
	SetNamespace (see page 7112)	This is SetNamespace, a member of class IImport.

73.2.13.2.1 IImport.GetLocation Method

Pascal

```
function GetLocation: WideString;
```

C++

```
__fastcall BSTR GetLocation();
```

Description

This is GetLocation, a member of class IImport.

73.2.13.2.2 IImport.GetNamespace Method

Pascal

```
function GetNamespace: WideString;
```

C++

```
__fastcall BSTR GetNamespace();
```

Description

This is GetNamespace, a member of class IImport.

73.2.13.2.3 IImport.SetLocation Method

Pascal

```
procedure SetLocation(Value: WideString);
```

C++

```
__fastcall SetLocation(BSTR Value);
```

Description

This is SetLocation, a member of class IImport.

73.2.13.2.4 IImport.SetNamespace Method

Pascal

```
procedure SetNamespace(Value: WideString);
```

C++

```
__fastcall SetNamespace(BSTR Value);
```

Description

This is SetNamespace, a member of class IImport.

73.2.13.3 IImport Properties

The properties of the IImport class are listed here.

Public Properties

	Name	Description
	Location (see page 7113)	This is Location, a member of class IImport.
	Namespace (see page 7113)	This is Namespace, a member of class IImport.

73.2.13.3.1 IImport.Location Property

Pascal

```
property Location: WideString;
```

C++

```
__property BSTR Location;
```

Description

This is Location, a member of class IImport.

73.2.13.3.2 IImport.Namespace Property

Pascal

```
property Namespace: WideString;
```

C++

```
__property BSTR Namespace;
```

Description

This is Namespace, a member of class IImport.

73.2.14 IImports Interface

Class Hierarchy

Pascal

```
IImports = interface(IXMLNodeCollection);
```

C++

```
__interface IImports : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IImports.

73.2.14.1 IImports Members

The following tables list the members exposed by IImports.

Public Methods

	Name	Description
	Add (see page 7115)	This is Add, a member of class IImports.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetImport (see page 7116)	This is GetImport, a member of class IImports.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7116)	This is Insert, a member of class IImports.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	Import (see page 7116)	This is Import, a member of class IImports.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.14.2 IImports Methods

The methods of the IImports class are listed here.

Public Methods

	Name	Description
	Add (see page 7115)	This is Add, a member of class IImports.
	GetImport (see page 7116)	This is GetImport, a member of class IImports.
	Insert (see page 7116)	This is Insert, a member of class IImports.

73.2.14.2.1 IImports.Add Method

Pascal

```
function Add(const Namespace: WideString; const Location: WideString): IImport;
```

C++

```
__fastcall IImport Add(const BSTR Namespace, const BSTR Location);
```

Description

This is Add, a member of class IImports.

73.2.14.2.2 IImports.GetImport Method

Pascal

```
function GetImport(Index: Integer): IImport;
```

C++

```
__fastcall IImport GetImport(int Index);
```

Description

This is GetImport, a member of class IImports.

73.2.14.2.3 IImports.Insert Method

Pascal

```
function Insert(Index: Integer): IImport;
```

C++

```
__fastcall IImport Insert(int Index);
```

Description

This is Insert, a member of class IImports.

73.2.14.3 IImports Properties

The properties of the IImports class are listed here.

Public Properties

	Name	Description
	Import (see page 7116)	This is Import, a member of class IImports.

73.2.14.3.1 IImports.Import Property

Pascal

```
property Import [Index: Integer]: IImport;
```

C++

```
__property IImport Import[int Index];
```

Description

This is Import, a member of class IImports.

73.2.15 IMessage Interface

Class Hierarchy

Pascal

```
IMessage = interface(IDocumented);
```

C++

```
__interface IMessage : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IMessage.

73.2.15.1 IMessage Members

The following tables list the members exposed by IMessage.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetName (see page 7118)	This is GetName, a member of class IMessage.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetParts (see page 7119)	This is GetParts, a member of class IMessage.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetName (see page 7119)	This is SetName, a member of class IMessage.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7119)	This is Name, a member of class IMessage.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Parts (see page 7119)	This is Parts, a member of class IMessage.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.15.2 IMessage Methods

The methods of the IMessage class are listed here.

Public Methods

	Name	Description
	GetName (see page 7118)	This is GetName, a member of class IMessage.
	GetParts (see page 7119)	This is GetParts, a member of class IMessage.
	SetName (see page 7119)	This is SetName, a member of class IMessage.

73.2.15.2.1 IMessage.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IMessage.

73.2.15.2.2 IMessage.GetParts Method

Pascal

```
function GetParts: IParts;
```

C++

```
__fastcall IParts GetParts();
```

Description

This is GetParts, a member of class IMessage.

73.2.15.2.3 IMessage.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IMessage.

73.2.15.3 IMessage Properties

The properties of the IMessage class are listed here.

Public Properties

	Name	Description
	Name (see page 7119)	This is Name, a member of class IMessage.
R	Parts (see page 7119)	This is Parts, a member of class IMessage.

73.2.15.3.1 IMessage.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IMessage.

73.2.15.3.2 IMessage.Parts Property

Pascal

```
property Parts: IParts;
```

C++

```
__property IParts Parts;
```

Description

This is Parts, a member of class IMessage.

73.2.16 IMessages Interface

Class Hierarchy

Pascal

```
IMessages = interface(IXMLNodeCollection);
```

C++

```
__interface IMessages : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IMessages.

73.2.16.1 IMessages Members

The following tables list the members exposed by IMessages.

Public Methods

	Name	Description
	Add (see page 7122)	This is Add, a member of class IMessages.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 7122)	This is GetMessage, a member of class IMessages.

	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7122)	This is Insert, a member of class IMessages.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	Message (see page 7123)	This is Message, a member of class IMessages.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.16.2 IMessages Methods

The methods of the IMessages class are listed here.

Public Methods

	Name	Description
	Add (see page 7122)	This is Add, a member of class IMessages.
	GetMessage (see page 7122)	This is GetMessage, a member of class IMessages.
	Insert (see page 7122)	This is Insert, a member of class IMessages.

73.2.16.2.1 IMessages.Add Method

Pascal

```
function Add(const Name: WideString): IMessage;
```

C++

```
__fastcall IMessage Add(const BSTR Name);
```

Description

This is Add, a member of class IMessages.

73.2.16.2.2 IMessages.GetMessage Method

Pascal

```
function GetMessage(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage GetMessage(int Index);
```

Description

This is GetMessage, a member of class IMessages.

73.2.16.2.3 IMessages.Insert Method

Pascal

```
function Insert(Index: Integer): IMessage;
```

C++

```
__fastcall IMessage Insert(int Index);
```

Description

This is Insert, a member of class IMessages.

73.2.16.3 IMessages Properties

The properties of the IMessages class are listed here.

Public Properties

	Name	Description
R	Message (see page 7123)	This is Message, a member of class IMessages.

73.2.16.3.1 IMessages.Message Property

Pascal

```
property Message [Index: Integer]: IMessage;
```

C++

```
__property IMessage Message[int Index];
```

Description

This is Message, a member of class IMessages.

73.2.17 IOperation Interface

Class Hierarchy

Pascal

```
IOperation = interface(IDocumented);
```

C++

```
__interface IOperation : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IOperation.

73.2.17.1 IOperation Members

The following tables list the members exposed by IOperation.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetFaults (see page 7125)	This is GetFaults, a member of class IOperation.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.

	GetInput (see page 7125)	This is GetInput, a member of class IOperation.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetName (see page 7125)	This is GetName, a member of class IOperation.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOutput (see page 7126)	This is GetOutput, a member of class IOperation.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetName (see page 7126)	This is SetName, a member of class IOperation.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	Faults (see page 7126)	This is Faults, a member of class IOperation.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	Input (see page 7126)	This is Input, a member of class IOperation.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7127)	This is Name, a member of class IOperation.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	Output (see page 7127)	This is Output, a member of class IOperation.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.

	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.17.2 IOperation Methods

The methods of the IOperation class are listed here.

Public Methods

	Name	Description
	GetFaults (see page 7125)	This is GetFaults, a member of class IOperation.
	GetInput (see page 7125)	This is GetInput, a member of class IOperation.
	GetName (see page 7125)	This is GetName, a member of class IOperation.
	GetOutput (see page 7126)	This is GetOutput, a member of class IOperation.
	SetName (see page 7126)	This is SetName, a member of class IOperation.

73.2.17.2.1 IOperation.GetFaults Method

Pascal

```
function GetFaults: IFaults;
```

C++

```
__fastcall IFaults GetFaults();
```

Description

This is GetFaults, a member of class IOperation.

73.2.17.2.2 IOperation.GetInput Method

Pascal

```
function GetInput: IParam;
```

C++

```
__fastcall IParam GetInput();
```

Description

This is GetInput, a member of class IOperation.

73.2.17.2.3 IOperation.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IOperation.

73.2.17.2.4 IOperation.GetOutput Method

Pascal

```
function GetOutput: IParam;
```

C++

```
__fastcall IParam GetOutput();
```

Description

This is GetOutput, a member of class IOperation.

73.2.17.2.5 IOperation.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IOperation.

73.2.17.3 IOperation Properties

The properties of the IOperation class are listed here.

Public Properties

	Name	Description
R	Faults (see page 7126)	This is Faults, a member of class IOperation.
R	Input (see page 7126)	This is Input, a member of class IOperation.
	Name (see page 7127)	This is Name, a member of class IOperation.
R	Output (see page 7127)	This is Output, a member of class IOperation.

73.2.17.3.1 IOperation.Faults Property

Pascal

```
property Faults: IFaults;
```

C++

```
__property IFaults Faults;
```

Description

This is Faults, a member of class IOperation.

73.2.17.3.2 IOperation.Input Property

Pascal

```
property Input: IParam;
```

C++

```
__property IParam Input;
```

Description

This is Input, a member of class IOperation.

73.2.17.3.3 IOperation.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IOperation.

73.2.17.3.4 IOperation.Output Property

Pascal

```
property Output: IParam;
```

C++

```
__property IParam Output;
```

Description

This is Output, a member of class IOperation.

73.2.18 IOperations Interface

Class Hierarchy

Pascal

```
IOperations = interface(IXMLNodeCollection);
```

C++

```
__interface IOperations : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IOperations.

73.2.18.1 IOperations Members

The following tables list the members exposed by IOperations.

Public Methods

	Name	Description
	Add (see page 7129)	This is the overview for the Add method overload.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOperation (see page 7130)	This is GetOperation, a member of class IOperations.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7130)	This is Insert, a member of class IOperations.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.

	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	Operation (see page 7130)	This is Operation, a member of class IOperations.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.18.2 IOperations Methods

The methods of the IOperations class are listed here.

Public Methods

	Name	Description
	Add (see page 7129)	This is the overview for the Add method overload.
	GetOperation (see page 7130)	This is GetOperation, a member of class IOperations.
	Insert (see page 7130)	This is Insert, a member of class IOperations.

73.2.18.2.1 Add Method

This is the overview for the Add method overload.

Overload List

	Name	Description
	IOperations.Add (WideString) (see page 7129)	This is Add, a member of class IOperations.
	IOperations.Add (WideString, WideString, WideString, WideString) (see page 7130)	This is Add, a member of class IOperations.

73.2.18.2.1.1 IOperations.Add Method (WideString)

Pascal

```
function Add(const Name: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name);
```

Description

This is Add, a member of class IOperations.

73.2.18.2.1.2 IOperations.Add Method (WideString, WideString, WideString, WideString)

Pascal

```
function Add(const Name: WideString; const InputMessage: WideString; const InputName:
WideString; const OutputMessage: WideString): IOperation; overload;
```

C++

```
__fastcall IOperation Add(const BSTR Name, const BSTR InputMessage, const BSTR InputName,
const BSTR OutputMessage);
```

Description

This is Add, a member of class IOperations.

73.2.18.2.2 IOperations.GetOperation Method

Pascal

```
function GetOperation(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation GetOperation(int Index);
```

Description

This is GetOperation, a member of class IOperations.

73.2.18.2.3 IOperations.Insert Method

Pascal

```
function Insert(Index: Integer): IOperation;
```

C++

```
__fastcall IOperation Insert(int Index);
```

Description

This is Insert, a member of class IOperations.

73.2.18.3 IOperations Properties

The properties of the IOperations class are listed here.

Public Properties

	Name	Description
	Operation (see page 7130)	This is Operation, a member of class IOperations.

73.2.18.3.1 IOperations.Operation Property

Pascal

```
property Operation [Index: Integer]: IOperation;
```

C++

```
__property IOperation Operation[int Index];
```

Description

This is Operation, a member of class IOperations.

73.2.19 IParam Interface

Class Hierarchy

Pascal

```
IParam = interface(IDocumented);
```

C++

```
__interface IParam : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IParam.

73.2.19.1 IParam Members

The following tables list the members exposed by IParam.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetMessage (see page 7133)	This is GetMessage, a member of class IParam.
	GetName (see page 7133)	This is GetName, a member of class IParam.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.

	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetMessage (see page 7133)	This is SetMessage, a member of class IParam.
	SetName (see page 7133)	This is SetName, a member of class IParam.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Message (see page 7134)	This is Message, a member of class IParam.
	Name (see page 7134)	This is Name, a member of class IParam.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.19.2 IParam Methods

The methods of the IParam class are listed here.

Public Methods

	Name	Description
	GetMessage (see page 7133)	This is GetMessage, a member of class IParam.
	GetName (see page 7133)	This is GetName, a member of class IParam.
	SetMessage (see page 7133)	This is SetMessage, a member of class IParam.
	SetName (see page 7133)	This is SetName, a member of class IParam.

73.2.19.2.1 IParam.GetMessage Method

Pascal

```
function GetMessage: WideString;
```

C++

```
__fastcall BSTR GetMessage();
```

Description

This is GetMessage, a member of class IParam.

73.2.19.2.2 IParam.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IParam.

73.2.19.2.3 IParam.SetMessage Method

Pascal

```
procedure SetMessage(Value: WideString);
```

C++

```
__fastcall SetMessage(BSTR Value);
```

Description

This is SetMessage, a member of class IParam.

73.2.19.2.4 IParam.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IParam.

73.2.19.3 IParam Properties

The properties of the IParam class are listed here.

Public Properties

	Name	Description
	Message (see page 7134)	This is Message, a member of class IParam.
	Name (see page 7134)	This is Name, a member of class IParam.

73.2.19.3.1 IParam.Message Property

Pascal

```
property Message: WideString;
```

C++

```
__property BSTR Message;
```

Description

This is Message, a member of class IParam.

73.2.19.3.2 IParam.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IParam.

73.2.20 IPart Interface

Class Hierarchy

Pascal

```
IPart = interface(IDocumented);
```

C++

```
__interface IPart : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IPart.

73.2.20.1 IPart Members

The following tables list the members exposed by IPart.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetElement (see page 7136)	This is GetElement, a member of class IPart.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetName (see page 7137)	This is GetName, a member of class IPart.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetType_ (see page 7137)	This is GetType_, a member of class IPart.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetElement (see page 7137)	This is SetElement, a member of class IPart.
	SetName (see page 7137)	This is SetName, a member of class IPart.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	SetType_ (see page 7137)	This is SetType_, a member of class IPart.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
	Element (see page 7138)	This is Element, a member of class IPart.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7138)	This is Name, a member of class IPart.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
	Type_ (see page 7138)	This is Type_, a member of class IPart.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.20.2 IPart Methods

The methods of the IPart class are listed here.

Public Methods

	Name	Description
	GetElement (see page 7136)	This is GetElement, a member of class IPart.
	GetName (see page 7137)	This is GetName, a member of class IPart.
	GetType_ (see page 7137)	This is GetType_, a member of class IPart.
	SetElement (see page 7137)	This is SetElement, a member of class IPart.
	SetName (see page 7137)	This is SetName, a member of class IPart.
	SetType_ (see page 7137)	This is SetType_, a member of class IPart.

73.2.20.2.1 IPart.GetElement Method

Pascal

```
function GetElement: WideString;
```

C++

```
__fastcall BSTR GetElement();
```

Description

This is GetElement, a member of class IPart.

73.2.20.2.2 IPart.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IPart.

73.2.20.2.3 IPart.GetType_ Method

Pascal

```
function GetType_: WideString;
```

C++

```
__fastcall BSTR GetType_();
```

Description

This is GetType_, a member of class IPart.

73.2.20.2.4 IPart.SetElement Method

Pascal

```
procedure SetElement(Value: WideString);
```

C++

```
__fastcall SetElement(BSTR Value);
```

Description

This is SetElement, a member of class IPart.

73.2.20.2.5 IPart.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IPart.

73.2.20.2.6 IPart.SetType_ Method

Pascal

```
procedure SetType_(Value: WideString);
```

C++

```
__fastcall SetType_(BSTR Value);
```

Description

This is SetType_, a member of class IPart.

73.2.20.3 IPart Properties

The properties of the IPart class are listed here.

Public Properties

	Name	Description
	Element (see page 7138)	This is Element, a member of class IPart.
	Name (see page 7138)	This is Name, a member of class IPart.
	Type_ (see page 7138)	This is Type_, a member of class IPart.

73.2.20.3.1 IPart.Element Property

Pascal

```
property Element: WideString;
```

C++

```
__property BSTR Element;
```

Description

This is Element, a member of class IPart.

73.2.20.3.2 IPart.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IPart.

73.2.20.3.3 IPart.Type_ Property

Pascal

```
property Type_: WideString;
```

C++

```
__property BSTR Type_;
```

Description

This is Type_, a member of class IPart.

73.2.21 IParts Interface

Class Hierarchy

Pascal

```
IParts = interface(IXMLNodeCollection);
```

C++

```
__interface IParts : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IParts.

73.2.21.1 IParts Members

The following tables list the members exposed by IParts.

Public Methods

	Name	Description
	Add (see page 7141)	This is Add, a member of class IParts.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.

	GetPart (see page 7141)	This is GetPart, a member of class IParts.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7141)	This is Insert, a member of class IParts.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Part (see page 7142)	This is Part, a member of class IParts.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.21.2 IParts Methods

The methods of the IParts class are listed here.

Public Methods

	Name	Description
	Add (see page 7141)	This is Add, a member of class IParts.
	GetPart (see page 7141)	This is GetPart, a member of class IParts.
	Insert (see page 7141)	This is Insert, a member of class IParts.

73.2.21.2.1 IParts.Add Method

Pascal

```
function Add(const Name: WideString; const Element: WideString; const AType: WideString = ''):
IPart;
```

C++

```
__fastcall IPart Add(const BSTR Name, const BSTR Element, const BSTR AType = '');
```

Description

This is Add, a member of class IParts.

73.2.21.2.2 IParts.GetPart Method

Pascal

```
function GetPart(Index: Integer): IPart;
```

C++

```
__fastcall IPart GetPart(int Index);
```

Description

This is GetPart, a member of class IParts.

73.2.21.2.3 IParts.Insert Method

Pascal

```
function Insert(Index: Integer): IPart;
```

C++

```
__fastcall IPart Insert(int Index);
```

Description

This is Insert, a member of class IParts.

73.2.21.3 IParts Properties

The properties of the IParts class are listed here.

Public Properties

	Name	Description
R	Part (see page 7142)	This is Part, a member of class IParts.

73.2.21.3.1 IParts.Part Property

Pascal

```
property Part [Index: Integer]: IPart;
```

C++

```
__property IPart Part[int Index];
```

Description

This is Part, a member of class IParts.

73.2.22 IPort Interface

Class Hierarchy

Pascal

```
IPort = interface(IDocumented);
```

C++

```
__interface IPort : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IPort.

73.2.22.1 IPort Members

The following tables list the members exposed by IPort.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetBinding (see page 7144)	This is GetBinding, a member of class IPort.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.

	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetName (see page 7144)	This is GetName, a member of class IPort.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetBinding (see page 7144)	This is SetBinding, a member of class IPort.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetName (see page 7144)	This is SetName, a member of class IPort.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
	Binding (see page 7145)	This is Binding, a member of class IPort.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7145)	This is Name, a member of class IPort.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.22.2 IPort Methods

The methods of the IPort class are listed here.

Public Methods

	Name	Description
	GetBinding (see page 7144)	This is GetBinding, a member of class IPort.
	GetName (see page 7144)	This is GetName, a member of class IPort.
	SetBinding (see page 7144)	This is SetBinding, a member of class IPort.
	SetName (see page 7144)	This is SetName, a member of class IPort.

73.2.22.2.1 IPort.GetBinding Method

Pascal

```
function GetBinding: WideString;
```

C++

```
__fastcall BSTR GetBinding();
```

Description

This is GetBinding, a member of class IPort.

73.2.22.2.2 IPort.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IPort.

73.2.22.2.3 IPort.SetBinding Method

Pascal

```
procedure SetBinding(Value: WideString);
```

C++

```
__fastcall SetBinding(BSTR Value);
```

Description

This is SetBinding, a member of class IPort.

73.2.22.2.4 IPort.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IPort.

73.2.22.3 IPort Properties

The properties of the IPort class are listed here.

Public Properties

	Name	Description
	Binding (see page 7145)	This is Binding, a member of class IPort.
	Name (see page 7145)	This is Name, a member of class IPort.

73.2.22.3.1 IPort.Binding Property

Pascal

```
property Binding: WideString;
```

C++

```
__property BSTR Binding;
```

Description

This is Binding, a member of class IPort.

73.2.22.3.2 IPort.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IPort.

73.2.23 IPorts Interface

Class Hierarchy

Pascal

```
IPorts = interface(IXMLNodeCollection);
```

C++

```
__interface IPorts : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IPorts.

73.2.23.1 IPorts Members

The following tables list the members exposed by IPorts.

Public Methods

	Name	Description
	Add (see page 7147)	This is Add, a member of class IPorts.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPort (see page 7148)	This is GetPort, a member of class IPorts.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7148)	This is Insert, a member of class IPorts.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Port (see page 7148)	This is Port, a member of class IPorts.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.23.2 IPorts Methods

The methods of the IPorts class are listed here.

Public Methods

	Name	Description
	Add (see page 7147)	This is Add, a member of class IPorts.
	GetPort (see page 7148)	This is GetPort, a member of class IPorts.
	Insert (see page 7148)	This is Insert, a member of class IPorts.

73.2.23.2.1 IPorts.Add Method

Pascal

```
function Add(const Name: WideString; const ABinding: WideString): IPort;
```

C++

```
__fastcall IPort Add(const BSTR Name, const BSTR ABinding);
```

Description

This is Add, a member of class IPorts.

73.2.23.2.2 IPorts.GetPort Method

Pascal

```
function GetPort(Index: Integer): IPort;
```

C++

```
__fastcall IPort GetPort(int Index);
```

Description

This is GetPort, a member of class IPorts.

73.2.23.2.3 IPorts.Insert Method

Pascal

```
function Insert(Index: Integer): IPort;
```

C++

```
__fastcall IPort Insert(int Index);
```

Description

This is Insert, a member of class IPorts.

73.2.23.3 IPorts Properties

The properties of the IPorts class are listed here.

Public Properties

	Name	Description
	Port (see page 7148)	This is Port, a member of class IPorts.

73.2.23.3.1 IPorts.Port Property

Pascal

```
property Port [Index: Integer]: IPort;
```

C++

```
__property IPort Port[int Index];
```

Description

This is Port, a member of class IPorts.

73.2.24 IPortType Interface

Class Hierarchy

Pascal

```
IPortType = interface(IDocumented);
```

C++

```
__interface IPortType : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IPortType.

73.2.24.1 IPortType Members

The following tables list the members exposed by IPortType.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetName (see page 7150)	This is GetName, a member of class IPortType.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOperations (see page 7151)	This is GetOperations, a member of class IPortType.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.

	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetName (see page 7151)	This is SetName, a member of class IPortType.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7151)	This is Name, a member of class IPortType.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	Operations (see page 7151)	This is Operations, a member of class IPortType.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.24.2 IPortType Methods

The methods of the IPortType class are listed here.

Public Methods

	Name	Description
	GetName (see page 7150)	This is GetName, a member of class IPortType.
	GetOperations (see page 7151)	This is GetOperations, a member of class IPortType.
	SetName (see page 7151)	This is SetName, a member of class IPortType.

73.2.24.2.1 IPortType.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IPortType.

73.2.24.2.2 IPortType.GetOperations Method

Pascal

```
function GetOperations: IOperations;
```

C++

```
__fastcall IOperations GetOperations();
```

Description

This is GetOperations, a member of class IPortType.

73.2.24.2.3 IPortType.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IPortType.

73.2.24.3 IPortType Properties

The properties of the IPortType class are listed here.

Public Properties

	Name	Description
	Name (see page 7151)	This is Name, a member of class IPortType.
R	Operations (see page 7151)	This is Operations, a member of class IPortType.

73.2.24.3.1 IPortType.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IPortType.

73.2.24.3.2 IPortType.Operations Property

Pascal

```
property Operations: IOperations;
```

C++

```
__property IOperations Operations;
```

Description

This is Operations, a member of class IPortType.

73.2.25 IPortTypes Interface

Class Hierarchy

Pascal

```
IPortTypes = interface(IXMLNodeCollection);
```

C++

```
__interface IPortTypes : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IPortTypes.

73.2.25.1 IPortTypes Members

The following tables list the members exposed by IPortTypes.

Public Methods

	Name	Description
	Add (see page 7154)	This is Add, a member of class IPortTypes.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.

	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPortType (see page 7154)	This is GetPortType, a member of class IPortTypes.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7154)	This is Insert, a member of class IPortTypes.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	PortType (see page 7155)	This is PortType, a member of class IPortTypes.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.25.2 IPortTypes Methods

The methods of the IPortTypes class are listed here.

Public Methods

	Name	Description
	Add (see page 7154)	This is Add, a member of class IPortTypes.
	GetPortType (see page 7154)	This is GetPortType, a member of class IPortTypes.
	Insert (see page 7154)	This is Insert, a member of class IPortTypes.

73.2.25.2.1 IPortTypes.Add Method

Pascal

```
function Add(const Name: WideString): IPortType;
```

C++

```
__fastcall IPortType Add(const BSTR Name);
```

Description

This is Add, a member of class IPortTypes.

73.2.25.2.2 IPortTypes.GetPortType Method

Pascal

```
function GetPortType(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType GetPortType(int Index);
```

Description

This is GetPortType, a member of class IPortTypes.

73.2.25.2.3 IPortTypes.Insert Method

Pascal

```
function Insert(Index: Integer): IPortType;
```

C++

```
__fastcall IPortType Insert(int Index);
```

Description

This is Insert, a member of class IPortTypes.

73.2.25.3 IPortTypes Properties

The properties of the IPortTypes class are listed here.

Public Properties

	Name	Description
R	PortType (see page 7155)	This is PortType, a member of class IPortTypes.

73.2.25.3.1 IPortTypes.PortType Property

Pascal

```
property PortType [Index: Integer]: IPortType;
```

C++

```
__property IPortType PortType[int Index];
```

Description

This is PortType, a member of class IPortTypes.

73.2.26 IService Interface

Class Hierarchy

Pascal

```
IService = interface(IDocumented);
```

C++

```
__interface IService : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.IService.

73.2.26.1 IService Members

The following tables list the members exposed by IService.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.

	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetName (see page 7157)	This is GetName, a member of class IService.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPorts (see page 7157)	This is GetPorts, a member of class IService.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetName (see page 7157)	This is SetName, a member of class IService.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	Name (see page 7158)	This is Name, a member of class IService.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Ports (see page 7158)	This is Ports, a member of class IService.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.26.2 IService Methods

The methods of the IService class are listed here.

Public Methods

	Name	Description
	GetName (see page 7157)	This is GetName, a member of class IService.
	GetPorts (see page 7157)	This is GetPorts, a member of class IService.
	SetName (see page 7157)	This is SetName, a member of class IService.

73.2.26.2.1 IService.GetName Method

Pascal

```
function GetName: WideString;
```

C++

```
__fastcall BSTR GetName();
```

Description

This is GetName, a member of class IService.

73.2.26.2.2 IService.GetPorts Method

Pascal

```
function GetPorts: IPorts;
```

C++

```
__fastcall IPorts GetPorts();
```

Description

This is GetPorts, a member of class IService.

73.2.26.2.3 IService.SetName Method

Pascal

```
procedure SetName(Value: WideString);
```

C++

```
__fastcall SetName(BSTR Value);
```

Description

This is SetName, a member of class IService.

73.2.26.3 IService Properties

The properties of the IService class are listed here.

Public Properties

	Name	Description
	Name (see page 7158)	This is Name, a member of class IService.

	Ports (see page 7158)	This is Ports, a member of class IService.

73.2.26.3.1 IService.Name Property

Pascal

```
property Name: WideString;
```

C++

```
__property BSTR Name;
```

Description

This is Name, a member of class IService.

73.2.26.3.2 IService.Ports Property

Pascal

```
property Ports: IPorts;
```

C++

```
__property IPorts Ports;
```

Description

This is Ports, a member of class IService.

73.2.27 IServices Interface

Class Hierarchy

Pascal

```
IServices = interface(IXMLNodeCollection);
```

C++

```
__interface IServices : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IServices.

73.2.27.1 IServices Members

The following tables list the members exposed by IServices.

Public Methods

	Name	Description
	Add (see page 7160)	This is Add, a member of class IServices.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.

	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetService (see page 7160)	This is GetService, a member of class IServices.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	Insert (see page 7161)	This is Insert, a member of class IServices.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.

	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
	NodeName (see page 7693)	Indicates the node name.
	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
	Service (see page 7161)	This is Service, a member of class IServices.
	Text (see page 7697)	Represents the Text of the node.
	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.27.2 IServices Methods

The methods of the IServices class are listed here.

Public Methods

	Name	Description
	Add (see page 7160)	This is Add, a member of class IServices.
	GetService (see page 7160)	This is GetService, a member of class IServices.
	Insert (see page 7161)	This is Insert, a member of class IServices.

73.2.27.2.1 IServices.Add Method

Pascal

```
function Add(const Name: WideString): IService;
```

C++

```
__fastcall IService Add(const BSTR Name);
```

Description

This is Add, a member of class IServices.

73.2.27.2.2 IServices.GetService Method

Pascal

```
function GetService(Index: Integer): IService;
```

C++

```
__fastcall IService GetService(int Index);
```

Description

This is GetService, a member of class IServices.

73.2.27.2.3 IServices.Insert Method

Pascal

```
function Insert(Index: Integer): IService;
```

C++

```
__fastcall IService Insert(int Index);
```

Description

This is Insert, a member of class IServices.

73.2.27.3 IServices Properties

The properties of the IServices class are listed here.

Public Properties

	Name	Description
	Service (see page 7161)	This is Service, a member of class IServices.

73.2.27.3.1 IServices.Service Property

Pascal

```
property Service [Index: Integer]: IService;
```

C++

```
__property IService Service[int Index];
```

Description

This is Service, a member of class IServices.

73.2.28 ITypes Interface

Class Hierarchy

Pascal

```
ITypes = interface(IDocumented);
```

C++

```
__interface ITypes : public IDocumented;
```

File

WSDLBind

Description

This is class WSDLBind.ITypes.

73.2.28.1 ITypes Members

The following tables list the members exposed by ITypes.

Public Methods

	Name	Description
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetDocumentationCollection (see page 7106)	This is GetDocumentationCollection, a member of class IDocumented.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.
	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetSchemaDefs (see page 7163)	This is GetSchemaDefs, a member of class ITypes.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.

	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Documentation (see page 7106)	This is Documentation, a member of class IDocumented.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	SchemaDefs (see page 7163)	This is SchemaDefs, a member of class ITypes.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.28.2 ITypes Methods

The methods of the ITypes class are listed here.

Public Methods

	Name	Description
	GetSchemaDefs (see page 7163)	This is GetSchemaDefs, a member of class ITypes.

73.2.28.2.1 ITypes.GetSchemaDefs Method

Pascal

```
function GetSchemaDefs: IXMLSchemaDefs;
```

C++

```
__fastcall IXMLSchemaDefs GetSchemaDefs();
```

Description

This is GetSchemaDefs, a member of class ITypes.

73.2.28.3 ITypes Properties

The properties of the ITypes class are listed here.

Public Properties

	Name	Description
R	SchemaDefs (see page 7163)	This is SchemaDefs, a member of class ITypes.

73.2.28.3.1 ITypes.SchemaDefs Property

Pascal

```
property SchemaDefs: IXMLSchemaDefs;
```

C++

```
__property IXMLSchemaDefs SchemaDefs;
```

Description

This is SchemaDefs, a member of class ITypes.

73.2.29 IWSDLDocument Interface

IWSDLDocument provides low-level access to the definitions in a WSDL document.

Class Hierarchy

Pascal

```
IWSDLDocument = interface(IXMLDocument);
```

C++

```
__interface IWSDLDocument : public IXMLDocument;
```

File

WSDLBind

Description

IWSDLDocument is an interface to the TWSDLDocument (see page 7063) class. It is primarily for internal use, because it only provides access to the Definitions property, which is used for low-level access to the definitions in a WSDL document. It is generally easier to work with a TWSDLItems object. You can often obtain this from an IWSDLDocument interface by using the global Supports function (Delphi) or the Supports method (C++) to obtain an IWSDLItems interface from this one, and then obtaining a TWSDLItems object from that interface.

Note: C++ method declarations that use IWSDLDocument use the _di_IWSDLDocument type instead. This type is a DelphiInterface (see page 3256) wrapper around the IWSDLDocument interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IWSDLDocument >  _di_IWSDLDocument;
```

See Also

TWSDLDocument (see page 7063)

IWSDLItems (see page 7256)

TWSDLItems (see page 7211)

73.2.29.1 IWSDLDocument Members

The following tables list the members exposed by IWSDLDocument.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7643)	This is the overview for the AddChild method overload.

	CreateElement (see page 7644)	Creates a new element node that is associated with this document.
	CreateNode (see page 7645)	Creates a new node that is associated with this document.
	GeneratePrefix (see page 7646)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 7646)	Returns the value of the Active (see page 7661) property.
	GetAsyncLoadState (see page 7647)	Returns the value of the AsyncLoadState (see page 7662) property.
	GetChildNodes (see page 7647)	Returns the value of the ChildNodes (see page 7663) property.
	GetDefinition (see page 7166)	Returns the value of the Definition (see page 7167) property.
	GetDocBinding (see page 7647)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 7648)	Returns the value of the DocumentElement (see page 7663) property.
	GetDocumentNode (see page 7648)	Returns the value of the Node (see page 7665) property.
	GetDOMDocument (see page 7648)	Returns the value of the DOMDocument (see page 7663) property.
	GetEncoding (see page 7649)	Returns the value of the Encoding (see page 7664) property.
	GetFileName (see page 7649)	Returns the value of the FileName (see page 7664) property.
	GetModified (see page 7649)	Returns the value of the Modified (see page 7665) property.
	GetNodeIndentStr (see page 7650)	Returns the value of the NodeIndentStr (see page 7666) property.
	GetOptions (see page 7650)	Returns the value of the Options (see page 7666) property.
	GetParseOptions (see page 7650)	Returns the value of the ParseOptions (see page 7667) property.
	GetSchemaRef (see page 7650)	Returns the value of the SchemaRef (see page 7667) property.
	GetStandAlone (see page 7651)	Returns the value of the StandAlone (see page 7668) property.
	GetVersion (see page 7651)	Returns the value of the Version (see page 7668) property.
	GetXML (see page 7651)	Returns the value of the XML (see page 7668) property.
	IsEmptyDoc (see page 7652)	Indicates whether the IXMLDocument (see page 7640) instance represents an empty document.
	LoadFromFile (see page 7652)	Loads an XML (see page 7668) document from disk.
	LoadFromStream (see page 7653)	Loads an XML (see page 7668) document from a stream and activates it.
	LoadFromXML (see page 7653)	This is the overview for the LoadFromXML method overload.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7654)	Updates the parsed XML (see page 7668) document to reflect external changes.
	RegisterDocBinding (see page 7654)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7655)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7655)	Saves the XML (see page 7668) document to disk.
	SaveToStream (see page 7656)	Saves the XML (see page 7668) document to a stream.
	SaveToXML (see page 7656)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7657)	Sets the value of the Active (see page 7661) property.
	SetDefinition (see page 7166)	Sets the value of the Definition (see page 7167) property.
	SetDocumentElement (see page 7657)	Sets the value of the DocumentElement (see page 7663) property.
	SetDOMDocument (see page 7658)	Sets the value of the DOMDocument (see page 7663) property.
	SetEncoding (see page 7658)	Sets the value of the Encoding (see page 7664) property.
	SetFileName (see page 7658)	Sets the value of the FileName (see page 7664) property.
	SetNodeIndentStr (see page 7659)	Sets the value of the NodeIndentStr (see page 7666) property.
	SetOnAsyncLoad (see page 7659)	Supplies an event handler that responds when the AsyncLoadState (see page 7662) property changes.
	SetOptions (see page 7659)	Sets the value of the Options (see page 7666) property.
	SetParseOptions (see page 7660)	Sets the value of the ParseOptions (see page 7667) property.
	SetStandAlone (see page 7660)	Sets the value of the StandAlone (see page 7668) property.
	SetVersion (see page 7660)	Sets the value of the Version (see page 7668) property.
	SetXML (see page 7661)	Sets the value of the XML (see page 7668) property.

Public Properties

	Name	Description
	Active (see page 7661)	Specifies whether the XML (see page 7668) document has been parsed so that the DOM interfaces are available to examine or change its contents.

R	AsyncLoadState (see page 7662)	Indicates the state of the DOM parser when it parses the XML (see page 7668) document asynchronously.
R	ChildNodes (see page 7663)	Lists all of the child nodes of the document.
	Definition (see page 7167)	Provides access to the definitions contained in the WSDL document.
	DocumentElement (see page 7663)	Provides access to the root node of the XML (see page 7668) document.
	DOMDocument (see page 7663)	Provides access to the DOM interface for the parsed XML (see page 7668) document.
	Encoding (see page 7664)	Indicates the character set that the XML (see page 7668) document uses to encode characters.
	FileName (see page 7664)	Indicates the XML (see page 7668) document file, if any, that this interface represents.
R	Modified (see page 7665)	Indicates whether the XML (see page 7668) document has been modified.
R	Node (see page 7665)	Provides access to the document node for the XML (see page 7668) document.
	NodeIndentStr (see page 7666)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7668) text.
	Options (see page 7666)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7667)	Specifies implementation-specific options that are followed when parsing the XML (see page 7668) document.
R	SchemaRef (see page 7667)	Returns the name of the schema associated with this XML (see page 7668) document.
	StandAlone (see page 7668)	Indicates whether the XML (see page 7668) document includes any external markup declarations.
	Version (see page 7668)	Indicates the XML (see page 7668) version that the document uses.
	XML (see page 7668)	Specifies the content of the XML document associated with this IXMLDocument (see page 7640) interface.

73.2.29.2 IWSDLDocument Methods

The methods of the IWSDLDocument class are listed here.

Public Methods

	Name	Description
	GetDefinition (see page 7166)	Returns the value of the Definition (see page 7167) property.
	SetDefinition (see page 7166)	Sets the value of the Definition (see page 7167) property.

73.2.29.2.1 IWSDLDocument.GetDefinition Method

Returns the value of the Definition (see page 7167) property.

Pascal

```
function GetDefinition: IDefinition;
```

C++

```
__fastcall IDefinition GetDefinition();
```

Description

GetDefinition is the read access method for the Definition (see page 7167) property.

See Also

Definition (see page 7167)

73.2.29.2.2 IWSDLDocument.SetDefinition Method

Sets the value of the Definition (see page 7167) property.

Pascal

```
procedure SetDefinition(const Value: IDefinition);
```

C++

```
__fastcall SetDefinition(const IDefinition Value);
```

Description

SetDefinition is the write method for the Definition (see page 7167) property.

See Also

Definition (see page 7167)

73.2.29.3 IWSDLDocument Properties

The properties of the IWSDLDocument class are listed here.

Public Properties

	Name	Description
	Definition (see page 7167)	Provides access to the definitions contained in the WSDL document.

73.2.29.3.1 IWSDLDocument.Definition Property

Provides access to the definitions contained in the WSDL document.

Pascal

```
property Definition: IDefinition;
```

C++

```
__property IDefinition Definition;
```

Description

Definition is the IDefinition (see page 7094) interface of the root node in the WSDL document. This interface is implemented by the node specified by DocumentElement.

You can use the IDefinition (see page 7094) interface to access the Bindings, Messages, PortTypes, Services, and Types (see page 4649) defined in the WSDL document by reading properties of the same names. Alternately, you can use the methods of TWSDLItems. To obtain a TWSDLItems instance for this document,

1.Cast this interface to IWSDLItems using the global Supports function (C++) or the inherited Supports method (C++).

2.Use the GetWSDLItems method of that interface.

See Also

DocumentElement (see page 7663)

TWSDLItems (see page 7211)

Supports (see page 4294)

73.2.30 IXMLSchemaDefs Interface

Class Hierarchy

Pascal

```
IXMLSchemaDefs = interface(IXMLNodeCollection);
```

C++

```
__interface IXMLSchemaDefs : public IXMLNodeCollection;
```

File

WSDLBind

Description

This is class WSDLBind.IXMLSchemaDefs.

73.2.30.1 IXMLSchemaDefs Members

The following tables list the members exposed by IXMLSchemaDefs.

Public Methods

	Name	Description
	Add (see page 7170)	This is Add, a member of class IXMLSchemaDefs.
	AddChild (see page 7672)	This is the overview for the AddChild method overload.
	Clear (see page 7700)	Removes all child nodes in the Nodes (see page 7703) property from the ChildList and Nodes (see page 7703) properties.
	CloneNode (see page 7673)	Creates a copy of this node and returns its interface.
	DeclareNamespace (see page 7674)	Adds an attribute to the node that declares a specified namespace URI.
	Delete (see page 7700)	Removes one of the repeating child nodes from this node.
	FindNamespaceDecl (see page 7674)	Returns the attribute node that declares a specified Namespace URI.
	FindNamespaceURI (see page 7674)	Returns the namespace URI for a namespace prefix or qualified tag name.
	GetAttribute (see page 7675)	Returns the value of one of this node's attributes.
	GetAttributeNodes (see page 7675)	Returns the value of the AttributeNodes (see page 7688) property.
	GetAttributeNS (see page 7676)	Returns the value of a specified attribute.
	GetChildNodes (see page 7676)	Returns the value of the ChildNodes (see page 7689) property.
	GetChildValue (see page 7676)	Returns the value of a specified child node.
	GetCollection (see page 7677)	Returns the value of the Collection (see page 7690) property.
	GetCount (see page 7701)	Returns the value of the Count (see page 7702) property.
	GetDOMNode (see page 7677)	Returns the value of the DOMNode (see page 7691) property.
	GetHasChildNodes (see page 7678)	Indicates whether the node has any child nodes.
	GetIsTextElement (see page 7678)	Indicates whether the node has a single text value.
	GetLocalName (see page 7678)	Returns the name of the node without any namespace prefix.
	GetNamespaceURI (see page 7679)	Returns the namespace URI for the node's qualified name.
	GetNode (see page 7701)	Returns the interface for one of the repeating child nodes.
	GetNodeName (see page 7679)	Returns the name of the node.
	GetNodeType (see page 7679)	Returns the type of the node.
	GetNodeValue (see page 7680)	Returns the value of the node.
	GetOwnerDocument (see page 7680)	Returns the interface for the document in which this node appears.
	GetParentNode (see page 7680)	Returns the interface for the node's parent node.

	GetPrefix (see page 7680)	Returns the namespace prefix from the node's name.
	GetReadOnly (see page 7681)	Returns the value of the ReadOnly (see page 7696) property.
	GetText (see page 7681)	Returns the text value of the node.
	GetXML (see page 7681)	Returns the value of the XML (see page 7697) property.
	GetXMLSchemaDef (see page 7170)	This is GetXMLSchemaDef, a member of class IXMLSchemaDefs.
	HasAttribute (see page 7682)	This is the overview for the HasAttribute method overload.
	NextSibling (see page 7682)	Returns the next child of this node's parent.
	Normalize (see page 7683)	Converts the subtree beneath this node to the structure it would have if it were just loaded from a document.
	PreviousSibling (see page 7683)	Returns the previous child of this node's parent.
	Remove (see page 7702)	Removes one of the repeating child nodes from this node.
	Resync (see page 7684)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SetAttribute (see page 7684)	Sets the value of one of this node's attributes.
	SetAttributeNS (see page 7684)	Sets the value of one of this node's attributes when you must explicitly specify the attribute's namespace.
	SetChildValue (see page 7685)	Sets the value of a specified child node.
	SetNodeValue (see page 7685)	Sets the value of this node.
	SetReadOnly (see page 7686)	Specifies whether the node can be modified.
	SetText (see page 7686)	Sets the text value of the node.
	TransformNode (see page 7686)	This is the overview for the TransformNode method overload.

Public Properties

	Name	Description
R	AttributeNodes (see page 7688)	Lists the interfaces for nodes that represent attributes of this node.
	Attributes (see page 7688)	Represents the values of this node's attributes.
R	ChildNodes (see page 7689)	Represents the child nodes of the node.
	ChildValues (see page 7690)	Represents the values of this node's child nodes.
R	Collection (see page 7690)	Indicates the collection in which this node appears.
R	Count (see page 7702)	Indicates the number of repeating child nodes.
R	DOMNode (see page 7691)	Provides access to the IDOMNode (see page 7557) interface for this node.
R	HasChildNodes (see page 7691)	Indicates whether this node has any child nodes.
R	IsTextElement (see page 7692)	Indicates whether the node has a single text value.
R	LocalName (see page 7692)	Indicates the name of the node without any namespace prefix.
R	NamespaceURI (see page 7693)	Identifies the URI for the namespace used in the qualified node name.
R	NodeName (see page 7693)	Indicates the node name.
R	Nodes (see page 7703)	Lists the interfaces of the repeating child nodes.
R	NodeType (see page 7694)	Indicates the type of the node.
	NodeValue (see page 7695)	Specifies the value of this node.
R	OwnerDocument (see page 7695)	Identifies the document in which this node appears.
R	ParentNode (see page 7695)	Identifies the interface of the node's parent node.
R	Prefix (see page 7696)	Identifies the namespace prefix of the node's name.
	ReadOnly (see page 7696)	Specifies whether the node can be modified.
R	SchemaDef (see page 7170)	This is SchemaDef, a member of class IXMLSchemaDefs.
	Text (see page 7697)	Represents the Text of the node.
R	XML (see page 7697)	Indicates the XML that corresponds to the subtree rooted at this node.

73.2.30.2 IXMLSchemaDefs Methods

The methods of the IXMLSchemaDefs class are listed here.

Public Methods

	Name	Description
	Add (see page 7170)	This is Add, a member of class IXMLSchemaDefs.

	GetXMLSchemaDef (see page 7170)	This is GetXMLSchemaDef, a member of class IXMLSchemaDefs.

73.2.30.2.1 IXMLSchemaDefs.Add Method

Pascal

```
function Add(const NamespaceURI: WideString = ''; const TargetNamespace: WideString = ''):
IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef Add(const BSTR NamespaceURI = '', const BSTR TargetNamespace = '');
```

Description

This is Add, a member of class IXMLSchemaDefs.

73.2.30.2.2 IXMLSchemaDefs.GetXMLSchemaDef Method

Pascal

```
function GetXMLSchemaDef(Index: Integer): IXMLSchemaDef;
```

C++

```
__fastcall IXMLSchemaDef GetXMLSchemaDef(int Index);
```

Description

This is GetXMLSchemaDef, a member of class IXMLSchemaDefs.

73.2.30.3 IXMLSchemaDefs Properties

The properties of the IXMLSchemaDefs class are listed here.

Public Properties

	Name	Description
	SchemaDef (see page 7170)	This is SchemaDef, a member of class IXMLSchemaDefs.

73.2.30.3.1 IXMLSchemaDefs.SchemaDef Property

Pascal

```
property SchemaDef [Index: Integer]: IXMLSchemaDef;
```

C++

```
__property IXMLSchemaDef SchemaDef[int Index];
```

Description

This is SchemaDef, a member of class IXMLSchemaDefs.

73.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	GetDefinition (see page 7171)	This is function WSDLBind.GetDefinition.
	LoadWSDLDoc (see page 7171)	This is function WSDLBind.LoadWSDLDoc.
	NewWSDLDoc (see page 7171)	This is function WSDLBind.NewWSDLDoc.

73.3.1 WSDLBind.GetDefinition Function

Pascal

```
function GetDefinition(Doc: TXMLDocument): IDefinition;
```

C++

```
IDefinition GetDefinition(TXMLDocument Doc);
```

File

WSDLBind

Description

This is function WSDLBind.GetDefinition.

73.3.2 WSDLBind.LoadWSDLDoc Function

Pascal

```
function LoadWSDLDoc(const FileName: WideString): IWSDLDocument;
```

C++

```
IWSDLDocument LoadWSDLDoc(const BSTR FileName);
```

File

WSDLBind

Description

This is function WSDLBind.LoadWSDLDoc.

73.3.3 WSDLBind.NewWSDLDoc Function

Pascal

```
function NewWSDLDoc: IWSDLDocument;
```

C++

```
IWSDLDocument NewWSDLDoc();
```

File

WSDLBind

Description

This is function WSDLBind.NewWSDLDoc.

73.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
SBinding (see page 7173)	This is constant WSDLBind.SBinding.
SDefinitions (see page 7173)	This is constant WSDLBind.SDefinitions.
SFault (see page 7174)	This is constant WSDLBind.SFault.
SImport (see page 7174)	This is constant WSDLBind.SImport.
SInput (see page 7174)	This is constant WSDLBind.SInput.
SLocation (see page 7175)	This is constant WSDLBind.SLocation.
SMessage (see page 7175)	This is constant WSDLBind.SMessage.
SNamespace (see page 7175)	This is constant WSDLBind.SNamespace.
SOperation (see page 7176)	This is constant WSDLBind.SOperation.
SOutput (see page 7176)	This is constant WSDLBind.SOutput.
SPart (see page 7176)	This is constant WSDLBind.SPart.
SPort (see page 7177)	This is constant WSDLBind.SPort.
SPortType (see page 7177)	This is constant WSDLBind.SPortType.
SService (see page 7177)	This is constant WSDLBind.SService.
SType (see page 7178)	This is constant WSDLBind.SType.
STypes (see page 7178)	This is constant WSDLBind.STypes.

73.4.1 WSDLBind.SBinding Constant

Pascal

```
SBinding = 'binding';
```

C++

```
SBinding = 'binding';
```

File

WSDLBind

Description

This is constant WSDLBind.SBinding.

73.4.2 WSDLBind.SDefinitions Constant

Pascal

```
SDefinitions = 'definitions';
```

C++

```
SDefinitions = 'definitions';
```

File

WSDLBind

Description

This is constant WSDLBind.SDefinitions.

73.4.3 WSDLBind.SFault Constant

Pascal

```
SFault = 'fault';
```

C++

```
SFault = 'fault';
```

File

WSDLBind

Description

This is constant WSDLBind.SFault.

73.4.4 WSDLBind.SImport Constant

Pascal

```
SImport = 'import';
```

C++

```
SImport = 'import';
```

File

WSDLBind

Description

This is constant WSDLBind.SImport.

73.4.5 WSDLBind.SInput Constant

Pascal

```
SInput = 'input';
```

C++

```
SInput = 'input';
```

File

WSDLBind

Description

This is constant WSDLBind.SInput.

73.4.6 WSDLBind.SLocation Constant

Pascal

```
SLocation = 'location';
```

C++

```
SLocation = 'location';
```

File

WSDLBind

Description

This is constant WSDLBind.SLocation.

73.4.7 WSDLBind.SMessage Constant

Pascal

```
SMessage = 'message';
```

C++

```
SMessage = 'message';
```

File

WSDLBind

Description

This is constant WSDLBind.SMessage.

73.4.8 WSDLBind.SNamespace Constant

Pascal

```
SNamespace = 'namespace';
```

C++

```
SNamespace = 'namespace';
```

File

WSDLBind

Description

This is constant WSDLBind.SNamespace.

73.4.9 WSDLBind.SOperation Constant

Pascal

```
SOperation = 'operation';
```

C++

```
SOperation = 'operation';
```

File

WSDLBind

Description

This is constant WSDLBind.SOperation.

73.4.10 WSDLBind.SOutput Constant

Pascal

```
SOutput = 'output';
```

C++

```
SOutput = 'output';
```

File

WSDLBind

Description

This is constant WSDLBind.SOutput.

73.4.11 WSDLBind.SPart Constant

Pascal

```
SPart = 'part';
```

C++

```
SPart = 'part';
```

File

WSDLBind

Description

This is constant WSDLBind.SPart.

73.4.12 WSDLBind.SPort Constant

Pascal

```
SPort = 'port';
```

C++

```
SPort = 'port';
```

File

WSDLBind

Description

This is constant WSDLBind.SPort.

73.4.13 WSDLBind.SPortType Constant

Pascal

```
SPortType = 'portType';
```

C++

```
SPortType = 'portType';
```

File

WSDLBind

Description

This is constant WSDLBind.SPortType.

73.4.14 WSDLBind.SService Constant

Pascal

```
SService = 'service';
```

C++

```
SService = 'service';
```

File

WSDLBind

Description

This is constant WSDLBind.SService.

73.4.15 WSDLBind.SType Constant

Pascal

```
SType = 'type';
```

C++

```
SType = 'type';
```

File

WSDLBind

Description

This is constant WSDLBind.SType.

73.4.16 WSDLBind.STypes Constant

Pascal

```
STypes = 'types';
```

C++

```
STypes = 'types';
```

File

WSDLBind

Description

This is constant WSDLBind.STypes.

74 WSDLIntf Namespace

This is namespace WSDLIntf.

Topics

Name	Description
Classes (see page 7181)	The following table lists classes in this documentation.
Structs, Records, Enums (see page 7185)	The following table lists structs, records, enums in this documentation.
Types (see page 7187)	The following table lists types in this documentation.
Constants (see page 7188)	The following table lists constants in this documentation.

Classes

	Name	Description
	TDOMStrings (see page 7181)	This is class WSDLIntf.TDOMStrings.

Constants

Name	Description
Directives (see page 7189)	This is constant WSDLIntf.Directives.
DynArrayTypes (see page 7189)	This is constant WSDLIntf.DynArrayTypes.
Httpns (see page 7190)	This is constant WSDLIntf.Httpns.
Operators (see page 7190)	This is constant WSDLIntf.Operators.
OtherReservedWords (see page 7190)	This is constant WSDLIntf.OtherReservedWords.
ReservedWords (see page 7191)	This is constant WSDLIntf.ReservedWords.
SAddress (see page 7191)	This is constant WSDLIntf.SAddress.
SAnySimpleType (see page 7192)	This is constant WSDLIntf.SAnySimpleType.
SAnyType (see page 7192)	This is constant WSDLIntf.SAnyType.
SArray (see page 7192)	This is constant WSDLIntf.SArray.
SArrayOf (see page 7193)	This is constant WSDLIntf.SArrayOf.
SArrayType (see page 7193)	This is constant WSDLIntf.SArrayType.
SBinding (see page 7193)	This is constant WSDLIntf.SBinding.
SBody (see page 7194)	This is constant WSDLIntf.SBody.
ScalarArrayTypes (see page 7194)	This is constant WSDLIntf.ScalarArrayTypes.
SComplexType (see page 7194)	This is constant WSDLIntf.SComplexType.
SDefinitions (see page 7195)	This is constant WSDLIntf.SDefinitions.
SDynArray (see page 7195)	This is constant WSDLIntf.SDynArray.
SElement (see page 7195)	This is constant WSDLIntf.SElement.
SEncodingStyle (see page 7196)	This is constant WSDLIntf.SEncodingStyle.

SFault (see page 7196)	This is constant WSDLIntf.SFault.
SHeader (see page 7196)	This is constant WSDLIntf.SHeader.
SImport (see page 7197)	This is constant WSDLIntf.SImport.
SInOut (see page 7197)	This is constant WSDLIntf.SInOut.
SInput (see page 7197)	This is constant WSDLIntf.SInput.
SLocation (see page 7198)	This is constant WSDLIntf.SLocation.
SMessage (see page 7198)	This is constant WSDLIntf.SMessage.
SName (see page 7198)	This is constant WSDLIntf.SName.
SNameSpace (see page 7199)	This is constant WSDLIntf.SNameSpace.
SNsPrefix (see page 7199)	This is constant WSDLIntf.SNsPrefix.
Soapns (see page 7199)	This is constant WSDLIntf.Soapns.
SOperation (see page 7200)	This is constant WSDLIntf.SOperation.
SOutput (see page 7200)	This is constant WSDLIntf.SOutput.
SPart (see page 7200)	This is constant WSDLIntf.SPart.
SParts (see page 7201)	This is constant WSDLIntf.SParts.
SPort (see page 7201)	This is constant WSDLIntf.SPort.
SPortType (see page 7201)	This is constant WSDLIntf.SPortType.
SRequest (see page 7202)	This is constant WSDLIntf.SRequest.
SResponse (see page 7202)	This is constant WSDLIntf.SResponse.
SReturn (see page 7202)	This is constant WSDLIntf.SReturn.
SSchema (see page 7203)	This is constant WSDLIntf.SSchema.
SService (see page 7203)	This is constant WSDLIntf.SService.
SSoapAction (see page 7203)	This is constant WSDLIntf.SSoapAction.
SStyle (see page 7204)	This is constant WSDLIntf.SStyle.
STns (see page 7204)	This is constant WSDLIntf.STns.
STransport (see page 7204)	This is constant WSDLIntf.STransport.
SType (see page 7205)	This is constant WSDLIntf.SType.
STypes (see page 7205)	This is constant WSDLIntf.STypes.
SUnknown (see page 7205)	This is constant WSDLIntf.SUnknown.
SUse (see page 7206)	This is constant WSDLIntf.SUse.
SVerb (see page 7206)	This is constant WSDLIntf.SVerb.
tns (see page 7206)	This is constant WSDLIntf.tns.
Wsdlns (see page 7207)	This is constant WSDLIntf.Wsdlns.
xsdns (see page 7207)	This is constant WSDLIntf.xsdns.

Structs, Records, Enums

	Name	Description
	TWebServiceBindingType (see page 7185)	TWebServiceBindingType indicates the binding type of a Web Service request or response.
	TWSDLElement (see page 7186)	This is record WSDLIntf.TWSDLElement.
	TWString (see page 7186)	This is record WSDLIntf.TWString.

Types

Name	Description
TWSDLElements (see page 7187)	This is type WSDLIntf.TWSDLElements.

74.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TDOMStrings (see page 7181)	This is class WSDLIntf.TDOMStrings.

74.1.1 TDOMStrings Class

Class Hierarchy

Pascal

```
TDOMStrings = class;
```

C++

```
class TDOMStrings;
```

File

WSDLIntf

Description

This is class WSDLIntf.TDOMStrings.

74.1.1.1 TDOMStrings Members

The following tables list the members exposed by TDOMStrings.

Public Methods

	Name	Description
	Add (see page 7182)	This is Add, a member of class TDOMStrings.
	Clear (see page 7183)	This is Clear, a member of class TDOMStrings.
	Count (see page 7183)	This is Count, a member of class TDOMStrings.
	Create (see page 7182)	This is Create, a member of class TDOMStrings.
	Destroy (see page 7182)	This is Destroy, a member of class TDOMStrings.
	IndexOf (see page 7183)	This is IndexOf, a member of class TDOMStrings.
	IndexOfIgnoreCase (see page 7183)	This is IndexOfIgnoreCase, a member of class TDOMStrings.
	Insert (see page 7183)	This is Insert, a member of class TDOMStrings.

Public Properties

	Name	Description
	Strings (see page 7184)	This is Strings, a member of class TDOMStrings.

74.1.1.2 TDOMStrings.Create Constructor

Pascal

```
constructor Create;
```

C++

```
__fastcall TDOMStrings();
```

Description

This is Create, a member of class TDOMStrings.

74.1.1.3 TDOMStrings.Destroy Destructor

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TDOMStrings();
```

Description

This is Destroy, a member of class TDOMStrings.

74.1.1.4 TDOMStrings Methods

The methods of the TDOMStrings class are listed here.

Public Methods

	Name	Description
	Add (see page 7182)	This is Add, a member of class TDOMStrings.
	Clear (see page 7183)	This is Clear, a member of class TDOMStrings.
	Count (see page 7183)	This is Count, a member of class TDOMStrings.
	IndexOf (see page 7183)	This is IndexOf, a member of class TDOMStrings.
	IndexOfIgnoreCase (see page 7183)	This is IndexOfIgnoreCase, a member of class TDOMStrings.
	Insert (see page 7183)	This is Insert, a member of class TDOMStrings.

74.1.1.4.1 TDOMStrings.Add Method

Pascal

```
function Add(const S: DOMString): Integer;
```

C++

```
__fastcall int Add(const DOMString S);
```

Description

This is Add, a member of class TDOMStrings.

74.1.1.4.2 TDOMStrings.Clear Method

Pascal

```
procedure Clear;
```

C++

```
__fastcall Clear();
```

Description

This is Clear, a member of class TDOMStrings.

74.1.1.4.3 TDOMStrings.Count Method

Pascal

```
function Count: Integer;
```

C++

```
__fastcall int Count();
```

Description

This is Count, a member of class TDOMStrings.

74.1.1.4.4 TDOMStrings.IndexOf Method

Pascal

```
function IndexOf(const S: DOMString): Integer;
```

C++

```
__fastcall int IndexOf(const DOMString S);
```

Description

This is IndexOf, a member of class TDOMStrings.

74.1.1.4.5 TDOMStrings.IndexOfIgnoreCase Method

Pascal

```
function IndexOfIgnoreCase(const S: DOMString): Integer;
```

C++

```
__fastcall int IndexOfIgnoreCase(const DOMString S);
```

Description

This is IndexOfIgnoreCase, a member of class TDOMStrings.

74.1.1.4.6 TDOMStrings.Insert Method

Pascal

```
procedure Insert(Index: Integer; const S: DOMString);
```

C++

```
__fastcall Insert(int Index, const DOMString S);
```

Description

This is Insert, a member of class TDOMStrings.

74.1.1.5 TDOMStrings Properties

The properties of the TDOMStrings class are listed here.

Public Properties

	Name	Description
	Strings (see page 7184)	This is Strings, a member of class TDOMStrings.

74.1.1.5.1 TDOMStrings.Strings Property

Pascal

```
property Strings [Index: Integer]: DOMString;
```

C++

```
__property DOMString Strings[int Index];
```

Description

This is Strings, a member of class TDOMStrings.

74.2 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	TWebServiceBindingType (see page 7185)	TWebServiceBindingType indicates the binding type of a Web Service request or response.
	TWSDLElement (see page 7186)	This is record WSDLIntf.TWSDLElement.

Records

	Name	Description
	TWString (see page 7186)	This is record WSDLIntf.TWString.

74.2.1 WSDLIntf.TWebServiceBindingType Enumeration

TWebServiceBindingType indicates the binding type of a Web Service request or response.

Pascal

```
TWebServiceBindingType = (
  btUnknown,
  btSoap,
  btHttp,
  btMime,
  btDIME
);
```

C++

```
enum TWebServiceBindingType {
  btUnknown,
  btSoap,
  btHttp,
  btMime,
  btDIME
};
```

File

WSDLIntf

Description

The following table lists the possible values:

Value	Meaning
btUnknown	The binding type is unknown.
btSoap	The request or response is encoded as a SOAP packet.
btHttp	The request or response is an HTTP messge.
btMime	The request or response uses a MIME encoding.
btDIME	The request or response uses a DIME encoding.

74.2.2 WSDLIntf.TWSDLElement Enumeration

Pascal

```
TWSDLElement = (
  weServiceIntf,
  weServiceImpl,
  weMessage,
  wePortType,
  weBinding,
  weService,
  weTypes,
  WeImport,
  weOperation,
  wePart
);
```

C++

```
enum TWSDLElement {
  weServiceIntf,
  weServiceImpl,
  weMessage,
  wePortType,
  weBinding,
  weService,
  weTypes,
  WeImport,
  weOperation,
  wePart
};
```

File

WSDLIntf

Description

This is record WSDLIntf.TWSDLElement.

74.2.3 WSDLIntf.TWString Record

Pascal

```
TWString = record
  WString: DOMString;
end;
```

C++

```
struct TWString {
  DOMString WString;
};
```

File

WSDLIntf

Description

This is record WSDLIntf.TWString.

74.3 Types

The following table lists types in this documentation.

Types

Name	Description
TWSDLElements (see page 7187)	This is type WSDLIntf.TWSDLElements.

74.3.1 WSDLIntf.TWSDLElements Type

Pascal

```
TWSDLElements = set of TWSDLElement;
```

C++

```
TWSDLElement TWSDLElements;
```

File

WSDLIntf

Description

This is type WSDLIntf.TWSDLElements.

74.4 Constants

The following table lists constants in this documentation.

Constants

Name	Description
Directives (see page 7189)	This is constant WSDLIntf.Directives.
DynArrayTypes (see page 7189)	This is constant WSDLIntf.DynArrayTypes.
Httpns (see page 7190)	This is constant WSDLIntf.Httpns.
Operators (see page 7190)	This is constant WSDLIntf.Operators.
OtherReservedWords (see page 7190)	This is constant WSDLIntf.OtherReservedWords.
ReservedWords (see page 7191)	This is constant WSDLIntf.ReservedWords.
SAddress (see page 7191)	This is constant WSDLIntf.SAddress.
SAnySimpleType (see page 7192)	This is constant WSDLIntf.SAnySimpleType.
SAnyType (see page 7192)	This is constant WSDLIntf.SAnyType.
SArray (see page 7192)	This is constant WSDLIntf.SArray.
SArrayOf (see page 7193)	This is constant WSDLIntf.SArrayOf.
SArrayType (see page 7193)	This is constant WSDLIntf.SArrayType.
SBinding (see page 7193)	This is constant WSDLIntf.SBinding.
SBody (see page 7194)	This is constant WSDLIntf.SBody.
ScalarArrayTypes (see page 7194)	This is constant WSDLIntf.ScalarArrayTypes.
SComplexType (see page 7194)	This is constant WSDLIntf.SComplexType.
SDefinitions (see page 7195)	This is constant WSDLIntf.SDefinitions.
SDynArray (see page 7195)	This is constant WSDLIntf.SDynArray.
SElement (see page 7195)	This is constant WSDLIntf.SElement.
SEncodingStyle (see page 7196)	This is constant WSDLIntf.SEncodingStyle.
SFault (see page 7196)	This is constant WSDLIntf.SFault.
SHeader (see page 7196)	This is constant WSDLIntf.SHeader.
SImport (see page 7197)	This is constant WSDLIntf.SImport.
SInOut (see page 7197)	This is constant WSDLIntf.SInOut.
SInput (see page 7197)	This is constant WSDLIntf.SInput.
SLocation (see page 7198)	This is constant WSDLIntf.SLocation.
SMessage (see page 7198)	This is constant WSDLIntf.SMessage.
SName (see page 7198)	This is constant WSDLIntf.SName.
SNameSpace (see page 7199)	This is constant WSDLIntf.SNameSpace.
SNsPrefix (see page 7199)	This is constant WSDLIntf.SNsPrefix.
Soapns (see page 7199)	This is constant WSDLIntf.Soapns.
SOperation (see page 7200)	This is constant WSDLIntf.SOperation.
SOutput (see page 7200)	This is constant WSDLIntf.SOutput.
SPart (see page 7200)	This is constant WSDLIntf.SPart.
SParts (see page 7201)	This is constant WSDLIntf.SParts.
SPort (see page 7201)	This is constant WSDLIntf.SPort.
SPortType (see page 7201)	This is constant WSDLIntf.SPortType.
SRequest (see page 7202)	This is constant WSDLIntf.SRequest.
SResponse (see page 7202)	This is constant WSDLIntf.SResponse.
SReturn (see page 7202)	This is constant WSDLIntf.SReturn.
SSchema (see page 7203)	This is constant WSDLIntf.SSchema.
SService (see page 7203)	This is constant WSDLIntf.SService.
SSoapAction (see page 7203)	This is constant WSDLIntf.SSoapAction.
SStyle (see page 7204)	This is constant WSDLIntf.SStyle.

STns (see page 7204)	This is constant WSDLIntf.STns.
STransport (see page 7204)	This is constant WSDLIntf.STransport.
SType (see page 7205)	This is constant WSDLIntf.SType.
STypes (see page 7205)	This is constant WSDLIntf.STypes.
SUnknown (see page 7205)	This is constant WSDLIntf.SUnknown.
SUse (see page 7206)	This is constant WSDLIntf.SUse.
SVerb (see page 7206)	This is constant WSDLIntf.SVerb.
tns (see page 7206)	This is constant WSDLIntf.tns.
Wsdlns (see page 7207)	This is constant WSDLIntf.Wsdlns.
xsdns (see page 7207)	This is constant WSDLIntf.xsdns.

74.4.1 WSDLIntf.Directives Constant

Pascal

```
Directives: array[0..43] of string =
('absolute','abstract','assembler','automated','cdecl','contains', 'default','dispid',
'dynamic', 'export','external','far','forward','implements','index','message',

l',
'stored','virtual','write','writeonly','on','platform','deprecated','local','varargs');
```

C++

```
array[0..43] of string Directives =
('absolute','abstract','assembler','automated','cdecl','contains', 'default','dispid',
'dynamic', 'export','external','far','forward','implements','index','message',
'name','near','nodefault','overload','override','package','pascal','private','protected','publi
c',
'published','read','readonly','register','reintroduce','requires','resident','safecall','stdcal
l',
'stored','virtual','write','writeonly','on','platform','deprecated','local','varargs');
```

File

WSDLIntf

Description

This is constant WSDLIntf.Directives.

74.4.2 WSDLIntf.DynArrayTypes Constant

Pascal

```
DynArrayTypes: array[0..12] of string =
('TIntegerDynArray','TCardinalDynArray','TWordDynArray',
'TSmallIntDynArray','TByteDynArray','TShortIntDynArray','TInt64DynArray','TLongWordDynArray','T
SingleDynArray',
'TDoubleDynArray','TBooleanDynArray','TStringDynArray','TWideStringDynArray');
```

C++

```
array[0..12] of string DynArrayTypes =
('TIntegerDynArray','TCardinalDynArray','TWordDynArray',
'TSmallIntDynArray','TByteDynArray','TShortIntDynArray','TInt64DynArray','TLongWordDynArray','T
SingleDynArray',
```

```
'TDoubleDynArray','TBooleanDynArray','TStringDynArray','TWideStringDynArray');
```

File

WSDLIntf

Description

This is constant WSDLIntf.DynArrayTypes.

74.4.3 WSDLIntf.Httpns Constant

Pascal

```
Httpns = Wsdlns +'http/';
```

C++

```
Httpns = Wsdlns +'http/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.Httpns.

74.4.4 WSDLIntf.Operators Constant

Pascal

```
Operators: array[0..12] of string = ('+','-','*','/','@','^','=','>','<','<>','<=','>=',':=');
```

C++

```
array[0..12] of string Operators = ('+','-','*','/','@','^','=','>','<','<>','<=','>=',':=');
```

File

WSDLIntf

Description

This is constant WSDLIntf.Operators.

74.4.5 WSDLIntf.OtherReservedWords Constant

Pascal

```
OtherReservedWords: array[0..0] of string = ('Application');
```

C++

```
array[0..0] of string OtherReservedWords = ('Application');
```

File

WSDLIntf

Description

This is constant WSDLIntf.OtherReservedWords.

74.4.6 WSDLIntf.ReservedWords Constant

Pascal

```
ReservedWords: array[0..66] of string = ('and', 'array', 'as', 'asm', 'begin','case',
'class','const','constructor','destructor', 'dispinterface', 'div', 'do','downto', 'else',
'end', 'except', 'exports', 'file', 'finalization', 'finally', 'for','function', 'goto',
'high', 'if', 'implementation', 'in','inherited','initialization', 'inline','interface',
'is','label','library', 'low',
'mod','nil','not','object','of','or','out','packed','procedure',
'program','property','raise','record','repeat', 'resourcestring', 'set','shl','shr', 'string',
'then', 'threadvar', 'to','try','type','unit','until','uses','var','while','with','xor');
```

C++

```
array[0..66] of string ReservedWords = ('and', 'array', 'as', 'asm', 'begin','case',
'class','const','constructor','destructor', 'dispinterface', 'div', 'do','downto', 'else',
'end', 'except', 'exports', 'file', 'finalization', 'finally', 'for','function', 'goto',
'high', 'if', 'implementation', 'in','inherited','initialization', 'inline','interface',
'is','label','library', 'low',
'mod','nil','not','object','of','or','out','packed','procedure',
'program','property','raise','record','repeat', 'resourcestring', 'set','shl','shr', 'string',
'then', 'threadvar', 'to','try','type','unit','until','uses','var','while','with','xor');
```

File

WSDLIntf

Description

This is constant WSDLIntf.ReservedWords.

74.4.7 WSDLIntf.SAddress Constant

Pascal

```
SAddress = 'address';
```

C++

```
SAddress = 'address';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SAddress.

74.4.8 WSDLIntf.SAnySimpleType Constant

Pascal

```
SAnySimpleType = 'anySimpleType';
```

C++

```
SAnySimpleType = 'anySimpleType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SAnySimpleType.

74.4.9 WSDLIntf.SAnyType Constant

Pascal

```
SAnyType = 'anyType';
```

C++

```
SAnyType = 'anyType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SAnyType.

74.4.10 WSDLIntf.SArray Constant

Pascal

```
SArray = 'Array';
```

C++

```
SArray = 'Array';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SArray.

74.4.11 WSDLIntf.SArrayOf Constant

Pascal

```
SArrayOf = 'ArrayOf';
```

C++

```
SArrayOf = 'ArrayOf';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SArrayOf.

74.4.12 WSDLIntf.SArrayType Constant

Pascal

```
SArrayType = 'arrayType';
```

C++

```
SArrayType = 'arrayType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SArrayType.

74.4.13 WSDLIntf.SBinding Constant

Pascal

```
SBinding = 'binding';
```

C++

```
SBinding = 'binding';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SBinding.

74.4.14 WSDLIntf.SBody Constant

Pascal

```
SBody = 'body';
```

C++

```
SBody = 'body';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SBody.

74.4.15 WSDLIntf.ScalarArrayTypes Constant

Pascal

```
ScalarArrayTypes: array[0..12] of string =
('Integer','Cardinal','Word','SmallInt','Byte','ShortInt','Int64',
'LongWord','Single','Double','Boolean','String','WideString');
```

C++

```
array[0..12] of string ScalarArrayTypes =
('Integer','Cardinal','Word','SmallInt','Byte','ShortInt','Int64',
'LongWord','Single','Double','Boolean','String','WideString');
```

File

WSDLIntf

Description

This is constant WSDLIntf.ScalarArrayTypes.

74.4.16 WSDLIntf.SComplexType Constant

Pascal

```
SComplexType = 'complexType';
```

C++

```
SComplexType = 'complexType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SComplexType.

74.4.17 WSDLIntf.SDefinitions Constant

Pascal

```
SDefinitions = 'definitions';
```

C++

```
SDefinitions = 'definitions';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SDefinitions.

74.4.18 WSDLIntf.SDynArray Constant

Pascal

```
SDynArray = 'array of ';
```

C++

```
SDynArray = 'array of ';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SDynArray.

74.4.19 WSDLIntf.SElement Constant

Pascal

```
SElement = 'element';
```

C++

```
SElement = 'element';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SElement.

74.4.20 WSDLIntf.SEncodingStyle Constant

Pascal

```
SEncodingStyle = 'encodingStyle';
```

C++

```
SEncodingStyle = 'encodingStyle';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SEncodingStyle.

74.4.21 WSDLIntf.SFault Constant

Pascal

```
SFault = 'fault';
```

C++

```
SFault = 'fault';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SFault.

74.4.22 WSDLIntf.SHeader Constant

Pascal

```
SHeader = 'header';
```

C++

```
SHeader = 'header';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SHeader.

74.4.23 WSDLIntf.SImport Constant

Pascal

```
SImport = 'import';
```

C++

```
SImport = 'import';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SImport.

74.4.24 WSDLIntf.SInOut Constant

Pascal

```
SInOut = 'inout';
```

C++

```
SInOut = 'inout';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SInOut.

74.4.25 WSDLIntf.SInput Constant

Pascal

```
SInput = 'input';
```

C++

```
SInput = 'input';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SInput.

74.4.26 WSDLIntf.SLocation Constant

Pascal

```
SLocation = 'location';
```

C++

```
SLocation = 'location';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SLocation.

74.4.27 WSDLIntf.SMessage Constant

Pascal

```
SMessage = 'message';
```

C++

```
SMessage = 'message';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SMessage.

74.4.28 WSDLIntf.SName Constant

Pascal

```
SName = 'name';
```

C++

```
SName = 'name';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SName.

74.4.29 WSDLIntf.SNameSpace Constant

Pascal

```
SNameSpace = 'namespace';
```

C++

```
SNameSpace = 'namespace';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SNameSpace.

74.4.30 WSDLIntf.SNsPrefix Constant

Pascal

```
SNsPrefix = 'ns';
```

C++

```
SNsPrefix = 'ns';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SNsPrefix.

74.4.31 WSDLIntf.Soapns Constant

Pascal

```
Soapns = Wsdlns +'soap/';
```

C++

```
Soapns = Wsdlns +'soap/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.Soapns.

74.4.32 WSDLIntf.SOperation Constant

Pascal

```
SOperation = 'operation';
```

C++

```
SOperation = 'operation';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SOperation.

74.4.33 WSDLIntf.SOutput Constant

Pascal

```
SOutput = 'output';
```

C++

```
SOutput = 'output';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SOutput.

74.4.34 WSDLIntf.SPart Constant

Pascal

```
SPart = 'part';
```

C++

```
SPart = 'part';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SPart.

74.4.35 WSDLIntf.SParts Constant

Pascal

```
SParts = 'parts';
```

C++

```
SParts = 'parts';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SParts.

74.4.36 WSDLIntf.SPort Constant

Pascal

```
SPort = 'port';
```

C++

```
SPort = 'port';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SPort.

74.4.37 WSDLIntf.SPortType Constant

Pascal

```
SPortType = 'portType';
```

C++

```
SPortType = 'portType';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SPortType.

74.4.38 WSDLIntf.SRequest Constant

Pascal

```
SRequest = 'Request';
```

C++

```
SRequest = 'Request';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SRequest.

74.4.39 WSDLIntf.SResponse Constant

Pascal

```
SResponse = 'Response';
```

C++

```
SResponse = 'Response';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SResponse.

74.4.40 WSDLIntf.SReturn Constant

Pascal

```
SReturn = 'return';
```

C++

```
SReturn = 'return';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SReturn.

74.4.41 WSDLIntf.SSchema Constant

Pascal

```
SSchema = 'schema';
```

C++

```
SSchema = 'schema';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SSchema.

74.4.42 WSDLIntf.SService Constant

Pascal

```
SService = 'service';
```

C++

```
SService = 'service';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SService.

74.4.43 WSDLIntf.SSoapAction Constant

Pascal

```
SSoapAction = 'soapAction';
```

C++

```
SSoapAction = 'soapAction';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SSoapAction.

74.4.44 WSDLIntf.SStyle Constant

Pascal

```
SStyle = 'style';
```

C++

```
SStyle = 'style';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SStyle.

74.4.45 WSDLIntf.STns Constant

Pascal

```
STns = 'targetNamespace';
```

C++

```
STns = 'targetNamespace';
```

File

WSDLIntf

Description

This is constant WSDLIntf.STns.

74.4.46 WSDLIntf.STransport Constant

Pascal

```
STransport = 'transport';
```

C++

```
STransport = 'transport';
```

File

WSDLIntf

Description

This is constant WSDLIntf.STransport.

74.4.47 WSDLIntf.SType Constant

Pascal

```
SType = 'type';
```

C++

```
SType = 'type';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SType.

74.4.48 WSDLIntf.STypes Constant

Pascal

```
STypes = 'types';
```

C++

```
STypes = 'types';
```

File

WSDLIntf

Description

This is constant WSDLIntf.STypes.

74.4.49 WSDLIntf.SUnknown Constant

Pascal

```
SUnknown = 'Unknown';
```

C++

```
SUnknown = 'Unknown';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SUnknown.

74.4.50 WSDLIntf.SUse Constant

Pascal

```
SUse = 'use';
```

C++

```
SUse = 'use';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SUse.

74.4.51 WSDLIntf.SVerb Constant

Pascal

```
SVerb = 'verb';
```

C++

```
SVerb = 'verb';
```

File

WSDLIntf

Description

This is constant WSDLIntf.SVerb.

74.4.52 WSDLIntf.tns Constant

Pascal

```
tns = 'http:/'+'/tempuri.org/';
```

C++

```
tns = 'http:/'+'/tempuri.org/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.tns.

74.4.53 WSDLIntf.Wsdlns Constant

Pascal

```
Wsdlns = 'http:/'+'/schemas.xmlsoap.org/wsdl/';
```

C++

```
Wsdlns = 'http:/'+'/schemas.xmlsoap.org/wsdl/';
```

File

WSDLIntf

Description

This is constant WSDLIntf.Wsdlns.

74.4.54 WSDLIntf.xsdns Constant

Pascal

```
xsdns = 'http:/'+'/www.w3.org/1999/XMLSchema';
```

C++

```
xsdns = 'http:/'+'/www.w3.org/1999/XMLSchema';
```

File

WSDLIntf

Description

This is constant WSDLIntf.xsdns.

75 WSDLItems Namespace

This is namespace WSDLItems.

Topics

Name	Description
Classes (see page 7211)	The following table lists classes in this documentation.
Interfaces (see page 7247)	The following table lists interfaces in this documentation.
Functions (see page 7259)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 7261)	The following table lists structs, records, enums in this documentation.
Types (see page 7262)	The following table lists types in this documentation.

Classes

	Name	Description
	TWSDLItems (see page 7211)	TWSDLItems represents the definitions in a WSDL document.

Functions

	Name	Description
	HasDefinition (see page 7259)	This is function WSDLItems.HasDefinition.
	HasDefinition (see page 7259)	This is function WSDLItems.HasDefinition.
	NewQualifiedName (see page 7259)	This is function WSDLItems.NewQualifiedName.

Interfaces

	Name	Description
	IHeaderInfo (see page 7247)	This is class WSDLItems.IHeaderInfo.
	IQualifiedName (see page 7252)	IQualifiedName is the interface for obtaining an information about a name in an XML document.
	IWSDLItems (see page 7256)	IWSDLItems provides access to a WSDL document.

Structs, Records, Enums

	Name	Description
	IterateImportOptions (see page 7261)	This is record WSDLItems.IterateImportOptions.

Types

Name	Description
IHeaderInfoArray (see page 7262)	This is type WSDLItems.IHeaderInfoArray.
IQualifiedNameArray (see page 7262)	IQualifiedNameArray is a dynamic array of interfaces for obtaining names of XML items.

TWSDLIterateProc (see page 7263)	TWSDLIterateProc is the type for callbacks that execute when importing a WSDL document.

75.1 Classes

The following table lists classes in this documentation.

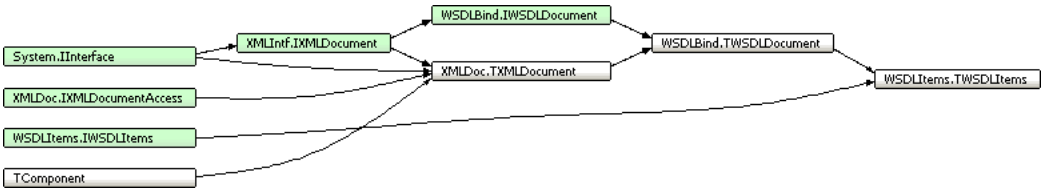
Classes

	Name	Description
	TWSDLItems (see page 7211)	TWSDLItems represents the definitions in a WSDL document.

75.1.1 TWSDLItems Class

TWSDLItems represents the definitions in a WSDL document.

Class Hierarchy



Pascal

```
TWSDLItems = class(TWSDLDocument, IWSDLItems);
```

C++

```
class TWSDLItems : public TWSDLDocument, public IWSDLItems;
```

File

WSDLItems

Description

Use TWSDLItems to represent a WSDL (Web Services Definition Language) document. A WSDL document is a special form of XML document that describes the contents of a Web Service application and how you call the services it implements. TWSDLItems augments its immediate ancestor (TWSDLDocument (see page 7063)) by introducing methods that provide easier access to the definitions in the WSDL document.

TWSDLItems can read an existing WSDL document from a file or server, it can be associated with an in-memory string that is the contents of a WSDL document, or it can create a new, empty WSDL document. TWSDLItems uses an external DOM (Document Object Model) parser to analyze the WSDL document. This parser is usually assigned by specifying the DOMVendor property. When you set the Active property to true, TWSDLItems uses the DOM parser to parse the WSDL document so that you can examine or modify it.

When TWSDLItems is created without an Owner, it behaves like an interfaced object. That is, when all references to its interface are released, the TWSDLItems instance is automatically freed. When TWSDLItems is created with an Owner, however, it behaves like any other component, and is freed by its Owner.

See Also

TWSDLView (see page 7271)

75.1.1.1 TWSDLItems Members

The following tables list the members exposed by TWSDLItems.

Protected Methods

	Name	Description
	_AddRef (see page 7354)	Called when an application uses a component interface.
	_Release (see page 7354)	Called when an application releases a component interface.
	AssignParseOptions (see page 7356)	This is AssignParseOptions, a member of class TXMLDocument.
	CheckActive (see page 7356)	This is CheckActive, a member of class TXMLDocument.
	CheckAutoSave (see page 7356)	This is CheckAutoSave, a member of class TXMLDocument.
	CheckDOM (see page 7356)	This is CheckDOM, a member of class TXMLDocument.
	DefineProperties (see page 7358)	Designates methods for storing an object's unpublished data on a stream such as a form file.
	DoAfterClose (see page 7359)	This is DoAfterClose, a member of class TXMLDocument.
	DoAfterOpen (see page 7359)	This is DoAfterOpen, a member of class TXMLDocument.
	DoBeforeClose (see page 7359)	This is DoBeforeClose, a member of class TXMLDocument.
	DoBeforeOpen (see page 7360)	This is DoBeforeOpen, a member of class TXMLDocument.
	DoNodeChange (see page 7360)	This is DoNodeChange, a member of class TXMLDocument.
	GetActive (see page 7360)	Returns the value of the Active property.
	GetAsyncLoadState (see page 7361)	Returns the value of the AsyncLoadState property.
	GetChildNodeClass (see page 7361)	This is GetChildNodeClass, a member of class TXMLDocument.
	GetChildNodes (see page 7361)	Returns the value of the ChildNodes property.
	GetDefinition (see page 7069)	Returns the value of the Definition property.
	GetDocumentElement (see page 7362)	Returns the value of the DocumentElement property.
	GetDocumentNode (see page 7362)	Returns the value of the Node property.
	GetDocumentObject (see page 7363)	This is GetDocumentObject, a member of class TXMLDocument.
	GetDOMDocument (see page 7363)	Returns the value of the DOMDocument property.
	GetDOMPersist (see page 7363)	This is GetDOMPersist, a member of class TXMLDocument.
	GetEncoding (see page 7363)	Returns the value of the Encoding property.
	GetFileName (see page 7364)	Returns the value of the FileName property.
	GetModified (see page 7364)	Returns the value of the Modified property.
	GetName (see page 7225)	Returns the name of the definitions node in the WSDL document.
	GetNodeIndentStr (see page 7364)	Returns the value of the NodeIndentStr property.
	GetOptions (see page 7365)	Returns the value of the Options property.
	GetParseOptions (see page 7365)	Returns the value of the ParseOptions property.
	GetPrologNode (see page 7365)	This is GetPrologNode, a member of class TXMLDocument.
	GetPrologValue (see page 7366)	This is GetPrologValue, a member of class TXMLDocument.
	GetSchemaRef (see page 7366)	Returns the value of the SchemaRef property.
	GetStandAlone (see page 7366)	Returns the value of the StandAlone property.
	GetTargetNamespace (see page 7242)	Returns the value of the TargetNamespace (see page 7246) property.
	GetTargetNamespacePrefix (see page 7243)	Returns the prefix string that represents the target namespace of the WSDL document.
	GetVersion (see page 7366)	Returns the value of the Version property.
	GetXML (see page 7367)	Returns the value of the XML property.
	InternalSetPrologValue (see page 7367)	This is InternalSetPrologValue, a member of class TXMLDocument.
	LoadData (see page 7069)	This is LoadData, a member of class TWSDLDocument.
	LoadData (see page 7368)	This is LoadData, a member of class TXMLDocument.
	Loaded (see page 7368)	Initializes the component after the form file has been read into memory.
	ReadDOMVendor (see page 7371)	This is ReadDOMVendor, a member of class TXMLDocument.
	ReleaseDoc (see page 7372)	This is ReleaseDoc, a member of class TXMLDocument.
	SaveToUTF8String (see page 7374)	This is SaveToUTF8String, a member of class TXMLDocument.
	SaveToXMLStrings (see page 7375)	Saves the XML (see page 7392) document to an internal string list.

	SetActive (see page 7375)	Sets the value of the Active property.
	SetDefinition (see page 7070)	Sets the value of the Definition property.
	SetDocumentElement (see page 7375)	Sets the value of the DocumentElement property.
	SetDOMDocument (see page 7376)	Sets the value of the DOMDocument property.
	SetEncoding (see page 7376)	Sets the value of the Encoding property.
	SetFileName (see page 7376)	Sets the value of the FileName property.
	SetModified (see page 7377)	This is SetModified, a member of class TXMLDocument.
	SetNodeIndentStr (see page 7377)	Sets the value of the NodeIndentStr property.
	SetOnAsyncLoad (see page 7377)	Supplies an event handler that responds when the AsyncLoadState property changes.
	SetOptions (see page 7378)	Sets the value of the Options property.
	SetParseOptions (see page 7378)	Sets the value of the ParseOptions property.
	SetPrologValue (see page 7378)	This is SetPrologValue, a member of class TXMLDocument.
	SetStandAlone (see page 7378)	Sets the value of the StandAlone property.
	SetVersion (see page 7379)	Sets the value of the Version property.
	SetXML (see page 7379)	Sets the value of the XML property.
	SetXMLStrings (see page 7379)	This is SetXMLStrings, a member of class TXMLDocument.
	WriteDOMVendor (see page 7380)	This is WriteDOMVendor, a member of class TXMLDocument.
	XMLStringsChanging (see page 7380)	This is XMLStringsChanging, a member of class TXMLDocument.

Protected Properties

	Name	Description
	DocBindingInfo (see page 7383)	This is DocBindingInfo, a member of class TXMLDocument.
	DocSource (see page 7383)	This is DocSource, a member of class TXMLDocument.
	DOMParseOptions (see page 7385)	This is DOMParseOptions, a member of class TXMLDocument.
	DOMPersist (see page 7386)	This is DOMPersist, a member of class TXMLDocument.
	PrefixID (see page 7391)	This is PrefixID, a member of class TXMLDocument.

Public Methods

	Name	Description
	_AddRef (see page 3503)	Increments the reference count for this interface.
	_Release (see page 3503)	Decrements the reference count for this interface.
	AddChild (see page 7354)	This is the overview for the AddChild method overload.
	AddChild (see page 7643)	This is the overview for the AddChild method overload.
	AfterConstruction (see page 7069)	Initializes the TWSDLDocument (see page 7063) object after the last constructor has executed.
	AfterConstruction (see page 7355)	Responds after the last constructor has executed.
	CompareName (see page 7219)	Indicates whether two node names refer to the same element.
	Create (see page 7217)	This is the overview for the Create constructor overload.
	Create (see page 7351)	This is the overview for the Create constructor overload.
	CreateElement (see page 7357)	Creates a new element node that is associated with this document.
	CreateElement (see page 7644)	Creates a new element node that is associated with this document.
	CreateNode (see page 7357)	Creates a new node that is associated with this document.
	CreateNode (see page 7645)	Creates a new node that is associated with this document.
	Destroy (see page 7352)	Disposes of a TXMLDocument (see page 7347) object.
	GeneratePrefix (see page 7360)	Generates a unique namespace prefix that can be used for a node in the document.
	GeneratePrefix (see page 7646)	Generates a unique namespace prefix that can be used for a node in the document.
	GetActive (see page 7646)	Returns the value of the Active (see page 7661) property.
	GetAsyncLoadState (see page 7647)	Returns the value of the AsyncLoadState (see page 7662) property.
	GetBindingForServicePort (see page 7220)	Returns the name of the binding associated with a specified service and port.
	GetBindingOfType (see page 7221)	Returns the names of all bindings associated with a specified port type.
	GetBindingOperationNode (see page 7221)	Returns the interface for a specified operation on a specified binding.
	GetBindings (see page 7222)	Fills a WideString (see page 3467) list with the names of all bindings defined in the WSDL document.

	GetBindingType (see page 7222)	Returns the port type to which a specified binding applies.
	GetChildNodes (see page 7647)	Returns the value of the ChildNodes (see page 7663) property.
	GetDefinition (see page 7166)	Returns the value of the Definition (see page 7167) property.
	GetDocBinding (see page 7362)	Replaces the document element with an instance of a specified implementation class.
	GetDocBinding (see page 7647)	Replaces a specified child node with an instance of a specified implementation class.
	GetDocumentElement (see page 7648)	Returns the value of the DocumentElement (see page 7663) property.
	GetDocumentNode (see page 7648)	Returns the value of the Node (see page 7665) property.
	GetDocumentObject (see page 7479)	This is GetDocumentObject, a member of class IXMLDocumentAccess.
	GetDOMDocument (see page 7648)	Returns the value of the DOMDocument (see page 7663) property.
	GetDOMPersist (see page 7479)	This is GetDOMPersist, a member of class IXMLDocumentAccess.
	GetEncoding (see page 7649)	Returns the value of the Encoding (see page 7664) property.
	GetFileName (see page 7649)	Returns the value of the FileName (see page 7664) property.
	GetHttpBindingAttribute (see page 7223)	This is the overview for the GetHttpBindingAttribute method overload.
	GetImports (see page 7223)	Fills a WideString (see page 3467) list with the namespaces of all documents imported by this one.
	GetLocationForImport (see page 7224)	Fills a string list with the names of all messages that must be passed in or out when calling a specified operation.
	GetMessageNode (see page 7224)	Returns the interface for the node that describes a message.
	GetMessages (see page 7224)	Fills a WideString (see page 3467) list with the names of all messages defined in the WSDL document.
	GetModified (see page 7649)	Returns the value of the Modified (see page 7665) property.
	GetNodeIndentStr (see page 7650)	Returns the value of the NodeIndentStr (see page 7666) property.
	GetOperationNode (see page 7225)	Returns the interface for the node that describes an operation.
	GetOperations (see page 7226)	Fills a WideString (see page 3467) list with the names of all operations defined for a specified port type.
	GetOperationsForBinding (see page 7226)	Fills a list with the names of all operations defined on the port type of a specified binding.
	GetOptions (see page 7650)	Returns the value of the Options (see page 7666) property.
	GetParseOptions (see page 7650)	Returns the value of the ParseOptions (see page 7667) property.
	GetPartNode (see page 7227)	Returns the interface for the node that describes a part of a message.
	GetParts (see page 7227)	Fills a list with the names of all parts defined for a specified message.
	GetPartsForOperation (see page 7228)	Fills a list with the names of all parts defined for input messages of a specified operation.
	GetPortsForService (see page 7229)	Fills a list with the names of all ports defined within a specified service.
	GetPortTypeNode (see page 7229)	Returns the interface for the node that describes a port type defined in the WSDL document.
	GetPortTypes (see page 7229)	Fills a list with the names of all port types defined in the WSDL document.
	GetSchemaNode (see page 7230)	Returns the interface for the schema node that defines a type.
	GetSchemaRef (see page 7650)	Returns the value of the SchemaRef (see page 7667) property.
	GetSchemas (see page 7230)	Fills a list with the namespaces for all schema definitions of types in the WSDL document.
	GetServiceAndPortOfBinding (see page 7231)	Retrieves the names of the service and port associated with a specified binding.
	GetServiceNode (see page 7231)	Returns the interface for the node that describes a service defined in the WSDL document.
	GetServices (see page 7232)	Fills a list with the names of all services defined in the WSDL document.
	GetSoapAction (see page 7232)	Returns the value of the soapAction attribute of a specified operation on a specified binding.
	GetSoapActionList (see page 7233)	Fills a list with the soapAction attributes for all operations on a specified SOAP binding.
	GetSoapAddressForServicePort (see page 7234)	Returns the address of a specified port from a specified service.
	GetSoapBindingAttribute (see page 7234)	Returns the value of a specified attribute of a specified SOAP binding.
	GetSoapBindingInputNode (see page 7235)	Returns the interface for the input node on a specified binding and operation.
	GetSoapBindingIONode (see page 7235)	Returns the interface for a node on a specified binding and operation.
	GetSoapBindingOutputNode (see page 7236)	Returns the interface for the output node on a specified binding and operation.
	GetSoapBodyAttribute (see page 7236)	Returns the value of an attribute of a body tag of a message type in an operation on the port type of a SOAP binding.

	GetSoapBodyInputAttribute (see page 7237)	Returns the value of an attribute of a body tag of an input message in an operation on the port type of a SOAP binding.
	GetSoapBodyNamespace (see page 7238)	Returns the value of the first namespace attribute found on a SOAP body node inside a binding with a specified port type.
	GetSoapBodyOutputAttribute (see page 7238)	Returns the value of an attribute of a body tag of an output message in an operation on the port type of a SOAP binding.
	GetSoapHeaders (see page 7239)	Returns an interface for accessing a specified set of header nodes.
	GetSoapInputHeaders (see page 7240)	Returns an interface for accessing the header nodes that belong to the input node of a specified binding and operation.
	GetSoapOperationAttribute (see page 7240)	Returns the value of an attribute on the <soap:operation> node of an operation on a SOAP binding.
	GetSoapOperationStyle (see page 7241)	Returns the value of the style attribute of a specified operation on a specified binding.
	GetSoapOutputHeaders (see page 7241)	Returns an interface for accessing the header nodes that belong to the output node of a specified binding and operation.
	GetStandAlone (see page 7651)	Returns the value of the StandAlone (see page 7668) property.
	GetVersion (see page 7651)	Returns the value of the Version (see page 7668) property.
	GetWSDLDoc (see page 7243)	Returns the interface for this TWSDLItems (see page 7211) instance.
	GetWSDLItems (see page 7243)	Returns a reference to this TWSDLItems (see page 7211) instance.
	GetXML (see page 7651)	Returns the value of the XML (see page 7668) property.
	HasTypesNode (see page 7244)	Indicates whether the WSDL document includes any type definitions.
	IsEmptyDoc (see page 7367)	Indicates whether the TXMLDocument (see page 7347) instance represents an empty document.
	IsEmptyDoc (see page 7652)	Indicates whether the IXMLDocument (see page 7640) instance represents an empty document.
	IsPortTypeHTTPBound (see page 7244)	Indicates whether a specified port type has an HTTP binding.
	IterateImports (see page 7244)	Executes a callback for every WSDL document that this one imports.
	Load (see page 7245)	Loads a WSDL document and activates it.
	LoadFromFile (see page 7368)	Loads an XML (see page 7392) document and activates it.
	LoadFromFile (see page 7652)	Loads an XML (see page 7668) document from disk.
	LoadFromStream (see page 7369)	Loads an XML (see page 7392) document from a stream and activates it.
	LoadFromStream (see page 7653)	Loads an XML (see page 7668) document from a stream and activates it.
	LoadFromXML (see page 7370)	This is the overview for the LoadFromXML method overload.
	LoadFromXML (see page 7653)	This is the overview for the LoadFromXML method overload.
	NewInstance (see page 7370)	Allocates memory for an instance of an object type and returns a pointer to that new instance.
	QueryInterface (see page 3504)	Returns a reference to a specified interface if the object supports that interface.
	Refresh (see page 7371)	Updates the parsed XML (see page 7392) document to reflect external changes.
	Refresh (see page 7654)	Updates the parsed XML (see page 7668) document to reflect external changes.
	RegisterDocBinding (see page 7372)	Registers an implementation class for child nodes with a specified tag name.
	RegisterDocBinding (see page 7654)	Registers an implementation class for child nodes with a specified tag name.
	Resync (see page 7372)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	Resync (see page 7655)	Forces all child nodes and attribute nodes to be reread from the underlying DOM implementation.
	SaveToFile (see page 7373)	Saves the XML (see page 7392) document to disk.
	SaveToFile (see page 7655)	Saves the XML (see page 7668) document to disk.
	SaveToStream (see page 7373)	Saves the XML (see page 7392) document to a stream.
	SaveToStream (see page 7656)	Saves the XML (see page 7668) document to a stream.
	SaveToXML (see page 7374)	This is the overview for the SaveToXML method overload.
	SaveToXML (see page 7656)	This is the overview for the SaveToXML method overload.
	SetActive (see page 7657)	Sets the value of the Active (see page 7661) property.
	SetDefinition (see page 7166)	Sets the value of the Definition (see page 7167) property.
	SetDocumentElement (see page 7657)	Sets the value of the DocumentElement (see page 7663) property.
	SetDOMDocument (see page 7658)	Sets the value of the DOMDocument (see page 7663) property.
	SetEncoding (see page 7658)	Sets the value of the Encoding (see page 7664) property.
	SetFileName (see page 7658)	Sets the value of the FileName (see page 7664) property.

	SetNodeIndentStr (see page 7659)	Sets the value of the NodeIndentStr (see page 7666) property.
	SetOnAsyncLoad (see page 7659)	Supplies an event handler that responds when the AsyncLoadState (see page 7662) property changes.
	SetOptions (see page 7659)	Sets the value of the Options (see page 7666) property.
	SetParseOptions (see page 7660)	Sets the value of the ParseOptions (see page 7667) property.
	SetStandAlone (see page 7660)	Sets the value of the StandAlone (see page 7668) property.
	SetVersion (see page 7660)	Sets the value of the Version (see page 7668) property.
	SetXML (see page 7661)	Sets the value of the XML (see page 7668) property.

Public Properties

	Name	Description
	Active (see page 7661)	Specifies whether the XML (see page 7668) document has been parsed so that the DOM interfaces are available to examine or change its contents.
R	AsyncLoadState (see page 7382)	Indicates the state of the DOM parser when it parses the XML (see page 7392) document asynchronously.
R	AsyncLoadState (see page 7662)	Indicates the state of the DOM parser when it parses the XML (see page 7668) document asynchronously.
R	ChildNodes (see page 7383)	Lists all of the child nodes of the document.
R	ChildNodes (see page 7663)	Lists all of the child nodes of the document.
	Definition (see page 7167)	Provides access to the definitions contained in the WSDL document.
	Definition (see page 7070)	Provides access to the definitions contained in the WSDL document.
	DocumentElement (see page 7383)	Provides access to the root node of the XML (see page 7392) document.
	DocumentElement (see page 7663)	Provides access to the root node of the XML (see page 7668) document.
R	DocumentObject (see page 7479)	This is DocumentObject, a member of class IXMLDocumentAccess.
	DOMDocument (see page 7384)	Provides access to the DOM interface for the parsed XML (see page 7392) document.
	DOMDocument (see page 7663)	Provides access to the DOM interface for the parsed XML (see page 7668) document.
	DOMImplementation (see page 7385)	Provides access to the DOM interface for document-independent functions.
R	DOMPersist (see page 7480)	This is DOMPersist, a member of class IXMLDocumentAccess.
	Encoding (see page 7386)	Indicates the character set that the XML (see page 7392) document uses to encode characters.
	Encoding (see page 7664)	Indicates the character set that the XML (see page 7668) document uses to encode characters.
	FileName (see page 7664)	Indicates the XML (see page 7668) document file, if any, that this interface represents.
R	Modified (see page 7387)	Indicates whether the XML (see page 7392) document has been modified.
R	Modified (see page 7665)	Indicates whether the XML (see page 7668) document has been modified.
R	Node (see page 7388)	Provides access to the document node for the XML (see page 7392) document.
R	Node (see page 7665)	Provides access to the document node for the XML (see page 7668) document.
	NodeIndentStr (see page 7666)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7668) text.
	NSPrefixBase (see page 7389)	Specifies the base string for automatically-generated namespace prefixes.
	Options (see page 7666)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7667)	Specifies implementation-specific options that are followed when parsing the XML (see page 7668) document.
R	SchemaRef (see page 7391)	Returns the name of the schema associated with this XML (see page 7392) document.
R	SchemaRef (see page 7667)	Returns the name of the schema associated with this XML (see page 7668) document.
	StandAlone (see page 7391)	Indicates whether the XML (see page 7392) document includes any external markup declarations.
	StandAlone (see page 7668)	Indicates whether the XML (see page 7668) document includes any external markup declarations.
R	StreamLoader (see page 7245)	Provides access to an interface for loading the WSDL document.
R	TargetNamespace (see page 7246)	Provides access to an interface for loading the WSDL document.
	Version (see page 7391)	Indicates the XML (see page 7392) version that the document uses.
	Version (see page 7668)	Indicates the XML (see page 7668) version that the document uses.

	XML (see page 7668)	Specifies the content of the XML document associated with this IXMLDocument (see page 7640) interface.

Published Events

	Name	Description
	AfterClose (see page 7393)	Occurs after the XML (see page 7392) document is closed.
	AfterNodeChange (see page 7393)	Occurs after a change is made to one of the nodes in the document.
	AfterOpen (see page 7394)	Occurs immediately after the XML (see page 7392) document is opened.
	BeforeClose (see page 7394)	Occurs immediately before the XML (see page 7392) document is closed.
	BeforeNodeChange (see page 7394)	Occurs before a change is made to one of the nodes in the document.
	BeforeOpen (see page 7395)	Occurs immediately before the XML (see page 7392) document is opened.
	OnAsyncLoad (see page 7395)	Occurs at various stages during the asynchronous parsing of an XML (see page 7392) document.

Published Properties

	Name	Description
	Active (see page 7381)	Specifies whether the XML (see page 7392) document has been parsed so that the DOM interfaces are available to examine or change its contents.
	DOMVendor (see page 7386)	Specifies the DOM implementation to use for parsing and manipulating the XML (see page 7392) document.
	FileName (see page 7387)	Specifies the file name for the XML (see page 7392) document associated with this TXMLDocument (see page 7347) object.
	NodeIndentStr (see page 7388)	Indicates the string that is inserted before nested nodes in the formatted XML (see page 7392) text.
	Options (see page 7389)	Influences various aspects of the document's behavior.
	ParseOptions (see page 7390)	Specifies implementation-specific options that are followed when parsing the XML (see page 7392) document.
	XML (see page 7392)	Specifies the content of the XML document associated with this TXMLDocument (see page 7347) object.

75.1.1.2 Create Constructor

This is the overview for the Create constructor overload.

Overload List

	Name	Description
	TWSDLItems.Create (TComponent) (see page 7217)	Creates and initializes a TWSDLItems (see page 7211) object.
	TWSDLItems.Create (TWSDLItems, IStreamLoader) (see page 7217)	Creates and initializes a TWSDLItems (see page 7211) object.

75.1.1.2.1 TWSDLItems.Create Constructor (TComponent)

Creates and initializes a TWSDLItems (see page 7211) object.

Pascal

```
constructor Create(AOwner: TComponent); override; overload;
constructor Create(const WSDLItems: TWSDLItems; const StreamLoader: IStreamLoader); virtual;
overload;
```

C++

```
virtual __fastcall TWSDLItems(TComponent * AOwner);
virtual __fastcall TWSDLItems(const TWSDLItems WSDLItems, const IStreamLoader StreamLoader);
```

Description

Call Create to instantiate a TWSDLItems (see page 7211) component at runtime. Typically, TWSDLItems (see page 7211) instances are created by other components, such as THTTPRIO, that use them.

AOwner is another component, typically a form or data module, that is responsible for freeing the TWSDLItems (see page 7211) instance. It becomes the value of the Owner property.

WSDLItems (see page 7209) is another TWSDLItems (see page 7211) object that the new instance can use to extract a stream loader if none is specified using the StreamLoader (see page 7245) property,

StreamLoader (see page 7245) is an interface to use for loading the WSDL document from a server. It includes properties for specifying the user name, password, and proxy server needed to connect to the server that hosts the WSDL document.

If you do not specify a stream loader, the TWSDLItems (see page 7211) constructor creates one as follows: Using the first syntax, it creates a default stream loader object. Using the second syntax, it uses the stream loader from the TWSDLItems (see page 7211) instance that is the first parameter. Thus, when using the second syntax, you must supply either the WSDLItems (see page 7209) or StreamLoader (see page 7245) argument.

THTTPRIO (see page 1248)

Owner

75.1.1.3 TWSDLItems Methods

The methods of the TWSDLItems class are listed here.

Protected Methods

	Name	Description
	GetName (see page 7225)	Returns the name of the definitions node in the WSDL document.
	GetTargetNamespace (see page 7242)	Returns the value of the TargetNamespace (see page 7246) property.
	GetTargetNamespacePrefix (see page 7243)	Returns the prefix string that represents the target namespace of the WSDL document.

Public Methods

	Name	Description
	CompareName (see page 7219)	Indicates whether two node names refer to the same element.
	GetBindingForServicePort (see page 7220)	Returns the name of the binding associated with a specified service and port.
	GetBindingOfType (see page 7221)	Returns the names of all bindings associated with a specified port type.
	GetBindingOperationNode (see page 7221)	Returns the interface for a specified operation on a specified binding.
	GetBindings (see page 7222)	Fills a WideString (see page 3467) list with the names of all bindings defined in the WSDL document.
	GetBindingType (see page 7222)	Returns the port type to which a specified binding applies.
	GetHttpBindingAttribute (see page 7223)	This is the overview for the GetHttpBindingAttribute method overload.
	GetImports (see page 7223)	Fills a WideString (see page 3467) list with the namespaces of all documents imported by this one.
	GetLocationForImport (see page 7224)	Fills a string list with the names of all messages that must be passed in or out when calling a specified operation.
	GetMessageNode (see page 7224)	Returns the interface for the node that describes a message.
	GetMessages (see page 7224)	Fills a WideString (see page 3467) list with the names of all messages defined in the WSDL document.
	GetOperationNode (see page 7225)	Returns the interface for the node that describes an operation.
	GetOperations (see page 7226)	Fills a WideString (see page 3467) list with the names of all operations defined for a specified port type.
	GetOperationsForBinding (see page 7226)	Fills a list with the names of all operations defined on the port type of a specified binding.

	GetPartNode (see page 7227)	Returns the interface for the node that describes a part of a message.
	GetParts (see page 7227)	Fills a list with the names of all parts defined for a specified message.
	GetPartsForOperation (see page 7228)	Fills a list with the names of all parts defined for input messages of a specified operation.
	GetPortsForService (see page 7229)	Fills a list with the names of all ports defined within a specified service.
	GetPortTypeNode (see page 7229)	Returns the interface for the node that describes a port type defined in the WSDL document.
	GetPortTypes (see page 7229)	Fills a list with the names of all port types defined in the WSDL document.
	GetSchemaNode (see page 7230)	Returns the interface for the schema node that defines a type.
	GetSchemas (see page 7230)	Fills a list with the namespaces for all schema definitions of types in the WSDL document.
	GetServiceAndPortOfBinding (see page 7231)	Retrieves the names of the service and port associated with a specified binding.
	GetServiceNode (see page 7231)	Returns the interface for the node that describes a service defined in the WSDL document.
	GetServices (see page 7232)	Fills a list with the names of all services defined in the WSDL document.
	GetSoapAction (see page 7232)	Returns the value of the soapAction attribute of a specified operation on a specified binding.
	GetSoapActionList (see page 7233)	Fills a list with the soapAction attributes for all operations on a specified SOAP binding.
	GetSoapAddressForServicePort (see page 7234)	Returns the address of a specified port from a specified service.
	GetSoapBindingAttribute (see page 7234)	Returns the value of a specified attribute of a specified SOAP binding.
	GetSoapBindingInputNode (see page 7235)	Returns the interface for the input node on a specified binding and operation.
	GetSoapBindingIONode (see page 7235)	Returns the interface for a node on a specified binding and operation.
	GetSoapBindingOutputNode (see page 7236)	Returns the interface for the output node on a specified binding and operation.
	GetSoapBodyAttribute (see page 7236)	Returns the value of an attribute of a body tag of a message type in an operation on the port type of a SOAP binding.
	GetSoapBodyInputAttribute (see page 7237)	Returns the value of an attribute of a body tag of an input message in an operation on the port type of a SOAP binding.
	GetSoapBodyNamespace (see page 7238)	Returns the value of the first namespace attribute found on a SOAP body node inside a binding with a specified port type.
	GetSoapBodyOutputAttribute (see page 7238)	Returns the value of an attribute of a body tag of an output message in an operation on the port type of a SOAP binding.
	GetSoapHeaders (see page 7239)	Returns an interface for accessing a specified set of header nodes.
	GetSoapInputHeaders (see page 7240)	Returns an interface for accessing the header nodes that belong to the input node of a specified binding and operation.
	GetSoapOperationAttribute (see page 7240)	Returns the value of an attribute on the <soap:operation> node of an operation on a SOAP binding.
	GetSoapOperationStyle (see page 7241)	Returns the value of the style attribute of a specified operation on a specified binding.
	GetSoapOutputHeaders (see page 7241)	Returns an interface for accessing the header nodes that belong to the output node of a specified binding and operation.
	GetWSDLDoc (see page 7243)	Returns the interface for this TWSDLItems (see page 7211) instance.
	GetWSDLItems (see page 7243)	Returns a reference to this TWSDLItems (see page 7211) instance.
	HasTypesNode (see page 7244)	Indicates whether the WSDL document includes any type definitions.
	IsPortTypeHTTPBound (see page 7244)	Indicates whether a specified port type has an HTTP binding.
	IterateImports (see page 7244)	Executes a callback for every WSDL document that this one imports.
	Load (see page 7245)	Loads a WSDL document and activates it.

75.1.1.3.1 TWSDLItems.CompareName Method

Indicates whether two node names refer to the same element.

Pascal

```
function CompareName(const NodeName: DOMString; const OtherName: DOMString; const TNS:
DOMString = ''): boolean;
```

C++

```
__fastcall boolean CompareName(const DOMString NodeName, const DOMString OtherName, const
DOMString TNS = '');
```

Description

Call CompareName to compare the names of two nodes to determine whether they match. CompareName compares the node names, taking into account any namespace prefix added to the node names. CompareName uses the namespace prefix to look up the corresponding namespace URI. If either node name does not have a namespace prefix, CompareName uses the TargetNamespace (see page 7246) property for the first node name, and the supplied namespace for the second. CompareName can find a match between two node names that have different namespace prefixes, as long as both prefixes map to the same namespace URI.

NodeName and OtherName are the two node names to compare.

TNS is the target namespace for OtherName. If this is a nonempty string, it is used to replace the namespace of OtherName. If it is an empty string, OtherName uses the namespace associated with its namespace prefix, or the TargetNamespace (see page 7246) property if it has no namespace prefix.

CompareName returns true if the two names match, false if they differ (either in the local name, or in the namespace to which the names belong).

See Also

NodeName (see page 7693)

TargetNamespace (see page 7246)

75.1.1.3.2 TWSDLItems.GetBindingForServicePort Method

Returns the name of the binding associated with a specified service and port.

Pascal

```
function GetBindingForServicePort(const ServiceName: DOMString; const PortName: DOMString):
IQualifiedName;
```

C++

```
__fastcall IQualifiedName GetBindingForServicePort(const DOMString ServiceName, const
DOMString PortName);
```

Description

Call GetBindingForServicePort to retrieve the name of a binding that is associated with the specified service and port. The binding is defined in the WSDL document or another document that it imports. A binding identifies an encoding format (e.g. soap:rpc) and communications protocol (eg. HTML) that is available for a specific port type (interface).

ServiceName is the name of the service to which the desired binding belongs.

PortName is the name of a port within the specified service that uses the binding.

See Also

GetBindings (see page 7222)

GetBindingType (see page 7222)

GetPortsForService (see page 7229)

GetServices (see page 7232)

GetBindingOfType (see page 7221)

GetServiceAndPortOfBinding (see page 7231)

75.1.1.3.3 TWSDLItems.GetBindingOfType Method

Returns the names of all bindings associated with a specified port type.

Pascal

```
function GetBindingOfType(const BindingTypeName: DOMString; const TNS: DOMString = ''):
IQualifiedNameArray; overload;
```

C++

```
__fastcall IQualifiedNameArray GetBindingOfType(const DOMString BindingTypeName, const
DOMString TNS = '');
```

Description

Call GetBindingOfType to retrieve the names of the bindings that are associated with the specified port type. Each bindings is defined in the WSDL document or another document that it imports. A binding identifies an encoding format (e.g. soap:rpc) and communications protocol (eg. HTML) that is available for a specific port type (interface).

BindingTypeName is the type of the binding. This is the name of a port type for which the binding describes an encoding format and communications protocol.

TNS is the namespace in which BindingTypeName is defined. If this parameter is omitted, GetBindingOfType assumes the value of the TargetNamespace (see page 7246) property.

GetBindingOfType returns an array of qualified names for each binding defined for the specified type.

See Also

GetBindings (see page 7222)

GetPortTypes (see page 7229)

GetBindingType (see page 7222)

TargetNamespace (see page 7246)

75.1.1.3.4 TWSDLItems.GetBindingOperationNode Method

Returns the interface for a specified operation on a specified binding.

Pascal

```
function GetBindingOperationNode(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): IBindingOperation;
```

C++

```
__fastcall IBindingOperation GetBindingOperationNode(const DOMString BindingName, const
DOMString Operation, int OverloadIndex);
```

Description

Call GetBindingOperationNode to retrieve the operation interface for a SOAP binding. GetBindingOperationNode locates a binding with the specified name, and searches its child nodes for an operation node with the specified name. If there is more than one operation with the specified name (that is, if the method is overloaded), GetBindingOperationNode locates the desired overload based on its position.

BindingName is the name of the binding. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that binding node. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node to choose if there are overloaded methods. 0 indicates the first operation node with the specified name, 1 indicates the second operation node with that name, and so on.

GetBindingOperationNode returns an IBindingOperation (see page 7083) interface, which can be used to access the name, inputs, outputs, and faults associated with the operation. If GetBindingOperationNode is unable to locate an operation node for the specified binding and operation names, it returns nil (Delphi) or NULL (C++).

See Also

GetOperationNode (see page 7225)

75.1.1.3.5 TWSDLItems.GetBindings Method

Fills a WideString (see page 3467) list with the names of all bindings defined in the WSDL document.

Pascal

```
procedure GetBindings(BindingNames: TDOMStrings; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetBindings(TDOMStrings BindingNames, Boolean QualifiedNames = False);
```

Description

Call GetBindings to retrieve the names of all bindings defined in the WSDL document. A binding identifies an encoding format (e.g. soap:rpc) and communications protocol (eg. HTML) that is available for a specific port type (interface).

BindingNames is an existing TWideStrings object to which the names of any defined bindings are added.

QualifiedNames indicates whether the binding names should be qualified using the target namespace prefix.

Note: GetBindings does not clear the WideString (see page 3467) list before adding the names of all defined bindings.

See Also

GetBindingForServicePort (see page 7220)

GetBindingType (see page 7222)

GetPortTypes (see page 7229)

75.1.1.3.6 TWSDLItems.GetBindingType Method

Returns the port type to which a specified binding applies.

Pascal

```
function GetBindingType(const BindingName: DOMString): DOMString;
```

C++

```
__fastcall DOMString GetBindingType(const DOMString BindingName);
```

Description

Call GetBindingType to retrieve the names of the port type to which a specified binding applies.

BindingName is the name of a binding defined in the WSDL document.

See Also

GetBindingForServicePort (see page 7220)

GetBindings (see page 7222)

GetPortTypes (see page 7229)

GetBindingOfType (see page 7221)

75.1.1.3.7 GetHttpBindingAttribute Method

This is the overview for the GetHttpBindingAttribute method overload.

Overload List

	Name	Description
	TWSDLItems.GetHttpBindingAttribute (DOMString, DOMString) (see page 7223)	Returns the value of a specified attribute of a binding's <http:binding> node.
	TWSDLItems.GetHttpBindingAttribute (IQualifiedName, DOMString) (see page 7223)	Returns the value of a specified attribute of a binding's <http:binding> node.

75.1.1.3.7.1 TWSDLItems.GetHttpBindingAttribute Method (DOMString, DOMString)

Returns the value of a specified attribute of a binding's <http:binding> node.

Pascal

```
function GetHttpBindingAttribute(const BindingName: DOMString; Attribute: DOMString):
DOMString; overload;
function GetHttpBindingAttribute(const QualifiedName: IQualifiedName; Attribute: DOMString):
DOMString; overload;
```

C++

```
__fastcall DOMString GetHttpBindingAttribute(const DOMString BindingName, DOMString Attribute);
__fastcall DOMString GetHttpBindingAttribute(const IQualifiedName QualifiedName, DOMString
Attribute);
```

Description

Call GetHttpBindingAttribute to retrieve value of an attribute on the http binding tag of a specified binding. The http binding tag can come from the WSDL document or another document that it imports.

BindingName or QualifiedName is the name of the binding that includes the <http:binding> tag.

Attribute is the name of the desired attribute on the <http:binding> tag.

See Also

GetSoapBindingAttribute (see page 7234)

GetSoapOperationAttribute (see page 7240)

GetSoapBodyAttribute (see page 7236)

75.1.1.3.8 TWSDLItems.GetImports Method

Fills a WideString (see page 3467) list with the namespaces of all documents imported by this one.

Pascal

```
procedure GetImports(ImportNames: TDOMStrings);
```

C++

```
__fastcall GetImports(TDOMStrings ImportNames);
```

Description

Call GetImports to retrieve the namespaces for of all documents that are imported into this one using an <import> tag. The location of these imported documents can be retrieved from the namespace using the GetLocationForImport (see page 7224)

method.

ImportNames is an existing TWideStrings object to which the namespaces for any imports are added.

Note: GetImports does not clear the WideString (see page 3467) list before adding the namespaces for all imported documents.

See Also

GetLocationForImport (see page 7224)

75.1.1.3.9 TWSDLItems.GetLocationForImport Method

Fills a string list with the names of all messages that must be passed in or out when calling a specified operation.

Pascal

```
function GetLocationForImport(const ImportNameSpace: DOMString): DOMString;
```

C++

```
__fastcall DOMString GetLocationForImport(const DOMString ImportNameSpace);
```

Description

Call GetLocationForImport to retrieve the URI that indicates the location of an imported document, given its namespace.

ImportNameSpace is the namespace that identifies another document that is imported into this WSDL document. It is one of the strings retrieved by the GetImports (see page 7223) method.

See Also

GetImports (see page 7223)

75.1.1.3.10 TWSDLItems.GetMessageNode Method

Returns the interface for the node that describes a message.

Pascal

```
function GetMessageNode(const MessageName: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetMessageNode(const DOMString MessageName);
```

Description

Call GetMessageNode to obtain information about a message defined in the WSDL document. A message describes a single item of data that is passed in or out when executing an operation (method). The parameters and return value of a method each map onto a message.

MessageName is the name of the message whose node is returned.

See Also

GetMessages (see page 7224)

GetParts (see page 7227)

75.1.1.3.11 TWSDLItems.GetMessages Method

Fills a WideString (see page 3467) list with the names of all messages defined in the WSDL document.

Pascal

```
procedure GetMessages(MessageNames: TDOMStrings; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetMessages(TDOMStrings MessageNames, Boolean QualifiedNames = False);
```

Description

Call GetMessages to retrieve the names of all messages defined in the WSDL document. Each message describes a single item of data that is passed in or out when executing an operation (method). The parameters and return value of a method each map onto a message.

MessageNames is an existing TWideStrings object to which the names of all messages are added.

QualifiedNames indicates whether the message names added to the list should be qualified using the target namespace prefix.

Note: GetMessages does not clear the WideString (see page 3467) list before adding the message names defined in the WSDL document.

See Also

GetMessageNode (see page 7224)

GetParts (see page 7227)

75.1.1.3.12 TWSDLItems.GetName Method

Returns the name of the definitions node in the WSDL document.

Pascal

```
function GetName: DOMString;
```

C++

```
__fastcall DOMString GetName();
```

Description

The root node of a WSDL document is always a definitions node. This node gives a name to the set of definitions in the WSDL document. Call GetName to retrieve that name.

See Also

Definition (see page 7070)

GetTargetNamespace (see page 7242)

75.1.1.3.13 TWSDLItems.GetOperationNode Method

Returns the interface for the node that describes an operation.

Pascal

```
function GetOperationNode(const PortTypeName: DOMString; const OperationName: DOMString):
IXMLNode;
```

C++

```
__fastcall IXMLNode GetOperationNode(const DOMString PortTypeName, const DOMString
OperationName);
```

Description

Call GetOperationNode to obtain information about an operation defined in the WSDL document. An operation corresponds to a

method on the interface that corresponds to a specified port type.

PortTypeName is the name of the port type that contains the specified operation.

OperationName is the name of the operation whose node is returned.

See Also

GetOperations (see page 7226)

GetOperationsForBinding (see page 7226)

GetPortTypes (see page 7229)

75.1.1.3.14 TWSDLItems.GetOperations Method

Fills a WideString (see page 3467) list with the names of all operations defined for a specified port type.

Pascal

```
procedure GetOperations(const PortTypeName: DOMString; OperationNames: TDOMStrings;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetOperations(const DOMString PortTypeName, TDOMStrings OperationNames, Boolean
QualifiedNames = False);
```

Description

Call GetOperations to retrieve the names of all operations defined in for the port type specified by PortTypeName. An operation corresponds to a method on the interface that corresponds to the specified port type.

PortTypeName is the name of the port type whose operations are retrieved.

OperationNames is an existing TWideStrings object to which the names of all operations on PortTypeName are added.

QualifiedNames indicates whether the operation names added to the list should be qualified using the target namespace prefix.

Note: GetOperations does not clear the WideString (see page 3467) list before adding the names of the operations on the specified port type.

See Also

GetOperationNode (see page 7225)

GetOperationsForBinding (see page 7226)

GetPortTypes (see page 7229)

75.1.1.3.15 TWSDLItems.GetOperationsForBinding Method

Fills a list with the names of all operations defined on the port type of a specified binding.

Pascal

```
procedure GetOperationsForBinding(const BindingName: DOMString; OperationNames: TDOMStrings;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetOperationsForBinding(const DOMString BindingName, TDOMStrings OperationNames,
Boolean QualifiedNames = False);
```

Description

Call GetOperationsForBinding to retrieve the names of all operations defined for the port type associated with a specified

binding. An operation corresponds to a method on the interface that corresponds to a port type. A binding represents a port type, plus the protocols used to encode data and transmit requests when calling that port type.

BindingName is the name of the binding associated with the port type whose operations are retrieved.

OperationNames is an existing TWideStrings object to which the names of all operations on the binding's port type are added.

QualifiedNames specifies whether the operation names should be qualified using the target namespace prefix.

Note: GetOperationsForBinding does not clear the WideString (see page 3467) list before adding the names of the operations.

See Also

GetOperationNode (see page 7225)

GetOperations (see page 7226)

GetBindings (see page 7222)

GetTargetNamespacePrefix (see page 7243)

75.1.1.3.16 TWSDLItems.GetPartNode Method

Returns the interface for the node that describes a part of a message.

Pascal

```
function GetPartNode(const MessageName: DOMString; const PartName: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetPartNode(const DOMString MessageName, const DOMString PartName);
```

Description

Call GetPartNode to obtain information about a part that is defined for a message. Every message consists of one or more parts, each of which is associated with a definition from some type system.

MessageName is the name of the message that is defined using the part.

PartName is the name of the part whose node is returned.

See Also

GetParts (see page 7227)

GetMessages (see page 7224)

GetPartsForOperation (see page 7228)

75.1.1.3.17 TWSDLItems.GetParts Method

Fills a list with the names of all parts defined for a specified message.

Pascal

```
procedure GetParts(const MessageName: DOMString; PartNames: TDOMStrings; QualifiedNames:
Boolean = False);
```

C++

```
__fastcall GetParts(const DOMString MessageName, TDOMStrings PartNames, Boolean QualifiedNames
= False);
```

Description

Call GetParts to retrieve the names of all parts that make up a specified message. A part corresponds to definition from some type system.

MessageName is the name of the message whose parts are retrieved.

PartNames is an existing TWideStrings object to which the names of all parts on MessageName are added.

QualifiedNames indicates whether the part names added to the list should be qualified using the target namespace prefix.

Note: GetParts does not clear the WideString (see page 3467) list before adding the names of the parts of the specified message.

See Also

GetPartNode (see page 7227)

GetMessages (see page 7224)

GetPartsForOperation (see page 7228)

75.1.1.3.18 TWSDLItems.GetPartsForOperation Method

Fills a list with the names of all parts defined for input messages of a specified operation.

Pascal

```
function GetPartsForOperation(const PortTypeName: DOMString; const OperationName: DOMString;
OperationIndex: Integer; PartNames: TDOMStrings): Boolean;
```

C++

```
__fastcall Boolean GetPartsForOperation(const DOMString PortTypeName, const DOMString
OperationName, int OperationIndex, TDOMStrings PartNames);
```

Description

Call GetPartsForOperation to retrieve the names of all parts that make up input messages on a specified operation. The part definition must be in the WSDL document or a document that it imports. A part corresponds to definition from some type system.

PortTypeName is the name of the port type that contains the operation. A port type corresponds to an invokable interface in a Web Service application.

OperationName is the name of the operation from whose input messages the parts are retrieved. An operation corresponds to a method on the interface that corresponds to PortTypeName.

PartNames is an existing TWideStrings object to which the names of all parts on input messages (input parameters) of the operation specified by OperationName.

GetPartsForOperation returns true if it adds any part names to PartNames, false if there are no parts to add.

Note: GetPartsForOperation does not clear the WideString (see page 3467) list before adding the names of the parts of the specified message.

See Also

GetPartNode (see page 7227)

GetParts (see page 7227)

GetOperations (see page 7226)

75.1.1.3.19 TWSDLItems.GetPortsForService Method

Fills a list with the names of all ports defined within a specified service.

Pascal

```
procedure GetPortsForService(const ServiceName: DOMString; PortNames: TDOMStrings;
SkipHttpBindings: Boolean = True; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetPortsForService(const DOMString ServiceName, TDOMStrings PortNames, Boolean
SkipHttpBindings = True, Boolean QualifiedNames = False);
```

Description

Call GetPortsForService to retrieve the names of all ports defined for the specified service. A port represents a binding, plus the address where that binding can be found.

ServiceName is the name of the service whose ports are listed.

PortNames is an existing TWideStrings object to which the names of all ports in the specified service are added.

SkipHttpBindings indicates whether GetPortsForService should include port types whose definitions include an <http:binding> tag. When false, GetPortsForService retrieves all port type definitions. When true, GetPortsForService ignores port type definitions with simple HTTP bindings.

QualifiedNames indicates whether the port names added to the list should be qualified using the target namespace prefix.

Note: GetPortsForService does not clear the WideString (see page 3467) list before adding the names of the ports.

See Also

GetBindingForServicePort (see page 7220)

GetServices (see page 7232)

75.1.1.3.20 TWSDLItems.GetPortTypeNode Method

Returns the interface for the node that describes a port type defined in the WSDL document.

Pascal

```
function GetPortTypeNode(const PortTypeName: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetPortTypeNode(const DOMString PortTypeName);
```

Description

Call GetPortTypeNode to obtain information about a port type that is defined in the WSDL document or a document that it imports. Each port type corresponds to an interface that the Web Service application can execute.

PortTypeName is the name of the port type whose node is returned.

See Also

GetPortTypes (see page 7229)

75.1.1.3.21 TWSDLItems.GetPortTypes Method

Fills a list with the names of all port types defined in the WSDL document.

Pascal

```
procedure GetPortTypes(PortTypeNames: TDOMStrings; SkipHttpBindings: Boolean = True;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetPortTypes(TDOMStrings PortTypeNames, Boolean SkipHttpBindings = True, Boolean
QualifiedNames = False);
```

Description

Call GetPortTypes to retrieve the names of all port types defined in the WSDL document or any document that it imports. Each port type corresponds to an interface that the Web Service application can execute.

PortTypeNames is an existing TWideStrings object to which the names of all port types are added.

SkipHttpBindings indicates whether GetPortTypes should include port types whose definitions include an <http:binding> tag. When false, GetPortTypes retrieves all port type definitions. When true, GetPortTypes ignores port type definitions with simple HTTP bindings.

QualifiedNames indicates whether the port type names added to the list should be qualified using the target namespace prefix.

Note: GetPortTypes does not clear the WideString (see page 3467) list before adding the names of the port types.

See Also

GetPortTypeNode (see page 7229)

GetOperations (see page 7226)

75.1.1.3.22 TWSDLItems.GetSchemaNode Method

Returns the interface for the schema node that defines a type.

Pascal

```
function GetSchemaNode(const SchemaTns: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSchemaNode(const DOMString SchemaTns);
```

Description

Call GetSchemaNode to obtain information about a schema definition for a type that is defined in the WSDL document.

SchemaTns is the target namespace of the schema definition for a type.

GetSchemaNode returns the corresponding node.

See Also

GetSchemas (see page 7230)

HasTypesNode (see page 7244)

75.1.1.3.23 TWSDLItems.GetSchemas Method

Fills a list with the namespaces for all schema definitions of types in the WSDL document.

Pascal

```
procedure GetSchemas(SchemaNames: TDOMStrings);
```

C++

```
__fastcall GetSchemas(TDOMStrings SchemaNames);
```

Description

Call GetSchemaTypes to retrieve the namespaces that correspond to schema definitions of types.

SchemaNames is an existing TWideStrings object to which the namespaces for the schema definitions are added.

Note: GetSchemas does not clear the WideString (see page 3467) list before adding the namespaces of the schema definitions.

See Also

GetSchemaNode (see page 7230)

HasTypesNode (see page 7244)

75.1.1.3.24 TWSDLItems.GetServiceAndPortOfBinding Method

Retrieves the names of the service and port associated with a specified binding.

Pascal

```
function GetServiceAndPortOfBinding(const BindingName: IQualifiedName; var ServiceName:
DOMString; var PortName: DOMString): Boolean;
```

C++

```
__fastcall Boolean GetServiceAndPortOfBinding(const IQualifiedName BindingName, DOMString
ServiceName, DOMString PortName);
```

Description

Call GetServiceAndPortOfBinding to retrieve the name of the service and port associated with a specified binding. GetServiceAndPortOfBinding performs the converse lookup from the GetBindingForServicePort (see page 7220) method.

BindingName specifies the qualified name of the binding for which you want to look up the service and port.

ServiceName returns the name of the service to which the binding belongs.

PortName returns the name of a port within the service that uses the binding.

GetServiceAndPortOfBinding returns true if it locates the specified binding and returns a service and port. It returns false if the specified binding is not defined in the WSDL document.

See Also

GetServices (see page 7232)

GetServiceNode (see page 7231)

GetBindingForServicePort (see page 7220)

GetPortsForService (see page 7229)

GetBindingOfType (see page 7221)

GetBindings (see page 7222)

75.1.1.3.25 TWSDLItems.GetServiceNode Method

Returns the interface for the node that describes a service defined in the WSDL document.

Pascal

```
function GetServiceNode(const ServiceName: DOMString): IXMLNode;
```

C++

```
__fastcall IXMLNode GetServiceNode(const DOMString ServiceName);
```

Description

Call GetServiceNode to obtain information about a service that is defined in the WSDL document. A service is a collection of related ports.

ServiceName is the name of the service whose node is returned.

See Also

GetServices (see page 7232)

GetPortsForService (see page 7229)

GetServiceAndPortOfBinding (see page 7231)

75.1.1.3.26 TWSDLItems.GetServices Method

Fills a list with the names of all services defined in the WSDL document.

Pascal

```
procedure GetServices(ServiceNames: TDOMStrings; QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetServices(TDOMStrings ServiceNames, Boolean QualifiedNames = False);
```

Description

Call GetServices to retrieve the names of all services defined in the WSDL document or any document that it imports. Each service is a collection of related ports.

ServiceNames is an existing TWideStrings object to which the names of all services are added.

QualifiedNames indicates whether the service names added to the list should be qualified using the target namespace prefix.

Note: GetServices does not clear the WideString (see page 3467) list before adding the names of the services.

See Also

GetServiceNode (see page 7231)

GetPortsForService (see page 7229)

GetServiceAndPortOfBinding (see page 7231)

75.1.1.3.27 TWSDLItems.GetSoapAction Method

Returns the value of the soapAction attribute of a specified operation on a specified binding.

Pascal

```
function GetSoapAction(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapAction(const DOMString BindingName, const DOMString Operation, int
OverloadIndex);
```

Description

Call GetSoapAction to retrieve the value of the soapAction attribute on the <soap:operation> tag associated with an operation on a specified SOAP binding. The soap operation tag can be in the WSDL document or in another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the <soap:operation> tag.

OverloadIndex indicates which operation is desired when the operation is overloaded.

See Also

GetSoapActionList (see page 7233)

GetBindings (see page 7222)

GetOperationsForBinding (see page 7226)

GetSoapOperationAttribute (see page 7240)

75.1.1.3.28 TWSDLItems.GetSoapActionList Method

Fills a list with the soapAction attributes for all operations on a specified SOAP binding.

Pascal

```
procedure GetSoapActionList(const BindingName: DOMString; ActionList: TDOMStrings;
QualifiedNames: Boolean = False);
```

C++

```
__fastcall GetSoapActionList(const DOMString BindingName, TDOMStrings ActionList, Boolean
QualifiedNames = False);
```

Description

Call GetSoapActionList to retrieve the value of the soapAction attribute of each operation of a specified SOAP binding. Each soapAction is added as a string with the format

```
OperationName = soapActionName
```

where OperationName is the name of the operation with which the soapAction attribute is associated.

BindingName is the name of the binding associated with the port type whose operations are retrieved along with their SOAP actions.

OperationNames is an existing TWideStrings object to which the names of all operations on the binding's port type are added.

QualifiedNames specifies whether the operation names should be qualified using the target namespace prefix.

Note: GetSoapActionList does not clear the WideString (see page 3467) list before adding the names of the operations and their corresponding SOAP actions.

See Also

GetSoapAction (see page 7232)

GetBindings (see page 7222)

GetOperationsForBinding (see page 7226)

GetSoapOperationAttribute (see page 7240)

75.1.1.3.29 TWSDLItems.GetSoapAddressForServicePort Method

Returns the address of a specified port from a specified service.

Pascal

```
function GetSoapAddressForServicePort(const ServiceName: DOMString; const PortName:
DOMString): DOMString;
```

C++

```
__fastcall DOMString GetSoapAddressForServicePort(const DOMString ServiceName, const DOMString
PortName);
```

Description

Call GetSoapAddressForServicePort to retrieve the address to which a SOAP request should be sent if it wants to access a specified port from a specified service.

ServiceName is the name of the service that contains the desired port. It is defined in the WSDL document or another document that it imports.

PortName is the name of the port whose address is returned.

See Also

GetBindingForServicePort (see page 7220)

GetPortsForService (see page 7229)

75.1.1.3.30 TWSDLItems.GetSoapBindingAttribute Method

Returns the value of a specified attribute of a specified SOAP binding.

Pascal

```
function GetSoapBindingAttribute(const BindingName: DOMString; Attribute: DOMString):
DOMString;
```

C++

```
__fastcall DOMString GetSoapBindingAttribute(const DOMString BindingName, DOMString Attribute);
```

Description

Call GetSoapBindingAttribute to retrieve value of an attribute on a SOAP binding. GetSoapBindingAttribute locates a binding with the specified name that includes a <soap:binding> tag, and returns the specified attribute from that <soap:binding> tag.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Attribute is the name of the desired attribute on the <soap:binding> tag.

If BindingName does not identify a binding that includes a <soap:binding> tag that has the specified attribute, GetSoapBindingAttribute returns an empty string.

See Also

GetSoapBodyAttribute (see page 7236)

GetSoapOperationAttribute (see page 7240)

GetBindingForServicePort (see page 7220)

75.1.1.3.31 TWSDLItems.GetSoapBindingInputNode Method

Returns the interface for the input node on a specified binding and operation.

Pascal

```
function GetSoapBindingInputNode(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSoapBindingInputNode(const DOMString BindingName, const DOMString
Operation, int OverloadIndex);
```

Description

Call GetSoapBindingInputNode to retrieve the node for input messages (parameters) on an operation of a SOAP binding. GetSoapBindingInputNode locates a binding with the specified name that includes a <soap:binding> tag, locates the specified operation node that is a child of that binding, and returns the input node for that operation.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

If GetSoapBindingInputNode is unable to locate an input node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapBindingOutputNode (see page 7236)

GetSoapBodyAttribute (see page 7236)

GetSoapBindingIONode (see page 7235)

GetBindingForServicePort (see page 7220)

75.1.1.3.32 TWSDLItems.GetSoapBindingIONode Method

Returns the interface for a node on a specified binding and operation.

Pascal

```
function GetSoapBindingIONode(const BindingName: DOMString; const Operation: DOMString; Input:
Boolean; OverloadIndex: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSoapBindingIONode(const DOMString BindingName, const DOMString
Operation, Boolean Input, int OverloadIndex);
```

Description

Call GetSoapBindingIONode to retrieve a specified node on an operation of a SOAP binding. GetSoapBindingIONode locates a binding with the specified name that includes a <soap:binding> tag, locates the specified operation node that is a child of that binding, and returns the child of that node with a specified name. This method provides the underlying implementation for the GetSoapBindingInputNode (see page 7235) and GetSoapBindingOutputNode (see page 7236) methods.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

Input (see page 3827) indicates whether the child node is an input node (true) or an output node (false).

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

If GetSoapBindingIONode is unable to locate a node for the specified name, binding, and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapBindingOutputNode (see page 7236)

GetSoapBodyAttribute (see page 7236)

GetSoapBindingInputNode (see page 7235)

GetBindingForServicePort (see page 7220)

75.1.1.3.33 TWSDLItems.GetSoapBindingOutputNode Method

Returns the interface for the output node on a specified binding and operation.

Pascal

```
function GetSoapBindingOutputNode(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): IXMLNode;
```

C++

```
__fastcall IXMLNode GetSoapBindingOutputNode(const DOMString BindingName, const DOMString
Operation, int OverloadIndex);
```

Description

Call GetSoapBindingOutputNode to retrieve the node for output messages (output parameters or return value) on an operation of a SOAP binding. GetSoapBindingOutputNode locates a binding with the specified name that includes a <soap:binding> tag, locates the specified operation node that is a child of that binding, and returns the output node for that operation.

BindingName is the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

If GetSoapBindingOutputNode is unable to locate an output node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapBindingInputNode (see page 7235)

GetSoapBodyAttribute (see page 7236)

GetSoapBindingIONode (see page 7235)

GetBindingForServicePort (see page 7220)

75.1.1.3.34 TWSDLItems.GetSoapBodyAttribute Method

Returns the value of an attribute of a body tag of a message type in an operation on the port type of a SOAP binding.

Pascal

```
function GetSoapBodyAttribute(const BindingName: DOMString; const Operation: DOMString; const
IOType: DOMString; const Attribute: DOMString; OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapBodyAttribute(const DOMString BindingName, const DOMString
Operation, const DOMString IOType, const DOMString Attribute, int OverloadIndex);
```

Description

Call GetSoapBodyAttribute to retrieve value of an attribute on the body tag for a message type that is part of an operation of the port type associated with a specified binding. The body tag can come from the WSDL document or another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the message.

IOType indicates the type of the message (input or output).

Attribute is the name of the desired attribute on the <soap:body> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

See Also

GetSoapBindingAttribute (see page 7234)

GetSoapOperationAttribute (see page 7240)

GetBindingForServicePort (see page 7220)

GetOperationsForBinding (see page 7226)

GetSoapBodyInputAttribute (see page 7237)

GetSoapBodyOutputAttribute (see page 7238)

75.1.1.3.35 TWSDLItems.GetSoapBodyInputAttribute Method

Returns the value of an attribute of a body tag of an input message in an operation on the port type of a SOAP binding.

Pascal

```
function GetSoapBodyInputAttribute(const BindingName: DOMString; const Operation: DOMString;
const Attribute: DOMString; OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapBodyInputAttribute(const DOMString BindingName, const DOMString
Operation, const DOMString Attribute, int OverloadIndex);
```

Description

Call GetSoapBodyInputAttribute to retrieve value of an attribute on the body tag for an input message that is part of an operation of the port type associated with a specified binding. The body tag can come from the WSDL document or another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the input message.

Attribute is the name of the desired attribute on the <soap:body> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

Note: GetSoapBodyInputAttribute returns the same value as GetSoapBodyAttribute (see page 7236) with an IOType of 'input'.

See Also

GetSoapBodyAttribute (see page 7236)

GetSoapBodyOutputAttribute (see page 7238)

GetSoapOperationAttribute (see page 7240)

GetBindingForServicePort (see page 7220)

GetOperationsForBinding (see page 7226)

75.1.1.3.36 TWSDLItems.GetSoapBodyNamespace Method

Returns the value of the first namespace attribute found on a SOAP body node inside a binding with a specified port type.

Pascal

```
function GetSoapBodyNamespace(const BindingPortType: DOMString): DOMString;
```

C++

```
__fastcall DOMString GetSoapBodyNamespace(const DOMString BindingPortType);
```

Description

GetSoapBodyNamespace searches the bindings in the WSDL document and any documents it imports for one that has a port type that matches BindingPortType. It then searches the operations of that binding to find one whose messages include a SOAP body node. It returns the namespace attribute of that SOAP body node.

PortTypeName is the name of the port type (interface) that must appear in the binding.

See Also

GetSoapBodyAttribute (see page 7236)

GetPortTypes (see page 7229)

75.1.1.3.37 TWSDLItems.GetSoapBodyOutputAttribute Method

Returns the value of an attribute of a body tag of an output message in an operation on the port type of a SOAP binding.

Pascal

```
function GetSoapBodyOutputAttribute(const BindingName: DOMString; const Operation: DOMString;
const Attribute: DOMString; OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapBodyOutputAttribute(const DOMString BindingName, const DOMString
Operation, const DOMString Attribute, int OverloadIndex);
```

Description

Call GetSoapBodyOutputAttribute to retrieve value of an attribute on the body tag for an output message that is part of an operation of the port type associated with a specified binding. The body tag can come from the WSDL document or another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the output message.

Attribute is the name of the desired attribute on the <soap:body> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

Note: GetSoapBodyOutputAttribute returns the same value as GetSoapBodyAttribute (see page 7236) with an IOType of 'output'.

See Also

GetSoapBodyAttribute (see page 7236)

GetSoapBodyInputAttribute (see page 7237)

GetSoapOperationAttribute (see page 7240)

GetBindingForServicePort (see page 7220)

GetOperationsForBinding (see page 7226)

75.1.1.3.38 TWSDLItems.GetSoapHeaders Method

Returns an interface for accessing a specified set of header nodes.

Pascal

```
function GetSoapHeaders(BindingName: IQualifiedName; const Operation: DOMString; Input:
Boolean; OverloadIndex: Integer; const MessageName: DOMString = ''): IHeaderInfoArray;
```

C++

```
__fastcall IHeaderInfoArray GetSoapHeaders(IQualifiedName BindingName, const DOMString
Operation, Boolean Input, int OverloadIndex, const DOMString MessageName = '');
```

Description

Call GetSoapHeaders to retrieve a dynamic array of interfaces for accessing information about the header nodes of a specified operation on a specified binding. This method provides the underlying implementation for the GetSoapInputHeaders (see page 7240) and GetSoapOutputHeaders (see page 7241) methods.

BindingName is an interface for reading the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

Input (see page 3827) indicates whether the header node should belong to the operation's input node (true) or output node (false).

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

MessageName is the name of a Message with which the header should be associated. If MessageName is an empty string, GetSoapHeaders does not check the message with which the header is associated.

If GetSoapHeaders is unable to locate a header node for the specified name, binding, and IOType, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapOutputHeaders (see page 7241)

GetSoapBindingIONode (see page 7235)

GetSoapInputHeaders (see page 7240)

GetBindingForServicePort (see page 7220)

GetPartNode (see page 7227)

75.1.1.3.39 TWSDLItems.GetSoapInputHeaders Method

Returns an interface for accessing the header nodes that belong to the input node of a specified binding and operation.

Pascal

```
function GetSoapInputHeaders(BindingName: IQualifiedName; const Operation: DOMString;
OverloadIndex: Integer; const MessageName: DOMString = ''): IHeaderInfoArray;
```

C++

```
__fastcall IHeaderInfoArray GetSoapInputHeaders(IQualifiedName BindingName, const DOMString
Operation, int OverloadIndex, const DOMString MessageName = '');
```

Description

Call GetSoapInputHeaders to retrieve a dynamic array of interfaces for accessing the header nodes of the input node on a specified binding. GetSoapInputHeaders locates the specified input node using the GetSoapBindingIONode (see page 7235) method, and extracts all of its child header nodes. It then checks the message and part attributes of that input node, and returns a dynamic array of interfaces for the headers.

BindingName is an interface for reading the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

MessageName is the name of a Message with which the header should be associated. If MessageName is an empty string, GetSoapInputHeaders does not check the message with which the header is associated.

If GetSoapInputHeaders is unable to locate an input header node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapOutputHeaders (see page 7241)

GetSoapBindingIONode (see page 7235)

GetSoapHeaders (see page 7239)

GetBindingForServicePort (see page 7220)

GetPartNode (see page 7227)

75.1.1.3.40 TWSDLItems.GetSoapOperationAttribute Method

Returns the value of an attribute on the <soap:operation> node of an operation on a SOAP binding.

Pascal

```
function GetSoapOperationAttribute(const BindingName: DOMString; const Operation: DOMString;
const Attribute: DOMString; OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapOperationAttribute(const DOMString BindingName, const DOMString
```

```
Operation, const DOMString Attribute, int OverloadIndex);
```

Description

Call GetSoapOperationAttribute to retrieve value of an attribute on the <soap:operation> tag associated with an operation on a specified SOAP binding. The soap operation tag can be in the WSDL document or in another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the <soap:operation> tag.

Attribute is the name of the desired attribute on the <soap:operation> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

See Also

GetSoapBindingAttribute (see page 7234)

GetSoapBodyAttribute (see page 7236)

75.1.1.3.41 TWSDLItems.GetSoapOperationStyle Method

Returns the value of the style attribute of a specified operation on a specified binding.

Pascal

```
function GetSoapOperationStyle(const BindingName: DOMString; const Operation: DOMString;
OverloadIndex: Integer): DOMString;
```

C++

```
__fastcall DOMString GetSoapOperationStyle(const DOMString BindingName, const DOMString
Operation, int OverloadIndex);
```

Description

Call GetSoapOperationStyle to retrieve the value of the style attribute on the <soap:operation> tag associated with an operation on a specified SOAP binding. The soap operation tag can be in the WSDL document or in another document that it imports.

BindingName is the name of the binding that includes the operation.

Operation is the name of the operation that includes the <soap:operation> tag.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

See Also

GetBindings (see page 7222)

GetOperationsForBinding (see page 7226)

GetSoapOperationAttribute (see page 7240)

75.1.1.3.42 TWSDLItems.GetSoapOutputHeaders Method

Returns an interface for accessing the header nodes that belong to the output node of a specified binding and operation.

Pascal

```
function GetSoapOutputHeaders(BindingName: IQualifiedName; const Operation: DOMString;
OverloadIndex: Integer; const MessageName: DOMString = ''): IHeaderInfoArray;
```

C++

```
__fastcall IHeaderInfoArray GetSoapOutputHeaders(IQualifiedName BindingName, const DOMString
Operation, int OverloadIndex, const DOMString MessageName = '');
```

Description

Call GetSoapOutputHeaders to retrieve a dynamic array of interfaces for accessing the header nodes of the output node on a specified binding. GetSoapOutputHeaders locates the specified output node using the GetSoapBindingIONode (see page 7235) method, and extracts all of its child header nodes. It then checks the message and part attributes of that output node, and returns a dynamic array of interfaces for the headers.

BindingName is an interface for reading the name of the binding that includes the <soap:binding> tag. A binding describes the encoding and transport protocols for an associated port type.

Operation is the name of the operation of that <soap:binding> tag. Operations correspond to methods on an invokable interface.

OverloadIndex indicates which operation node is desired when the binding has multiple operations with the same name (overloaded methods). 0 indicates the first operation with the specified name, 1 indicates the second operation node, and so on.

MessageName is the name of a Message with which the header should be associated. If MessageName is an empty string, GetSoapOutputHeaders does not check the message with which the header is associated.

If GetSoapOutputHeaders is unable to locate an output header node for the specified binding and operation, it returns nil (Delphi) or NULL (C++).

See Also

GetSoapInputHeaders (see page 7240)

GetSoapBindingIONode (see page 7235)

GetSoapHeaders (see page 7239)

GetBindingForServicePort (see page 7220)

GetPartNode (see page 7227)

75.1.1.3.43 TWSDLItems.GetTargetNamespace Method

Returns the value of the TargetNamespace (see page 7246) property.

Pascal

```
function GetTargetNamespace: DOMString;
```

C++

```
__fastcall DOMString GetTargetNamespace();
```

Description

GetTargetNamespace is the read access method for the TargetNamespace (see page 7246) property.

See Also

Definition (see page 7070)

GetTargetNamespacePrefix (see page 7243)

TargetNamespace (see page 7246)

75.1.1.3.44 TWSDLItems.GetTargetNamespacePrefix Method

Returns the prefix string that represents the target namespace of the WSDL document.

Pascal

```
function GetTargetNamespacePrefix: DOMString;
```

C++

```
__fastcall DOMString GetTargetNamespacePrefix();
```

Description

Call GetTargetNamespacePrefix to retrieve the prefix string that should be added to node names so that they explicitly use the target namespace of the WSDL document. Node names that include this prefix are defined in the namespace identified by the URL that is the value of the TargetNamespace (see page 7246) property.

See Also

TargetNamespace (see page 7246)

75.1.1.3.45 TWSDLItems.GetWSDLDoc Method

Returns the interface for this TWSDLItems (see page 7211) instance.

Pascal

```
function GetWSDLDoc: IWSDLDocument;
```

C++

```
__fastcall IWSDLDocument GetWSDLDoc();
```

Description

GetWSDLDoc returns the IWSDLDocument (see page 7164) for this TWSDLItems (see page 7211) instance. This interface can be used to access the Definition property, which supplies uninterpreted access to the definitions in the WSDL document.

See Also

Definition (see page 7070)

75.1.1.3.46 TWSDLItems.GetWSDLItems Method

Returns a reference to this TWSDLItems (see page 7211) instance.

Pascal

```
function GetWSDLItems: TWSDLItems;
```

C++

```
__fastcall TWSDLItems GetWSDLItems();
```

Description

GetWSDLItems returns a reference to the TWSDLItems (see page 7211) instance. This method is mostly used by code that holds an IWSDLItems (see page 7256) interface and needs to use the methods of the object itself.

See Also

IWSDLItems (see page 7256)

75.1.1.3.47 TWSDLItems.HasTypesNode Method

Indicates whether the WSDL document includes any type definitions.

Pascal

```
function HasTypesNode: Boolean;
```

C++

```
__fastcall Boolean HasTypesNode();
```

Description

HasTypesNode returns true if the WSDL document includes any type definitions, false otherwise.

75.1.1.3.48 TWSDLItems.IsPortTypeHTTPBound Method

Indicates whether a specified port type has an HTTP binding.

Pascal

```
function IsPortTypeHTTPBound(const PortType: DOMString): Boolean;
```

C++

```
__fastcall Boolean IsPortTypeHTTPBound(const DOMString PortType);
```

Description

Call IsPortTypeHTTPBound to determine whether there is an HTTP binding for a specified port type. A port type corresponds to an invokable interface.

PortType is the port type you want to check.

IsPortTypeHTTPBound returns true if the specified port type has an HTTP binding, false otherwise.

See Also

GetPortTypes (see page 7229)

GetPortTypeNode (see page 7229)

GetBindingOfType (see page 7221)

75.1.1.3.49 TWSDLItems.IterateImports Method

Executes a callback for every WSDL document that this one imports.

Pascal

```
procedure IterateImports(IterateProc: TWSDLIterateProc);
```

C++

```
__fastcall IterateImports(TWSDLIterateProc IterateProc);
```

Description

IterateImports is used to execute a callback before and after loading each WSDL document that this one imports, including those documents that are imported by documents that this one imports.

75.1.1.3.50 TWSDLItems.Load Method

Loads a WSDL document and activates it.

Pascal

```
procedure Load(const WSDLFileName: DOMString);
```

C++

```
__fastcall Load(const DOMString WSDLFileName);
```

Description

Load uses the stream loader specified by the StreamLoader (see page 7245) property to load a WSDL document into memory. It then sets itself to represent that WSDL document and activates it.

WSDLFileName is the name of a WSDL document file, an XML schema file, or the URL where such a document can be found.

See Also

StreamLoader (see page 7245)

LoadFromFile (see page 7368)

LoadFromStream (see page 7369)

LoadFromXML (see page 7370)

75.1.1.4 TWSDLItems Properties

The properties of the TWSDLItems class are listed here.

Public Properties

	Name	Description
R	StreamLoader (see page 7245)	Provides access to an interface for loading the WSDL document.
R	TargetNamespace (see page 7246)	Provides access to an interface for loading the WSDL document.

75.1.1.4.1 TWSDLItems.StreamLoader Property

Provides access to an interface for loading the WSDL document.

Pascal

```
property StreamLoader: IStreamLoader;
```

C++

```
__property IStreamLoader StreamLoader;
```

Description

StreamLoader is set by the TWSDLItems (see page 7211) constructor. It is an interface that specifies basic authentication information that can be used to load a WSDL document that is on another server. The IStreamLoader interface specifies the password, user name, and proxy server that can be used to connect to the server that hosts the WSDL document. TWSDLItems (see page 7211) uses this to load the WSDL document.

See Also

Create (see page 7217)

75.1.1.4.2 TWSDLItems.TargetNamespace Property

Provides access to an interface for loading the WSDL document.

Pascal

```
property TargetNamespace: DOMString;
```

C++

```
__property DOMString TargetNamespace;
```

Description

The root node of a WSDL document is always a definitions node. This node includes a TargetNamespace attribute that uniquely identifies the set of definitions in the WSDL document. Read (see page 3634) TargetNamespace to retrieve that namespace.

See Also

Definition (see page 7070)

GetTargetNamespacePrefix (see page 7243)

75.2 Interfaces

The following table lists interfaces in this documentation.

Interfaces

	Name	Description
	IHeaderInfo (see page 7247)	This is class WSDLItems.IHeaderInfo.
	IQualifiedName (see page 7252)	IQualifiedName is the interface for obtaining an information about a name in an XML document.
	IWSDLItems (see page 7256)	IWSDLItems provides access to a WSDL document.

75.2.1 IHeaderInfo Interface

Class Hierarchy

WSDLItems.IHeaderInfo

Pascal

```
IHeaderInfo = interface;
```

C++

```
__interface IHeaderInfo;
```

File

WSDLItems

Description

This is class WSDLItems.IHeaderInfo.

75.2.1.1 IHeaderInfo Members

The following tables list the members exposed by IHeaderInfo.

Public Methods

	Name	Description
	GetEncodingStyle (see page 7248)	This is GetEncodingStyle, a member of class IHeaderInfo.
	GetName (see page 7248)	This is GetName, a member of class IHeaderInfo.
	GetNamespace (see page 7249)	This is GetNamespace, a member of class IHeaderInfo.
	GetPart (see page 7249)	This is GetPart, a member of class IHeaderInfo.
	GetRequired (see page 7249)	This is GetRequired, a member of class IHeaderInfo.
	GetUse (see page 7249)	This is GetUse, a member of class IHeaderInfo.
	SetEncodingStyle (see page 7249)	This is SetEncodingStyle, a member of class IHeaderInfo.
	SetName (see page 7250)	This is SetName, a member of class IHeaderInfo.
	SetNamespace (see page 7250)	This is SetNamespace, a member of class IHeaderInfo.
	SetPart (see page 7250)	This is SetPart, a member of class IHeaderInfo.
	SetRequired (see page 7250)	This is SetRequired, a member of class IHeaderInfo.
	SetUse (see page 7251)	This is SetUse, a member of class IHeaderInfo.

Public Properties

	Name	Description
	EncodingStyle (see page 7251)	This is EncodingStyle, a member of class IHeaderInfo.
	Name (see page 7251)	This is Name, a member of class IHeaderInfo.
	Namespace (see page 7251)	This is Namespace, a member of class IHeaderInfo.
	Part (see page 7252)	This is Part, a member of class IHeaderInfo.
	Required (see page 7252)	This is Required, a member of class IHeaderInfo.
	Use (see page 7252)	This is Use, a member of class IHeaderInfo.

75.2.1.2 IHeaderInfo Methods

The methods of the IHeaderInfo class are listed here.

Public Methods

	Name	Description
	GetEncodingStyle (see page 7248)	This is GetEncodingStyle, a member of class IHeaderInfo.
	GetName (see page 7248)	This is GetName, a member of class IHeaderInfo.
	GetNamespace (see page 7249)	This is GetNamespace, a member of class IHeaderInfo.
	GetPart (see page 7249)	This is GetPart, a member of class IHeaderInfo.
	GetRequired (see page 7249)	This is GetRequired, a member of class IHeaderInfo.
	GetUse (see page 7249)	This is GetUse, a member of class IHeaderInfo.
	SetEncodingStyle (see page 7249)	This is SetEncodingStyle, a member of class IHeaderInfo.
	SetName (see page 7250)	This is SetName, a member of class IHeaderInfo.
	SetNamespace (see page 7250)	This is SetNamespace, a member of class IHeaderInfo.
	SetPart (see page 7250)	This is SetPart, a member of class IHeaderInfo.
	SetRequired (see page 7250)	This is SetRequired, a member of class IHeaderInfo.
	SetUse (see page 7251)	This is SetUse, a member of class IHeaderInfo.

75.2.1.2.1 IHeaderInfo.GetEncodingStyle Method

Pascal

```
function GetEncodingStyle: DOMString;
```

C++

```
__fastcall DOMString GetEncodingStyle();
```

Description

This is GetEncodingStyle, a member of class IHeaderInfo.

75.2.1.2.2 IHeaderInfo.GetName Method

Pascal

```
function GetName: DOMString;
```

C++

```
__fastcall DOMString GetName();
```

Description

This is GetName, a member of class IHeaderInfo.

75.2.1.2.3 IHeaderInfo.GetNamespace Method

Pascal

```
function GetNamespace: DOMString;
```

C++

```
__fastcall DOMString GetNamespace();
```

Description

This is GetNamespace, a member of class IHeaderInfo.

75.2.1.2.4 IHeaderInfo.GetPart Method

Pascal

```
function GetPart: IPart;
```

C++

```
__fastcall IPart GetPart();
```

Description

This is GetPart, a member of class IHeaderInfo.

75.2.1.2.5 IHeaderInfo.GetRequired Method

Pascal

```
function GetRequired: Boolean;
```

C++

```
__fastcall Boolean GetRequired();
```

Description

This is GetRequired, a member of class IHeaderInfo.

75.2.1.2.6 IHeaderInfo.GetUse Method

Pascal

```
function GetUse: DOMString;
```

C++

```
__fastcall DOMString GetUse();
```

Description

This is GetUse, a member of class IHeaderInfo.

75.2.1.2.7 IHeaderInfo.SetEncodingStyle Method

Pascal

```
procedure SetEncodingStyle(const EncStyl: DOMString);
```

C++

```
__fastcall SetEncodingStyle(const DOMString EncStyl);
```

Description

This is SetEncodingStyle, a member of class IHeaderInfo.

75.2.1.2.8 IHeaderInfo.SetName Method

Pascal

```
procedure SetName(const N: DOMString);
```

C++

```
__fastcall SetName(const DOMString N);
```

Description

This is SetName, a member of class IHeaderInfo.

75.2.1.2.9 IHeaderInfo.SetNamespace Method

Pascal

```
procedure SetNamespace(const N: DOMString);
```

C++

```
__fastcall SetNamespace(const DOMString N);
```

Description

This is SetNamespace, a member of class IHeaderInfo.

75.2.1.2.10 IHeaderInfo.SetPart Method

Pascal

```
procedure SetPart(const P: IPart);
```

C++

```
__fastcall SetPart(const IPart P);
```

Description

This is SetPart, a member of class IHeaderInfo.

75.2.1.2.11 IHeaderInfo.SetRequired Method

Pascal

```
procedure SetRequired(Req: Boolean);
```

C++

```
__fastcall SetRequired(Boolean Req);
```

Description

This is SetRequired, a member of class IHeaderInfo.

75.2.1.2.12 IHeaderInfo.SetUse Method

Pascal

```
procedure SetUse(const U: DOMString);
```

C++

```
__fastcall SetUse(const DOMString U);
```

Description

This is SetUse, a member of class IHeaderInfo.

75.2.1.3 IHeaderInfo Properties

The properties of the IHeaderInfo class are listed here.

Public Properties

	Name	Description
	EncodingStyle (see page 7251)	This is EncodingStyle, a member of class IHeaderInfo.
	Name (see page 7251)	This is Name, a member of class IHeaderInfo.
	Namespace (see page 7251)	This is Namespace, a member of class IHeaderInfo.
	Part (see page 7252)	This is Part, a member of class IHeaderInfo.
	Required (see page 7252)	This is Required, a member of class IHeaderInfo.
	Use (see page 7252)	This is Use, a member of class IHeaderInfo.

75.2.1.3.1 IHeaderInfo.EncodingStyle Property

Pascal

```
property EncodingStyle: DOMString;
```

C++

```
__property DOMString EncodingStyle;
```

Description

This is EncodingStyle, a member of class IHeaderInfo.

75.2.1.3.2 IHeaderInfo.Name Property

Pascal

```
property Name: DOMString;
```

C++

```
__property DOMString Name;
```

Description

This is Name, a member of class IHeaderInfo.

75.2.1.3.3 IHeaderInfo.Namespace Property

Pascal

```
property Namespace: DOMString;
```

C++

```
__property DOMString Namespace;
```

Description

This is Namespace, a member of class IHeaderInfo.

75.2.1.3.4 IHeaderInfo.Part Property

Pascal

```
property Part: IPart;
```

C++

```
__property IPart Part;
```

Description

This is Part, a member of class IHeaderInfo.

75.2.1.3.5 IHeaderInfo.Required Property

Pascal

```
property Required: Boolean;
```

C++

```
__property Boolean Required;
```

Description

This is Required, a member of class IHeaderInfo.

75.2.1.3.6 IHeaderInfo.Use Property

Pascal

```
property Use: DOMString;
```

C++

```
__property DOMString Use;
```

Description

This is Use, a member of class IHeaderInfo.

75.2.2 IQualifiedName Interface

IQualifiedName is the interface for obtaining an information about a name in an XML document.

Class Hierarchy

Pascal

```
IQualifiedName = interface;
```

C++

```
__interface IQualifiedName;
```

File

WSDLItems

Description

IQualifiedName introduces two properties, Name (see page 7255) and Namespace (see page 7255), which represent the local name and namespace URI for a name that is used in an XML document. Using IQualifiedName makes it easier to work with names where it is important to know the namespace in which the name is defined.

Note: C++ method declarations that use IQualifiedName use the _di_IQualifiedName type instead. This type is a DelphiInterface (see page 3256) wrapper around the IQualifiedName interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IQualifiedName >  _di_IQualifiedName;
```

See Also

TWSDLItems (see page 7211)

TMemoryStream

75.2.2.1 IQualifiedName Members

The following tables list the members exposed by IQualifiedName.

Public Methods

	Name	Description
	GetName (see page 7253)	Returns the value of the Name (see page 7255) property.
	GetNamespace (see page 7254)	Returns the value of the Namespace (see page 7255) property.
	SetName (see page 7254)	Sets the value of the Name (see page 7255) property.
	SetNamespace (see page 7254)	Sets the value of the Namespace (see page 7255) property.

Public Properties

	Name	Description
	Name (see page 7255)	Specifies the local name.
	Namespace (see page 7255)	Specifies the namespace in which the name is defined.

75.2.2.2 IQualifiedName Methods

The methods of the IQualifiedName class are listed here.

Public Methods

	Name	Description
	GetName (see page 7253)	Returns the value of the Name (see page 7255) property.
	GetNamespace (see page 7254)	Returns the value of the Namespace (see page 7255) property.
	SetName (see page 7254)	Sets the value of the Name (see page 7255) property.
	SetNamespace (see page 7254)	Sets the value of the Namespace (see page 7255) property.

75.2.2.2.1 IQualifiedName.GetName Method

Returns the value of the Name (see page 7255) property.

Pascal

```
function GetName: DOMString;
```

C++

```
__fastcall DOMString GetName();
```

Description

GetName is the read implementation for the Name (see page 7255) property.

See Also

Name (see page 7255)

75.2.2.2.2 IQualifiedName.GetNamespace Method

Returns the value of the Namespace (see page 7255) property.

Pascal

```
function GetNamespace: DOMString;
```

C++

```
__fastcall DOMString GetNamespace();
```

Description

GetNamespace is the read implementation for the Namespace (see page 7255) property.

See Also

Namespace (see page 7255)

75.2.2.2.3 IQualifiedName.SetName Method

Sets the value of the Name (see page 7255) property.

Pascal

```
procedure SetName(const name: DOMString);
```

C++

```
__fastcall SetName(const DOMString name);
```

Description

SetName is the write implementation for the Name (see page 7255) property.

Name (see page 7255) is the new name.

See Also

Name (see page 7255)

75.2.2.2.4 IQualifiedName.SetNamespace Method

Sets the value of the Namespace (see page 7255) property.

Pascal

```
procedure SetNamespace(const ns: DOMString);
```

C++

```
__fastcall SetNamespace(const DOMString ns);
```

Description

SetNamespace is the write implementation for the Namespace (see page 7255) property.

Namespace (see page 7255) is the new namespace in which to interpret Name (see page 7255).

See Also

Namespace (see page 7255)

75.2.2.3 IQualifiedName Properties

The properties of the IQualifiedName class are listed here.

Public Properties

	Name	Description
	Name (see page 7255)	Specifies the local name.
	Namespace (see page 7255)	Specifies the namespace in which the name is defined.

75.2.2.3.1 IQualifiedName.Name Property

Specifies the local name.

Pascal

```
property Name: DOMString;
```

C++

```
__property DOMString Name;
```

Description

Name specifies the local name portion of the qualified name. This name is defined within the context of the namespace that the Namespace (see page 7255) property specifies.

See Also

Namespace (see page 7255)

75.2.2.3.2 IQualifiedName.Namespace Property

Specifies the namespace in which the name is defined.

Pascal

```
property Namespace: DOMString;
```

C++

```
__property DOMString Namespace;
```

Description

Namespace specifies the namespace that is used to interpret the value of the Name (see page 7255) property.

See Also

Name (see page 7255)

75.2.3 IWSDLItems Interface

IWSDLItems provides access to a WSDL document.

Class Hierarchy

Pascal

```
IWSDLItems = interface;
```

C++

```
__interface IWSDLItems;
```

File

WSDLItems

Description

IWSDLItems is an interface to the TWSDLItems (see page 7211) class. You can use this interface to load the WSDL document from a file or server, obtain access to the TWSDLItems (see page 7211) object whose methods provide information about the definitions in that document, and obtain an IWSDLDocument (see page 7164) interface for low-level access to the definitions in the document.

Note: C++ method declarations that use IWSDLItems use the _di_IWSDLItems type instead. This type is a DelphiInterface (see page 3256) wrapper around the IWSDLItems interface:

```
typedef System::DelphiInterfaceDelphiInterface_object< IWSDLDocument >  _di_IWSDLDocument;
```

See Also

TWSDLItems (see page 7211)

75.2.3.1 IWSDLItems Members

The following tables list the members exposed by IWSDLItems.

Public Methods

	Name	Description
	GetWSDLDoc (see page 7257)	Returns the IWSDLDocument (see page 7164) interface for the WSDL document.
	GetWSDLItems (see page 7257)	Returns a reference to the TWSDLItems (see page 7211) instance that implements this interface.
	Load (see page 7257)	Loads a WSDL document so that its definitions are available.

75.2.3.2 IWSDLItems Methods

The methods of the IWSDLItems class are listed here.

Public Methods

	Name	Description
	GetWSDLDoc (see page 7257)	Returns the IWSDLDocument (see page 7164) interface for the WSDL document.
	GetWSDLItems (see page 7257)	Returns a reference to the TWSDLItems (see page 7211) instance that implements this interface.
	Load (see page 7257)	Loads a WSDL document so that its definitions are available.

75.2.3.2.1 IWSDLItems.GetWSDLDoc Method

Returns the IWSDLDocument (see page 7164) interface for the WSDL document.

Pascal

```
function GetWSDLDoc: IWSDLDocument;
```

C++

```
__fastcall IWSDLDocument GetWSDLDoc();
```

Description

GetWSDLDoc returns a IWSDLDocument (see page 7164) interface, which supplies uninterpreted access to the definitions in the WSDL document. To access these definitions more easily, use the GetWSDLItems (see page 7257) method, which returns a reference to the underlying TWSDLItems (see page 7211) object.

See Also

GetWSDLItems (see page 7257)

75.2.3.2.2 IWSDLItems.GetWSDLItems Method

Returns a reference to the TWSDLItems (see page 7211) instance that implements this interface.

Pascal

```
function GetWSDLItems: TWSDLItems;
```

C++

```
__fastcall TWSDLItems GetWSDLItems();
```

Description

GetWSDLItems returns a reference to the underlying TWSDLItems (see page 7211) instance. This object has numerous methods that let you access the definitions in the WSDL document.

75.2.3.2.3 IWSDLItems.Load Method

Loads a WSDL document so that its definitions are available.

Pascal

```
procedure Load(const WSDLFileName: DOMString);
```

C++

```
__fastcall Load(const DOMString WSDLFileName);
```

Description

Load reads and interprets a specified WSDL document. This method should be called before you attempt to access the definitions in the WSDL document.

WSDLFileName is the name of a WSDL document file, an XML schema file, or the URL where such a document can be found.

75.3 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	HasDefinition (see page 7259)	This is function WSDLItems.HasDefinition.
	HasDefinition (see page 7259)	This is function WSDLItems.HasDefinition.
	NewQualifiedName (see page 7259)	This is function WSDLItems.NewQualifiedName.

75.3.1 WSDLItems.HasDefinition Function

Pascal

```
function HasDefinition(const WSDLDoc: IWSDLDocument): Boolean; overload;
```

C++

```
Boolean HasDefinition(const IWSDLDocument WSDLDoc);
```

File

WSDLItems

Description

This is function WSDLItems.HasDefinition.

75.3.2 WSDLItems.HasDefinition Function

Pascal

```
function HasDefinition(const WSDLItems: IWSDLItems): Boolean; overload;
```

C++

```
Boolean HasDefinition(const IWSDLItems WSDLItems);
```

File

WSDLItems

Description

This is function WSDLItems.HasDefinition.

75.3.3 WSDLItems.NewQualifiedName Function

Pascal

```
function NewQualifiedName(const Name: DOMString = ''; const Namespace: DOMString = ''):
```

```
  IQualifiedName;
```

C++

```
  IQualifiedName NewQualifiedName(const DOMString Name = '', const DOMString Namespace = '');
```

File

WSDLItems

Description

This is function WSDLItems.NewQualifiedName.

75.4 Structs, Records, Enums

The following table lists structs, records, enums in this documentation.

Enumerations

	Name	Description
	IterateImportOptions (see page 7261)	This is record WSDLItems.IterateImportOptions.

75.4.1 WSDLItems.IterateImportOptions Enumeration

Pascal

```
IterateImportOptions = (
  ioBeforeLoad,
  ioLoaded
);
```

C++

```
enum IterateImportOptions {
  ioBeforeLoad,
  ioLoaded
};
```

File

WSDLItems

Description

This is record WSDLItems.IterateImportOptions.

75.5 Types

The following table lists types in this documentation.

Types

Name	Description
IHeaderInfoArray (see page 7262)	This is type WSDLItems.IHeaderInfoArray.
IQualifiedNameArray (see page 7262)	IQualifiedNameArray is a dynamic array of interfaces for obtaining names of XML items.
TWSDLIterateProc (see page 7263)	TWSDLIterateProc is the type for callbacks that execute when importing a WSDL document.

75.5.1 WSDLItems.IHeaderInfoArray Type

Pascal

```
IHeaderInfoArray = array of IHeaderInfo;
```

C++

```
array of IHeaderInfo IHeaderInfoArray;
```

File

WSDLItems

Description

This is type WSDLItems.IHeaderInfoArray.

75.5.2 WSDLItems.IQualifiedNameArray Type

IQualifiedNameArray is a dynamic array of interfaces for obtaining names of XML items.

Pascal

```
IQualifiedNameArray = array of IQualifiedName;
```

C++

```
array of IQualifiedName IQualifiedNameArray;
```

File

WSDLItems

Description

IQualifiedNameArray is a dynamic array of IQualifiedName (see page 7252) interfaces. Each interface in the array can be used to access the name of an item from an XML document and the namespace in which that name is defined.

75.5.3 WSDLItems.TWSDLIterateProc Type

TWSDLIterateProc is the type for callbacks that execute when importing a WSDL document.

Pascal

```
TWSDLIterateProc = procedure (const Options: IterateImportOptions; const WSDLItems:
IWSDLItems; const XMLSchemaDoc: IXMLSchemaDoc; const Name: DOMString) of object;
```

C++

```
(const Options: IterateImportOptions; const WSDLItems: IWSDLItems; const XMLSchemaDoc:
IXMLSchemaDoc; const Name: DOMString) ( TWSDLIterateProc)();
```

File

WSDLItems

Description

TWSDLIterateProc is the type of a callback that executes for every WSDL document that is imported by being included in another..

Options indicates whether the callback is executing before or after the imported WSDL document is loaded.

WSDLItems (see page 7209) is the interface for the imported WSDL document. It is only available when Options is ioLoaded. If the imported document is an XML schema, it is nil (Delphi) or NULL (C++), and you should use XMLSchemaDoc instead.

XMLSchemaDoc is the interface for an imported XML schema when the imported document is an XML schema. It is only available when Options is ioLoaded. If the imported document is a WSDL document, it is nil (Delphi) or NULL (C++), and you should use WSDLItems (see page 7209) instead.

Name is the name (URL) of the imported document.

76 WSDLNode Namespace

This is namespace WSDLNode.

Topics

Name	Description
Classes (see page 7266)	The following table lists classes in this documentation.
Functions (see page 7277)	The following table lists functions in this documentation.

Classes

	Name	Description
	EWSDLLoadException (see page 7266)	This is class WSDLNode.EWSDLLoadException.
	TWSDLClientNode (see page 7266)	This is class WSDLNode.TWSDLClientNode.
	TWSDLView (see page 7271)	TWSDLView represents a specific binding and operation in a WSDL (see page 7276) document.

Functions

	Name	Description
	ActivateWSDL (see page 7277)	This is function WSDLNode.ActivateWSDL.

76.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	EWSDLLoadException (see page 7266)	This is class WSDLNode.EWSDLLoadException.
	TWSDLClientNode (see page 7266)	This is class WSDLNode.TWSDLClientNode.
	TWSDLView (see page 7271)	TWSDLView represents a specific binding and operation in a WSDL (see page 7276) document.

76.1.1 EWSDLLoadException Class

Class Hierarchy

Pascal

```
EWSDLLoadException = class(Exception);
```

C++

```
class EWSDLLoadException : public Exception;
```

File

WSDLNode

Description

This is class WSDLNode.EWSDLLoadException.

76.1.2 TWSDLClientNode Class

Class Hierarchy

Pascal

```
TWSDLClientNode = class(TComponent, IWebNode);
```

C++

```
class TWSDLClientNode : public TComponent, public IWebNode;
```

File

WSDLNode

Description

This is class WSDLNode.TWSDLClientNode.

76.1.2.1 TWSDLClientNode Members

The following tables list the members exposed by TWSDLClientNode.

Protected Methods

	Name	Description
	GetMimeBoundary (see page 7269)	Returns the value of the MimeBoundary property.
	SetMimeBoundary (see page 7270)	Sets the value of the MimeBoundary property.

Public Methods

	Name	Description
	BeforeExecute (see page 7267)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 6618)	This is the overview for the Execute method overload.
	Execute (see page 7268)	This is the overview for the Execute method overload.
	Notification (see page 7269)	Forwards notification messages to all owned components.

Public Properties

	Name	Description
	MimeBoundary (see page 6619)	Specifies the value of the MIME boundary header, if any, for the section of the document that contains the method call.

Published Properties

	Name	Description
	TransportNode (see page 7270)	This is TransportNode, a member of class TWSDLClientNode.
	WSDLView (see page 7271)	This is WSDLView, a member of class TWSDLClientNode.

76.1.2.2 TWSDLClientNode Methods

The methods of the TWSDLClientNode class are listed here.

Protected Methods

	Name	Description
	GetMimeBoundary (see page 7269)	Returns the value of the MimeBoundary property.
	SetMimeBoundary (see page 7270)	Sets the value of the MimeBoundary property.

Public Methods

	Name	Description
	BeforeExecute (see page 7267)	Performs any transport-specific setup before executing an encoded method call.
	Execute (see page 7268)	This is the overview for the Execute method overload.
	Notification (see page 7269)	Forwards notification messages to all owned components.

76.1.2.2.1 TWSDLClientNode.BeforeExecute Method

Performs any transport-specific setup before executing an encoded method call.

Pascal

```
procedure BeforeExecute(const IntfMetaData: TIntfMetaData; const MethodMetaData:
TIntfMethEntry; MethodIndex: Integer; AttachHandler: IMimeAttachmentHandler);
```

C++

```
__fastcall BeforeExecute(const TIntfMetaData IntfMetaData, const TIntfMethEntry
MethodMetaData, int MethodIndex, IMimeAttachmentHandler AttachHandler);
```

Description

BeforeExecute handles transport-specific tasks such as dynamically querying a WSDL document or setting up serialization options before a call is made to the Execute method. Remote interfaced objects (TRio) call this method after their OnBeforeExecute event, but before delegating the execution of the method to the Execute method.

IntfMD is the runtime type information (RTTI) of the invokable interface that includes the method to execute.

MethMD is describes the method that is about to be executed.

MethodIndex indicates which overload to use when methMD describes an overloaded method. 0 indicates the first overload, 1 indicates the second overload, and so on.

AttachHandler is an interface to use for handling any attachments that are used as parameters of the method.

See Also

Execute (see page 6618)

OnBeforeExecute

76.1.2.2.2 Execute Method

This is the overview for the Execute method overload.

Overload List

	Name	Description
	TWSDLClientNode.Execute (String, TStream) (see page 7268)	Executes an encoded method call and returns the encoded results in a stream.
	TWSDLClientNode.Execute (TStream) (see page 7269)	This is Execute, a member of class TWSDLClientNode.
	TWSDLClientNode.Execute (TStream, TStream) (see page 7269)	This is Execute, a member of class TWSDLClientNode.

76.1.2.2.2.1 TWSDLClientNode.Execute Method (String, TStream)

Executes an encoded method call and returns the encoded results in a stream.

Pascal

```
procedure Execute(const DataMsg: String; Resp: TStream); overload;
```

C++

```
__fastcall Execute(const UnicodeString DataMsg, TStream Resp);
```

Description

Execute interprets an encoded method call, executes it, and returns the encoded results using a stream. Typically, this method works in conjunction with an object that implements the IOPConvert interface, which marshals a method call into the DataMsg or Request string and unmarshals the return value.

DataMsg is an encoded method call. It represents the results of marshaling a method call on an invokable interface into a transportable string. The use of this syntax is not recommended.

Request is a stream from which to read the same string that is the value of the DataMsg parameter. This syntax is preferred because the stream need not store this value in memory (for example, it can be a file stream).

Response is a stream object that receives the encoded results that arise from executing the method call.

When using the third syntax, Execute returns a stream from which to read the encoded results from executing the method call. In this case, the caller is responsible for freeing the stream.

See Also

IOPConvert

BeforeExecute (see page 6617)

76.1.2.2.2.2 TWSDLClientNode.Execute Method (TStream)

Pascal

```
function Execute(const Request: TStream): TStream; overload;
```

C++

```
__fastcall TStream Execute(const TStream Request);
```

Description

This is Execute, a member of class TWSDLClientNode.

76.1.2.2.2.3 TWSDLClientNode.Execute Method (TStream, TStream)

Pascal

```
procedure Execute(const Request: TStream; Response: TStream); overload;
```

C++

```
__fastcall Execute(const TStream Request, TStream Response);
```

Description

This is Execute, a member of class TWSDLClientNode.

76.1.2.2.3 TWSDLClientNode.GetMimeBoundary Method

Returns the value of the MimeBoundary property.

Pascal

```
function GetMimeBoundary: string;
```

C++

```
__fastcall UnicodeString GetMimeBoundary();
```

Description

GetMimeBoundary is the read access method for the MimeBoundary property.

See Also

MimeBoundary (see page 6619)

76.1.2.2.4 TWSDLClientNode.Notification Method

Forwards notification messages to all owned components.

Pascal

```
procedure Notification(AComponent: TComponent; Operation: TOperation); override;
```

C++

```
virtual __fastcall Notification(TComponent * AComponent, TOperation Operation);
```

Description

Do not call the Notification method in an application. Notification is called automatically when the component specified by AComponent is about to be inserted or removed, as specified by Operation. By default, components pass along the notification to their owned components, if any.

A component can, if needed, act on the notification that a component is being inserted or removed. For example, if a component has object fields or properties that contain references to other components, it can check the notifications of component removals and invalidate those references as needed.

Note: Notification is not called for components that are freed implicitly (because their Owner is freed).

See Also

FreeNotification

InsertComponent

RemoveComponent

Owner

76.1.2.2.5 TWSDLClientNode.SetMimeBoundary Method

Sets the value of the MimeBoundary property.

Pascal

```
procedure SetMimeBoundary(Value: string);
```

C++

```
__fastcall SetMimeBoundary(UnicodeString Value);
```

Description

SetMimeBoundary is the write implementation for the MimeBoundary property.

Value is the new value for MimeBoundary.

See Also

MimeBoundary (see page 6619)

76.1.2.3 TWSDLClientNode Properties

The properties of the TWSDLClientNode class are listed here.

Published Properties

	Name	Description
	TransportNode (see page 7270)	This is TransportNode, a member of class TWSDLClientNode.
	WSDLView (see page 7271)	This is WSDLView, a member of class TWSDLClientNode.

76.1.2.3.1 TWSDLClientNode.TransportNode Property

Pascal

```
property TransportNode: IWebNode;
```

C++

```
__property IWebNode TransportNode;
```

Description

This is TransportNode, a member of class TWSDLClientNode.

76.1.2.3.2 TWSDLClientNode.WSDLView Property

Pascal

```
property WSDLView: TWSDLView;
```

C++

```
__property TWSDLView WSDLView;
```

Description

This is WSDLView, a member of class TWSDLClientNode.

76.1.3 TWSDLView Class

TWSDLView represents a specific binding and operation in a WSDL (see page 7276) document.

Class Hierarchy

Pascal

```
TWSDLView = class(TComponent);
```

C++

```
class TWSDLView : public TComponent;
```

File

WSDLNode

Description

TWSDLView is used by components that work with WSDL (see page 7276) documents to represent a specific port and/or operation that is defined in a WSDL (see page 7276) document. The WSDL (see page 7276) property provides access to the WSDL (see page 7276) document itself. The other properties give the names of the entities of interest that are defined within that document.

THTTPReqResp (see page 1276)

TOPToSoapDomConvert

TWSDLItems (see page 7211)

76.1.3.1 TWSDLView Members

The following tables list the members exposed by TWSDLView.

Public Fields

	Name	Description
	IntfInfo (see page 7272)	This is IntfInfo, a member of class TWSDLView.

Public Methods

	Name	Description
	Activate (see page 7273)	This is Activate, a member of class TWSDLView.
	SetDesignState (see page 7273)	This is SetDesignState, a member of class TWSDLView.

Published Properties

	Name	Description
	Operation (see page 7273)	Identifies the target operation that is defined in the WSDL (see page 7276) document.
	Password (see page 7274)	This is Password, a member of class TWSDLView.
	Port (see page 7274)	Specifies the target port that is defined in the WSDL (see page 7276) document.
	PortType (see page 7274)	Specifies the target port type that is defined in the WSDL (see page 7276) document.
	Proxy (see page 7275)	This is Proxy, a member of class TWSDLView.
	Service (see page 7275)	Specifies the target service that is defined in the WSDL (see page 7276) document.
	UserName (see page 7275)	This is UserName, a member of class TWSDLView.
	WSDL (see page 7276)	Provides access to the definitions in the WSDL document.

76.1.3.2 TWSDLView Fields

The fields of the TWSDLView class are listed here.

Public Fields

	Name	Description
	IntfInfo (see page 7272)	This is IntfInfo, a member of class TWSDLView.

76.1.3.2.1 TWSDLView.IntfInfo Field

Pascal

```
IntfInfo: PTypeInfo;
```

C++

```
PTypeInfo IntfInfo;
```

Description

This is IntfInfo, a member of class TWSDLView.

76.1.3.3 TWSDLView Methods

The methods of the TWSDLView class are listed here.

Public Methods

	Name	Description
	Activate (see page 7273)	This is Activate, a member of class TWSDLView.
	SetDesignState (see page 7273)	This is SetDesignState, a member of class TWSDLView.

76.1.3.3.1 TWSDLView.Activate Method

Pascal

```
procedure Activate;
```

C++

```
__fastcall Activate();
```

Description

This is Activate, a member of class TWSDLView.

76.1.3.3.2 TWSDLView.SetDesignState Method

Pascal

```
procedure SetDesignState(Designing: Boolean);
```

C++

```
__fastcall SetDesignState(Boolean Designing);
```

Description

This is SetDesignState, a member of class TWSDLView.

76.1.3.4 TWSDLView Properties

The properties of the TWSDLView class are listed here.

Published Properties

	Name	Description
	Operation (see page 7273)	Identifies the target operation that is defined in the WSDL (see page 7276) document.
	Password (see page 7274)	This is Password, a member of class TWSDLView.
	Port (see page 7274)	Specifies the target port that is defined in the WSDL (see page 7276) document.
	PortType (see page 7274)	Specifies the target port type that is defined in the WSDL (see page 7276) document.
	Proxy (see page 7275)	This is Proxy, a member of class TWSDLView.
	Service (see page 7275)	Specifies the target service that is defined in the WSDL (see page 7276) document.
	UserName (see page 7275)	This is UserName, a member of class TWSDLView.
	WSDL (see page 7276)	Provides access to the definitions in the WSDL document.

76.1.3.4.1 TWSDLView.Operation Property

Identifies the target operation that is defined in the WSDL (see page 7276) document.

Pascal

```
property Operation: string;
```

C++

```
__property UnicodeString Operation;
```

Description

Operation is the name of an operation that is defined in the WSDL (see page 7276) document identified by the WSDL (see

page 7276) property. Operation maps to a method on the interface that corresponds to the PortType (see page 7274) property.

See Also

PortType (see page 7274)

WSDL (see page 7276)

76.1.3.4.2 TWSDLView.Password Property

Pascal

```
property Password: string;
```

C++

```
__property UnicodeString Password;
```

Description

This is Password, a member of class TWSDLView.

76.1.3.4.3 TWSDLView.Port Property

Specifies the target port that is defined in the WSDL (see page 7276) document.

Pascal

```
property Port: string;
```

C++

```
__property UnicodeString Port;
```

Description

Port is the name of a port that is defined in the WSDL (see page 7276) document identified by the WSDL (see page 7276) property. A Port represents the address of a Web Service (see page 7275) application, a transport protocol that is used for requests to that application, the data format to use for encoding requests, and the port type that defines the operations contained in those requests.

See Also

PortType (see page 7274)

WSDL (see page 7276)

Service (see page 7275)

76.1.3.4.4 TWSDLView.PortType Property

Specifies the target port type that is defined in the WSDL (see page 7276) document.

Pascal

```
property PortType: string;
```

C++

```
__property UnicodeString PortType;
```

Description

Port (see page 7274) is the name of a port type that is defined in the WSDL (see page 7276) document identified by the WSDL (see page 7276) property. A port type corresponds to an interface that the Web Service (see page 7275) application

implements.

The target method on that interface is identified by the Operation (see page 7273) property. The address and protocols to use when calling this interface are identified by the Port (see page 7274) property.

See Also

WSDL (see page 7276)

Port (see page 7274)

Operation (see page 7273)

76.1.3.4.5 TWSDLView.Proxy Property

Pascal

```
property Proxy: string;
```

C++

```
__property UnicodeString Proxy;
```

Description

This is Proxy, a member of class TWSDLView.

76.1.3.4.6 TWSDLView.Service Property

Specifies the target service that is defined in the WSDL (see page 7276) document.

Pascal

```
property Service: string;
```

C++

```
__property UnicodeString Service;
```

Description

Service is the name of the service of interest that is defined in the WSDL (see page 7276) document identified by the WSDL (see page 7276) property. A service is a collection of related ports, including the one specified by the Port (see page 7274) property.

See Also

Port (see page 7274)

WSDL (see page 7276)

76.1.3.4.7 TWSDLView.UserName Property

Pascal

```
property UserName: string;
```

C++

```
__property UnicodeString UserName;
```

Description

This is UserName, a member of class TWSDLView.

76.1.3.4.8 TWSDLView.WSDL Property

Provides access to the definitions in the WSDL document.

Pascal

```
property WSDL: TWSDLItems;
```

C++

```
__property TWSDLItems WSDL;
```

Description

WSDLItems (see page 7209) is a helper object whose methods return the definitions included in the WSDL document. All the other TWSDLView (see page 7271) properties refer to definitions contained in this WSDL document

76.2 Functions

The following table lists functions in this documentation.

Functions

	Name	Description
	ActivateWSDL (see page 7277)	This is function WSDLNode.ActivateWSDL.

76.2.1 WSDLNode.ActivateWSDL Function

Pascal

```
function ActivateWSDL(WSDL: TWSDLItems; const Name: string; const Password: string; const
Proxy: string): Boolean;
```

C++

```
Boolean ActivateWSDL(TWSDLItems WSDL, const UnicodeString Name, const UnicodeString Password,
const UnicodeString Proxy);
```

File

WSDLNode

Description

This is function WSDLNode.ActivateWSDL.

77 WSDLPub Namespace

This is namespace WSDLPub.

Topics

Name	Description
Classes (see page 7280)	The following table lists classes in this documentation.
Interfaces (see page 7295)	The following table lists interfaces in this documentation.
Functions (see page 7297)	The following table lists functions in this documentation.
Structs, Records, Enums (see page 7298)	The following table lists structs, records, enums in this documentation.
Types (see page 7299)	The following table lists types in this documentation.

Classes

	Name	Description
	TWSDLHTMLPublish (see page 7280)	TWSDLHTMLPublish publishes a list of WSDL documents describing a Web Services application.
	TWSDLPublish (see page 7291)	This is class WSDLPub.TWSDLPublish.

Functions

	Name	Description
	WSDLPubFactory (see page 7297)	This is function WSDLPub.WSDLPubFactory.

Interfaces

	Name	Description
	IWSDLPublish (see page 7295)	This is class WSDLPub.IWSDLPublish.

Structs, Records, Enums

	Name	Description
	SOAPPublishOptions (see page 7298)	SOAPPublishOptions and TSOAPPublishOptions (see page 7299) are flags that customize the definitions the TWSDLHTMLPublish (see page 7280) creates for a Web Service.

Types

Name	Description
TBeforePublishingWSDLEvent (see page 7299)	TBeforePublishingWSDLEvent is the type of the OnBeforePublishingWSDL event of TWSDLHTMLPublish (see page 7280).
TSOAPPublishOptions (see page 7299)	This is type WSDLPub.TSOAPPublishOptions.

77.1 Classes

The following table lists classes in this documentation.

Classes

	Name	Description
	TWSDLHTMLPublish (see page 7280)	TWSDLHTMLPublish publishes a list of WSDL documents describing a Web Services application.
	TWSDLPublish (see page 7291)	This is class WSDLPub.TWSDLPublish.

77.1.1 TWSDLHTMLPublish Class

TWSDLHTMLPublish publishes a list of WSDL documents describing a Web Services application.

Class Hierarchy

Pascal

```
TWSDLHTMLPublish = class(TComponent, IWebDispatch);
```

C++

```
class TWSDLHTMLPublish : public TComponent, public IWebDispatch;
```

File

WSDLPub

Description

Add TWSDLHTMLPublish to the Web module of a Web Service application to publish a list of WSDL documents that describe how to call that Web Service application. By publishing WSDL documents for your Web Service application, you allow arbitrary clients to call on your Web Services.

TWSDLHTMLPublish publishes definitions it derives from all the invokable interfaces that are registered with the invocation registry (InvRegistry), as well as from all remotable classes and types that are registered with the remotable type registry (RemTypeRegistry). By default, it uses the address where you install the application that contains the TWSDLHTMLPublish component as the address where those services are available. If you deploy the implementation of those Web Services elsewhere, you can enable the WSDL administrator (using the AdminEnabled (see page 7287) property), and then launch the WSDL administrator from a Web browser to change the addresses specified in the generated WSDL documents.

TWSDLHTMLPublish automatically registers itself with the Web module (or Web dispatcher) as an auto-dispatching object. This means that the Web module or Web dispatcher forwards all incoming HTTP messages directed to the WSDL publisher without requiring the use of Web action items. Those messages include requests for the list of WSDL documents and requests for the WSDL administrator.

77.1.1.1 TWSDLHTMLPublish Members

The following tables list the members exposed by TWSDLHTMLPublish.

Protected Methods

	Name	Description
	AddInterfaceList (see page 7283)	This is AddInterfaceList, a member of class TWSDLHTMLPublish.
	AddPortList (see page 7283)	This is AddPortList, a member of class TWSDLHTMLPublish.
	GetHostScriptBaseURL (see page 7285)	This is GetHostScriptBaseURL, a member of class TWSDLHTMLPublish.
	UpdatePortList (see page 7286)	This is UpdatePortList, a member of class TWSDLHTMLPublish.
	WSILInfo (see page 7286)	Returns the WS inspection document that describes the Web Service.

Public Methods

	Name	Description
	Create (see page 7281)	Creates an instance of TWSDLHTMLPublish (see page 7280).
	Destroy (see page 7282)	Destroys the instance of a TWSDLHTMLPublish (see page 7280) object.
	DispatchEnabled (see page 7283)	Indicates whether the WSDL publisher is enabled to respond to incoming messages.
	DispatchMask (see page 7283)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 7284)	Returns the method type of all HTTP messages to which this component responds.
	DispatchRequest (see page 7284)	Responds to an incoming message and generates the appropriate response message.
	GetTargetNamespace (see page 7285)	Returns the value of the TargetNamespace (see page 7288) property.
	HandleRequest (see page 7285)	Generates the response for an incoming request message.
	ServiceInfo (see page 7286)	Responds to requests that are otherwise not handled by the application.

Published Events

	Name	Description
	OnAfterPublishingWSDL (see page 7289)	Occurs after the publisher generates a WSDL document for the Web Service application.
	OnBeforePublishingTypes (see page 7290)	Occurs before the publisher starts adding type definitions to the WSDL document.
	OnBeforePublishingWSDL (see page 7290)	Occurs before the publisher generates its WSDL document.
	OnPublishingType (see page 7290)	Occurs before the publisher generates the schema for a given type.

Published Properties

	Name	Description
	AdminEnabled (see page 7287)	Enables or disables the WSDL administrator.
	PublishOptions (see page 7288)	Controls the definitions TWSDLHTMLPublish (see page 7280) creates when it generates its WSDL documents.
	TargetNamespace (see page 7288)	Specifies the target namespace URL of the WSDL document.
	WebDispatch (see page 7288)	Lets the Web dispatcher identify what HTTP messages should return a list of WSDL documents.

77.1.1.2 TWSDLHTMLPublish.Create Constructor

Creates an instance of TWSDLHTMLPublish (see page 7280).

Pascal

```
constructor Create(AOwner: TComponent); override;
```

C++

```
virtual __fastcall TWSDLHTMLPublish(TComponent * AOwner);
```

Description

Call Create to instantiate a TWSDLHTMLPublish (see page 7280) object at runtime. TWSDLHTMLPublish (see page 7280) components added to web modules at design time are created automatically.

The AOwner parameter specifies another component (usually the web module) that is responsible for freeing the TWSDLHTMLPublish (see page 7280) instance. It becomes the value of the Owner property.

See Also

Owner

77.1.1.3 TWSDLHTMLPublish.Destroy Destructor

Destroys the instance of a TWSDLHTMLPublish (see page 7280) object.

Pascal

```
destructor Destroy; override;
```

C++

```
virtual __fastcall ~TWSDLHTMLPublish();
```

Description

Use the Free method to free a TWSDLHTMLPublish (see page 7280) instance. Unlike the Destroy method, Free guards against a nil reference.

See Also

System::TObject::Free (see page 3372)

77.1.1.4 TWSDLHTMLPublish Methods

The methods of the TWSDLHTMLPublish class are listed here.

Protected Methods

	Name	Description
	AddInterfaceList (see page 7283)	This is AddInterfaceList, a member of class TWSDLHTMLPublish.
	AddPortList (see page 7283)	This is AddPortList, a member of class TWSDLHTMLPublish.
	GetHostScriptBaseURL (see page 7285)	This is GetHostScriptBaseURL, a member of class TWSDLHTMLPublish.
	UpdatePortList (see page 7286)	This is UpdatePortList, a member of class TWSDLHTMLPublish.
	WSILInfo (see page 7286)	Returns the WS inspection document that describes the Web Service.

Public Methods

	Name	Description
	DispatchEnabled (see page 7283)	Indicates whether the WSDL publisher is enabled to respond to incoming messages.
	DispatchMask (see page 7283)	Returns a mask that matches the path portion of any URL to which this object responds.
	DispatchMethodType (see page 7284)	Returns the method type of all HTTP messages to which this component responds.

	DispatchRequest (see page 7284)	Responds to an incoming message and generates the appropriate response message.
	GetTargetNamespace (see page 7285)	Returns the value of the TargetNamespace (see page 7288) property.
	HandleRequest (see page 7285)	Generates the response for an incoming request message.
	ServiceInfo (see page 7286)	Responds to requests that are otherwise not handled by the application.

77.1.1.4.1 TWSDLHTMLPublish.AddInterfaceList Method

Pascal

```
procedure AddInterfaceList(htmldoc: TStringList; const WSDLBaseURL: String);
```

C++

```
__fastcall AddInterfaceList(TStringList htmldoc, const UnicodeString WSDLBaseURL);
```

Description

This is AddInterfaceList, a member of class TWSDLHTMLPublish.

77.1.1.4.2 TWSDLHTMLPublish.AddPortList Method

Pascal

```
procedure AddPortList(htmldoc: TStringList; const PortType: String);
```

C++

```
__fastcall AddPortList(TStringList htmldoc, const UnicodeString PortType);
```

Description

This is AddPortList, a member of class TWSDLHTMLPublish.

77.1.1.4.3 TWSDLHTMLPublish.DispatchEnabled Method

Indicates whether the WSDL publisher is enabled to respond to incoming messages.

Pascal

```
function DispatchEnabled: Boolean;
```

C++

```
__fastcall Boolean DispatchEnabled();
```

Description

The DispatchEnabled method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to determine whether it can receive incoming messages. In TWSDLHTMLPublish (see page 7280), DispatchEnabled always returns true.

See Also

WebDispatch (see page 7288)

77.1.1.4.4 TWSDLHTMLPublish.DispatchMask Method

Returns a mask that matches the path portion of any URL to which this object responds.

Pascal

```
function DispatchMask: TMask;
```

C++

```
__fastcall TMask DispatchMask();
```

Description

The DispatchMask method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to the this component. It returns a Mask derived from the Mask property of the WebDispatch (see page 7288) property.

See Also

WebDispatch (see page 7288)

Mask

77.1.1.4.5 TWSDLHTMLPublish.DispatchMethodType Method

Returns the method type of all HTTP messages to which this component responds.

Pascal

```
function DispatchMethodType: TMethodType;
```

C++

```
__fastcall TMethodType DispatchMethodType();
```

Description

The DispatchMethodType method must be implemented by all auto-dispatching objects to allow Web Module (or Web Dispatcher) to identify the HTTP messages it should forward to this component. It returns the MethodType properties of WebDispatch (see page 7288).

See Also

MethodType

WebDispatch (see page 7288)

77.1.1.4.6 TWSDLHTMLPublish.DispatchRequest Method

Responds to an incoming message and generates the appropriate response message.

Pascal

```
function DispatchRequest(Sender: TObject; Request: TWebRequest; Response: TWebResponse):
Boolean;
```

C++

```
__fastcall Boolean DispatchRequest(TObject * Sender, TWebRequest Request, TWebResponse
Response);
```

Description

The Web Module (or Web Dispatcher) calls DispatchRequest when it identifies an HTTP message that matches the properties of the WebDispatch (see page 7288) property. DispatchRequest responds by generating an HTML page that lists the WSDL documents describing the Web Service, and including a button for the WSDL administrator if the AdminEnabled (see page 7287) property is true.

Sender is not used in the DispatchRequest method.

Request contains information about the incoming request message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

DispatchRequest returns true if it successfully generates a response. It returns false if it could not handle the request.

See Also

WebDispatch (see page 7288)

AdminEnabled (see page 7287)

77.1.1.4.7 TWSDLHTMLPublish.GetHostScriptBaseURL Method

Pascal

```
function GetHostScriptBaseURL(Request: TWebRequest): String;
```

C++

```
__fastcall UnicodeString GetHostScriptBaseURL(TWebRequest Request);
```

Description

This is GetHostScriptBaseURL, a member of class TWSDLHTMLPublish.

77.1.1.4.8 TWSDLHTMLPublish.GetTargetNamespace Method

Returns the value of the TargetNamespace (see page 7288) property.

Pascal

```
function GetTargetNamespace: InvString;
```

C++

```
__fastcall InvString GetTargetNamespace();
```

Description

GetTargetNamespace is the read implementation for the TargetNamespace (see page 7288) property.

See Also

TargetNamespace (see page 7288)

77.1.1.4.9 TWSDLHTMLPublish.HandleRequest Method

Generates the response for an incoming request message.

Pascal

```
function HandleRequest(Resp: TStringList; const Path: String; const HostScriptBaseURL: String;
var ContentType: String; Request: TWebRequest): integer;
```

C++

```
__fastcall int HandleRequest(TStringList Resp, const UnicodeString Path, const UnicodeString
HostScriptBaseURL, UnicodeString ContentType, TWebRequest Request);
```

Description

The DispatchRequest (see page 7284) method calls HandleRequest to generate the content of the HTTP response message it fills out. Typically, applications should not need to call this method.

Resp is a string list to which HandleRequest writes the content of the response.

Path is the path information taken from the incoming request message.

HostScriptBaseURL is the URL for the script name to which the incoming request is addressed.

ContentType returns the content type of the response that is written to Resp. This becomes the value of a ContentType header on the response message.

Request is the request message for which this method generates a response.

HandleRequest returns the StatusCode for the generated response. This becomes the StatusCode property of the response message.

See Also

DispatchRequest (see page 7284)

StatusCode

77.1.1.4.10 TWSDLHTMLPublish.ServiceInfo Method

Responds to requests that are otherwise not handled by the application.

Pascal

```
procedure ServiceInfo(Sender: TObject; Request: TWebRequest; Response: TWebResponse; var
Handled: Boolean);
```

C++

```
__fastcall ServiceInfo(TObject * Sender, TWebRequest Request, TWebResponse Response, Boolean
Handled);
```

Description

The Web Module (or Web Dispatcher) calls ServiceInfo when there are no other components in the application to handle an incoming request message. ServiceInfo responds by generating a default Web page that includes a link to the WSDL documents.

Sender is not used in the ServiceInfo method.

Request contains information about the incoming request message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

Handled always returns true, indicating that ServiceInfo successfully generated a response.

See Also

DispatchRequest (see page 7284)

77.1.1.4.11 TWSDLHTMLPublish.UpdatePortList Method

Pascal

```
procedure UpdatePortList(PortList: TStrings; const PortType: String; const Command: String);
```

C++

```
__fastcall UpdatePortList(TStrings PortList, const UnicodeString PortType, const UnicodeString
Command);
```

Description

This is UpdatePortList, a member of class TWSDLHTMLPublish.

77.1.1.4.12 TWSDLHTMLPublish.WSILInfo Method

Returns the WS inspection document that describes the Web Service.

Pascal

```
procedure WSILInfo(const HostScriptBaseURL: string; Request: TWebRequest; Response:
TWebResponse; var Handled: Boolean);
```

C++

```
__fastcall WSILInfo(const UnicodeString HostScriptBaseURL, TWebRequest Request, TWebResponse
Response, Boolean Handled);
```

Description

The Web Module (or Web Dispatcher) calls WSILInfo when a request is made for the WS inspection document for the Web Service (when the path portion of the request ends in the string 'inspection.wisl'.. WSILInfo responds by generating the WSIL description.

HostScriptBaseURL is the base path for accessing the WSDL documents of the Web Service.

Request contains information about the incoming request message.

Response is a TWebResponse object that is filled out to indicate the response that should be returned to the Web client.

Handled always returns true, indicating that WSILInfo successfully generated a response.

See Also

DispatchRequest (see page 7284)

ServiceInfo (see page 7286)

77.1.1.5 TWSDLHTMLPublish Properties

The properties of the TWSDLHTMLPublish class are listed here.

Published Properties

	Name	Description
	AdminEnabled (see page 7287)	Enables or disables the WSDL administrator.
	PublishOptions (see page 7288)	Controls the definitions TWSDLHTMLPublish (see page 7280) creates when it generates its WSDL documents.
	TargetNamespace (see page 7288)	Specifies the target namespace URL of the WSDL document.
	WebDispatch (see page 7288)	Lets the Web dispatcher identify what HTTP messages should return a list of WSDL documents.

77.1.1.5.1 TWSDLHTMLPublish.AdminEnabled Property

Enables or disables the WSDL administrator.

Pascal

```
property AdminEnabled: Boolean;
```

C++

```
__property Boolean AdminEnabled;
```

Description
